[local]hostname(nse-fr-peer-nsei-<nse_id>)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bssgp-timer

This command has been deprecated.

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the global configuration mode.

ns-reset-mode

The command configures automatic NS-Reset for a specific Frame Relay peer NSE (network service entity).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ns-reset-mode { active | passive }

default ns-reset-mode
```

default

Resets the configuration to the passive mode.

active

Configures active mode so that the SGSN is enabled to initiate NS-Reset without manual intervention.

passive

Configures passive mode which means the SGSN continues *not* to initiate NS-Reset.
This is the default mode.

Usage

Use this command to configure the SGSN for active mode regarding the peer NSE, so that the SGSN will initiate:

- NS-Reset when NSVC-DLCI binding is done.
- NS-Reset when the link goes down and then comes back.
- NS-Unblock upon receipt of NS-Reset-Ack message.

Active mode is useful in the following scenarios:

- if the SGSN detects LMI down but the BSC does not detect any link failure so does not send NS-Reset.
- if the NS layer can go down and the SGSN will mark the link as 'Blocked-Dead'. If the link comes up later, the NS layer state for that link will remain in the Blocked state.

Example

Configure active mode to perform NS-Reset when the link goes down and comes back up:

```
ns-reset-mode active
```

ns-vc

This command creates a network service virtual circuit (NSVC) for this frame relay NSE and enters the configuration sub-mode to define the NSVC parameters. These parameters are described in the NSVC Configuration Mode chapter elsewhere in this CLI Reference Guide.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] ns-vc id *ns-vc_id*

no

Removes the specified NSVC configuration.

id *ns-vc_id*

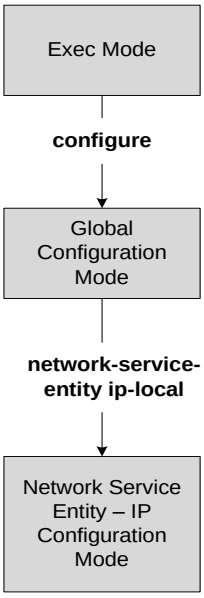
This keyword defines the NSVC configuration identifier.
ns-vc_id: Must be an integer from 0 to 65535

Usage

Access the NSVC configuration mode.

Example

Gain access to the NSVC configuration mode to change the 4th instance.



```
ns-vc id 4
```

Chapter 196
Network Service Entity- IP Local Configuration Mode Commands

The Network Service Entity (NSE) - IP Local configuration mode is a sub-mode of the Global Configuration mode. This sub-mode configures the local endpoint for NS/IP with the commands and parameters to define the management functionality for the Gb interface between a BSS and an SGSN over a 2.5G GPRS IP network connection.

Upon entering this mode, the prompt will appear in a manner similar to:

```
[local]hostname(nse-ip-local)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

all-nsvc-failure-action

Configure how the SGSN handles the NSE when all NSVCs go down.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
all-nsvc-failure-action clear-nse

default all-nsvc-failure-action
```

default

By default, the NSE is not cleared if all NSVCs go down.

clear-nse

Instructs the SGSN to SGSN to clear NSEs if all NSVCs to the BSC are down.

Usage

Enable the SGSN to clear NSE information when all NSVCs go down.

Example

Use the following command to configure the SGSN to clear NSEs when all NSVCs go down.

```
all-nsvc-failure-action clear-nse
```

bssgp-timer

This command has been deprecated.

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Returns to the global configuration mode.

max-ns-retransmissions

This command configures the maximum number of transmission retries counter.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[default] max-ns-retransmissions { alive *count* **| sns-proc** *count* **}**

default

Resets the specified counter configuration to the default value.

alive *count*

Sets the maximum number of alive retries.
count: Must be an integer between 0 and 10. Default is 3.

sns-proc *count*

Sets the maximum number of retries for the SNS procedure
count: Must be an integer between 0 and 5. Default is 3.

Usage

Sets the maximum for NS transmission retries.

Example

max-ns-retransmission alive *4*

ns-timer

This command sets the network service (NS) counters for the SNS procedure and testing.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ns-timer { sns-guard *timeout_val* **| sns-prov** *timeout_val* **| test** *timeout_val* **}**

default ns-timer { sns-guard | sns-prov | test }

default

Resets the selected timer configuration to its default value.

sns-guard *timeout_val*

Sets the SNS-guard timer which is used in the auto-learn procedure to clean-up learnt BSC/NSE informtation. Timeout value is in seconds.
timeout_val: Enter an integer from 1 to 300. Default is 60.

sns-prov *timeout_val*

Sets the SNS procedure timeout value in seconds.
timeout_val: Enter an integer from 1 to 10. Default is 5.

test *timeout_val*

Sets the test procedure timeout value in seconds.
timeout_val: Enter an integer from 1 to 60. Default is 30 seconds.

Usage

Set NS timers to help manage the NSE-IP connection.

Example

The following example sets the test timer to 4 seconds:

```
ns-timer test 4
```

nsvc-failure-action

This command enables and disables the sending of an NS-STATUS message with cause ‘ip-test fail’ when NSVC goes down.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
nsvc-failure-action send-ns-status

default nsvc-failure-action
```

default

Resets the command configuration to its default value. The default action is not to send an NS-STATUS message. This is applicable only to NSVCs that are auto-learned and not configured.

send-ns-status

Enables the sending of the NS-STATUS message.

Usage

Use this command to enable or disable sending an NS-STATUS messages when an NSVC goes down.

Example

Enable sending of the message:

```
nsvc-failure-action send-ns-status
```

nsvl

This command creates and instance of a network service virtual link (NSVL) and enters the NSVL configuration mode.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] nsvl instance *nsvl_id*

no

Removes the identified NSVL definition from the configuration.

instance *nsvl_id*

Identifies a specific NSVL configuration instance.
nsvl_id: Must be an integer from 0 to 3.

Usage

Access the NSVL configuration mode.

Example

Enter the NSVL configuration sub-mode to modify the configuration for NSVL instance 2:

```
nsvl instance 2
```

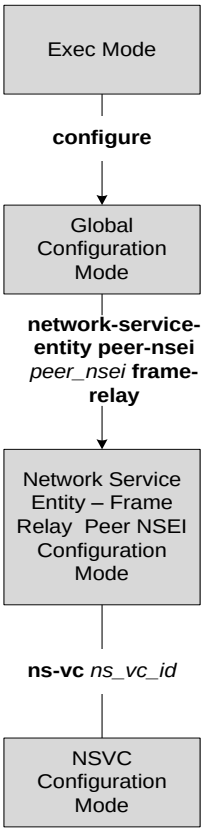
peer-network-service-entity

This command has been replaced by the Network Service Entity - Peer NSEI Frame Relay configuration mode.

retry-count

This command has been replaced by the **max-ns-retransmissions** command.

timer



This command has been replaced by the **ns-timer** command.

Chapter 197
Network Service Virtual Connection Configuration Mode Commands

The Network Service Virtual Connection (NSVC) configuration mode is a sub-mode of the Network Service Entity (NSE) - Peer NSEI (for Frame Relay) configuration mode. The NSVC sub-mode creates a configuration instance for a specific NSVC, within the Gb interface, between a BSS and an SGSN in a 2.5G GPRSFrame Relay network connection.

Upon accessing this mode, the prompt will appear similar to:

```
[local]hostname(nse-fr-peer-nsei-<nse_id>-nsvci-<nsvc_id>)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

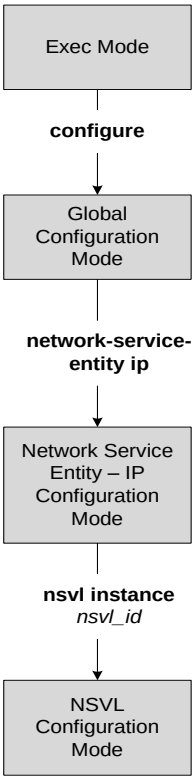
Privilege

Security Administrator, Administrator

Syntax

exit

Usage



Returns to the network service entity - frame relay configuration mode.

Chapter 198
Network Service Virtual Link Configuration Mode Commands

The Network Service Virtual Link configuration mode is a sub-mode of the Network Service Entity - IP configuration mode. This sub-mode provides the commands and parameters to define the NSVL of the Gb interface between a BSS and an SGSN in a 2.5G GPRS IP network connection.

Upon entering this mode, the prompt should appear similarly to the following:

```
[local]hostname(nse-ip-local-nsvl-<nsvl_id>)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the network service entity - IP configuration mode. mode.

nsvl-address

This command configures the IP address of the NSVL. end-point.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

nsvl-address ip-address *ip_address* **context** *ctxt_name* **port** *port_num*

ip-address *ip_address*

Identifies the address of the NSVL.
ip_address: Must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.

context *ctxt_name*

Identifies the specific context associated with this NSVL address.
ctxt_name: Enter up to 79 alphanumeric characters.

port *port_num*

Specifies the UDP port to associate with the NSVL end-point.
port_num: Must be an integer from 1 to 65535.

Usage

Use this command to configure the IP address, context name and port number for the NSVL end-point.

Example

```
nsvl-address ip-address 1.1.1.1 context sgsn2 port 3735
```

weight

This command configures the signaling or data weight for NSVL.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

weight { data *data_weight* **| signaling** *signaling_weight* **}**

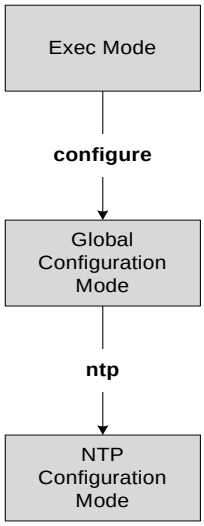
data *data_weight*

Defines the data weight for the NSVL.
data_weight: Must be an integer from 0 to 255. Default is 1.

signaling *signaling_weight*

Defines the signaling weight for the NSVL.
signaling_weight: Must be an integer from 0 to 255. Default is 1.

Usage



Configure the weight of the signaling or data for the NSVL.

Example

weight data *234*

Chapter 199
NTP Configuration Mode Commands

The NTP Configuration Mode is used to manage the Network Time Protocol (NTP) options for the entire system.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

enable

Enables the use of the Network Time Protocol (NTP) for synchronizing the system clock. By default, NTP is not enabled externally and should be configured when the system is initially installed. When enabled, the active ASR 5000 SMC or ASR 5500 MIO will synchronize with external sources. If not enabled, the active SMC or MIO will use its local clock as a time source. In the event of an NTP server or network outage, an already running SMC or MIO will continue to use NTP to maintain time accuracy, but in a holdover mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

enable [*context* **]**

context

Default: local
Specifies the context for which NTP is to be enabled as an alphanumeric string of 1 through 79 characters.

Important: NTP must be configured for use in the local context only. Use of other contexts will cause issues.

Usage

Sets the NTP server to be used for the system. Only one NTP server may be active at any given time.
The system uses NTP to synchronize internal clocks on the chassis to external time sources (typically GPS NTP sources, or other Stratum 2 or 3 servers, switches or routers).
All cards with CPUs synchronize to the active SMC or MIO internally. This occurs even if an external NTP server is not configured. In the event of a SMC or MIO switchover, all other cards will start synchronizing with the newly active SMC or MIO automatically.
If any NTP server is enabled, the chassis system clock will be synchronized to the active NTP server which covers all contexts for timing synchronization.
Refer to the *System Administration Guide* for additional information on configuring NTP.

Example

The following command enables use of NTP for the *local* context.

```
enable
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

server

Configures a Network TIme Protocol (NTP) server for use by the local NTP client in synchronizing the system clock.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

server *ip_address* **[prefer] [version** *number* **] [minpoll** *poll_period* **] [maxpoll** *poll_period* **]**

no server *ip_address*

no

Indicates the server specified is to be removed from the list of NTP servers for clock synchronization.

ip_address

Specifies the IP address of the NTP server to be used for clock synchronization in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
NTP should be configured for at least three external NTP servers. With three or more servers, outlyers and broken or misconfigured servers can be detected and excluded. Generally, the more servers the better (within reason).

prefer

Indicates the NTP server specified to be the preferred server. Only one server can be set to preferred. The preferred server is the first one contacted for clock synchronization.

Important: Use of the **prefer** keyword is not recommended.

Important: Do not change the **version**, **minpoll** or **maxpoll** keyword settings unless instructed to do so by Cisco TAC.

version *number*

Specifies the network timing protocol version to use for server communications as an integer from 1 to 4.
Default: 4 (RFC 5905)

minpoll *poll_period*

Specifies the minimum polling interval (in seconds) for NTP messages as a power of 2. *poll_period* is the exponent (power of) expressed as an integer from 6 through 17. For example, if you specify the number 6, the value is 2^6 and the resultant poll period is 64 seconds. Default: 6

maxpoll *poll_period*

Specifies the maximum polling interval (in seconds) for NTP messages as a power of 2. *poll_period* is the exponent (power of) expressed as an integer from 6 through 17. For example, if you specify the number 10, the value is 2^10 and the resultant poll period is 1024 seconds. Default: 10

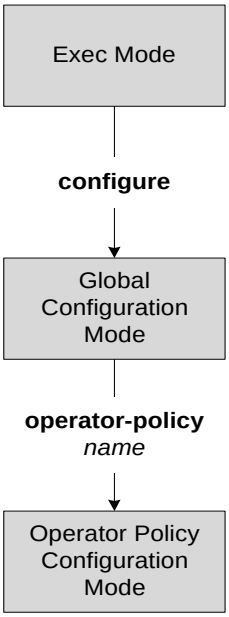
Usage

Configure the NTP servers in response to network changes.
Refer to the *System Administration Guide* for important information on configuring NTP servers with local sources, and using a load balancer to communicate with external NTP servers.

Important: Adding, removing, or modifying an NTP server configuration entry causes the NTP client to restart itself and resynchronize with all configured NTP servers.

Example

The following command adds the NTP server with address *10.2.3.4* to the list of NTP servers.



```
server 10.2.3.4
```

Chapter 200
Operator Policy Configuration Mode

Operator Policy configuration mode associates APNs, APN profiles, IMEI ranges, IMEI profiles, an APN remap table and a call control profile to an operator policy. These profiles and tables are created and defined within their own configuration modes to generate sets of rules and instructions that can be reused and assigned to multiple policies.

- A maximum of 1,000 operator policies can be defined, including the "default" operator policy.
- A maximum of 128 APN profiles can be associated with a single operator policy.
- A maximum of 128 IMEI profiles can be associated with a single operator policy.
- Only one APN remap table can be associated with a single operator policy.
- Only one call control profile can be associated with a single operator policy.

Using the Operator Policy feature allows the operator to fine-tune any desired restrictions or limitations needed to control call handling per subscriber or for a group of callers across IMSI ranges.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

apn

This command identifies an APN (access point name) and associates it with an APN profile (created separately in the APN Profile Configuration mode).

Platform

ASR 5000

Product

MME, S-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

apn { default-apn-profile *apn_profile_name* **| network-identifier** *apn_net_id* **apn-profile** *apn_profile_name* **| operator-identifier** *apn_op_id* **apn-profile** *apn_profile_name* **}**

no apn { default-apn-profile | network-identifier *apn_net_id* **| operator-identifier** *apn_op_id* **}**

no

Disables the specified APN to APN Profile correspondence.

default-apn-profile *apn_profile_name*

Enables the use of a default APN profile comprised of default values for all parameters. this profile will be used when none of the configured APNs match the APN in the incoming Request.
apn_profile_name must be an alphanumeric string of 1 through 64 characters.

apn-profile*apn_profile_name*

apn_profile_name must be an alphanumeric string of 1 through 64 characters.

network-identifier *apn_net_id*

Links the specified APN network ID with the specified APN profile.
apn_net_id must be an alphanumeric string of 1 through 63 characters, including dots (.) and dashes (-).

operator-identifier *apn_op_id*

Links the specified APN operator ID with the specified APN profile.
apn_op_id: must be an alphanumeric string of 1 through 18 characters, including dots (.). The string must be in the following format, where # represents a digit: MNC###.MCC###.GPRS.

Usage

Use this command, to associate APNs with APN profiles. This command can be repeated to associate multiple APNs with profiles.

Example

Associate the APN profile named *apnprof1* to APN network ID *starflash.com*:

```
apn apnprof1 network-identifier starflash.com
```

associate

Associate an APN remap table and a call control profile with the operator policy.

Platform

ASR 5000

Product

MME, S-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

associate { apn-remap-table *table_id* **| call-control-profile** *profile_id* **}**

no associate { apn-remap-table | call-control-profile }

no

Removes the association definition from the policy configuration.

apn-remap-table *table_id*

Identifies the APN remap table to be associated with the operator policy.
table_id must be an alphanumeric string of 1 through 65 characters.

call-control-profile *profile_id*

Identifies a call control profile to be associated with the operator policy.
profile_id must be an alphanumeric string of 1 through 64 characters.

Usage

Use this command to associate an APN remap table and/or a call control profile with this Operator Policy. The APN remap table and the call control profile contain the definitions that instruct the SGSN or MME how to handle calls. Only one of each of these can be associated with an operator policy.

Example

Associate the *stardust.net_APNremap1* APN remap table with this operator policy:

```
associate apn-remap-table stardust.net_APNremap1
```

description

Associates a description with or names an operator policy.

Platform

ASR 5000

Product

MME, S-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

description *description*

no description

description

Enter an alphanumeric string of 1 through 100 characters. If the string includes spaces, punctuation, and case-sensitive letters, it must be bracketed with double quotation marks (“ “).

no

Removes the existing description from this operator policy.

Usage

Identity this particularly operator policy using descriptive text.

Example

```
description “sgsn1 operator policy carrier1”
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

imei

Defines a range of IMEI (International Mobile Equipment Identity) numbers and associates an IMEI profile with the range definition.

Platform

ASR 5000

Product

MME, S-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

imei range *IMEI_number* **to** *IMEI_number* **{ imei-profile** *profile_name* **| sv** *##* **imei-profile** *profile_name* **}**

no imei range *IMEI_number* **to** *IMEI_number* **sv** *##*

no

Removes the IMEI definition from the policy configuration.

range *IMEI_number* **to** *IMEI_number*

Defines the beginning and end of a range of IMEIs.
IMEI_number must be a numerical string of up to 14 digits.

sv *##*

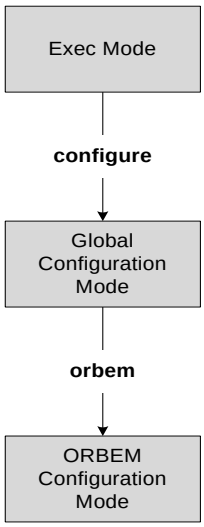
Identifies the software version to fine-tune the IMEI definition. This keyword should only be included if the IMEISV is retrievable.
must be a 2-digit integer.

imei-profile *profile_name*

Identify the IMEI profile that defines the actions appropriate to the devices identified within the specified range.
profile_name must be an alphanumeric string of 1 through 64 characters.

Usage

This command defines the IMEI ranges that will be used by the operator policy to determine if the device is appropriately selected for actions defined in the specified IMEI profile.



Example

All devices with an IMEI of *123123** requesting Attach shall be subject to actions in the *blacklist_profile1*

```
imei range 1231230 to 1231239 imei-profile name blacklist_profile1
```

Chapter 201
ORBEM Configuration Mode Commands

The ORBEM Configuration Mode is used to manage the Object Request Broker Element Manager (ORBEM) server options for the current context.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

activate

Activates/deactivates a Common Object Request Broker Architecture (CORBA) client for the ORBEM interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
active client id

no active client id
```

no

Indicates the client specified is to be deactivated. When omitted, the client is activated.

id *name*

Specifies the client to be activated. *name* must refer to a previously configured client expressed as an alphanumeric string of 1 through 10 characters.

Usage

Activates CORBA clients after they have been configured or deactivated by the system or by configuration.

Example

```
active client wem

no active client wem
```

client

Configures/removes a CORBA client from the ORB element manager system interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

client id *name* **[encrypted] password** *pwd*

no client id *name*

no

Indicates the client specified is to be removed from the configuration.

id *name*

Specifies the client to be configured. *name* must be an alphanumeric string of 1 through 10 characters.

encrypted

Indicates password specified is encrypted.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

password *pwd*

Specifies the password for the CORBA client. *pwd* must be an alphanumeric string of 1 through 35 characters.

Usage

ORBEM clients must be configured prior to being activated.

Example

The following commands set the password for client *wem* specifying a plain text password and an encrypted password as well.

```
client id wem password wem1001

client id wem encrypted password f54gj801sd
```

The following deletes *wem* from the configuration.

```
no client id wem
```

default

Restores the system default values for the option specified.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { event-notif-iiop-port | event-notif-service filter | event-notif-siop-port |
iiop-port | iop-address | max-attempt | session-timeout | siop-port }
```

event-notif-iiop-port

Restores the port number for the inter-ORB event notifications to the system default: 7778.

event-notif-service filter

Restores the ORB Notification Service filter to its default behavior of sending all “error” level and higher events, and “info” level events for the orbs facility, CLI command logs, and license change logs.

event-notif-siop-port

Restores the port to use for secure socket layer inter-ORB event communication to the system default: 7777.

iiop-port

Restores the port number for inter-ORB communications to the system default: 14132.

iop-address

Restores the IP address for inter-ORB communications to the system default: IP address of current context.

max-attempt

Restores the maximum number of failed login attempts before which the client is deactivated to the system default: 3 attempts.

session-timeout

restores the amount of idle time (no activity) before a session is terminated to the system default: 300 seconds.

siop-port

Restores the secure socket layer I/O port for inter-ORB events to the system default: 14131.

Usage

Restore the ORB element manager options to a well known values, the system defaults.

Example

```
default event-notif-iiop-port

default max-attempt
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

event-notif-iiop-port

Configures the port number for Internet inter-ORB event notifications.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-notif-iiop-port *number*

number

Default: 7778
Specifies the port number to use as an integer from 1 through 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications.
Event notification port configured is only used if the Internet inter-ORB transport is enabled via the **iiop-transport** command with the event notification service being enabled as well.

Example

```
event-notif-iiop-port 25466
```

event-notif-service

Enables or disables the ORB Notification Service and allows the configuration of filters dictating which event notifications are sent.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] event-notif-service [filter { event-id *event_id* **[to** *final_event_id* **] | facility** *event_facility* **level** *event_level* **}]**

---

no

Disables the event notification service.

---

filter

Specifies a filter that determines for which events the system sends notifications.

---

event-id *event_id* **[to** *final_event_id* **]**

Specifies an event filter based on event identification (event ID) number.
event_id is a specific event ID to filter or is the initial event ID in range if the **to** keyword is used. It can be configured to an integer from 1 through 100000.
to allows the specification of a range of event IDs to filter. When used, *final_event_id* specifies the last event ID in the range to be filtered. It can be configured to an integer from 1 through 100000, but must be a value greater than the initial event ID.

---

facility *event_facility* **level** *event_level*

Specifies an event filter based on facility type and notification severity level.
event_facility specifies the facility type and can be any one of the following:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: Authentication, Authorization and Accounting (AAA) client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **aal2**: ATM Adaptation Layer 2 (AAL2) protocol logging facility
- **acl-log**: Access Control List (ACL) logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: ACS Manager facility
- **alarmctrl**: Alarm Controller facility

- **alcap**: Access Link Control Application Part (ALCAP) protocol logging facility
- **alcapmgr**: ALCAP manager logging facility
- **all**: All facilities
- **asngwmgr**: Access Service Network (ASN) Gateway Manager facility
- **asnpcmgr**: ASN Paging Controller Manager facility
- **bfd**: Bidirectional Forwarding Detection (BFD) protocol logging facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **bssap+**: Base Station Sub-system Application Part+ protocol facility for the login interface between the SGSN and the MSC/VLR (2.5G and 3G)
- **bssgp**: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)
- **callhome**: Call Home application logging facility
- **cap**: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
- **cli**: Command Line Interface (CLI) logging facility
- **credit-control**: Credit Control (CC) facility
- **cscf**: IMS/MMD Call Session Control Function (CSCF)
- **cscfmgr**: SIP CSCF Manager facility
- **cscfnpdb**: CSCF Number Portability Database (NPDB) logging facility
- **cscfttmgr**: SIP CSCF Tunnel and Transport Manager facility
- **csp**: Card/Slot/Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: CSS RADIUS Signaling facility
- **cx-diameter**: Cx Diameter Messages facility
- **dcardctrl**: IPSec Daughter Card Controller logging facility
- **dcardmgr**: IPSec Daughter Card Manager logging facility
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: Dynamic Host Configuration Protocol (DHCP) logging facility
- **dhcpv6**: DHCPv6
- **dhost**: Distributed Host logging facility
- **diabase**: Diabase messages facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-dns**: Diameter DNS subsystem
- **diameter-ecs**: ACS Diameter signaling facility
- **diameter-hdd**: Diameter Horizontal Directional Drilling (HDD) Interface facility

- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSec Data Path facility
- **drvctrl**: Driver Controller facility
- **eap-ipsec**: Extensible Authentication Protocol (EAP) IPSec facility
- **eap-sta-s6a-s13-s6b-diameter**: EAP/STA/S6A/S13/S6B Diameter messages facility
- **ecs-css**: ACSMGR <-> Session Manager Signalling Interface facility
- **egtpc**: eGTP-C logging facility
- **egtpmgr**: enhanced GPRS Tunneling Protocol (eGTP) manager logging facility
- **egtpu**: eGTP-U logging facility
- **epdg**: evolved Packet Data (ePDG) gateway logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **fng**: Femto Network Gateway (FNG) logging facility
- **gmm**:
  - For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
  - For 3G: Logs the access application layer (above the RANAP layer)
- **gprs-app**: GPRS Application logging facility
- **gprs-ns**: GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
- **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages facility
- **gss-gcdr**: GTPP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility
- **gtpcmgr**: GTP-C protocol manager logging facility
- **gtpp**: GTP-prime protocol logging facility
- **gtpu**: GTP-U protocol logging facility
- **gtpumgr**: GTP-U Demux manager
- **gx-ty-diameter**: Gx/Ty Diameter messages facility
- **gy-diameter**: Gy Diameter messages facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **hdctrl**: HD Controller logging facility
- **hnb-gw**: HNB-GW (3G Femto GW) logging facility
- **hnbmgr**: HNB-GW Demux Manager logging facility
- **hss-peer-service**: Home Subscriber Server (HSS) Peer Service facility
- **igmp**: Internet Group Management Protocol (IGMP)
- **ikev2**: Internet Key Exchange version 2 (IKEv2)

- **ims-authorizatn**: IP Multimedia Subsystem (IMS) Authorization Service facility
- **ims-sh**: HSS Diameter Sh Interface Service facility
- **imsimgr**: SGSN IMSI Manager facility
- **imsue**: IMS User Equipment (IMSUE) facility
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipms**: Intelligent Packet Monitoring System (IPMS) logging facility
- **ipsec**: IP Security logging facility
- **ipsg**: IP Service Gateway interface logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ipsp**: IP Pool Sharing Protocol logging facility
- **kvstore**: Key/Value Store (KVSTORE) Store facility
- **l2tp-control**: Layer 2 Tunneling Precool (L2TP) control logging facility
- **l2tp-data**: L2TP data logging facility
- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility
- **lagmgr**: Link Aggregation Group (LAG) manager logging facility
- **li**: Refer to the *Lawful Intercept Interface Reference* for a description of this command.
- **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
- **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
- **local-policy**: Local Policy Service facility
- **location-service**: Location Services facility
- **m3ua**: M3UA Protocol logging facility
- **magmgr**: Mobile Access Gateway manager logging facility
- **map**: Mobile Application Part (MAP) protocol logging facility
- **megadiammgr**: MegaDiameter Manager (SLF Service) logging facility
- **mme-app**: Mobility Management Entity (MME) Application logging facility
- **mme-misc**: MME miscellaneous logging facility
- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager facility
- **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 logging facility
- **mpls**: Multiprotocol Label Switching (MPLS) protocol logging facility

- **mtp2**: Message Transfer Part 2 (MTP2) Service logging facility
- **mtp3**: Message Transfer Part 3 (MTP3) Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **npumgr-acl**: NPUMGR ACL logging facility
- **npumgr-flow**: NPUMGR FLOW logging facility
- **npumgr-fwd**: NPUMGR FWD logging facility
- **npumgr-init**: NPUMGR INIT logging facility
- **npumgr-port**: NPUMGR PORT logging facility
- **npumgr-recovery**: NPUMGR RECOVERY logging facility
- **ntfy-intf**: Notification Interface logging facility [Release 12.0 and earlier versions only]
- **ogw-app**: Offload Gateway (OGW) application logging facility [Release 12.0 and earlier versions only]
- **ogw-gtpc**: OGW GTP-C application logging facility [Release 12.0 and earlier versions only]
- **ogw-gtpu**: OGW GTP-U application logging facility [Release 12.0 and earlier versions only]
- **ogwmgr**: OGW Demux Manager logging facility [Release 12.0 and earlier versions only]
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF protocol logging facility
- **ospfv3**: OSPFv3 protocol logging facility
- **p2p**: Peer-to-Peer Detection logging facility
- **pdg**: Packet Data Gateway (PDG) logging facility
- **pdgdmgr**: PDG Demux Manager logging facility
- **pdif**: Packet Data Interworking Function (PDIF) logging facility
- **pgw**: Packet Data Network Gateway (PGW) logging facility
- **phs**: Payload Header Suppression (PHS)
- **phs-control**: PHS X1/X5 and X2/X6 Interface logging facility
- **phs-data**: PHS Data logging facility
- **phs-eapol**: PHS EAP over LAN (EAPOL) logging facility
- **phsgwmgr**: PHS Gateway Manager facility
- **phspcmgr**: PHS Paging Controller Manager facility
- **pmm-app**: Packet Mobility Management (PMM) application logging facility
- **ppp**: Point-To-Point Protocol (PPP) link and packet facilities
- **pppoe**: PPP over Ethernet logging facility
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect

- **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Diameter Rf interface messages facility
- **rip**: Routing Information Protocol (RIP) logging facility [RIP is not supported at this time.]
- **rohc**: Robust Header Compression (RoHC) facility
- **rsvp**: Reservation Protocol logging facility
- **rua**: RANAP User Adaptation (RUA) [3G Femto GW - RUA messages] logging facility
- **s1ap**: S1 Application Protocol (S1AP) Protocol logging facility
- **sccp:** Signalling Connection Control Part (SCCP) Protocol logging (connection-oriented messages between RANAP and TCAP layers).
- **sct**: Shared Configuration Task logging facility
- **sctp**: Stream Control Transmission Protocol (SCTP) Protocol logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sesstrc**: session trace logging facility
- **sft**: Switch Fabric Task logging facility
- **sgs**: SGs interface protocol logging facility
- **sgsn-app**: SGSN-APP logging various SGSN “glue” interfaces (for example, between PMM, MAP, GPRS-FSM, SMS).
- **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
- **sgsn-gtpc**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
- **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
- **sgsn-mbms-bearer**: SGSN Multimedia Broadcast/Multicast Service (MBMS) Bearer app (SMGR) logging facility
- **sgsn-misc**: Used by stack manager to log binding and removing between layers
- **sgsn-system**: SGSN System Components logging facility (used infrequently)
- **sgsn-test**: SGSN Tests logging facility; used infrequently
- **sgtpcmgr**: SGSN GTP-C Manager logging information exchange through SGTPC and the GGSN
- **sgw**: Serving Gateway facility
- **sh-diameter**: Sh Diameter messages facility
- **sitmain**: System Initialization Task main logging facility
- **sm-app**: SM Protocol logging facility
- **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
- **sndcp**: Sub Network Dependent Convergence Protocol (SNDCP) logging facility
- **snmp**: SNMP logging facility

- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **sscfnni**: SSCFNNI Protocol logging facility
- **sscop**: SSCOP Protocol logging facility
- **ssh-ipsec**: SSH IP Security logging facility
- **ssl**: Secure Socket Layer (SSL) message logging facility
- **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **tcap**: TCAP Protocol logging facility
- **testctrl**: Test Controller logging facility
- **testmgr**: Test Manager logging facility
- **threshold**: threshold logging facility
- **ttg**: Tunnel Termination Gateway (TTG) logging facility
- **tucl**: TCP/UDP Convergence Layer (TUCL) logging facility
- **udr**: User Data Record (UDR) facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User Layer 3 tunnel logging facility
- **usertcp-stack**: User TCP Stack
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

event_level

specifies the severity level of the event notification to filter and can be configured to one of the following:

- critical: display critical events
- error: display error events and all events with a higher severity level
- warning: display warning events and all events with a higher severity level
- unusual: display unusual events and all events with a higher severity level
- info: display info events and all events with a higher severity level
- trace: display trace events and all events with a higher severity level
- debug: display all events

Usage

This command is used to enable or disable the ORB Notification Service. Additionally, it can be used to configure filters dictating which events are sent. This service is disabled by default.
Filters can be configured for a specific event identification number (event ID), a range of event IDs, or specific severity levels for events for particular facilities.

When no filters are configured and the service is enabled, the ORB Notification Service sends all "error" level and higher events, and "info" level events for the orbs facility, CLI command logs, and license change logs.
Multiple instance of this command can be executed to configure multiple filters.

Example

The following command enables the ORB Notification service:

```
event-notif-service
```

The following command disables the ORB Notification service:

```
no event-notif-service
```

The following command configures a filter for the ORB Notification Service allowing only event IDs *800* through *805* to be sent:

```
event-notif-service filter event-id 800 to 805
```

The following command configures a filter for the ORB Notification Service allowing only *critical* level notifications for all facilities:

```
event-notif-service filter facility all level critical
```

event-notif-siop-port

Configures the port to use for secure socket layer (SSL) inter-ORB event communication.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-notif-siop-port *number*

number

Default: 7777
Specifies the port number to use as an integer from 1 through 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications using SSL.

Example

```
event-notif-siop-port 25466
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

iiop-port

Configures the port number for Internet Inter-ORB Protocol (IIOP) communications.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] iiop-port *number*

no

Disables the IIOP port.

number

Default: 14132
Specifies the port number to use as an integer from 1 through 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for standardized inter-ORB communications.
Internet inter-ORB port is only used if IIOP transport is enabled via the **iiop-transport** command.

Example

```
iiop-port 25466
```

iiop-transport

Enables/disables use of the Internet Inter-ORB Protocol (IIOP) for management across the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
iiop-transport

no iiop-transport
```

no

Disables internet inter-ORB protocol communication across the network.

Usage

Enables the transport of IIOP messages to support remote management across the network.
The default is IIOP transport disabled.

Example

The following commands enable and disable the ORB-based management across the network, respectively.

```
iiop-transport

no iiop-transport
```

iop-address

Sets the IP address used by the ORBEM Server to advertise service.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

iop-address *ip_address*

ip_address

Specifies the IP address to use for inter-ORB communications for the current context. *ip_address* must be specified using IPv4 dotted-decimal notation.

Usage

Change the inter-ORB IP address when the IP address of the current context should not be used. The IP address of the local context may not be appropriate when the ORB configuration across nodes would cause conflicts with the IP addresses.
The default inter-ORB IP address is the IP address of the current context.

Example

```
iop-address 10.2.3.4
```

max-attempt

Configures the maximum number of failed login attempts after which the client is deactivated.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

max-attempt *count*

count

Default: 3 attempts
Specifies the number of failed login attempts prior to deactivating a client. The value must be an integer from 1 through 10.

Usage

Adjust the maximum number of attempts to a smaller value to increase the security level of the system.

Example

```
max-attempt 3
```

session-timeout

Configures the amount of idle time (no activity) before a client session is terminated.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

session-timeout *seconds*

seconds

Default: 300 seconds
Specifies the number of seconds of idle time before a client session is terminated. The value must be must be an integer from 1 through 86400.

Usage

Reduce the session timeout when the maximum number of sessions allowed is frequently being reached. Setting this to a lower value will help release idle sessions faster to allow use by other clients.

Example

```
session-timeout 1800
```

siop-port

Configures the SSL I/O port for inter-ORB events.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

siop-port *number*

number

Default: 14131
Specifies the port number to use as an integer from 1 through 65535.

Usage

Explicitly set the port number when the default port number is not the desired port value for integrating multiple products together for inter-ORB communications.

Example

```
siop-port 25466
```

ssl-auth-policy

Configures the SSL peer authentication policy used by the ORBEM server.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ssl-auth-policy { auth-none | auth-once | auth-once-fail | auth-peer | auth-peer-fail }
```

auth-none | auth-once | auth-once-fail | auth-peer | auth-peer-fail

Default: **auth-none**
auth-none: ORBEM server does not authenticate the peer
auth-once: ORBEM server authenticates the peer once (no fail)
auth-once-fail: ORBEM server authenticates the peer once (fail if no certificate)
auth-peer: ORBEM server authenticates the peer every time (no fail)
auth-peer-fail: ORBEM server authenticates the peer every time (fail if no certificate)

Usage

Use to configure the peer authentication policy used by the SSL transport of ORBEM.

Example

The following command sets the policy to authenticate the peer once without failure.

```
ssl-auth-policy auth-once
```

ssl-certificate

Defines the certificate to be used by the SSL transport of ORBEM.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

ssl-certificate { string *certificate* **| file** *url* **}**

string *certificate*

Specifies an ORBEM SSL certificate. *certificate* is an alphanumeric string of up to 4096 characters.

file *url*

Default: /usr/ssl/certs/orbscert.pem
Specifies an ORBEM SSL certificate file and location. *url* is an alphanumeric string of up to 1024 characters.

Usage

Use to configure the certificate to be used by the SSL transport of ORBEM. Note that if the **file** option is used, the certificate content is read from the *url* and converted into a quoted string.

Example

The following command defines the certificate *cert3.pem* file as being located in the **/usr/ssl/certs** directory:

```
ssl-certificate file /usr/ssl/certs/cert3.pem
```

The following command defines the certificate string (the string shown is abbreviated):

```
ssl-certificate string
```

ssl-private-key

Configures the SSL private key used by the ORBEM server.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

ssl-private-key { string *key* **| file** *url* **}**

string *key*

Specifies an ORBEM SSL private key. *key* is an alphanumeric string of up to 4096 characters.

file *url*

Default: /usr/ssl/certs/orbscert.pem
Specifies the ORBEM SSL private key file location. T*url* is an alphanumeric string of up to 1024 characters.

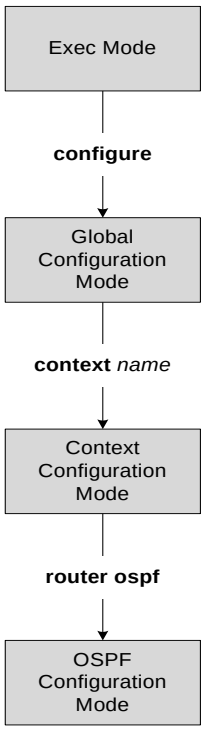
Usage

Use to configure the private key for the SSL transport of ORBEM. Note that if **file** option is used, the private key is read from the *url* and converted into a quoted string.

Example

The following command defines the private-key *cert3.pem* file as being located in the **/usr/ssl/certs** directory:

```
ssl-private-key file /usr/ssl/certs/cert3.pem
```



The following command defines the private-key string (the string shown is abbreviated):

```
ssl-private-key string
```

Chapter 202
OSPF Configuration Mode Commands

The OSPF Configuration sub-mode is used to configure the Open Shortest Path First (OSPF) routing protocol. This mode includes commands that configure OSPF routing parameters.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

area authentication

Enables authentication for the specified OSPF area.

Platform

ASR 5000

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area  { ipaddress | decimal_value } authentication [ message-digest ]
```

no

Disables authentication for the specified area.

ipaddress

Specifies the IP address of the area where authentication will be enabled in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the area where authentication will be enabled. This must be an integer from 0 through 4294967295.

authentication

Sets the OSPF authentication type to use the simple authentication method.

message-digest

Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

Usage

Use this command to enable authentication of OPSF areas.

Example

The following command enables authentication for an OSPF area defined by the IP address *192.168.100.10* and the OSPF authentication type to MD5:

```
area 192.168.100.10 authentication message-digest
```

area default-cost

Configures the default cost for an area.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } default-cost cost_value
```

no

Deletes the default cost for the area.

ipaddress

Specifies the IP address of the area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the area as an integer from 0 through 4294967295.

cost_value

Sets the default cost to be configured for the specified area as an integer from 0 through 16777215.

Usage

Use this command to configure the default cost for an OSPF area.

Example

The following command sets the default cost for an OSPF area defined by the IP address *192.168.100.10* to *300*:

```
area 192.168.100.10 default-cost 300
```

area nssa

Defines an area as an NSSA (Not So Stubby Area) and configures OSPF parameters for it.

Platform

ASR 5000

Product

PDSN, HA GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } nssa [ default-information-originate ] [ no-redistribution ] [ no-summary ] [ translate-always ] [ translate-candidate ] [ translate-never ]
```

ipaddress

Specifies the IP address of the NSSA in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the NSSA area as an integer from 0 through 4294967295.

default-information-originate

Originates default information to the NSSA area.

no-redistribution

Does not redistribute external routes to the NSSA area.

no-summary

Does not inject inter-area routes into NSSA.

translate-always

Configures the NSSA-ABR (Area Border Router) to always translate

translate-candidate

Configure NSSA-ABR for translate election. (This is enabled by default.)

translate-never

Configure NSSA-ABR to never translate.

Usage

Use this command to define NSSA areas.

Example

The following command defines the area designated by the IP address *192.168.100.10* as an NSSA area:

```
area 192.168.100.10 nssa
```

area stub

Defines an area as an OSPF stub area.

Platform

ASR 5000

Product

PDSN, HAGGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } stub [ no-summary ]
```

ipaddress

Specifies the IP address of the stub area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the stub area as an integer from 0 through 4294967295.

no-summary

Disables (stops) the ABR (Area Border Router) from sending summary link state advertisements (LSAs) into the stub area.

Usage

Use this command to define an OPSF area as a stub area.

Example

The following command defines the OSPF area defined by the IP address *192.168.100.10* as a stub area:

```
area 192.168.100.10 stub
```

area virtual-link

Configures a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } virtual-link router_id_address
```

no

Disables area virtual-link.

ipaddress

Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

decimal-value

Specifies The identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

Usage

Use this command to create a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command creates a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:

```
area 192.168.100.10 virtual-link 192.168.200.20
```

area virtual link authentication

Configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } virtual-link router_id_address authentication { message-digest | null | text }
```

no

Disables area virtual link authentication.

ipaddress

Specifies the IP address of the transit ares in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

authentication

Sets the OSPF authentication type to use the simple authentication method.

message-digest

Sets the OSPF authentication type to use the message digest (MD) authentication method.

null

Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

text

Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the authentication method for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to use no authentication:

```
area 192.168.100.10 virtual-link 192.168.200.2 null
```

area virtual-link authentication-key

Configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **authentication-key** { **encrypted password** *encrypted_authentication_key* | **password** *authentication_key* }

no area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **authentication-key**

no

Disables the area virtual link authentication key.

ipaddress

Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

encrypted password

encrypted_authentication_key is an alphanumeric string of 1 through 523 characters.
Use this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is an alphanumeric string of 1 through 16 characters that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to specify the authentication password for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command creates an authentication password of *123456* for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:

```
area 192.168.100.10 virtual-link 192.168.200.20 authentication-key password 123456
```

area virtual link intervals

Configures the interval or delay type, and the delay time in seconds, for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] area { ipaddress | decimal_value } virtual-link router_id_address [ dead-interval
value ] [ hello-interval value ] [ retransmit-interval value ] [ transmit-delay value ]
```

no

Disables the area virtual link intervals.

ipaddress

Specifies the IP address of the area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPv4 dotted-decimal notation.

dead-interval *value*

Specifies The interval (in seconds) that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

hello-interval *value*

Specifies the interval (in seconds) before sending a hello packet. *value* must be an integer from 1 through 65535.

retransmit-interval *value*

Specifies the interval (in seconds) that router should wait before retransmitting a packet. *value* must be an integer from 1 through 3600.

transmit-delay *value*

Specifies the interval (in seconds) that the router should wait before transmitting a packet. *value* must be an integer from 1 through 3600.

Usage

Use this command to set the intervals or delay types for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to *60* seconds:

```
area 192.168.100.10 virtual-link 192.168.200.20 retransmit-interval 60
```

area virtual link message-digest-key

Enables the use of MD5-based OSPF authentication for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **message-digest-key** *key_id* **md5** { **encrypted password** *encrypted_authentication_key* | **password** *authentication_key* }

no area { *ipaddress* | *decimal_value* } **virtual-link** *router_id_address* **message-digest-key** *key_id*

no

Disables the area virtual link message digest key.

ipaddress

Specifies the IP address of the transit area in IPv4 dotted-decimal notation.

decimal-value

Specifies the identification number of the transit area as an integer from 0 through 4294967295.

router_id_address

Specifies the router id of the ABR to be linked to in IPV4 dotted-decimal notation.

message-digest-key *key_id*

Specifies the key identifier number. *key_id* must be an integer from 1 through 255.

encrypted password

Specifies the use of an encrypted password. *encrypted_authentication_key* is an alphanumeric string of 1 through 523 characters.
Used this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

Specifies the password to use for authentication. *authentication_key* is an alphanumeric string from 1 through 16 characters that is entered in clear text format.

Usage

Use this command to enable the use of MD5-based OSPF authentication for a virtual link between an area that is connected to the network backbone and an area that cannot be connected to the network backbone.

Example

The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*, sets the MD5 Key ID to *25*, and the password to *123456*:

```
area 192.168.100.10 virtual-link 192.168.200.20 message-digest-key 25 md5 password 123456
```

capability graceful-restart

Configures graceful-restart. By default, this capability is set to enabled.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] capability graceful-restart
```

no

Disables the graceful-restart capability.

default

Enables the graceful-restart capability if it has been disabled.

Usage

Use this command to configure graceful-restart.

Example

The following command configures graceful-restart:

```
capability graceful-restart
```

default-information originate

Creates a default external route into an OSPF routing domain.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default-information originate

default-information originate [ always ] [ metric metric_value ] [ metric-type { 1 | 2 }
] [ route-map route_map_name ]

no default-information originate
```

no

Disables the default external route.

always

Always advertise the route regardless of whether or not the software has a default route.

metric *metric_value*

Sets the OSPF metric used in creating the default rout as an integer from 1 through 16777214.

metric-type { 1 | 2 }

Sets the default route metric type.
1: Sets the OSPF external link type for default routes to Type 1.
2: Sets the OSPF external link type for default routes to Type 2.

route-map *route_map_name*

Specifies the name of the default route-map to be use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to set the default external route into an OSPF routing domain.

Example

The following command sets the default external route to originate from the route map named *rmap1*:

```
default-information originate route-map rmap1
```

default-metric

Configures the default metric value for the OSPF routing protocol. All OSPF interfaces have a cost, which is a routing metric that is used in the link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics. When several equal-cost routes to a destination exist, traffic is distributed equally among them. The default metric is a global parameter that specifies the cost applied to all OSPF routes by default.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

default-metric *metric_value*

no default-metric

metric-value

Sets the metric value expressed as an integer from 1 through 16777214. Default: 26385.

no

Enables or disables the default metric value for OSPF.

Usage

Use this command to set the default metric for routes.

Example

The following command sets the default metric to *235*:

```
default-metric 235
```

distance

Configures the OSPF route administrative distances for all OSPF route types or based on specific route type. Administrative distance is the measure used by Cisco routers to select the best path when there are two or more different routes to the same destination from two different routing protocols. Administrative distance defines the reliability of a routing protocol. Each routing protocol is prioritized in order of most to least reliable (believable) using an administrative distance value. A lower numerical value is preferred.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] distance { distance_value | ospf { [ external distance_value ] [ inter-area
distance_value ] [ intra-area distance_value ] } }
```

no

Disables the OSPF route administrative distances for all OSPF route types.

distance_value

Specifies the OSPF route administrative distances as an integer from 1 to 255. The default distance value is 110.

ospf { [external *distance_value* **] [inter-area** *distance_value* **] [intra-area** *distance_value* **] }**

Set the distance value for the specified route type.
external *distance_value*: Set the OSPF route administrative distance for routes from other routing domains, learned by redistribution. This must be an integer from 1 through 255. The default is 110.
inter-area *distance_value*: sets the OSPF route administrative distance for routes from one routing area to another. This must be an integer from 1 through 255. The default is 110.
intra-area *distance_value*: sets the OSPF route administrative distance for all routes within an area. This must be an integer from 1 through 255. The default is 110.

no

Enables or disables the specified option.

Usage

Use this command to set the administrative distance for OSPF routes.

Example

The following command sets the administrative distance for all OSPF route types to *30*:

```
distance 30
```

distribute-list

Enables or disables the filtering of networks in outgoing routing updates.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] distribute-list route_access_list out { connected | rip | static }
```

no

Disables the filtering of networks in outgoing routing updates.

route_access_list

Specifies the name of the OSPF route access list to use for filtering as an alphanumeric string of 1 through 63 characters.

connected

Filters connected routes.

rip

Filters RIP routes. (RIP is not supported at this time.)

static

Filters static routes.

no

Disables the specified option.

Usage

Use this command to enable the filtering of outgoing route updates by using the specified route access list.

Example

The following command uses the route access list named *ral1* to filter outgoing routing updates for all connected routes:

```
distribute-list ral1 out connected
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

ip vrf

Configures the Virtual Routing and Forwarding (VRF) instances for OSPF routing protocol.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip vrf vrf_name
```

no

Disables the VRF instances and removes the configured VRF context association for OSPF routing.

vrf*vrf_name*

Configures Virtual Routing & Forwarding (VRF) parameters.
vrf_name is name of a preconfigured VRF context configured in Context Configuration Mode via the **ip vrf** command. It is an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the IP VRF forwarding also to associate the preconfigured VRF context with the specific tunnel interface.
This command creates and enters the OSPF VRF Configuration Mode if required to configure the VRF context instances for OSPF routing.

Example

The following command enables preconfigured VRF context instance *ospf_vrf1* for OSPF routing and enters the OSPF VRF Configuration mode:

```
ip vrf ospf_vrf1
```

neighbor

Configures OSPF routers that interconnect to non-broadcast networks.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] neighbor  ip_address  [ poll-interval poll_interval_value ] [ priority
priority_value ]
```

no

Disables OSPF routers that interconnect to non-broadcast networks.

ip_address

Specifies the interface IP address of the OSPF neighbor expressed using IPv4 dotted-decimal notation.

poll-interval *poll_interval_value*

Default: 120
Sets the number of seconds in the dead neighbor polling interval as an integer from 1 through 65535

priority *priority_value*

Default: 0
Sets the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the specified IP address. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

Usage

Use this command to configure OSPF routers that connect to non-broadcast networks.

Example

The following command specifies an OSPF router neighbor with the IP address of *192.168.100.10*:

```
neighbor 192.168.100.10
```

network area

Enables OSPF on an interface and defines the OSPF area for that network.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] network network_ip_address / network_mask area { area_id | area_ip_address }
```

no

Disables OSPF on an interface and defines the OSPF area for that network.

network_ip_address/network_mask

Specifies the network address and mask as well as the interface on which OSPF will be enabled. *network_ip_address* in entered in IPv4 dotted-decimal notation, followed by the "/" and the mask (CIDR).

area_id

Specifies the OSPF area identification number for the specified network as an integer from 0 through 4294967295.

area_ip_address

Specifies the IP address of the OSPF area for this network. This must be entered in IPv4 dotted-decimal notation.

Usage

Use this command to specify the IP address of the network interface that the OSPF router will use.

Example

The following command specified that the OSPF router will use the interface at IP address *192.168.1.0* with a netmask of *24*:

```
network 192.168.1.0/24
```

ospf graceful-restart

Configures OSPF graceful-restart settings.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ospf graceful-restart { **grace-period** *grace_period* | **helper** { **never** | **policy** { **only-reload** | **only-upgrade** } } }

grace-period grace-period

Specifies the OSPF graceful restart grace period (in seconds) as an integer from 1 through 1800. Default grace period is 60 seconds.

helper { never | policy { only-reload | only-upgrade } }

Helps configure OSPF helper settings.
never: Do not allow helper mode.
policy { only-reload | only-upgrade }: Allows ospf graceful-restart helper mode.

- **only-reload**: Allows ospf graceful-restart helper mode only for a reload.
- **only-upgrade**: Allows ospf graceful-restart helper mode only for an upgrade.

Default is ospf graceful-restart grace-period.

Usage

Use this command to configure graceful-restart specific settings.

Example

The following command sets the graceful restart grace period to *60* seconds:

```
ospf graceful-restart grace-period 60
```

```
ospf graceful-restart helper policy only-reloadL
```

```
ospf graceful-restart helper policy only-upgrade
```

ospf router-id

This command configures the router ID for the OSPF process.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ospf router-id  ip_address
```

no

Disables the router ID for the OSPF process.

router-id *ip_address*

Specifies the router ID for the OSPF process. *ip_address* is entered using IPv4 dotted-decimal notation.

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:

```
ospf router-id 192.168.200.1
```

passive-interface

Enables or disables the suppression of OSPF routing updates on the specified interface.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] passive-interface interface_name
```

no

Disables the name assigned to a logical interface within the specific context.

interface_name

Specifies the name assigned to a logical interface within the specific context as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to suppress router updates on an interface in the current context.

Example

The following command suppresses OSPF routing updates on the interface named *Intfc1*:

```
passive-interface Intfc1
```

redistribute

Redistributes routes from other protocols to OSPF neighbors using the OSPF protocol.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

redistribute { **connected** | **rip** | **static** } [**metric** *metric_value*] [**metric-type** { **1** | **2** }] [**route-map** *route_map_name*]

no redistribute { **connected** | **rip** | **static** }

no

Disables the redistributed routes.

connected

Redistributes connected routes.

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Redistributes static routes.

metric *metric_value*

Sets the OSPF metric used in the redistributed route. This must be an integer from 1 through 16777214.

metric-type { 1 | 2 }

Default: 2
Sets route metric type that is applied to redistributed routes.
1: Sets the OSPF external link type for routes to Type 1.
2: Sets the OSPF external link type for routes to Type 2.

route-map *route_map_name*

Filter routes through the specified route map before redistribution. *route_map_name* specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to define what routing protocols should have their routes redistributed into OSPF.

Example

The following command defines that BGP routes should be redistributed:

```
redistribute connected
```

refresh timer

Adjusts settings for the OSPF refresh timer.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] refresh  timer value
```

no

Disables the refresh timer.

value

Default: 10
Specifies the minimum amount of time (in seconds) to wait before refreshing a Link-state Advertisement (LSA). This must be an integer from 10 through 1800.

Usage

Use this command to define the amount of time to wait before refreshing an LSA.

Example

The following command sets the refresh timer to *90* seconds:

```
refresh timer 90
```

router-id

Configures the router ID for the OSPF process.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] router-id ip_address
```

no

Disables the router ID for the OSPF process.

ip_address

Specifies the router ID for the OSPF process in IPv4 dotted-decimal notation.

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:

```
router-id 192.168.200.1
```

timers spf

Sets the Shortest Path First (SPF) timers.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

timers spf *delay_value hold_time_value*

no timers spf

no

Disables SPF timers.

delay_value

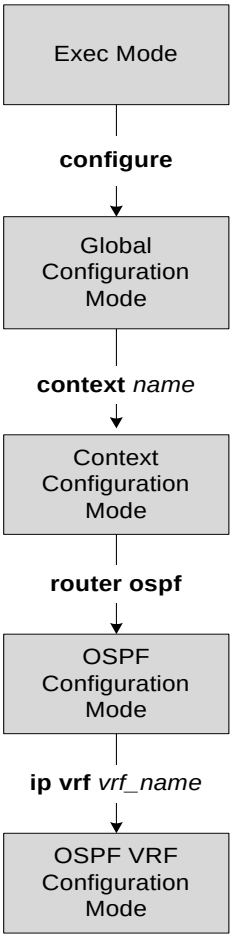
Default: 5
Specifies the delay time (in seconds) between receiving changes to an SPF calculation. This must be an integer from 0 through 4294967295.

hold_time_value

Default: 10
Specifies the hold time (in seconds) between consecutive SPF calculations. This must be an integer from 0 through 4294967295.

Usage

Use this command to set the SPF delay and hold timers for the current OSPF router process.



Example

The following command sets the delay timer to *15* and the hold timer to *15*:

```
timers spf 15 15
```

Chapter 203
OSPF VRF Configuration Mode Commands

The OSPF VRF Configuration sub-mode is used to configure the virtual routing and forwarding (VRF) context instances for OSPF routing protocol. This mode includes commands that configure VRF instance for OSPF routing parameters.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

area

Configures various parameters, including authentication, area identification, virtual link ID, and delay/interval values for the specified OSPF area using a specific VRF instance.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] area { *decimal_value* **|** *ip_address* **} {authentication [message-digest] | default-cost** *cost_value* **| nssa [default-information-originate] [no-redistribution] [no-summary] [translate-always] [translate-candidate] [translate-never] | stub [no-summary] | virtual-link** *router_ip_address* **[authentication {message-digest | null | text}| authentication-key {encrypted password** *encrypted_string* **| password** *password_string***}| message-digest-key** *key_id* **md5 [encrypted password** *encrypted_string* **| password** *password_string***]} [dead-interval] [hello-interval] [retransmit-interval] [transmit-delay]**

no

Disables or removes configured parameters for the specified OSPF area using a specific VRF instance.

ip_address

Specifies the IP address of the area where authentication will be enabled in IPv4 dotted-decimal notation.

decimal_value

Specifies the identification number of the area where parameters to be configured as an integer from 0 through 4294967295.

authentication

Sets the OSPF authentication type to use the simple authentication method.

message-digest

Sets the OSPF authentication type to use the message digest 5 (MD5) authentication method.

default-cost *cost_value*

Sets the default cost for an OSPF area. *cost_value* must be an integer from 0 through 16777215.

nssa [default-information-originate] [no-redistribution no-summary] [translate-always] [translate-candidate] [translate-never]

Configures and defines an area as an NSSA (Not So Stubby Area) and configures OSPF parameters for it. **default-information-originate**: Configures the OSPF VRF instances to originate default information to the NSSA area.

no-redistribution: Configures the OSPF VRF instance to not to redistribute external routes to the NSSA area.
no-summary: Configures the OSPF VRF instance to not to inject the inter-area routes into NSSA.
translate-always: Configures the NSSA-ABR (Area Border Router) always to translate. By default this is disabled.
translate-candidate: Configures the NSSA-ABR always to translate election. By default this is enabled.
translate-never: Configures the NSSA-ABR never to translate. By default this is disabled.

---

stub [no-summary]

Specifies an OSPF area as an stub area configures the NSSA-ABR never to translate. By default this is disabled.
no-summary: Disables (stops) the ABR from sending summary LSAs into the stub area.

---

virtual-link *router_id*

Specifies the router identifier which provides a virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone. *router_id* must be an IP address in IPv4 dotted-decimal notation of the ABR to be linked to.

---

authentication {message-digest | null | text}

Configures the OSPF authentication method to be used by the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.
message-digest: Set the OSPF authentication type to use the message digest (MD) authentication method.
null: Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.
text: Set the OSPF authentication type to use the clear text authentication method.

---

authentication-key

Configures the authentication password for the virtual link between an area that cannot be physically connected to the network backbone and an area that is physically connected to the network backbone.

---

message-digest-key *key_id*

Specifies the MD key identifier number for virtual link connection. *key_id* must be an integer from 1 through 255.

---

md5

Sets the message digest to MD5 for virtual link connection.

[encrypted] password *passwd_string*

Specifies the password required for virtual link connection authentications. The keyword **password** is optional and if specified *passwd_string* must be an alphanumeric string of 1 through 63 characters. The password specified must be in an encrypted format if the optional keyword **encrypted** was specified.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file. *encrypted_string* is an alphanumeric string of 1 through 523 characters.

dead-interval *value*

Specifies the dead interval (in seconds) that the router should wait, during which time no packets are received and after the router considers a neighboring router to be off-line. *value* must be an integer from 1 through 65535.

hello-interval *value*

Specifies the hello interval (in seconds) before sending a hello packet. *value* must be an integer from 1 through 65535.

retransmit-interval *value*

Specifies the delay between retransmission (in seconds) that router should wait before retransmitting a packet. *value* must be an integer from 1 through 3600.

transmit-delay *value*

Specifies the interval (in seconds) that the router should wait before transmitting a packet. *value* must be an integer from 1 through 3600.

Usage

Use this command to configure/set the various network/connection/authentication parameters of OPSF areas using specific VRF instance.

Example

The following command enables authentication for an OSPF area defined by the IP address *192.168.100.10* and the OSPF authentication type to MD5:

```
area 192.168.100.10 authentication message-digest
```

The following command defines the area designated by the IP address *192.168.100.10* as an NSSA area where translation of NSSA candidate is enabled by default:

```
area 192.168.100.10 nssa
```

The following command defines the OSPF area defined by the IP address *192.168.100.10* as a stub area:

```
area 192.168.100.10 stub
```

The following command creates a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:

```
area 192.168.100.10 virtual-link 192.168.200.20
```

The following command sets the authentication method for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to use no authentication:

```
area 192.168.100.10 virtual-link 192.168.200.20 null
```

The following command creates an authentication password of *123456* for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*:

```
area 192.168.100.10 virtual-link 192.168.200.20 authentication-key
password 123456
```

The following command enables the use of MD5-based OSPF authentication for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20*, sets the MD5 Key ID to *25*, and the password to *123456*:

```
area 192.168.100.10 virtual-link 192.168.200.20 message-digest-key 25 md5
password 123456
```

The following command sets the retransmit interval for a virtual link between the OSPF areas defined by the IP address *192.168.100.10* and the IP address *192.168.200.20* to *60* seconds:

```
area 192.168.100.10 virtual-link 192.168.200.20 retransmit-interval 60
```

default-information originate

Creates a default external route into an OSPF routing domain.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
default-information originate

default-information originate [ always ] [ metric metric_value ] [ metric-type { 1 | 2 }
] [ route-map route_map_name ]

no default-information originate
```

no

Disables the default external route.

always

Always advertise the route regardless of whether or not the software has a default route.

metric *metric_value*

Sets the OSPF metric used in creating the default rout as an integer from 1 through 16777214.

metric-type { 1 | 2 }

Sets the default route metric type.
1: Sets the OSPF external link type for default routes to Type 1.
2: Sets the OSPF external link type for default routes to Type 2.

route-map *route_map_name*

Specifies the name of the default route-map to be use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to set the default external route into an OSPF routing domain.

Example

The following command sets the default external route to originate from the route map named *rmap1*:

```
default-information originate route-map rmap1
```

default metric

Configures the default metric value for the OSPF routing protocol.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

default-metric *metric_value*

no default-metric

metric-value

Sets the metric value expressed as an integer from 1 through 16777214. The default metric value setting is 26385.

no

Enables or disables the default metric value for OSPF.

Usage

Use this command to set the default metric for routes.

Example

The following command sets the default metric to *235*:

default-metric 235

distance

Configures the OSPF route administrative distances for all OSPF route types or based on specific route type. Administrative distance is the measure used by Cisco routers to select the best path when there are two or more different routes to the same destination from two different routing protocols. Administrative distance defines the reliability of a routing protocol. Each routing protocol is prioritized in order of most to least reliable (believable) using an administrative distance value. A lower numerical value is preferred.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] distance { distance_value | ospf { [ external distance_value ] [ inter-area
distance_value ] [ intra-area distance_value ] } }
```

no

Disables the OSPF route administrative distances for all OSPF route types.

distance_value

Specifies the OSPF route administrative distances as an integer from 1 to 255. The default distance value is 110.

ospf { [external *distance_value* **] [inter-area** *distance_value* **] [intra-area** *distance_value* **] }**

Set the distance value for the specified route type.
external *distance_value*: Set the OSPF route administrative distance for routes from other routing domains, learned by redistribution. This must be an integer from 1 through 255. The default is 110.
inter-area *distance_value*: sets the OSPF route administrative distance for routes from one routing area to another. This must be an integer from 1 through 255. The default is 110.
intra-area *distance_value*: sets the OSPF route administrative distance for all routes within an area. This must be an integer from 1 through 255. The default is 110.

no

Enables or disables the specified option.

Usage

Use this command to set the administrative distance for OSPF routes.

Example

The following command sets the administrative distance for all OSPF route types to *30*:

```
distance 30
```

distribute-list

Enables or disables the filtering of networks in outgoing routing updates.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] distribute-list route_access_list out { connected | rip | static }
```

no

Disables the filtering of networks in outgoing routing updates.

route_access_list

Specifies the name of the OSPF route access list to use for filtering as an alphanumeric string of 1 through 63 characters.

connected

Filters connected routes.

rip

Filters RIP routes. (RIP is not supported at this time.)

static

Filters static routes.

no

Disables the specified option.

Usage

Use this command to enable the filtering of outgoing route updates by using the specified route access list.

Example

The following command uses the route access list named *ral1* to filter outgoing routing updates for all connected routes:

```
distribute-list ral1 out connected
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

neighbor

Configures OSPF routers that interconnect to non-broadcast networks.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] neighbor  ip_address  [ poll-interval poll_interval_value ] [ priority
priority_value ]
```

no

Disables OSPF routers that interconnect to non-broadcast networks.

ip_address

Specifies the interface IP address of the OSPF neighbor expressed using IPv4 dotted-decimal notation.

poll-interval *poll_interval_value*

Default: 120
Sets the number of seconds in the dead neighbor polling interval as an integer from 1 through 65535

priority *priority_value*

Default: 0
Sets the 8-bit number that represents the router priority value of the non-broadcast neighbor associated with the specified IP address. This must be an integer from 0 through 255. This keyword does not apply to point-to-multipoint interfaces.

Usage

Use this command to configure OSPF routers that connect to non-broadcast networks.

Example

The following command specifies an OSPF router neighbor with the IP address of *192.168.100.10*:

```
neighbor 192.168.100.10
```

network area

Enables OSPF on an interface and defines the OSPF area for that network.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] network network_ip_address / network_mask area { area_id | area_ip_address }
```

no

Disables OSPF on an interface and defines the OSPF area for that network.

network_ip_address/network_mask

Specifies the network address and mask as well as the interface on which OSPF will be enabled. *network_ip_address* in entered in IPv4 dotted-decimal notation, followed by the "/" and the mask (CIDR).

area_id

Specifies the OSPF area identification number for the specified network as an integer from 0 through 4294967295.

area_ip_address

Specifies the IP address of the OSPF area for this network. This must be entered in IPv4 dotted-decimal notation.

Usage

Use this command to specify the IP address of the network interface that the OSPF router will use.

Example

The following command specified that the OSPF router will use the interface at IP address *192.168.1.0* with a netmask of *24*:

```
network 192.168.1.0/24
```

ospf router-id

Configures the router ID for the OSPF process.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

ospf router-id *ip_address*

no ospf router-id *ip_address*

no

Disables **ospf router-id**.

ip_address

Specifies the router ID for the OSPF process as an IP address entered using IPv4 dotted-decimal notation

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:

```
ospf router-id 192.168.200.1
```

passive-interface

Enables or disables the suppression of OSPF routing updates on the specified interface.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] passive-interface interface_name
```

no

Disables the name assigned to a logical interface within the specific context.

interface_name

Specifies the name assigned to a logical interface within the specific context as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to suppress router updates on an interface in the current context.

Example

The following command suppresses OSPF routing updates on the interface named *Intfc1*:

```
passive-interface Intfc1
```

redistribute

Redistributes routes from other protocols to OSPF neighbors using the OSPF protocol.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

redistribute { **connected** | **rip** | **static** } [**metric** *metric_value*] [**metric-type** { **1** | **2** }] [**route-map** *route_map_name*]

no redistribute { **connected** | **rip** | **static** }

no

Disables the redistributed routes.

connected

Redistributes connected routes.

rip

Specifies that RIP routes will be redistributed. (RIP is not supported at this time.)

static

Redistributes static routes.

metric *metric_value*

Sets the OSPF metric used in the redistributed route. This must be an integer from 1 through 16777214.

metric-type { 1 | 2 }

Default: 2
Sets route metric type that is applied to redistributed routes.
1: Sets the OSPF external link type for routes to Type 1.
2: Sets the OSPF external link type for routes to Type 2.

route-map *route_map_name*

Filter routes through the specified route map before redistribution. *route_map_name* specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to define what routing protocols should have their routes redistributed into OSPF.

Example

The following command defines that BGP routes should be redistributed:

```
redistribute connected
```

refresh timer

Adjusts settings for the OSPF refresh timer.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] refresh  timer value
```

no

Disables the refresh timer.

value

Default: 10
Specifies the minimum amount of time (in seconds) to wait before refreshing a Link-state Advertisement (LSA). This must be an integer from 10 through 1800.

Usage

Use this command to define the amount of time to wait before refreshing an LSA.

Example

The following command sets the refresh timer to *90* seconds:

```
refresh timer 90
```

router-id

Configures the router ID for the OSPF process.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] router-id *ip_address*

no

Disables the router ID for the OSPF process.

ip_address

Specifies the router ID for the OSPF process in IPv4 dotted-decimal notation.

Usage

Use this command to set the router ID for the current OSPF router process.

Example

The following command sets the router ID to *192.168.200.1*:

```
router-id 192.168.200.1
```

timers spf

Sets the Shortest Path First (SPF) timers.

Platform

ASR 5000

Product

PDSN, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

timers spf *delay_value hold_time_value*

no timers spf

no

Disables SPF timers.

delay_value

Default: 5
Specifies the delay time (in seconds) between receiving changes to an SPF calculation. This must be an integer from 0 through 4294967295.

hold_time_value

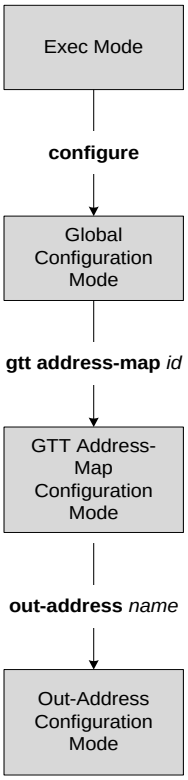
Default: 10
Specifies the hold time (in seconds) between consecutive SPF calculations. This must be an integer from 0 through 4294967295.

Usage

Use this command to set the SPF delay and hold timers for the current OSPF router process.

Example

The following command sets the delay timer to *15* and the hold timer to *15*:



```
timers spf 15 15
```

Chapter 204
Out-Address Configuration Mode Commands

The Out-Address configuration mode provides the commands to configure the outgoing addresses for SCCP entities.

In this mode, the prompt line will appear similar to:

```
[local]hostname(config-gtt-addrmap-outaddr-<name>)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

gt-address

Configures the SCCP short address.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-address *gt_address*

gt_address

A string of 1 to 15 digits to define the GT-address

Usage

Define the GT-address

Example

gt-address *010405525397*

gt-format

The GT-format provides four formats that can be used during GTT.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gt-format *format_num*

format_num

1: Selects GT-format 1 options which include **nature-of-address** and **odd/even.** Once selected, the system enters GT-Format1 configuration mode.
2: Selects GT-format2 options which include **translation-type**. Once selected, the system enters GT-Format2 configuration mode.
3: Selects GT-format3 options which include **encoding-scheme**, **numbering-plan3** and **translation-type**. Once selected, the system enters GT-Format1 configuration mode.
4: Selects GT-format4 options which include **encoding-scheme**, **nature-of-address**, **numbering-plan**, and **translation-type**. Once selected, the system enters GT-Format4 configuration mode.

Usage

Select the a GT-format that include encoding-scheme as part of the GTT process.

Example

gt-format *3*

ni-indicator

Configures the National and International indicator to use during the GTT process.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ni-indicator *ni_ind*

ni_ind

Select one of the following as the appropriate type of national indicator for the address structure:

- **national**
- **international**

Usage

Select the international indicator to be used for out-going addresses.

Example

ni-indicator *international*

point-code

Selects and configures the SS7-type point code for use with the out-going address.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

point-code *pt_code*

pt_code

Enter 1 to 11 digits in the point code format predefined during variant selection of GTT association.

Usage

Define an ITU point code to be used for out-going address processing.

Example

point-code *6.255.6*

routing-indicator

Selects the type of routing and the indicator to be included in the out-going message.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

routing-indicator *routing_ind*

routing_ind

Select one of the following options:

- **gt**: Inserts an indicator that identifies routing based on global title.
- **ssn**: Inserts an indicator that identifies routing based on the subsystem number.

Usage

Select global title as the appropriate routing indicator.

Example

routing-indicator *gt*

ssf

Selects the subservice field as factor in the out-going address processing. **ssf** sets the network indicator in the subservice field for SS7 Message Signal Units (MSUs). The indicator carried in the message's routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the national - international.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ssf *sub_svc_fld*

sub_svc_fld

Select one of the following options:

- **international:** The network indicator identifies the message as international with a point code structure that does not match the national point code structure,
- **national:** The network indicator identifies the messages as having a national point code structure.
- **reserved:** Provides an alternate network indicator for national messages.
- **spare:** Provides an alternate network indicator for international messages.

Usage

Select the international NI for inclusion in out-going address subservice fields.

Example

ssf *international*

ssn

Selects the subsystem number to be included in the out-going message.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

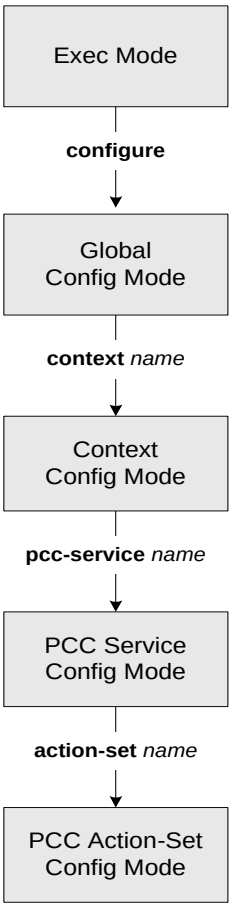
ssn *sub_sys_num*

sub_sys_num

Enter an integer from 1 to 255.

Usage

Use subsystem number 44 in the out-going address.



Example

ssn *44*

Chapter 205
PCC-Action-Set Configuration Mode Commands

The PCC- Action-Set Configuration Mode provides the parameters to indicate the policy and charging as well as event generation related decisions that will get activated when the corresponding PCC-Condition-Group is evaluated to TRUE within a profile. A maximum of 32 actions can be configured in an instance of PCC-Action-Set.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

af-media-type

This command is used to set the action to be taken when specific media type is received from Application Function (AF) over Rx interface.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

`[ no ] af-media-type {application | audio | control | data | message | other | text | video} {qos-profile` *`qos_profile_value`* **`[ gate-status { disabled | enabled | enabled-downlink | enabled-uplink ] } | {gate-status {disabled | enabled | enabled-downlink | enabled-uplink [qos-profile`** *`qos_profile_value`* **`] }`**

`no`

Removes the configured action set for different type of AF media in a PCC-Action-Set configuration instance for PCC-Service configuration.

`application`

Sets the AF media type to ‘application’ data traffic for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

`audio`

Sets the AF media type to ‘audio’ data traffic for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

`control`

Sets the AF media type to ‘control’ signal for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

`data`

Sets the AF media type to ‘data’ for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

`message`

Sets the AF media type to ‘message’ data for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

`other`

Sets the AF media type to ‘other’, out of AF media type configured here, for various action configuration under PCC-Action-Set configuration instance for PCC-Service configuration.

text

Sets the AF media type to 'text' for various action configured under PCC-Action-Set configuration instance for PCC-Service configuration.

video

Sets the AF media type to 'video' for various action configured under PCC-Action-Set configuration instance for PCC-Service configuration.

qos-profile *qos_profile_value*

Associate the pre-defined PCC-QoS-Profile for specific AF media type for various action configured for PCC-Service configuration.
qos_profile_value is name of the pre-defined PCC-QoS-Profile in PCC-Service Configuration instance.

gate-status {disabled | enabled | enabled-downlink | enabled-uplink}

Default: Enabled
Associate the status of Gate for specific AF media type for various action configured for PCC-Service configuration.
disabled: disables the Gate status in downlink and uplink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance.
enabled: Enables the Gate status in downlink and uplink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance. This is the default status of Gate.
enabled-downlink: Enables the Gate status in downlink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance.
enabled-uplink: Enables the Gate status in uplink direction for specific type of AF media type along optionally with PCC-QoS-Profile in PCC-Service Configuration instance.

Usage

Use this command to set the action to be taken when specific media type is received from Application Function (AF) over Rx interface.
It also associates the pre-defined PCC-QoS-Profile and **Gate** function with specific media type.

Example

The following command sets the AF media type to 'video' with PCC-QoS-Profile named *video_qos1* with gate status enabled in downlink and uplink traffic for various action configured under PCC-Action-Set configuration instance for PCC-Service configuration:

```
af-media-type video qos-profile video_qos1 gate-status enabled
```

associate monitoring-key

This command associates a Monitoring Key id with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] associate monitoring-key mon_key_id usage-monitor usage_mon_name
```

no

Removes the associated Monitoring Key id configuration along with the association to PCC-Usage-Monitor from a PCC-Action-Set configuration instance for PCC-Service configuration.

mon_key_id

Specifies the Monitoring Key identifier to be associated with PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.
mon_key_id must be an integer between 1 through 65535.

usage-monitor *usage_mon_name*

Specifies the PCC-Usage-Monitor associated with Monitoring Key *mon_key_id* under PCC-Action-Set configuration instance for PCC-Service configuration.
usage_mon_name is a pre-configured PCC-Usage-Monitor instance in PCC-Service Profile Configuration for PCC-Service configuration.

Usage

Use this command to associate a Monitoring Key with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.
There is a Many-To-Many relationship between Usage-Monitor and Monitoring-Key. Operator can change this relationship using required command.
When usage is reported to IPCF for a particular Monitoring Key, the usage is added to all the Usage Monitoring to which the Monitoring Key is associated.
Operator can break the relationship between Monitoring Key and Usage Monitor by **dissociate monitoring-key** command.

Example

The following command associates Monitoring Key id *102* with pre-defined PCC-Usage-Monitor named *usage_mon1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
associate monitoring-key 102 usage-monitor usage_mon1
```

authorize

This command sets an action to change the various authorization parameters used for the IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] authorize {apn-mbr | default-eps-bearer | qci qci_value} qos-profile qos_prof_name
```

no

Removes the configured action for QoS Profile authorization parameters from PCC-Action-Set configuration instance for PCC-Service configuration.

apn-mbr

Sets the action for QoS authorization of Maximum Bit Rate (MBR) at APN through a pre-configured QoS profile name *qos_prof_name* which is to use for the authorization at different level in an PCC-Service instance.
This keyword is applicable only to EPS access type. MBR Download and MBR Upload values of the QoS profile is used with this authorization.

default-eps-bearer

Sets the action QoS authorization of the Default EPS bearer in an EPS access network through a pre-configured QoS profile name *qos_prof_name* which is to use for the authorization at different level in an PCC-Service instance.
This keyword is applicable only to EPS access type. QoS Class Identifier (QCI) and Allocation and Retention Priority (ARP) values of the QoS profile is used with this authorization.

qci *qci_value*

Sets the action QoS authorization per QCI in case of PCEF binding through a pre-configured QoS profile name *qos_prof_name* which is to use for the authorization at different level in an PCC-Service instance.
qci_value must be an integer value between 1 through 255.

Important: This keyword is applicable only in case of PCEF binding. QCI defined in QoS profile is not used when this keyword is active, so this keyword is repeated per QCI that has to be authorized by IPCF. For each QCI authorization Maximum Bit Rate Upload/Download (MBR DL/MBR UL) or Guaranteed Bit Rate Upload/Download (GBR DL/MBR UL) and ARP values of the QoS profile is used with this authorization.

qos-profile *qos_prof_name*

This keyword associate the action configured for authorization with a pre-configured PCC-QoS-Profile named *qos_prof_name* and uses configured values from specific PCC-QoS-Profile during authorization.

qos_prof_name specifies the pre-configured QoS profile name which is to use for the authorization at different level in an PCC-Service instance.

Usage

Use this command to define an action for the authorization parameters in PCC-QoS-Profile which is to be used under PCC-Action-Set configuration instance for PCC-Service configuration.

Example

Following command sets the action for QoS authorization for APN MBR with PCC-QoS-Profile *apn_qos_prof1* under PCC-Action-Set configuration instance for PCC-Service configuration.

```
authorize apn-mbr qos-profile apn_qos_prof1
```

dissociate monitoring-key

This command dissociates a Monitoring Key id with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] dissociate monitoring-key mon_key_id usage-monitor usage_mon_name
```

no

Removes the dissociated Monitoring Key id configuration from a PCC-Action-Set configuration instance for PCC-Service configuration.

mon_key_id

Specifies the Monitoring Key identifier to be dissociated with PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.
mon_key_id must be an integer between 1 through 65535.

usage-monitor *usage_mon_name*

Specifies the PCC-Usage-Monitor need to be dissociated with Monitoring Key *mon_key_id* under PCC-Action-Set configuration instance for PCC-Service configuration.
usage_mon_name is a pre-configured PCC-Usage-Monitor instance in PCC-Service Profile Configuration for PCC-Service configuration.

Usage

Use this command to dissociate a Monitoring Key with a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.
There is a Many-To-Many relationship between Usage-Monitor and Monitoring-Key. Operator can change this relationship using required commands.
When usage is reported to IPCF for a particular Monitoring Key, the usage is added to all the Usage Monitoring to which the Monitoring Key is associated.
Operator can reassociate the relationship between Monitoring Key and Usage Monitor by **associate monitoring-key** command.

Example

The following command dissociates a associated pair of Monitoring Key id *102* and PCC-Usage-Monitor named *usage_mon1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
dissociate monitoring-key 102 usage-monitor usage_mon1
```

dynamic-rule-install

This command sets an action to install a PCC Dynamic rule for the specified PCC-Data-service in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] dynamic-rule-install data-service data_svc_name [qos-profile qos_prof_name]
[precedence preced_value] [monitoring-key mon_key_id [rating-group rating_grp_id] [gate-
status {disabled | enabled | enabled-downlink | enabled-uplink}] [defer-by interval
delayed_dur] [metering-method {both-duration-volume | duration | volume}] [reporting-
level {service-identifier-level | rating-group-level}] [failure-policy { continue |
terminate}]
```

no

Removes the Dynamic Rule install action configured for specific PCC-Data-Service from a PCC-Action-Set configuration instance for PCC-Service configuration.

data-service *data_svc_name*

Specifies the name of the pre-configured PCC-Data-Service for which Dynamic Rules to be installed under PCC-Action-Set configuration instance for PCC-Service configuration.
data_svc_name is a pre-configured PCC-Data-Service instance in PCC-Service Configuration mode.

metering-method {both-duration-volume | duration | volume}

Specifies the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-service instance on IPCF node.

- **both-duration-volume** sets the metering method as based on volume of data usage and duration of session, both for offline charging in a PCC-Data-service instance on IPCF node.
- **duration** sets the metering method as based on duration of session usage for offline charging in a PCC-Data-service instance on IPCF node.
- **volume** sets the metering method as based on the volume of data usage for offline charging in a PCC-Data-service instance on IPCF node.

If no metering method is defined, the reporting level preconfigured at PCEF is considered.

monitoring-key *mon_key_id*

Specifies the pre-defined Monitoring Key identifier which is to be used in Dynamic Rule for specific PCC-Data-service under PCC-Action-Set configuration instance for PCC-Service configuration.
mon_key_id is a pre-defined Monitoring Key identifier in PCC-Service Configuration mode.

precedence *preced_value*

Specifies the precedence value for the Dynamic Rule for specific PCC-Data-service under PCC-Action-Set configuration instance for PCC-Service configuration.
preced_value must be an integer between 1 through 65535.

qos-profile *qos_prof_name*

Specifies the name of the pre-configured PCC-QoS-Profile which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.
qos_prof_name is a pre-configured PCC-QoS-Profile instance in PCC-Service Configuration mode.

rating-group *rating_grp_id*

Specifies the pre-defined Rating Group identifier which is to be used in Dynamic Rule for specific PCC-Data-service under PCC-Action-Set configuration instance for PCC-Service configuration.
rating_grp_id is a pre-defined Rating Group identifier in PCC-Service Configuration mode.

reporting-level {service-identifier-level | rating-group-level

Specifies the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-service instance on IPCF node.

- **service-identifier-level** sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the Service Identifier level which is configured in a PCC-Data-service instance on IPCF node.
- **rating-group-level** sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the Rating Group level which is configured in a PCC-Data-service instance on IPCF node.

If no reporting level is defined, the reporting level preconfigured at PCEF is considered.

gate-status {disabled | enabled | enabled-downlink | enabled-uplink}

Default: Enabled
Sets the Gate-status which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.
disabled: disables the Gate status in downlink and uplink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.
enabled: Enables the Gate status in downlink and uplink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration. This is the default status of Gate.
enabled-downlink: Enables the Gate status in downlink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.
enabled-uplink: Enables the Gate status in uplink direction which is to be used in Dynamic Rule for specific PCC-Data-Service under PCC-Action-Set configuration instance for PCC-Service configuration.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for dynamic rule installation.
delayed_dur configures the relative delay time by which the corresponding dynamic rule installation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

failure-policy { continue | terminate}

Default: Continue
This optional keyword configures the rule failure policy action when failure occurs on PCEF for PCC rules.

- **Continue**: If this option enabled, the IPCF continues even if PCEF reports rule failure through charging rule report. This is the default action.
- **Terminate**: If this option enabled, the IPCF triggers PCC session termination on receiving rule failure through charging rule report.

Usage

Use this command to set an action to install a PCC Dynamic rule for the specified PCC-Data-Service in PCC-Action-Set configuration for PCC-Service instance
Operator can override parameters such as, QoS profile, Precedence, Gate-status, Monitoring Key and PCC-Rating-id.
The same command is used to modify already installed PCC Dynamic-rule for the PCC-Data-Service by overriding required parameters only.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding dynamic rule installation is deferred.
IPCF handles operation of PCC Rule and activate/deactivate/install/modify/remove the PCC rules at PCEF through this configuration. PCC rule operation may fail on PCEF due to various reasons. In such failure cases PCEF sends back a Charging Rule Report containing name of the failed PCC rule and corresponding failure cause.
The IPCF handles these charging rule report and take appropriate actions based on configuration done through **failure-policy** keyword.
Charging Rule Report comes through CCA or RAA messages in a call flow used for handling the charging-rule-report.
IPCF supports following charging rule failure codes in report:

- Out-of-credit
- Reallocation-of-credit
- Unknown rule name
- Invalid Rating Group
- Invalid Service Identifier
- GW/PCEF Malfunction
- Limited Resources
- Max No. of Bearers Reached
- Unknown Bearer Id
- Missing Bearer Id
- Missing Flow Description
- Resource Allocation Failure

- QoS Validation Failure

Charging rule status can any one of the following in this scenario:

- Active
- Inactive
- Temporarily Inactive

A charging rule report can occur in CCR message multiple times and maximum of 16 charging rule reports per CCR message is supported by IPCF.

Example

The following command sets the action for PCC-Data-Service named *temp_data1* for Dynamic Rule install with PCC-QoS-Profile named *temp_qos1* having precedence *22* and Gate-status as **Enabled** under PCC-Action-Set configuration instance for PCC-Service configuration:

```
dynamic-rule-install data-service temp_data1 qos-profile temp_qos1
precedence 22
```

dynamic-rule-uninstall

This command sets an action to uninstall a Dynamic Rule for the specified PCC-Data-Service in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] dynamic-rule-uninstall data-service data_svc_name [defer-by interval delayed_dur]
```

no

Removes the Dynamic Rule Uninstall action configured for specific PCC-Data-Service from a PCC-Action-Set configuration instance for PCC-Service configuration.

data-service *data_svc_name*

Specifies the name of the pre-configured PCC-Data-Service for which Dynamic Rules to be uninstalled under PCC-Action-Set configuration instance for PCC-Service configuration.
data_svc_name is a pre-configured PCC-Data-Service instance in PCC-Service Configuration mode.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for dynamic rule removal.
delayed_dur configures the relative delay time by which the corresponding dynamic rule uninstallation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to uninstall a PCC Dynamic rule for the specified PCC-Data-Service in PCC-Action-Set configuration for PCC-Service instance
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding dynamic rule uninstallation is deferred.

Example

The following command sets the action of Dynamic Rule uninstall for PCC-Data-Service named *temp_data1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
dynamic-rule-uninstall data-service temp_data1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

log-event

This command allows operator to specify a string to be logged at Subscriber Service Controller (SSC) when the corresponding action set is triggered under PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] log-event msg-text message_string
```

no

Removes the notification message configured for specific action under a PCC-Action-Set configuration instance for PCC-Service configuration.

msg-text *message_string*

Specifies the message notification text string to be logged at the SSC when a particular PCC-Action-Set triggered for PCC-Service instance.
message_string is a string of alphanumerical characters of 1 through 255 characters

Usage

Use this command to allow operator to specify a string to be logged at Subscriber Service Controller (SSC) when the corresponding action set is triggered under PCC-Action-Set configuration for PCC-Service instance.

Example

The following command sets the notification message for an action under PCC-Action-Set configuration instance for PCC-Service configuration:

```
log-event msg-text "This Action is Applicable for EPS Session Only."
```

notify-user

This command allows operator to specify a string template-id at SSC under PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] notify-user message-id message_id [parameter value_pair]
```

no

Removes the user notification message id configured for specific action under a PCC-Action-Set configuration instance for PCC-Service configuration.

message-id *message_id*

Specifies the message template id stored at SSC to be used for user notification for action under PCC-Action-Set configuration for PCC-Service instance.
message_id is a string of alphanumerical characters of 1 through 255 characters

parameter *value_pair*

Specifies the parameters in the form of name value pairs separated by comma. A maximum of 16 name value pairs can be defined for action under PCC-Action-Set configuration for PCC-Service instance.
The name value pairs is encoded into **xml** data like other parameters and sent out to SSC for user notification.
value_pair is a string of alphanumerical characters of 1 through 255 characters which can accommodate up to 16 name value pair separated by comma (,).

Usage

Use this command to allow operator to specify a string template-id under PCC-Action-Set configuration for PCC-Service instance.
The template description exists at SSC and when the corresponding action set is hit, the subscriber is notified with the specified template configured via this command.
The action set makes a XML remote procedure call towards SSC. The XML contains information like IMSI, template-id of the SMS/E-mail template and other details like MSISDN, NAI if available. To give more flexibility to the operator, now the this command accepts name value pairs, which are also sent along with the said data.

Example

The following command sets the message id *"Invalid User."* for user notification message to an action under PCC-Action-Set configuration instance for PCC-Service configuration:

```
notify-user message-id "Invalid User."
```

offline-charging-server

This command sets the action to change the offline charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] offline-charging-server primary pri_serv_address [secondary sec_serv_address]
```

no

Removes the action set to change the offline charging server under PCC-Action-Set configuration instance for PCC-Service configuration.

primary *pri_serv_address*

Identifies the name of the primary offline charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
The *pri_serv_address* must be the address of an offline charging server in Diameter URI format (*FQDN* [*port*] [*transport*] [*protocol*]).

secondary *sec_serv_address*

Identifies the name of the secondary offline charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
The *sec_serv_address* must be the address of an offline charging server in Diameter URI format (*FQDN* [*port*] [*transport*] [*protocol*]).

Usage

Use this command to set an action to change the offline charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Example

Following command configures an action change the offline charging server to primary server *aaa://host.abc.com:6666;transport=tcp;protocol=diameter* and secondary server *aaa://host.xyz.com:6666;transport=sctp;protocol=radius* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
offline-charging-server primary
aaa://host.abc.com:6666;transport=tcp;protocol=diameter secondary
aaa://host.xyz.com:6666;transport=sctp;protocol=radius
```

online-charging-server

This command sets the action to change the online charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] online-charging-server primary pri_serv_address [secondary sec_serv_address]
```

no

Removes the action set to change the online charging server under PCC-Action-Set configuration instance for PCC-Service configuration.

primary *pri_serv_address*

Identifies the name of the primary online charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
The *pri_serv_address* must be the address of an online charging server in Diameter URI format (*FQDN* [*port*] [*transport*] [*protocol*]).

secondary *sec_serv_address*

Identifies the name of the secondary online charging server which is to be used for action to change under PCC-Action-Set configuration instance for PCC-Service configuration.
The *sec_serv_address* must be the address of an online charging server in Diameter URI format (*FQDN* [*port*] [*transport*] [*protocol*]).

Usage

Use this command to set an action to change the online charging server applicable to an IP-CAN session under PCC-Action-Set configuration instance for PCC-Service configuration.

Example

Following command configures an action change the online charging server to primary server *aaa://host.abc.com:6666;transport=tcp;protocol=diameter* and secondary server *aaa://host.xyz.com:6666;transport=sctp;protocol=radius* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
online-charging-server primary
aaa://host.abc.com:6666;transport=tcp;protocol=diameter secondary
aaa://host.xyz.com:6666;transport=sctp;protocol=radius
```

request-usage-report monitoring-key

This command configures the action to allow operator to explicitly request usage report for the specified Monitoring Key or all Monitoring Keys under PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] request-usage-report monitoring-key {mon_key_id | any}
```

no

Removes the usage request action configuration for Monitoring Key id from a PCC-Action-Set configuration instance for PCC-Service configuration.

mon_key_id

Specifies the Monitoring Key identifier for which usage report action is to be set under PCC-Action-Set configuration instance for PCC-Service configuration.
mon_key_id must be an integer between 1 through 65535.

any

Specifies the Monitoring Key identifier to "ANY" value for which usage report action is to be set under PCC-Action-Set configuration instance for PCC-Service configuration.

Usage

Use this command to configure the action to allow operator to explicitly request usage report for the specified Monitoring Key or all Monitoring Keys under PCC-Action-Set configuration for PCC-Service instance.

Example

The following command sets an action to request the usage report for Monitoring Key id *102* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
request-usage-report monitoring-key 102
```

rule-activate

This command sets an action to activate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] rule-activate rule_name[defer-by interval delayed_dur]
```

no

Removes the action to activate a pre-configured Rule from a PCC-Action-Set configuration instance for PCC-Service configuration.

rule_name

Specifies the name of the pre-configured Rule on PCEF for an activation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.
rule_name is a pre-configured Rule in PCEF.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for rule activation.
delayed_dur configures the relative delay time by which the corresponding rule activation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to activate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding rule activation is deferred.

Example

The following command sets an action to activate for Rule *rule1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rule-activate rule1
```

rule-deactivate

This command sets an action to deactivate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] rule-deactivate rule_name [defer-by interval delayed_dur]
```

no

Removes the action to deactivate a pre-configured Rule from a PCC-Action-Set configuration instance for PCC-Service configuration.

rule_name

Specifies the name of the pre-configured Rule on PCEF for a deactivation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.
rule_name is a pre-configured Rule in PCEF.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for rule deactivation.
delayed_dur configures the relative delay time by which the corresponding rule deactivation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to deactivate a pre-configured Rule in PCC-Action-Set configuration for PCC-Service instance.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding rule deactivation is deferred.

Example

The following command sets an action to deactivate for Rule *rule1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rule-deactivate rule1
```

rulebase-activate

This command sets an action to activate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] rulebase-activate rulebase_name [defer-by interval delayed_dur]
```

no

Removes the action to activate a pre-configured Rulebase from a PCC-Action-Set configuration instance for PCC-Service configuration.

rulebase_name

Specifies the name of the pre-configured Rulebase on PCEF for an activation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.
rulebase_name is a pre-configured Rulebase in PCEF.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for Rulebase activation.
delayed_dur configures the relative delay time by which the corresponding Rulebase activation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to activate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding Rulebase activation is deferred.

Example

The following command sets an action to activate for Rulebase *rulebase1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rulebase-activate rulebase1
```

rulebase-deactivate

This command sets an action to deactivate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] rulebase-deactivate rulebase_name [defer-by interval delayed_dur]
```

no

Removes the action to deactivate a pre-configured Rulebase from a PCC-Action-Set configuration instance for PCC-Service configuration.

rulebase_name

Specifies the name of the pre-configured Rulebase on PCEF for a deactivation action is set under PCC-Action-Set configuration instance for PCC-Service configuration.
rule_name is a pre-configured Rulebase in PCEF.

defer-by interval *delayed_dur*

This optional keyword supports the time-of-day-based procedures under PCC-Action-Set instance by configuring the relative time delay for Rulebase deactivation.
delayed_dur configures the relative delay time by which the corresponding Rulebase deactivation is deferred. The action is triggered only when the time specified by *delayed_dur* is passed.
delayed_dur specifies the delayed interval in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *delayed_dur*:

- *HH* specifies the hour to defer the action trigger and must be an integer between 00 through 23.
- *MIN* specifies the minutes to defer the action trigger and must be an integer between 00 through 59.
- *SS* specifies the seconds to defer the action trigger and must be an integer between 00 through 59.

Usage

Use this command to set an action to deactivate a pre-configured Rulebase in PCC-Action-Set configuration for PCC-Service instance.
Additionally **defer-by interval** keyword is used to configure relative time by which the corresponding Rulebase deactivation is deferred.

Example

The following command sets an action to deactivate for Rulebase *rulebase1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
rulebase-deactivate rulebase1
```

service-tag

This command sets an action to activate/deactivate a pre-configured Service Tag rule in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] service-tag svc_tag {activate-rule | activate-rule}
```

no

Removes the action to activate/deactivate a pre-configured Service Tag rule in PCC-Action-Set configuration for PCC-Service instance.

svc_tag

Specifies the name of the pre-configured Service Tag rule for an activation/deactivation is set under PCC-Action-Set configuration instance for PCC-Service configuration.
svc_tag is a pre-configured Service Tag name.

activate-rule

Specifies that action to be set for Service Tag activation rule under PCC-Action-Set configuration instance for PCC-Service configuration.

deactivate-rule

Specifies that action to be set for Service Tag deactivation rule under PCC-Action-Set configuration instance for PCC-Service configuration.

Usage

Use this command to set an action to activate/deactivate a pre-configured Service Tag rule in PCC-Action-Set configuration for PCC-Service instance.

Example

The following command sets the an activation rule for Service Tag named *service_1* under PCC-Action-Set configuration instance for PCC-Service configuration:

```
service-tag service_1 activate-rule
```

terminate-session

This command sets an action to terminate a Bearer based on **bearer-id** or unique combination of QCI and ARP received through current CCR message in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] terminate-session
```

no

Removes the action to terminate a Bearer based on **bearer-id** from a PCC-Action-Set configuration instance for PCC-Service configuration.

Usage

Use this command to set an action to terminate a Bearer based on **bearer-id** or unique combination of QCI and ARP received through current CCR message in PCC-Action-Set configuration for PCC-Service instance. Termination of Bearer is possible only in case of PCRF binding and limited to Dynamic rules.

Important: This action is only applicable to IP-CAN sessions with access type as GPRS. When terminate Bearer is initiated, IPCF triggers **Bearer Termination Procedure** for the **bearer-id** received through current CCR message.

Caution: This command triggers termination of **Gx** and SPR sub session active under PCC-Service instance.

Example

The following command sets an action to terminate a Bearer based on **bearer-id** received through current CCR message under PCC-Action-Set configuration instance for PCC-Service configuration:

```
terminate-session
```

usage-monitor

This command sets an action to allow operator to stop, reset or start the counting for a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] usage-monitor usage_mon_name {reset-counter | start-counter | stop-counter}
```

no

Removes the action to allow operator to stop, reset or start the counting for a PCC-Usage-Monitor in PCC-Action-Set configuration for PCC-Service instance.

usage_mon_name

Specifies the name of the pre-configured PCC-Usage-Monitor for which counter action is configured under PCC-Action-Set configuration instance for PCC-Service configuration.
usage_mon_name is a pre-configured PCC-Usage-Monitor.

reset-counter

Resets the usage counts for PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

start-counter

Starts the accumulation of usage counts for PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

stop-counter

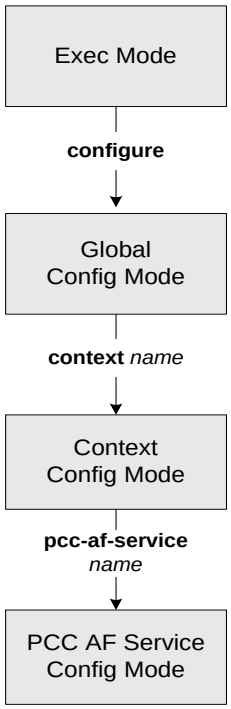
Stops the accumulation of usage counts for PCC-Usage-Monitor under PCC-Action-Set configuration instance for PCC-Service configuration.

Usage

Use this command to set an action to allow operator to stop, reset or start the counting for a usage monitor in PCC-Action-Set configuration for PCC-Service instance.

Example

The following command sets the an action to stop the accumulation of usage counts for PCC-Usage-Monitor named *usage_1* under PCC-Action-Set configuration instance for PCC-Service configuration:



```
usage-monitor usage_1 stop-counter
```

Chapter 206
PCC-AF-Service Configuration Mode Commands

The PCC-AF-Service Configuration mode provides a mechanism to IPCF to manage the external interfaces required for media and application function management. The PCC-AF-Service manages **Rx** interface which would be based on the dictionary used.

An Application Function (AF) provides Application (layer 7) proxies for client server applications. It also provides enforcement of operator and subscriber QoS, Charging, and Security policies to subscriber session and represents the network element that supports applications that require dynamic policy and/or charging control. In the IMS model, the AF is implemented by the Proxy Call Session Control Function (P-CSCF).

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate pcc-service

This command is used to associate a pre-configured PCC-Service with a PCC-AF-Service for IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

associate pcc-service *pcc_svc_name*

[**no**] **associate pcc-service**

no

Removes/disassociate the configured PCC-service from this PCC-AF-Service instance configured for IPCF configuration.

pcc_svc_name

Specifies the name of a pre-configured PCC-service configured in Context Configuration mode for IPCF configuration.
The *pcc_svc_name* is name of a predefined PCC-Service instance and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to associate a pre-configured PCC-Service instance for IPCF configuration.

Important: For more information on PCC-Service configuration, refer *PCC-Service Configuration Mode Commands*.

Example

Following command binds a PCC-Service named *pcc_svc1* with in a PCC-AF-Service.

```
associate pcc-service pcc_svc1
```

Following command removes an associated PCC-Service named *pcc_svc1* from a PCC-AF-Service.

```
no associate pcc-service pcc_svc1
```

diameter dictionary

This command is used to assign a Diameter dictionary for **Rx** messaging with a PCC-AF-Service for IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter dictionary {**r8-standard** | **standard**}

default diameter dictionary

default

Sets the Diameter **Rx** dictionary to default dictionary **r8-standard** (3GPP Rel. 8 standard) for a PCC-AF-Service instance configured for IPCF configuration.

r8-standard

Default: Enabled
Sets the Diameter **Rx** dictionary to be used by a PCC-AF-Service instance configured for IPCF configuration over **Rx** interface to 3GPP Rel. 8 standard.

standard

Default: Disabled
Sets the Diameter **Rx** dictionary to be used by a PCC-AF-Service instance configured for IPCF configuration over **Rx** interface to 3GPP Rel. 7 standard.

Usage

Use this command to configure the PCC-AF-Service to determine which of the 3GPP dictionary to be used for **Rx** interface messaging for media and application function management.

Example

Following command sets the PCC-AF-Service to use 3GPP Rel. 8 standard dictionary for **Rx** interface and application function management related messaging in a PCC-AF-Service.

```
default diameter dictionary
```

diameter origin end-point

This command is used to bind/associate a pre-configured Diameter host/realm (AF) over **Rx** interface with a PCC-AF-Service to be used for subscriber service control and AF profile management.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *dia_endpoint_name*

no diameter origin endpoint

no

Removes the associated Diameter Origin Endpoint configuration from PCC-AF-Service instance configured for IPCF configuration.

any

Sets the PCC-AF-Service instance to use any available AF node over **Rx** interface for AF support.

dia_endpoint_name

The *dia_endpoint_name* is a predefined Diameter origin endpoint node and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to bind the AF node over **Rx** interface by associating a pre-configured Diameter Origin Endpoint with a PCC-AF-Service.
The Diameter origin endpoint must be a pre-configured instance in the Context Configuration Mode. For more information on Diameter origin endpoint configuration, refer *Diameter Endpoint Configuration Mode Commands* chapter.

Example

Following command associates a pre-configured Diameter endpoint node configuration named *af_pcscf1* with a PCC-AF-Service for AF profile management.

```
diameter origin endpoint af_pcscf1
```

Following command removes the pre-associated Diameter endpoint node configuration named *af_pcscf1* with a PCC-AF-Service.

```
no diameter origin endpoint
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

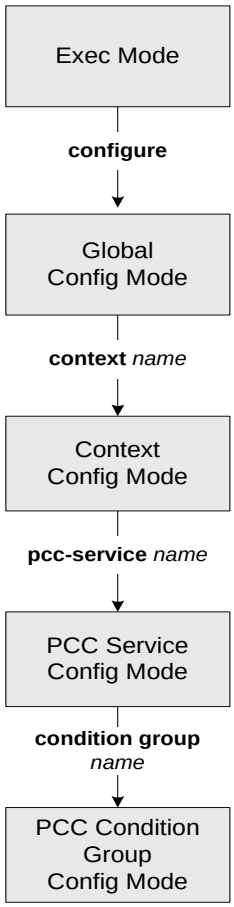
All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```



Usage

Use this command to return to the parent configuration mode.

Chapter 207
PCC-Condition-Group Configuration Mode Commands

The PCC-Condition-Group Configuration Mode is used to configure the various rating parameters under a logical identifier name in the PCC-Service. A PCC-Condition-Group is a collection of conditions that identify a network or state constraint represented as a logical expression. A maximum of 128 conditions can be configured in one PCC-Condition-Group.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

af-application-id

This command defines a condition based on the application id of an Application Function service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] af-application-id *operator af_app_id*

no

Removes the specified condition definition.

operator

Specifies how to logically match the AF-Application id.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

af_app_id

Specifies the identity string for AF-Application identifier over **Rx** interface.
af_app_id must be an alphanumeric string of 1 to 256 characters.

Usage

Use this command to define a condition based on the application id of an Application Function service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the AF Application id is not equal to *pcc_af_1*:

```
af-application-id != pcc_af_1
```

af-media-codec

This command defines a condition based on the media Codec used by AF application in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] af-media-coded *operator*{**g722** | **g726** | **ilbc** | **pcma** | **pcmu**}

no

Removes the specified condition definition.

operator

Specifies how to logically match the AF-media Codec.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

g722

Specifies the media Codec as G.722 used for user traffic from AF server over **Rx** interface.
G.722 is a ITU-T standard 7 kHz wideband speech codec operating at 48, 56 and 64 kbit/s.

g726

Specifies the media codec as G.726 used for user traffic from AF server over **Rx** interface.
G.726 is an ITU-T ADPCM speech codec standard covering the transmission of voice at rates of 16, 24, 32, and 40 kbit/s.

ilbc

Specifies the media codec as Internet Low Bitrate Codec (iLBC) used for user traffic from AF server over **Rx** interface.
iLBC is a narrowband speech codec suitable for VoIP applications, streaming audio, archival and messaging. The encoded blocks encapsulated in Real-time Transport Protocol (RTP) protocol for transport.

pcma

Specifies the media codec as Pulse Code Modulation A-law scaling (PCMA) used for user traffic from AF server over **Rx** interface.
PCMA is an ITU-T Recommendation G.711 audio data encoding in eight bits per sample, after A-law logarithmic scaling.

pcmu

Specifies the media codec as Pulse Code Modulation mu-law scaling (PCMU) used for user traffic from AF server over **Rx** interface.
PCMU is an ITU-T Recommendation G.711 audio data encoding in eight bits per sample, after mu-law logarithmic scaling.

Usage

Use this command to define a condition based on the media codecs used by AF service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the AF Media codec is equal to PCMA:

```
af-media-codec = pcma
```

af-media-type

This command defines a condition based on the media type used by AF application in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] af-media-type *operator*{**application** | **audio** | **control** | **data** | **message** | **other** | **text** | **video**}

---

no

Removes the specified condition definition.

---

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

application

Specifies the media type as Application in user traffic from AF server over **Rx** interface.

---

audio

Specifies the media type as Audio in user traffic from AF server over **Rx** interface.

---

control

Specifies the media type as Control in user traffic from AF server over **Rx** interface.

---

data

Specifies the media type as Data in user traffic from AF server over **Rx** interface.

---

message

Specifies the media type as Message in user traffic from AF server over **Rx** interface.

---

text

Specifies the media type as Text in user traffic from AF server over **Rx** interface.

---

video

Specifies the media type as Video in user traffic from AF server over **Rx** interface.

Usage

Use this command to define a condition based on the media type used by AF service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the AF Media type is equal to Video:

```
af-media-type = video
```

af-service-urn

This command defines a condition based on the service Uniform Resource Names (URNs) used by AF application in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] af-service-urn *operatorurn_string*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

urn_string

Specifies the URN in user traffic from AF server over **Rx** interface.
urn_string must be an alphanumeric string of 1 through 256 characters.

Usage

Use this command to define a condition based on the URN used by AF service through the **Rx** interface over which the IPCF receives media information for the application usage in an IP-CAN session.
Uniform Resource Names (URNs) serves as persistent, location-independent resource identifiers and are designed to make it easy to map other namespaces into URN-space.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the AF service URN is equal to *ietf:rfc:4003*:

af-service-urn = *ietf:rfc:4003*

an-gw-address

This command defines a condition based on the IP address of Access Node Gateway (AN-GW) on which subscriber is attached in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] an-gw-address {*operatorangw_ip/mask* | {**in-range** | **!in-range**} *range_start_ip* **to** *range_end_ip*}

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

in-range

Specifies the condition to accept the IP address which are in range as argument to define the Access Node Gateway address which is used by subscriber in IP-CAN session.

!in-range

Specifies the condition to accept the IP address which are NOT in range as argument to define the Access Node Gateway address which is used by subscriber in IP-CAN session.

range_start_ip

Specifies the starting IP address which is used for defining the range of AN-GW IP addresses which is used by subscriber in IP-CAN session.
range_start_ip is an IP address and must be lesser than *end_start_ip* address.

range_end_ip

Specifies the ending IP address which is used for defining the range of AN-GW IP addresses which is used by subscriber in IP-CAN session.
range_end_ip is an IP address and must be greater than *end_start_ip* address.

angw_ip/mask

Specifies the IP address of the Access Node Gateway which is used by subscriber in IP-CAN session along with IP mask as well.

angw_ip must be an IP address in IPv4 or IPv6 notation.
mask Specifies the IP address mask bits to determine the number of IP addresses of AN-GW in condition. *mask* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to define a condition based on the AN-GW IP address used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on AN-GW IP address *1.2.3.4* in an IP-CAN session:

```
an-gw-address = 1.2.3.4
```

authorized-qci

This command defines a condition based on the authorized QoS Class Identifier used in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] authorized-qci operatorqci
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

qci

Specifies the authorized QoS class identifier in user traffic for condition validation.
qci must be an integer between 1 through 255.

Usage

Use this command to define a condition based on the authorized QCI used by the subscriber in an IP-CAN session.
The condition evaluates to TRUE, if Bearer Control Mode is UE and network (PCEF bearer binding) and IPCF has authorized the specified QCI earlier.
QCI is a number which describes the error rate and delay that are associated with the service. It includes bearer parameters including scheduling weights and queue management thresholds.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the authorized QCI is greater than or equal to *4*:

```
authorized-qci >= 4
```

base-station-id

This command defines a condition based on the various parameters used in base-station id by subscriber in an IP-CAN session between PCEF (PDSN) and IPCF over **Gx** interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] base-station-id {[sid operator sys_identifier] | range start_range to end_range]]
[nid operator netwrk_identifier ] | range start_range to end_range ]] [ cellid operator
cell_identifier ] | range start_range to end_range ]]}
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<**: Lesser than
- **<=**: Lesser than or equals
- **=**: Equals
- **>**: Greater than
- **>=**: Greater than or equals

sid *operator sys_identifier*

Specifies the system identifier in base-station id of subscriber for condition validation in an IP-CAN session.
sys_identifier must be an integer between 0 through 65535.

nid *operator netwrk_identifier*

Specifies the network identifier in base-station id, which is used by subscriber, for condition validation in an IP-CAN session.
netwrk_identifier must be an integer between 0 through 65535.

cellid *operator cell_identifier*

Specifies the cell identifier in base-station id, which is used by subscriber, for condition validation in an IP-CAN session.
cell_identifier must be an integer between 0 through 65535.

range *start_range* **to** *end_range*

This optional keyword specifies range of the identifiers (SID, Cell id, Network Id) to be used for condition validation in an IP-CAN session.
start_range is the start value of range having integer between 0 through 65535 and it must be lesser than *end_range*.
end_range is the end value of range having integer between 0 through 65535 and it must be greater than *start_range*.

Usage

User this command to define a condition based on the parameters used in base-station id of subscriber, which is composition of SID, Cell Id, and/or Network Id, in an IP-CAN session between PCEF (PDSN) and IPCF over **Gx** interface.
This condition is defined for PCC functionality support to CDMA users over **Gx** interface.

Example

The following command creates a condition definition to analyze the condition based on base-station id of subscriber where SID is *1001* and cell id is in range of *2001* to *2069* in an IP-CAN session between PDSN and IPCF having network id as *3989*:

```
base-station-id sid = 1001 nid = 3989 cellid = range 2001 to 2069
```

bearer-count

This command defines a condition based on the number of bearers allowed in a subscriber session on IPCF to accept bearer-count in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bearer-count *operatornum_bearer*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

num_bearer

Specifies the number of bearers in user traffic for condition validation.
num_bearer indicates a condition based on the number of bearer established in a IP-CAN session and must be an integer between 1 through 11.

Usage

Use this command to define a condition based on the number of bearers allowed for a subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for bearers allowed in a subscriber session is equal to *4*:

```
bearer-count = 4
```

connectivity-access-network

This command defines a condition based on the access network type used by subscriber in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] connectivity-access-network *operator* **{3gpp-gprs | 3gpp2 | 3gpp2-eps | docsis | wimax | xdsl }**

no

Removes the specified condition definition.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

3gpp-gprs

Specifies the network access connectivity type as 3GPP-GPRS for user traffic in condition definition.

3gpp2

Specifies the network access connectivity type as 3GPP2 (CDMA) for user traffic in condition definition.

3gpp2-eps

Specifies the network access connectivity type as 3GPP2-EPS for user traffic in condition definition.

docsis

Specifies the network access connectivity type as Data Over Cable Service Interface Specification (DOCSIS) for user traffic in condition definition.

wimax

Specifies the network access connectivity type as Wi-MAX for user traffic in condition definition.

xdsl

Specifies the network access connectivity type as xDSL (ADSL/SDSL) or user traffic in condition definition.

Usage

Use this command to define a condition based on the type of connectivity used for network access by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the network type is equal to Wi-MAX:

```
connectivity-access-network = wimax
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

eval-condition-group

This command defines a condition based on the TRUE or FALSE setting of a configured PCC-Condition-Group for subscriber in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] eval-condition-group cond_grp_name operator {FALSE | TRUE}
```

no

Removes the specified condition definition.

cond_grp_name

Specifies the name of the configured PCC-Condition-Group which is used for evaluation with in this PCC-Condition-Group for user traffic.
cond_grp_name must be a pre-configured PCC-Condition-Group in this configuration mode.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

FALSE

Sets the evaluation condition for specified PCC-Condition-Group to FALSE.
With this keyword system rejects all conditions defined in specific PCC-Condition-Group and match the same in user traffic.

TRUE

Sets the evaluation condition for specified PCC-Condition-Group to TRUE.
With this keyword system accepts all conditions defined in specific PCC-Condition-Group and match the same in user traffic.

Usage

Use this command to define a condition based on the acceptance or rejection of specific pre-configured PCC-Condition-Group for user traffic in an IP-CAN session.
This command allows the operator to use configured PCC-Condition-Group in another PCC-Condition-Group as subset of PCC-Condition-Group.

Important: A maximum of 3 level of recursion depth is allowed for PCC-Condition-Group evaluation in a PCC-Condition-Group.

Example

The following command creates a condition definition to accept the all conditions defined in PCC-Condition-Group named *af_1*:

```
eval-condition-group af_1 = TRUE
```

event-time

This command defines a condition based on the event-trigger time as per the time specified by the named Time definition (Timedef) configured for subscriber session in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] event-time operator timedef_name
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

timedef_name

Specifies the name of the configured time definition (start and end timer of session) which is used for evaluation with this PCC-Condition-Group for user traffic.
timedef_name must be a pre-configured Time definition in *PCC-Service Configuration Mode*.

Usage

Use this command to define a condition based on the start and end time defined in a Time Definition configuration in *PCC-Service Configuration Mode* for user traffic in an IP-CAN session.
Event trigger in this command indicates a condition when the event-trigger time was as per the time specified by the named Time Definition.
This command allows the operator to use configured time period as event trigger for this PCC-Condition-Group.

Example

The following command creates a condition definition to trigger the condition based on the start and end time defined in Timedef named *timedef_night*:

```
event-time = timedef_night
```

event-trigger

This command defines a condition based on the event triggers due to various conditions for subscriber in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] event-trigger operator event_trigger
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

event_trigger

Specifies the network events as condition definition for user traffic in an IP-CAN session.
Following event triggers are supported with this command:

- **an-gw-change**
- **bearer-qos-change**
- **bearer-setup**
- **bearer-termination**
- **default-eps-bearer-qos-change**
- **ip-can-change**
- **loss-of-bearer**
- **out-of-credit**
- **pgw-trace-control**
- **plmn-change**
- **qos-change**
- **qos-change-exceeding-authorization**
- **rai-change**

- **rat-change**
- **reallocation-of-credit**
- **recover-of-bearer**
- **resource-modification-request**
- **revalidation-timeout**
- **session-setup**
- **session-termination**
- **sgsn-change**
- **successful-resource-allocation**
- **tft-change**
- **ue-ip-address-allocate**
- **ue-ip-address-release**
- **ue-time-zone-change**
- **user-location-change**

Usage

Use this command to define a condition based on the event triggered in network for user traffic.

Example

The following command creates a condition definition when there is a change in traffic flow template for subscriber:

```
event-trigger = tft-change
```

imsi

This command defines a condition based on the International Mobile Station Identification number (IMSI) of a subscriber in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imsi *operatorimsi*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imsi

Specifies the IMSI of subscriber to be used for condition validation in an IP-CAN session.
imsi must be a string of between 8 to 15 digits which starts with 3 digit of MCC then 2 to 3 digit of MNC. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

Usage

Use this command to define a condition based on the IMSI of a subscriber used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on subscriber IMSI as *12334566434* in an IP-CAN session:

```
imsi = 12334566434
```

msisdn

This command defines a condition based on the Mobile Station International Subscriber Directory Number (MSISDN) of a subscriber in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] msisdn *operatormsisdn*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imsi

Specifies the MSISDN of subscriber to be used for condition validation in an IP-CAN session.
msisdn must be a string of between 1 to 16 digits which contains CC + NDC/NPA + SN.
Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

Usage

Use this command to define a condition based on the MS ISDN of a subscriber used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on subscriber MSISDN as *380561234567* in an IP-CAN session:

```
msisdn = 380561234567
```

multi-line-or

This command enables/disables the “OR” relation across all conditions exist in PCC-Condition-Group Configuration Mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] multi-line-or
```

no

Sets the PCC-Condition-Group to “AND” relation across all conditions exist in a PCC-Condition-Group Configuration Mode.

Usage

Use this command to enable the “OR” relation across all conditions exist in PCC-Condition-Group Configuration Mode.
In absence of this command the default relation of “AND” applies across all conditions exist in PCC-Condition-Group Configuration Mode.

Example

The following command enables the “OR” relation across all conditions exist in *PCC-Condition-Group Configuration Mode*:

```
multi-line-or
```

The following command enables the default “AND” relation across all conditions exist in *PCC-Condition-Group Configuration Mode*:

```
no multi-line-or
```

nai

This command defines a condition based on the Network Access Identifier (NAI) of a subscriber in an IP-CAN session between PCEF (PDSN) and IPCF over **Gx** interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] nai *operator* {**username** *user_name* [**domain** *domain*] | **domain** *domain*}

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

username *user_name*

Specifies the subscriber user name to be used for condition validation in an IP-CAN session.
user_name must be an alpha and/or numeric string of 1 through 128 characters in length. The user name can contain all special characters.

domain *domain*

Specifies the domain (Realm) of subscriber to be used for condition validation in an IP-CAN session.
domain must be an alpha and/or numeric string of 1 through 128 characters in length. The domain name can contain all special characters.

Usage

User this command to define a condition based on the NAI, which contains of user name and domain name, of a subscriber in an IP-CAN session between PCEF (PDSN) and IPCF over **Gx** interface.
This condition is defined for PCC functionality support to CDMA users over **Gx** interface.

Example

The following command creates a condition definition to analyze the condition based on subscriber user name as *cdma2000_subs1* in an IP-CAN session between PDSN and IPCF having *xyz.com* as domain:

```
nai = username cdma2000_subs1 domain xyz.com
```

out-of-credit rulename

This command defines a condition based on the exhaustion of credit for subscriber Rulename at PCEF in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] out-of-credit rulename operator rule_name
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

rule_name

Specifies the name of the Rulename for which out of credit condition is to match in an IP-CAN session.
rule_name is a pre-configured Rulename on PCEF and must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the exhaustion of credit for subscriber Rulename at PCEF in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on the exhaustion of credit for subscriber Rulename *rule_101* at PCEF in an IP-CAN session:

```
out-of-credit rulename = rule_101
```

out-of-credit rulebase-name

This command defines a condition based on the exhaustion of credit for subscriber Rulebase name at PCEF in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] out-of-credit rulebase-name operator rulebase_name
```

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

rulebase_name

Specifies the name of the Rulebase for which out of credit condition is to match in an IP-CAN session.
rulebase_name is a pre-configured Rulebase on PCEF and must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the exhaustion of credit for subscriber Rulebase name at PCEF in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on the exhaustion of credit for subscriber Rulebase name *rulebase_101* at PCEF in an IP-CAN session:

```
out-of-credit rulebase-name = rulebase_101
```

pcef-address

This command defines a condition based on the IP address of Policy and Charging Enforcement Function (PCEF) which is served by IPCF and through which subscriber is attached to an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pcef-address {*operatorpcef_ip/mask* | {**in-range** | **!in-range**}*range_start_ip* **to** *range_end_ip*}

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

in-range

Specifies the condition to accept the IP address which are in range as argument to define the PCEF address which is used by subscriber in IP-CAN session.

!in-range

Specifies the condition to accept the IP address which are NOT in range as argument to define the PCEF address which is used by subscriber in IP-CAN session.

range_start_ip

Specifies the starting IP address which is used for defining the range of PCEF IP addresses which is used by subscriber in IP-CAN session.
range_start_ip is an IP address and must be lesser than *end_start_ip* address.

range_end_ip

Specifies the ending IP address which is used for defining the range of PCEF IP addresses which is used by subscriber in IP-CAN session.
range_end_ip is an IP address and must be greater than *end_start_ip* address.

pcef_ip/mask

Specifies the IP address of the PCEF which is used by subscriber in IP-CAN session along with IP mask as well.

pcef_ip must be an IP address in IPv4 or IPv6 notation.
mask Specifies the IP address mask bits to determine the number of IP addresses of PCEF in condition. *mask* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to define a condition based on the PCEF IP address used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on PCEF P address *1.2.3.4* in an IP-CAN session:

```
pcef-address = 1.2.3.4
```

pdn-id

This command defines a condition based on the PDN or calling station id in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] pdn-id [case-insensitive] *operatorpdn_id*

no

Removes the specified condition definition.

case-insensitive

This optional keyword sets the condition to not to consider the case of argument phrase for condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals
- **contains**: Contains
- **!contains**: Does not contain
- **starts-with**: Starts with
- **!starts-with**: Does not start with
- **ends-with**: Ends with
- **!ends-with**: Does not end with

pdn_id

Specifies the PDN or calling station id to be used for condition validation in an IP-CAN session.
pdn_id must be an alphanumeric string of between 1 to 128 characters.

Usage

Use this command to define a condition based on the PDN or calling station id used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on calling station id *ggsn_all_102* in an IP-CAN session:

pdn-id = *ggsn_all_102*

profile-attribute

This command defines a condition based on the matching between subscriber profile attribute value and SPR attribute value in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] profile-attribute parameter *subs_prof_attr_value operator spr_attr_value*

no

Removes the specified condition definition.

parameter *subs_prof_attr_value*

Specifies the attribute parameter value to match with SPR attribute for condition validation in an IP-CAN session.
subs_prof_attr_value must be an alphanumeric string of from 1 through 31 characters.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

spr_attr_value

Specifies the attribute value in SPR to match with Subscriber profile attribute for condition validation in an IP-CAN session.
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the matching parameters between subscriber profile attribute and SPR attribute parameters used in an IP-CAN session and provides a generic way of specifying and triggering actions based on any of the subscriber profile attribute received from SPR interactions.

Example

The following command creates a condition definition to analyze the condition based on matching of subscriber profile attribute value *subs_gold_102* with SPR attribute value *spr_gold_102*in an IP-CAN session:

```
profile-attribute parameter subs_gold_102 = spr_gold_102
```

radio-access-technology

This command defines a condition based on the radio access technology used by subscriber in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] radio-access-technology *operatorRAT*

no

Removes the specified condition definition.

operator

Specifies how to logically match the media type in user traffic.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

RAT

Specifies the radio access technology used by subscriber to access the network as condition definition for user traffic in an IP-CAN session.
Following RAT are supported with this command:

- **cdma2000-1x**: 3GPP2 CDMA 2000 - 1x RTT
- **eutran**: Evolved Universal Terrestrial Radio Access Network (eUTRAN)
- **gan**: Generic Access Network (GAN)
- **geran**: GSM Edge Radio Access Network (GERAN)
- **hrpd**: High Rate Packet Data (CDMA 2000 1xEV-DO)
- **hspa-evolution**: Evolved High-Speed Packet Access (eHSPA/HSPA+)
- **umb**: Ultra-Mobile Broadband
- **utran**: Universal Terrestrial Radio Access Network (UTRAN)
- **wlan**: Wireless Local Area Network (WLAN/xDSL)

Usage

Use this command to define a condition based on the type of radio technology used for network access by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the PCC service user traffic for the radio access technology type as WLAN:

```
radio-access-technology = wlan
```

sgsn-ip

This command defines a condition based on the IP address of SGSN on which subscriber is attached in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sgsn-ip {*operatorsgsn_ip/mask* | {**in-range** | **!in-range**} *range_start_ip* **to** *range_end_ip*}

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

in-range

Specifies the condition to accept the IP address which are in range as argument to define the SGSN address which is used by subscriber in IP-CAN session.

!in-range

Specifies the condition to accept the IP address which are NOT in range as argument to define the SGSN address which is used by subscriber in IP-CAN session.

range_start_ip

Specifies the starting IP address which is used for defining the range of SGSN IP addresses which is used by subscriber in IP-CAN session.
range_start_ip is an IP address and must be lesser than *end_start_ip* address.

range_end_ip

Specifies the ending IP address which is used for defining the range of SGSN IP addresses which is used by subscriber in IP-CAN session.
range_end_ip is an IP address and must be greater than *end_start_ip* address.

sgsn_ip/mask

Specifies the IP address of the SGSN which is used by subscriber in IP-CAN session along with IP mask as well.

sgsn_ip must be an IP address in IPv4 or IPv6 notation.
mask Specifies the IP address mask bits to determine the number of IP addresses of SGSN in condition. *mask* must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to define a condition based on the SGSN IP address used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on SGSN IP address *1.2.3.4* in an IP-CAN session:

```
sgsn-ip = 1.2.3.4
```

sgsn-mcc-mnc

This command defines a condition based on the PLMN (MCC+MNC) of SGSN on which subscriber is attached in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] sgsn-mcc-mnc *operator* {**mcc** *mcc_value* [**mnc** *mnc_value*] | [**mcc** *mcc_value*] **mnc** *mnc_value*}

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

mcc *mcc_value*

Specifies the Mobile Country Code in PLMN of SGSN which is used by subscriber in IP-CAN session.
mcc_value must be an integer between 101 and 998.

mnc *mnc_value*

Specifies the Mobile Network Code in PLMN of SGSN which is used by subscriber in IP-CAN session.
mnc_value must be an integer between 1 and 998.

Usage

Use this command to define a condition based on the PLMN of SGSN used by subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on PLMN of SGSN with MCC as *102* and MNC as *99*in an IP-CAN session:

```
sgsn-mcc-mnc = mcc 102 mnc 99
```

subscription-attribute

This command defines a condition based on the matching between subscriber subscription attribute value and SPR attribute value in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] subscription-attribute subsription_attr_value operator spr_attr_value
```

no

Removes the specified condition definition.

subsription_attr_value

Specifies the subscriber subscription attribute value to match with SPR attribute for condition validation in an IP-CAN session.
subsription_attr_value must be an alphanumeric string of from 1 through 31 characters.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

spr_attr_value

Specifies the attribute value in SPR to match with subscriber subscription attribute for condition validation in an IP-CAN session.
spr_attr_value must be an alphanumeric string of from 1 through 63 characters.

Usage

Use this command to define a condition based on the matching parameters between subscriber subscription attribute and SPR attribute value used in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on matching of subscriber subscription attribute value *subs_gold_102* with SPR attribute value *spr_gold_101*in an IP-CAN session:

```
subscription-attribute subscribe_gold_102 = spr_gold_101
```

spr-profile-not-found

This command defines a condition based on the availability of SPR profile for s subscriber in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] spr-profile-not-found
```

no

Removes the specified condition definition.

Usage

Use this command to define a condition based on the availability of SPR profile for a subscriber in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition if SPR profile is not available for a subscriber in an IP-CAN session:

```
spr-profile-not-found
```

threshold-condition usage-monitor

This command defines a condition based on the threshold conditions in usage of traffic by subscriber session in an IP-CAN session. It is used to support usage tracking and dynamic Policy control based on subscriber usage.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] threshold-condition usage-monitor *usage_mon_name* **usage** *operator* **{ absolute value** *volume* **| subscription-limit | subscription-threshold** *subs_thres_limit***}**

no

Removes the specified condition definition.

usage_mon_name

Specifies a unique name for configured usage monitor condition which is used for evaluation with this condition group for user traffic in IP-CAN session.
usage_mon_name must be an alphanumeric string of 1 through 63 characters.

usage

This keyword specifies the condition as usage for threshold condition which is used for evaluation with this condition group for user traffic in IP-CAN session.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

absolute value *volume*

Specifies the threshold limit condition definition based on absolute usage volume *volume* in Kilo Bytes which is used for evaluation with this condition group for user traffic in IP-CAN session.
volume must be an integer between 1 through 4294967295.

subscription-limit

Specifies the threshold limit condition based on Subscriber's subscription limit which is used for evaluation with this condition group for user traffic in IP-CAN session.

In this condition the system takes Subscriber's subscription limit as defined in subscriber subscription policy for threshold limit monitoring.

subscription-threshold *subs_thres_limit*

Specifies the condition definition for threshold limit based on a configured usage monitor threshold named *subs_thres_limit* in IP-CAN session.
subs_thres_limit is a pre-configured subscription limit in this configuration mode.
This command allows the operator to use configured subscription limit as subset of a threshold condition.

Usage

Use this command to define a condition based on the duration of usage of service in seconds or volume usage in Bytes for user traffic in an IP-CAN session. This usage monitor is used to support usage tracking and dynamic Policy control based on subscriber usage.
IPCF supports the concept of Monitoring Key. PCEF, when instructed by PCRF, keeps track of usage per Monitoring Key. PCEF reports the usage when thresholds are reached or requested by PCRF.
To allow operator to have dynamic Policy control, IPCF uses Usage Monitor. This Usage Monitor has attribute of volume-limit. Operator can "associate" different Monitoring Keys to these usage monitors. It can be a Many-To-Many relationship between Usage-Monitor and Monitoring-Key. Operator can use Usage conditions on Usage Monitors instead of Monitoring Keys directly.
IPCF tracks usage per usage-monitor. Different monitoring keys associated to a Usage-Monitor. When monitoring key is associated to a Usage-Monitor, the usage reported for that particular monitoring key is added to all the usage monitoring to which it is associated.
IPCF supports 2 types of usage monitors; it can be defined on IPCF or SSC supplied usage monitors. The name *usage_mon_name* identifies an usage-monitor, which is locally defined or received from SSC. The **absolute** value applies to both types of usage monitors.
This command allows the operator to use configured threshold condition with another threshold condition as subset.
A maximum of 8 thresholds can be configured per usage monitor.

Example

The following command creates a threshold condition with usage monitor name *threshold1* as usage monitor to trigger the condition based on the **subscription limit** as provide in Subscriber policy:

```
threshold-condition usage-monitor threshold1 usage = subscription-limit
```

user-access-network

This command defines a condition based on the access location type of the subscriber in an IP-CAN session as received on **Gx** interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] user-access-network *operator* **value roaming**

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

value roaming

Specifies the subscriber network access type as Roaming for condition validation in an IP-CAN session. This condition contains all subscribers active in Roaming networks in this condition.

Usage

Use this command to define a condition based on the location of the user as defined in SPR attribute or subscriber profile attribut or location of user in Home, Roaming, Visiting in an IP-CAN session as received on **Gx** interface.
This configuration compares ULI and other location information from Gx data with the Home/roaming/visiting location as received from SSC. IPCF will also use global data as received from SSC in determining user access network through Subscriber profile attribute or SPR attribute in profile attribute.

Example

The following command creates a condition definition to analyze the condition based on location of the subscribes as **roaming** in an IP-CAN session:

```
user-access-network = value roaming
```

user-equipment-info esn

This command defines a condition based on the Electronic Serial Number (ESN) used for the identification of mobile device (UE) in a Non-3GPP IP-CAN session received over **Gx** interface between PDSN and IPCF.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] user-equipment-info esn *operatoresn*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

esn

Specifies the Electronic Serial Number used for the identification of UE in 64 bit format as condition value for UE information received over **Gx** interface in a Non-3GPP IP-CAN session.
esn must be a 15 character long string of Hexadecimal numbers only.

Usage

Use this command to define a condition based on the ESN of the UE received over **Gx** interface in a Non-3GPP IP-CAN session between PDSN and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the ESN of the UE as *1234567890120AF* in a Non-3GPP IP-CAN session:

```
user-equipment-info esn = 1234567890120AF
```

user-equipment-info eui64

This command defines a condition based on the Extended Unique Identifier in 64 bit (EUI-64) used for the identification of mobile device (UE) in an IP-CAN session received over **Gx** interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] user-equipment-info eui64 *operatoreui64*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

eui64

Specifies the Extended Unique Identifier in 64 bit format as a condition value for UE information received over **Gx** interface in an IP-CAN session.
eui64 is a 16 character long string of Hexadecimal numbers only.

Usage

Use this command to define a condition based on the EUI-64 value of the UE received over **Gx** interface in an IP-CAN session between PCEF and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the EUI-64 of the UE as *0012989099832345* in an IP-CAN session:

```
user-equipment-info eui64 = 0012989099832345
```

user-equipment-info imeisv

This command defines a condition based on the International Mobile Equipment Identity Software Version (IMEI-SV) used for the identification of mobile device (UE) in an IP-CAN session received over **Gx** interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] user-equipment-info imeisv *operatorimei_sv*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imei_sv

Specifies the International Mobile Equipment Identity Software Version (IMEI-SV) as a condition value for UE information received over **Gx** interface in an IP-CAN session.
imei_sv is a 16 digit long string of decimal numbers only.

Usage

Use this command to define a condition based on the IMEI-SV value of the UE received over **Gx** interface in an IP-CAN session between PCEF and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the IMEI-SV of the UE as *0012989099832345* in an IP-CAN session:

user-equipment-info eui64 = *0012989099832345*

user-equipment-info mac

This command defines a condition based on the Media Access Control (MAC) address used for the UE information in an IP-CAN session as received over **Gx** interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] user-equipment-info mac *operatormac_value*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

mac_value

Specifies the Media Access Control (MAC) address as condition value for UE information received over **Gx** interface in an IP-CAN session.
mac_value is a 17 character long string of Hexadecimal numbers in *xx:xx:xx:xx:xx:xx* format only.

Usage

Use this command to define a condition based on the MAC address value as UE information received over **Gx** interface in an IP-CAN session.

Example

The following command creates a condition definition to analyze the condition based on the MAC value of the UE as *00:12:98:90:99:83* in an IP-CAN session:

user-equipment-info mac = *00:12:98:90:99:83*

user-equipment-info meid

This command defines a condition based on the Mobile Equipment Id (MEID) used for the identification of CDMA mobile device (UE) in a Non-3GPP IP-CAN session received over **Gx** interface between PDSN and IPCF.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] user-equipment-info meid *operatorme_id*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

me_id

Specifies the Mobile Equipment identifier used for the identification of UE in 64 bit format as condition value for UE information received over **Gx** interface in a Non-3GPP IP-CAN session.
me_id must be a 14 character long string of Hexadecimal numbers only.

Usage

Use this command to define a condition based on the MEID of the CDMAUE received over **Gx** interface in a Non-3GPP IP-CAN session between PDSN and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the MEID of the CDMA UE as *123456780120AF* in a Non-3GPP IP-CAN session:

```
user-equipment-info meid = 123456780120AF
```

user-equipment-info modified-eui64

This command defines a condition based on the modified-Extended Unique Identifier in 64 bit (EUI-64) used for the identification of mobile device (UE) in an IP-CAN session received over **Gx** interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] user-equipment-info modified-eui64 *operatormeui64*

no

Removes the specified condition definition.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

meui64

Specifies the modified Extended Unique Identifier (EUI) in 64 bit format as condition value for UE information received over **Gx** interface in an IP-CAN session.
meui64 is a 16 character long string of Hexadecimal numbers only.

Usage

Use this command to define a condition based on the modified EUI-64 value of the UE received over **Gx** interface in an IP-CAN session between PCEF and IPCF.

Example

The following command creates a condition definition to analyze the condition based on the EUI-64 of the UE as *0012989099832345* in an IP-CAN session:

user-equipment-info modified-eui64 *= 0012989099832345*

user-location-info

This command defines a condition based on the UE location used in an IP-CAN session as received on **Gx** interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] user-location-info {cgi operator mcc mcc_value mnc mnc_value lac lac_value ci
ci_value | ecgi operator mcc mcc_value mnc mnc_value ecgi ecgi_value | rai operator mcc
mcc_value mnc mnc_value lac lac_value rai rai_value| sai operator mcc mcc_value mnc
mnc_value lac lac_value sac sac_value| tai operator mcc mcc_value mnc mnc_value tai
tai_value}
```

no

Removes the specified condition definition.

cgi

Specifies the Cell Global Identifier in UE location received over **Gx** interface in an IP-CAN session.

ecgi

Specifies the E-UTRAN Cell Global Identifier in UE location received over **Gx** interface in an IP-CAN session.

rai

Specifies the Routing Area Identifier in UE location received over **Gx** interface in an IP-CAN session.

sai

Specifies the Service Area Identifier in UE location received over **Gx** interface in an IP-CAN session.

tai

Specifies the Tracking Area Identifier in UE location received over **Gx** interface in an IP-CAN session.

operator

Specifies how to logically match the information in the analyzed field.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

mcc *mcc_value*

Specifies the Mobile Country Code used in UE location information received over **Gx** interface in IP-CAN session.
mcc_value must be an integer between 101 through 998.

mnc *mnc_value*

Specifies the Mobile Network Code used in UE location information received over **Gx** interface in IP-CAN session.
mnc_value must be an integer between 1 through 998.

lac *lac_value*

Specifies the Location Area Code used in UE location information received over **Gx** interface in IP-CAN session.
lac_value must be an integer between 1 through 65535.

ci *ci_value*

Specifies the Cell Identifier used in UE location information received over **Gx** interface in IP-CAN session.
ci_value must be an integer between 1 through 65535.

ecgi *ecgi_value*

Specifies the E-UTRAN Cell Global Identifier used in UE location information received over **Gx** interface in IP-CAN session.
ecgi_value must be an integer between 1 through 1048575.

rai *rai_value*

Specifies the Routing Area Identifier used in UE location information received over **Gx** interface in IP-CAN session.
rai_value must be an integer between 1 through 65535.

sac *sac_value*

Specifies the Service Area Code used in UE location information received over **Gx** interface in IP-CAN session.
sac_value must be an integer between 1 through 65535.

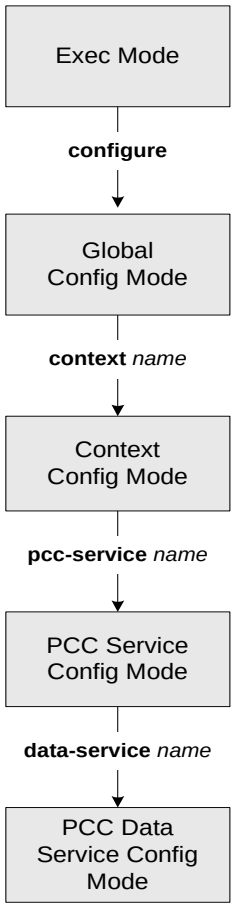
tai *tai_value*

Specifies the Tracking Area Code used in UE location information received over **Gx** interface in IP-CAN session.
tai_value must be an integer between 1 through 65535.

Usage

Use this command to define a condition based on the UE location information received over **Gx** interface in an IP-CAN session.

Example



The following command creates a condition definition to analyze the condition based on the RAI received for UE location in an IP-CAN session:

```
user-location-info rai  = mcc 102 mnc 99 lac 1003 rai 3521
```

Chapter 208
PCC-Data-Service Configuration Mode Commands

The PCC-Data-Service Configuration Mode is used to configure the data flow parameters for the media data, as well as corresponding attributes that are necessary for charging and policy enforcement decisions for the media parameters represented by its service flows in the PCC-service. A maximum of ten service data flows can be configured in a PCC-Data-Service instance.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

flow direction in

This command configures the flow service parameters for incoming data flow in PCC-Data-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] flow direction in protocol {ip | tcp | udp} from {src_ip_addr | any} port
{src_port_num | any} to {dest_ip_addr | any} port {dest_port_num | any}
```

no

Removes the configured data service flow parameters from PCC-Data-Service instance for IPCF configuration.

protocol {ip | tcp | udp}

This keyword configures the data flow parameters for specific protocol.
Following protocols are supported through this keyword:

- **ip**: Sets the parameters for IP traffic.
- **tcp**: Sets the parameters for TCP traffic.
- **UDP**: Sets the parameters for UDP traffic.

from {*src_ip_addr* | any} port {*src_port_num* | any}

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.
Following parameters are defined with this keyword:

- *src_ip_addr*: specifies the specific IP address in IPv4/IPv6 notation as source of flow.
- **any**: specifies that flow from any source IP address/port can be analyzed or considered.
- **port** *src_port_num*: specifies the specific source port parameter for flow.

  src_port_num is the source port number of flow and must be an integer from 1 through 65535.

to {*dest_ip_addr* | any} port {*dest_port_num* | any}

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.
Following parameters are defined with this keyword:

- *dest_ip_addr*: specifies the specific IP address in IPv4/IPv6 notation as destination of flow.
- **any**: specifies that flow to any destination IP address/port can be analyzed or considered.

- **port** *dest_port_num*: specifies the specific destination port parameter for flow.

  dest_port_num is the destination port number of flow and must be an integer from 1 through 65535.

Usage

Use this command to configure the flow service parameters for incoming data flow in PCC-Data-Service instance for IPCF Configuration.

Example

Following command sets the data service parameters for **tcp** type protocol from **any** IP/port source to **any** IP/port in incoming direction with in a PCC-Data-Service.

```
flow direction in protocol tcp from any port any to any port any
```

flow direction out

This command configures the flow service parameters for outgoing data flow in PCC-Data-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] flow direction in protocol {ip | tcp | udp} from {src_ip_addr | any} port
{src_port_num | any} to {dest_ip_addr | any} port {dest_port_num | any}
```

no

Removes the configured data service flow parameters from PCC-Data-Service instance on IPCF node.

protocol {ip | tcp | udp}

This keyword configures the data flow parameters for specific protocol.
Following protocols are supported through this keyword:

- **ip**: Sets the parameters for IP traffic.
- **tcp**: Sets the parameters for TCP traffic.
- **UDP**: Sets the parameters for UDP traffic.

from {*src_ip_addr* | any} port {*src_port_num* | any}

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.
Following parameters are defined with this keyword:

- *src_ip_addr*: specifies the specific IP address in IPv4/IPv6 notation as source of flow.
- **any**: specifies that flow from any source IP address/port can be analyzed or considered.
- **port** *src_port_num*: specifies the specific source port parameter for flow.

  src_port_num is the source port number of flow and must be an integer from 1 through 65535.

to {*dest_ip_addr* | any} port {*dest_port_num* | any}

This keyword configures the data flow condition parameters for specific protocol through IP address and port as source of flow.
Following parameters are defined with this keyword:

- *dest_ip_addr*: specifies the specific IP address in IPv4/IPv6 notation as destination of flow.
- **any**: specifies that flow to any destination IP address/port can be analyzed or considered.
- **port** *dest_port_num*: specifies the specific destination port parameter for flow.

dest_port_num is the destination port number of flow and must be an integer from 1 through 65535.

Usage

Use this command to configure the flow service parameters for outgoing data flow in PCC-Data-Service instance on IPCF node.

Example

Following command sets the data service parameters for **tcp** type protocol from **any** IP/port source to **any** IP/port in outgoing direction with in a PCC-Data-Service.

```
flow direction out protocol tcp from any port any to any port any
```

metering-method

This command specifies the metering method to be used by PCEF for offline charging in a PCC-Data-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] metering-method {both-duration-volume | duration | volume}
```

no

Removes the configured metering method from PCC-Data-Service instance on IPCF node.
In such scenario, the metering method pre-configured at PCEF is considered.

both-duration-volume

Specifies the metering method as based on volume of data usage and duration of session, both for offline charging in a PCC-Data-Service instance on IPCF node.

duration

Specifies the metering method as based on the duration of session usage for offline charging in a PCC-Data-Service instance on IPCF node.

volume

Specifies the metering method as based on the volume of data usage for offline charging in a PCC-Data-Service instance on IPCF node.

Usage

Use this command to define the metering method to be used for offline charging in a PCC-Data-Service instance on IPCF node.
If no metering method is defined, the metering method preconfigured at PCEF is considered.

Example

Following command sets the metering method as based on volume of data usage and duration of session, both for offline charging in a PCC-Data-Service instance on IPCF node.

```
metering-method both-duration-volume
```

monitoring-key

This command defines the monitoring key under which data is monitored for the PCC-Data-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

monitoring-key *mon_key_value*

[**no**] **monitoring-key**

no

Removes the configured monitoring-key from PCC-Data-Service instance on IPCF node.

mon_key_value

Specifies the monitoring key value under which data usage is monitored for the PCC-Data-Service instance and must be an integer from 1 through 65535.

Usage

Use this command to define the monitoring key under which data is monitored for the PCC-Data-Service instance on IPCF node.

Example

Following command sets the monitoring key *123* for data monitoring in PCC-Data-Service instance on IPCF node.

```
monitoring-key 123
```

precedence

This command defines the precedence that is assigned to the Dynamic PCC rule created for a PCC-Data-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

precedence *preced_value*

[**no**] **precedence**

no

Removes the configured precedence value from PCC-Data-Service instance on IPCF node.

preced_value

Specifies the precedence that is assigned to the dynamic PCC rule created for a PCC-Data-Service instance and must be an integer from 1 through 65535.

Usage

Use this command to define the precedence value that is assigned to the Dynamic PCC rule created for a PCC-Data-Service instance on IPCF node.

Example

Following command sets the precedence value*2* to assign to the dynamic PCC rule created for a PCC-Data-Service instance on IPCF node.

```
precedence 2
```

qos-profile

This command defines the PCC-QoS-Profile which is to use for the PCC-Data-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

qos-profile *qos_prof_name*

[**no**] **qos-profile**

no

Removes the configured PCC-QoS-Profile from PCC-Data-Service instance on IPCF node.

qos_prof_name

Specifies the pre-configured PCC-QoS-Profile name which is to use for the PCC-Data-Service instance.

Usage

Use this command to define the PCC-QoS-Profile for a PCC-Data-Service instance on IPCF node.

Example

Following command sets the PCC-QoS-Profile *ipcf_qos_prof1* for PCC-Data-Service instance on IPCF node.

```
qos-profile ipcf_qos_prof1
```

rating-group

This command defines the PCC-Rating-Group that is assigned for a PCC-Data-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

rating-group *rating_grp_id*

[**no**] **rating-group**

no

Removes the configured PCC-Rating-Group Id from PCC-Data-Service instance on IPCF node.

rating_grp_id

Specifies the PCC-Rating-Group Id that is assigned to the PCC-Data-Service instance and must be an integer from 1 through 99.

Usage

Use this command to define the PCC-Rating Id value for a PCC-Data-Service instance on IPCF node.

Example

Following command sets the Rating Group id *11* for a PCC-Data-Service instance on IPCF node.

```
rating-group 11
```

reporting-level

This command specifies the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] reporting-level {service-identifier-level | rating-group-level}
```

no

Removes the configured usage reporting level from PCC-Data-Service instance on IPCF node.
In such scenario, the reporting level configured at PCEF is considered.

service-identifier-level

Sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the service identifier level in a PCC-Data-Service instance on IPCF node.

rating-group-level

Sets the data usage reporting level to be used by PCEF to report the data usage for the related PCC rule at the Rating-group level in a PCC-Data-Service instance on IPCF node.

Usage

Use this command to define the reporting level to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-Service instance on IPCF node.
If no reporting level is defined, the reporting level preconfigured at PCEF is considered.

Example

Following command sets the reporting level at 'Rating-group' level which is to be used by PCEF to report the data usage for the related PCC rule in a PCC-Data-Service instance on IPCF node.

```
reporting-level rating-group-level
```

service-identifier

This command defines the service identifier for a PCC-Data-Service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

service-identifier *svc_id*

[**no**] **service-identifier**

no

Removes the configured Service Identifier from PCC-Data-Service instance on IPCF node.

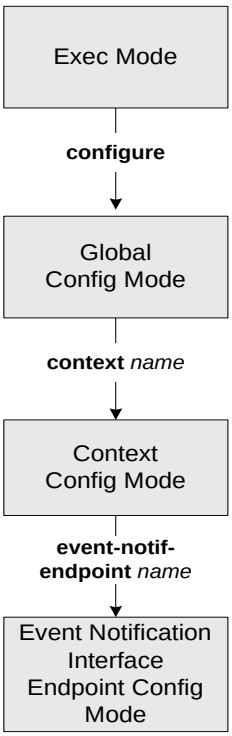
svc_id

Specifies the Service Identifier that is assigned to the PCC-Data-Service instance and must be an integer from 1 through 65535.

Usage

Use this command to define the Service Identifier for a PCC-Data-Service instance on IPCF node.

Example



Following command sets the Service Identifier *1011* for a PCC-Data-Service instance on IPCF node.

```
service-identifier 1011
```

Chapter 209
PCC-Event-Notification-Interface-Endpoint Configuration Mode Commands

The PCC-Event-Notification-Interface-Endpoint configuration mode is used to enable the event notification interface mechanism for the Intelligent Policy Control Function (IPCF) and to configure the Event Notification collection server endpoint related parameters.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

address

This command binds an IP address to the local IPCF node which is to be used for event notification processing with remote event collection server endpoint during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

address *ip_address*

ip_address

Specifies the IP address bind with local IPCF node to be used by the event collection server endpoint for event message processing during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Usage

Use this command to bind an IP address to interact with the remote event notification collection server endpoint to which the event messages are sent for IP-CAN session events.

Example

Following command binds the *1.2.3.4* for event notification message with remote event notification endpoint.

```
address1.2.3.4
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

peer name

This command binds/associates a remote Event Notification collection server as peer having specified IP address and optionally port for event notification during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

peer name *peer_name* **address** *ip_address* [**port** *port_num*]

name *peer_name*

Sets the in PCC-Event-Notification-Interface-Endpoint instance to use a particular peer node configured by a peer name *peer_name* for event notification interface.
The *peer_name* is name of the peer node to be sued for event collection and must be an alphanumerical string from 1 through 31 characters. *peer_name* allows punctuation marks.

ip-address *ip_address*

Sets the PCC-Event-Notification-Interface-Endpoint instance to bind the particular peer node name with IP address *ip_address* in IPv4 or IPv6 notation for event notification message processing.
The *ip_address* is an IP address in IPv4/IPv6 notation.

port *port_num*

This optional keyword sets a particular port number to be used with in the PCC-Event-Notification-Interface-Endpoint instance to configure a particular peer node having a pre assigned IP address *ip_address* in IPv4 or IPv6 notation for event notification message processing.
The *port_num* must be an integer between 1 and 65535.

Usage

Use this command to bind/associate a remote Event Notification collection server as peer having specified IP address and optionally port for event notification during IP-CAN session in the PCC-Event-Notification-Interface-Endpoint instance.
Multiple peers can be configured using this command and peer selection methods, **primary-secondary** or **round-robin** can be applied using **peer select-algorithm** command for event notification during IP-CAN session in this configuration mode.

Example

Following command configures and associates an Event Notification peer node named *event_peer_1* having an IP address *1.2.3.4* with port number as *2345* in an PCC-Event-Notification-Interface-Endpoint instance.

```
peer name event_peer_1 ip-address 1.2.3.4 port 2345
```

peer select-algorithm

This command applies the peer selection algorithm to select the configured remote Event Notification collection server during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

peer select-algorithm {**primary-secondary** | **round-robin**}

primary-secondary

Sets the PCC-Event-Notification-Interface-Endpoint peer selection algorithm to select the configured remote peer servers in primary and secondary method during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.
This mode is applicable only when multiple peers are configured and primary and secondary peer is defined using **peer select-peer** command in this configuration mode.

round-robin

Sets the PCC-Event-Notification-Interface-Endpoint peer selection algorithm to select the configured remote peer servers in round-robin method mode during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.
This mode is applicable only when multiple peers are configured in this configuration mode.

Usage

Use this command apply the peer selection algorithm to select the configured remote Event Notification collection server during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Example

Following command configures the peer selection algorithm to select the configured remote peer in **round-robin** method in PCC-Event-Notification-Interface-Endpoint instance.

```
peer select-algorithm round-robin
```

Following command configures the peer selection algorithm to select the configured primary and secondary remote peers in **primary-secondary** method in PCC-Event-Notification-Interface-Endpoint instance.

```
peer select-algorithm primary-secondary
```

peer select-peer

This command sets the configured remote Event Notification collection server as primary and secondary servers for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

peer select-peer *pri_peer_name* **secondary** *sec_peer_name*

pri_peer_name

Sets the configured remote PCC-Event-Notification-Interface-Endpoint peer as primary peer for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance. *pri_peer_name* must be a pre-configured peer name configured with **peer name** command in this configuration mode.

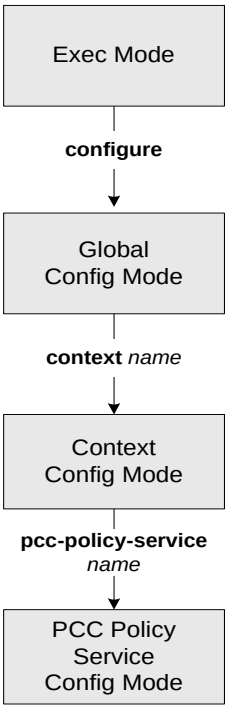
secondary *sec_peer_name*

Sets the configured remote PCC-Event-Notification-Interface-Endpoint peer as secondary peer for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance. *sec_peer_name* must be a pre-configured peer name configured with **peer name** command in this configuration mode.

Usage

Use this command to set the configured remote Event Notification collection server as primary and secondary node for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.
This configuration is used when peer selection algorithm is set to **primary-secondary** using **peer select-algorithm** command in this configuration mode.

Example



Following command configures the specified peer *event1* as primary and *event2* as secondary node for event notification collection during IP-CAN session in PCC-Event-Notification-Interface-Endpoint instance.

```
peer select-peer event1 secondary event2
```

Chapter 210
PCC-Policy-Service Configuration Mode Commands

The PCC-Policy-Service Configuration mode provides a mechanism for the Intelligent Policy Control Function (IPCF) to manage the external interfaces required for policy authorization purpose between IPCF and PCEF Bearer Binding and Event Reporting Function (BBERF). The PCC-Policy-Service manages **Gx**/**Gx** based on the Diameter dictionary used.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate pcc-service

This command associates a pre-configured PCC-Service with a PCC-Policy-Service for IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

associate pcc-service *pcc_service_name*

[**no**] **associate pcc-service**

no

Removes/disassociate the configured PCC-Service from this PCC-Policy-Service instance configured for IPCF configuration.

pcc_service_name

Specifies the name of a pre-configured PCC-Service configured in Context Configuration mode for IPCF configuration.
The *pcc_service_name* is name of a predefined PCC-Service instance and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to associate a pre-configured PCC-Service instance for IPCF configuration.

Important: For more information on PCC-Service configuration, refer *PCC-Service Configuration Mode Commands*.

Example

Following command binds a PCC-Service named *pcc_svc1* with in a PCC-Policy-Service.

associate pcc-service *pcc_svc1*

Following command removes an associated PCC-Service named *pcc_svc1* from a PCC-Policy-Service.

no associate pcc-service *pcc_svc1*

diameter dictionary

This command assigns a Diameter dictionary for **Gx**/**Gxa** messaging with a PCC-Policy-Service for IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary {gxa-standard | r7-standard | standard}

default diameter dictionary
```

default

Sets the Diameter **Gx** dictionary to default dictionary **standard** (3GPP Rel. 8 standard) for a PCC-Policy-Service instance configured for IPCF configuration.

gxa-standard

Default: Disabled
Sets the Diameter **Gxa** dictionary to be used by a PCC-Policy-Service instance configured for IPCF configuration over **Gxa** interface to 3GPP Rel. 8 standard.

r7-standard

Default: Disabled
Sets the Diameter **Gx** dictionary to be used by a PCC-Policy-Service instance configured for IPCF configuration over **Gx** interface to 3GPP Rel. 7 standard.

standard

Default: Enabled
Sets the Diameter **Gx** dictionary to be used by a PCC-Policy-Service instance configured for IPCF configuration over **Gx** interface to 3GPP Rel. 8 standard.

Usage

Use this command to configure the PCC-Policy-Service to determine which of the 3GPP dictionary to be used for **Gx** or **Gxa** interface messaging for policy and/or quota management.

Example

Following command sets the PCC-Policy-Service to use 3GPP Rel. 8 standard dictionary for **Gx** interface and policy management related messaging in a PCC-Policy-Service.

```
default diameter dictionary
```

diameter origin end-point

This command binds/associates a pre-configured Diameter host/realm (PCEF/BBERF) over **Gx/Gxa** interface with a PCC-Policy-Service to be used for subscriber service control and policy profile management.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *dia_endpoint_name*

no diameter origin endpoint

no

Removes the associated Diameter Origin Endpoint configuration from PCC-Policy-Service instance configured for IPCF configuration.

any

Sets the PCC-Policy-Service instance to use any available PCEF/BBERF node for policy interfaces (**Gx**/**Gx**-like) support.

dia_endpoint_name

The *dia_endpoint_name* is a predefined Diameter origin endpoint node and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to bind the PCEF/BBERF node over **Gx**/**Gx**-like interface by associating a pre-configured Diameter Origin Endpoint with a PCC-Policy-Service.
The Diameter origin endpoint must be a pre-configured instance in the Context Configuration Mode. For more information on Diameter origin endpoint configuration, refer *Diameter Endpoint Configuration Mode Commands* chapter.

Example

Following command associates a pre-configured Diameter endpoint node configuration named *pcef_1* with a PCC-Policy-Service for policy profile management.

```
diameter origin endpointpcef_1
```

Following command removes the pre-associated Diameter endpoint node configuration named *pcef_1* with a PCC-Policy-Service.

```
no diameter origin endpoint
```

ehrpd-access-bcm

This command configures the PCC-Policy-Service to accept the applicable Bearer-Control-Mode for eHRPD access over **Gxa** interface on IPCF.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

ehrpd-access-bcm {**as-requested** | **ue-nw** | **ue-only**}

default ehrpd-access-bcm

default

Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for eHRPD access over **Gxa** interface on IPCF node.

as-requested

Default: Enabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for eHRPD access over **Gxa** interface on IPCF node.

ue-nw

Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE and/or network element for eHRPD access over **Gxa** interface on IPCF node.

ue-only

Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE only for eHRPD access over **Gxa** interface on IPCF node.

Usage

Use this command to set the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS or UE or Network for eHRPD access over **Gxa** interface on IPCF node.

Example

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS for eHRPD access over **Gxa** interface on IPCF node.

```
default ehrpd-access-bcm
```

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request only from UE for eHRPD access over **Gxa** interface on IPCF node.

ehrpd-access-bcm ue-only

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

gprs-access-bcm

This command configures the PCC-Policy-Service to accept the applicable Bearer-Control-Mode for GPRS access over **Gx** interface on IPCF.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

gprs-access-bcm {**as-requested** | **ue-nw** | **ue-only**}

default gprs-access-bcm

default

Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for GGSN access over **Gx** interface on IPCF node.

as-requested

Default: Enabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from Application Server (AS) for GGSN access over **Gx** interface on IPCF node.

ue-nw

Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE and/or network element for GGSN access over **Gx** interface on IPCF node.

ue-only

Default: Disabled.
Sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from UE only for GGSN access over **Gx** interface on IPCF node.

Usage

Use this command to set the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS or UE or Network for GGSN access over **Gx** interface on IPCF node.

Example

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request from AS for GGSN access over **Gx** interface on IPCF node.

```
default gprs-access-bcm
```

Following command sets the PCC-Policy-Service to accept the Bearer-Control-Mode request only from UE for GGSN access over **Gx** interface on IPCF node.

```
gprs-access-bcm ue-only
```

max policy-sessions

This command configures the maximum limit of the policy sessions allowed in a PCC-Policy-Service instance on IPCF.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

max policy-sessions *max_session*

default max policy-sessions

default

Sets the maximum policy sessions allowed in PCC-Policy-Service instance to default value of 10000 sessions.

max_session

Default: 10000
Specifies the maximum number of policy sessions configured in PCC-Policy-Service to allow to be connected in PCC-Quota service instance.
max_session must be an integer between 0 and 4000000.

Usage

Use this command to set the maximum number of policy sessions allowed by a PCC-Policy-Service instance on IPCF.

Example

Following command sets the maximum number of policy sessions allowed in PCC-Policy-Service instance to 10000.

```
default max policy-sessions
```

subscriber-binding-identifier

This command specifies the subscriber binding identifier to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

subscriber-binding-identifier {**imsi** | **msisdn** | **nai** | **sip-uri**}

default subscriber-binding-identifier

default

Sets the subscriber binding identifier to default value; i.e. IMSI, to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

imsi

Default: Enabled.
Sets the subscriber binding identifier as IMSI to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

msisdn

Default: Disabled.
Sets the subscriber binding identifier as MSISDN to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

nai

Default: Disabled.
Sets the subscriber binding identifier as Network Access Identifier (NAI) to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

sip-uri

Default: Disabled.
Sets the subscriber binding identifier as SIP URI (Uniform Resource Identifier) to be used by **bindmux** for binding different subscriber session to PCC-Policy-Service on IPCF node.

Usage

Use this command to configure the **bindmux** in PCC-Policy-Service instance on IPCF node to use specific subscriber identifier for binding different subscriber session to IP-CAN session.

Example

The following command sets the PCC-Policy-Service to use IMSI as subscriber binding identifier for IP-CAN session on an IPCF node.

```
default subscriber-binding-identifier
```

subscription-id-absence-action

This command configures the PCC-Policy-Service instance to handle the Initial Credit Control Request (CCR-I) messages during initial authentication over **Gx** interface when CCR-I message received by IPCF node is without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.).

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
{default} subscription-id-absence-action initial-auth {continue | reject}
```

default

Sets the PCC-Policy-Service instance to reject the CCR-I message during initial authentication over **Gx** interface if received without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.) on IPCF node.

continue

Default: Disabled.
Sets the PCC-Policy-Service instance to accept the CCR-I message and continue with the session if CCR-I is received without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.) on IPCF node.
In this case, IPCF accepts the CCR-I message and will do the PCC provisioning as per the operator configuration in associated PCC-Service.

reject

Default: Enabled.
Sets the PCC-Policy-Service instance to reject the CCR-I message and continue with the session if CCR-I is received without a valid Subscription-Id AVP (IMSI, NAI, E164 etc.) on IPCF node.
In this case, IPCF will send CCA-I message with Result-code as **Permanent Error** and rejects the session establishment with PCEF.

Usage

Use this command to configure the PCC-Policy-Service instance to handle the Initial Credit Control Request (CCR-I) message processing during the initial authentication over **Gx** interface if CCR-I message received by IPCF node has no valid Subscription-Id AVP.

Example

The following command sets the PCC-Policy-Service to reject the CCR-I request and terminations the session establishment with PCEF.

```
default subscription-id-absence-action initial-auth
```

unsolicited-provisioning

This command is used to enable/disable the support for unsolicited time-of-day-based procedures to PCC-Policy-Service on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] unsolicited-provisioning time-of-day
```

default

Sets the support for unsolicited time-of-day-based procedures to default mode; i.e. disabled, in PCC-Policy-Service instance on IPCF node.

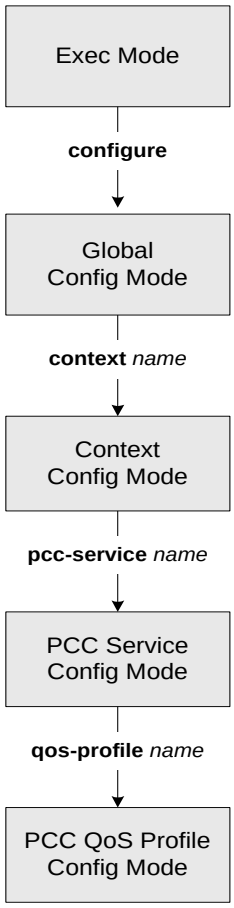
no

Removes the configured support for unsolicited time-of-day-based procedures in PCC-Policy-Service instance on IPCF node.

Usage

Use this command to enable/disable the support for unsolicited time-of-day-based procedures to PCC-Policy-Service on IPCF node.
By default this command is disabled.

Example



The following command enables the unsolicited time-of-day-based procedures to PCC-Policy-Service on an IPCF node.

```
unsolicited-provisioning time-of-day
```

Chapter 211
PCC-QoS-Profile Configuration Mode Commands

The PCC-QoS-Profile Configuration Mode is used to define the QoS logic used by the operator for managing the QoS policy requirements and objectives for the network specific to a group of subscribers in the network. A QoS Profile represents a resource requirement identified by means of the corresponding QoS attributes like QCI, MBR, GBR, ARP etc.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

arp-priority

This command is used to define the Allocation and Retention Priority (ARP) values of the QoS profile in PCC-QoS-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] arp-priority arp_priority pre-emption {capable | not-capable} {not-vulnerable | vulnerable}
```

no

Removes the configured ARP priority set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

arp_priority

Specifies the priority value for ARP in a PCC-QoS-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.
arp_priority must be an integer from 1 through 15.

pre-emption {capable | not-capable}

Sets the Pre-emption capability related parameters with ARP priority in PCC-QoS-Profile name which is to use in Subscriber profile in PCC-Service instance on IPCF node.
Pre-emption capability determines whether a bearer with a lower ARP priority level should be dropped to free up the required resources.
capable: This keyword indicates that the service data flow is allowed to get resources that were already assigned to another service data flow with a lower priority level.
non-capable: This keyword indicates that the service data flow is not allowed to get resources that were already assigned to another service data flow with a lower priority level.

{not-vulnerable | vulnerable}

Sets the Pre-emption vulnerability related parameters with ARP priority in PCC-QoS-Profile name which is to use in Subscriber profile in PCC-Service instance on IPCF node.
Pre-emption vulnerability determines whether a bearer is applicable for dropping by a pre-emption capable bearer with a higher ARP priority value.
not-vulnerable: This keyword indicates that the resources assigned to the service data flow shall not be pre-empted and allocated to a service data flow with a higher priority level.
vulnerable: This keyword indicates that the resources assigned to the service data flow can be pre-empted and allocated to a service data flow with a higher priority level.

Usage

Use this command to define the ARP priority and pre-empt parameters in PCC-QoS-Profile which is to be used in Subscriber profile in PCC-Service instance on IPCF node.
ARP controls how the IPCF reacts when there are insufficient resources to establish the new RAB. Typically it manages it by; 1) Deny the RAB request and 2) Preempt an existing RAB and accept the new RAB request.

Example

Following command sets the ARP Priority *2* with preemption capability and vulnerability in PCC-QoS-Profile instance on IPCF node.

```
arp-priority 2 pre-emption capable vulnerable
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

guaranteed-bitrate

This command defines the Guaranteed Bit Rate (GBR) value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] guaranteed-bitrate downlink downlink_gbr uplink uplink_gbr
```

no

Removes the configured GBR value set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

downlink *downlink_gbr*

Sets the Guaranteed Bit Rate allowed in downlink direction (from PCEF to UE) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
downlink_gbr must be an integer from 0 through 104857600. A 'zero' value disables the downlink in specified PCC-QoS-Profile.

uplink *uplink_gbr*

Sets the Guaranteed Bit Rate allowed in uplink direction (from PCEF to PDN) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
uplink_gbr must be an integer from 0 through 104857600. A 'zero' value disables the uplink in specified PCC-QoS-Profile.

Usage

Use this command to define the Guaranteed Bit Rate value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Example

Following command sets the *1024* bits per seconds as uplink GBR and *2048* bits per second as downlink GBR in PCC-QoS-Profile instance on IPCF node.

```
guaranteed-bitrate downlink 2048 uplink 1024
```

max-bitrate

This command defines the Maximum Bit Rate (MBR) value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] max-bitrate downlink downlink_mbr uplink uplink_mbr
```

no

Removes the configured Maximum Bit Rate value set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

downlink *downlink_mbr*

Sets the Maximum Bit Rate allowed in downlink direction (from PCEF to UE) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
downlink_mbr must be an integer from 0 through 104857600. A 'zero' value disables the downlink in specified PCC-QoS-Profile.

uplink *uplink_mbr*

Sets the Maximum Bit Rate allowed in uplink direction (from PCEF to PDN) in bits per second for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
uplink_mbr must be an integer from 0 through 104857600. A 'zero' value disables the uplink in specified PCC-QoS-Profile.

Usage

Use this command to define the Maximum Bit Rate value in bits per second for downlink and uplink traffic in PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Example

Following command sets the *1024* bits per seconds as uplink MBR and *2048* bits per second as downlink MBR in PCC-QoS-Profile instance on IPCF node.

```
max-bitrate downlink 2048 uplink 1024
```

qci

This command sets the QoS Class Identifier (QCI) for PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] qci qci_id
```

no

Removes the configured QCI value set for PCC-QoS-Profile for PCC-Service instance on IPCF node.

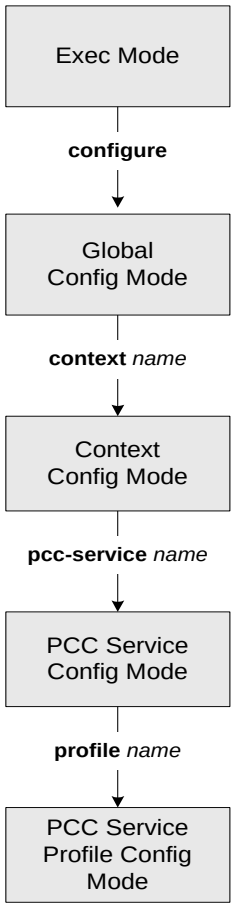
qci *qci_id*

Sets the QoS Class Identifier for a PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.
qci_id must be an integer from 1 through 255.

Usage

Use this command to set the QoS Class Identifier for PCC-QoS-Profile which is to use for Subscriber profile in PCC-Service instance on IPCF node.

Example



Following command sets the QCI *101* for PCC-QoS-Profile instance on IPCF node.

```
qci 101
```

Chapter 212
PCC-Service-Profile Configuration Mode Commands

The PCC-Service-Profile Configuration Mode is used to define the business logic used by the operator for managing the policy requirements and objectives for the network specific to a group of subscribers in the network. A PCC-Service-Profile manages multiple PCC-Conditions-Groups and associated PCC-Action-Sets pairs in an ordered manner. A maximum of 32 PCC-Service-Profile can be configured in a PCC-Service instance.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default-rulebase-name

This command is used to associate the default PCC-Rulebase with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] default-rulebase-name rulebase_name
```

no

Removes the configured default PCC-Rulebase from PCC-Service-Profile instance on IPCF node.

rulebase_name

This keyword specifies the default PCC-Rulebase name to be associated with PCC-Service-Profile instance. *rulebase_name* is the Rulebase name configured at PCEF and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associate the default PCC-Rulebase configured on PCEF with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Example

Following command associates the PCC-Rulebase named *pcc_rulebase1* for PCC-Profile instance on IPCF node.

```
default-rulebase-name pcc_rulebase1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

eval-priority

This command sets the priority for evaluation of PCC-Condition-Group with corresponding PCC-Action-Set in a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] eval-priority last action-set actionset_name

[no] eval-priority priority_value timedef timedef_name [condition-group cond_grp_name]
action-set actionset_name

[no] eval-priority priority_value condition-group cond_grp_name action-set actionset_name
```

no

Removes the configured evaluation priority for PCC-Condition-Group with corresponding PCC-Action-Set from PCC-Service-Profile instance on IPCF node.

last

Sets last evaluation priority action-set configured for the PCC-Service-Profile instance.
no removes the last evaluation priority action-set.

priority_value

Specifies the priority to be set for PCC-Condition-Group with corresponding PCC-Action-Set in a PCC-Service-Profile instance.
priority_value must be an integer from 1 through 1023.

timedef *timedef_name*

Specifies a pre-configured time definition in *PCC-Timedef Configuration mode* and to be set for evaluation priority in a PCC-Service-Profile instance.
timedef_name is a pre-configured PCC-Timedef and must be an alphanumerical string of 1 through 63 characters.

condition-group *cond_grp_name*

Specifies a pre-configured PCC-Condition-Group to be set for evaluation priority in a PCC-Service-Profile instance.
cond_grp_name is a pre-configured PCC-Condition-Group and must be an alphanumerical string of 1 through 63 characters.

Important: An special PCC-Condition-Group "none" can be used to set the default PCC-Condition-Group for **any-match** typically used for a default condition for a session which does not match any of the conditions specified with higher evaluation priority.

action-set *actionset_name*

Specifies a pre-configured PCC-Action-Set for PCC-Condition-Group to be set for evaluation priority in a PCC-Service-Profile instance.
actionset_name is a pre-configured PCC-Action-Set and must be an alphanumerical string of 1 through 63 characters.

Usage

Use this command to set the priority for evaluation of PCC-Condition-Group with corresponding PCC-Action-Set in a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.
Additionally **timedef** is used to accept the Timedefs to support the time-of-day-based procedures to trigger an evaluation priority. The action is triggered only when the time of session lies in the time span defined in specific PCC-Timedef *timedef_name*.
Default **eval-priority** has the lowest priority in the PCC-Service-Profile and as default **eval-priority** does not have any PCC-Condition-Group associated with it, all the actions in the **action-set** always be applied.
A maximum of 64 PCC-Evaluation-Priorities can be configured in a PCC-Service-Profile.

Example

Following command sets the evaluation priority value as *1* for PCC-Condition-Group *cond_1* along with PCC-Action-Set *act_cond1* for PCC-Service-Profile instance on IPCF node:

```
eval-priority 1 condition-group cond_1 action-set act_cond1
```

Following command sets the evaluation priority value as *2* for PCC-Condition-Group *none* for **any-match** typically used for a default condition for a session which does not match any of the conditions specified with higher evaluation priority.along with PCC-Action-Set *act_cond1* for PCC-Service-Profile instance on IPCF node:

```
eval-priority 1 condition-group none action-set act_cond1
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

service-tag

This command configures the PCC-Service Tags to be used for PCC-Rulename or PCC-Rule-base in a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] service-tag svc_tag {rule-name rule_name | rulebase-name rulebase_name}
```

no

Removes the configured PCC-Service Tags for PCC-Rulename and PCC-Rulebase from PCC-Service-Profile instance on IPCF node.

svc_tag

Specifies the name of the PCC-Service Tag to be used for PCC-Rulename and PCC-Rulebase in a PCC-Service-Profile instance.
svc_tag must be an alphanumerical string of 1 through 63 characters.

rule-name *rule_name*

Specifies a pre-defined PCC-Rulename on PCEF to be used with PCC-Service Tag *svc_tag* in a PCC-Service-Profile instance.
rule_name is a pre-defined PCC-Rulename on PCEF and must be an alphanumerical string of 1 through 63 characters.

rulebase-name *rulebase_name*

Specifies a pre-defined PCC-Rulebase name pre-defined on PCEF to be used with PCC-Service Tag *svc_tag* in a PCC-Service-Profile instance.
rulebase_name is a pre-defined PCC-Rulebase name on PCEF and must be an alphanumerical string of 1 through 63 characters.

Usage

Use this command to set the PCC-Service Tag for PCC-Rulename and PCC-Rulebase which are defined on PCEF with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance.

Example

Following command sets the PCC-Service Tag named *Rule1* for PCC-Rulebase named *pcc_rulebase1* for PCC-Service-Profile instance on IPCF node:

```
service-tag Rule1 rulebase-name pcc_rulebase1
```

Following command sets the PCC-Service Tag named *Rule11* for PCC-Rulename *pcc_rule1* for PCC-Service-Profile instance on IPCF node:

```
service-tag Rule11 rule-name pcc_rule1
```

usage-monitor

This command creates/modifies/deletes the PCC-Usage-Monitor Configuration instance to track the usage volume across the PCC-services based on the usage monitor settings in a PCC-service instance for IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] usage-monitor usage_mon_name [-noconfirm]
```

no

Removes the configured PCC-Usage-Monitor from PCC-Service-Profile instance for IPCF configuration.

usage_mon_name

Identifies the name of the PCC-Usage-Monitor instance which is to be created or modified through this command.
The *usage_mon_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no usage-monitor** *usage_mon_name* command, the PCC-Usage-Monitor instance named *usage_mon_name* is deleted with all configured parameters without prompting any warning or confirmation.

Usage

Use this command to create and configure a PCC-Usage-Monitor for PCC-Service-Profile in a PCC-service instance of IPCF configuration.
A maximum number of 8 PCC-Usage-Monitors can be configured per PCC-Service-Profile.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-profile-usage-mon)#
```

The commands configured in this mode are defined in the *PCC-Usage-Monitor Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-Usage-Monitor for volume usage can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command configures the PCC-Usage-Monitor named *pcc_usage1* to track the usage of service with in a PCC-Service-Profile instance.

usage-monitor *pcc_usage1*

unknown-services-treatment

This command configures the PCC-Service for handling of unknown services at IPCF which is to be used in Subscriber profile in PCC-Service instance on IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[default] unknown-services-treatment {not-allowed | qos-profile qos_prof_name precedence
from start_preced to end_preced order {ascending | descending}}
```

default

Sets the configured PCC-Service for handling of unknown services at IPCF to default value of "**Not allowed**" which is to be used in Subscriber profile in PCC-Service instance on IPCF node.

not-allowed

Sets the PCC-Service-Profile instance to reject the packet filters and does not installs any dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.

qos-profile *qos_prof_name*

Specifies a pre-defined PCC-QoS profile name to be used to create dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.
qos_prof_name is a pre-defined PCC-QoS Profile and must be an alphanumerical string of 1 through 63 characters.

precedence from *start_preced* **to** *end_preced*

Specifies the precedence parameters to install dynamic rules for selection of QoS profile when QoS profile is configured to create dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.
start_preced is an integer between 1 through 65535 and must be less than *end_preced* value where *end_preced* is an integer between 1 through 65535 and must be more than *start_preced* value

order {ascending | descending}

Specifies the order of precedence for QoS profile to be used to install dynamic rule when IPCF receives any request to authorize Packet Filters from PCEF and no matching service flow is found in data service list.

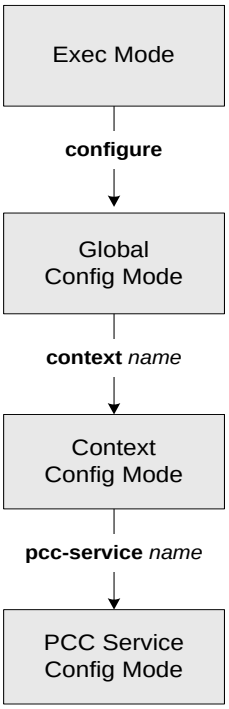
- **ascending** sets the precedence setting in ascending order.
- **descending** sets the precedence setting in descending order.

Usage

Use this command to set the PCC-Service Tag for PCC-Rulename and PCC-Rulebase which are defined on PCEF with a PCC-Service-Profile which is to use in Subscriber profile in PCC-Service instance.
Whenever IPCF receives any request to authorize Packet Filters from PCEF, it does a lookup in data service list to find a match. If **No** service flow is found matching then the requested filters are treated as **unknown service request** and handled as per the mentioned configuration.
When unknown-service-treatment is set to **not-allowed**, then Packet Filters are rejected and no dynamic rule is installed. Otherwise, dynamic rule is created using the requested packet filters, data rates mentioned in the QoS profile name *qos_prof_name* and precedence value derived from the configured values.
The precedence configuration works in following manner:

- If precedence limits are configured as 1000 to 2000 with order **ascending** then precedence of subsequent dynamic rules will go from 1000 to 2000.
- If precedence limits are configured as 1000 to 2000 with order **descending** then precedence of subsequent dynamic rules will go from 2000 to 1000.

Example



Following command sets the PCC-Service for handling of unknown services for PCC-Service-Profile instance on IPCF node to default action of **not allowed**:

```
default unknown-services-treatment
```

Chapter 213
PCC-Service Configuration Mode Commands

The PCC-Service Configuration Mode is used to link, consolidate and manage the policy logic for the network. It defines the authorization of resources for a subscriber's data usage under various conditions and policies in the PCC-service.

Important: This configuration mode is supported from StarOS Release 12.1 onward

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action-set

This command is used to create a new set of action, action-set, or modify a previously configured action set and enters the PCC-Action-Set Configuration Mode. This command can also be used to delete an existing PCC-Action-Set.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

action-set *act_set_name* [**-noconfirm**]

no action-set *act_set_name*

no

Removes the configured PCC-Action-Set from this PCC-service instance for IPCF configuration.

act_set_name

Identifies the name of the PCC-Action-Set which is to be created or modified through this command.
The *act_set_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/remove/configure an action-set in a PCC-service instance for IPCF Configuration.
An Action-set indicates the policy and charging as well as event generation related decisions that will get activated when the corresponding *Condition-Group* is evaluated to *TRUE* within a subscriber policy/profile.
A maximum of 512 PCC-Action-Sets can be configured in 1 instance of PCC-Service.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-action-set)
```

Important: For more information on PCC-Action-Set configuration, refer *PCC-Action-Set Configuration Mode Commands*.

Example

Following command creates a PCC-action-set named *pcc_act1* with in a PCC-service.

```
action-set pcc_act1
```

Following command removes a pre-configured PCC-action-set named *pcc_act1* from a PCC-service.

no action-set *pcc_act1*

charging method

This command defines the charging method selection parameters in a PCC-service instance for IPCF.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

charging method {**both-offline-and-online** | **offline** | **online**}

[**default** | **no**] **charging method**

default

Sets the charging method to "no" in a PCC-service instance on IPCF node.

no

Removes the configured charging method from a PCC-service instance on IPCF node.

both-offline-and-online

Default: Disabled.
Defines that this PCC-service instance is configured for both, online and offline, charging method for IPCF configuration.

offline

Default: Disabled.
Defines that this PCC-service instance is configured only for offline charging method for IPCF configuration.

online

Default: Disabled.
Defines that this PCC-service instance is configured only for online charging method for IPCF configuration.

Usage

Use this command to define the charging method selection parameters in a PCC-service instance for IPCF. Charging method used can be online, offline or both.

Example

Following command defines the charging method for a PCC-service instance as both, online and offline:

```
default charging method
```

charging server

This command defines the charging server parameters in a PCC-service instance for IPCF.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

charging server *server_name* **function** {**offline** | **online**} {**primary** | **secondary**}

no charging server {**all** | **function** {**offline** | **online**} {**primary** | **secondary**}

no

Removes/disables the charging server parameters in a PCC-service instance for IPCF configuration.

server_name

Identifies the name of the charging server which is to be configured with these parameters in a PCC-service instance for IPCF configuration.
The *server_name* must be an alphanumerical string from 1 through 63 characters.

offline

Sets the specific charging server to be used as offline server in a PCC-service instance for IPCF configuration.

online

Sets the specific charging server to be used as online server in a PCC-service instance for IPCF configuration.

primary

Sets the specific charging server to be used as primary charging server for offline or online charging method in a PCC-service instance for IPCF configuration.

secondary

Sets the specific charging server to be used as secondary charging server for offline or online charging method in a PCC-service instance for IPCF configuration.

all

This keyword is used with **no** keyword only. It removes the all configured charging server parameters from a PCC-service instance for IPCF configuration.

Usage

Use this command to configured the online or offline charging servers to be used as primary or secondary in a PCC-service instance for IPCF configuration.

Example

Following command configures the **online** charging server named *Gx1* as **primary** for online charging method for a PCC-service instance:

```
charging server Gx1 function online primary
```

Following command removes the all, online/offline/primary/secondary, type of charging servers from a PCC-service instance:

```
no charging server function all
```

condition-group

This command creates a new group of conditions, condition-group, or modify a previously configured condition-group and enters the PCC-Condition-Group Configuration Mode. This command can also be used to delete an existing PCC-Condition-Group.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

condition-group *cond_grp_name* [**-noconfirm**]

no condition-group *cond_grp_name*

no

Removes the configured PCC-condition-group from a PCC-service instance for IPCF configuration.

cond_grp_name

Identifies the name of the PCC-condition-group which is to be created or modified through this command. The *cond_grp_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/remove/configure a group of condition, condition-group, in a PCC-service instance for IPCF configuration.
A Condition-group is a collection of conditions that identify a network or state constraint represented as an logical expression. A condition-group may use another **condition-group** within with the nesting level limited to 3.
Within a condition-group the conditions and condition-groups can either be linked with an **AND** or an **OR** relation. A Condition is built using predefined keywords representing unique service conditions such as *user-location*, *app-service* etc.
A maximum of 1024 PCC-Condition-Groups can be configured in 1 instance of PCC-Service.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-condition-group))#
```

The commands configured in this mode are defined in the *PCC-Condition-Group Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-Condition Group can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command creates a PCC-condition-group named *cond_grp1* with in a PCC-service instance.

```
condition-group cond_grp1
```

Following command removes a pre-configured PCC-condition-group named *cond_grp1* from a PCC-service instance.

```
no condition-group cond_grp1
```

data-service

This command creates a new service for data, data-service, or modify a pre-configured data-service and enters the PCC-Data-Service Configuration Mode. This command can also be used to delete an existing PCC-Data-Service.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

data-service *data_svc_name* [**-noconfirm**]

no data-service *data_svc_name*

no

Removes the configured PCC-Data-Service from a PCC-service instance for IPCF configuration.

data_svc_name

Identifies the name of the PCC-Data-Service which is to be created or modified through this command. The *data_svc_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create and configure a PCC-data-service in a PCC-service instance for IPCF configuration.
A PCC-Data-Service defines the flows for the media data as well as corresponding attributes that are necessary for the charging as well as policy enforcement decisions for the kind of media represented by its Service-Flows.
A maximum of 256 PCC-Data-Services can be configured in 1 instance of PCC-Service.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-data-service))#
```

The commands configured in this mode are defined in the *PCC-Data Service Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-Data-service can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command defines a PCC-data-service named *pcc_data_svc1* in a PCC-service instance without any confirmation prompt.

```
data-service pcc_data_svc1 -noconfirm
```

Following command removes a pre-configured PCC-data-service named *pcc_data_svc1* from a PCC-service instance without any confirmation prompt.

```
no data-service pcc_data_svc1 -noconfirm
```

end

Exits the current configuration mode and returns to the Exec mode.

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

map-profile priority

This command defines the parameter and key priorities to match the profile condition for a subscriber in a PCC-service instance for IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] map-profile priority map_prio_value apn [apn_name profile-policy name pcc_prof_name]

[ no ] map-profile priority map_prio_value profile-policy name pcc_prof_name]

[ no ] map-profile priority map_prio_value subscription-attribute name subs_attrib_name [
value subs_attrib_value ] profile-policy name pcc_prof_name]
```

no

Removes/disables the set priority value of specific profile mapping parameters.

map_prio_value

Identifies the priority value of specific profile mapping parameters.
The *map_prio_value* must be an integer value from 1 through 1024.

apn *apn_name*

This keywords associates a pre-configured/defined APN name to map with specific profile mapping priority.
The *apn_name* specifies the name of the APN configured for subscriber session to which a priority value is set for profile mapping and must be an alphanumerical string from 1 through 63 characters.

condition-group *cond_grp_name*

This keywords associates a pre-configured/defined PCC-Condition-Group configured in PCC-Service Configuration mode to map with specific profile making priority.
The *cond_grp_name* is pre-configured PCC-Condition-Group and must be an alphanumerical string from 1 through 63 characters.

Important: For more information on PCC-Condition-Group configuration, refer **condition-group** command in this chapter.

spr-profile-not-found

This keyword set the condition based on unavailability of subscriber profile on SSC.
This support is provided to select a pre-configured profile policy *pcc_prof_name* if subscriber's SPR profile is not available and to allow operator to have different policies for such Subscribers.

If operator does not want to map a separate profile but treat such Subscribers differently, then a condition based on this criteria can be configured in *PCC-Condition-Group Configuration Mode*.

subscription-attribute name *subs_attrib_name*

This keywords associates a pre-configured/defined subscription attributes to map with specific profile making priority.
The *subs_attrib_name* specifies the subscription attribute name set/configured for the subscriber to which a priority value is set for profile mapping and must be an alphanumerical string from 1 through 63 characters.

value *subs_attrib_value*

This keywords associates a pre-configured/defined subscription attributes value associated with a subscription attribute name to map with specific profile making priority.
The *subs_attrib_value* specifies the subscription attribute value associated with a subscription attribute name set/configured for the subscriber to which a priority value is set for profile mapping and must be an alphanumerical string of 1 through 63 characters.

profile-policy *pcc_prof_name*

This keywords associates a pre-configured/defined PCC-Service-Profile configured in PCC-Service Configuration mode to map with specific profile making priority.
The *pcc_prof_name* is pre-configured PCC-Service-Profile and must be an alphanumerical string from 1 through 63 characters.

Important: For more information on PCC-Service-Profile configuration, refer **profile-policy** command in this chapter.

Usage

Use this command to identify the keys used to match the profile for a subscriber in a PCC-service instance for IPCF configuration.
The profile map is used when the subscriber session established. It is based on the priority of map and condition matches the corresponding named profile is used for the subscriber session.

Important: For a subscriber session, only a single profile will match.

Example

Following command configures the profile mapping priority to *2* for an APN named *apn_ipcf1* with PCC-Service-Profile named *pcc_prof1* with in a PCC-service instance.

```
map-profile priority 2 apn apn_ipcf1 profile-policy name pcc_profile1
```

Following command configures the profile mapping priority to *0* for all sessions with PCC-Service-Profile named *pcc_prof2* with in a PCC-service instance.

```
map-profile priority 2 profile-policy name pcc_profile2
```

monitoring-key

This command creates a monitoring key and sets the threshold to provide the facility for tracking and dynamic Policy control based on subscriber usage in a PCC-service instance for IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

monitoring-key { any | *mon_key_value* } grant-size*volume_value***

no monitoring-key *mon_key_value*

default monitoring-key any

no

Resets the grant size for specified Monitoring Key *mon_key_value* used in this PCC service instance to default threshold of 1024 KB for grant volume and 10 second for grant time.

default

Resets the grant size for any Monitoring Key used in this PCC service instance to default threshold of 1024 KB for grant volume and 10 second for grant time.

any

Default: Enabled
This keywords sets the threshold size for ANY monitoring key to configured grant volume or grant time duration. IPCF uses the configured grant size while installing a Monitoring Key in PCEF.

mon_key_value

This keywords configures the Monitoring Key with a configurable grant volume size. IPCF installs this Monitoring Key in PCEF for usage tracking.
mon_key_value must be an integer between 1 through 65535.

grant-size volume *volume_value*

Default: 1024 for volume
This keywords associates a configurable grant size in seconds for time or in Kilo Bytes volume for specific usage Monitor Key on IPCF to install on PCEF.

- **volume** *volume_value*: This keyword sets the threshold volume in Kilo Bytes for usage Monitoring Key and *volume_value* must be an integer between 1 through 4294967296.

Usage

Use this command to allow operator to configure the threshold size for a monitoring key in a PCC-service instance in IPCF considering grant volume size. IPCF uses the configured volume size while installing a Monitoring Key in PCEF. The configured threshold values are configurable to reduce the amount of usage for any of the usage conditions.
PCEF when instructed by IPCF keeps track of usage per Monitoring Key and also reports the usage when either thresholds reached or requested by IPCF.
To allow operator to have dynamic Policy control, the IPCF uses objects called as Usage Monitor. Operator can "associate" different Monitoring Keys to these usage monitors. It can be a Many-To-Many relationship between Usage-Monitor and Monitoring-Key.
Operator has option to set usage conditions on Usage Monitors instead of Monitoring Keys directly.

Example

Following command configures the Monitoring Key *2* for a grant volume threshold size of *2048* Kilo Bytes with in a PCC-service instance.

```
monitoring-key 2 grant-size volume 2048
```

multiple-pcef-per-subscriber

This command enables the IPCF to support more than one **Gx**-session for single subscriber session coming from multiple PCEF in a PCC-service instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no | default] multiple-pcef-per-subscriber
```

no

Default: Disabled
Removes the multiple **Gx** session for a single subscriber from a PCC-service instance for IPCF configuration.

default

Sets the PCC-service instance to default setting to accept the multiple **Gx** session for a single subscriber for IPCF configuration.

Usage

Use this command to enable multiple **Gx** session and multiple PCEF support for a single subscriber in a PCC-service instance for IPCF configuration.
By default this feature is enabled.

Example

Following command sets the IPCF to accept multiple **Gx** sessions from multiple PCEFs for a single subscriber with in a PCC-service instance.

```
multiple-pcef-per-subscriber
```

profile

This command creates a new PCC-Service-Profile or modifies a previously configured policy profile and enters the PCC-Service-Profile Configuration Mode. This command can also be used to delete an existing PCC-Service-Profile.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

profile *pcc_prof_name* [**-noconfirm**]

no profile *pcc_prof_name*

no

Removes the configured PCC-Service-Profile from a PCC-service instance for IPCF configuration.

pcc_prof_name

Identifies the name of the PCC-Service-Profile which is to be created or modified through this command. The *pcc_prof_name* must be an alphanumerical string from 1 through 63 characters. A maximum of 32 profiles can be configured in a PCC-service instance.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/remove/configure a PCC-Service-Profile for managing the policy requirement and objectives for network specific to a group of subscribers in the network in a PCC-service instance for IPCF configuration.

A profile manages multiple *Condition-Groups* and associated *Action-Sets* pairs in an ordered manner. On internal or external triggers that cause the profile evaluation, the PCC-rules-engine, evaluates the conditions within the *Condition-Groups* in the specified priority. Corresponding actions performed for *Condition-Groups* that evaluates to *TRUE*. Once a *TRUE* match found the evaluation of *Condition-Groups* does not continue further.

A maximum of 32 PCC-Service-Profiles can be configured in 1 instance of PCC-Service.

Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-profile))#
```

The commands configured in this mode are defined in the *PCC-Service-Profile Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-Service-Profile can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command creates a PCC-Service-Profile named *pcc_prof1* with in a PCC-service instance.

```
profile pcc_prof1
```

Following command removes a pre-configured PCC-Service-Profile named *pcc_prof1* from a PCC-service instance.

```
no profile pcc_prof1
```

qos-profile

This command creates a new PCC-QoS-Profile for QoS parameters or modify a pre-configured PCC-QoS-Profile and enters the PCC-QoS-Profile Configuration Mode. This command can also be used to delete an existing PCC-QoS-Profile.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

qos-profile *qos_prof_name* [**-noconfirm**]

no qos-profile *qos_prof_name*

no

Removes the configured PCC-QoS-Profile from a PCC-service instance for IPCF configuration.

qos_prof_name

Identifies the name of the PCC-QoS-Profile which is to be created or modified through this command. The *qos_prof_name* must be an alphanumerical string from 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create and configure a PCC-QoS profile in a PCC-service instance for IPCF configuration.
A PCC-QoS-Profile represents a resource requirement identified by means of the corresponding QoS attributes such as:

- QoS class identifier
- Maximum Requested bandwidth for uplink (UL)
- Maximum Requested bandwidth downlink (DL)
- Guaranteed bandwidth for uplink (UL)
- Guaranteed bandwidth downlink (DL)
- Allocation and Retention Priority (ARP)

A maximum of 256 PCC-QoS-Profiles can be configured in 1 instance of PCC-Service.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-qos-profile))#
```

The commands configured in this mode are defined in the *PCC-QoS-Profile Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-QoS-Profiles can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command creates a PCC-QoS-Profile named *qos_profile1* with in a PCC-service instance.

```
qos-profile qos_profile1
```

Following command removes a pre-configured PCC-QoS-Profile named *qos_profile1* from a PCC-service instance.

```
no qos-profile qos_profile1
```

spr-failure

This command defines SSC session failure handling policies in a PCC-service instance on an IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
spr-failure after-auth {continue | terminate}

[default] spr-failure after-auth
```

default

Sets the configured SSC session failure handling parameters and actions to default action of **continue** with a PCC-service instance for IPCF configuration.

after-auth {continue | terminate}

This keyword is used to set the PCC-service to take decision on SSC communication failure after authorization of session.
Following actions are initiated on SSC session failure after authorization:

- **continue**: IPCF allows session to continue.
- **terminate**: IPCF terminates the session for subscriber.

Usage

Use this command to set the PCC-service to take decision on SSC communication failure after authorization of session.

Example

Following command sets the session failure handling policy with SSC to **terminate** the session on failure of communication with SSC after authorization in a PCC-service instance.

```
spr-failure after-auth terminate
```

ssc-usage-update-policy

This command provides the configuration to manage the SSC update frequency over **Sp** interface for usage reports received from PCEF over **Gx** interface in a PCC-service instance for IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[default] ssc-usage-update-policy {always | average-tps tps | on-terminate}
```

default

Sets the PCC-service to configure the SSC update frequency to **always** over **Sp** interface for usage reports received from PCEF over **Gx** interface in a PCC-service instance for IPCF configuration.

always

Default: Enabled
This keyword sets the PCC-service instance to generate SSC usage update every time PCC-service instance received Usage Report from PCEF over **Gx** interface for IPCF configuration.

average-tps *tps*

Default: Disabled
This keyword generates the SSC usage update towards the SSC over **Sp** interface for Usage Reports received by IPCF from PCEF over **Gx** interface only when average transaction-per-second exceeds the configured threshold *tps*.
The *tps* specifies the average transactions-per-second on IPCF and must be an integer from 1 through 5000.

on-terminate

Default: Disabled
This keyword generates the SSC usage update towards the SSC over **Sp** interface for Usage Reports received by IPCF from PCEF over **Gx** interface only when IP-CAN session terminates.

Usage

Use this command to configure the PCC-service to manage the SSC update frequency over **Sp** interface for Usage Reports received from PCEF over **Gx** interface in a PCC-service instance for IPCF configuration.

Example

Following command configures the SSC usage update over **Sp** interface every time when a usage report is received over **Gx** interface in a PCC-service instance.

```
default ssc-usage-update-policy
```

timedef

This command creates a new Time Definition (TimeDef), or modify a pre-configured Timedef and enters the PCC-TimeDef Configuration Mode. This command can also be used to delete an existing PCC-TimeDef.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
[no] timedef timedef_name [-noconfirm]
```

no

Removes the configured PCC-TimeDef from a PCC-service instance for IPCF configuration.

timedef_name

Identifies the name of the PCC-TimeDef which is to be created or modified through this command.
The *timedef_name* must be an alphanumerical string from 1 through 127 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create and configure a PCC-Time Definition (TimeDef) in a PCC-service instance for IPCF configuration.
The PCC-TimeDefs can be used to configured date and time for triggering the event for policy related procedures as well.
Entering this command results in the following prompt:

```
[context_name]hostname(config-pcc-timedef))#
```

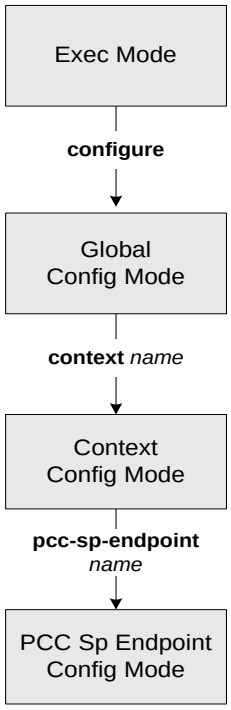
A maximum of 512 PCC-TimeDefs can be configured in 1 instance of PCC-Service.
The commands configured in this mode are defined in the *PCC-TimeDef Configuration Mode Commands* chapter of *Command Line Interface Reference*.

Caution: This is a critical configuration. The PCC-TimeDefs can not be configured without this configuration. Any change to this configuration would lead to removing or disabling configuration parameters defined here.

Example

Following command creates a PCC-TimeDef named *time_day1* with in a PCC-service instance.

```
timedef time_day1
```



Following command removes a pre-configured PCC-TimeDef named *time_day1* from a PCC-service instance.

no timedef*time_day1*

Chapter 214
PCC-Sp-Endpoint Configuration Mode Commands

The PCC-Sp-Endpoint Configuration mode provides a mechanism for Intelligent Policy Control Function (IPCF) to support the **Sp** interface endpoint. It represents a client end for SSC interactions. The PCC-Sp-Endpoint configuration mode facilitates the configuration of **Sp** interface, and manages the connection and operational parameters related to its peer.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-type

This command is used to define the type of access protocol to be used with a PCC-Sp-Endpoint instance for IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
access-type {diameter | ldap}

default access-type
```

default

Sets access type protocol to be used by endpoints to default protocol of **Diameter** protocol in a PCC-Sp-Endpoint instance for IPCF configuration.

diameter

Default: Enabled
Sets access type protocol to be used by endpoints to Diameter protocol in a PCC-Sp-Endpoint instance for IPCF configuration.

ldap

Default: Disabled
Sets access type protocol to be used by endpoints to Lightweight Directory Access Protocol (LDAP) in a PCC-Sp-Endpoint instance for IPCF configuration.

Usage

Use this command to define the type of access protocol to be used with a PCC-Sp-Endpoint instance for IPCF configuration.

Example

Following command sets the access type of protocol to **Diameter** for a PCC-Sp-Endpoint instance.

```
default access-type
```

diameter dictionary

This command is used to assign a Diameter dictionary for interaction with SSC and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary {sh-custon-starent | sh-custom2 | sh-standard }

default diameter dictionary
```

default

Sets the Diameter **Sh** dictionary to default dictionary **sh-custon-starent** (3GPP Rel. 8 Sh standard) for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

sh-custom-starent

Default: Enabled
Sets the Diameter **Sh** dictionary to default dictionary **sh-custom-starent** for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

sh-custom2

Default: Disabled
Sets the Diameter **Sh** dictionary to **sh-custom2**with Cisco ULI AVP support for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

sh-standard

Default: Disabled
Sets the Diameter **Sh** dictionary to default dictionary **sh-standard** (3GPP Rel. 8 standard) for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

Usage

Use this command to assign a Diameter dictionary for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration.

Example

Following command sets the Diameter dictionary for **Sh** interaction and messaging over **Sp** interface in a PCC-Sp-Endpoint instance of IPCF configuration to 3GPP Rel. 8 standard.

```
diameter dictionary sh-standard
```

diameter origin end-point

This command is used to bind/associate a pre-configured Diameter host/realm (SSC) over **Sp** interface for SPR interactions with a PCC-Sp-Endpoint instance to be used for subscriber profile and policy management.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *ssc_node_name*

no diameter origin endpoint

no

Removes the associated Diameter Origin Endpoint configuration from PCC-Sp-Endpoint instance configured for IPCF configuration.

ssc_node_name

The *ssc_node_name* is a predefined Diameter origin endpoint node (SSC) and must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to bind the SSC node over **Sp** interface by associating a pre-configured Diameter Origin Endpoint configuration with a PCC-Sp-Endpoint instance.
The Diameter origin endpoint must be a pre-configured instance in the Context Configuration Mode. For more information on Diameter origin endpoint configuration, refer *Diameter Endpoint Configuration Mode Commands* chapter.

Example

Following command associates a pre-configured Diameter endpoint node configuration named *ssc_1* with a PCC-Sp-Endpoint instance for subscriber policy profile management.

```
diameter origin endpoint ssc_1
```

Following command removes the pre-associated Diameter endpoint node configuration named *ssc_1* from a PCC-Sp-Endpoint instance.

```
no diameter origin endpoint
```

diameter peer-select

This command nominates primary and secondary Diameter peers amongst the peers configured under Diameter Endpoint Configuration instance which is associated with a PCC-Sp-Endpoint configuration.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

diameter peer-select peer *pri_peer_name* [**realm** *realm_name*] [**secondary peer** *sec_peer_name* [**realm** *sec_realm_name*]]

no diameter peer-select

no

Removes the configured Diameter peer from peer-select process which are configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configured for IPCF configuration.

peer *pri_peer_name*

Sets a configured Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, as **primary** in Diameter peer selection process for IPCF configuration.
The *pri_peer_name* is a pre-configured Diameter peer in Diameter Endpoint configuration which is associated with a PCC-Sp-Endpoint configuration and must be an alphanumerical string from 1 through 63 characters. *pri_peer_name* allows punctuation marks.

realm *realm-name*

This keyword optionally defines the realm (domain) of a configured **primary** Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, in Diameter peer selection process for IPCF configuration.
realm_name is the realm (domain) of the associated primary Diameter peer in Diameter Endpoint configuration which associated with a PCC-Sp-Endpoint configuration. The *realm_name* must be an alpha and/or numeric string of from 1 to 127 characters. The realm may typically be a company or service name and it allows punctuation marks.

secondary peer *sec_peer_name*

Sets a configured Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, as **secondary** in Diameter peer selection process for IPCF configuration.
The *sec_peer_name* is a pre-configured Diameter peer in Diameter Endpoint configuration which is associated with a PCC-Sp-Endpoint configuration and must be an alphanumerical string from 1 through 63 characters. *sec_peer_name* allows punctuation marks.

realm *sec_realm-name*

This keyword optionally defines the realm (domain) of a configured **secondary** Diameter peer, which is configured in Diameter Endpoint configuration associated with PCC-Sp-Endpoint instance configuration, in Diameter peer selection process for IPCF configuration.
sec_realm_name is the realm (domain) of the associated primary Diameter peer in Diameter Endpoint configuration which associated with a PCC-Sp-Endpoint configuration. The *sec_realm_name* must be an alpha and/or numeric string of from 1 to 127 characters. The realm may typically be a company or service name and it allows punctuation marks.

Usage

Use this command to nominate primary and secondary Diameter peers amongst the peers configured under Diameter Endpoint Configuration instance which is associated with a PCC-Sp-Endpoint configuration. When both primary and secondary are down, the remaining Diameter peers are chosen based on their configured weight in round robin manner.
Multiple Diameter peers can be configured in a PCC-Sp-Endpoint instance by entering this command multiple times.

Example

Following command nominates a pre-configured Diameter peer *dia1* as primary and *dia2* as secondary for Diameter peer selection process in a PCC-Sp-Endpoint configuration instance.

```
diameter peer-select peer dia1 secondary peer dia2
```

end

Exits the current configuration mode and returns to the Exec mode.

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

profile-data

This command allows the operator to specify data-reference and service indication AVP values used in UDR/SNR message for profile data sent over **Sp** endpoint when access type is set to Diameter.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

profile-data key data-reference *data_ref_value* [**service-indication** *svc_ind_value*]

default profile-data key

default

Specifies the data-reference value used in UDR/SNR message for profile data sent over **Sp** endpoint to default value of '*0*' (zero) and service indication AVP value to *profile data* when access type is set to Diameter in PCC-Sp-Endpoint instance.

data-reference *data_ref_value*

Default: 0
Specifies the data-reference values used in UDR/SNR message for profile data sent over **Sp** endpoint when access type is set to Diameter in PCC-Sp-Endpoint instance.
The data reference value *data_ref_value* must be an integer from 1 through 65535.

service-indication *svc_ind_value*

Specifies the service indication AVP value used in UDR/SNR message for profile data sent over **Sp** endpoint when access type is set to Diameter in PCC-Sp-Endpoint instance.

Important: The Service-Indication values are set as per application logic and are supposed to be used only with SSC.

The service indication value *svc_ind_value* must be a string of alpha and/or numeric characters from 1 to 32 characters.

Usage

Use this command to allow the operator to specify data-reference and service indication AVP values used in UDR/SNR message for profile data sent over **Sp** endpoint when access type is set to Diameter in PCC-Sp-Endpoint configuration instance.
Default service-indication value varies as per other interface configuration **default profile-data key** is used to set the service indication value.

Example

Following command set the data-reference value used in UDR/SNR message for profile data sent over **Sp** endpoint to default value of '*0*' (zero) and service-indication value as per application logic when access type is set to Diameter in PCC-Sp-Endpoint instance.

default profile-data key

profile-update-notification

This command sets the system to indicate whether SSC and IPCF are capable of supporting profile update notifications in a PCC-Sp-Endpoint instance.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

```
profile-update-notification {allow | disallow}

default profile-update-notification
```

default

Set the PCC-Sp-Endpoint instance default mode for supporting profile update notifications in a PCC-Sp-Endpoint instance and also to use the same in a PCC-Sp-Endpoint configuration instance.

allow

Default: Enabled
Set the PCC-Sp-Endpoint instance to support the profile update notifications and also allow to use the same in **Sp** interaction.

disallow

Default: Disabled
Set the PCC-Sp-Endpoint instance to not to support the profile update notifications and also does not allow to use the same in **Sp** interaction.

Usage

Use command to set to indicate whether SSC and IPCF are capable of supporting profile update notifications in a PCC-Sp-Endpoint instance. It also sets that whether profile update notification should be used or not for a PCC-Sp-Endpoint configuration instance.

Example

Following command indicates that SSC and IPCF are capable of supporting profile update notifications in a PCC-Sp-Endpoint instance and also allow to use it for a PCC-Sp-Endpoint configuration instance.

```
default profile-update-notification
```

spr subscriber identifier

This command sets the PCC-Sp-Endpoint instance to indicate how a subscriber is uniquely identified in SPR database while requesting subscriber data from SSC.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

spr subscriber identifier {**imsi** | **msisdn** | **nai**}

default spr subscriber identifier

default

Sets the PCC-Sp-Endpoint instance to use subscriber IMSI to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.

imsi

Default: Enabled
Sets the PCC-Sp-Endpoint instance to use subscriber IMSI to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.

msisdn

Default: Disabled
Sets the PCC-Sp-Endpoint instance to use subscriber MSISDN to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.

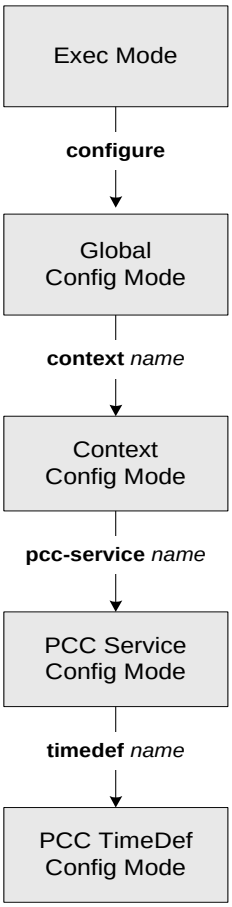
nai

Default: Disabled
Sets the PCC-Sp-Endpoint instance to use Network Address Identifier as token to identify subscriber uniquely in SPR database while requesting subscriber data from SSC.
This token facilitates CDMA users for Policy Control and Charging functions.

Usage

Use command to set the PCC-Sp-Endpoint instance to indicate how a subscriber is uniquely identified in SPR database on SSC while requesting subscriber data. By default it uses Subscriber IMSI for identification in SPR database.
For IP-CAN session between PDSN and IPCF the subscriber token NAI facilitates the Policy Control and Charging functions to subscribers.

Example



Following command sets the PCC-Sp-Endpoint instance to use a subscriber IMSI to uniquely identified in SPR database at SSC.

```
default spr subscriber identifier
```

Chapter 215
PCC-TimeDef Configuration Mode Commands

The PCC-TimeDef Configuration Mode is used to configure various time definitions (TimeDefs) in the PCC-service instance. A PCC-TimeDef specifies the start and end time for triggering policy-related procedures or conditions.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

start date

This command defines PCC-TimeDefs with a start and end dates with time for an event to trigger a procedure or condition in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] start date start_date time start_time end date end_date time end_time
```

no

Removes the specified time definition.

date *start_date*

Specifies the start date *start_date* in *MM*/*DD*/*YY* format.
Following format is used for *MM*/*DD*/*YY* in *start_date*:

- *MM* specifies the month of the start date from January through December and must be an integer between 1 through 12.
- *DD* specifies the date of month of the start date 1 through 31 and must be an integer between 1 through 31.
- *YY* specifies the year of the start date from 2010 through 2037 and must be an integer between 10 through 37.

time *start_time*

Specifies the start time *start_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *start_time*:

- *HH* specifies the hour of the start date in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the start date must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the start date must be an integer between 00 through 59.

end date *end_date*

Specifies the end date *end_date* in *MM*/*DD*/*YY* format.
Following format is used for *MM*/*DD*/*YY* in *end_date*:

- *MM* specifies the month of the end date from January through December and must be an integer between 1 through 12.
- *DD* specifies the date of month of the end date 1 through 31 and must be an integer between 1 through 31.

- *YY* specifies the year of the end date from 2010 through 2037 and must be an integer between 10 through 37.

time *end_time*

Specifies the end time *end_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *end_time*:

- *HH* specifies the hour of the end date in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the end date must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the end date must be an integer between 00 through 59.

Usage

Use this command to define a PCC-TimeDef with a start and end dates with time for an event to trigger a procedure or condition in an IP-CAN session.

Example

The following command defines a PCC-TimeDef with start date as December 31st 2010 at 00 Hrs. 30 mins. and 00 seconds and end date as January 31st 2011 at 23 Hrs. 59 mins. and 59 seconds:

start date *12/31/10* **time** *00 30 00* **end date** *01/31/11* **time** *23 59 59*

start day

This command defines PCC-TimeDefs with a start and end week days with time for an event to trigger a procedure or condition in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] start day start_weekdays time start_time end day end_weekdays time end_time
```

no

Removes the specified time definition.

day *start_weekdays*

Specifies the start day as week days.
Following days are used as *start_weekdays*:

- **friday** specifies Friday of the week as start day.
- **monday** specifies Monday of the week as start day.
- **saturday** specifies Saturday of the week as start day.
- **sunday** specifies Sunday of the week as start day.
- **thrusday** specifies Thursday of the week as start day.
- **tuesday** specifies Tuesday of the week as start day.
- **wednesday** specifies Wednesday of the week as start day.

time *start_time*

Specifies the start time *start_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *start_time*:

- *HH* specifies the hour of the start day in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the start day must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the start day must be an integer between 00 through 59.

end day *end_weekdays*

Specifies the end day as week days.
Following days are used as *end_weekdays*:

- **friday** specifies Friday of the week as end day.
- **monday** specifies Monday of the week as end day.

- **saturday** specifies Saturday of the week as end day.
- **sunday** specifies Sunday of the week as end day.
- **thrusday** specifies Thursday of the week as end day.
- **tuesday** specifies Tuesday of the week as end day.
- **wednesday** specifies Wednesday of the week as end day.

time *end_time*

Specifies the end time *end_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *end_time*:

- *HH* specifies the hour of the end day in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the end day must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the end day must be an integer between 00 through 59.

Usage

Use this command to define a PCC-TimeDef with a start and end weekdays with time for an event to trigger a procedure or condition in an IP-CAN session.

Example

The following command defines a PCC-TimeDef with start day as Friday at 00 Hrs. 30 mins. and 00 seconds and end day as Sunday at 23 Hrs. 59 mins. and 59 seconds:

start day friday time *00 30 00* **end day sunday time** *23 59 59*

start time

This command defines PCC-TimeDefs with a start and end time of a day for an event to trigger a procedure or condition in an IP-CAN session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] start time start_time end time end_time
```

no

Removes the specified time definition.

time *start_time*

Specifies the start time *start_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *start_time*:

- *HH* specifies the hour of the day in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the hour of the day must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the day must be an integer between 00 through 59.

end time *end_time*

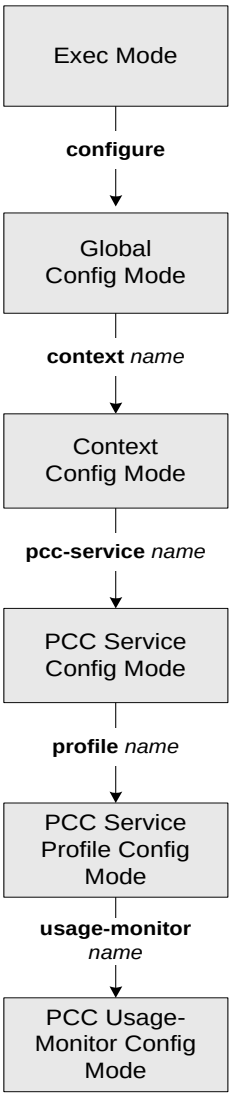
Specifies the end time *end_time* in *HH MIN SS* format.
Following format is used for *HH MIN SS* in *end_time*:

- *HH* specifies the end hour of the day in 24 hour format and must be an integer between 00 through 23.
- *MIN* specifies the minutes of the end hour of the day must be an integer between 00 through 59.
- *SS* specifies the seconds of the minute of the end hour must be an integer between 00 through 59.

Usage

Use this command to define a PCC-TimeDef with a start and end time for an event to trigger a procedure or condition in an IP-CAN session.

Example



The following command defines a PCC-TimeDef with start at 00 Hrs. 30 mins. and 00 seconds and end at 23 Hrs. 59 mins. and 59 seconds:

```
start time 00 30 00 end time 23 59 59
```

Chapter 216
PCC-Usage-Monitor Configuration Mode Commands

The PCC-Usage-Monitor Configuration mode provides a mechanism to set the usage threshold limit in a PCC-Service-Profile to trigger a required condition and action set in PCC-Service instance.

Important: This configuration mode is supported from StarOS Release 12.1 onward.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

usage-limit volume

Sets the usage limit by volume for a subscriber profile for a PCC-Service-Profile on an IPCF node.

Platform

ASR 5000

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

[**default usage-limit volume** [**downlink** *dlink_volume* | **total** *total_volume* | **uplink** *uplink_volume*]

default

Sets the usage limit volume to "0" for downlink, uplink and total bucket in a PCC-Service-Profile.

downlink *dlink_volume*

Specifies the usage volume (in kilobytes) in the downlink direction (from PCEF to UE) as an integer from 1 through 4294967296. A "0" (zero) value disables the downlink volume usage. Default: 0

total *total_volume*

Specifies the usage volume (in kilobytes) in the downlink and uplink directions (from PCEF to UE and PCEF to PDN) as an integer from 1 through 4294967296. A "0" (zero) value disables the downlink volume usage. Default: 0

uplink *uplink_volume*

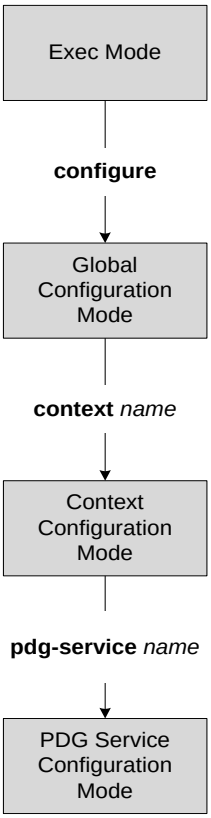
Specifies the usage volume (in kilobytes) in the uplink direction (from PCEF to PDN) as an integer from 1 through 4294967296. A "0" (zero) value disables the downlink volume usage. Default: 0

Usage

Use this command to set the usage limit in volume for subscriber profile for a PCC-Service-Profile on IPCF node.

Example

The following command sets the usage limit volume to 20000 kilobytes in the upload direction within a PCC-Service-Profile.



```
usage-limit volume uplink 20000
```

The following command sets the usage limit volume to 400000 kilobytes in the download direction within a PCC-Service-Profile.

```
usage-limit volume downlink 400000
```

Chapter 217
PDG Service Configuration Mode Commands

The PDG Service Configuration Mode is used to specify the properties required for the UEs in the WLAN (Wireless Local Access Network) to interface with the Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG).

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa attribute

Sets the attributes that the system uses in AAA messages.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

aaa attribute { 3gpp-negotiated-qos-profile *string* **}**

no aaa attribute

3gpp-negotiated-qos-profile *string*

Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling as an alphanumeric string of 1 through 31 characters.

no aaa attribute

Removes a previously configured AAA attribute.

Usage

Specifies the 3GPP negotiated QoS profile to use in AAA messages during IMS emergency call handling.

Example

The following command specifies the 3GPP negotiated QoS profile to use during IMS emergency call handling:

```
aaa attribute 3gpp-negotiated-qos-profile 100
```

associate sgtp-service

Identifies the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG. TTG functionality supports GTP-C (GTP control plane) messaging and GTP-U (GTP user data plane) messaging between the TTG and the GGSN over the Gn' interface.

Important: This command can be used before the associated service instance is created and configured but care should be used to match the service names.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

`[ no ] associate sgtp-service` *`sgtp_service_name`* **`[ context`** *`sgtp_context_name`* **`]`**

`no`

Removes the service association definition from the configuration.

`sgtp-service` *`sgtp_service_name`*

Specifies which SGTP service configuration, by naming the SGTP service instance, to associate with this PDG service.
`sgtp_service_name` is an alphanumeric string of 1 through 63 characters with no spaces.

`context` *`sgpt_context_name`*

Defines the context in which the SGTP service was created. If no context is specified, the current context is used.
`sgtp_context_name` is an alphanumeric string of 1 through 63 characters with no spaces.

Usage

Use this command to associate the SGTP service to be associated with the PDG service to enable TTG functionality on the PDG/TTG.

Example

The following command associates SGTP service *`sgtp_service_1`* with this PDG service:

```
associate sgtp-service sgtp_service_1 context sgtp_context_1
```

certificate-selection

Configures the PDG/TTG to select the trusted certificate (and the private key for calculating the AUTH payload) to be included in the first IKE_AUTH message from the PDG/TTG based on the APN (Access Point Name). The selected certificate is associated with the APN included in the IDr payload of the first IKE_AUTH message from the UE.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] certificate-selection apn-based

default certificate-selection
```

certificate-selection apn-based

Selects a trusted certificate for the first IKE-AUTH message based on the APN.

no certificate-selection

Disables APN-based certificate selection and resumes sending a certificate bound to a crypto template.

default certificate-selection

Sets the default certificate selection method to a certificate bound to a crypto template.

Usage

Configures the PDG/TTG to select the trusted certificate to be included in the first IKE_AUTH message based on the APN.

Example

Use the following example to enable APN-based certificate selection:

```
certificate-selection apn-based
```

bind

Binds the PDG service IP address to a crypto template and specifies the maximum number of sessions the PDG service supports.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bind address` *`ipv4_address`* **`{ crypto-template`** *`string`* **`} mode { ttg | pdg } [ max-sessions`** *`number`* **`]`**

`no`

Removes a previously configured binding.

`bind address` *`ipv4_address`*

Specifies the IPv4 address of the PDG service with which the UE attempts to establish an IKEv2/IPSec tunnel. This address must be a valid IP address within the context.
This is a mandatory parameter.

`crypto-template` *`string`*

Specifies the name of the crypto template to be bound to the PDG service. This is the name of the IPSec policy to be used as a template for PDG/TTG subscriber session IPSec policies. The crypto template includes most of the IPSec and IKEv2 parameters for keepalive, lifetime, NAT-T, and cryptographic and authentication algorithms. There must be one crypto template per PDG service.
This is a mandatory parameter.
`string` is an alphanumeric string of 0 through 127 characters.

`mode { ttg | pdg }`

Default: There is no default value.
Specifies whether the PDG service provides TTG or PDG functionality, as follows:

- In TTG mode, PDN connectivity is provided through the GGSN. PDG functionality is provided by the combined TTG and GGSN.
- In PDG mode, PDN connectivity and PDG functionality are provided directly through the PDG service.

This is a mandatory parameter.

Important: PDG mode is not supported in this software release.

Dependencies:
When you configure the PDG service to be in TTG mode, you must also configure the SGTP service using the **`associate sgtp-service`** command, as the TTG needs to connect with the GGSN to complete the PDG functionality.

The following behaviors occur when the PDG service operates in TTG mode:

- If the SGTP service associated with PDG service is not configured, the PDG service is not started.
- If the SGTP service associated with PDG service is not started, the PDG service is not started.
- If the SGTP service associated with PDG service is stopped, the PDG service is stopped.
- If the SGTP service associated with PDG service is re-started, the PDG service is re-started.
- If the SGTP service is not yet configured, whenever the SGTP service is started, the PDG service is started.

Note that starting or stopping the PDG service has no impact on the SGTP service.

max-sessions *number*

Specifies the maximum number of sessions to be supported by the PDG service as an integer from 0 through 1000000. Default: 1000000
If the max-sessions value is changed on an existing system, the new value takes effect immediately if it is higher than the current value. If the new value is lower than the current value, existing sessions remain established, but no new sessions are permitted until usage falls below the newly-configured value.

Usage

Use this command in PDG Service Configuration Mode to bind the IP address used as the connection point for establishing IKEv2/IPSec sessions to a crypto template. You can also use it to define the maximum number of sessions the PDG service supports.

Example

The following command binds a PDG service with an IP address of *10.2.3.4* to the crypto template *crypto_template_1*, sets the mode to TTG, and sets the maximum number of sessions to *500000*:

```
bind address 10.2.3.4 crypto-template crypto_template_1 mode ttg max-
sessions 500000
```

ip gnp-qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Gn' interface in the uplink direction.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

[no] ip gnp-qos-dscp { background *dscp* **| conversational***dscp* **| interactive** *dscp* **| streaming** *dscp* **| interactive [traffic-handling-priority** *traffic_priority* **] { allocation-retention-priority** *allocation_retention_priority* **} } +**

default ip gnp-qos-dscp

no

Disables the overriding of the ToS (Type of Service) field and enables the pass-through option.

background *dscp*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP background class, in which the data transfer is not time-critical (for example, in e-mail exchanges). This traffic class is the lowest QoS.
dscp: Sets the DSCP for the specified traffic class. See the *dscp* section below.

conversational *dscp*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP conversational class, in which there is a constant flow of traffic in both the uplink and downlink direction. This traffic class is the highest QoS.
dscp: Sets the DSCP for the specified traffic pattern. See the dscp section below.

interactive [traffic-handling-priority *traffic_priority* **]**

Specifies the DSCP marking to be used for packets of sessions subscribed to three possible traffic priorities in the 3GPP interactive class, in which there is an intermittent flow of packets in the uplink and downlink direction. This traffic class has a higher QoS than the background class, but not as high as the streaming class.
traffic_priority is the 3GPP traffic handling priority and can be the integers 1, 2 or 3.

allocation-retention-priority *allocation_retention_priority*

Specifies the DSCP for the interactive class if the allocation priority is present in the QoS profile.
allocation-retention-priority can be the integers 1, 2, or 3.
DSCP uses the values in the following table based on the traffic handling priority and allocation/retention priority if the allocation priority is present in the QOS profile.

Allocation Priority	1	2	3

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	af21	af21	af21
3	af21	af21	af21

Important: If you only configure DCSP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility however, it is recommended that you configure all three values.

`streaming` *`dscp`*

Specifies the DSCP marking to be used for packets of sessions subscribed to the 3GPP streaming class, in which there is a constant flow of data in either in the uplink or downlink direction. This traffic class has a higher QoS than the interactive class, but not as high as the conversational class.
dscp: Set the DSCP for the specified traffic pattern. See the dscp section below.

`dscp`

Default:

- background: be
- interactive
- Traffic Priority 1: ef
- Traffic Priority 1: af21
- Traffic Priority 1: af21
- streaming: af11
- conversational: ef

Specifies the DSCP for the specified traffic pattern. *`dscp`* can be configured to any one of the following:

• af11: Assured Forwarding 11 per-hop-behavior (PHB)	• af33: Assured Forwarding 33 PHB
• af12: Assured Forwarding 12 PHB	• af41: Assured Forwarding 41 PHB
• af13: Assured Forwarding 13 PHB	• af42: Assured Forwarding 42 PHB
• af21: Assured Forwarding 21 PHB	• af43: Assured Forwarding 43 PHB
• af22: Assured Forwarding 22 PHB	• be: Best effort forwarding PHB
• af23: Assured Forwarding 23 PHB	• ef: Expedited forwarding PHB

• af31: Assured Forwarding 31 PHB	
• af32: Assured Forwarding 32 PHB	

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they're tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Gn' interface(s).
The four traffic patterns have the following order of precedence: background (lowest), interactive, streaming, and conversational (highest). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Precedence (low to high)	DSCP
1	Best Effort (be)
2	Class 1
3	Class 2
4	Class 3
5	Class 4
6	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP level for the streaming traffic pattern to be ef:**`ip gnp-qos-dscp streaming ef`**
The following command configures the DSCP levels for the conversational, streaming, interactive and background traffic patterns to be ef, af22, and af41, respectively:**`ip gnp-qos-dscp conversational ef streaming ef interactive af22 background af41`**

ip qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets over the Wu interface in the downlink direction.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

ip qos-dscp { **qci** { **1** { *dscp-pt* } | **2** { *dscp-pt* } | **3** { *dscp-pt* } | **4** { *dscp-pt* } | **5** { *allocation-retention-priority 1..3* | *dscp-pt* } | **6** { *allocation-retention-priority 1..3* | *dscp-pt* } | **7** { *allocation-retention-priority 1..3dscp* | *dscp-pt* } | **8** { *allocation-retention-priority 1..3* | *dscp-pt* } | **9** { *dscp-pt* } *+* }

no ip qos-dscp { **qci** { 1 | 2 | 3 | 4 | 5 { *allocation-retention-priority 1..3* | *dscp-pt* } | 6 { *allocation-retention-priority 1..3* | *dscp-pt* } | 7 { *allocation-retention-priority 1..3* | *dscp-pt* } | 8 { *allocation-retention-priority 1..3* | *dscp-pt* } | 9 {*+*

allocation-retention-priority

Specifies the DSCP for interactive class if the allocation priority is present in the QOS profile.
allocation-retention-priority can be the integers 1, 2, or 3.
DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QOS profile.
The following table shows the DSCP value matrix for *allocation-retention-priority*.

Table 29. Default DSCP Value Matrix

	Allocation Priority 1	Allocation Priority 2	Allocation Priority 3
Traffic Handling Priority			
1	ef	ef	ef
2	af21	af21	af21
3	af21	af21	af21

qci

Configures the QCI attribute of QoS. Here the *qci_val* is the QCI for which the negotiate limit is being set, it ranges from 1 to 9.

dscp

Default QCI:

- 1: ef
- 2: ef
- 3: af11
- 4: af11
- 5: ef
- 6: ef
- 7: af21
- 8: af21
- 9: be

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• **af11:** Assured Forwarding 11 per-hop-behavior (PHB)	• **af32:** Assured Forwarding 32 PHB
• **af12:** Assured Forwarding 12 PHB	• **af33:** Assured Forwarding 33 PHB
• **af13:** Assured Forwarding 13 PHB	• **af41:** Assured Forwarding 41 PHB
• **af21:** Assured Forwarding 21 PHB	• **af42:** Assured Forwarding 42 PHB
• **af22:** Assured Forwarding 22 PHB	• **af43:** Assured Forwarding 43 PHB
• **af23:** Assured Forwarding 23 PHB	• **be:** Best effort forwarding PHB
• **af31:** Assured Forwarding 31 PHB	• **ef:** Expedited forwarding PHB

+

More than one of the above keywords can be entered within a single command.

Usage

You can assign DSCP to specific traffic patterns to ensure that data packets are delivered according to the precedence with which they are tagged. The diffserv markings are applied to the outer IP header of every GTP data packet. The diffserv marking of the inner IP header is not modified.
The traffic patterns are defined by QCI (1 to 9). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

Table 30. Class structure for assured forwarding (af) levels

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
High	af13	af23	af33	af43

Table 31. DSCP Precedence

Precedence (low to high)	DSCP
0	Best Effort (be)
1	Class 1
2	Class 2
3	Class 3
4	Class 4
5	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command. The no ip qos command can be issued to remove a QOS setting and return it to it's default setting.

Example

The following command configures the DSCP level for QCI to be Expedited Forwarding,**ef**:

```
ip qos-dscp qci 1 ef
```

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected, or for verifying packet routing and labeling within the network.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { clear-on-valid-packet | drop-limit *num* **period** *secs* **}**

default ip source-violation { drop-limit *num* **period** *secs* **}**

no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Configures the service to reset the drop-limit counters upon receipt of a properly addressed packet. Default: disabled

drop-limit *num*

Sets the maximum number of allowed IP source violations within the detection period before dropping a call. If *num* is not specified, the value is set to the default value.
num is an integer from 1 to 1000000. Default: 10

period *secs*

Sets the detection period (in seconds) for IP source violations as an integer from 1 through 1000000. If *secs* is not specified, the value is set to the default value. Default: 120

default ip source-violation { drop-limit *num* **period** *secs* **}**

Sets or restores the IP source violation detection defaults, as follows:

- **drop-limit**: Sets or restores the maximum number of IP source violations within the detection period before dropping the call to the default value of 10.
- **period**: Sets or restores the detection period for IP source violations to the default value of 120 seconds.

no ip source-violation clear-on-valid-packet

The drop-limit counters are not reset upon receipt of a properly addressed packet.

Usage

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.
This function operates in the following manner: When a subscriber packet is received with a source IP address violation, the system increments the IP source violation drop-limit counter and starts the timer for the IP source violation period. Every subsequent packet received with a bad source address during the IP source violation period causes the drop-limit counter to increment. For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The detection period timer continues to count throughout this process.

Example

The following command sets the drop limit to 15 and leaves the other values at their default values:

```
ip source-violation drop-limit 15
```

max-tunnels-per-ue

Specifies the maximum number of IKEv2/IPSec tunnels allowed per UE by the PDG/TTG. This maximum number is specified per PDG service.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

max-tunnels-per-ue *integer*

default max-tunnels-per-ue

integer

Specifies the maximum number of IKEv2/IPSec tunnels allowed per UE as an integer from 1 to 11. Default: 11

default max-tunnels-per-ue

Sets the maximum number of IKEv2/IPSec tunnels allowed per UE to its default value, which is 11.

Usage

Use this command to set the maximum number of IKEv2/IPSec tunnels allowed per UE.

Example

Use the following command to set the maximum number of IKEv2/IPSec tunnels allowed per UE to *2*:

```
max-tunnels-per-ue 2
```

plmn id

Configures location specific mobile network identifiers used to help translate local emergency and service-related numbers. Default is disabled.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

plmn id mcc *mcc_number* **mnc** *mnc_number*

no plmn id mcc *mcc_number* **mnc** *mnc_number*

mcc *mnc_number*

Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer from 200 through 999.

mnc *mnc_number*

Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 2-digit integer from 00 through 999.

no plmn id mcc *mcc_number* **mnc** *mnc_number*

Removes a previously configured PLMN identifier for the PDG service.

Usage

The PLMN ID is included in the RAI (Routing Area Identity) field of the PDP Create Request messages sent to the GGSN. Multiple PDG services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each PDG service.

Example

The following command configures the PLMN identifier with an MCC of *462* and MNC of *2*:

```
plmn id mcc 462 mnc 02
```

setup-timeout

Specifies the maximum time allowed to set up a session.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

setup-timeout *integer*

default setup-timeout

setup-timeout integer

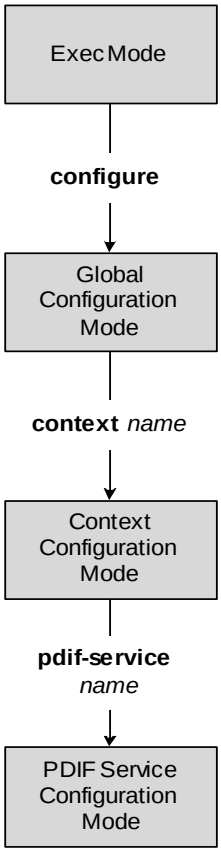
Sets the session setup timeout value (in seconds) as an integer from 2 through 300. Default: 60

default setup-timeout

Sets or restores the default session setup timer value to 60 seconds.

Usage

The PDG/TTG clears both the user session and tunnels if a call does not initiate successfully before the session setup timer expires.



Example

The following command sets the session setup timeout value to the default value of 60 seconds:

```
default setup-timeout
```

Chapter 218
PDIF Service Configuration Mode Commands

The PDIF Service Configuration Mode is used to configure the properties required for a mobile station to interface with a Packet Data Interworking Function (PDIF).

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa attribute

Sets the system attributes for AAA messages.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
aaa attribute { 3gpp2-bsid string | 3gpp2-service-option integer | calling-station-id
integer | 3gpp2-serving-pcf ip-address }

no aaa attribute

default aaa attribute 3gpp2-service-option integer
```

no

Removes a previously configured AAA attribute.

default

Returns the specified aaa attribute to the original default system settings.

3gpp2-bsid *string*

Specifies the base-station ID and consists of the SID + NID + CELLID.
string must contain 12 hexadecimal upper-case ASCII characters.

3gpp2-service-option *integer*

Specifies the radius attribute value when sending authentication and accounting messages as an integer from 0 through 32767. Default: 4095

calling-station-id *integer*

Specifies the calling station phone number as a sequence of 1 through 15 digits.

3gpp2-serving-pcf *ip-address*

Use this command to generate attribute values without creating a new ASR 5000 image.

Usage

If the RADIUS protocol is being used, accounting messages can be sent over a AAA interface to the RADIUS server.
3gpp2-serving-pcf attribute value (if configured) is sent in both RADIUS authentication and accounting messages. If the attribute value is not configured (or explicitly “not configured” using the **no** keyword), RADIUS attributes are still included with just type and length. This is because inclusion/exclusion of RADIUS attributes are still controlled through the dictionary, not via the CLI.

Example

The following command identifies the base station ID:

```
aaa attribute 3gpp2-bsid 0ab2389acb3
```

aaa authentication

Sets the aaa authentication for first and second phase authentication when multiple authentication is configured on the system.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
aaa authentication { { first-phase | second-phase } | { context-name name aaa-group name } }

no aaa authentication { first-phase | second-phase }
```

no aaa authentication { first-phase | second-phase }

Removes any existing authentication configuration.

first-phase context-name *name* **aaa-group** *name*

Specifies the context name and the aaa group name configured in the context for the first authentication phase.

Important: First phase authentication is mandatory when multiple authentication is configured on the system.

- **context-name** *name*: Specifies the context where the aaa server group is defined as an alphanumeric string of 1 through 79 characters.
- **aaa-group** *name*: Specifies the name of the aaa-group to be used for authentication as an alphanumeric string of 1 through 79 characters.

second-phase context-name *name* **aaa-group** *name*

Specifies the context name and the aaa group name configured in the context for the second authentication phase.

- **context-name** *name*: Specifies the context where aaa server group is defined as an alphanumeric string of 1 through 79 characters.
- **aaa-group** *name*: Specifies the name of the aaa-group to be used for authentication as an alphanumeric string of 1 through 63 characters.

Usage

Two phase-authentication happens in IKEv2 setup for setting up the IPSec session. The first authentication uses Diameter AAA EAP method and second authentication uses RADIUS AAA authentication. The same

AAA context may be used for both authentications. PDIF service allows you to specify only a single AAA group, which could normally be used for the first authentication method.
A given AAA group only supports either Diameter or RADIUS authentication. If the NAI in the first authentication is different from NAI in the second authentication each NAI can point to a different domain profile in the PDIF. Each domain profile may be configured with each AAA group, one for Diameter and the other for RADIUS.

Example

Use the following to configure first-phase authentication for an aaa group named *aaa-10* in the PDIF context:

```
first-phase context-name pdif aaa-group aaa-10
```

bind

Binds the service IP address to a crypto template and configures the number of sessions the PDIF can support.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

bind address *address* **{ crypto-template** *string* **} [max-sessions** *number* **]**

no bind

no

Removes a previously configured binding.

address

Specifies the IP address of the service.

crypto-template *string*

Specifies the name of the crypto template to be bound to the service as an alphanumeric string of 0 through 127 characters.

max-sessions *number*

Specifies the maximum number of sessions to be supported by the service as an integer from 0 to 3000000. Default: 3000000

Usage

Binds the IP address used as the connection point for establishing the IKEv2 sessions to the crypto template. It can also define the number of sessions the PDIF can support.

Example

The following command binds a service with the IP address *13.1.1.1* to the crypto template *T1* and sets the maximum number of sessions to *2000000*:

```
bind address 13.1.1.1 crypto-template T1 max-sessions 200000
```

default

Sets or restores the default condition for the selected parameter.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

default { { aaa attribute 3gpp2-service-option } | duplicate-session-detection | hss { failure-handling mac-address-validation-failure | mac-address-validation | update-profile } | ip source-violation { drop-limit | period } | setup-timeout | subscriber *name* **| username mac-address-stripping } }**

---

aaa attribute 3gpp2-service-option

Configures the default value 4095.

---

duplicate-session-detection

Configures the default to be NAI-based.

---

hss { failure-handling mac-address-validation-failure | mac-address-validation | update-profile }

Configures the HSS server defaults:
failure-handling mac-address-validation-failure: By default, the MAC address is validated by IMS-Sh interface.

- **mac-address-validation**: By default, validating the MAC address is disabled.
- **update-profile**: By default, updating the PDIF profile is disabled.

---

ip source-violation (drop-limit | period }

Configures IP source-violation detection defaults.

- **drop-limit**: Default number of ip source violations permitted in detection period before the call is dropped is 10.
- **period**: Default detection period is 120 seconds.

---

setup-timeout

Default call setup time limit is 60 seconds.

---

subscriber *name*

Configures the default subscriber name. *name* is a string of 1-127 characters.

username mac-address-stripping

Default is to disable stripping the MAC address from the username.

Usage

Configures the default settings for a given parameter.

Example

Use the following example to configure the default call setup time limit:

```
default setup-timeout
```

duplicate-session-detection

Configures the PDIF to detect duplicate call sessions using old IMSI or NAI addresses and clear old call information.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] duplicate-session-detection { imsi-based | nai-based }
```

no

Stops duplicate session detection.

default

Configures the default setting, which is NAI-based detection.

imsi-based

Configures the PDIF to detect duplicate call sessions based on the IMSI address.

nai-based

Configures the PDIF to detect duplicate call sessions based on the NAI address. This is the default setting.

Usage

If an MS leaves the Wi-Fi coverage area and subsequently comes back online, it may initiate a new session setup procedure. After both the device authentication with HSS and the subscriber authentication with AAA server are completed, PDIF runs the internal mechanism to see whether there was any other session bound with the same IMSI. If an old session is detected, PDIF starts clearing this old session by sending a proxy-MIP Deregistration request to the HA. PDIF resumes new session setup by sending a proxy-MIP registration request. When the old session is aborted, PDIF sends Diameter STR messages and RADIUS Acct STOP messages to corresponding AAA servers.
PDIF allows duplicate session detection based on either the NAI or IMSI addresses. When detecting based on NAI, it is the first-phase (device authentication) NAI that is used.

Example

The following command configures duplicate session detection to use IMSI addressing:

```
duplicate-session-detection imsi
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

hss

Configures the Home Subscriber Server (HSS) parameters.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
hss { failure-handling { { mac-address-validation-failure | update-profile } action {
terminate | continue } } | update-profile | mac-address-validation }

[ no | default ] hss { failure-handling | update-profile | mac-address-validation }
```

no

Removes a previously configured HSS profile.

default

Resets the defaults for this command.

failure-handling mac-address-validation-failure

Configures how the HSS is to handle errors.
If HSS returns a list of MAC addresses and if PDIF fails to match the subscriber MAC address against the list, the session is always terminated.

action { continue | terminate }

Configures the action to be performed depending on the failure type.

- **continue**: Ignores a mac-address-validation-failure and continue the session.
- **terminate**: Terminates the session on a mac-address-validation-failure.

mac-address-validation

If mac-address-validation is enabled, the PDIF queries the HSS for a list of MAC addresses associated with the Mobile Directory Number (MDN). Default: Disabled

update-profile

Update the HSS with the subscriber profile. Default: Disabled

Usage

An HSS provides MAC address validation and store part of the subscriber profile. This command enables or disables validation and profile updates, and configures how the system responds to failures: terminate or continue a session.
An ims-sh-service and Diameter interface need to be configured to communicate with the HSS.

Example

The following example enables *mac-address* validation:

```
hss mac-address-validation
```

ims-sh-service

Associates the IMS-Sh-service parameters.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

ims-sh-service name *name*

no ims-sh-service name *name*

no

Removes a previously configured IMS-Sh-service.

name

Names the IMS-Sh-service in the pdif-service context.

Usage

This command is used to name the IMS-Sh-service.

Example

The following command names the IMS-Sh-service ims1:

```
ims-sh-service name imsi1
```

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires that the source address of the received packets matches the IP address assigned to the subscriber (either statically or dynamically) during the session.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { **clear-on-valid-packet** | **drop-limit** *num* | **period** *secs* }

no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet. Default: disabled

drop-limit *num*

Sets the number of allowed source violations within a detection period before forcing a call disconnect. If *num* is not specified, the value is set to the default.
num is an integer from 1 to 1000000. Default: 10

period *secs*

Sets the length of time (in seconds) for a source violation detection period to last.
If *secs* is not specified, the value is set to the default.
secs is an integer from 1 to1000000. Default: 120

Usage

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDIFs a number of times during a handoff scenario.
This function operates in the following manner:
When a subscriber packet is received with a source address violation, the system increments the IP source-violation drop-limit counter and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the drop-limit counter to increment.
For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The period timer continues to count throughout this process.

Example

The following command sets the drop limit to *15* and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```

mobile-ip

Sets the MIP FA context for the specific PDIF service.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

mobile-ip foreign-agent context *string* **[fa-service** *string* **]**

no mobile-ip

no

Removes previously configured parameters.

foreign-agent context *string*

Specifies the context name in which the FA is configured as an alphanumeric string of 1 through 79 characters.

fa-service *string*

Specifies the name of the FA service in the FA context as an alphanumeric string of 1 through 79 characters.

Usage

Shows in which context the FA is located and names the FA service.

Example

This command configures MIP for the FA context named *fa1*:

```
mobile-ip foreign-agent context fa1
```

setup-timeout

Configures the maximum time allowed to set up a session.

Platform

ASR 5000

Product

PDIF

Privilege

Security-Administrator, Administrator

Syntax

setup-timeout *integer*

default setup-timeout

setup-timeout *integer*

Specifies the session setup timer (in seconds) as an integer from 2 through 300. Default: 60

default setup-timeout

Defaults the session setup timer to 60 seconds.

Usage

PDIF clears both user session and tunnels if a call does not initiate successfully before the timer expires.

Example

The following command sets the setup-timeout to the default 30 seconds:

```
default setup-timeout
```

username

Configures mac-address-stripping on a username coming in from a mobile station session.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
username mac-address-stripping

[ default | no ] username mac-address-stripping
```

username mac-address-stripping

Configures mac-address stripping from the Network Access Identifier (NAI).

default

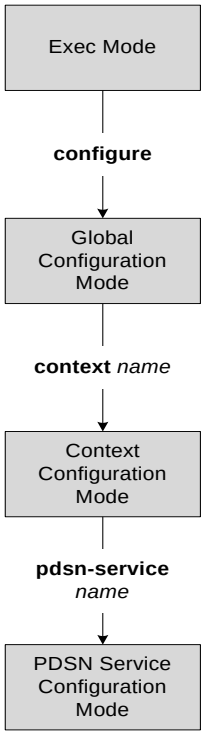
Configures the default parameter which is **disabled**.

no

Returns the configuration to the default condition.

Usage

When enabled, PDIF strips the MAC address from a mobile username NAI before sending to the RADIUS AAA server.



Example

The following example disables mac-address-stripping.

```
no username mac-address-stripping
```

Chapter 219
PDSN Service Configuration Mode Commands

The PDSN Service Configuration Mode is used to create and manage PDSN service instances for the current context.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

a11-signalling-packets

Applies DSCP marking for IP header carrying outgoing A11-signalling packets.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

a11-signalling-packetsip-header-dscp *hexa_number*

[**no** | **default**] **a11-signalling-packetsip-header-dscp**

no

Disables the **a11-signalling-packets ip-header-dscp** option configuration.

default

Sets / Restores default value assigned for specified parameter **a11-signalling-packets ip-header-dscp**.

hexa_number

a Hexa decimal number between 0x0 and 0x3F.

Usage

Use this command to configured value of DSCP to be set for all outgoing A11 signaling msg.
By default the CLI is disabled and DSCP is marked as 0 in ip-header.

Example

The following command configures value of DSCP to be set for all outgoing to A11 signaling message *0x3F*:

a11-signalling-packets ip-header-dscp *0x3F*

aaa 3gpp2-service-option

Specifies the value for the 3gpp2-service option.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

aaa 3gpp2-service-option *number*

no aaa 3gpp2-service-option

default aaa 3gpp2-service-option

no

Disables the aaa 3gpp2-service option configuration.

default

Sets / Restores default value assigned for specified parameter **aaa 3gpp2-service-option**.

number

Service option *number* is integer and should be between *0* to *32767*.

Usage

Allows the configuration of a default service option value to be sent in accounting when service option values are not received from PCF. The PDSN will default the service option value to the configured value if the value is not specified by the PCF.

Example

The following command sets the service option to be *40*:

```
aaa 3gpp2-service-option 40
```

aaa nas-ip-address

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

aaa nas-ip-address*IPv4 address*

no aaa nas-ip-address

default aaa 3nas-ip-address

no

Disables the aaa nas-ip-address option configuration.

default

Sets / Restores default value assigned for specified parameter **aaa nas-ip-address** by default this is disabled.

ipv4 address

Specifies the IPv4 addresses to be used.

Usage

Allows the configuration.

Example

The following command configures *1.2.3.4*:

aaa as-ip-addres *1.2.3.4*

access-flow traffic-validation

If **access-flow traffic-validation** is enabled for the service and the subscriber then the flows are checked against the filter rules. If the packets does not match the filter rules, and N violations occur in K seconds, the rp connection is downgraded to best-effort flow, if it is not already a best-effort flow.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

access-flow traffic-validation [**threshold** { **interval** *seconds* | **violations***limit* }]

no access-flow traffic-validation

default access-flow traffic-validation [**threshold** { **interval** | **violations** }]

no

Disable traffic validation for the service.

default

Traffic validation configuration for the service is set to the default value.

threshold { [violations *limit* **] [interval** *seconds* **] }**

violations *limit*: Sets the parameters that determine traffic access violations. This is determined by setting the maximum number of violations within a set time period. must be an integer from *1* through *100000*.

interval *seconds* Sets the time interval, in seconds. must be an integer from *1* through *100000*.

Usage

Use this command to enable traffic validation for the current PDSN service.

Example

The following command enables traffic validation for the current PDSN service and sets the limit allowed to *100* **violations** within *5* seconds:

```
access-flow traffic-validation threshold violations 100 interval 5
```

access-network

Configures access network parameters.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

access-network { **accounting identifier** *identifier_name* | **realm** *realm_name* }

no access-network { **accounting identifier** | **realm** } }

no

Disables the **access-network**.

accounting identifier

Configures accounting for the access-network. This value must be a string from 1 to 128 characters in length.

realm *realm_name*

Configures the realm for the access-network. *realm_name* must be a string from 1 to 128 characters in length.

Usage

Use this command to configure access-network parameters for accounting and realms.

Example

The following command creates an **access-network realm** named *realm2*.

access-networkrealm *realm2*

airlink bad-sequence-number

Configures PDSN behavior for airlink related parameters.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

```
airlink bad-sequence-number { accept | deny [use-deny-code { poorly-formed-request |
unsupported-vendor-id}]}

[ no | default ] airlinkbad-sequence-number
```

no

Disables the deny of bad-sequence number and accept it.

---

default

It is the default behavior.

---

accept

Accepts the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.
It is the default behavior.

---

deny

Rejects the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.
It uses **poorly-formed-request** option by default to deny a request.

---

use-deny-code { poorly-formed-request | unsupported-vendor-id }

These are optional keywords that used with **deny** sub-command to deny the A11 RRQ messages that have either an unsupported vendor Id or A11 Requests with bad/poor formation.
unsupported-vendor-id denies request on the basis of vendor Id.
poorly-formed-request will deny the A11 request on the basis of request formation or structure. It is the default deny code for **deny** sub-command.

Usage

This command is used to configure the airlink parameters for A11 RRQs.
When configured it denies the A11 RRQ messages that have an Airlink Sequence number less than or equal to a previously received sequence number.

Example

The following command would configure the system to deny all A11 RRQ messages having unsupported vendor Id or bad structure of message, including those having arilink sequence number less than or equal to a previously received sequence number:

```
airlinkbad-sequence-number deny
```

allow alt-ppp

Allows proprietary modified versions of PPP type sessions to connect this PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
allowalt-ppp

no allow alt-ppp

default allow alt-ppp
```

no

Disables the allowed alternate PPP feature.

default

Sets the specified parameter to default.

Usage

This command is used to deviate from standard PPP protocol and use a proprietary modified version of PPP with a pre-defined non-negotiable PPP parameters.
It is a vendor-specific licensed feature command.

Example

```
allow alt-ppp
```

always-on-indication

Enables/disables the inclusion of 3GPP2 Always On Indicators in messages to the PCF.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
always-on-indication

no always-on-indication
```

no

Disables the sending of 3GPP2 Always On Indication messages.

Usage

This command is available when the 3GPP2 Always-On RP Extensions feature-use license is installed. When enabled, this command causes the PDSN service to include the Always On Indicators in the Normal Vendor Specific Extension (NVSE) part of an A11 Session Update message to the PCF. The indicator will only be sent for those subscriber sessions in which Always On functionality is enabled as determined after a successful authentication: the 3GPP2-Always-On attribute is set to a value of *1* (Active) for subscribers configured on a AAA server, or the always-on parameter is set for locally configured subscribers.
This functionality is enabled by default.

Example

use the following command to Enables the inclusion of 3GPP2 Always On Indicators in messages to the PCF.

```
always-on-indication
```

associate

Associates a PDSN-service with a Quality of Service (QoS) policy.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

associate qci-qos-mapping *string*

no associate qci-qos-mapping

no

Disables the configuration to associate PDSN-serivce with qos policy.

qci-qos-mapping *string*

qci-qos-mapping configures QCI to QoS mapping for this PDSN service.

string a string of size 1 to 63.

Usage

The following is used for configuration to associate PDSN-serivce with qos policy.

Example

associate qci-qos-mapping *sample*

authentication

Configures authentication parameters for specific PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

authentication { [**allow-noauth**] [**chap** *chap_priority*] [**mschap** *mschap_priority*] [**pap** *pap_priority*] } | [**msid-auth**]

default authentication

default

Configures authentication parameters for specific PDSN service.

allow-noauth

Default: Disabled
This option configures the system to provide subscribers with network access even though they have not been authenticated. This command issued by itself would cause the system to not attempt to authenticate subscribers.
When the allow-noauth option is used in conjunction with commands specifying other authentication protocols and priorities to use, then if attempts to use those protocols fail, the system will treat the allow-noauth option as the lowest priority.
If no authentication is allowed, then NAI construct will be implemented in order to provide accounting records for the subscriber.

chap *chap_priority*

Default: 1
This option configures the system to attempt to use the Challenge Handshake Authentication Protocol (CHAP) to authenticate the subscriber.
A *chap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
chap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.
CHAP is enabled by default as the highest preference.

mschap *mschap_priority*

Default: Disabled
This option configures the system to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the subscriber.
A *mschap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
mschap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.

pap *pap_priority*

Default: 2
This option configures the system to attempt to use the Password Authentication Protocol (PAP) to authenticate the subscriber.
A *pap_priority* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on.
pap_priority must be an integer from 1 through 1000. The lower the integer, the higher the preference.
PAP is enabled by default as the second highest preference.

msid-auth

Default: Disabled
This option configures the system to attempt to authenticate the subscriber based on their Mobile Station Identity (MSID).

Usage

Use to specify how the PDSN service should handle authentication and what protocols to use. The flexibility is given to configure this option to accommodate the fact that not every mobile will implement the same authentication protocols.
The chassis is shipped from the factory with the authentication options set as follows:

- allow-noauth disabled
- chap enabled with a priority of 1
- mschap disabled
- msid-auth disabled
- pap enabled with a priority of 2

Important: At least one of the keywords must be used to complete the command.

Example

The following command would configure the system to allow no authentication for subscribers and would perform accounting using the default NAI-construct of *username@domain*:

```
authentication allow-noauth
```

The following command would configure the system to attempt subscriber authentication first using CHAP, then MSCHAP, and finally PAP. If the allow-noauth command was also issued, if all attempts to authenticate the subscriber using these protocols fail, then the subscriber would be allowed access:

```
authentication chap 1 mschap 2 pap 3
```

bcmcs

Sets the BCMCS (Broadcast Multicast Service) group username and password for RADIUS access.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

bcmcs { **customptt** | **encrypted grppasswd** *group_passwd* | **flow-id** *value* [**flow-id-type** { **flow-id** | **program-id** }] | **grppasswd** *group_password* | **grpusrname***group_name* | **ptt** { **destination-context** *dest_name* | **disconnect-dscp-label** *dscp_label* | **mtu** *transmission_unit* | **rohc-profile-name** *rohc_profile_name* } }

default bcmcs [**custom ptt** | **ptt** { **disconnect-dscp-label** | **mtu** | **rohc-profile-name** }]

no bcmcs { **custom ptt** | **flow-id value** [**flow-id-type** { **flow-id** | **program-id** } | **grppasswd** | **grpusrname** | **ptt** { **destination-context** | **disconnect-dscp-label** | **mtu** | **rohc-profile-name** } }

custom

Customise the BCMCS configuration.

flow-id *value*

Set the BCMCS flow-id. This value must be a hex string between *0x1000* and *0xFFFFFFFF*.
Making this entry opens a new mode: bcmcs-flow-id.
rohc-profile name : Configure ROHC parameters name, name should be string of size *1* to *63*.

grpusrname *group_name*

Sets the BCMCS group name for RADIUS access requests. This value must be a string from *1* to *127* characters in length.

encrypted grppasswd *group_passwd*

Set the BCMCS group password for RADIUS access requests. This value must be a string from *1* to *63* characters in length.
Password can be encrypted or clear.

ptt {destination-context *dest_name* **| disconnect-dscp-label** *dscp_label*| **mtu** *transmission_unit* **| rohc-profile-name** *rohc_profile_name* **}**

destination-context: Specify the intended destination context name. This value must be string of *1* to *79* characters in length.
disconnect-dscp-label: Configures the DSCP label to be present in the In Call Signalling packet based on which In Call Signalling and Media Flows will be disconnected. This value must be a Hexadecimal number between *0x0* and *0xFF*.

mtu *transmission_unit*: Configures maximum transmission unit, This value must be ranging from *100* to *2000*. Default is *1500*.
rohc_profile_name *rohc_profile_name*: Profile name of the ROHC compressor and decompressor. This value should be a string of *1* to *63*.

Usage

Use this command to set the BCMCS group username and password for RADIUS access requests.

Example

bcmcsgrpusername *group_name***bcmcsgrppasswd** *group_password*

bind

Binds the PDSN service to a logical IP interface serving as the R-P interface. Specifies the maximum number of subscribers that can access this service over the interface.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

bindaddress*address* [**max-subscribers** *count*]

no bind address

no

Removes a previously configured binding.

address

Specifies the IP address (address) of the interface configured as the R-P interface. *address* is specified in dotted decimal notation.

max-subscribers *count*

Default: *500000*
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to any integer value between *0* and *2500000*.

Important: The maximum number of subscribers supported is dependant on the license key and the number of active PACs/PSCs installed in the system. A fully loaded system with *13* active PACs/PSCs can support *2500000* total subscribers. Refer to the license key command for additional information.

Usage

Associate or tie the PDSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an R-P interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces that you will configure for use as R-P interfaces
- The maximum number of subscriber sessions that all of the interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-Tx or 1000Base-T) to which these interfaces will be bound

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *192.168.3.1* to the PDSN service and specifies that a maximum of *600* simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
nobind address
```

data-available-indicator

Enables sending Data Available Indicator extension in R-P Registration Reply.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] data-available-indicator
```

no

Default: Disabled
Disable the sending of the Data Available Indicator extension in R-P Registration Reply.

default

Sets / Restores default value assigned for specified parameter for **data-available-indicator**.

Usage

Use this command to enable or disable the sending of the Data Available Indicator extension in R-P Registration Reply

Example

Use the following command to enable sending the Data Available Indicator extension in R-P Registration Reply:

```
data-available-indicator
```

Use the following command to disable sending the Data Available Indicator extension in R-P Registration Reply

```
no data-available-indicator
```

data-over-signaling

Enables the data-over-signaling marking feature for A10 packets.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] data-over signaling
```

default

Sets / Restores default value assigned for specified parameter for **data-over signaling**

no

Default: Enabled
Disable the data-over signaling feature for A10 packets.

Usage

Use this command to enable or disable the data-over signaling feature for A10 packets.

Important: This is a customer-specific command.

Example

```
no data-over-signaling
```

default subscriber

Specifies the name of a subscriber profile configured within the same context as the PDSN service from which to base the handling of all other subscriber sessions handled by the PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

defaultsubscriber *profile_name*

no default subscriber

no

Enables/Disables the option **default subscriber** *profile_name*

profile_name

Specifies the name of the configured subscriber profile. *profile_name* can be between *1* and *127* alpha and/or number characters and is case sensitive.

Usage

Each subscriber profile specifies "rules" such as permissions, PPP settings, and timeout values.
By default, the PDSN service will use the information configured for the subscriber named default within the same context. This command allows for multiple PDSN services within the same context to apply different "rules" to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.
Use the **no default subscriber** *profile_name* command to delete the configured default subscriber.

Example

To configure the PDSN service to apply the rules configured for a subscriber named *user1* to every other subscriber session it processes, enter the following command:

```
default subscriber user1
```

direct-lte-indicator

Enables sending Direct LTE Indicator VSA in Access Request.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] direct-lte-indicator
```

default

Sets / Restores default value assigned for specified parameter for **data-over signaling**

no

Default: Enabled
Disables sending Direct LTE Indicator VSA in Access Request.

Usage

Use this command to enable or disable sending Direct LTE Indicator VSA in Access Request.

Important: This is a customer-specific command.

Example

```
nodirect-lte-indicator
```

dormant-transition

Configures the PDSN behavior to terminate A10 session, when the PDSN receives the A11-RRQ (Type 4) before the session for the original MN is established completely.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] dormant-transition initial-session-setup
```

no

Terminates the A10 session, when PDSN receives the A11-RRQ (Type 4) before the original session established completely.

default

Keeps the A10 session live in case of A11-RRQ (Type 4) is received before the original session is established completely.

Usage

When the status of A10 session goes to dormant before the session for the original MN is established completely, the different MN may possibly send the A11-RRQ (Type 4) to the PDSN and PPP renegotiation may start.
This command is used to terminate the A10 session when the PDSN receives the A11-RRQ (Type 4) before the session for original MN is established completely.

Example

Following command is used to release the A10 session in case of receiving A11-RRQ (Type 4) before the original session is established completely

```
no dormant-transition  initial-session-setup
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fragment

Enables or disables PPP payload fragmentation.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no | default] fragment ppp-data

no

Disables the fragmentation of ppp data.

default

Default enables ppp data fragmentation.

Usage

This command is to indicate to the RP module to NOT fragment PPP payloads being sent to the PCF, if the total packet size (PPP+GRE+IP) exceeds *1500* bytes.
Disabling fragmentation may cause the **sessmgr** to perform outer IP fragmentation of the outgoing packet, if the resulting packet exceeds the MED MTU.

Example

The following command enables PPP payload fragmentation.

fragment ppp-data

gre

Configures Generic Routing Encapsulation (GRE) parameters for the A10 protocol within the PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

gre { **checksum** | **checksum-verify** | **ip-header-dscp** *value* { **all-control-packets** | **setup-packets-only** } | **protocol-type** {**any** | **byte-stream** | **ppp** } | **reorder-timeout** *value* | **segmentation** |**sequence-mode** { **none** | **reorder** } | **sequence-numbers** | **threegppp2-ext-header qos-marking** }

no gre { **checksum** | **checksum-verify** | **ip-header-dscp** | **segmentation** | **sequence-numbers** | **threegppp2-ext-headers qos-marking** }

default gre { **checksum** | **checksum-verify** | **ip-header-dscp** | **protocol-type** | **reorder-timeout** | **segmentation** | **sequence-mode** | **sequence-numbers** | **threegppp2-ext-headers qos-marking** }

---

no

Disables the specified functionality.

---

default

Restores the specified parameter to its default setting.

---

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

---

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

---

ip-header-dscp *value* **{ all-control-packets | setup-packets-only }**

Default: Disabled
Used to configure the QoS Differentiated Services Code Point (DSCP) marking for GRE packets.

- *value* : Represents the DSCP setting. It represents the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F.
- **all-control-packets** : Dictates that the DSCP marking is to be provided in all GRE control packets.
- **setup-packets-only** : Dictates that the DSCP marking is to be provided only in GRE setup packets.

protocol-type { any | byte-stream | ppp }

Specifies the protocol used fro GRE encapsulation that is acceptable to
any: Specifies that the PDSN service will accept GRE packets encapsulated using any protocol.
byte-stream: Specifies that the PDSN service will accept GRE packets only encapsulated using byte stream. Using byte stream encapsulation, PPP packets are framed at different intervals and sent.
ppp: Specifies that the PDSN service will accept GRE packets only encapsulated using the Point-to-Point Protocol (PPP). Using PPP encapsulation, PPP packets are framed at regular intervals and sent.

reorder-timeout

Default: *100*
Configures max number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *milliseconds* must be an integer from *0* through *5000*.

segmentation

Default: disabled
Enables GRE Segmentation for the PDSN service.

sequence-mode { none | reorder }

Default: none
Configures handling of incoming out-of-sequence GRE packets.
none: Specifies that sequence numbers in packets are ignored and all arriving packets are processed in the order they arrive.
reorder: Specifies that out of sequence packets are stored in a sequencing queue until one of the conditions is met:

- The reorder timeout occurs: All queued packets are sent for processing and the accepted sequence number is updated to the highest number in the queue.
- The queue is full (five packets): All packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number in the queue.
- An arriving packet has a sequence number such that the difference between this and the packet at the head of the queue is greater than five. All the packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number that arrived.
- A packet arrives that fills a gap in the sequenced numbers stored in the queue and creates a subset of packets whose sequence numbers are continuous with the current accepted sequence number. This subset of packets in the queue is sent for processing. The reorder timer continues to run and the accepted sequence number is updated to the highest number in the subset delivered.

sequence-numbers

Enables insertion of GRE sequence numbers in data that is about to be transmitted over the A10 interface. Data coming into the system containing sequence numbers but that is out of sequence is not re-sequenced.

threegppp2-ext-headers qos-marking

When threegppp2-ext-headers qos-marking is enabled and the PCF negotiates capability in the A11 RRQ, the PDSN will include the qos optional data attribute in the GRE 3gpp2 extension header.
The **no** keyword, enables qos-marking in the gre header based on the tos value in the header.

Usage

The **gre protocol-type** command can be used to prevent the PDSN service from servicing PCFs that use a specific form of encapsulation.

Use the **no gre sequence-numbers** command to disable the inclusion of GRE sequence numbers in the A10 data path.

The chassis is shipped from the factory with the authentication options set as follows:

- **protocol-type any**
- sequence-numbers enabled

Example

Use this command to configure the PDSN service to exclude byte stream encapsulated GRE traffic:

```
gre protocol-type ppp
```

inter-pdsn-handoff mobility-event-indicator

Configures the PDSN to support the Mobility Event Identifier (MEI) during inter-PDSN handoffs. The presence of the Mobility Event Indicator (MEI) and Access Network Identifier (ANID) elements in a A11 handoff request represents an Inter-PDSN handoff.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
inter-pdsn-handoff mobility-event-indicator

no inter-pdsn-handoff mobility-event-indicator

default inter-pdsn-handoff mobility-event-indicator
```

no

Disables support for the MEI during inter-PDSN handoffs.

default

Sets / Restores default value assigned for **inter-pdsn-handoff mobility-event-indicator**. By default it is disabled.

Usage

Use this command to configure support for the MEI during inter-PDSN handoffs.

Example

Use the following command to enable support for the MEI during inter-PDSN handoffs

```
inter-pdsn-handoff  mobility-event-indicator
```

inter-pdsn-handover

Configures Inter-PDSN handoff related parameters.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
inter-pdsn-handover use-canid-panid

no inter-pdsn-handover use-canid-panid

default inter-pdsn-handover use-canid-panid
```

no

Disables support for the MEI during inter-PDSN handoffs parameters.

default

Sets / Restores default value assigned for **inter-pdsn-handoff mobility-event-indicator**. By default it is disabled.

Usage

Use this command to configure Inter-PDSN handoff related parameters.

Example

Use the following command to econfigure Inter-PDSN handoff related parameters.

```
inter-pdsn-handover use-canid-panid
```

ip header-compression rohc

Enters PDSN Service ROHC Configuration Mode and allows you to configure ROHC parameters that the PDSN conveys to the PCF in the initial A11 RRP message before PPP authentication.

By default, ROHC is disabled for a PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
ipheader-compression rohc

default ipheader-compression rohc

no ipheader-compression rohc
```

default

Sets all PDSN Service ROHC Configuration Mode values back to the defaults and disable ROHC for this PDSN service.

no

Disable IP header compression for this PDSN Service.

Usage

Use this command to enter the PDSN Service ROHC Configuration Mode or disable ROHC for the current PDSN service.

Example

The following command disables ROHC for the current PDSN service and sets all of the values for commands in PDSN Service ROHC Configuration Mode back to their default settings:

```
no ip header-compression rohc
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the R-P interfaces' IP socket.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ip local-port *number*

default ip local-port

number

Default: *699*
Specifies the UDP port number.
number can be any integer value between *1* and *65535*.

default

Designates UDP port, default value as *699*.

Usage

Specify the UDP port that should be used for communications between the Packet Control Function (PCF) and the PDSN.

Important: The UDP port setting on the PCF must match the local-port setting for the PDSN service on the system in order for the two devices to communicate.

Example

Use the following command to specify a UDP port of *3950* for the PDSN service to use to communicate with the PCF on the R-P interface:

iplocal-port *3950*

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Platform

ASR 5000

Product

PDSN, PDIF

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { **clear-on-valid-packet** | **drop-limit** *num* | **period** *secs* | **reneg-limit** *num* }

no ip source-violation clear-on-valid-packet

defaultip source-violation { **drop-limit** | **period** | **reneg-limit** }

no

Enables/Disables **ip source-violation clear-on-valid-packet**.

default

Configure default settings related to **ip source-violation**.

clear-on-valid-packet

Default: disabled
Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

drop-limit *num*

Default: *10*
Sets the number of allowed source violations within a detection period before forcing a call disconnect. If *num* is not specified, the value is set to the default.
num can be any integer value from *1* to *1000000*.

period *secs*

Default: *120*
The length of time, in seconds, for a source violation detection period to last. drop-limit and reneg-limit counters are decremented each time this value is reached.
The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If *secs* is not specified, the value is set to the default.
secs can be any integer value from *1* to *1000000*.

reneg-limit *num*

Default: *5*
Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If *num* is not specified, the value is set to the default.
num can be any integer value from *1* to *1000000*.

Usage

This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two PDIFs PDSNs a number of times during a handoff scenario. This function operates in the following manner:
When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.
For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it re-negotiates PPP.
If the drop-limit is set to *10*, the above process of receiving *5* source violations and renegotiating PPP occurs only once. After the second *5* source violations, the call is dropped. The period timer continues to count throughout this process.
If the configured source-violation period is exceeded at any time before the call is dropped, the reneg-limit counter is checked. If the reneg-limit counter is greater than zero (0), the reneg-limit is decremented by *1*. If the reneg-limit counter equals zero, the drop-limit is decremented by half.

Example

The following command sets the drop limit to *15* and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```

lifetime

Specifies the time that an A10 connection can exist before its registration is considered expired.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

lifetime *time*

no lifetime

default lifetime

no lifetime

Specifies that an A10 connection can exist for an infinite amount of time.

default lifetime

Sets / Restores default value assigned for **lifetime** as 1800.

time

Default: 1800
Specifies the time that an A10 connection can exist before its registration is considered expired.
time is measured in seconds and can be configured to any integer value between *1* and *65534*.

Usage

Set a limit to the amount of time that a subscriber session can remain up whether or not the session is active or dormant. If the lifetime timer expires before the subscriber terminates the session, their connection will be terminated automatically.
Use the **no lifetime** command to delete a previously configured lifetime setting. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default lifetime** command.

Example

The following command specifies a time of *3600* seconds (1 hour) for subscriber sessions on this PDSN service:

```
lifetime 3600
```

max-retransmissions

Configures the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

max-retransmissions *count*

default max-retransmissions

default

Sets / Restores default value assigned for **max-retransmissions** as *5*.

count

Specifies the maximum number of times the PDSN service will attempt to communicate with a PCF before it marks it as unreachable.
count can be configured to any integer value between *1* and *1,000,000*.

Usage

If the value configured for the max-retransmissions is reached the call will be dropped.
The chassis is shipped from the factory with the Internet maximum number of retransmissions set to *5*.

Example

The following command configures the maximum number of retransmissions for the PDSN service to *3*:

```
max-retransmissions 3
```

mobile-ip foreign-agent context

For Mobile IP support, specifies the context in which the FA service(s) are configured.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

mobile-ip foreign-agent context *context_name* [**fa-service** *name*]

no mobile-ip foreign-agent context

no

Enables/Disables **mobile-ip foreign-agent context**

context_name

Specifies the name of the previously configured context that facilitates the FA service(s). context_name must be between *1* and *79* alpha or numeric characters and is case sensitive.

[fa-service *name* **]**

This optional keyword allows you to link the PDSN service to a particular FA service in the specified context. *name* is the name of the FA service to link to. *name* is a string of size *1* to *63*

Usage

FA services on the system can be configured either in the same or different contexts from those facilitating PDSN services. When they are configured in separate contexts, this command configured with a PDSN service instructs the PDSN service to route traffic to the context facilitating the FA service.
Use the **no mobile-ip foreign-agent context** to delete a previously configured destination context.

Example

The following command instructs the PDSN service to use the context named FA-destination for FA functionality:

mobile-ip foreign-agent context *fa-destination*

mobile-ipv6

Configures Mobile IPv6 parameters within specific PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

mobile-ipv6 mobile-access-gateway context *context_name* [**mag-service** *name*]

mobile-access-gateway

Configures Mobile Access Gateway (MAG) parameters within specific PDSN service.

context *context_name*

Designates name of the context in which the MAG service is configured. Must be followed by context name of MAG service.

context_name is a string of size 1 to 79.

mag-service *name*

Designates name of the MAG service in that context. Must be followed by MAG service name.

name is a string of size 1 to 63.

Usage

This command is used to configure Mobile IPv6 parameters and Mobile Access Gateway (MAG) parameters within specific PDSN service.

Example

The following command configures Mobile IPv6 parameters and Mobile Access Gateway (MAG) parameters within specific PDSN service.

mobile-ipv6 mobile-access-gateway context *pdsn1* **mag-service** *serv1*

msid length

Configures checking the length of the A11 MSID in A11 Session Specific Extn and airlink records.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
msid length { [ min min_length ] | max max_length }

default msid length
```

default

Specifies the default length of MSID (*10* to *15*) as per standard. By default **msid** is disabled.

min *min_length*

Specifies the minimum length for MSID.
min_length is any Integer value between *10* to *15*, but should be less than *max_length* specified with **max**. Default is *10*.

max *max_length*

Specifies the maximum length for MSID.
max_length is any Integer value between *10* to *15*, but should be more than *min_length* specified with **min**. Default is *15*.

Usage

MSID length can be configured either in the standard length or different customized length form. This command is used to specify the allowed length of MSID.

Example

The following command specifies an MSID length between *12* and *15*:

```
msid length min 12 max 15
```

nai-construction

Specifies a domain alias that will be used to represent the context which the PDSN service should use for AAA functionality.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

nai-construction domain *alias*

no nai-construction domain

domain *alias*

alias represents the "domain" name that you would like to associate with the context in which AAA functionality is configured. alias can be between *1* and *79* alpha and/or numeric characters and is case-sensitive.

Usage

Enabling NAI will be constructed for the subscriber in the event that their mobile station (MS) does not negotiate CHAP, PAP, or MSCHAP. If this option is selected, no further attempts will be made to authenticate the user. Instead, the constructed NAI will be used for accounting purposes.
The context specified by this command would be used to provide the communication with the RADIUS accounting server.
Use the **no nai-constructed** domain command to deleted a configured alias.

Important: This command should only be used if the PDSN service is configured to allow no authentication using the authentication allow-noauth command.

Additionally, the **aaa constructed-nai** command in the Context Configuration mode can be used to configure a password for constructed NAIs.

Example

The following command configured a domain alias of aaa_context for the PDSN service to use when an NAI is constructed for a subscriber session:

nai-construction domain *aaa_context*

new-call conflict

Enable or disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] new-call conflict terminate-session-old-pcf
```

no

Disable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

default

Enable to send A11-RUPD to current PCF, when system receives the A11-RRQ(Type1) from new PCF during the session exists.

Usage

This configuration supports to enable or disable to send A11-RUPD to current PCF, when the system receives the A11-RRQ(Type1) from new PCF during the session exists.
If the configuration is **no new-call conflict terminate-session-old-pcf** system will not send registration update to old PCF on receiving a new call (A11-RRQ(Type1)) request for an existing active/dormant session.
The default behavior is to send registration updates.

Example The following command configured a system to send a registration update on receiving an A11-RRQ (Type 1) request for an existing active/dormant session:

```
new-call conflict terminate-session-old-pcf
```

pcf-monitor

Enables the monitoring of all the PCFs that have sessions associated with it. The PDSN stops monitoring a PCF if it is determined to be down. Once a PCF is determined to be down, the PDSN tears down all sessions that correspond to the PCF and generates AAA Accounting Stop messages. All the PCFs that are connected to the PDSN service are monitored.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

pcf-monitor [**interval** *seconds* | **max-inactivity-time** *seconds* | **num-retry** *num* | **timeout** *seconds*]

[**no** | **default**] **pcf-monitor**

pcf-monitor

Entering the command with no keywords enables the PCF monitoring function with all parameters set to the defaults.

no

Disables the pcf monitoring function.

default

Sets / Restores default value assigned for **pcf-monitor**.

interval *seconds*

Default: 60 seconds
Sets the amount of time to wait between ping request messages.
seconds must be an integer in the range from 1 through 3600.

max-inactivity-time *seconds*

Default: 120 seconds
The maximum amount of time (seconds) with no A10 traffic from a PCF before the ICMP-ping mechanism is triggered.
seconds must be an integer from 1 through 3600.

num-retry *num*

Default: 5
Sets the number of times that the PDSN retries to ping the PCF. When num-retry for a given PCF has been exhausted with no response, sessions that correspond to the non-responsive PCF are terminated and Accounting Stop records for each terminated session are generated.
num must be an integer in the range from 0 through 100.

timeout *seconds*

Default: 3 seconds
The amount of time to wait for a response before retrying.
seconds must be in the range from 1 through 10.

Usage

Use this command to enable the PDSN service to monitor the PCFs that have sessions associated with the PDSN service.

Example

The following command enables PCF monitoring with parameters set to the defaults:

```
pcf-monitor
```

The following command enables PCF monitoring and sets the timeout to *10* seconds:

```
pcf-monitor timeout 10
```

The following command disables pcf-monitoring:

```
no pcf-monitor
```

pcf-session-id-change restart-ppp

Manages current session and PPP renegotiation on GRE-key change without any change in PCF/PANID/CANID. This command disables or enables the PPP renegotiation restart on receiving an RP registration request from the current PCF with GRE key (PCF session Id) change. With this command the PDSN aborts and restarts the call causing PPP renegotiation.

This is enabled by default.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] pcf-session-id-change restart-ppp
```

no

Disables the pcf-session-id-change restart-ppp function.
With this option PDSN does not restart the PPP renegotiation on GRE key change from current PCF in an RP registration request, unless it indicates change in PCF/PANID/CANID.

default

Set the pcf-session-id-change function to the default state on enabled.

Usage

GRE key (PCF session ID) is sued to identify the data packet for a session and is negotiated through the A11 signaling messages between PCF and PDSN. By default PDSN aborts and restart the PPP renegotiation on receipt of any RP registration request with change in GRE key or PCF session Id.
With use of no pcf-session-id-change restart-ppp command PDSN is configured to disable the restart of call or PPP renegotiation on receipt of any RP registration request with changed GRE key, unless it has any PCF/ANID/CANID change. PDSN silently switches the GRE key for the session, retaining the existing PPP session.

Example

The following command disables the PPP renegotiation restart action on receipt of any RP RRQ with changed GRE key from same PCF/PANID/CANID.

```
no pcf-session-id-change  restart-ppp
```

pdsn type0-tft attempt-inner-match

Configures a type0 traffic flow template (tft) to a type1 traffic flow template.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no | default] pdsn type0-tft attempt-inner-match

no

Disables **pdsn type0-tft attempt-inner-match**.

default

Sets / Restores default value assigned for **pdsn type0-tft attempt-inner-match.**

Usage

This CLI is used make PDSN match inner IP packets for an AIMS call. When enabled, the PDSN tries to match a type-0 tft to match both outer and inner packet, so that MN can use a Type-0 filter for HoA traffic which are tunneled.
This is disabled by default.

Example

The following command enables type0 tft:

pdsn type0-tft attempt-inner-match

peer-pcf

Configures settings for any PCF that has a connection with this PDSN.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

peer-pcf { *ip_address* | *ip_address/mask* } **bcmcs-framing** { **hdlc-like** | **segment-based** }

ip_address **|** *ip_address/mask*

ip_address must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6.
ip_address/mask must be specified using the standard IPv4 dotted decimal notation or colon notation for IPv6, followed by the mask.

bcmcs_framing { hdlc-like | segment-based }

Specifies the type of bcmcs_framing to use for this PCF connection.

- hdlc-like: applies HDLC-like framing for all BCMCS flows
- segment-based: applies segment-based framing for all BCMCS flows

Usage

Use this command to configure the settings for any PCF that is connected to this PDSN. You can also specify bcmcs framing settings to use for the connection.

Example

The following command configures the peer-pcf for an IP address of *131.2.3.4*:

peer-pcf *131.2.3.4*

pma-capability-indicator

Enables sending PMIP Capability Indicator VSA in Access Request.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
pma-capability-indicator  [ 3gpp2 ]

[ no | default ] pma-capability-indicator
```

3gpp2

Use 3GPP2 defined VSA. Default is to use Custom1 VSA.

no

Enables/Disables sending PMIP Capability Indicator VSA in Access Request.

default

Sets / Restores default value assigned for PMIP Capability Indicator.

Usage

Use this command to enable sending PMIP Capability Indicator VSA in Access Request.

Example

The following command enables sending PMIP Capability Indicator using 3GPP2 defined VSA in Access Request.

```
pma-capability-indicator 3gpp2
```

policy

Configures PDSN service policies.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

policy msid-match *msid_with_wildcards* **redirect** *address* [**weight** *weight_num*] [*address2* [**weight** *weight_num*]... *address16* [**weight** *weight_num*]] [**weight** *weight_num*]

no policy msid-match *msid_with_wildcards*

policy overload { **redirect** *address* [**weight** *weight_num*] [*address2* [**weight** *weight_num*] ... *address16* [**weight** *weight_num*]] | **reject** [**use-reject-code** { **admin-prohibited** | **insufficient-resources** }] }

no policy overload [**redirect** *address* [*address2* ... *address16*]]

default policy overload

policy pcf-zone-match *zone_number* **redirect** *address* [**weight** *weight_num*] [*address2* [**weight***weight_num*] ... *address16* [**weight** *weight_num*]]

no policy pcf-zone-match*zone_number*

[**default** | **no**] **policy rrq mei-from-current-pcf suppress-ppp-restart**

policy service-option enforce

[**default** | **no**] **policy service-option**

policy unknown-cvse enforce

[**default** | **no**] **policy unknown-cvse**

no

Enables/Disables the PDSN service policies.

default

Sets / Restores default value assigned for specified PDSN service policies.

policy msid-match *msid_with_wildcards* **redirect** *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **]...** *address16* **[weight** *weight_num* **]] [weight** *weight_num* **]**

Specifies how a PDSN service should handle an incoming call that matches a list of wildcard MSIDs.

msid_with_wildcards: An MSID in which up to 16 digits have been replaced with the wildcard '$'. This defines the list of possible matches for incoming calls.

redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.

address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

policy overload { redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ... address16 [weight** *weight_num* **]] | reject [use-reject-code { admin-prohibited | insufficient-resources }] }**

Specifies how a PDSN service should handle an overload condition.

redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.

address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

reject: This option will cause any overload traffic to be rejected. The PDSN will send an A11 Registration Reply Code of 82H (insufficient resources).

use-reject-codeadmin-prohibited: When this keyword is specified and traffic is rejected, the error code admin prohibited is returned instead of the error code insufficient resources. This is the default behavior.

use-reject-codeinsufficient-resources: When this keyword is specified and traffic is rejected, the error code insufficient resources is returned instead of the error code admin prohibited.

policy pcf-zone-match *zone_number* **redirect** *address* **[weight** *weight_num* **] [** *address2* **[weight***weight_num* **]** *... address16* **[weight** *weight_num* **]]**

Specifies how a PDSN service should handle an incoming call that matches a predefined zone number.

zone_number: An integer between 1 and 32 that defines the zone incoming calls must match for redirection.

redirect: This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the PDSN service rejects new sessions with an A11 Registration Reply Code of 88H (unknown PDSN address) and provides the IP address of an alternate PDSN. This command can be issued multiple times.

address: The IP address of an alternate PDSN expressed in IP v4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.

weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

policy rrq mei-from-current-pcf suppress-ppp-restart

rrq configures policy for PPP restart after getting mei in rrq.

mei-from-current-pcf mei is received in rrq from current pcf.

suppress-ppp-restart suppresses ppp restart when mei is received in rrq from current pcf

policy service-option enforce

service-option configures R-P service-option to use for specific PDSN service. Must be followed by valid service-option number, ranging from 0 to 1000.

enforce designates enforcement of R-P service-option number.

policy unknown-cvse enforce

unknown-cvse configures PDSN service unknown cvse policy.

enforce enforces unknown cvse policy where unknown CVSEs in RRQs will cause Deny

Usage

Policies can be implemented to dictate PDSN service behavior for various conditions such as overloading.
The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system.
The system automatically invokes the overload policy when an on-line software upgrade is started.
Use the **no policy** { **overload** | **service-option** } command to delete a previously configured policy. If after deleting the policy setting you desire to return the policy parameter to its default setting, use the **default policy** command.
The chassis is shipped from the factory with the policy options set as follows:

- overload disabled
- sequence-numbers enforced enabled

Caution: Incorrect configuration of the **policy msid-match** and **policy pcf-zone-match** keywords could result in sessions failing to be established. For example, if PDSN1 is configured to redirect sessions to PDSN2 while PDSN2 is configured to redirect sessions to PDSN1, a loop is created in which all sessions would fail to be connected. In addition, sessions will not be established if the PDSN to which the sessions are being redirected is unavailable.

Example

The following command configures the PDSN service to redirect traffic to two different destinations with weights of *1* and *10* respectively:

```
policy overload redirect 192.168.1.100 weight 1 192.168.1.200 weight 10
```

ppp

Sets PPP tunneling parameters for subscribers in the current PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

ppp { **tunnel-context** *context_name* | **tunnel-type** { **l2tp** | **none** } }

[**no** | **default**] **ppp tunnel-type**

no

Enables/Disables the PPP tunneling parameters for subscribers in the current PDSN service.

default

Sets / Restores default value assigned for PPP tunneling parameters for subscribers in the current PDSN service.

tunnel-context *context_name*

The name of the context that has a LAC service configured to handle all tunnels from this PDSN service.

tunnel-type { l2tp |none }

l2tp: Force all subscriber sessions in this PDSN service to use L2TP tunneling.
none: Do not force L2TP tunneling. This is the default.

Important: If the context specified by the **ppp tunnel-context** *context_name* command does not have a LAC service configured and **tunnel-type** is set to **l2tp** or the call is rejected.

Important: If the PPP tunnel context has not been set or has been cleared with the **no ppp tunnel-context** command and **tunnel-type** is set to **l2tp**, the context where the current PDSN service resides is used. If that context does not have a LAC service configured the call is rejected.

Usage

Use this command to enable or disable forced L2TP tunneling for all subscribers using this PDSN service. Also use this command to define which context defines the L2TP tunneling parameters.

Example

To set the tunnel context to the context named *context1* and enable forced L2TP tunneling, use the following commands;

ppp tunnel-context *context1***ppp tunnel-type** *l2tp*

To enable forced L2TP tunneling with IPSEC security, use the following commands;

```
ppp tunnel-type l2tp-secure
```

To disable forced tunneling, use the following command;

```
ppp tunnel-type none
```

To clear the setting for the tunnel context, use the following command;

```
no ppp tunnel-context
```

qos-profile-id-mapping

Creates the customized QoS profile identifier to QoS mapping for IMS authorization support.

Platform

ASR 5000

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
qos-profile-id-mapping profile-idid_num { [ description desc ] | [ downlink-bw dl_bw] | [
drop-rate drop_percentage ] | [ latency latency_duration ] | [ qos-class { class-A |
class-B | class-C | class-D | class-E | calss-F } ] | [ uplink-bwul_bw ] } +

[ default | no ] qos-profile-id-mappingprofile-id id_num
```

default

Configures the specified QoS profile ID for QoS mapping with default values in this PDSN service.

no

Removes the configured QoS profile ID mapping in this PDSN service.

profile-id *id_num*

Specifies the profile identifier for QoS parameters to be used as the customized profile ID or modifies the QoS parameters in a profile ID (*id_num*) coming from RAN.
id_num must be an integer between 0 and 65535.

description *desc*

Specifies the user defined description for profile identifier.
desc must be an alpha and/or numeric string between 1 and 32 characters.

downlink-bw *dl_bw*

Default: 32
Specifies the downlink (towards the MN) data traffic bandwidth in kilo-bits per second for this QoS profile.
dl_bw must be an integer value between 0 and 100000.

drop-rate *drop_percentage*

Default: 0
Specifies the permitted packet drop rate in percentage for traffic flow to this QoS profile.
drop_percentage must be an integer value between 0 and 1000.

latency *latency_duration*

Default: 1000
Specifies the permitted latency duration in milli-seconds for this QoS profile.

latency_duration must be an integer value between 0 and 1000.

qos-class {class-A | class-B | class-C | class-D | class-E | class-F }

Default: Class-C
Specifies the type of QoS class associated with this QoS profile
class-A: Specifies the A type of QoS class.
class-B: Specifies the B type of QoS class.
class-C: Specifies the C type of QoS class.
class-D: Specifies the D type of QoS class.
class-E: Specifies the E type of QoS class.
class-F: Specifies the F type of QoS class.

uplink-bw *ul_bw*

Default: 32
Specifies the uplink (from the MN) data traffic bandwidth in kilo-bits per second for this QoS profile.
ul_bw must be an integer value between 0 and 100000.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to define the values associated with the profile ID on the PDSN. This profile ID is used during the mapping to and from the authorized QoS to the QoS parameters for the A10 link. This mapping is required because the PDSN only knows the profile IDs and not the actual configured values for the profile ID in the RAN. Also this configuration allows the use of custom profile IDs for the subscribers.
If no values are defined with a QoS profile ID, the values from matching QoS profile ID from RAN will be applicable to the subscriber traffic.

Example

The following command sets the downlink bandwidth to *32* kbps, latency duration as *1000* ms, uplink bandwidth to *32* kbps, and QoS class to Class-C for the QoS profile ID *11* in a PDSN service:

```
default qos-profile-id-mapping profile-id 11
```

qos update

Sets QoS update parameters for policy mismatches or wait timeouts.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
qos-update { policy-mismatch | wait-timeout seconds action { disconnect-session |
downgrade-to-best-effort | drop-packets } }

 [ no | default ] qos-update { policy-mismatch | wait-timeout }
```

no

Enables/Disables the **qos-update** [**policy-mismatch** | **wait-timeout**].

default

Sets / Restores default value for **qos-update** [**policy-mismatch** | **wait-timeout**].

policy-mismatch

PDSN raises a TFT violation if there is a QoS policy mismatch.

wait-timeout *seconds* **action { disconnect-session | downgrade-to-best-effort | drop-packets }**

Sets the wait time for A11 RRQ for QoS changes. *seconds* must be an integer from 1 through 1000.
action: configures the action on the wait-timeout

- **disconnect-session**: Drops the call if the A11 RRQ has not been received for the QoS update. This includes all of the IP flows for the session.
- **downgrade-to-best-effort**: Drops packets if the A11 RRQ has not been received for the QoS update. Sends the forward traffic over best effort (flow FF or FE if available).
- **drop-packets**: Drops packets if the A11 RRQ has not been received for the QoS update.

Usage

This command provides a PDSN service level configurable to configure an action, if the PCF ignores the QoS Update request from PDSN. It sets the amount of time to wait and the action to take, if no RRQ is received before the timeout. The action can be to drop packets for the flow, disconnect the session or to downgrade to best effort.

Example

```
qos-update policy-mismatch
```

The following command sets **wait-timeout** to *60* seconds and invokes **downgrade-to-best-effort** if the A11 RRQ has not been received for the QoS update:

```
qos-update wait-timeout 60 actiondowngrade-to-best-effort
```

registration-accept

Allows the PDSN to accept registration requests when a handoff disconnect is in progress. When the PDSN is tearing down a session and the MN moves over to a new PCF and initiates a new session, the PDSN by default does not accept the handoff until it tears down the old session.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no | default]registration-accept handoff session-disconnect-in-progress

no

Disable accepting of registration requests when a handoff disconnect is still in progress.

default

Default is disabled.
Sets / Restores default value assigned for **registration-accept handoff session-disconnect-in-progress**.

Usage

Use this command to allow the PDSN service to accept registration requests when a handoff disconnect is still in progress.

Example

registration-accept handoffsession-disconnect-in-progress

registration-ack-deny terminate-session-on-error

Configures the PDSN service to terminate an A11 session when a Registration ACK received from the PCF has an error status.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ]registration-ack-deny terminate-session-on-error
```

no

Disable terminating A11 sessions on a Registration ACK error from the PCF.

default

Sets / Restores default value assigned to **registration-ack-deny terminate-session-on-error**.

Usage

Use this command to enable the PDSN service to terminate A11 sessions on a Registration ACK error from the PCF.

Example

Use the following command to enable this functionality in the PDSN:

```
registration-ack-deny terminate-session-on-error
```

registration-deny

Configures parameters related to registration rejection.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

registration-deny { **handoff** { **closedrp-rp handoff-in-progress** | **connection-setup-record-absent** [**use-deny-code** { **poorly-formed-request** | **reason-unspecified** } | **max-deny-reply-limit** *num* | **mismatched-coa-source-address** | **new-call** { **connection-setup-record-absent** | **reverse-tunnel-unavailable** } | **session-already-active** | **session-already-closed** | **session-already-dormant** | **terminate-session-on-error** | **use-zero-gre-key**}

[**default** |**no**] **registration-deny** { **handoff** { **closedrp-rp handoff-in-progress** | **connection-setup-record-absent** } | **mismatched-coa-source-address** | **new-call** { **connection-setup-record-absent** | **reverse-tunnel-unavailable** } | **session-already-active** | **session-already-closed** | **session-already-dormant** | **terminate-session-on-error** | **use-zero-gre-key**}

default

Sets / Restores default value for **registration-deny**.

no

Disables the specified option.

handoff { closedrp-rp handoff-in-progress | connection-setup-record-absent [use-deny-code { poorly-formed-request | reason-unspecified }

This command configures the handoff behavior.
closedrp-rp handoff-in-progress: Configures parameters related to denying handoffs from Closed-RP to RP systems. When enabled the PDSN rejects retransmitted handoff R-P requests when a handoff is already in progress from Closed RP to RP. The deny code used is 'Reason Unspecified'. The default is disabled meaning that the PDSN simply discards such requests.
connection-setup-record-absent [**use-deny-code** { **poorly-formed-request** | **reason-unspecified** }]: When enabled the PDSN denies or discards handoff R-P sessions that do not have an Airlink Connection Setup record in the A11 Registration Request. Default is disabled. Default PDSN behavior is to accept such requests.
[**use-deny-code** { **poorly-formed-request** | **reason-unspecified** }: Sets the specified Registration Deny Code when denying a handoff because of a missing connection setup record.

max-deny-reply-limit *num*

Default: 3
Configures max number of retries of erroneous registration request message from PCF for a session before PDSN terminates the session. *num* can be from 1 to 10.

mismatched-coa-source-address

Default: disabled
Denies RP requests which have a care-of-address field that is different from the request source address.

new-call { connection-setup-record-absent [use-deny-code { poorly-formed-request | reason-unspecified } | reverse-tunnel-unavailable }

connection-setup-record-absent: Configures the PDSN to reject calls that do not have the airlink connection setup record in the RRQ.
use-deny-code { **poorly-formed-request** | **reason-unspecified** } When rejecting calls that do not have the airlink setup record, use the specified deny code.
reverse-tunnel-unavailable: Configures the PDSN to reject calls if the GRE key for a user collides with that of another user.

session-already-active

PDSN denies Registration requests for sessions that are already active with the error code “poorly formed request” .

session-already-closed

PDSN denies RP renew and dereg requests with error code 0x8E for absent R-P sessions.

session-already-dormant

PDSN denies Registration requests for sessions that are already dormant with the error code “poorly formed request” .

terminate-session-on-error

Default: Disabled.
Configures PDSN to terminate session if erroneous registration request message is received for the session.

use-zero-gre-key

Configures the PDSN to set the GRE key to zero (0) when denying a new R-P session.

Usage

Use this command to configure parameters relating to the rejection of registration requests.

Example

To reject calls that do not have the airlink setup record in the RRQ, enter the following command:

```
registration-deny new-call connection-setup-record-absent
```

To reject calls if the GRE key collides with that of another user, enter the following command:

```
registration-deny new-call reverse-tunnel-unavailable
```

To set the GRE key to 0 (zero) when a new R-P session is denied, enter the following command:

```
registration-deny new-call use-zero-gre-key
```

registration-discard

Configures the PDSN service to discard any Registration Request message containing multiple information elements of the same type or a different GRE key for existing IMSI session.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ defualt | no ] registration-discard { bad-extension | gre-key-change |
handoffconnection-setup-record-absent }
```

default

Sets / Restores default value assigned for **registration-discard** .

no

Disables the discarding of Registration request messages containing multiple information elements or different GRE keys.

bad-extension

Default: Disabled
Configures the PDSN to discard Registration Request message containing multiple information elements of same type.

gre-key-change

Default: Disabled
Configures PDSN to discard Registration Request message containing different GRE key for existing IMSI session. Default is disable

handoff connection-setup-record-absent

Default: Disabled
When enabled, discards A11 Handoff requests that do not contain the Airlink Setup record.

Usage

Use this command to configure the PDSN service to discard and Registration Requests that contain multiple information elements of the same type or discard Registration Requests that contain GRE keys that have different GRE keys for the existing IMSI session.

Example

To configure the PDSN service to discard of Registration Requests that have multiple information elements of the same type, enter the following command:

```
registration-discard bad-extension
```

To configure the PDSN service to discard registration Requests that contain a GRE key that is different than the existing one for the existing IMSI session, enter the following command:

```
registration-discard gre-key-change
```

registration-update

Configures registration update related parameters for the PDSN.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

registration-update { **pdsn-code-nvse** | **wait-timeout** *secs* **}**

[**default** | **no**] **registration-update** { **pdsn-code-nvse** | **wait-timeout }**

no

If this option is used with the **pdsn-code-nvse** keyword, then pdsn-code-nvse configuration is disabled.
If this option is used with the **wait-timeout** keyword, a separate A11 timer is not used. The PDSN waits for the ppp retransmit-timeout and then sends the A11 Update. If a value is provided, then the "ppp retransmit-timeout" is ignored and a separate A11 timeout is started immediately upon sending the LCP Term-Ack. The A11 Update is then sent when the timer expires.
A value of 0 sends the A11 Update immediately after sending the LCP Term-Ack.

default

Sets / Restores default value assigned for **registration-update** { **pdsn-code-nvse** | **wait-timeout }**

pdsn-code-nvse

Adds the PDSN code NVSE in all A11 registration update messages.

secs

The number of seconds to wait. *secs* must be an integer in the range from 0 through 16.

wait-timeout

After the Mobile Node terminates a PPP session between the PDSN and the Mobile Node, the PDSN service waits for the specified time period to receive an A11 RRQ from the PCF before it sends out a Registration-Update to clear the Session from the PCF.

Usage

Use this command to configure registration update related
The **wait-tiimeout** keyword configures the PDSN to wait the specified amount of time before sending out a Registration-Update to clear the Session from the PCF.

Example

Use the following command to set the registration wait-timeout to *16* seconds:

```
registration-update wait-timeout 16
```

retransmission-timeout

Configures the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

retransmission-timeout *time*

[**default** | **no**] **retransmission-timeout**

no

Enables/Disables the **retransmission-timeout**.

default

Sets / Restores default value assigned for **retransmission-timeout**.

time

Specifies the maximum allowable time for the PDSN service to wait for a response from the PCF before it a) attempts to communicate with the PCF again (if the system is configured to retry the PCF) or b) marks the PCF as unreachable.
time is measured in seconds and can be configured to any integer value between 1 and 1,000,000.

Usage

Use the retransmission timeout command in conjunction with the **max-retransmissions** command in order to configure the PDSN services behavior when it does not receive a response from a particular PCF.
Use the **no retransmission-timeout** command to delete a previously configured timeout value. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default retransmission-timeout** command.
The chassis is shipped from the factory with the retransmission timeout set to 3 seconds.

Example

The following command configures a retransmission timeout value of *5* seconds:

```
retransmission-timeout 5
```

The following command deletes a previously configured retransmission-timeout setting:

```
noretransmission-timeout
```

service-option

If the service option policy is enabled, this command specifies the service options supported by the PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

service-option *number*

no service-option *number*

no

Enables/Disables the **service-option** *number*

default

Sets / Restores default value assigned for **service-option**.

number

Default: 7, 15, 22, 23, 24, 25, 33, 59, 67
Specifies a specific Service Option (SO) number that this PDSN service is allowed to support.
number can be configured to any integer value between 1 and 1000.

Usage

Use the service option command in conjunction with the policy service option enforce command to configure specific SO numbers that are supported. If a particular SO number is not configured, then any subscriber session received with that SO number will be rejected and an A11 Registration Reply Code of 86 (poorly formed request) will be sent.
By default, PDSN services are configured to support the following service option numbers:

- 7: PCF specific
- 15: PCF specific
- 22: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS1 reverse)
- 23: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS1 forward, RS2 reverse)
- 24: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS1 reverse)
- 25: High Speed Packet Data Service: Internet or ISO Protocol Stack (RS2 forward, RS2 reverse)
- 33: 3G High Speed Packet Data
- 59: High Rate Packet Data
- 67: RP A10 connection

Important: Option 67 is used for auxiliary connections for Rev-A calls. PPP encapsulation of data packets does not flow over this service option connection. ROHC can be performed without PPP for this service option.

Use the **no service-option** *number* command to delete a previously configured service option. If after deleting the service option setting you desire to return the service option parameter to its default setting, use the **default service-option command**.

Example

The following command enables a service option of *12*:

```
service-option 12
```

The following command disables the default service option *59* :

```
no service-option 59
```

setup-timeout

Specifies the maximum amount of time allowed for session setup.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ]setup-timeout seconds

default setup-timeout
```

default

Sets / Restores default value assigned for **setup-timeout**.

seconds

Default: 60 seconds
The maximum amount of time, in seconds, to allow for setup of a session. *seconds* must be an integer from 1 through 1000000

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

Use the following command to set the maximum time allowed for setting up a session to *300* seconds:

```
setup-timeout 300
```

simple-ip allow

Enables or disables Simple-IP sessions from making a connection before authorization takes place.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[no | default ] simple-ip allow
```

no

When a session attempts PPP authentication, it is assumed that it is a Simple-IP session and it is disconnected before the user is authenticated (RADIUS or local authentication). Also, if **allow-noauth** is enabled and PPP authentication is not performed, after IPCP the session is disconnected if it is discovered that it is a Simple-IP session.

default

Reset this command to allow Simple-IP sessions to connect.

Usage

Use this command to prevent Simple-IP sessions from connecting to a PDSN service.

Example

The following command configures the PDSN service so that it will reject any Simple-IP sessions:

```
nosimple-ip allow
```

The following command configures the PDSN service to allow Simple-IP sessions:

```
simple-ip allow
```

spi

Configures the security parameter index (SPI) between the PDSN service and the PCF. This command also configures the redirection of call based on PCF zone.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
spiremote-address { pcf_ip_address | ip_addr_mask_combo } spi-number number {
encrypted secret enc_secret | secret secret } [ description string ] [ hash-
algorithm { md5 | rfc2002-md5 } ] [ replay-protection { nonce | timestamp } ] [
timestamp-tolerance tolerance ] [ zone zone_id ]
```

```
no spi remote-address pcf_ip_address spi-number number
```

remote-address { *pcf_ip_address* | *ip_addr_mask_combo* }

pcf_ip_address: Specifies the IP address of the PCF. pcf_ip_address is an IP address expressed in IP v4 dotted decimal notation.
ip_addr_mask_combo: Specifies the IP address of the PCF and specifies the IP address network mask bits. *ip_addr_mask_combo* must be specified using the form 'IP Address/Mask Bits' where the IP address must either be an IPv4 address expressed in dotted decimal notation or an IPv6 address expressed in colon notation and the mask bits are a numeric value which is the number of bits in the subnet mask.

spi-number *number*

Specifies the SPI (number) which indicates a security context between the PCF and the PDSN in accordance with IOS 4.1 and RFC 2002.
number can be configured to any integer value between 256 and 4294967295.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the PDSN service and the PCF. The secret can be either encrypted or non-encrypted.
encrypted secret *enc_secret*: Specifies the encrypted shared key (enc_secret) between the PCF and the PDSN service. enc_secret must be between 1 and 254 alpha and/or numeric characters and is case sensitive.
secret *secret*: Specifies the shared key (secret) between the PCF and the PDSN services. secret must be between 1 and 127 alpha and/or numeric characters and is case sensitive.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

description *string*

This is a description for the SPI. *string* must be an alpha and or numeric string of from 1 through 31 characters.

hash-algorithm { md5 | rfc2002-md5 }

Default: md5
Specifies the hash-algorithm used between the PDSN service and the PCF.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

replay-protection { nonce | timestamp }

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the PDSN service.
nonce: Configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: Configures replay protection to be implemented using timestamps per RFC 2002.

timestamp-tolerance *tolerance*

Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then time stamp tolerance checking is disabled at the receiving end.
tolerance is measured in seconds and can be configured to any integer value between 0 and 65535.

zone *zone_id*

Specifies the different PCF zones to configure in PDSN service. Mapping of a zone-number to a set of PDSNs can be done per PDSN service basis.
zone_id must be an integer value between 1 and 32. A maximum of 32 PCF zones can be configured for a PDSN service.

Usage

An SPI is a security mechanism configured and shared by the PCF and the PDSN service. Please refer to IOS 4.1 and RFC 2002 for additional information.
Multiple SPIs can be configured if the PDSN service is communicating with multiple PCFs.

Important: The SPI configuration on the PCF must match the SPI configuration for the PDSN service on the system in order for the two devices to communicate properly.

Use the **no** version of this command to delete a previously configured SPI.
This command used with **zone** *zone_id* redirects all calls on the basis of PCF zone to the specific PDSN on the basis of parameters configured at policy pcf-zone-match command.

Example

The following command configures the PDSN service to use an SPI of 256 when communicating with a PCF with the IP address 192.168.0.2. The key that would be shared between the PCF and the PDSN service is q397F65.

```
spi remote-address 192.168.0.2 spi-number 256 secret q397F65
```

The following command deletes the configured SPI of *400* for an PCF with an IP address of *172.100.3.200*:

```
no spi remote-address 172.100.3.200 spi-number 400
```

The following command creates the configured SPI of *400* for an PCF with an IP address of *172.100.3.200* and zone id as 11:

```
spi remote-address 172.100.3.200 spi-number 400 zone 11
```

tft-validation wait-timeout

Configures the TFT validation wait timeout value for QoS changes. The QoS update timer triggers automatic QoS updates based on dynamic policies.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

tft-validation wait-timeout *seconds*

[**default** | **no**] **tft-validation wait-timeout**

no

Removes the wait-timeout timer.

default

Sets / Restores default value assigned for **tft-validation wait-timeout**.

Usage

Configures the TFT validation wait time value for A11 RRQ for QoS changes. *seconds* must be an integer from 1 through 65535.

Example

Use the following command to set the TFT validation wait-timeout to *5* seconds:

```
tft-validation wait-timeout 5
```

threshold a11-ppp-send-discard

Sets an alarm or alert for the PDSN service based on the number of packets that the PPP protocol processing layer internally discarded on transmit for any reason.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold a11-ppp-send-discard *high_thresh* [**clear** *low_thresh*]

no threshold a11-ppp-send-discard

no

Deletes the alert or alarm.

high_thresh

Default: *0*
The high threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between *0* and *100000*.

clear *low_thresh*

Default:*0*
The low threshold number of discarded PPP send packets that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between *0* and *100000*.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of discarded PPP send packets is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of discarded PPP send packets is based on the following rules:

- **Enter condition:** Actual number of discarded PPP send packets > High Threshold
- **Clear condition:** Actual number of discarded PPP send packets £ Low Threshold

Example

The following command configures a number of discarded PPP send packets threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-ppp-send-discard 1000 clear 500
```

threshold a11-rac-msg-discard

Sets an alarm or alert based on the number of Discarded A11 Registration Acknowledgements for the PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold a11-rac-msg-discard *high_thresh* [**clear** *low_thresh*]

no threshold a11-rac-msg-discard

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of Discarded A11 Registration Acknowledgements that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default: *0*
The low threshold number of Discarded A11 Registration Acknowledgements that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between *0* and *100000*.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of Discarded A11 Registration Acknowledgements is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of Discarded A11 Registration Acknowledgements based on the following rules:

- **Enter condition:** Actual number of Discarded A11 Registration Acknowledgements > High Threshold
- **Clear condition:** Actual number of Discarded A11 Registration Acknowledgements £ Low Threshold

Example

The following command configures a number of Discarded A11 Registration Acknowledgements threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

threshold a11-rac-msg-discard *1000* **clear** *500*

threshold a11-rrp-failure

Sets an alarm or alert based on the number of A11 Registration Response failures for the PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
threshold a11-rrp-failure high_thresh [ clear low_thresh ]
no threshold a11-rrp-failure
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of A11 Registration Response failures that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of A11 Registration Response failures that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of A11 Registration Response failures is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of A11 Registration Response failures based on the following rules:

- **Enter condition:** Actual number of A11 Registration Response failures > High Threshold
- **Clear condition:** Actual number of A11 Registration Response failures £ Low Threshold

Example

The following command configures a number of A11 Registration Response failures threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-rrp-failure 1000 clear 500
```

threshold a11-rrq-msg-discard

Sets an alarm or alert based on the number of Discarded A11 Registration Requests for the PDSN service.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

threshold a11-rrq-msg-discard*high_thresh* [**clear** *low_thresh*]

no threshold a11-rrq-msg-discard

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between 0 and 100000.

clear *low_thresh*

Default:0
The low threshold number of Discarded A11 Registration Requests that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between 0 and 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of Discarded A11 Registration Requests is equal to or greater than a specified number.
Alerts or alarms are triggered for the number of Discarded A11 Registration Requests based on the following rules:

- **Enter condition:** Actual number of Discarded A11 Registration Requests > High Threshold
- **Clear condition:** Actual number of Discarded A11 Registration Requests £ Low Threshold

Example

The following command configures a number of Discarded A11 Registration Requests threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold a11-rrq-msg-discard 1000 clear 500
```

threshold init-rrq-rcvd-rate

Sets an alarm or alert based on the average number of calls setup per second for the context.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
threshold init-rrq-rcvd-rate high_thresh [  clear  low_thresh ]

no threshold init-rrq-rcvd-rate
```

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold average number of calls setup per second must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to any integer value between *0* and *1000000*.

clear *low_thresh*

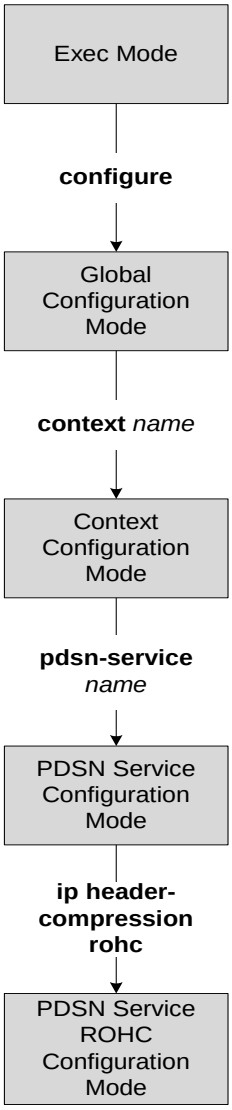
Default:0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to any integer value between *0* and *1000000*.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second > High Threshold
- **Clear condition:** Actual number of calls setup per second £ Low Threshold



Example

The following command configures a number of calls setup per second threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold init-rrq-rcvd-rate 1000 clear 500
```

Chapter 220
PDSN Service RoHC Configuration Mode Commands

The PDSN Service RoHC Configuration Mode is used to configure RoHC (Robust Header Compression) parameters the PDSN service conveys to the PCF in the initial A11 RRP message before PPP authentication.

Important: The commands, keywords and variables in this mode are available dependent on platform type, product version, and installed license(s).

cid-mode

Enters the RoHC Profile Compression Options Configuration mode.and configures options that apply during RoHC compression for the current RoHC profile.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

cid-mode { large | small } max-cid *integer*

default cid-mode

default

Reset all options in the RoHC Profile Compression Configuration mode to their default values.

large

Use large packets with optional information for RoHC

small

This is the default packet size.
Use small RoHC packets.

max-cid *integer*

Default: 15
The highest context ID number to be used by the compressor. *integer* must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.

Usage

Use this command to set the RoHC packet size and define the maximum

Example

The following command sets large RoHC packet size and sets the maximum CID to 100:

```
cid-mode large max-cid 100
```

The following command sets the cid-mode to the default settings of small packets and max-cid 0:

```
default cid-mode
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

mrru

Sets the size of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments. The size includes the CRC. If MRRU is negotiated to be 0, no segment headers are allowed on the channel.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

mrru *num_octets*

default mrru

default

reset the value of this command to its default setting

num_octets

Default: 0
This is the number of octets for the maximum size of the largest reconstructed reception unit allowed. *num_octets* must be an integer from 0 through 65535.

Usage

Use this command to set the size, in octets, of the largest reconstructed reception unit, in octets, that the decompressor is expected to reassemble from segments.

Example

The following command sets the largest reconstructed reception unit to 1024 octets:

```
mrru 1024
```

The following command resets the mrru size to its default of 0 octets:

```
default mrru
```

profile

Specifies the header compression profiles to use. A header compression profile is a specification of how to compress the headers of a specific kind of packet stream over a specific kind of link. At least one profile must be specified.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
profile { [ esp-ip ] [ rtp-udp ] [ udp-ip ] [ uncompressed-ip ] }

default profile
```

default

Default: esp-ip rtp-udp udp-ip uncompressed-ip
This command sets the RoHC profile configuration back to its default setting.

esp-ip

This enables RoHC Profile 0x0003 which is for ESP/IP compression, compression of the header chain up to and including the first ESP header, but not subsequent subheaders.

rtp-udp

This enables RoHCProfile 0x0001 which is for RTP/UDP/IP compression

udp-ip

This enables RoHC Profile 0x0002 which is for UDP/IP compression, compression of the first 12 octets of the UDP payload is not attempted.

uncompressed-ip

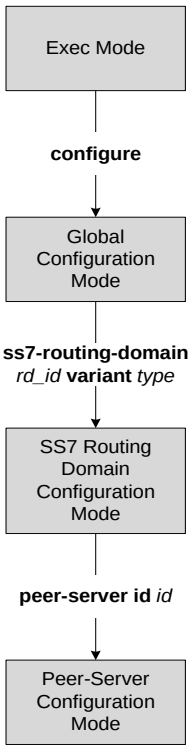
This enables RoHC Profile 0x0000 which is for sending uncompressed IP packets.

Usage

Us this command to specify the RoHC header compression profiles to use.

Example

The following command sets the profiles to use as esp-ip and rtp-udp:



```
profile esp-ip rtp-udp
```

Chapter 221
Peer-Server Configuration Mode Commands

The Peer-Server configuration mode provides the commands to define and manage the peer server configuration part of the SS7 routing on an SGSN.

In this mode, the prompt line usually appears similar to:

```
[local]hostname(config-ss7-rd-<ss7rd_id>-ps-id-<ps_id>)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

mode

Configures the operational mode of the peer-server.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
mode ( loadshare | standby )
```

loadshare

Sets the peer-server to load share. This is the default.

standby

Sets the peer-server to be in standby mode.

Usage

Configure the operational mode of the peer-server.

Example

Configure the peer-server for standby mode.

```
mode standby
```

name

Defines the unique identification - the name - of the peer-server in the SS7 routing domain.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

name *name*

no name

no

Removes the peer server's name from this configuration instance.

name

name: Must be a string of 1 to 64 alphanumeric characters to define a unique identification for the peer-server within the specific SS7 routing domain. Double quotes must be used to create a name that includes spaces.

Usage

Create peer server names that are easy to remember and uniquely identify the PSP.

Example

Use this command to create an easily remembered alphanumeric name for the peer-server:

```
name "Berlin West"
```

psp

Creates the peer-server-process (PSP) instance and enters the PSP configuration mode. See the PSP Configuration Mode chapter in this guide for information on the configuration commands.

Important: This command configures a mandatory parameter in the configuration of the peer server.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

[no] psp instance *id*

no

Removes the PSP instance from the peer server configuration.

id

id Uniquely identifies the specific peer-server-process configuration. The Id must be an integer from 1 to 4.

Usage

Use this command to define the peer-server-process (PSP) instance ID number for the SGSN configuration.

Example

Use this command to create instance #3 for the PSP configuration:

```
psp instance 3
```

routing-context

Defines the ID of the routing context for the peer-server to use.

Important: This command configures a mandatory parameter in the configuration of the peer server.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

routing-context *id*

no routing-context

id

id Uniquely identifies a specific routing context for the peer-server-process to use. The Id must be an integer from 1 to 65535.

no

Removes the routing-context definition from the peer server configuration.

Usage

Use this command to define routing contexts for the peer server.

Example

Define routing-context instance 15:

```
routing-context 15
```

self-point-code

This command defines the point-code to identify the SGSN as a peer server.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

self-point-code *point-code*

no self-point-code

point-code

Point-code is an SS7-type address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

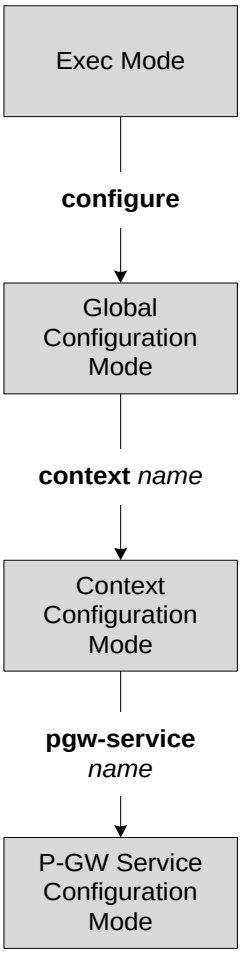
no

Removes the self-point-code configuration for this linkset in the peer server.

Important: Removing the self-point-code will result in the termination of all traffic on this link.

Usage

Use this command to define the point-code to identify the SGSN.



Example

Use the following command to remove the self-point-code definition from the peer-server configuration:

```
no self-point-code
```

Chapter 222
P-GW Service Configuration Mode Commands

The P-GW (PDN Gateway) Service Configuration Mode is used to create and manage the relationship between specified services used for either GTP or PMIP network traffic.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

Associates the P-GW service with specific pre-configured services and/or policies configured in the same context.

Platform

ASR 5000

Product

P-GW

Privilege

Administrator

Syntax

associate { egtp-service *name* **[lma-service** *name* **] | ggsn-service** *name* **| lma-service** *name* **[egtp-service** *name* **] | qci-qos-mapping** *name* **}**

no associate { egtp-service | lma-service | qci-qos-mapping }

no

Removes the selected association from this service.

egtp-service *name* **[lma-service** *name* **] | lma-service** *name* **[egtp-service** *name* **]**

egtp-service *name* **[lma-service** *name* **]**: Specifies that the P-GW service is to be associated with an existing eGTP service within this context.
name must be an alphanumeric string of 1 through 63 characters and be an existing eGTP service.
Configure an associated LMA service name to support handoffs between PMIPv6 and GTP. *name* must be an alphanumeric string of 1 through 63 characters and be an existing LMA service.
lma-service *name* **[egtp-service** *name* **]**: Specifies that the P-GW service is to be associated with an existing LMA service within this context.
name must be an alphanumeric string of 1 through 63 characters and be an existing LMA service.
Configure an associated eGTP service name to support handoffs between PMIPv6 and GTP. *name* must be an alphanumeric string of 1 through 63 characters and be an existing eGTP service.

ggsn-service *name*

Specifies that the P-GW service is to be associated with an existing GGSN service within this context.
name must be an alphanumeric string of 1 through 63 characters and be an existing GGSN service.

qci-qos-mapping *name*

Specifies that the P-GW service is to be associated with an existing QCI-QoS mapping configuration within this context.
name must be an alphanumeric string of 1 through 63 characters and be an existing QCI-QoS mapping configuration.
QCI-Qos mapping is typically configured in a AAA context. Refer to the *QCI-QoS Mapping Configuration Mode Commands* chapter for more information.

Important: If a GGSN service is associated with a P-GW service, then the GGSN service will use the QCI-QoS mapping tables specified in the **qci-qos-mapping** command and assigned to its associated P-GW service.

Usage

Use this command to associate the P-GW service with other pre-configured services and/or policies configured in the same context.

Example

The following command associates this service with an eGTP service called *egtp1*:

```
associate egtp-service egtp1
```

authorize-with-hss

This command enables or disables subscriber session authorization via a Home Subscriber Server (HSS) over an S6b Diameter interface. This feature is required to support the interworking of GGSN with P-GW and HA.

Platform

ASR 5000

Product

P-GW

Privilege

Administrator

Syntax

```
authorize-with-hss [ report-ipv6-addr ]

[ default | no ] authorize-with-hss
```

`[ default | no ]`

Disables the default authorization of subscriber over S6b interface. Resets the command to the default setting of "authorize locally" from an internal APN authorization configuration.

Usage

Use this command to enable/disable the authorization support for subscriber over S6b interface, which is used between P-GW and the 3GPP AAA to exchange the information related to charging, GGSN discovery, etc.

dns-client

Specifies the DNS client context to use for sending DNS queries.

Platform

ASR 5000

Product

P-GW

Privilege

Administrator

Syntax

dns-client context *name*

[default | no] dns-client context

default

Returns the command to the default setting of targeting the DNS client in the context where the P-GW service resides.

no

Disables DNS queries.

context *name*

Specifies the name of the context where the DNS client is used for the resolution of PCSCF-FQDN received from S6b interface.
name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to specify the context where the DNS client resides to perform P-CSCF-FQDN resolution from the S6b interface.

Example

The following command identifies the *egress1* context as the context where the DNS client resides:

```
dns-client context egress1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

fqdn

Configures a Fully Qualified Domain Name for this P-GW service used in messages between the P-GW and a 3GPP AAA server over the S6b interface.

Platform

ASR 5000

Product

P-GW

Privilege

Administrator

Syntax

fqdn host *domain_name* **realm** *realm_name*

[default | no] fqdn

default

Returns the command to the default setting of "null".

no

Removes the configured FQDN from this service configuration.

host *domain_name*

Specifies the domain name of the P-GW service.
domain_name must be an alphanumeric string of 1 through 255 characters.

realm *realm_name*

Specifies the realm name of the P-GW service.
realm_name must be an alphanumeric string of 1 through 255 characters.

Usage

Use this command to identify the P-GW service using an FQDN required when sending messages over the S6b interface to a 3GPP AAA server.

Important: In order to properly interact with other nodes in the network, the FQDN should be less than or equal to 96 alphanumeric characters.

Topology Matching (eHRPD only)

You may specify which P-GW you wish an HSGW interface to connect with by enabling topology matching within the FQDNs for both the HSGW service and P-GW service. Topology matching selects geographically closer nodes and reduces backhaul traffic for a specified interface.

The following optional keywords enable or disable topology matching when added to the beginning of an FQDN:

- **topon.***interface_name*.

Beginning an FQDN with **topon** initiates topology matching with available HSGWs in the network. Once this feature is enabled, the rest of the FQDN is processed from right to left until a matching regional designator is found on a corresponding HSGW FQDN.

- **topoff.***interface_name*.

  By default, topology matching is disabled. If you enable topology matching for any interfaces within a node, however, all interfaces not using this feature should be designated with **topoff**.

Example

The following command configures the FQDN for this P-GW service as *123abc.all.com* with a realm name of *all.com*:

```
fqdn host 123abc.all.com realm all.com
```

The following command configures this P-GW service with an FQDN that enables topology matching:

```
fqdn host topon.interface_name.pgw01.bos.ma.node.epc
.mnc<value>.mcc<value>.3gppnetwork.org realm
node.epc.mnc.mcc.3gppnetwork.org
```

Important: The associated HSGW service must have a corresponding FQDN similar to the following:

```
topon.interface_name.hsgw01.bos.ma.node.epc.mncvalue.mccvalue.3gppnetwork
.org
```

gx-li

Refer to the *Lawful Intercept Configuration Guide* for a description of this command.

newcall

Configures the P-GW to accept or reject requests for a static IP address if the address is already in use by another session.

Platform

ASR 5000

Product

P-GW

Privilege

Administrator

Syntax

```
newcall duplicate-subscriber-requested-address { accept | reject }

no newcall duplicate-subscriber-requested-address
```

no

Returns the command to the default setting of "reject".

duplicate-subscriber-requested-address { accept | reject }

Default: **reject**
accept: Specifies that the old session with the requested address will be ended to accept the new session with the same address.
reject: Specifies that the new session requesting the same address will be rejected.

Usage

Use this command to configure the behavior of the P-GW service when receiving requests for static IP address already in use by other sessions.

Important: This command is only applicable to sessions using services supporting duplicate address abort. These services include HA, GGSN, and P-GW.

Example

The following command allows for the acceptance of requests for static IP addresses already in use by other sessions:

```
newcall duplicate-subscriber-requested-address accept
```

plmn

Configures Public Land Mobile Network identifiers used to determine if a mobile station is visiting, roaming, or belongs to this network.

Platform

ASR 5000

Product

P-GW

Privilege

Administrator

Syntax

plmn id mcc *number* **mnc** *number* **[primary]**

id mcc *number* **mnc** *number*

mcc *number*: Specifies the mobile country code (MCC) portion of the PLMN identifier.
number is the PLMN MCC identifier and must be an integer from 100 through 999.
mnc *number*: Specifies the mobile network code (MNC) portion of the PLMN identifier.
number is the PLMN MNC identifier and can be configured to a 2- or 3-digit integer from 00 through 999.

primary

When multiple PLMN IDs are configured, the **primary** keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute.

Usage

The PLMN identifier is used to aid the P-GW service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple P-GW services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each P-GW Service.

Example

The following command configures the PLMN identifier with an MCC of *462* and MNC of *02*:

```
plmn id mcc 462 mnc 02
```

session-delete-delay

Configures a delay in terminating a session.

Platform

ASR 5000

Product

P-GW

Privilege

Administrator

Syntax

session-delete-delay timeout [*msec* **]**

[default | no] session-delete-delay timeout

default

Resets the command to the default setting of 10000 milliseconds.

no

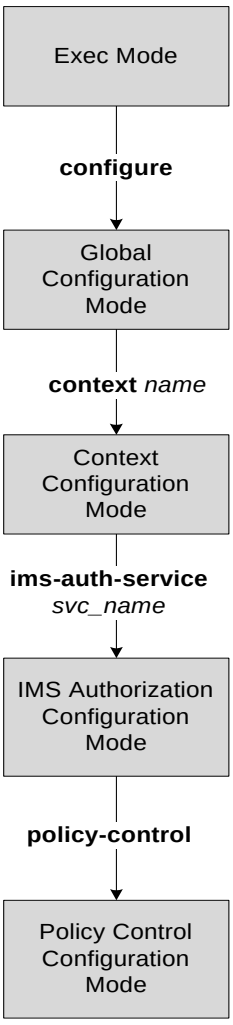
Disables the feature.

timeout *msec*

Default: 10000
Specifies the time to retain the session (in milliseconds) before terminating it.
msec must be an integer from 1000 to 60000.

Usage

Use this command to set a delay to provide session continuity in break-before-make scenarios.



Example

The following command sets the session delete delay to the default setting of 10,000 milliseconds:

```
session-delete-delay timeout
```

Chapter 223
Policy Control Configuration Mode Commands

Policy Control Configuration mode is used to configure the Diameter dictionary, origin host, host table entry and host selection algorithm for IMS Authorization service.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

apn-name-to-be-included

This command configures the APN name to be included in CCR Gx messages.

Platform

ASR 5000

Product

GGSN, IPSG, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
apn-name-to-be-included { gn | virtual }

default apn-name-to-be-included
```

gn | virtual

Specifies which APN name must be sent in the Gx messages.
gn: Specifies to send the real APN name.
virtual: Specifies to send the virtual APN name if present, else to send the real APN name.

default

Applies the default setting for this command.
Default: **gn**

Usage

Use this command to configure the APN name to be included in the CCR Gx messages to the PCRF — the real APN name or the virtual APN name.

Example

The following command configures sending the real APN name in Gx messages:

```
apn-name-to-be-included gn
```

arp-priority-level

This command enables mapping of the ARP priority-level value received from PCRF to inter-user-priority value and be sent in A11 session update.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
arp-priority-level map-to inter-user-priority

[ default | no ] arp-priority-level map-to
```

default

Configures the default setting for this command.
Default: arp-priority-level to inter-user-priority mapping not applicable

no

Disables arp-priority-level to inter-user-priority mapping.

Usage

Important: This command is for a customer-specific implementation to support IP-CAN policy control via Gx interface in PDSN, wherein the PCRF informs the subscriber's subscription level (such as gold, silver, bronze) to PDSN/PCEF via Priority-Level AVP, then PDSN maps the subscriber's subscription level to inter-user-priority and transmits it to PCF via A11 session update message. For more information on the use of this command contact your Cisco account representative.

cc-profile

This command configures the value of the **Offline** AVP sent to the PCRF based on the Charging Characteristics (CC) profile received from the SGSN.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
cc-profile cc_profile_number [ to cc_profile_number_range_end ] map-to offline-avp { 0 |
1 }

{ default | no } cc-profile
```

default

Configures the default setting for this command.
Default: Deletes all previously configured mappings.

no

Deletes all previously configured mappings.

cc_profile_number

Specifies the CC profile number to map.
For example, 1 for Hot Billing.
cc_profile_number must be an integer from 0 through 15.

cc_profile_number_range_end

Specifies, for a range of CC profile numbers to map, the end number. That is, from *cc_profile_number* through *cc_profile_number_range_end*.
cc_profile_number_range_end must be an integer from 1 through 15.

map-to offline-avp { 0 | 1 }

Specifies to map the CC profile number(s) to the **Offline** AVP value sent to the PCRF.

- **0**: Corresponds to the value DISABLE_OFFLINE (0).
- **1**: Corresponds to the value ENABLE_OFFLINE (1).

Usage

Use this command to configure the CC Profile to **Offline** AVP value mapping. The **Offline** AVP's value (DISABLE_OFFLINE (0), ENABLE_OFFLINE (1)) is derived based on the CC profile received from the SGSN as specified by this mapping.
The following example shows how this command can be configured multiple times:

```
cc-profile 1 to 2 map-to offline-avp 1

cc-profile 4 map-to offline-avp 0

cc-profile 8 map-to offline-avp 1
```

On configuring the above set of commands, the Offline AVP value is sent as 1 (Offline enabled) for the CC profiles 1 (Hot Billing), 2 (Flat Rate), and 8 (Post-Paid). And, as 0 (Offline disabled) for the CC profile 4 (Pre-paid).
When configuring this command, overlapping of CC profile numbers is not permitted. In the following example, after configuring the first command, which specifies to send the **Offline** AVP's value as 1 (Offline enabled) for the CC profiles 1 through 15, the second command, which specifies to map CC profile 7, is not permitted:

```
cc-profile 1 to 15 map-to offline-avp 1

cc-profile 7 map-to offline-avp 0
```

Example

The following command specifies to send **Offline** AVP value as 1 (Offline enabled) for the CC profile 1 (Hot Billing):

```
cc-profile 1 map-to offline-avp 1
```

The following command specifies to delete all previously configured mappings:

```
no cc-profile
```

custom-reauth-trigger

This command enables custom reauthorization event triggers.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
custom-reauth-trigger { none | { preservation-changed | reactivation-changed } + }

default custom-reauth-trigger
```

none

Disables all custom event triggers.
This is the default setting.

preservation-changed

Enables preservation-changed event trigger.

Important: This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

reactivation-changed

Enables reactivation-changed event trigger.

Important: This keyword is for use with a customer-specific implementation, and will be available only if a valid license is installed.

default

Configures the default setting for this command.

Usage

Use this command to enable/disable custom reauth event triggers.
It is recommended that the preservation-changed and reactivation-changed triggers both be enabled. As, when the bearer goes into preservation mode with the preservation-changed trigger, the reactivation-changed trigger must also be enabled for the bearer to get reactivated subsequently.
If only the preservation-changed trigger is enabled, and the bearer goes into preservation mode, the bearer will never get reactivated. The reactivation triggers will be ignored. If only the reactivation-changed trigger is enabled, reactivation of the already active bearer does not take place, and the reactivation triggers are ignored.

Example

The following command disables all custom event triggers:

```
custom-reauth-trigger none
```

diameter dictionary

This command specifies the Diameter Policy Control Application dictionary to be used by the IMS Authorization Service for the policy control application.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter dictionary { Standard | dpca-custom1 | dpca-custom10 | dpca-custom11 | dpca-
custom12 | dpca-custom13 | dpca-custom14 | dpca-custom15 | dpca-custom16 | dpca-custom17
| dpca-custom18 | dpca-custom19 | dpca-custom2 | dpca-custom20 | dpca-custom3 | dpca-
custom4 | dpca-custom5 | dpca-custom6 | dpca-custom7 | dpca-custom8 | dpca-custom9 | gx-
wimax-standard | gxa-3gpp2-standard | gxc-standard | pdsn-ty | r8-gx-standard | std-pdsn-
ty | ty-plus | ty-standard }

default diameter dictionary
```

dpca-custom1

Custom-defined Diameter dictionary for the Gx interface.

dpca-custom2

Custom-defined Diameter dictionary for Rel. 7 Gx interface.

dpca-custom3

Custom-defined Diameter dictionary for the Gx interface in conjunction with IP Services Gateway (IPSG).

dpca-custom4

Standard Diameter dictionary for 3GPP Rel. 7 Gx interface.

dpca-custom5

Custom-defined Diameter dictionary for Rel. 7 Gx interface.

dpca-custom6 ... dpca-custom20

Custom-defined Diameter dictionaries.

gx-wimax-standard

Gx WiMAX standard dictionary.

gxa-3gpp2-standard

Gxa 3GPP2 standard dictionary.

gxc-standard

Gxc standard dictionary.

pdsn-ty

This keyword is restricted.

r8-gx-standard

R8 Gx standard dictionary.

Standard

Standard Diameter dictionary for the 3GPP Rel. 6 Gx interface.
Default: Enabled for Gx support in 3GPP networks.

std-pdsn-ty

This keyword is restricted.

ty-plus

This keyword is restricted.

ty-standard

This keyword is restricted.

default

Sets the default Diameter dictionary.
Default: **Standard**

Usage

Use this command to specify the Diameter dictionary for IMS Authorization Service.

Example

The following command sets the **Standard** dictionary for Diameter Policy Control functions in 3GPP network:

```
diameter dictionary Standard
```

diameter host-select reselect

This command controls pacing of the reselection or switching of the PCRF after a change occurs in the table configuration for an IMS Authorization Service.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter host-select reselect subscriber-limit *subs_limit* **time-interval** *duration*

[default | no] diameter host-select reselect

subscriber-limit *subs_limit*

Specifies the limit of subscribers to switch or reselect the PCRF for subscribers not more than *subs_limit* in time duration of *duration* second(s).
subs_limit must be an integer from 1 through 10000000.

time-interval *duration*

Specifies the time duration, in seconds, to reselect PCRF for subscribers not more than *subs_limit* in time duration of *duration* second(s).
duration must be an integer from 1 through 3600.

default

Applies the default setting for this command.
Sets the PCRF reselection or switching to default state.

no

Removes the configured PCRF reselection method and disables the reselection or switching of PCRF.

Usage

Use this command to specify the pacing of reselection or switching of the PCRF in an IMS authorization service..
In case IMS authorization session have been opened on certain PCRF on the basis of the current selection table, and the current active table configuration is changed, the IMSA starts selection procedure for the PCRF. Existing sessions on current PCRF from earlier table is required to close and reopened on the selected PCRF from the new table. This reselection periodicity is controlled by this command and it indicates the number of subscriber sessions *subs_limit* to be reselected or moved in *duration* seconds.
For example, if this command is configured with *100* subscribers and *2* seconds, then the system reselects the PCRF for no more than *100* subscribers per *2* seconds.

Example

The following command sets the system to reselect the new PCRF for no more than *1000* subscriber in *15* seconds:

```
diameter host-select reselect subscriber-limit 1000 time-interval 15
```

diameter host-select row-precedence

This command adds/appends rows with precedence to a Diameter host table or MSISDN prefix range table.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter host-select row-precedence *precedence_value* **table { { { 1 | 2 } host** *host_name* **[realm** *realm_id* **] [secondary host** *host_name* **[realm** *realm_id* **]] } | { prefix-table { 1 | 2 } msisdn-prefix-from** *msisdn_prefix_from* **msisdn-prefix-to** *msisdn_prefix_to* **host** *host_name* **[realm** *realm_id* **] [secondary host** *sec_host_name* **[realm** *sec_realm_id* **] algorithm { active-standby | round-robin }] } } [-noconfirm]**

no diameter host-select row-precedence *precedence_value* **table { { 1 | 2 } | prefix-table { 1 | 2 } }**

---

diameter host-select row-precedence *precedence_value* **table { 1 | 2 } host** *host_name* **[realm** *realm_id* **] [secondary host** *sec_host_name* **[realm** *sec_realm_id* **]]**

This command adds/appends a row in the specified Diameter host table.
In 8.0, a maximum of 16 rows can be added to a table. In 8.1 and later releases, a maximum of 128 rows can be added per table.
row-precedence *precedence_value*: Specifies precedence of the row in the Diameter host table.

Important: In 8.1 and later releases, *precedence_value* must be an integer from 1 through 128. In 8.0 and previous releases, *precedence_value* must be an integer from 1 through 100.

table { 1 | 2 }: Specifies the Diameter host table to add/append the primary and secondary Diameter host addresses.
host *host_name*: Specifies the primary host name. *host_name* must be an alphanumeric string of 1 through 127 characters in length.
realm *realm_id*: Specifies the primary realm ID. *realm_id* must be an alphanumeric string of 1 through 127 characters in length.
secondary host *sec_host_name* **[realm** *sec_realm_id* **]**: Specifies the secondary host name and realm ID:
host *sec_host_name*: Specifies the secondary host name. *host_name* must be an alphanumeric string of 1 through 127 characters in length.
realm *sec_realm_id*: Specifies the secondary realm ID. *realm_name* must be an alphanumeric string of 1 through 127 characters in length.

---

no diameter host-select row-precedence *precedence_value* **table prefix-table { 1 | 2 } }**

Removes the row with the specified precedence from the specified MSISDN prefix range table.

diameter host-select row-precedence *precedence_value* **table prefix-table { 1 | 2 } msisdn-prefix-from** *msisdn_prefix_from* **msisdn-prefix-to** *msisdn_prefix_to* **host** *host_name* **[realm** *realm_id* **] [secondary host** *sec_host_name* **[realm** *sec_realm_id* **] algorithm { active-standby | round-robin }] [-noconfirm]**

Use this command to configure the MSISDN prefix range based PCRF selection mechanism for Rel. 7 Gx interface support, wherein the PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation.
This command adds a row in the specified MSISDN prefix range table. A maximum of 128 rows can be added per prefix range table.
row-precedence *precedence_value*: Specifies precedence of the row in the table.

Important: In 8.1 and later releases, *precedence_value* must be an integer from 1 through 128. In 8.0 and previous releases, *precedence_value* must be an integer from 1 through 100.

prefix-table { 1 | 2 }: Specifies the MSISDN prefix range table to add the primary and/or secondary Diameter host addresses.
msisdn-prefix-from *msisdn_prefix_from*: For a range of MSISDNs, specifies the starting MSISDN.
msisdn-prefix-to *msisdn_prefix_to*: For a range of MSISDNs, specifies the ending MSISDN.

Important: To enable the Gx interface to connect to a specific PCRF for a range of MSISDNs/subscribers configure *msisdn_prefix_from* and *msisdn_prefix_to* with the starting and ending MSISDNs respectively. The MSISDN ranges must not overlap between rows. To enable the Gx interface to connect to a specific PCRF for a specific MSISDN/subscriber, configure both *msisdn_prefix_from* and *msisdn_prefix_to* with the same MSISDN.

host *host_name*: Specifies the primary host name. *host_name* must be an alphanumeric string of 1 through 127 characters in length.
realm *realm_id*: Specifies the primary realm ID. *realm_id* must be an alphanumeric string of 1 through 127 characters in length.
secondary host *sec_host_name* **[realm** *sec_realm_id* **]**: Specifies the secondary host name and realm ID: **host** *sec_host_name*: Specifies the secondary host name. *sec_host_name* must be an alphanumeric string of 1 through 127 characters in length.
realm *sec_realm_id*: Specifies the secondary realm ID. *sec_realm_id* must be an alphanumeric string of 1 through 127 characters in length.
algorithm { active-standby | round-robin }: Specifies the algorithm for selection between primary and secondary servers in the MSISDN prefix range table.
Default: **active-standby**
active-standby: Specifies selection of servers in the Active-Standby fashion.
round-robin: Specifies selection of servers in the Round-Robin fashion.

Important: The Round Robin algorithm for PCRF selection is effective only over a large number of PCRF selections, and not at a granular level.

[-noconfirm]

Specifies that the command is to execute without any additional prompt and confirmation from the user.

no diameter host-select row-precedence *precedence_value* **table { 1 | 2 }**

Removes the row with the specified precedence from the specified Diameter host table.

Usage

Use this command to add, update, or delete rows specified with a precedence from a Diameter host table or MSISDN prefix range table.
In the Rel. 7 Gx implementation, when the Gateway interworks with multiple PCRFs, the Gateway can configure the primary and secondary server based on the MSISDN-prefix range in the MSISDN prefix range table. Using this command, you can add a new prefix row into the MSISDN prefix table.
If a row with the precedence that you add already exists in a table, the existing prefix row is removed and the new row is inserted with the same precedence.

Example

The following command adds a row with precedence *12* in table **2** with primary host name as *star_ims1* and secondary host name as *star_ims2* to Diameter host table.

```
diameter host-select row-precedence 12 table 2 host star_ims1 secondary
host star_ims2
```

diameter host-select table

This command selects the Diameter host table or the MSISDN prefix range table, and the algorithm to select rows from the Diameter host table.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter host-select table { { 1 | 2 } algorithm { ip-address-modulus [ prefer-ipv4 |
prefer-ipv6 ] | msisdn-modulus | round-robin } | prefix-table { 1 | 2 } }

[ default | no ] diameter host-select table
```

`diameter host-select table { 1 | 2 } algorithm { ip-address-modulus | msisdn-modulus | round-robin }`

`table { 1 | 2 }`: Specifies the Diameter host table to obtain the primary and secondary host name for PCRF.

`algorithm { ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ] | msisdn-modulus | round-robin }`: Specifies the algorithm to select row from the Diameter host table.

Default: **`round-robin`**

- **`ip-address-modulus [ prefer-ipv4 | prefer-ipv6 ]`**: This algorithm divides the IP address, in binary, of the subscriber by the number of rows in the table, and the remainder is used as an index into the specified table to select the row.
- prefer-ipv4: Specifies that IPv4 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.
- prefer-ipv6: Specifies that IPv6 addresses are to be used, if an IPv4v6 call is received, for selecting the rows in the host table.
- **`msisdn-modulus`**: This algorithm divides the MSISDN value in binary without the leading "+" of the subscriber by the number of rows in the table, and the remainder is used as an index in the specific table to select the row.
- **`round-robin`**: This algorithm rotates all rows in the active table for selection of the row in round-robin fashion. If no algorithm is specified this is the default behavior.

Important: The Round Robin algorithm is effective only over a large number of selections, and not at a granular level.

`diameter host-select table prefix-table { 1 | 2 }`

Specifies the MSISDN Prefix Range table to be used in case of MSISDN prefix range based PCRF discovery mechanism.

default

Applies the default setting for this command.

no

Removes previous configuration.
When no table is selected, the system will not communicate with any PCRF for new sessions.

Usage

Use this command to configure the Diameter host table and row selection methods to select host name or realm for PCRF.
When this command is used to change which table the system should be using, user must re-determine which E-PDF the system should be using for each subscriber. If a different E-PDF results from the configuration change in the table, the system will wait for all of the IMS sessions for the subscriber to be no longer active and then the system either closes/opens Gx sessions with the old/new PDFs respectively, or the system deactivates the PDP contexts of the subscriber.
Here is an example of how row selection is configured for three hosts that the system will use for load-balancing. Operator can configure six rows in a table, as follows.

Modulo 6	Primary Host	Secondary Host
0	1	2
1	1	3
2	2	1
3	2	3
4	3	1
5	3	2

In the above table, the three hosts are named 1, 2, and 3. When all hosts are working, the load will be distributed among all the three hosts. If host 1 fails, then the load will be distributed between the remaining two hosts. In this scenario, the modulo 6 results of 2 and 4 will return rows that have primary hosts but no working back-up host.
In the Rel. 7 Gx implementation, the GGSN/PCEF is required to discover and select an appropriate PCRF to establish control relationship at primary PDP context activation. The ip-address-modulus, msisdn-modulus, and round-robin algorithms are supported by the GGSN/PCEF for PCRF discovery. In addition, the active/standby and round-robin algorithms are used for selection between primary and secondary servers based on the MSISDN Prefix Range Table.

Example

The following command specifies **table 1** with **round-robin** algorithm to select the rows with host name for E-PDF in Diameter host table.

```
diameter host-select table 1 algorithm round-robin
```

diameter origin endpoint

This command binds the origin endpoint configured in Context Configuration mode to the IMS Authorization service for Diameter Policy Control Application (DPCA).

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter origin endpoint *endpoint_name*

no diameter origin

endpoint *endpoint_name*

endpoint_name is the Diameter endpoint configured in Context Configuration Mode to bind with IMS authorization service, and must be an alpha/numeric string of 1 through 63 characters in length.

no

Removes the binding of Diameter origin endpoint with IMS Authorization service.

Usage

Use this command to bind a configured Diameter origin endpoint to the IMS Authorization service for DPCA. This IMS authorization service searches all system contexts until it finds one with a matching Diameter origin endpoint name specified.

Example

The following command binds a configured endpoint named test to the IMS authorization service:

```
diameter origin endpoint test
```

diameter request-timeout

This command configures the request-timeout setting for Diameter-IMSA Gx interface.

Platform

ASR 5000

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

diameter request-timeout *timeout*

default diameter request-timeout

timeout

Specifies the timeout period in seconds.
timeout must be an integer from 1 through 300.
Default: 10 seconds

default

Applies the default setting for this command.

Usage

Use this command to configure the request-timeout setting for Diameter-IMSA Gx interface. At the request-timeout value, DPCA will apply failure-handling to the subscriber. Action will be taken based on the failure-handling configuration (terminate/retry-terminate/continue).

Example

The following command configures the Diameter request-timeout setting to *20* seconds:

```
diameter request-timeout 20
```

diameter update-dictionary-avps

This command enables dictionary control of the AVPs that need to be added based on the version of the specification to which the PCEF is compliant with.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
diameter update-dictionary avps { 3gpp-r8 | 3gpp-r9 }

{ default | no } diameter update-dictionary avps
```

default | no

Configures this command with the default setting.
The default behavior is that R9 support will not be indicated as part of Supported-Features AVP in a R7/R8 dictionary and R8 support will not be indicated as part of Supported-Features AVP in a R7 dictionary.

3gpp-r8

Specifies to select the 3GPP Rel. 8 AVPs for encoding.

3gpp-r9

Specifies to select the 3GPP Rel. 9 AVPs for encoding.

Usage

Important: This command is applicable only to Diameter dictionaries that support standard based volume reporting over Gx feature.

Use this command to encode the AVPs in the dictionary based on the release version of the specification to which the PCEF is compliant with.
Release 12.0 onwards, if a 3GPP Rel. 7 based dictionary is already configured with **diameter dictionary dpca-custom4** command, and then if the **diameter update-dictionary-avps 3gpp-r9** command is applied, the Supported-Features AVP with feature bit 1 being set will be sent in the CCR-I to indicate that 3GPP Rel. 9 AVPs are also supported.
Both **default** and **no** command have the same behavior, as if the CLI command is not configured. Hence, in the output of **show configuration verbose** command, the **default** and **no** command is shown as **no diameter update-dictionary-avps**.
This CLI command when configured results in behavioral changes as indicated in the following table.

Possible Upgrade Scenarios	Behavior
3GPP Rel. 7 based dictionary upgraded to 3GPP Rel. 9 For example: **diameter dictionary dpca-custom4** **diameter update-dictionary-avps 3gpp-r9**	In the CCR-I, Supported-Features AVP will be encoded with value 2 for the Feature-List AVP. [V] [M] Supported-Features: [M] Vendor-Id: 10415 [V] [M] Feature-List-ID: 1 [V] [M] Feature-List: 2 The Feature-List AVP value suggest that it is 3GPP Rel. 9 compliant. But, it is not fully complaint to 3GPP Rel. 9. In the current release, for this upgrade scenario (3GPP Rel. 7 to 3GPP Rel. 9), only volume reporting related AVPs mentioned in the 3GPP Rel. 9 will be supported.
3GPP Rel. 7 based dictionary upgraded to 3GPP Rel. 8 For example: **diameter dictionary dpca-custom4** **diameter update-dictionary-avps 3gpp-r8**	In the CCR-I, Supported-Features AVP will be encoded with value 1 for the Feature-List AVP. [V] [M] Supported-Features: [M] Vendor-Id: 10415 [V] [M] Feature-List-ID: 1 [V] [M] Feature-List: 1 The Feature-List AVP value suggest that it is 3GPP Rel. 8 compliant. But, it is not fully complaint to 3GPP Rel. 8. In the current release, for this upgrade scenario (3GPP Rel. 7 to 3GPP Rel. 8), none of the features mentioned in 3GPP Rel. 8 will be supported.
3GPP Rel. 8 based dictionary upgraded to 3GPP Rel. 9 For example: **diameter dictionary r8-gx-standard** **diameter update-dictionary-avps 3gpp-r9**	In the CCR-I, value for the Feature-List AVP in the Supported-Features AVP will be 2. [V] [M] Supported-Features: [M] Vendor-Id: 10415 [V] [M] Feature-List-ID: 1 [V] [M] Feature-List: 2 The Feature-List AVP value suggest that it is 3GPP Rel. 9 compliant. But, it is not fully complaint to 3GPP Rel. 9. Currently for this upgrade scenario (3GPP Rel. 8 to 3GPP Rel. 9), only volume reporting related AVPs mentioned in 3GPP Rel. 9 will be supported.

Example

The following command enables encoding of AVPs in the dictionary based on 3GPP Rel. 9:

```
diameter update-dictionary-avps 3gpp-r9
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

event-report-indication

This command enables event report indication.

Platform

ASR 5000

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

```
event-report-indication { all | pgw-trace-control | qos-change | rai-change | rat-change
| sgsn-change | ue-timezone-change | user-loc-change } [ pgw-trace-control ] [ qos-change
] [ rai-change ] [ rat-change ] [ sgsn-change ] [ ue-timezone-change ] [ user-loc-change
]

[ default | no ] event-report-indication
```

`all | pgw-trace-control | qos-change | rai-change | rat-change | sgsn-change | ue-timezone-change | user-loc-change`

Specifies which types of changes will trigger an event report from the PCRF.

- **`all`**: all triggers
- **`pgw-trace-control`**: P-GW trace control change trigger
- **`qos-change`**: QoS change trigger
- **`rai-change`**: RAI change trigger
- **`rat-change`**: RAT change trigger
- **`sgsn-change`**: SGSN change trigger
- **`ue-timezone-change`**: UE time zone change trigger
- **`user-loc-change`**: User location change trigger

`default | no`

Disables event report indication.

Usage

Use this command to determine what type of event changes are reported from the PCRF.

Example

The following command enables event report indication for all triggers.

```
event-report-indication all
```

event-update

This command configures sending usage monitoring information in event updates.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
event-update send-usage-report [ reset-usage ]

[ default | no ] event-update
```

default

Configures the default setting for this command.
Default: Usage report is not sent in event update.

no

Disables sending usage report in event update.

reset-usage

Resets the usage at PCEF after reporting in event update.

Usage

Use this command to send volume usage information when an event change is reported to the PCRF in a CCR-U message.

Example

The following command specifies to send volume usage report in event updates to the PCRF for all event triggers:

```
event-update send-usage-report reset-usage
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

failure-handling

This command configures Diameter failure handling behavior.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

In Release 8.0:

failure-handling { continue | retry-and-terminate | terminate | diameter-result-code { any-error | *result_code* } ccfh { continue | retry-and-terminate | terminate } [cc-request-type { initial-request | terminate-request | update-request }] }

no failure-handling diameter-result-code { any-error | integer *result_code* } [cc-request-type { initial-request | terminate-request | update-request }]

In 8.1 and later releases:

failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } { diameter-result-code { any-error | *result_code* [to *end_result_code*] } } { continue | retry-and-terminate | terminate }

no failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } [diameter-result-code { any-error | *result_code* [to *end_result_code*] }]

no

Disables previous failure-handling configuration.

continue

Specifies that in the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.

retry-and-terminate

Specifies that in the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.

terminate

Specifies that in the event of a failure the user session be terminated.

diameter-result-code { any-error | *result_code* [to *end_result_code*] }

Specifies failure handling behavior for any/specific result-code(s) to identify the type of failure and failure handling action for specific credit control request type.
any-error: Specifies failure handling behavior for those result-codes for which failure-handling behavior has not been specified.
result_code: Specifies a Diameter failure result code. *result_code* is the code returned for a failure handling action and must be an integer from 3000 through 4999.
to *end_result_code*: Use to specify a range of Diameter failure result codes. *end_result_code* must be an integer from 3000 through 4999, and must be greater than *result_code*.

continue | retry-and-terminate | terminate

As in 8.1 and later releases.
Specifies the credit control failure handling action.

- **continue** : In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.
- **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.
- **terminate**: In the event of a failure the user session is terminated.

ccfh { continue | retry-and-terminate | terminate }

As in 8.0 release:
Specifies the credit control failure handling (CCFH) action with or without credit control request type.

- **continue**: In the event of a failure the user session continues. DPCA/Diameter will make periodic request and/or connection retry attempts and/or will attempt to communicate with a secondary peer depending on the peer config and session-binding setting.
- **retry-and-terminate**: In the event of a failure the user session continues for the duration of one retry attempt with the server. If this retry attempt also fails, the session is terminated.
- **terminate**: In the event of a failure the user session is terminated.

cc-request-type

As in 8.0 release:
This optional keyword defines the type of credit control request with failure result code and credit control failure handling action for a session.

- **any-request**: Specifies the request type as any request for a new session.
- **initial-request**: Specifies the request type as initial request for a new session.
- **terminate-request**: Specifies the request type as terminate request for a session.
- **update-request**: Specifies the request type as update request for an active session.

Usage

Use this command to configure the Diameter Policy Control Application (DPCA) failure handling behavior. When an unknown rulebase comes in CCA, changing of rulebase and failure handling is managed in the following manner:

- If the new and existing rulebases have the same CCA policy, then switch to the new rulebase is successful.

- If the new rulebase is valid and has CCA-enabled, in CCA-Initial/Update request, switch to the new rulebase is successful.
- If the new rulebase is valid and does NOT have CCA enabled, whereas the existing rulebase has credit enabled, or vice versa, in CCA-Initial/Update request:
  - CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-RETRY&TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-TERMINATE: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
- If the new rulebase is invalid, in CCA-Initial/Update request:
  - CCFH-Continue: Goes offline immediately after sending the CCR-T with termination cause as BAD_ANSWER.
  - CCFH-RETRY&TERMINATE: Terminates on successful CCA-T, or terminates after successful/failed retry to secondary.
  - CCFH-TERMINATE: Terminates on successful/failed CCR-T to Primary.

The default failure handling behavior is:
`failure-handling diameter-result-code any-error ccfh terminate`

Example

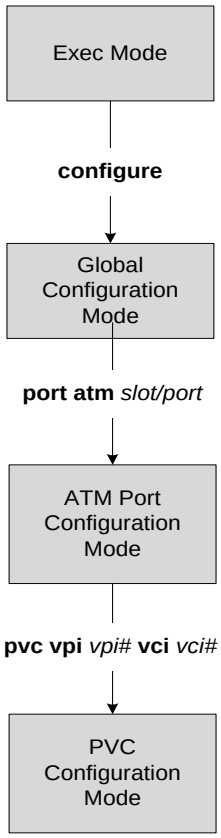
The following command sets the DPCA failure handling to **`retry-and-terminate`** and return a result code of *`3456`* for credit control request type **`initial-request`**:
As in 8.0 release:

```
failure-handling diameter-result-code 3456 ccfh retry-and-terminate cc-request-type initial-request
```

As in 8.1 and later releases:

```
failure-handling cc-request-type initial-request diameter-result-code 3456 retry-and-terminate
```

li-secret



Refer to the *Cisco ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

Chapter 224
PVC Configuration Mode Commands

The Permanent Virtual Connection (PVC) configuration mode commands bind IP interfaces or SS7-Frame Relay links a PVC as well as configure PVC operational parameters for a specific port.

In this mode, the prompt line should appear similar to:

```
[local]hostname(config-port-<slot#>/<port#>-pvc-<pvc_num>/<vci_num>)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, version, and installed license(s).

bind

This command binds an IP interface or an SS7 link to the PVC.

Important: Prior to attempting the binding, the interface and context or the SS7 routing information and link must have been configured.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] bind { interface *interface_name context_name* **| link ss7-routing-domain** *rd_id* **linkset-id** *id* **link-id** *id* **}**

no

Removes the binding from the configuration.

interface_name

Defines the name of the virtual interface to be bound to the PVC. *interface_name:* Must be a unique string consisting of 1 to 79 alphanumeric characters.

context_name

Specifies the name of the context to be bound to the virtual interface. *context_name:* Must be a unique string consisting of 1 to 79 alphanumeric characters.

ss7-routing-domain *rd_id*

Identifies a specific SS7 routing domain. *rd_id* must be an integer from 1 to 12

linkset-id *id*

Identifies a specific linkset within the routing domain. *id*: must be an integer from 1 to 33

link-id *id*

Identifies a specific link within the linkset. *id*: must be an integer value 1 - 16

Usage

Use this command to bind the PVC to an interface or a specific link.

Example

Use a command similar to the following to bind a PVC to a link ID #2:

bind ss7-routing-domain *1* **linkset-id** *23* **link-id** *2*

encapsulation aal5

Specify the data encapsulation type for the ATM adaptation layer 5 (AAL5) frames for the PVC.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
encapsulation aal5 { llc-snap | vc-mux }
```

llc-snap

Frames protocol is identified in the AAL5 using logical link control (LLC) encapsulation.

vc-mux

Frames are not encapsulated and use virtual circuit multiplexing (VC-MUX) to identify the protocols used for the AAL5 frames.

Usage

Use this command to identify the protocol type for the circuit.

Example

```
encapsulation aal5 vc-mux
```

end

Exits the PVC configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the PVC configuration mode and returns to the ATM port configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the port configuration mode.

shaping

Specify the type of traffic shaping (rates) for this PVC.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

shaping { cbr pcr *prc_num* **| ubr pcr** *prc_num* **| ubr+ pcr** *prc_num* **mrc** *mrc_num* **| vbr pcr** *prc_num* **scr** *src_num* **mbs** *mbs_num* **}**

cbr

Constant bit rate
pcr - peak cell rate = cells per second
prc_num: Must be an integer from 75 to 1412830

ubr

Unspecified Bit Rate
pcr - peak cell rate = cells per second
prc_num: Must be an integer from 75 to 1412830

ubr+

Unspecified Bit Rate with Minimum Cell Rate.
The PCR and MCR values should be set to maintain the following relationship: PCR >= (MCR + minRate), where the current recomment minRate is 75.
pcr - peak cell rate = cells per second
prc_num: Must be an integer from 75 to 1412830
mcr - minimum cell rate
mrc_num: Must be an integer from 75 to 1412830

vbr

Variable Bit Rate, NRT (not real time) type.
The PCR and MCR values should be set to maintain the following relationship: PCR >= (MCR + minRate), where the current recomment minRate is 75.
pcr - peak cell rate = cells per second
prc_num must be an integer from 75 to 1412830
scr - sustained cell rate
src_num must be an integer from 75 to 1412830
mbs - maximum burst size
mbs_num must be an integer from 75 to 1412830

Usage

Use this command to configure the shaping for egress traffic on this PVC.

Example

```
shaping cbr pcr 56000
```

shutdown

Disables/enables traffic over the current VLAN.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
shutdown

no shutdown
```

no

Enables the VLAN. When omitted the VLAN is non-functional.

Usage

Enables/ Disables specified VLAN.
This command is necessary to bring a VLAN into service by enabling it via the **no** keyword.

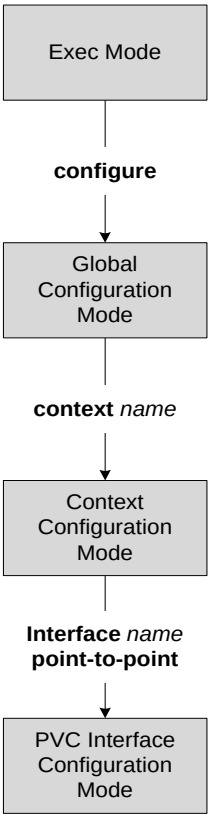
Example

To disable a VLAN from sending or receiving network traffic use the following command:

```
shutdown
```

To enable a VLAN use the following command:

```
no shutdown
```



Chapter 225
PVC Interface Configuration Mode Commands

The PVC (permanent virtual connection) Interface configuration mode is used to create and manage the IP parameters for PVC interface(s) associated with an OLC (ATM-type) for a specific context.

In this mode, the prompt line should appear similar to:

```
[<context_name>]hostname<config-if-pvc)#
```

All configuration information specified with these commands is displayed using the Exec mode.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

description

Defines descriptive text to provide useful information about the current interface.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's description from the configuration file.

text

text: Must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters, 79.

Example

description *"PVC12 connects server 1 to home office."*

end

Exits the PVC interface configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the interface configuration mode and returns to the context configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

ip

The commands in this section are used to configure the IP parameters for the PVC interface.

Important: Before configuring the OSPF parameters in this section, you need to enable OSPF using the router command and OSPF configuration sub-mode commands accessed in the Context configuration mode and documented in the Context Configuration Mode chapter of this Command Line Interface Reference.

ip access-group

This command identities the access control list (ACL to be associated with this PVC interface in this context.

Important: Prior to using this command, the access list must be created for this context with the **ip access-list** command in the Context configuration mode and then the ACL must be configured using the commands described in CLI chapter ACL Configuration Mode.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip access-group *name* **{ in | out }**

no ip access-group *name* **{ in | out }**

no

Indicates the specified access group to be removed from the access list.

name

Specifies the access control list (ACL) rule to be added or removed from the group.
name: Must be a string of 1 to 79 alphanumeric characters with no spaces.

Important: Up to 8 ACLs can be applied to a group provided that the number of rules configured within the ACL(s) does not exceed the 128 rule limit for the interface.

in | out

in: Specifies list is for in-bound access control.
out: Specifies the list is for out-bound access control.

Important: Even though "in" or "out" can be specified, context-level ACL rules are automatically applied to both directions.

Usage

Use this command to add IP access lists configured for the same context to an IP access-group. The list can be configured to apply to all inbound and/or outbound traffic.

Example

The following adds ACL access-list-1 to the IP access-group associated with this PVC for this context.

```
ip access-group access-list-1 in
```

ip address

Defines the primary IP address and the network mask to be associated with this PVC interface for this context. This command can also be used to configure the secondary IP address.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip address *ip_address ip_mask* **[secondary]**

no ip address *ip_address*

no

Removes the IP address information for this PVC from the configuration. It is not necessary to include the subnet mask with the command.
The command must first be issued with the secondary IP address if one exists and then re-issued with the primary IP address.

address *ip_address ip_mask*

Configures the IP address and the network mask for this PVC interface. The first time this command is entered, it automatically defines the primary IP address for this interface.
ip_address and *ip_mask* must be specified using the standard IPv4 or IPv6 dotted decimal notation.

secondary

secondary: Including this keyword indicates the IP address and subnet mask being defined are to be used as the secondary IP address for this PVC interface. This is referred to as multi-homing of the interface.

Usage

Configures or deletes the IPv4 or IPv6 addresses and subnet mask to be associated with this PVC.

Example

The following configures the secondary IP address to associate with the interface.

```
ip address 131.2.3.4 255.255.255.0  secondary
```

The following set of commands removes the primary IP address from the PVC interface configuration for this context.

```
no ip address secondary address

no ip address primary address
```

ip mtu

Configures the maximum transmission unit (MTU) to be supported on this interface.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip mtu *value*

no ip mtu

no

Disables and/or restores the option to the system default.

mtu *value*

Configures the maximum transmission unit in octets.
value: Enter an integer between 576 and 1600. Default is 1500.

Usage

Change the maximum transmission unit size to 1300.

Example

```
ip mtu 1300
```

ip ospf authentication-key

This command configures the password or key to be used for OSPF (Open Shortest Path First) authentication with neighboring routers.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf authentication-key [encrypted] password *auth_key*

no ip ospf authentication-key

no

Deletes the authentication key.

encrypted

Enter this keyword if you are pasting a previously encrypted authentication key into the **password** *auth_key* for this command.

password*auth_key*

auth_key is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication key (password). This variable is entered in clear text format.

Usage

Use this command to set the authentication key used when authenticating with neighboring routers.

Example

To set the authentication key to 123abc, use the following command;

ip ospf authentication-key password *123abc*

Use the following command to delete the authentication key;

no ip ospf authentication-key

ip ospf authentication-type

This command configures the OSPF authentication method to be used with OSPF neighbors over the logical interface.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ip ospf authentication-type { message-digest | null | text }

no ip ospf authentication-type { message-digest | null | text }
```

no

Disable this function.

message-digest

Set the OSPF authentication type to use the message digest (MD) authentication method.

null

Set the OSPF authentication type to use no authentication, thus disabling either MD or clear text methods.

text

Set the OSPF authentication type to use the clear text authentication method.

Usage

Use this command to set the type of authentication to use when authenticating with neighboring routers.

Example

To set the authentication type to use clear text, enter the following command;

```
ip ospf authentication-type text
```

ip ospf cost

This command configures the cost associated with sending a packet over this logical interface.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf cost *value*

no ip ospf cost

no

Disable this function.

value

Default: 10
The cost to assign to OSPF packets. This must be an integer from 1 through 65535.

Usage

Use this command to set the cost associated with routes from the interface.

Example

Use the following command to set the cost to 20;

ip ospf cost *20*

Use the following command to disable the cost setting;

no ip ospf cost

ip ospf dead-interval

This command configures the dead-interval and the delay time in seconds, for OSPF communications.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf dead-interval *value*

no ip ospf dead-interval

no

Deletes the value set and returns the value to its default.

value

The interval, in seconds, that the router should wait. During this interval, if no packets are received then the system considers the neighboring router to be off-line. This interval is typically 4 times the duration of the hello-interval.
value must be an integer from 1 through 65535. Default: 40

Usage

Use this command to set the dead-intervals or delays for OSPF communications.

Example

To set the dead-interval to 100, use the following command;

ip ospf dead-interval *100*

To delete the setting for the dead-interval and reset the dead-interval value to its default of 40, use the following command'

no ip ospf dead-interval

ip ospf hello-interval

This command configures the delay time in seconds, for OSPF hello interval.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf hello-interval *value*

no ip ospf hello-interval

no

Deletes the value set and returns the value to its default.

value

The interval, in seconds, between sending hello packets. This value is typically set to be 1/4 of the value of the **dead-interval**.
value must be an integer from 1 through 65535. Default: 10

Usage

Use this command to set the delays for the hello-interval.

Example

To set the hello-interval to 25, use the following command;

ip ospf hello-interval *25*

To delete the setting for the hello-interval and reset the hello-interval value to its default of 10, use the following command'

no ip ospf hello-interval

ip ospf message-digest-key

This command enables the use of MD5-based OSPF authentication.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf message-digest-key *key_id* **md5 [encrypted] password** *authentication_key*

no ip ospfmessage-digest-key *key_id*

no

Deletes the key.

message-digest-key key_id

Specifies the key identifier number. key_id must be an integer from 1 through 255.

encrypted

Use this if you are pasting a previously encrypted authentication key into the CLI command.

password *authentication_key*

The password to use for authentication. *authentication_key* is a string variable, from 1 through 16 alphanumeric characters, that denotes the authentication password. This variable is entered in clear text format.

Usage

Use this command to create an authentication key that uses MD5-based OSPF authentication.

Example

To create a key with the ID of 25 and a password of 123abc, use the following command;

```
ip ospf message-digest-key 25 md5 password 123abc
```

To delete the same key, enter the following command;

```
no ip ospf message-digest-key 25
```

ip ospf network

Configures the OSPF network type.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf network { broadcast | non-broadcast | point-to-multipoint | point-to-point }

no ip ospf network

no

Disable this function.

broadcast

Sets the network type to broadcast.

non-broadcast

Sets the network type to non-broadcast multi access (NBMA).

point-to-multipoint

Sets the network type to point-to-multipoint.

point-to-point

Sets the network type to point-to-point.

Usage

Use this command to specify the OSPF network type.

Example

To set the OSPF network type to broadcast, enter the following command;

```
ip ospf network broadcast
```

To disable the OSPF network type, enter the following command;

```
no ip ospf network
```

ip ospf priority

This command designates the OSPF router priority.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf priority *value*

no ip ospf priority *value*

no

Disable this function.

value

The priority value to assign. This must be an integer from 0 through 255.

Usage

Use this command to set the OSPF router priority.

Example

To set the priority to 25, enter the following command:

```
ip ospf priority 25
```

To disable the priority, enter the following command:

```
no ip ospf priority
```

ip ospf retransmit-interval

This command configures the retransmit-interval and the delay time in seconds, for OSPF communications.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf dead-interval *value*

no ip ospf dead-interval

no

Deletes the value set and returns the value to its default.

value

The interval, in seconds, between LSA (Link State Advertisement) retransmissions.
value must be an integer from 1 through 65535. Default: 5

Usage

Use this command to set the retransmit-intervals or delays for OSPF communications.

Example

To set the dead-interval to 25, use the following command;

ip ospf retransmit-interval *25*

ip ospf transmit-delay

This command configures the transmit-delay the OSPF communications parameters.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ip ospf transmit-delay *value*

no ip ospf transmit-delay

no

Deletes the value set and returns the value to its default.

transmit-delay *value*

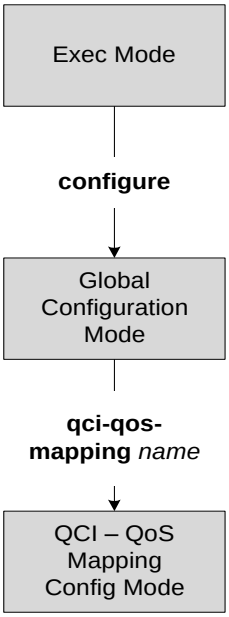
The interval, in seconds, that the router should wait before transmitting a packet.
value must be an integer from 1 through 65535. Default: 1

Usage

Use this command to set the transmit-delay.

Example

To set the transmit delay to 5 seconds, use the following command;



```
ip ospf transmit-delay 5
```

To delete the setting for the transmit-delay or reset the transmit-delay value to its default of 1, use the following command'

```
no ip ospf transmit-delay
```

Chapter 226
QCI - QoS Mapping Configuration Mode Commands

The QoS Class Index (QCI) to QoS Mapping Configuration Mode is used to map QoS Class Indexes to enforceable QoS parameters. Mapping can occur between the RAN and the Serving Gateway (S-GW), the Mobility Management Entity (MME), and/or the PDN Gateway (P-GW) in an LTE network or between the RAN and the eHRPD Serving Gateway (HSGW) in an eHRPD network.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

qci

Creates and maps QCI values to enforceable QoS parameters.

Platform

ASR 5000

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

qci *num* **[delay-class** *num* **precedence-class** *num* **reliability-class** *num* **[downlink | uplink]]**

qci *num* **[downlink { encaps-header { copy-inner | dscp-marking** *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }]**

qci *num* **[gbr [delay-class | downlink | max-packet-delay | traffic-policing | uplink]]**

qci *num* **[max-packet-delay** *num* **max-error-rate** *num* **[downlink | uplink]]**

qci *num* **[non-gbr [delay-class | downlink | max-packet-delay | traffic-policing | uplink]]**

qci *num* **[traffic-policing interval** *interval* **[delay-class | downlink | max-packet-delay | uplink]]**

qci *num* **[uplink { encaps-header { copy-inner | dscp-marking** *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }]**

[default | no] qci *num*

Important: The optional keywords associated with each of the initial optional keywords are abbreviated in the syntax examples above for clarity. Refer to the definitions below for the full keyword paths and associated descriptions for each keyword string in this command.

default

Resets the default values for the select QCI value.

no

Disables the selected QCI value.

num

Specifies the QCI value to be enabled. *num* must be an integer from 1 through 32.
QCI values of 1 through 9 are standard values. Only undefined values (10 through 32) can be defined.

Important: QCI values 1 through 9 are defined in *3GPP Specification TS 23.203 "Policy and charging control architecture"*.

delay-class *num* **precedence-class** *num* **reliability-class** *num*

delay-class *num*: Specifies the pre-release 8 value for configuring packet delay.
num must be an integer from 1 and 32.
precedence-class *num*: Specifies the pre-release 8 value for configuring packet precedence.
num must be an integer from 1 through 32.
reliability-class *num*: Specifies the pre-release 8 value for configuring packet reliability.
num must be an integer from 1 through 32.

downlink { encaps-header { copy-inner | dscp-marking *hex* **} | user-datagram dscp-marking** *hex* **[encaps-header { copy-inner | dscp-marking** *hex* **}] }**

Configures parameters for downlink traffic.
encaps-header: Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.
user-datagram dscp-marking *hex*: Specifies that the IP DSCP marking is to be defined by this keyword.
hex is expressed as a hexadecimal number from 0x00 through 0x3F.
{ copy-inner | dscp-marking *hex* **}**

- **copy-inner**: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.
- **dscp-marking** *hex*: Specifies that the DSCP marking is to be defined by this keyword.

  hex ia expressed as a hexadecimal number from 0x00 through 0x3F.

gbr

Specifies that this QCI type is Guaranteed Bit Rate (GBR).

max-packet-delay *num* **max-error-rate** *num*

max-packet-delay *num*: Specifies the maximum packet delay (in milliseconds) that can be applied to the data with the QCI.
num must be an integer from 10 through 1000. Default is 10ms for QCI values greater than 9.
max-error-rate *num*: Specifies the maximum error loss rate of non-congestion related packet loss.
num must be an integer from 1 through 6, specifying 10-1 through 10-6. Default is 3 (or 10-3) for QCI values greater than 9.

Important: Defaults for QCI values less than 9 are defined in *3GPP Specification TS 23.203 "Policy and charging control architecture"*.

non-gbr

Specifies that this QCI type is non-Guaranteed Bit Rate (non-GBR).

traffic-policing interval *interval*

Specifies the traffic policing interval associated with the this QCI.
interval must be an integer from 1 through 100.

uplink { encaps-header { copy-inner | dscp-marking *hex* } | user-datagram dscp-marking *hex* [encaps-header { copy-inner | dscp-marking *hex* }] }

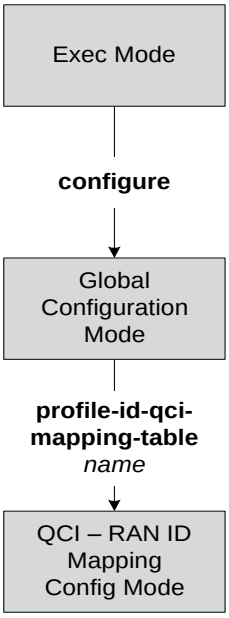
Configures parameters for uplink traffic.
encaps-header: Specifies that the DSCP marking must be set on the encapsulation header for IP-in-IP, GRE, or GTP encapsulation.
user-datagram dscp-marking *hex*: Specifies that the IP DSCP marking is to be defined by this keyword.
hex is expressed as a hexadecimal number from 0x00 through 0x3F.
{ copy-inner | dscp-marking *hex* **}**

- **copy-inner**: Specifies that the DSCP marking is to be acquired from the UDP headers within the encapsulation.
- **dscp-marking** *hex*: Specifies that the DSCP marking is to be defined by this keyword.

  hex is expressed as a hexadecimal number from 0x00 through 0x3F.

Usage

Use this command to create and map QCI values to enforceable QoS parameters.



Example

The following command creates a QCI value of *15* and defines the uplink encapsulation header as using the DSCP marking from the encapsulated UDP header:

```
qci 15 uplink encaps-header copy-inner
```

Chapter 227
QCI - RAN ID Mapping Configuration Mode Commands

The QoS Class Index (QCI) Mapping Configuration Mode is used to map RAN profile IDs to QoS Class Indexes via the HRPD Serving Gateway (HSGW) in an eHRPD network.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

profile-id

Maps a QCI ID to a RAN profile ID and modifies data flow bit rate ranges.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Syntax

profile-id *id* **qci** *num* **[uplink { gbr** *rate* **[mbr** *rate* **] | mbr** *rate* **[gbr** *rate* **] } downlink { gbr** *rate* **[mbr** *rate* **] | mbr** *rate* **[gbr** *rate* **]]**

no profile-id *id*

no

Removes the specified profile ID entry from this map.

id

Specifies the profile ID to which a QCI ID will be mapped. *id* must be an integer value from 1 to 65535.

qci *num*

Specifies the QCI number to which the profile ID will be mapped. *num* must be an integer value from 1 to 255.

uplink

Specifies that the guaranteed bit rate (GBR) and/or maximum bite rate (MBR) setting that follow this keyword will be applied to the uplink data flow.

downlink

Specifies that the guaranteed bit rate (GBR) and/or maximum bite rate (MBR) settings that follow this keyword will be applied to the downlink data flow.

gbr *rate*

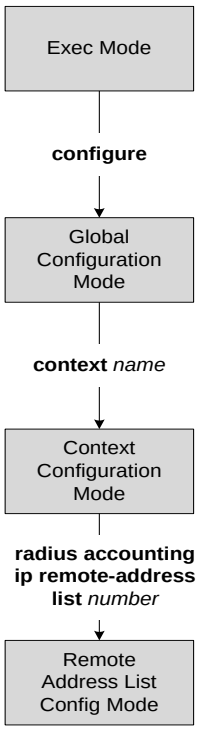
Specifies the guaranteed bit rate for the uplink or downlink data flow. *rate* must be an integer value from 0 to 4294967295.

mbr *rate*

Specifies the maximum bit rate for the uplink or downlink data flow. *rate* must be an integer value from 0 to 4294967295.

Usage

Use this command to map a QCI ID to a RAN profile ID and, optionally, modify data flow bit rate ranges.



Example

The following command maps a QCI ID (*1*) to a profile ID (*10*) and sets the uplink guaranteed bite rate to *10000* and the downlink guaranteed bit rate to *20000*:

```
profile-id 10 qci 1 uplink gbr 10000 downlink gbr 20000
```

Chapter 228
Remote Address List Configuration Mode Commands

The Remote Address List Configuration Mode is used to configure address lists for the Remote Address-based Accounting feature on a per-context basis.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

address

Configures addresses within a Remote Address List.

Platform

ASR 5000

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

[no] address *ip_address* **netmask** *subnet*

no

Removes a previously configured address.

ip_address

Specifies the IP address of the remote device.
ip_address is entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

netmask *subnet*

Specifies the subnet mask of the remote device.
subnet is the netmask expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Usage

Use this command to configure remote address lists for use with the Remote Address-based accounting feature. A maximum of 10 address can be configured per list.

Example

The following command adds an IP address of *192.168.100.1* with a subnet mask of *255.255.255.0* to the list:

```
address 192.168.100.1 netmask 255.255.255.0
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

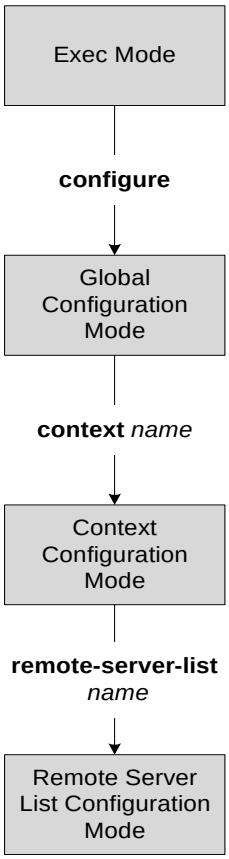
Product

All

Privilege

Security Administrator, Administrator

Syntax



```
exit
```

Usage

Use this command to return to the parent configuration mode.

Chapter 229
Remote Server List Configuration Mode Commands

The Remote Server List Configuration Mode manages the list of server addresses to which a context has access.

Important: Available commands or keywords/variables vary based on platform type, product version, and installed license(s).

address

Configures or removes an IP address to a remote server.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

address *remote-ip-address* **netmask** *ip_netmask*

no address *remote-ip-address* **netmask** *ip_netmask*

no

Removes the specified IP address from the Remote Server List.

remote-ip-address **netmask** *ip_netmask*

Specifies the IP address and netmask of the remote server in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Usage

Use this command to create and maintain a list of remote servers accessible by this context.

Example

```
address 193.154.78.9 netmask 255.255.255.0
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

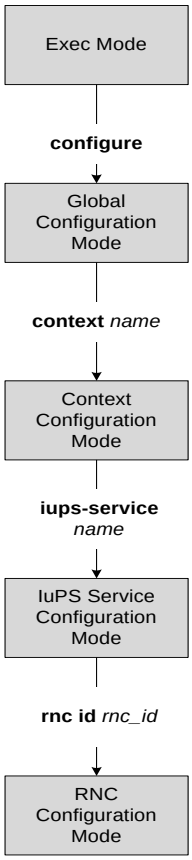
Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage



Use this command to return to the parent configuration mode.

Chapter 230
RNC Configuration Mode Commands

The RNC (radio network controller) configuration mode defines the parameters related to the SGSN connection with an RNC.

This mode is accessed from the IuPS Service configuration mode and the command prompt for this mode will appear similar to:

```
[<context_name>]hostname(config-ctx-iups-service-rnc)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate-gtpu-bind-address

This command defines the GTP-U loopback address and associates (binds) this address with a particular interface (non-loopback) address.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] associate-gtpu-bind-address *ip_address* **to-interface-address** *ip_address*

no

Removes the loopback address definition and interface association from the current RNC configuration.

ip_address

ip_address: Must be specified using the standard IPv4 dotted decimal notation.

Usage

Use this command to setup associations between loopback GTP-U addresses and a non-loopback addresses.

Example

Bind the GTP-U loopback address of *123.1.1.1* to interface address *222.1.1.1*:

```
associate-gtpu-bind-address 123.1.1.1 to-interface-address 222.1.1.1
```

description

This command defines an alphanumeric string that is intended to provide descriptive information about the radio network controller (RNC). This is used for operator reference only.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

no

Removes the description string from the current RNC configuration.

string

Specifies the alphanumeric string that is stored. must be from 1 through 255 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify a particular RNC and carrier in Uganda *"RNC1 Carrier2 Uganda"*:

```
description "RNC1 Carrier2 Uganda"
```

direct-tunnel

This command enables/disables the direct tunnel feature through the interface to the radio network controller (RNC).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
direct-tunnel not-permitted-by-rnc

default direct-tunnel
```

default

Sets the direct tunnel support on RNC to default mode; i.e. enabling direct tunnel.

not-permitted-by-rnc

Default: enabled
Disables the direct-tunnel support on radio network controller (RNC).

Usage

Use this command to disable/enable the direct-tunnel function through the interface to the RNC.

Example

Following command disables the direct tunnel support to the RNC:

```
direct-tunnel not-permitted-by-rnc
```

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode to the Exec mode.

exit

Exits the current configuration mode and returns to the IuPS Service configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous configuration mode.

lac

This command identifies a Local Area Concentrator (LAC) and a Remote Area Concentrator (RAC) and associates them with this RNC definition.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] lac lac_id rac rac_id
```

no

Deletes the LAC and RAC information from the system configuration.

lac_id

A unique numeric identifier for the LAC associated with the RNC.
lac_id must be an integer between 1 and 65535.

rac_id

A unique numeric identifier for the RLAC associated with the RNC.
rac_id must be an integer between 1 and 255.

Usage

Creates an association with a specific LAC and RAC.

Example

Associate LAC *545* and RAC *23* with this RNC:

```
lac 545 rac 23
```

mbms

Configures RNC options for multimedia broadcast multicast service.

Important: This feature and command are currently under development and are not supported.

Platform

ASR 5000

Product

SGSN

overload-action disable

This command maps an action to be taken if traffic reaches or exceeds defined levels.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

overload-action disable { activate | attach | auth-challenge | modify-request | paging-downlink-data | ptmsi-reallocation | service-request-data | sms } traffic-level *traffic-level*

[no | default] overload-action disable { activate | attach | auth-challenge | modify-request | paging-downlink-data | ptmsi-reallocation | service-request-data | sms }

no

Removes the defined overload action from configuration.

default

Resets the traffic level to the default level for the associated overload action.

activate traffic-level *traffic-level*

The system rejects new requests to activate PDP contexts if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 14

attach traffic-level *traffic-level*

The system rejects new requests for GPRS attach if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 15

auth-challenge traffic-level *traffic-level*

The system skips performing authentication challenges if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 4

modify-request *traffic-level*

The system rejects requests to modify a PDP context if the defined traffic-level is exceeded.
traffic-level: An integer 1 to 15.
Default: 12

paging-downlink-data traffic-level *traffic-level*

If the defined traffic-level is exceeded, then paging is not performed for data during downlinks if RABs are not available.
traffic-level: An integer 1 to 15.
Default: 11

ptmsi-reallocation traffic-level *traffic-level*

The system skips performing ptmsi-reallocation if the defined traffic-level is reached or exceeded.
traffic-level: An integer from 1 to 15.
Default: 4

service-request-data traffic-level *traffic-level*

The system rejects service requests to accept data and establish new RABs if the defined traffic-level is reached or exceeded.
traffic-level: An integer from 1 to 15.
Default: 10

sms traffic-level *traffic-level*

The system rejects SMS signaling if the defined traffic-level is reached or exceeded.
traffic-level: An integer 1 to 15.
Default: 8

Usage

This command defines traffic levels and the actions to take if traffic exceeds the defined levels. The command can be re-entered multiple times to create individual definitions for each type of traffic level and action.

Example

Use the following to instruct the system to reject service requests to establish new RABs if the traffic level reaches *3*:

```
overload-action disable service-request-data traffic-level 3
```

paging-non-searching-indication

This command instructs the SGSN to include the non-searching indicator flag in the page-request message.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
paging-non-searching-indication { non-searching | searching }

[ no | default ] paging-non-searching-indication
```

no | default

This is the default. Entering no or default with this command disables the inclusion of the flag.

non-searching

Set the non-searching-indication to non-searching in the page-request message.

searching

Set the non-searching-indication to searching in the page-request message.

Usage

Use this command to determine which type of search indicator flag will be included in the page-request message.

Example

Use this command to include the non-searching flag in page-request messages:

```
paging-non-searching-indication non-searching
```

pointcode

Configures the point code of the RNC.

The access protocol that is part of the IuPS Service configuration mode must be configured prior to defining the RNC's point code.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

pointcode *pt_code*

no pointcode

no

Deletes the RNC's point code information from the system configuration.

pt_code

Point code in dotted-decimal format :

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- string of 1 to 11 characters

Usage

Use this command to identify the point code of the associated RNC.

Example

Identify the pointcode for this RNC as *1.234.2*:

```
pointcode 1.234.2
```

pooled

Configure an RNC as either ‘pooled’ or ‘non-pooled’.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
pooled

[ default | no ] pooled
```

default | no

Entering either **default** or **no** returns the RNC configuration to the default ‘non-pooled’ state.

Usage

Each RNC, one-at-a-time, can be identified as ‘pooled’ -- as participating within an SGSN pool -- or ‘non-pooled’. Pooled RNCs can co-exist with non-pooled RNCs.

Example

Identify this RNC as being part of an SGSN pool:

```
pooled
```

rab-asymmetry-indicator

Configures the SGSN to force “Asymmetric-Bidirecitonal” as the RAB Asymmetry Indicator when uplink/downlink bitrates are equal.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
rab-asymmetry-indicator symmetric-bidirectional force-asymmetric-bidirectional

no rab-asymmetry-indicator symmetric-bidirectional force-asymmetric-bidirectional

default rab-asymmetry-indicator
```

default | no

Disables the override and sets the indicator based on the symmetry of the bitrates as described for the Default Functionality below.

Usage

This command defines an override that uses “Asymmetric-Bidirecitonal” as the RAB Asymmetry Indicator when uplink/downlink bitrates are equal (default functionality item #1). This overrides the default functionality (see below) for the RAB indicator in the RAB Assignment Request.
As a result of using this override command, two sets of bitrates, one for downlink and one for uplink, will be included in RAB Assignment Requests for establish or modify per 3GPP TS 25.413.
Default Functionality: The SGSN sets the value of the RAB Asymmetry Indicator based on symmetry of negotiated maximum bitrates in the following manner:

- If the uplink and downlink bitrates are equal, then it is set to “Symmetric-Bidirectional”.
- If uplink bitrate is set to 0 kbps, then it is set to “Asymmetric-Unidirectional-Downlink”.
- If downlink bitrate is set to 0 kbps, then it is set to “Asymmetric-Unidirectional-Uplink”.
- If the uplink and downlink bitrates are non-zero and different, then it is set to “Asymmetric-Bidirectional”.

Example

Override the use of the “Symmetric-Bidirectional” RAB Asymmetry Indicator for equal up/downlink bitrates with the following command:

```
rab-asymmetry-indicator symmetric-bidirectional force-asymmetric-
bidirectional
```

Disable the override with the following command:

```
no rab-asymmetry-indicator symmetric-bidirectional force-asymmetric-
bidirectional
```

rab-modify-procedure

This command configures how the RAB (radio access bearer) assignment procedure will be modified

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
rab-modify-procedure { normal-modify | release-and-establish }

default rab-modify-procedure
```

default

Returns the configuration to the default setting for this command parameter.

normal-modify

Selects the normal RAB modify procedure.

release-and-establish

Instructs the system to release and establish the RAB procedure.

Usage

Set the procedure to establish the radio access bearer (RAB).

Example

```
rab-modify-procedure normal-modify
```

ranap global-cn-id

This command configures the SGSN to use include the Global Core Network ID IE in the various messages.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ranap global-cn-id { paging-request | relocation-request | reset-procedure | reset-resource-procedure } [ network-sharing selected-plmn ]

[ default | no ] ranap global-cn-id { paging-request | relocation-request }
```

default

Returns the configuration to the default setting and sends the common-plmn in the Global CN ID IE.

no

Disables sending the Global CN ID IE.

paging-request

Instructs the SGSN to send the Global CN ID IE in the Paging Request message.

relocation-request

Instructs the SGSN to send the Global CN ID IE in the Relocation Request message.

reset-procedure

Instructs the SGSN to send the Global CN ID IE in the Reset/Ack message.

reset-resource-procedure

Instructs the SGSN to send the Global CN ID IE in the Reset-Resource/Ack message.

network-sharing selected-plmn

Instructs the SGSN to send the selected-plmn in the Global CN ID IE *if* network sharing has been enabled.

Usage

Use this command to configure the SGSN to use ‘selected-plmn’ in the Global Core Network ID IE in various messages when network sharing is enabled.

Example

Use the following command to include the global-cn-id IE in a Paging Request with the common PLMN when network sharing is enabled :

```
default ranap global-cn-id paging-request
```

Use the following command to include global-cn-id IE in Relocation Request with the selected-plmn (assumes network sharing has been enabled):

```
ranap global-cn-id relocation-request network-sharing selected-plmn
```

ranap paging-area-id

This command configures the SGSN to use include the Paging Area ID IE in the Paging Request message.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ranap paging-area-id paging-request [ network-sharing selected-plmn ]

[ default | no ] ranap paging-area-id paging-request [ network-sharing selected-plmn ]
```

default

Returns the configuration to the default setting and sends the common-plmn in the Paging Area ID IE.

no

Disables sending the Paging Area ID IE.

paging-request

Instructs the SGSN to send the Paging Area ID IE in the Paging Request message.

network-sharing selected-plmn

Instructs the SGSN to send the selected-plmn in the Paging Area ID IE *if* network sharing has been enabled.

Usage

Use this command to configure the SGSN to use 'selected-plmn' in the Paging Area ID IE in the Paging Request message when network sharing is enabled.

Example

Use the following command to include the paging-area-id IE in a Paging Request with the common PLMN when network sharing is enabled :

```
default ranap paging-area-id paging-request
```

Use the following command to include global-cn-id IE in Paging Request with the selected-plmn (assumes network sharing has been enabled):

```
ranap global-cn-id paging-request network-sharing selected-plmn
```

ranap paging-cause-ie

This command sets the paging cause value and either includes or suppresses the Paging Cause IE in responses to Paging Requests due to various sources. This command is available in releases 8.1 and higher.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ranap { paging-cause-ie { all | background-data [*value* **] | conversational-data [** *value* **] | gmm-signalling [** *value* **] | gs-signalling [** *value* **] | interactive-data [** *value* **] | sm-signalling [** *value* **] | sms-signalling [** *value* **] | streaming-data [** *value* **] }**

[default | no] ranap { paging-cause-ie { all | background-data | conversational-data | gmm-signalling | gs-signalling | interactive-data | sm-signalling | sms-signalling | streaming-data }

default

Resets the specific parameters value to default.

no

Suppresses the Paging Cause IE so that it is not included in responses to Paging Requests from respective sources.

all

Using **all** sets the action for the Paging Cause IE value for all paging due to all sources.

background-data [*value* **]**

Default: 3 (terminating background call)
Set the Paging Cause IE value for paging due to background data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

conversational-data [*value* **]**

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to conversational data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

gmm-signalling [*value* **]**

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to gmm-signaling.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

gs-signalling [*value*]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to VLR Paging Request.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

interactive-data [*value*]

Default: 2 (terminating interactive call)
Set the Paging Cause IE value for paging due to interactive data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

sm-signalling [*value*]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to SM signaling.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

sms-signalling [*value*]

Default: 4 (terminating low priority signaling)
Set the Paging Cause IE value for paging due to SMS signaling.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

streaming-data [*value*]

Default: 5 (terminating high priority signaling)
Set the Paging Cause IE value for paging due to streaming data.
value : Must be an integer from 0 to 5. See Paging Cause value mapping in Usage section.

Usage

This command can be used to set the value (meaning) of the Paging Cause IE included in responses to Paging Requests or it can be used to suppress the inclusion of the Paging Cause IE in the responses. These actions can be configured for paging for all sources or for a specified source.
The following values are applicable to all Paging Cause IEs:

- **0** - Terminating conversational call
- **1** - Terminating streaming call
- **2** - Terminating interactive call
- **3** - Terminating background call
- **4** - Terminating low priority signaling
- **5** - Terminating high priority signaling

Example

Use the following command to set Paging Cause value to *3* for paging due to GMM signaling without affecting cause values for other sources:

```
ranap paging-cause-ie gmm-signalling 3
```

Use the following command to suppress the Paging Cause IE from all Paging Requests to the RNC:

```
no ranap paging-cause-ie all
```

Either of the following commands will cause the Paging Cause IE to be included in Paging Requests with the default value for SM signaling without affecting the cause for other sources:

```
ranap paging-cause-ie sm-signalling

default ranap paging-cause-ie sm-signalling
```

ranap signalling-indication-ie

This command enables/disables the inclusion of the Signaling Indication IE in either or both the RAB Assignment Request and/or the Relocation Request RANAP messages.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
ranap signalling-indication-ie { rab-assignment-request [ relocation-request ] |
relocation-request [ rab-assignment-request ] }

no ranap signalling-indication-ie

default ranap signalling-indication-ie
```

no

Sets the configuration so that the SGSN never includes the IE.

default

Resets the configuration to the default - the SGSN includes the IE in the messages if preconditions are met (see Usage section).

rab-assignment-request | relocation-request

Including one or both of these keywords configures what type of RANAP message will include the IE.

Usage

The command enables the operator to determine whether the signalling indication information element is included in either or both the RAB Assignment Request and Relocation Request messages during the PDP context setup procedure.

For this command configuration to work so that the IE is included, two preconditions must be met:

- Received QoS traffic class for the context must be interactive
- Received QoS has a signalling indication value as optimized

When an RNC receives this IE, the RNC assumes that the customer is using IMS signaling and allocates massive amounts of bandwidth, potentially causing cell congestion. This command enables the operator to determine the usage of this IE which provides the operator with additional session management control.

Example

Use the following command to include the signalling indication IE in the RAB Assignment Request:

```
ranap signalling-indication-ie rab-assignment-request
```

release-compliance

This command allows the SGSN to set support based on the RNC's 3GPP release compliance and to define per RNC QoS overrides.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

release-compliance { pre-release-7 | release-7 } [gbr-down *gbr_dn_val* **| gbr-up** *gbr_up_val* **| mbr-down** *mbr_dn_val* **| mbr-up** *mbr_up_val* **] +**

default release-compliance

default

Returns the configuration to the default value, **release-7**.

pre-release-7

Enables support for an RNC with capabilities compliant with releases prior to Release 7, such as HSPA in R6.

release-7

Enables support for RNC with capabilities compliant with 3GPP Release 7 or later, such as HSPA+ available in R7.

gbr-down *gbr_dn_val*

Defines a guaranteed kbps bit rate for downlink direction,

- options for **pre-release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000. Default cap is 16000.
- options for **release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000, 21000, 28000, 42000. See default cap information below.

gbr-up *gbr_up_val*

Defines a guaranteed kbps bit rate for uplink direction,

- options for **pre-release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000. Default cap is 16000.
- options for **release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000, 21000, 28000, 42000. See default cap information below.

mbr-down *mbr_dn_val*

Defines a maximum kbps bit rate for downlink direction,

- options for **pre-release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000. Default cap is 16000.
- options for **release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000, 21000, 28000, 42000. See default cap information below.

mbr-up *mbr_up_val*

Defines a maximum kbps bit rate for uplink direction,

- options for **pre-release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000. Default cap is 16000.
- options for **release-7** include: 16, 32, 64, 128, 256, 512, 1024, 2048, 4096, 8192, 11500, 16000, 21000, 28000, 42000. See default cap information below.

Usage

Use this command to match the 3GPP release support by the RNC. As the 3GPP releases each support differing data rate options - R6 supports HSPA and R7 supports HSPA+ - then selecting the compliance is a method of preforming data rate management on a per RNC basis.
Also use this command to set QoS capping overrides for each RNC separately. Default caps for Release 7 RNC will vary depending upon which overrides are set.

Important: Once caps are set for an RNC, if the RNC release level changes the capping remains the same until the QoS override values are changed for that RNC. Values do not automatically change to the default values appropriate for that release .

Example

Enable HSPA fallback to R6 compliance:

```
release-compliance pre-release-7
```

reset-resource

This command enables the operator to control message length by configuring the number of IuConIDs sent in each RANAP Reset Resource messages.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

reset-resource max-iuconid-per-msg *number*

default reset-resource max-iuconid-per-msg

default

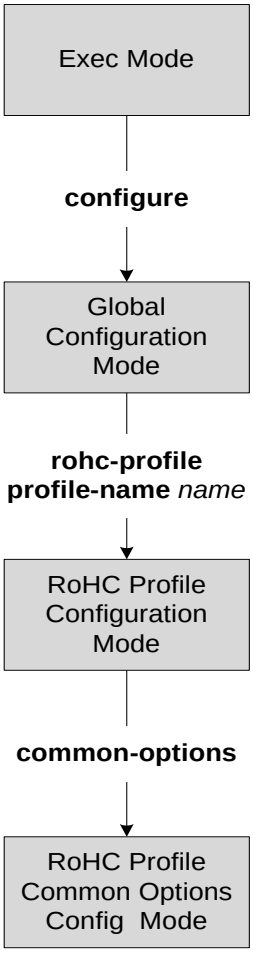
Resets the number of Iu connection Ids included in the Reset Resource messages. Default is 250.

max-iuconid-per-msg *number*

Sets the number of Iu connection Ids to be included in the Reset Resource messages.
number: Integer from 1 to 250.
Default: 250

Usage

Id numbers for each Iu connection are included in the RANAP Reset Resource messages. Including this potentially long stream of numbers can make the message very long. With this command, the operator can control the size of the messages by controlling the number of Id messages included in the messages.



Example

Limit the number of Iu connection IDs to *30*:

```
reset-resource max-iuconid-per-msg 30
```

Chapter 231
RoHC Profile Common Options Configuration Mode Commands

The RoHC Profile Common Options Configuration Mode is used to set timers that, upon expiration, release robust header compression contexts.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

delay-release-hc-context-timer

Sets a delay in releasing Robust Header Compression (RoHC) contexts allowing for context continuation during intra-gateway handoffs.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

delay-release-hc-context-timer *seconds*

no delay-release-hc-context-timer

no

Removes previously configured value for this command. No value disables the feature.

seconds

Specifies the number of seconds the system delays before releasing the header compression context as an integer from 0 to 65535.

Usage

Use this command to set a delay in releasing a header compression context. THis command is necessary when employing RoHC and mobility. Typically, when an RP connection is released, the header compression context is also released immediately. However, in mobility situations, such as intra-PDSN handoffs, the header compression context should be preserved. Adding a delay to cover the handoff time allows the context to be maintained.
A header compression context contains the compression/decompression configuration and statistics for the session.

Example

The following command sets the header compression release delay to 20 seconds:

```
delay-release-hc-context-timer 20
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

inactive-traffic-release-hc-context-timer

Sets an inactivity timer that is checked when inactivity is detected on an SO67 A10 bearer connection with negotiated RoHC parameters. When this timer expires, the header compression context is released.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

inactive-traffic-release-hc-context-timer *seconds*

no inactive-traffic-release-hc-context-timer

no

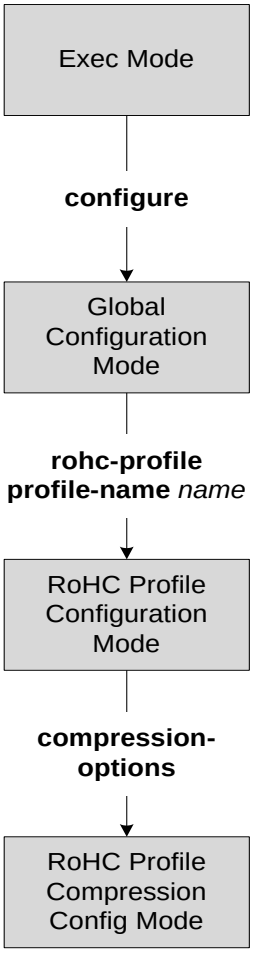
Removes previously configured value for this command. No value disables the feature.

seconds

Specifies the time, in seconds, the system waits for activity on the bearer channel before releasing the header compression context as an integer from 1 through 65535.

Usage

Use this command to set a timer that is started upon detecting inactivity on the bearer channel. Upon expiry, the header compression context is released. Enable this feature for more efficient memory utilization.



Example

The following command sets the bearer channel inactivity timer to 60 seconds:

```
inactive-traffic-release-hc-context-timer 60
```

Chapter 232
RoHC Profile Compression Configuration Mode Commands

The RoHC Profile Compression Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor parameters. RoHC is not supported on GGSN.

Important: The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).

context-timeout

Context timeout in seconds.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

context-timeout *seconds*

default context-timeout

default

Returns the command to its default value.

seconds

Specifies the context timeout value (in seconds) as an integer from 0 through 100.
Default: 20

Usage

Use this command to set the context timeout.

Example

The following command sets the context timeout to 10 seconds:

```
context-timeout-period 10
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ipid-history-size

Specifies the number of IP-IDs of previously sent packets to store. An IP ID is a 16-bit header field that stores IPv4 Identification information.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

ipid-history-size *number*

default ipid-history-size

default

Returns the command to its default value.

number

Specifies the number of IP IDs to store as an integer from 1 through 32.
Default: 8

Usage

Use this command to set the number of IP IDs to store in the history.

Example

The following command sets the history size to 24 IP-IDs:

```
ipid-history-size 24
```

max-jitter-cd

Specifies the upper boundary of jitter expected on the communication channel between the compressor and decompressor.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

max-jitter-cd *num_ms*

default max-jitter-cd

default

Returns the command to its default value.

num_ms

Specifies the number of milliseconds for the maximum jitter setting as an integer from 0 through 999999999.
Default: 150

Usage

Use this command to set the maximum amount of jitter allowed on the communication channel between compressor and decompressor.

Example

The following command sets the jitter limit to 1000 ms (1 second):

```
max-jitter-cd 1000
```

max-sliding-window

Specifies the width of the sliding window for W-LSB (Windows-based Least Significant Bits) encoded values.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

max-sliding-window *size*

default max-sliding-window

default

Returns the command to its default value.

size

Specifies the size of the sliding window as an integer from 1 through 1000.
Default: 6

Usage

Use this command to set the size of the sliding window used to compute jitter for W-LSB encoded values.

Example

The following command sets the sliding window size to 500:

```
max-sliding-window 500
```

multiple-ts-stride

Enables or disables the use of repeated transmission of RTS_STRIDE for timer-based compression.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ no ] multiple-ts-stride
```

no

Disables the use of repeated transmission of RTS_STRIDE for time-based compression.

Usage

Use this command to enable or disable a gateway's ability to repeatedly transmit RTS_STRIDE for timer-based compression.

new-context-blocking-time

Specifies the time period in seconds for blocking the establishment of new contexts after the compressor has received a feedback reject.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

new-context-blocking-time *seconds*

default context-timeout

default

Returns the command to its default value.

seconds

Specifies the context blocking time (in seconds) as an integer from 0 through 100.
Default: 20

Usage

Use this command to set the context blocking time after the compressor has received a feedback reject.

Example

The following command sets the context blocking time to 10 seconds:

```
new-context-blocking-time 10
```

num-pkts-ts

Specifies the number packets per RTP timestamp (TS).

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

num-pkts-ts *num_pkts*

default num-pkts-ts

default

Returns the command to its default value.

num_pkts

Specifies the number of packets for the timestamp as an integer from 0 through 999.
Default: 6

Usage

Use this command to set the number of packets for each RTP timestamp (TS).

Example

The following command sets the number of packets per timestamp to 50:

```
num-pkts-ts 50
```

num-pkts-u-mode

Specifies the number of packets sent when operating in U-Mode (unidirectional mode).

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

num-pkts-u-mode *num_pkts*

default num-pkts-u-mode

default

Returns the command to its default value.

num_pkts

Specifies the number of packets sent in U-Mode as an integer from 0 through 999.
Default: 1

Usage

Use this command to set the number of packets sent when in U-Mode.

Example

The following command sets the number of packets for U-Mode to 50:

```
num-pkts-u-mode 50
```

num-updates-ir

Configures the number of IR (Initiation and Refresh state) updates.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

num-updates-ir *num_pkts*

default num-updates-ir

default

Returns the command to its default value of 4.

num_pkts

Specifies the number of IR updates as an integer from 0 through 999.
Default: 4

Usage

Use this command to set the number of IR updates.

Example

The following command sets the number of IR updates to 30:

```
num-updates-ir 30
```

optimistic-repeats

Specifies the number of repeated packets to send to the decompressor. For transition from the FO (First Order) to the SO (Second Order) state, the compressor should be confident that the decompressor has all the parameters needed to decompress according to a fixed pattern.The compressor obtains its confidence about decompressor status by sending several packets with the same information according to the lower compression state. If the decompressor receives any of these packets, it is in sync with the compressor.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

optimistic-repeats *num_pkts*

default optimistic-repeats

default

Returns the command to its default value.

num_pkts

Specifies the number of packets to repeat with the same information to assure synchronization with the decompressor.
num_pkts must be an integer from 0 through 10.
Default: 6

Usage

Use this command to set the number of packets to repeat to the decompressor to assure synchronization before transition states.

Example

The following command sets the number of repeated packets to 5:

```
optimistic-repeats 5
```

rtp-sn-p

Specifies the value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the decompressor derives the original value using a previously received value as reference (v_ref). The scheme is guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

f(v_ref, k). Let f(v_ref, k) = [v_ref - p, v_ref + (2^k - 1) - p]

Where p is an integer.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-sn-p *p_value*

default rtp-sn-p

default

Returns the command to its default value.

p_value

Specifies the value of p in the RTP SN calculation as an integer from 0 through 999.
Default: 6

Usage

Use this command to set the value for p when performing the RTP SN calculation.

Example

The following command sets the value of p to 100:

```
rtp-sn-p 100
```

rtp-sn-p-override

Enables an override of p in the RTP SN calculation. This is disabled by default.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] rtp-sn-p-override
```

default

Returns the command to its default value of disabled.

no

Disables overriding p in RTP SN calculation.

Usage

Use this command to enable an override of p in RTP SN calculation.

Example

The following command enables the override of p in the RTP SN calculation:

```
rtp-sn-p-override
```

rtp-time-stride

Sets the time interval used for one TS (RTP Time Stamp) stride. This interval is used when timer-based encoding is enabled.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-time-stride *num_ms*

default rtp-time-stride

default

Returns the command to its default value.

num_ms

Specifies the number of milliseconds to use for TS_STRIDE as an integer from 0 through 999999999.
Default: 20

Usage

Use this command to set the length of the TS_STRIDE in milliseconds.

Example

The following command sets TS_STRIDE to 100ms:

```
rtp-time-stride 100
```

rtp-ts-deviation

Sets the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-ts-deviation *percentage*

default rtp-ts-deviation

default

Returns the command to its default value of 25.

percentage

Specifies the maximum percentage of deviation allowed for input RTP packets for timer-based compression as an integer value from 0 through 100.
Default: 25

Usage

Use this command to set the maximum percentage of deviation allowed for input RTP packets for timer-based compression.

Example

The following command sets the percentage to 30:

```
rtp-ts-deviation 30
```

rtp-ts-stride

Specifies the amount by which TS (RTP time stamp) is incremented. This value is used for Scaled RTP TS encoding.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-ts-stride *num_ms*

default rtp-ts-stride

default

Returns the command to its default value of 160.

num_ms

Specifies the number of milliseconds to use incrementing TS as an integer from 0 through 999999999.
Default: 160

Usage

Use this command to set the amount by which TS is incremented for Scaled RTP TS encoding.

Example

The following command sets amount by which TS is incremented to 100ms:

```
rtp-ts-stride 100
```

sliding-window-ts

Sets the sliding window used to compute jitter.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

sliding-window-ts *size*

default sliding-window-ts

default

Returns the window to its default value of 4.

size

Specifies the size of the sliding window as an integer from 1 through 1000.
Default: 4

Usage

Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

Example

The following command sets the sliding window size to 500:

```
sliding-window-ts 500
```

total-jitter-ipv4

Specifies the total jitter allowed after compression for IPv4.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

total-jitter-ipv4 *time*

default total-jitter-ipv4

default

Returns the command to its default value of 270.

time

Specifies the time interval to use (in milliseconds) as an integer from 0 through 999999999.
Default: 270

Usage

Use this command to set the jitter limit after compression.

Example

The following command sets the jitter after compression limit to 900 ms:

```
total-jitter-ipv4 900
```

total-jitter-ipv6

Specifies the total jitter allowed after compression for IPv6.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

total-jitter-ipv6 *time*

default total-jitter-ipv6

default

Returns the command to its default value 580.

time

Specifies the total jitter interval allowed (in milliseconds) as an integer from 0 through 999999999.
Default: 580

Usage

Use this command to set the jitter limit after compression.

Example

The following command sets the jitter after compression limit to 900 ms:

```
total-jitter-ipv6 900
```

unimode-timeout-to-fo-state

Specifies the time period in seconds before falling back to the FO (First Order) state.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

unimode-timeout-to-fo-state *num_ms*

default unimode-timeout-to-fo-state

default

Returns the command to its default value of 3.

num_ms

Specifies the timeout period (in seconds) as an integer from 0 through 10.
Default: 3

Usage

Use this command to set the timeout before falling back to the FO state when in Unimode.

Example

The following command sets the fall back timeout to 2 seconds:

```
unimode-timeout-to-fo-state 2
```

unimode-timeout-to-ir-state

Specifies the time period in seconds before falling back to the IR (Initiation and Refresh) state.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

unimode-timeout-to-ir-state *num_ms*

default unimode-timeout-to-ir-state

default

Returns the command to its default value of 5.

num_ms

Specifies the timeout period in seconds as an integer from 0 through 20.
Default: 5

Usage

Use this command to set the timeout before falling back to the IR state when in Unimode.

Example

The following command sets the fall back timeout to 3 seconds:

```
unimode-timeout-to-ir-state 3
```

use-calculated-rtp-time-stride

Overrides the configured value of rtp-time-stride with a calculated value.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-calculated-rtp-time-stride
```

default

Returns the command to its default value of enabled.

no

Disables the use of calculated RTP time stride override.

Usage

This command overrides the configured value of rtp-time-stride with a calculated value.

Example

The following command overrides the configured value of rtp-time-stride.

```
use-calculated-rtp-time-stride
```

use-calculated-rtp-ts-stride

Overrides the configured value of rtp-ts-stride with a calculated value.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-calculated-rtp-ts-stride
```

default

Returns the command to its default value of enabled.

no

Disables the use of calculated RTP TS time stride override.

Usage

This command overrides the configured value of rtp-ts-stride with a calculated value.

Example

The following command overrides the configured value of rtp-ts-stride.

```
use-calculated-rtp-ts-stride
```

use-ipid-override

Enables or disables overriding the IP-ID (IPv4 Identification header field).

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-ipid-override
```

default

Returns the command to its default value of disabled.

no

Disables the IP-ID override.

Usage

Use this command to enable overriding of the IP-ID.

Example

The following command enables the IP-ID override feature:

```
use-ipid-override
```

The following command disables the IP-ID override feature:

```
no use-ipid-override
```

The following command also disables the IP-ID override feature:

```
default use-ipid-override
```

use-optimized-talkspurt

Enables or disables the use of optimized talkspurt.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-optimized-talkspurt
```

default

Returns the command to its default value of enabled.

no

Disables the use of optimized talkspurt.

Usage

Use this command to enable and disable the use of optimized talkspurt

Example

The following command enables the use of optimized talkspurt:

```
use-optimized-talkspurt
```

The following command disables the use of optimized talkspurt:

```
no use-optimized-talkspurt
```

use-optimized-transience

Enables or disables the use of optimized transience.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-optimized-transience
```

default

Returns the command to its default value of enabled.

no

Disables the use of optimized transience.

Usage

Use this command to enable or disable the use of optimized transience.

Example

The following command enables the use of optimized transience.

```
use-optimized-transience
```

The following command disables the use of optimized transience.

```
no use-optimized-transience
```

use-timer-based-compression

Enables or disables timer-based compression of the RTP time stamp (TS) at the compressor.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-timer-based-compression
```

default

Returns the command to its default value of enabled.

no

Disables the use of timer-based compression.

Usage

Use this command to enable or disable the use of timer-based compression.

Example

The following command enables the use of timer-based compression.

```
use-timer-based-compression
```

The following command disables the use of timer-based compression.

```
no use-timer-based-compression
```

use-uncomp-profile

Enables or disables the use of the Uncompressed Profile (0x0000) if required at the compressor.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[default | no ] useS-uncomp-profile
```

default

Returns the command to its default value of disabled.

no

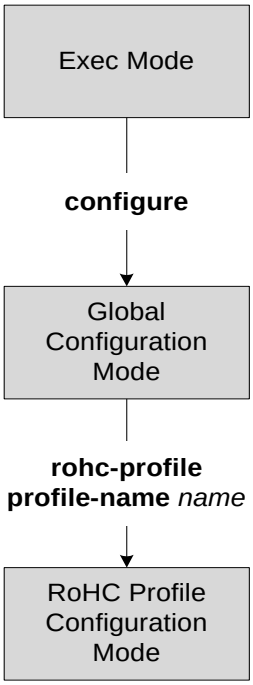
Disables the use of the Uncompressed Profile.

Usage

Use this command to enable or disable the use of the Uncompressed Profile.

Example

The following command enables the use of the Uncompressed Profile.



```
use-uncomp-profile
```

The following command disables the use of the Uncompressed Profile.

```
no use-uncomp-profile
```

Chapter 233
RoHC Profile Configuration Mode Commands

The RoHC Profile Configuration Mode is used to configure RoHC (Robust Header Compression) Compressor and Decompressor parameters. The profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured. RoHC is not supported on GGSN.

Important: The availability of commands, keywords and variables in this mode is dependent on platform type, product version, and installed license(s).

common-options

Enters the RoHC Profile Common Options Configuration Mode where inactivity and delay timers are set to support dynamic header compression contexts and context preservation during handoffs.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default ] common-options
```

default

Reset all parameters in the RoHC Profile Common Options Configuration Mode to default values.

Usage

Use this command to enter the RoHC Profile Common Options Configuration Mode where parameters for maintaining header compression contexts and inactivity timers can be configured.
Entering this command results in the following prompt:
[*context_name*]*host*(config-rohcprofile-<*profile_name*>-common)#
RoHC Profile Common Options Configuration Mode commands are defined in the RoHC Profile Common Options Configuration Mode Commands chapter.

compression-options

Enters the RoHC Profile Compression Options Configuration Mode allowing configuration of options applied during RoHC compression for the current RoHC profile.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default ] compression-options
```

default

Reset all options in the RoHC Profile Compression Configuration Mode to their default values.

Usage

Use this command to enter RoHC Profile Compression Configuration Mode to set the compression options that are used for subscriber sessions using the current RoHC profile.
Entering this command results in the following prompt:
[*context_name*]*host*(config-rohcprofile-<*profile_name*>-comp)#
RoHC Profile Compression Options Configuration Mode commands are defined in the RoHC Profile Compression Configuration Mode Commands chapter.

Example

The following command enters RoHC Profile Compression Options Configuration Mode:

```
compression-options
```

The following command sets all compression options to their default values:

```
default compression-options
```

decompression-options

Enters the RoHC Profile Decompression Options Configuration Mode allowing configuration of options applied during RoHC decompression for the current RoHC profile.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[default ] decompression-options
```

default

Reset all options in the RoHC Profile Decompression Options Configuration Mode to their default values.

Usage

Use this command to enter RoHC Profile Decompression Options Configuration Mode to set the decompression options used for subscriber sessions using the current RoHC profile.
Entering this command results in the following prompt:
[*context_name*]*host*(config-rohcprofile-<*profile_name*>-decomp)#
RoHC Profile Decompression Options Configuration Mode commands are defined in the RoHC Profile Decompression Configuration Mode Commands chapter.

Example

The following command enters RoHC Profile Decompression Options Configuration Mode:

```
decompression-options
```

The following command sets all decompression options to their default values:

```
default decompression-options
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

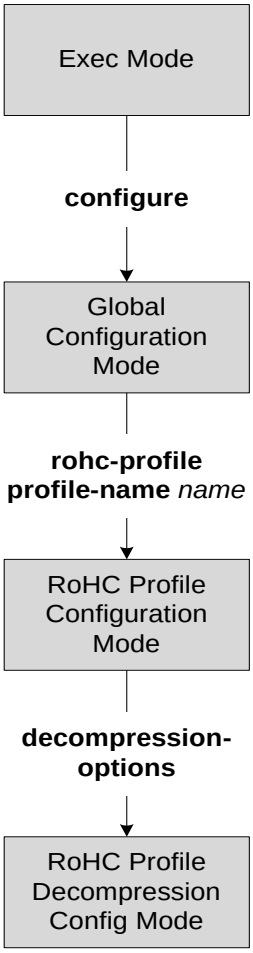
Product

All

Privilege

Security Administrator, Administrator

Syntax



```
exit
```

Usage

Use this command to return to the parent configuration mode.

Chapter 234
RoHC Profile Decompression Configuration Mode Commands

The RoHC Profile Decompression Configuration Mode is used to configure RoHC (Robust Header Compression) Decompressor parameters.

Important: The availability of commands, keywords and variables in this mode are dependent on platform type, product version, and installed license(s).

accept-delayed-pkts

Accepts delayed packets

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default ] accept-delayed-pkts
```

default

Returns the command to its default value of disabled.

Usage

This command helps reduce packet loss during context repair.

Example

Use the following command to enable the system to accept delayed packets:

```
accept-delayed-pkts
```

context-timeout

Ensures that no expired contexts are used for data compression.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

context-timeout *seconds*

default context-timeout

default

Returns the command to its default value.

seconds

Specifies the context timeout value (in seconds) as an integer from 0 through 100.
Default: 20

Usage

The RoHC stack should periodically clean up expired contexts and release memory in case there is no data activity for the call on this context. The context cleanup period is internally calculated to be set to half of the value of the context-timeout value. This will ensure that no expired contexts are used for data compression.

Example

The following command sets the context-timeout parameter to 30 seconds:

```
context-timeout 30
```

crc-errors-fo

Sets the limits for when a NACK message is sent while in the FO (First Order) state. A NACK is sent whenever CRC errors are detected within a specified number of packets.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

crc-errors-fo-k *num_errors*

crc-errors-fo-n *num_packts*

default crc-errors-fo-k

default crc-errors-fo-n

default

Returns the command to its default value.

crc-errors-fo-k *num_errors*

Specifies the number of received packets that trigger the sending of a NACK as an integer from 1 through 10.
Default: 1

Important: *num_errors* must be less than or equal to the value specified with the **crc-errors-fo-n** command.

crc-errors-fo-n *num_packts*

Specifies the number of packets to check for CRC errors as an integer from 1 through 10.
Default: 1

Usage

Use this command to set the parameters that trigger sending a NACK message when in the FO state.

Example

To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the FO state, use the following commands:

```
crc-errors-fo-k 4

crc-errors-fo-n 10
```

crc-errors-so

Sets the limits for when a NACK message is sent while in the SO (Second Order) state. A NACK is sent whenever CRC errors are detected within a specified number of packets.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

crc-errors-so-k *num_errors*

crc-errors-so-n *num_packets*

default crc-errors-so-k

default crc-errors-so-n

default

Returns the command to its default value.

crc-errors-so-k *num_errors*

Specifies the number of received packets that trigger the sending of a NACK as an integer from 0 through 10.
Default: 1

Important: *num_errors* must be less than or equal to the value specified with the **crc-errors-so-n** command.

crc-errors-so-n *num_packets*

Specifies the number of packets to check for CRC errors as an integer from 1 through 10.
Default: 1

Usage

Use this command to set the parameters that trigger sending a NACK message when in the SO state.

Example

To configure a NACK to be sent when 4 out of the last 10 packets have CRC errors when in the SO state, use the following commands:

```
crc-errors-so-k 4

crc-errors-so-n 10
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

nack-limit

Sets the number of unsuccessful decompressions allowed before a NACK is sent.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

nack-limit *limit*

default nack-limit

default

Returns the command to its default value.

limit

Specifies the number of unsuccessful decompressions allowed as an integer from 0 through 20.
Default: 0

Usage

Use this command to set the maximum number of unsuccessful decompressions before a NACK message is sent.

Example

The following command sets the number of unsuccessful decompressions allowed to 10:

```
nack-limit 10
```

optimistic-mode-ack

When this command is enabled and a type 2 IR-DYN packet is successfully decompressed, an optional ACK is sent in U-mode.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] optimistic-mode-ack
```

default

Returns the command to its default value of enabled.

no

Disables the sending of the optional ACK.

Usage

Use this command to enable and disable the sending of an optional ACK in U-mode when a type 2 IR-DYN packet is successfully decompressed.

Example

To enable the sending of the optional ACK, enter the following command:

```
optimistic-mode-ack
```

To disable the sending of the optional ACK, enter the following command:

```
no optimistic-mode-ack
```

optimistic-mode-ack-limit

Sets the number of packets for which to send ACKs.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

optimistic-mode-ack-limit *num_pkts*

default optimistic-mode-ack-limit

default

Returns the command to its default value.

num_pkts

Specifies the number of packets for which to send ACKs as an integer from 0 through 20.
Default: 3

Usage

Use this command to set the number of packets to send the optional ACK for when a type 2 IR-DYN packet is successfully decompressed.

Example

Enter the following command to set the number of packets to send and ACK for to 6:

```
optimistic-mode-ack-limit 6
```

Use the following command to set the number of packets to send an ACK for back to the default of 3:

```
default optimistic-mode-ack-limit
```

piggyback-wait-time

Specifies the time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

piggyback-wait-time *m_secs*

default piggyback-wait-time

default

Returns the command to its default value.

m_secs

Specifies the time (in milliseconds) to wait for a feedback packet to be picked up as an integer value from 0 through 1000.
Default: 80

Usage

Use this command to set the time in milliseconds to wait for a feedback packet to be picked up as piggybacked feedback by the associated compressor.

Example

The following command sets the wait time to 120 ms:

```
piggyback-wait-time 120
```

preferred-feedback-mode

Specifies the preferred feedback mode to use between the compressor and the decompressor

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
preferred-feedback-mode { bidirectional-optimistic | bidirectional-reliable |
unidirectional }

default preferred-feedback-mode
```

default

Returns the command to its default setting of bidirectional-optimistic.

bidirectional-optimistic

This mode is similar to the Unidirectional mode, with the exception of a feedback channel used to send error recovery requests from the decompressor to compressor.
This is the default mode.

bidirectional-reliable

Reliable mode makes extensive use of a feedback channel to avoid packet loss from context invalidation. A secure reference model is used instead of the optimistic approach used in the other modes. With the secure reference model, the confidence of the compressor depends on acknowledgements from the decompressor for every context updating packet.
Periodically the compressor sends context updating packets repeatedly until an acknowledgement is received from the decompressor.

unidirectional

Packets are sent in only one direction, from the compressor to the decompressor.

Usage

Use this command to specify the preferred feedback method to use between the compressor and the decompressor for the current RoHC profile.

Example

Use the following command to set the preferred feedback mode to bidirectional-reliable:

```
preferred-feedback-mode bidirectional-reliable
```

rtp-sn-p

Specifies the value of p in RTP SN (RTP Sequence Number) calculation. Least Significant Bits (LSB) encoding is used for header fields whose values are usually subject to small changes. With LSB encoding, the k least significant bits of the field value are transmitted instead of the original field value, where k is a positive integer. After receiving k bits, the decompressor derives the original value using a previously received value as reference (v_ref). The scheme is guaranteed to be correct if the compressor and the decompressor each use interpretation intervals as follows:

- In which the original value resides
- And in which the original value is the only value that has the exact same k least significant bits as those transmitted.

The interpretation interval can be described as a function:

f(v_ref, k). Let f(v_ref, k) = [v_ref - p, v_ref + (2^k - 1) - p]

Where p is an integer.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

rtp-sn-p *value*

default rtp-sn-p

default

Returns the command to its default value.

value

Specifies the number the value of p in the RTP SN calculation as an integer from 0 through 999.

Usage

Use this command to set the value to use for p when performing the RTP SN calculation.

Example

The following command sets the RTP Sequence Number integer “p” value to 100:

```
rtp-sn-p 100
```

rtp-sn-p-override

Allows an override of p in RTP SN calculation. This is disabled by default.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] rtp-sn-p-override
```

default

Returns the command to its default value of disabled.

no

Disables overriding p in RTP SN calculation.

Usage

Use this command to allow an override of p in RTP SN calculations.

Example

The following command enables the override of p in the RTP SN calculation:

```
rtp-sn-p-override
```

sliding-window-ts

Computes jitter as described in RFC 3095,[4.5.4]

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

sliding-window-ts *size*

default sliding-window-ts

default

Returns the command to its default value of 4.

size

Sets the size of the sliding window. *size* must be an integer from 1 through 1000.
Default: 4

Usage

Use this command to set the size of the sliding window used to compute jitter for the current RoHC profile.

Example

The following command sets the sliding window size to 500:

```
sliding-window-ts 500
```

use-clock-option

Controls usage of the RoHC clock option. The clock option informs the compressor of the clock resolution of the decompressor. This allows the compressor to estimate the jitter introduced by the clock of the decompressor when doing timer-based compression of the RTP timestamp.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-clock-option
```

default

Returns the command to its default value of enabled.

no

Disables use of the RoHC clock option.

Usage

Use this command to enable and disable the use of the RoHC clock option.

Example

The following command enables RoHC clock option usage:

```
use-clock-option
```

The following command disables RoHC clock option usage:

```
no use-clock-option
```

use-crc-option

Controls usage of the RoHC cyclic redundancy check (CRC) option. The CRC option contains an 8-bit CRC computed over the entire feedback payload, without the packet type and code octet, but including any CID fields,

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-crc-option
```

default

Returns the command to its default value of enabled.

no

Disables use of the CRC option.

Usage

Use this command to enable and disable the use of the RoHC CRC option.

Example

The following command enables RoHC CRC option usage:

```
use-crc-option
```

The following command disables RoHC CRC option usage:

```
no use-crc-option
```

use-feedback

Controls use of the feedback channel. A feedback channel sends error recovery requests and (optionally) acknowledgments of significant context updates from the decompressor to the compressor.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] use-feedback
```

default

Returns the command to its default value of disabled.

no

Disables use of the feedback channel.

Usage

Use this command to enable and disable the use of the RoHC feedback channel.

Example

The following command enables RoHC feedback channel usage:

```
use-feedback
```

The following command disables RoHC feedback channel usage:

```
no use-feedback
```

use-jitter-option

Controls usage of RoHC jitter option. The jitter option allows the decompressor to report the maximum jitter it has observed

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-jitter-option
```

default

Returns the command to its default value of enabled.

no

Disables use of the jitter option.

Usage

Use this command to enable and disable the use of the RoHC jitter option.

Example

The following command enables RoHC jitter option usage:

```
use-jitter-option
```

The following command disables RoHC jitter option usage:

```
no use-jitter-option
```

use-reject-option

Controls usage of RoHC reject option. The reject option informs the compressor that the decompressor does not have sufficient resources to handle the flow.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-reject-option
```

default

Returns the command to its default value of disabled.

no

Disables use of the reject option.

Usage

Use this command to enable and disable the use of the RoHC reject option.

Example

The following command enables RoHC reject option usage:

```
use-reject-option
```

The following command disables RoHC reject option usage:

```
no use-reject-option
```

use-sn-not-valid-option

Controls usage of the RoHC SN not valid option. The sn-not-valid option indicates that the SN of the feedback is not valid. A compressor must not use the SN of the feedback to find the corresponding sent header when this option is present.

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-sn-not-valid-option
```

default

Returns the command to its default value of enabled.

no

Disables use of the sn-not-valid option.

Usage

Use this command to enable and disable the use of the RoHC sn not valid option.

Example

The following command enables RoHC sn not valid option usage:

```
use-sn-not-valid-option
```

The following command disables RoHC sn not valid option usage:

```
no use-sn-not-valid-option
```

use-sn-option

Controls usage of RoHC sn option. The sn option provides eight additional bits of SN (Sequence Number, usually the RTP Sequence Number.)

Platform

ASR 5000

Product

HSGW, PDSN

Privilege

Administrator

Syntax

```
[ default | no ] use-sn-option
```

default

Returns the command to its default value of enabled.

no

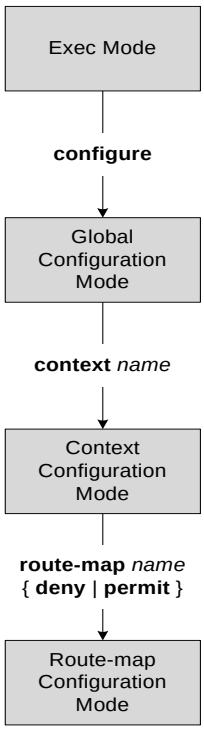
Disables use of the SN option.

Usage

Use this command to enable and disable the use of the RoHC SN option.

Example

The following command enables RoHC SN option usage:



```
use-sn-option
```

The following command disables RoHC SN option usage:

```
no use-sn-option
```

Chapter 235
Route-map Configuration Mode Commands

The Route-Map Configuration sub-mode is used for the OSPFv2 and BGP-4 routing protocols. This mode includes commands that configure matching rules and set actions to perform on matched routes.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

match as-path

Matches an Autonomous System (AS) path access list

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] match as-path *AS_list*

no

Disables matching the specified AS path access list.

AS_list

Specifies the name of an AS path access list for matching as an alphanumeric string of 1 through 79 characters.

Usage

This command is used for BGP-4 routing to specify an AS path access list to be matched. Refer to the **ip as-path access-list** command for more information.

Example

To match entries in an AS path access list named *ASlist1*, enter the following command;

```
match as-path ASlist1
```

match interface

Specifies the next-hop interface name of a route to be matched.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match interface *interface-name*

no

Disables matching the specified interface name.

interface-name

Specifies the name of the virtual interface for matching as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to specify the next hop interface name for routes to be matched.

Example

To match routes that have the next hop interface specified as *Interface123*, enter the following command:

```
match interface Interface123
```

To disable matching routes that have the next hop interface specified as *Interface123*, enter the following command:

```
no match interface Interface123
```

match ip address

Matches routes with entries in a route-access-list or prefix-list.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match ip address { prefix-list | route-access-list } *list_name*

no

Disables matching from the specified prefix list or route access list.

prefix-list

Matches any routes with entries in a prefix-list.

route-access-list

Matches any routes with entries in a route-access-list

list_name

Specifies the name of the IP prefix list or IP route access-list as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to match routes specified in a route-access-list or prefix-list.

Example

To match routes that are specified in a prefix list named *Prefix100*, enter the following command:

```
match ip address prefix-list Prefix100
```

To disable matching routes that are specified in a prefix list named *Prefix100*, enter the following command:

```
no match ip address prefix-list Prefix100
```

match ip next-hop

Matches next-hop IP addresses with entries in specified standard prefix-list or route-access-list.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match ip address next-hop { prefix-list | route-access-list }*list_name*

prefix-list

Matches any routes that have a next-hop router address that has an entry in the specified prefix list.

route-access-list

Matches any routes that have a next-hop router address that has an entry in the specified route-access-list.

list_name

Specifies the name of the IP prefix-list or IP route-access-list as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to match next-hop IP addresses that have entries in the specified prefix-list or route-access-list.

Example

To match next-hop addresses with entries in a prefix-list named *Prefix100*, enter the following command:

```
match ip address next-hop prefix-list Prefix100
```

To disable matching next-hop addresses with entries in a prefix-list named *Prefix100*, enter the following command:

```
no match ip address next-hop prefix-list Prefix100
```

match metric

Matches routes that have the specified route metric.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match metric *metric_value*

no

Disables matching of the specified route metric.

metric_value

Specifies the route metric to match as an integer from 0 through 4294967295.

Usage

Use this command to match routes that have the specified route metric.

Example

To match routes with the route metric of *1200*, enter the following command:

```
match metric 1200
```

To disable matching routes with a route metric of *1200*, enter the following command:

```
no match metric 1200
```

match origin

Matches the origin code learned from BGP. This command is for route maps that are used with BGP routing only.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match origin { egp | igp | incomplete }
```

no

Disables matching of the origin code.

egp

Matches origins learned via the External Gateway Protocol (EGP)

igp

Match origins learned via the local Interior Glittery Protocol (IGP)

incomplete

Match origins with unknown heritage.

Usage

Use this command to match origin codes for BGP routing.

Example

To match origin codes learned from EGP, enter the following command:

```
match origin egp
```

match route-type external

Match external Open Shortest Path First (OSPF) routes of the specified type.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] match route-type external { type-1 | type-2 }
```

type-1

Only matches type-1 external routes.

type-2

Only matches type-2 external routes.

Usage

Use this command to match external routes of a specific type.

Example

The following command matches all external routes that are type-2:

```
match route-type external type-2
```

The following command disables matching external routes that are type-2:

```
no match route-type external type-2
```

match tag

Matches routes with the specified route tag value.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] match tag *tag_value*

no

Disables matching routes with the specified route tag value.

tag_value

Specifies the route tag value to match as an integer from 0 through 4294967295.

Usage

Use this command to match routes that have the specified route tag value.

Example

Use the following command match routes that have a route tag value of *1234*:

```
match tag 1234
```

Use the following command to disable matching routes that have a route tag value of *1234*:

```
no match tag 1234
```

set as-path

Modifies an Autonomous System (AS) path for a route by adding the specified AS numbers to the front of the path.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] set as-path prepend *ASN*

no

Disables prepending the AS path. Any previously set prepends are removed.

prepend

Prepends the AS path.

ASN

AS number(s) to be prepended to the AS path. You can specify up to 16 different AS numbers to be prepended in the order specified. Each AS number must be separated by a space. *ASN* must be an integer from 1 through 65535.

Usage

Use this command to add up to 16 specified AS numbers to the front of the AS path.

Example

The following command prepends the AS numbers *100*, *200*, and *1000* to matching AS paths:

```
set as-path prepend 100 200 1000
```

set ip next-hop

Sets the IP address that is applied as the next hop for routes.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] set ip next-hop` *`ip_address`*

`no`

Disables the specified next hop address.

`ip_address`

Specifies the IP address of the next hop to which packets are output, entered using IPv4 dotted-decimal notation.

Usage

Use this command to set the IP address that is used as the next hop for routes.

Example

To set the next hop for routes to the IP address *`192.168.2.100`*, use the following command:

```
set ip next-hop 192.168.2.100
```

To disable setting the next hop for routes to the IP address *`192.168.2.100`*, use the following command:

```
no set ip next-hop 192.168.2.100
```

set metric

Sets the route metric for matching routes to a specified value.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] set metric *metric_value*

metric_value

Specifies the metric value that is set for routes as an integer from 1 through 16777214.

Usage

Use this command to set the route metric for matched routes.

Example

To set the route metric to *12345*, use the following command;

```
set metric 12345
```

To disable setting the route metric to *12345*, enter the following command;

```
no set metric 12345
```

set metric-type

This command sets the route metric type to either Type-1 or Type-2 in the AS-external-LSA.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] set metric-type { type-1 | type-2 }
```

type-1

Sets the route metric to external type-1.

type-2

Sets the route metric to external type-2

Usage

Use this command to set the route metric to either external type-1 or external type-2.

Example

To set the route metric to type-1, enter the following command:

```
set metric type-1
```

To disable setting the metric to type, enter the following command:

```
no set metric type-1
```

set origin

Sets the Border Gateway Protocol (BGP) origin code to a specified value. This command is for route maps that are used with BGP routing only.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] set origin { egp | igp | incomplete }
```

no

Disables setting the origin code.

egp

Sets the origin code to specify that the path is from a remote External Gateway Protocol (EGP) system.

igp

Sets the origin code to specify that the path is from a local Interior Gateway Protocol (IGP) system.

incomplete

Sets the origin code to specify that the path is from an unknown system.

Usage

Use this command to set a specified origin code for BGP.

Example

To set the origin code to be from an External Gateway Protocol (EGP) system, enter the following command:

```
set origin egp
```

set tag

Sets the route tag value for matched routes.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] set tag *tag_value*

no

Disable setting the route tag to the specified value.

tag_value

Specifies the route tag value as an integer from 0 through 4294967295.

Usage

Use this command to set the route tag value that is applied to all matched routes.

Example

To set the route tag value to *12345*, enter the following command:

```
set tag 12345
```

To disable setting the route tag value to *12345*, enter the following command:

```
no set tag 12345
```

set weight

Sets the weight in the routing table for matching routes to the specified value.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no] set weight *value*

no

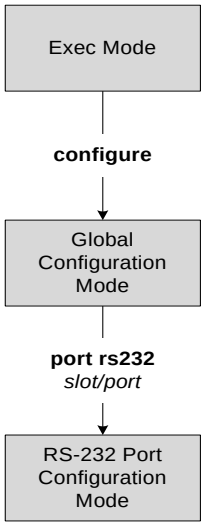
Disable setting the routing weight value.

value

Specifies the weight in the routing table as an integer from 1 through 4294967295.

Usage

Use this command to set the routing table weight on matched routes.



Example

The following command sets the routing table weight for matched routes to *1000*:

```
set weight 1000
```

Chapter 236
RS-232 Port Configuration Mode Commands

The RS-232 Port Configuration Mode is used to manage the RS-232 ports on the SPIO cards.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Restores the port's default speed and communication mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { preferred slot | terminal { all | databits | flowcontrol | parity | speed |
stopbits }
```

preferred slot

Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a **port switch to** command to return service to the original port.

terminal { all | databits | flowcontrol | parity | speed | stopbits }

Sets the terminal settings for the RS-232 port to their default settings.
all: Restores all settings to their default values.
databits: Restores the databits setting to its default value of 8.
flowcontrol: Restores the flowcontrol setting to its default value of none.
parity: Restores the parity setting to its default value of none.
speed: Restores the speed setting to its default value of 9600.
stopbits: Restores the stopbits setting to its default value of 1.

Usage

Restores port-level parameters to their default values.

Example

The following command restores all terminal settings to their default values:

```
default terminal all
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

preferred slot

Assigns revertive or non-revertive control to port redundancy auto-recovery.

Default: non-revertive operation

Platform

ASR 5000

Product

PDSN, FA, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

no preferred slot *slot#*

no

Disables revertive, or auto-recovery, operation for selected port.

slot#

Identifies the physical chassis slot where the SPIO card is installed.

Usage

This command enables or disables revertive port redundancy, wherein after a port failover, when the original port is restored to service (such as link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.
This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual line cards or SPIO cards. For example, ports 1 through 4 could be configured as "preferred" on the line card in slot 17, while ports 5 through 8 are "preferred" on the line card in slot 33. In this scenario, both line cards would be in an Active operational state while still providing LC and port redundancy for the other.

Important: This command is not supported on all platforms.

Example

```
preferred slot 24
```

snmp trap link-status

Enables or disables the generation of an SNMP trap for link status changes.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
snmp trap link-status

no snmp trap link-status
```

no

Disables the sending of traps for link status changes.

Usage

Enable link status change traps when a monitoring facility can use the information or if there are trouble shooting activities are in progress.

Example

```
snmp trap link-status

no snmp trap link-status
```

terminal

Configures the console port on the SPIO.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
terminal { carrierdetect { off | on } | databits { 7 | 8 } | flowcontrol { hardware |
none } | parity { even | none | odd } | speed { 115200 | 19200 | 38400 | 57600 | 9600 } |
stopbits { 1 | 2 } }
```

carrierdetect { off | on }

Default:
Specifies whether or not the console port is to use carrier detect when connecting to a terminal.

databits { 7 | 8 }

Default: 8
Specifies the number of data bits used to transmit and receive characters.

flowcontrol { hardware | none }

Default: none
Specifies how the flow of data is controlled between the SPIO and a terminal.

parity { even | none | odd }

Default: none
Specifies the type of error checking used on the port.
even: Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.
none: Disables error checking.
odd: Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

speed { 115200 | 19200 | 38400 | 57600 | 9600 }

Default: 9600
Specifies the flow of data in bits per second between the console port and terminal.

stopbits { 1 | 2 }

Default: 1
Specifies the number of stop bits between each transmitted character.

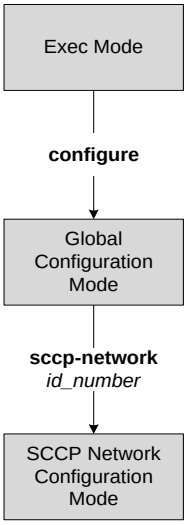
Usage

Sets the SPIO console port parameters for communication with the terminal device.

Example

The following command sets the SPIO's console port. The terminal must support these values.

```
terminal carrierdetect off databits 7 flowcontrol hardware parity even
speed 115200 stopbits 1
```



Chapter 237
SCCP Network Configuration Mode Commands

The SCCP Network Configuration Mode is used to configure properties for Signaling Connection Control Part (SCCP) services for SS7.

In this mode, the command prompt should be similar to:

```
[local]hostname(config-sccp-network-<sccp_id>)#
```

Signaling Connection Control Part (SCCP) is a routing protocol in the SS7 protocol suite in layer 4, which provides end-to-end routing for TCAP messages to their proper database.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

Associates an SS7 routing domain with the SCCP network.

Platform

ASR 5000

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate ss7-routing-domain *rd_id*

no associate

no

Removes the association with the SS7 routing domain from the system configuration.

rd_id

This number identifies an already defined SS7 routing domain.
rd_id: enter an integer from 1 through 12.

Usage

Use this command to associate SS7 routing domain configurations with SCCP network configurations.

Example

The following command associates the SCCP network with SS7 routing domain 2:

associate ss7-routing-domain *2*

description

This command defines a string that describes the SCCP network. The description is used for operator reference.

Platform

ASR 5000

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

string

This is a string to describe the SCCP network.
string must be an alphanumeric string from 1 through 127 characters in length. If there are spaces in the string the string must be enclosed in double-quotes. For example; “This is a Description”.

no

Removes the description from the system configuration.

Usage

Use this command to configure a description of this SCCP service for operator reference.

Example

The following command sets the description to “This is the SCCP Service Number 1”:

```
description ”This is the SCCP Service Number 1.”
```

destination

This command configures the SCCP network destination information. Use this command multiple times to set all of the destination information required.

Platform

ASR 5000

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

destination dpc *pt_code* **{ name** *route_name* **| next-hop** *pt_code* **[priority** *priority* **] | ssn** *subsys_num* **| version** *sccp_ver* **}**

no destination dpc *p_code* **[name** *route_name* **| ssn** *ssn_num* **| version** *sccp_ver* **]**

no

Deletes the specified destination information from the SCCP network configuration.

dpc *pt_code*

Specifies the SCCP destination point code.
pt_code: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ######## format.

name *route_name*

The name of the SCCP destination route.
route_name: enter an alphanumeric string from 1 through 64 characters in length.

next-hop *pt_code* **[priority** *priority*

Associates the next destination defined in the SS7 routing domain and assigns the next-hop a priority for use.
pt_code: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ######## format.
priority: Must be an integer from 0 to 15, with 0 setting the highest priority.

ssn *subsys_num*

The destination subsystem number.
subsys_num: enter an integer from 1 through 255.

version *sccp_ver*

sccp_ver: enter one of the following to select the SCCP variant:

- ANSI88
- ANSI92
- ANSI96
- BELL05
- CHINA

- GSM0806
- ITU88
- ITU92
- ITU96

Usage

Use this command to configure the destination information for the SCCP network.

Example

The following commands set the name of the destination route to default_route, the subsystem number to 1, and the variant version to ITU96, all with a destination point code of 1:

```
destination dpc 1 name default_routedestination dpc 1 ssn 1destination
dpc version ITU96
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN , HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the global configuration mode.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the global configuration mode.

global-title-translation

This command associates a GTT address-map with this SCCP network.

Platform

ASR 5000

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

global-title-translation address-map instance *instance*

no global-title-translation address-map instance *instance*

no

Deletes the GTT address-map instance associated with this SCCP network.

instance

This value uniquely identifies a specific previously defined instance of a GTT address-map.
instance: enter an integer from 1 to 4096.

Usage

Use this command to link a GTT address-map, configured with the GTT Address Map configuration mode, to a specific SCCP network configuration.

Example

global-title-translation address-map instance *gtt-map1*

hop-count

This command specifies the hop count for this SCCP network.

Platform

ASR 5000

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

hop-count *hop_cnt*

default hop-count

default

Resets the hop-count value to the system default of 5.

hop_cnt

The hop count to assign to this SCCP network.
hop_cnt: enter an integer from 1 to 15.

Usage

Use this command to define the hop count for this SCCP network.

Example

The following command sets the hop count to 3:

```
hop-count 3
```

self-point-code

This command specifies the SS7 point code for this SCCP service.

Platform

ASR 5000

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

self-point-code *point_code*

no self-point-code

no

Deletes the configured self point code.

point_code

Defines the point code to assign to this SCCP network service.
point_code: value entered must adhere to the point code variant selected when the SCCP network instance was defined:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- a string of 1 to 11 combined digits ad period.

Usage

Use this command to assign the self point code to use for this SCCP service.

Example

The following command sets an ITU-based point code for this SCCP service:

```
self-pointcode 4.121.5
```

The following command removes the configured self-point code:

```
no self-pointcode
```

timeout

This command configures the timeout parameters for this SCCP network.

Platform

ASR 5000

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

timeout { attack-timer | congestion-timer | conn-est-timer | crd-timer | decay-timer | iar-timer | ias-timer | interval-timer | reassembly-timer | release-timer | repeat-release-timer | reset-timer | sst-timer } +

default timeout

no timeout *timer*

attack-timer *time*

Defines the time before the attack timer expires.
time: enter an integer between 1 and 10.

congestion-timer *time*

Defines the time before the congestion timer expires.
time: enter an integer between 1 and 10.

conn-est-timer *time*

Defines the time before the connection timer expires.
time: enter an integer between 6 and 12.

crd-timer *time*

Defines the time before the coordinated-state-change timer expires.
time: enter an integer between 60 and 120.

decay-timer *time*

Defines the time before the decay timer expires.
time: enter an integer between 1 and 10.

iar-timer *time*

Defines the time before the inactivity-receive timer expires.
time: enter an integer between 60 and 120.

ias-timer *time*

Defines the time before the inactivity-send timer expires.

time: enter an integer between 30 and 60.

interval-timer *time*

Defines the time before the interval timer expires.
time: enter an integer between 6 and 12

reassembly-timer *time*

Defines the time before the reassembly-timer expires.
time: enter an integer between 10 and 20.

release-timer *time*

Defines the time before the release-assembly timer expires.
time: enter an integer between 1 and 2.

repeat-release-timer *time*

Defines the time before repeat-release timer expires.
time: enter an integer between 1 and 2

reset-timer *time*

Defines the amount of time before the reset timer expires.
time: enter an integer between 1 and 2

sst-timer *time*

Defines the amount of time before the subsystem status test timer expires.
time: enter an integer between 5 and 1200.

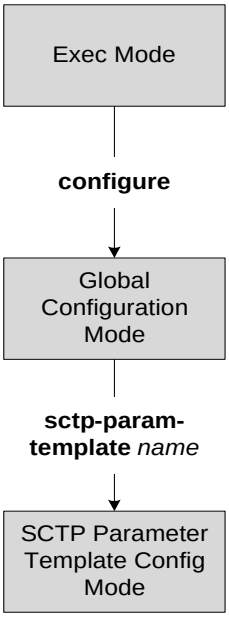
default

Resets the timeout parameter to the system default.

no

Deletes the specified timer configuration.

Usage



Use this command to assign timeout timers and timeout values for this SCCP service.

Example

```
timeout reset-timer 75
```

Chapter 238
SCTP Parameter Template Configuration Mode Commands

This chapter provides information about commands used to configure parameters for Stream Control Transmission Protocol (SCTP) associations. The commands become part of a template that can be associated with services running on the system.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

sctp-alpha

Configures the SCTP retransmission timeout (RTO) alpha value.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-alpha *value*

default sctp-alpha

default

Returns the command to its default setting of 5.

value

Default: 5
Specifies the SCTP retransmission timeout alpha value. *value* must be an integer from 0 through 65535.

Usage

Use this command to configure the SCTP RTO alpha value. The RTO alpha value is used in calculating the smoothed round-trip time (SRTT) and the round-trip time variation (RTTVAR) for new round trip time (RTT) measurements.

Example

The following command sets the SCTP RTO alpha value to *10*:

```
sctp-alpha 10
```

sctp-alt-accept-flag

Configures the SCTP alternate accept flag for additional life time for the association.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

```
sctp-alt-accept-flag { disable | enable }

default sctp-alt-accept-flag
```

default

Returns the command to its default setting of enable.

disable | enable

Specifies if the alternate accept flag is enabled or disabled.

Usage

Use this command to configure the SCTP alternate accept flag for additional life time for the association.

Example

The following command disables the alternate accept flag for the SCTP association:

```
sctp-alt-accept-flag disable
```

sctp-beta

Configures the SCTP retransmission timeout (RTO) beta value.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-beta *value*

default sctp-beta

default

Returns the command to its default setting of 10.

value

Specifies the SCTP retransmission timeout beta value as an integer from 0 through 65535. Default: 10

Usage

Use this command to configure the SCTP RTO beta value. The RTO beta value is used in calculating the smoothed round-trip time (SRTT) and the round-trip time variation (RTTVAR) for new round trip time (RTT) measurements.

Example

The following command sets the SCTP RTO beta value to *20*:

```
sctp-beta 20
```

sctp-checksum-type

Configures the checksum type used to increase the integrity of the SCTP packets during transmission.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

```
sctp-checksum-type { adler32 | crc32 }

default sctp-checksum-type
```

default

Returns the command to its default setting of CRC32.

adler32 | crc32

Specifies the type of checksum used to increase data integrity of SCTP packets.
adler32: Specifies that the Adler-32 checksum algorithm is used to increase data integrity for SCTP packets.
crc32: Specifies that a 32-bit cyclic redundancy check is used to increase data integrity of SCTP packets.

Usage

Use this command to select the checksum for data integrity of SCTP packets.

Example

The following command enables the Adler-32 checksum algorithm used to increase data integrity of SCTP packets:

```
sctp-checksum-type adler32
```

sctp-cookie-life

Configures the lifetime of the SCTP cookie.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-cookie-life *value*

default sctp-cookie-life

default

Returns the command to its default setting of 600 (60000 milliseconds).

value

Default: 600 (60000 milliseconds)
Specifies the lifetime of the SCTP cookie. *value* is an integer from 50 through 1200. The range translates to 5000 milliseconds to 120000 milliseconds, as the granularity is in 100-millisecond increments.

Usage

Use this command to configure the lifetime of the SCTP cookie.

Example

The following command configures the lifetime of the SCTP cookie to 80000 milliseconds:

```
sctp-cookie-life 800
```

sctp-max-assoc-retx

Configures the maximum number of retransmissions for SCTP associations.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-max-assoc-retx *value*

default sctp-max-assoc-retx

default

Returns the command to its default setting of 10.

value

Specifies the maximum number of retransmissions allowed by this template for SCTP associations as an integer from 0 through 255. Default: 10

Usage

Use this command to configure the maximum number of retransmissions allowed by this template for SCTP associations.

Example

The following command configures the maximum number of retransmissions to 7:

```
sctp-max-assoc-retx 7
```

sctp-max-in-strms

Configures the maximum number of incoming SCTP streams allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-max-in-strms *value*

default sctp-max-in-strms

default

Returns the command to its default setting of 16.

value

Specifies the maximum number of incoming SCTP streams allowed by the template as an integer from1 through 16. Default: 16

Usage

Use this command to configure the maximum number of incoming SCTP streams allowed by the template.

Example

The following command configures the maximum number of incoming SCTP streams allowed by the template to *5*:

```
sctp-max-in-strms 5
```

sctp-max-init-retx

Configures the maximum number of retransmissions of SCTP initiations allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-max-init-retx *value*

default sctp-max-init-retx

default

Returns the command to its default setting of 5.

value

Specifies the maximum number of retransmissions of SCTP initiations allowed by the template as an integer from 0 through 255. Default: 5

Usage

Use this command to configure the maximum number of retransmissions of SCTP initiations allowed by the template.

Example

The following command configures the maximum number of retransmissions of SCTP initiations allowed by the template to *10*:

```
sctp-max-init-retx 10
```

sctp-max-mtu-size

Configures the maximum transmission unit (MTU) size (in bytes) for SCTP streams allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-max-mtu-size *bytes*

default sctp-max-mtu-size

default

Returns the command to its default setting of 1500 bytes.

bytes

Specifies the maximum MTU size (in bytes) for SCTP streams allowed by the template as an integer from 508 through 65535. Default: 1500

Usage

Use this command to configure the maximum MTU size, in bytes, for SCTP streams allowed by the template.

Example

The following command configures the maximum MTU size for SCTP streams allowed by the template to *3000*:

```
sctp-max-mtu-size 3000
```

sctp-max-out-strms

Configures the maximum number of outgoing SCTP streams allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-max-out-strms *value*

default sctp-max-out-strms

default

Returns the command to its default setting of 16.

value

Specifies the maximum number of outgoing SCTP streams allowed by the template as an integer from 1 through 16. Default: 16

Usage

Use this command to configure the maximum number of outgoing SCTP streams allowed by the template.

Example

The following command configures the maximum number of outgoing SCTP streams allowed by the template to *5*:

```
sctp-max-out-strms 5
```

sctp-max-path-retx

Configures the maximum number of retransmissions of SCTP paths allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-max-path-retx *value*

default sctp-max-path-retx

default

Returns the command to its default setting of 5.

value

Specifies the maximum number of retransmissions of SCTP paths allowed by the template as an integer from 0 through 255. Default: 5

Usage

Use this command to configure the maximum number of retransmissions of SCTP paths allowed by the template. An SCTP path is a connection between an endpoint address and a peer endpoint address.

Example

The following command configures the maximum number of retransmissions of SCTP paths allowed by the template to *10*:

```
sctp-max-path-retx 10
```

sctp-min-mtu-size

Configures the minimum maximum transmission unit (MTU) size (in bytes) for SCTP streams allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-min-mtu-size *bytes*

default sctp-min-mtu-size

default

Returns the command to its default setting of 508 bytes.

bytes

Specifies the minimum MTU size (in bytes) for SCTP streams allowed by the template as an integer from 508 through 65535. Default: 508

Usage

Use this command to configure the minimum MTU size, in bytes, for SCTP streams allowed by the template.

Example

The following command configures the minimum MTU size for SCTP streams allowed by the template to *1000*:

```
sctp-min-mtu-size 1000
```

sctp-rto-initial

Configures the initial time for SCTP retransmission timeouts (RTOs) allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-rto-initial *value*

default sctp-rto-initial

default

Returns the command to its default setting of 30 (3000 milliseconds).

value

Specifies the initial time for SCTP RTO as an integer from 1 through 1200. The granularity is in 100ms increments (20 = 2000ms). Default: 30 (3000 milliseconds)

Usage

Use this command to configure the initial time for SCTP RTOs allowed by the template.

Example

The following command configures the initial SCTP RTO to 6000ms:

```
sctp-rto-initial 60
```

sctp-rto-max

Configures the maximum time for SCTP retransmission timeouts (RTOs) allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-rto-max *value*

default sctp-rto-max

default

Returns the command to its default setting of 600 (60000 milliseconds).

value

Specifies the maximum time for SCTP RTOs allowed by the template as an integer from 50 through 1200. The granularity is in 100ms increments (120 = 12000ms). Default: 600 (60000 milliseconds)

Usage

Use this command to configure the maximum time for SCTP RTOs allowed by the template.

Example

The following command configures the maximum time for SCTP RTOs allowed by the template to 120000ms:

```
sctp-rto-max 120
```

sctp-rto-min

Configures the minimum time for SCTP retransmission timeouts (RTOs) allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-rto-min *value*

default sctp-rto-min

default

Returns the command to its default setting of 10 (1000 milliseconds).

value

Specifies the minimum time for SCTP RTOs allowed by the template as an integer from 1 through 500. The granularity is in 100ms increments (20 = 2000ms). Default: 10 (1000 milliseconds)

Usage

Use this command to configure the minimum time for SCTP RTOs allowed by the template.

Example

The following command configures the minimum time for SCTP RTOs allowed by the template to 2000ms:

```
sctp-rto-min 20
```

sctp-sack-frequency

Configures the frequency of SCTP selective acknowledgements allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-sack-frequency *value*

default sctp-sack-frequency

default

Returns the command to its default setting of 2.

value

Specifies the frequency of SCTP selective acknowledgements allowed by the template as an integer from 1 through 20. Default: 2

Usage

Use this command to configure the frequency of SCTP selective acknowledgements allowed by the template.

Example

The following command configures the frequency of SCTP selective acknowledgements allowed by the template to 10:

```
sctp-sack-frequency 10
```

sctp-sack-period

Configures the period for SCTP selective acknowledgements allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-sack-period { *value* | units-10ms *value* }

default sctp-sack-period

default

Returns the command to its default setting of 2 (200 milliseconds).

value

Specifies the period for SCTP selective acknowledgements allowed by the template as an integer from 0 through 5. The granularity is in 100ms increments (3 = 300ms). Default: 2 (200 milliseconds)

units-10ms *value*

Specifies that the integer added as *value* is to be calculated using 10ms granularity for this command. *value* is an integer from 0 through 50.

Usage

Use this command to configure the period for SCTP selective acknowledgements allowed by the template.

Example

The following command configures the period for SCTP selective acknowledgements allowed by the template to 400ms (using the 10ms granularity):

```
sctp-sack-period units-10ms 40
```

sctp-start-mtu-size

Configures the start maximum transmission unit (MTU) size (in bytes) for SCTP streams allowed by the template.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

sctp-start-mtu-size *bytes*

default sctp-start-mtu-size

default

Returns the command to its default setting of 1500 bytes.

bytes

Specifies the start MTU size (in bytes) for SCTP streams allowed by the template as an integer from 508 through 65535. Default: 1500

Usage

Use this command to configure the start MTU size, in bytes, for SCTP streams allowed by the template.

Example

The following command configures the start MTU size for SCTP streams allowed by the template to *3000*:

```
sctp-start-mtu-size 3000
```

timeout

Configures timeouts for SCTP data chunk bundle transmissions and/or SCTP heartbeat request responses.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Syntax

timeout { sctp-bundle *value* **| sctp-heart-beat** *value* **}**

[default | no] timeout { sctp-bundle | sctp-heart-beat }

default

Returns the command to its default setting of disabled for **sctp-bundle** and 30 seconds for **sctp-heart-beat**.

no

Removes the selected configuration.

sctp-bundle *value*

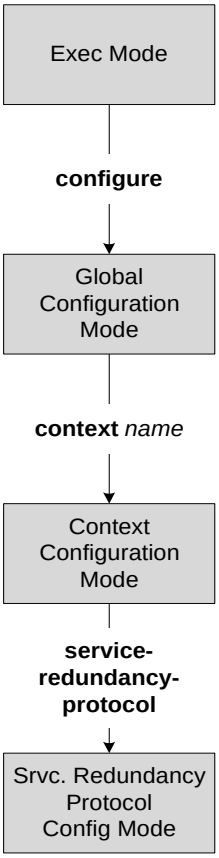
Specifies that SCTP data chunks are to be queued until this timer expires at which time the data chunks are bundled and committed for transmission. *value* is an integer from 1 through 65535. The granularity is in 100ms increments (10 = 1000ms or 1 second). Default: disabled

sctp-heart-beat *value*

Default: 30 seconds
Specifies the SCTP heartbeat timeout (in seconds) as an integer from 1 through 300. An SCTP heartbeat is sent o a peer to determine reachability. If an acknowledgement is not received before this timer runs out, heartbeat requests are no longer sent and the peer is considered unreachable.

Usage

Use this command to configure timeouts for SCTP data chunk bundle transmissions and/or SCTP heartbeat request responses.



Example

The following command enables the SCTP data chunk bundle timeout value and configures it to 2 seconds:

```
timeout sctp-bundle 20
```

Chapter 239
Service Redundancy Protocol Configuration Mode Commands

The Service Redundancy Protocol Mode is used to configure properties for Interchassis Session Recovery (ICSR) services.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind

Binds the service to the IP address of the local chassis.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

bind address { *ipv4 _address* | *ipv6_address* }

no bind address

no

Removes the IP bind address.

ipv4 _address | ipv6_address

Specifies the system IP address using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Important: Both peers must be using the same address family (IPv4 or IPv6) or the Service Redundancy Protocol (SRP) connection will not be established.

Usage

Defines the IP address of the local chassis defined as part of the ICSR configuration.

Example

The following example binds the service to the IP address *10.1.1.1*:

```
bind address 10.1.1.1
```

chassis-mode

Defines the chassis's operational mode - primary or backup - for ICSR.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

```
chassis-mode { backup | primary }

default chassis-mode
```

default

Resets the chassis mode to the default setting of backup.

backup

(Default) Configures the system as the backup chassis operating in standby state.

primary

Configures the system as the primary chassis operating in active state.

Usage

Sets the chassis mode (primary or backup) for the system within the framework of ICSR.

Example

The following example configures the system as the primary chassis operating in active state

```
chassis-mode primary
```

checkpoint

Configures check pointing for ICSR. With check pointing enabled, the system stores a snapshot of the current application state use it for restarting the execution in case of failure.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

checkpoint session duration *duration*

default checkpoint session duration

default

Resets the checkpoint session duration to the default setting of 60 seconds.

duration

Specifies the amount of time (in seconds) that a call must be active before it is check pointed. *duration* must be an integer from 1 through 65535.
Default: 60

Usage

Sets the amount of time the chassis waits before check pointing an existing call session.

Example

The following example configures sets the checkpoint session duration to 6500 seconds:

```
checkpoint session duration 6500
```

configuration-interval

Defines the configuration validation interval.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

configuration-interval *interval*

default configuration-interval

default

Resets the configuration interval to the default setting of 3600 seconds.

interval

Specifies the amount of time (number of seconds) between one configuration validation and the next configuration validation.
interval must be an integer from 1 through 65535.
Default: 3600

Usage

This configures the interval between configuration validations of the primary and backup chassis.

Example

The following example sets the configuration interval to 34 seconds:

```
configuration-interval 34
```

dead-interval

Defines the timeout interval before a peer is determined to be down.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

dead-interval *interval*

default dead-interval

default

Resets the dead interval to the default setting of 30 seconds.

interval

Specifies the amount of time (in seconds) for the dead interval. *interval* must be an integer from 1 through 65535.
Default: 30

Usage

This command specifies the amount of time that one chassis waits to receive a communication from a peer before the listening chassis determines that the peer chassis is down.

Example

The following example sets the dead interval to 65 seconds:

```
dead-interval 65
```

delay-interval

Configures the delay time for starting the dead timer after configuration files are loaded.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

delay-interval*interval*

default delay-interval

default

Sets or restores the default value assigned for the specified parameter.

interval

Specifies the amount of time (in seconds) for the delay interval. *interval* must be an integer from 1 through 65535.

Usage

This configures interval for starting the dead timer after configuration files are loaded.

Example

The following example sets the delay interval to 65 seconds after the configuration files are loaded:

```
delay interval 65
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

hello-interval

Defines the lapse time between sending the hello message.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

hello-interval *interval*

default hello-interval

default

Resets the hello interval to the default setting of 10 seconds.

interval

Specifies the lapse time (in seconds) between sending the hello message. *interval* must be an integer from 1 through 65535.
Default: 10

Usage

This command configures the hello interval - the amount of time that lapses between the sending of each hello message. Each chassis sends the other chassis a hello message at the expiration of every hello interval.

Example

The following example sets the hello interval to 35 seconds:

```
hello-interval 35
```

internal-switchover-retry-interval

Defines the interval between internal switchover retries.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

internal-switchover-retry-interval *interval*

default internal-switchover-retry-interval

default

Resets the internal switchover retry interval to the default setting of 60 seconds.

interval

Specifies the amount of time (in seconds) between internal switchover retries. *interval* must be an integer from 10 through 120.
Default: 60

Usage

This configures the interval between internal switchover retries. The system only initiates internal switchovers if Service Redundancy Protocol (SRP) monitoring is configured.

Important: See the **monitor authentication-probe**, **monitor bgp**, or **monitor diameter** commands for more information on associated SRP monitoring.

Example

The following example sets the internal switchover retry interval to 34 seconds:

```
internal-switchover-retry-interval 34
```

monitor authentication-probe

Enables SRP monitoring of the connection between the specified AAA server and the primary chassis.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] monitor authentication-probe context context_name { ipv4_address | ipv6_address }
[ port port_number ]
```

no

Turns off the monitoring.

context *context_name*

Identifies the context being used.
context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

ipv4 _address **|** *ipv6_address*

Defines the IP address of the AAA server to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

port *port_number*

Identifies a specific port for the authentication probe. *port_number* must be the port for the AAA server expressed as an integer from 1 through 65535.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified AAA server through the use of authentication probe packets. If the connection drops, the standby chassis becomes active.

Example

The following example initiates the connection monitoring between the primary chassis and AAA server *10.2.3.4* at port *1025*:

```
monitor authentication-probe context test1 10.2.3.4 port 1025
```

monitor bfd

Enables SRP monitoring of the connection between the specified Bidirectional Forwarding Detection (BFD) neighbor and the primary chassis.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

[no] monitor bfd context *context_name* **{** *ipv4_address* **|** *ipv6_address* **} { chassis-to-chassis | chassis-to-router }**

no

Disables monitoring.

context *context_name*

Identifies the context being used.
context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

ipv4 _address **|** *ipv6_address*

Defines the IP address of the BFD neighbor to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation

chassis-to-chassis | chassis-to-router

chassis-to-chassis: BFD runs between primary and backup chassis on non-SRP links.
chassis-to-router: BFD runs between chassis and router.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified BFD neighbor in the specified context. If the connection drops, the standby chassis becomes active.

Important: BFD monitoring must run between chassis-to-chassis or chassis-to-router.

Example

The following example initiates the chassis-to-chassis connection monitoring between the primary chassis and BFD neighbor *12.2.1.54*:

```
monitor bfd context test 12.2.1.54 chassis-to-chassis
```

monitor bgp

Enables SRP monitoring of the connection between the specified Border Gateway Protocol (BGP) peer and the primary chassis.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

[no] monitor bgp context *context_name* **{** *ipv4_address* **|** *ipv6_address* **} [vrf** *vrf_name* **]**

no

Disables monitoring.

context *context_name*

Identifies the context being used.
context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

ipv4 _address **|** *ipv6_address*

Defines the IP address of the BGP peer to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation

vrf *vrf_name*

Defines the VPN Routing/Forwarding instance.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified BGP peer in the specified context. If the connection drops, the standby chassis becomes active.

Example

The following example initiates the connection monitoring between the primary chassis and BGP peer *125.2.1.56*:

```
monitor bgp context test 125.2.1.56
```

monitor diameter

Enables SRP monitoring of the connection between the specified Diameter server and the primary chassis.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

[no] monitor diameter context *context_name* **endpoint** *endpoint_name* **[fqdn** *fqdn* **| peer {** *ipv4_address* **|** *ipv6_address* **}] [port** *port_number* **]**

no

Turns off the monitoring.

context *context_name*

Identifies the context being used.
context_name must be an existing context expressed as an alphanumeric string of 1 through 79 characters.

endpoint *endpoint_name*

Identifies the endpoint being used.
endpoint_name must be for the Diameter server expressed as an alphanumeric string of 1 through 63 characters.

fqdn *fqdn*

Identifies a Fully Qualified Domain Name (FQDN).
fqdn must be for the Diameter server expressed an alphanumeric string of 1 through 127 characters.

peer { *ipv4 _address* **|** *ipv6_address* **}**

Defines the IP address of the Diameter server to be monitored, entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

port *port_number*

Identifies a specific port to monitor.
port_number must be the port for the Diameter server and an integer from 1 through 65535.

Usage

This command initiates monitoring of the connection between the primary chassis and the specified Diameter server in the specified context. If the connection drops, the standby chassis becomes active.

Important: Endpoint name, FQDN, IP address, and port must all match the Diameter protocol configured values for the peer state to be updated.

Example

The following example initiates the connection monitoring between the primary chassis and the Diameter server on context *test1* and endpoint *end2*:

```
monitor diameter context test1 10.6.7.8 endpoint end2
```

num-internal-switchover-retry

Defines the number of times an internal switchover would be retried.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

num-internal-switchover-retry *retries*

default num-internal-switchover-retry

default

Resets the configuration interval to the default setting of 3 retries.

retries

The number of times an internal switchover would be retried in case of standby chassis. *retries* must be an integer from 1 through 10.
Default: 3

Usage

This configures the number of times an internal switchover would be retried in case of standby chassis failure to respond or become active.

Example

The following example sets the retry number to *5*:

```
num-internal-switchover-retry 5
```

peer-ip-address

Specifies the IP address for the peer chassis.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

peer-ip-address { *ipv4_address* | *ipv6_address* }

no peer-ip-address

no

Removes the peer IP address of the backup chassis.

ipv4_address | *ipv6_address*

Specifies the IP address of the backup chassis, entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Important: Both peers must be using the same address family (IPv4 or IPv6) or the Service Redundancy Protocol (SRP) connection will not be established.

Usage

This command is used to identify the peer chassis in the ICSR configuration. From the primary's perspective, the peer is the backup and from the backup's perspective, the peer is the primary.

Example

The following example specifies *10.2.3.4* as a backup peer system to the primary system:

```
peer-ip-address 10.2.3.4
```

priority

Sets the initial ICSR priority of each peer chassis.

Important: **priority** takes affect only during simultaneous initializing of all chassis in an ICSR configuration, and only if a misconfiguration has both chassis in the same mode (both Primary or both Backup).

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

priority *priority_value*

default priority

default

Resets the priority to the default setting of 125.

priority_value

Specifies the priority for the chassis.
priority_value must be an integer from 1 through 255, where 1 is the highest priority.
Default: 125

Usage

This command determines which chassis transitions to the Active state when all chassis have the same mode configuration. **priority** acts as a tie breaker for the state determination only when all chassis initialize simultaneously. The chassis with the higher priority (lower number) becomes Active, while the chassis with the lower priority (higher number) becomes Standby.
Once chassis become operational (after initialization), if there is an event requiring a chassis change of state, then each chassis returns to its previous state (Active or Standby) after both chassis recover.

Example

The following example sets the priority value to *5*:

```
priority 5
```

route-modifier

Sets the route modifier for the peer chassis.

Platform

ASR 5000

Product

All products supporting ICSR

Privilege

Security Administrator, Administrator

Syntax

route-modifier threshold *threshold_value*

default route-modifier

default

Resets the route modifier to the default setting of 16.

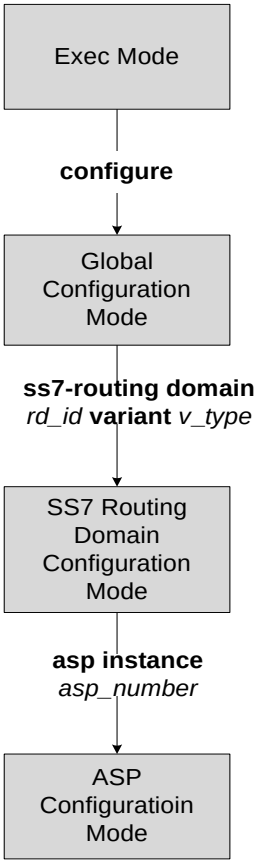
threshold_value

Specifies the value that causes the route-modifier counter to be reset to the initial value. *threshold_value* must be an integer from 2 through 32.
Default: 16

Usage

This command is used to determine when the route modifier should be reset to its initial value to avoid rollover.

Example



The following example sets the route modifier threshold to *10*:

```
route-modifier threshold 10
```

Chapter 240
SGSN ASP Configuration Mode Commands

The ASP (application server process) configuration mode defines the M3UA end-point parameters for a specific SS7 routing domain instance. The ASP instance is generated and accessed via the SS7 routing domain configuration mode commands.

`[local]`*`hostname`*`(config-ss7-rd-<`*`ss7rd_id`*`>-asp-inst-<`*`asp_inst`*`>)#`

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec Mode.

end-point

This command defines or deletes the IP address and/or port number to be associated with the local SCTP end-point for this ASP. At least one address needs to be configured before the end-point can be activated.

When using the **bind** keyword, this command also activates the end-point once the address has been defined. Once bound, it cannot be reconfigured until it is unbound with the **no end-point bind** command.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
end-point { address ip_address context context_id | bind | port port_number }

no end-point { address ip_address context context_id | bind }
```

address ip_address context context_id:

Specifies the IP address and the context associated with the address for this end-point.
ip_address**:** must be defined using the standard IPv4 dotted decimal notation or the colon notation of IPv6.
context context_id: a string of 1 to 79 alphanumeric characters to identify the specific context associated with the end-point address.

bind

Activates (binds) the end-point.

Important: Only use **bind** after you have configured other parameters.

port port_number

Identifies the M3UA's SCTP port associated with this end-point.
port_number: must be an integer fom 1 to 65535. Default is 2905.

no

Removes the end-point configuration or deactivates the end-point.

Caution: Entering this command will terminate all current subscriber sessions for associated peers.

Usage

Use this command to manage the ASP end-point. Once the ASP end-point is bound the end-point configuration can not be changed until it is unbound.

Example

Activate the end-point with the following command:

```
end-point bind
```

Deactivate or unbind the end-point with the following command:

```
no end-point bind
```

Set the end-point port to default for ASP 1 with the following command:

```
default asp instance 1 end-point port
```

exit

Exits the current mode and returns to the previous mode.

Product

SGSN

Privilege

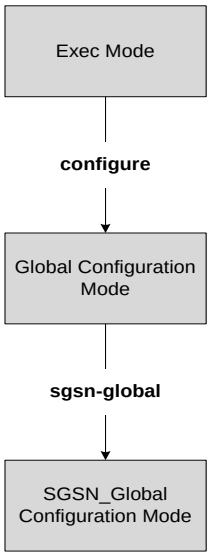
Security Administrator, Administrator

Syntax

```
exit
```

Usage

Returns to the previous mode.



Chapter 241
SGSN Global Configuration Mode Commands

The commands in this mode configure SGSN-specific parameters impact the entire SGSN and that are independent of the GPRS or the IuPS services.

In this mode, your prompt will look similar to:

```
[local]hostname(config-sgsn-global)#
```

The SGSN Global configuration mode is a sub-mode derived from the Global configuration mode.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aggregate-ipc-msg

Enables/disables aggregation of inter-process communication (IPC) messages in the link manager (linkmgr) and session manager (sessmgr).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

aggregate-ipc-msg { linkmgr | sessmgr } { flush-frequency *frequency* **| num-msgs** *number_msgs* **}**

default aggregate-ipc-msg { linkmgr | sessmgr }

default

Resets the managers to default values for flushing.

linkmgr

Selects the linkmgr to configure the number of IPC messages to be aggregated and frequency of flushing.

sessmgr

Selects the sessmgr to configure the number of IPC messages to be aggregated and frequency of flushing.

flush-frequency *frequency*

Configure the frequency, in 100-millisecond intervals, that the aggregated IPC messages will be flushed.
frequency : Enter an integer from 1 to 3. Default is 1.

num-msgs *number_msgs*

Configure the number of IPC messages to aggregate before flushing.
number_msgs : Enter the integer 1 (to disable aggregation) or an integer from 2 to 164 to define the number of messages. Default is 10.

Usage

Use this command to enable/disable aggregation of IPC messages in the linkmgr and/or the sessmgr. This command includes options to configure the frequency of aggregated message flushing and the number of packets to be buffered before the flush. This command provides a solution for reducing latency while sending the IPC messages towards the core network (CN).
By default, the link manager buffers packets and then send them over the SCCP link if there are events to be sent via SCCP Connection Request (SCCP CR) towards the core node. The SGSN aggregate packets for 100 msec and send them with whatever aggregation has been done during those 100 msecs.
At the SGSN, this command can be used to reduce the processing involved in sending every event individually towards the core node in the following manner:

- If aggregation is enabled, then there could be a time delay for sending SCCP CRs depending on configuration of the HNB-GW or SGSN.
- If aggregation is reduced to 1, then there will be no delay for aggregation and events are sent via SCCP CR without delay. This reduces the SCCP connection setup time.

To view aggregate IPC message statistics, use command **show config | grep aggregate-ipc-msg**.

Example

Configure the linkmgr to buffer *45* messages before flushing the linkmgr IPC messages:

```
aggregate-ipc-msg linkmgr flush-frequency 45
```

The following command configures the *linkmgr* to flush the IPC messages towards the CN without aggregation:

```
aggregate-ipc-msg linkmgr1
```

The following command configures the *sessmgr* to flush the IPC messages towards the CN without aggregation:

```
aggregate-ipc-msg sessmgr1
```

apn-resolve-dns-query snaptr

Enable/disable sending of SNAPTR DNS query to resolve an APN for a subscriber with an EPS (evolved packet system)-capable handset.

Important: This command is no longer available in all 12.0 and 12.2 releases. If you do not see this command in your release, look for the **apn-resolve-dns-query snaptr** command in the APN Profile configuration mode to accomplish the same task.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] apn-resolve-dns-query snaptr

default apn-resolve-dns-query
```

default

Resets the default, the ability to send SNAPTR DNS query is disabled.

no

Disables the ability to send SNAPTR DNS query.

Usage

By default, sending the SNAPTR DNS query is disabled. Use this command to send SNAPTR DNS query when resolving an APN for an EPS-capable subscriber.
At PDP context activation, the SGSN will use the UE capabilitly as input to select either a GGSN or a P-GW for the EPS-capable subscriber. The SNAPTR DNS query will be used for P-GW resolution. Enabling this feature will give priority to P-GW selection for E-UTRAN-capable UEs.

Example

Use the following command to enable sending of SNAPTR DNS query for APN resolution:

```
apn-resolve-dns-query
```

Use the following command to disable the use of SNAPTR DNS query for APN resolution:

```
no apn-resolve-dns-query
```

bssgp-message ms-flow-control-from-unknown-ms

This command determines the SGSN response to MS-Flow-Control messages received from an unknown MS.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

bssgp-message ms-flow-control-from-unknown-ms { discard-message | send-ack | send-status }

default bssgp-message ms-flow-control-from-unknown-ms

default

Including **default** with the command configures the SGSN to use default behavior so that the SGSN sends BSSGP-Status messages whenever the SGSN receives an MS-Flow-Control message from an unknown MS.

discard-message

This keyword instructs the SGSN to discard the received BSSGP message. With this option, the SGSN does not send any response to the MS after discarding the received BSSGP message.

send-ack

This keyword instructs the SGSN to send an acknowledgement message (MS-Flow-Control-ACK) after receiving an MS-Flow-Control message.

send-status

Default
This keyword instructs the SGSN to send a BSSGP-Status message to the MS whenever the SGSN receives an MS-Flow-Control message from an unknown MS.

Usage

This command allows the operator to specify the action the SGSN needs to take whenever the SGSN receives an MS-Flow-Control message from an unknown mobile station. This configuration determines the response for the SGSN globally.
The list of possible actions are:

- send a BSSGP-Status response message
- send an ACK message (MS-Flow-Control-ACK)
- discard the BSSGP message

To see the statistics for the number of MS-Flow-Control messages that have been discarded, use the **show bssgp statistics** command from the Exec mode.

Example

Change the default configuration and have the SGSN acknowledge receipt of the MS-Flow-Control message:

```
bssgp-message ms-flow-control-from-unknown-ms send-ack
```

bssgp-timer

Configures the T2 and TH timers for the BVCs (BSSGP virtual connections) of the NSE (network service entities).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

bssgp-timer { t2 *T2_time* **| th** *TH_time* **}**

default bssgp-timer { t2 | th }

default

Resets the specified timers to default settings.

t2 *T2_time*

Configures the BVC reset guard timer (at the BSSGP layer) in units of 1 second.
T2_time : Enter an integer from 1 to 120. Default is 30 seconds.

th *TH_time*

Configures, at the BSSGP layer, the MS flow control parameter validity timeouts in units of 1 second.
TH_time : Enter an integer from 6 to 5999. Default is 500 seconds.

Usage

Use this command to configure timer timeout values for MS flow control and BVC reset timers that control BVCs for the NSEs.

Example

Set the TH timeout for *20* seconds:

```
bssgp-timer th 20
```

bvc-unblock

This command enables (disabled by default) or disables the SGSN to unblock blocked BVCs based on the receipt of uplink packets from the BSC.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
bvc-unblock { data-or-flow-control | flow-control | ul-data }

[ default | no ] bvc-unblock
```

default

Include **default** with the command to disable the function.

no

Include **no** with the command to disable this function.

data-or-flow-control

Enables the BVC-Unblock function when the SGSN receives either a FLOW-CONTROL-BVC packet or a UL-UNITDATA packet.

flow-control

Enables the BVC-Unblock function when the SGSN receives a FLOW-CONTROL-BVC packet.

ul-data

Enables the BVC-Unblock function when the SGSN receives a UL-UNITDATA packet.

Usage

Configurations defined with this command are common to all NSE defined for the SGSN.
This command is useful if there is a BVC status mismatch across different SGSN managers (such as the sessmgr and the linkmgr) when the BSC sends BVC-Block (SGSN should move to BLOCKED) followed by a BVC-Reset (SGSN should move to UNBLOCKED). Such mismatches can easily occur, particularly on Gb-IP network connection, when one link receives the BVC-Block and a different link receives the BVC-Reset with little delay between the two.
If BVC-Unblock function is enabled, the SGSN ensures that BVCs which are in the BLOCKED state move to the UNBLOCKED state upon receipt of the configured packet type(s).

Example

Instruct the SGSN to perform BVC-Unblock when a mismatch occurs and the SGSN receives a FLOW-CONTROL-BVC packet:

bvc-unblock flow-control

dscp-template

Creates and/or deletes DSCP templates that can be configured for use for all GPRS services on the SGSN and provides access to the DSCP Template configuration mode.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
dscp-template template_name [ -noconfirm ]

no dscp-template template_name
```

no

Deletes the template instance from the SGSN Global configuration.

template_name

Enter 1 to 64 alphanumeric characters, including dots (.), dashes (-), and forward slashes (/). to identify a unique instance of a DSCP template.
There is no known limit to the number of templates that can be created.

Usage

This command enables the operator to create or delete an instance of a DSCP template and access the DSCP Template configuration mode. The DSCP templates are used to define the DSCP configuration for control packets and data packets for the GPRS services.

Related commands:

- This command provides access to the mode containing all the configuration commands used to define DSCP markings for the control packets and data packets for a particular GPRS service (see the *DSCP Template Configuration Mode Commands* section).
- To associated a specific DSCP template with a specific GPRS service configuration, for builds prior to release 14.0 use the **associate-dscp-template downlink** command and for builds in releases 14.0 and higher use the **associate dscp-template downlink**command. Both commands are documented in the *GPRS Service Configuration Mode Commands* section.
- To check the list of DSCP templates configured, use the **show sgsn-mode** command documented in the *Exec Mode Commands* section.

Example

Use a command similar to the following to create a DSCP template with ID *dscp_london* that can be used specifically for Gb/IP calls from subscribers in London:

```
dscp-template dscp_london
```

end

Exits the current mode and returns to the Exec Mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec Mode.

exit

Exits the current mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode to the Global Configuration Mode.

gmm-message

This command configures the SGSN to discard (drop) the Attach-Request message received with a random TLLI already in use.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] gmm-message attach-with-tlli-in-use discard-message
```

default

Resets the default function allowing multiple MS, using the same random TLLI, to attempt to Attach simultaneously and disables discarding the Attach-Request message for random TLLI already in use.

Usage

Working with the two related commands (noted below), this command is part of a procedure for handling multiple MS Attaches all with the Same Random TLLI. Use this command to configure the SGSN to allow only one subscriber at a time to attach using a fixed random TLLI.

Related Commands:

- The **old-tlli invalidate tlli** command configures a list of random TLLI to be invalidated from the GMM after the invalidate old-TLLI timer expires.
- The **old-tlli hold-time** command configures the old-TLLI expiry timer.

Example

Configure the SGSN to drop Attach Request containing TLLI already in use:

```
gmm-message attach-with-tlli-in-use discard-message
```

gmm-sm-statistics

This command is used to configure display of counters for internal/external reasons which lead to 2G/3G and Combined Attach Reject scenarios.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gmm-sm-statistics attach-rejects cause network-failure only-internal

no gmm-sm-statistics attach-rejects
```

no

The no form of the command is used to configure the display of counters for both internal and external triggers/reasons which lead to 2G/3G and Combined Attach Reject scenarios. This is also the default behavior.

Usage

Different internal or external triggers/reasons lead to 2G/3G and Combined Attach Reject scenarios. 2G/3G and Combined Attach Requests are rejected with network failure cause codes.The operator is provided the flexibility to configure the display of internal or external reasons which lead to reject scenarios.

Example

The following command is used to configure display of counters for internal reasons which lead to 2G/3G and Combined Attach Reject scenarios:

```
gmm-sm-statistics attach-rejects cause network-failure only-internal
```

The following command is used to configure display of counters for both internal and external reasons which lead to 2G/3G and Combined Attach Reject scenarios:

```
no gmm-sm-statistics attach-rejects
```

interface-management

This command creates an interface management configuration and provides access to the SGSN global interface management configuration mode.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
interface-management
```

Usage

Use this command to access the SGSN global interface management configuration command to map NSE-ID and NSE-name to the Gb interface and/or to lock and unlock NSE/BSC from the SGSN.

Example

Access the SGSN global interface management configuration command mode:

```
interface-management
```

imsi-range

Configure an IMSI range or a PLMN ID to associate with an Operator Policy.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

imsi-range mcc *mcc_num* **mnc** *mnc_num* **{ msin first** *start_number* **last** *stop_number* **[operator-policy** *policy_name* **[description** *description* **]] | plmnid** *plmn_id* **operator-policy** *policy_name* **[description** *description* **] } +**

no imsi-range mcc *mcc_num* **mnc** *mnc_num* **{ msin first** *start_number* **last** *stop_number* **| plmnid** *plmn_id* **}**

no

Using **no** in the command deletes the definition from the SGSN Global configuration.

mcc *mcc_num*

mcc defines the mobile country code (MCC) of an IMSI.
mcc_num: Enter a 3-digit number from 100 to 999 - 000 to 099 are reserved.

mnc *mnc_num*

mnc defines the mobile network code (MNC) of an IMSI.
mnc_num: Enter a 2 or 3-digit number from 00 to 999.

msin

MSIN (mobile subscriber international number) portion of the IMSI.
first *start_num:* Defines first MSIN prefix number in a range
last *stop_num:* Defines the last or final MSIN prefix number in a range.

operator-policy *policy_name* **description** *description*

Identify the operator policy that the IMSI range definition and/or the PLMN-ID is to be associated.
policy_name : Enter a string of 1 to 64 alphanumeric characters.
description: Enter a string of 1 to 100 alphanumeric characters to provide range clarification for converted Release 9.0 configurations.
If a PLMN-ID is to be included in the definition, enter the **plmnid** before entering the operator policy name.

plmnid *plmn_id*

The 5-6 digit PLMN-ID consists of the MCC (mobile country code) plus the MNC (mobile network code) to identify the public land mobile network (PLMN) for a specific operator. This keyword associates a specific PLMN with this specific SGSN operator policy.
plmn_id : Enter 5 to 6 digits.

+

This symbol indicates that command can be repeated to create repeated definitions.

Usage

An IMSI = maximum of 15 digits. An IMSI consists of the MCC (3 digits) + the MNC (2 or 3 digits) + the MSIN (the remaining 10 or 9 digits depending on the length of the MNC).
MCC and MNC are the minimum amount of information required to identify a unique operator policy with IMSI filtering. The MCC and MNC combine uniquely to identify the country and the network operator, for example: Cingular Wireless in the United States = **mcc** *311***mnc** *180*
To improve the granularity of call handling, an operator policy with additional IMSI filtering parameters can be defined, to include filtering based on the MSIN, by defining a MSIN range - first (or start-of-range) MSIN and last (or end-of-range) MSIN. The range numbers do not include the maximum allowed for the MSIN but should include a sufficient number to enable the operator policy to filter effectively.
For the most efficient IMSI filter, the operator policy should include all of the above parameters and the PLMN ID which defines the current location of the MS -- this parameter is particularly useful for highlighting which calls are roaming.
And if none of the operator policies contain useful filtering information, then the default operator policy will be applied as the information in this command is never defined for the default operator policy.
The following table will illustrate how these filtering parameters determine which operator policy will govern a call:

Operator Policy ID	MCC	MNC	MSINfirst	MSINlast	PLMN ID
OpPol-1	123	45	67890	67898	
OpPol-2	123	45			
OpPol-3	123	45	67890	67898	23232
OpPol-4	123	45			23232
OpPol-5	123	45	6789012	6789019	
OpPol-6	123	45	6789012	6789019	23232
default					

The filtering selects which operator policy will be used to determine how a call is handled - the operator policy that best matches the IMSI. So, a call with IMSI 123456789012345 PLMNID 23232 is best matched with OpPol-6.
In most cases, the operator policy with the most information defined will be used as a combination of PLMNID and IMSI provides the best match. But OpPol-6 won't always be the best match. Using the table above:
OpPol-1 is the best match for IMSI 123456789011111
OpPol-2 is the best match for IMSI 123456789099999
OpPol-5 is the best match for IMSI 123456789012345 if the PLMNID is 12344

Example

The following associates operator policy *oppol1* with country code *310*, mobile network code of *33*, and IMSI range *1231234 - 1231244*:

```
imsi-range mcc 310 mnc 33 msin first 1231234 last 1231244 operator-policy
oppol1
```

location-services

Enable or ‘start’ Location Services (LCS) on the SGSN.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
location-services

no location-services
```

no

Disables or ‘stops’ LCS on the SGSN.

Usage

By default, Location Services is not enabled on the SGSN. This command is mandatory to enable the SGSN to support LCS, which is a license-controlled feature. Multiple other commands are required to configure LCS functionality. For more information about the operation and configuration of LCS on the SGSN, refer to the *Location Services* section of the *SGSN Administration Guide*.

Example

Use the following command to disable Location Services once they have been enabled:

```
no location-services
```

map-message

This command instructs the SGSN to ignore the CAMEL subscription when there is no CAMEL service associated or in existence.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
map-message insert-subscriber-data csi-handling when-camel-not-associated ignore-subscription

default map-message insert-subscriber-data csi-handling
```

default

Resets the SGSN's default behavior. By default, the SGSN validates the CAMEL subscription and rejects an Attach Request when there is no CAMEL service association.

Usage

By default, the SGSN updates the the CAMEL subscription included in the INSERT-SUBSCRIBER-DATA (ISD) messages received from the HLR. While processing the ATTACH request from the CAMEL subscriber, the SGSN checks whether it has a CAMEL service associated with the corresponding service (either GPRS service or SGN service). It drops the ATTACH request if there is no CAMEL service associated with a corresponding service.
Also by default, the SGSN does not allow establishment of a Direct Tunnel (DT) for a CAMEL subscriber. It strictly validates the subscriber against the CAMEL subscription during the Direct Tunnel setup procedure. This command enables the operator to control the behavior of the SGSN by configuring the SGSN to ignore the CAMEL subscription. This allows the SGSN to successfully complete an ATTACH procedure when there is an ATTACH Request from a CAMEL subscriber and there is no CAMEL service association in the SGSN. As well, during the Direct Tunnel establishment, validation of the CAMEL subscription is ignored to allow the DT to setup when there is no CAMEL service association in the SGSN.

Example

Instruct the SGSN to validate the CAMEL subscription:

```
default map-message insert-subscriber-data csi-handling
```

max-pending-attaches

Configure the maximum length of the pending attach queue.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-pending-attaches *limit*

default max-pending-attaches

default

Resets the SGSN's Attach queue to a maximum pending value of 10,000.

limit

Set the a maximum limit to the pending Attach/RAU messages queue in the LinkMgr. When the limit is reached a message is sent to the IMSIMgr.
limit : Enter an integer from 5000 - 50000. Default is 10000.

Usage

With this command, configure the maximum limit to the pending ATTACH/RAU messages queue in the LinkMgr. When the limit is reached, the LinkMgr sends the Query/Forward messages to the IMSIMgr.
As the IMSIMgr gets busier and does not responded to Query/Forward requests, the response to the requests will get slower and slower and the queue size continues inflating if the incoming message rate is high. To avoid this situation, set the **max-pending-attaches** for the pending queue for Attach and RAU messages. All other messages from the HLR will be added to the queue as they cannot be dropped. High and low watermarks are set to the queue at 80% of **max-pending-attaches** " and 60% of **max-pending-attaches** respectively.
Once a high watermark is reached, the new Attach and RAU requests are dropped and relevant statistics are incremented. Once a low watermark is hit, the new Attach/RAU requests are accepted and added to the pending queue. The entries are added to the pending queue only when the window-size between IMSIMgr and LinkMgr becomes zero. This is a very rare occurrence and will not affect the current behavior in normal circumstances.

Example

Set the queue length to a maximum of *15000* requests:

```
max-pending-attaches 15000
```

old-tlli invalidate tlli

This command configures a list of random TLLI to be invalidated (removed) from the GMM after the invalidate old-TLLI timer expires.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

`[ no ] old-tlli invalidate tlli` *`< hexadecimal >`*

`no`

Removes a single random TLLI from the configured list.

`< hexadecimal >`

Identifies a single random TLLI to be removed from the GMM after the old-TLLI timer expires.

Usage

Use this command to create a list of up to 50 random TLLI to be dropped from the GMM after the old-TLLI timer expires. This command also starts the invalidate old-TLLI timer.

Important: If the old-TLLI expiry timer is not configured with the **`old-tlli hold-time`** command, then the SGSN will only drop second Attach Requests using the same random TLLI already in use.

Related Commands:

- The **`gmm-message`** configures the SGSN to discard (drop) the Attach-Request message received with a random TLLI already in use
- The **`old-tlli hold-time`** command configures the old-TLLI expiry timer.

Example

Add random TLLI *`0x7f05a30a`* to the Invalidate List:

```
old-tlli invalidate tlli 0x7f05a30a
```

old-tlli hold-time

This command configures the old-TLLI expiry timer to be started in GMM when anyone of the listed random TLLI are received.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] old-tlli hold-time < seconds >
```

default

Resets the timer to 5 seconds

< seconds >

Sets the numbers of seconds before the timer expires; range 1 to 125.

Usage

Use this command to configure the old-TLLI expiry timer to be started in GMM when anyone of the listed random TLLI are received. If the timer expires prior to receiving Attach-Complete then the SGSN invalidates (removes) the TLLI from the GMM.

Important: For this configuration to work, the list of random TLLI to be removed (invalidated) from the GMM must be defined with the **old-tlli invalidate tlli** command.

Related Commands:

- The **gmm-message** configures the SGSN to discard (drop) the Attach-Request message received with a random TLLI already in use
- The **old-tlli invalidate tlli** command configures the random invalidate TLLI list.

Example

Set the timer for *2* seconds:

```
old-tlli hold-time 2
```

pdp-deactivation-rate

Set the rate the SGSN deactivates PDP connections per second per SessMgr when GPT-C path failure is detected.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

pdp-deactivation-rate { connected-ready *rate* **| idle-standby** *rate* **}**

default pdp-deactivation-rate { connected-ready | idle-standby }

default

If this keyword is used with the command, then the default deactivation rates are used.

connected-ready *rate*

Subscribers that are in the PMM-Connected / GPRS-Ready state and actively using the SGSN service need to be deactivated at a faster rate to facilitate the deactivation/re-activation process.
rate -sets the number of subscribers to be deactivated per second per SessMgr and the valid range is 1 to 1000 and the default is 760 connected-ready subscribers deactivated per second.

idle-standby *rate*

Subscribers that are in the PMM-Idle / GPRS-Standby state are not actively using the SGSN service and can be deactivated at a slower rate. The deactivation process for idle-standby subscribers includes paging before the Deactivate Request is sent.
rate - sets the number of subscribers to be deactivated per second per SessMgr and the valid range is 1 to 1000 and the default is 240 idle-standby subscribers deactivated per second.

Usage

Use this command to define a rate at which the SGSN processes PDP deactivations when a GTP-C path failure is detected (and confirmed according to the SGSN's default behavior). The operator can use this command to set a deactivation rate that ensures radio network congestion is avoided.
Related commands:

- **max-remote-restart-counter-change** - allows the operator to set a maximum variance between stored and received values for restart counter changes coming from the GGSN. For details, refer to the SGSN Global configuration mode documentation.
- **disable-remote-restart-counter-verification** - allows the operator to disable the default behavior. For details, refer to this command in the SGSN Global configuration mode documentation.

Example

Use the following command to deactivate PDP connections for *600* PMM-Connected / GPRS-Ready subscribers per second:

```
pdp-deactivation-rate connected-ready 600
```

Use the following command to deactivate PDP connections for *320* PMM-Idle / GPRS-Standby subscribers per second:

```
pdp-deactivation-rate idle-standby 320
```

Use the following command to reset the default *760* per second deactivation rate for PMM-Connected / GPRS-Ready subscribers:

```
default pdp-deactivation-rate connected-ready
```

target-offloading

Selects the subscriber offloading algorithm to be applied to the SessMgr and the IMSIMgr.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
target-offloading algorithm [ optimized-for-speed | optimized-for-target-count ]

default target-offloading algorithm
```

default

Resets the configuration to default values.

optimized-for-speed

Enables faster algorithm to achieve the target count.

optimized-for-target-count

Enables a reliable algorithm to achieve the target count.
Default.

Usage

With the SGSN's distributed architecture, there are many SessMgrs and offloading will happen in parallel at all SessMgrs. This command enables the operator to control the total number of subscribers being offloaded.

Important: The value for this command can not be altered once dynamic offloading has begun - refer to the command description for the **sgsn-offload** command in the *Exec Mode* chapter..

Example

Set the SGSN to use the faster algorithm for offloading:

```
target-offloading algorithm optimized-for-speed
```

tlli-cb-audit

This command enable (default is disabled) or disables a periodic (hourly) audit of TLLI-CBs in the BSSGP layer.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
tlli-cb-audit

[ default | no ] tlli-cb-audit
```

default

Include **default** with the command to disable the audit function.

no

Include **no** with the command to disable the audit function.

Usage

This command is used to clean-up hanging or unassociated TLLI in the BSSGP layer. This configuration defined with this command will be common to all NSE configured for this SGSN.
Independent of this command configuration, the SGSN triggers and audit when the number of TLLI-CBs reaches 35,000.

Example

Use the following command to enable the hourly audit for unassociated TLLl-CBs:

```
tlli-cb-audit
```

umts-aka-r99

This command enables the operator to authenticate mobile equipment (MEs) with R99+ USIMs and capable of UMTS AKA.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
umts-aka-r99

no umts-aka-r99
```

no

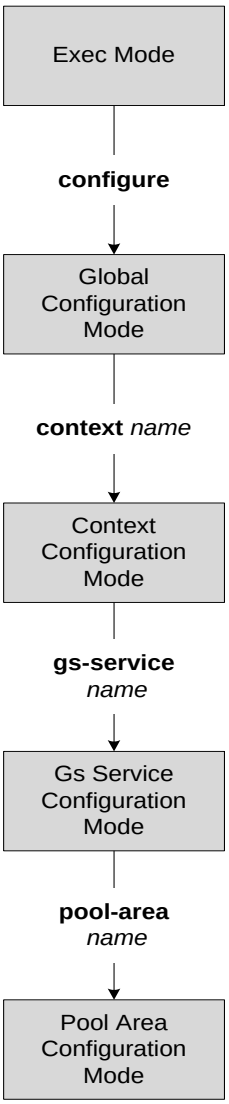
Including **no** with the command disables the authentication.

Usage

This command enables operators to authenticate MEs that are attempting to connect to a 2.5G network with R99+ USIMs if the MEs are UMTS AKA capable. For R99 mobiles, the SGSN will continue to perform GSM AKA even if quintuplets are received fromthe HLR.

Example

Use the following command to disable UMTS AKA authentication for MEs with R99+ USIMs:



```
no umts-aka-r99
```

Chapter 242
SGSN Pool Area Configuration Mode Commands

The Pool Area configuration mode configures the parameters used to setup the VLRs to use with a pool area in a Gs service.

With this mode, the command prompt will be similar to:

```
[ctx_name]hostname(config-gs-pool-area)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous configuration mode.

hash-value

This command configures the load distribution for the VLRs that service this pool area.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

hash-value { *hash_value* | **non-configured-values** | **range** *start_value* **to** *end_value* } **use-vlr** *vlr_name*

no hash-value { *hash_value* | **non-configured-values** | **range** *start_value* **to** *end_value* }

no

Removes the configured Gs procedures from this Gs service.

hash_value

Specifies the specific hash value for VLR(s).
hash_value must be an integer value from 0 through 999.

range *start_value* **to** *end_value*

Specifies the range of hash values for a VLR.
start_value specifies the start value for range of hash and is an integer value from 0 through 999.
start_value must be lower than *end_value*.
end_value specifies the end value for range of hash and is an integer value from 0 through 999. *end_value* must be higher than *start_value*.

non-configured-values

This keyword assign all non-configured hash values to use the named VLR.

use-vlr *vlr_name*

Specifies the name of the VLR to be associated with this pool area.
vlr_name is the name of VLR and must be an alpha and/or numeric string of 1 to 63 characters.

Usage

Use this command to command configures the load distribution for the VLRs that service this pool area as defined in TS 23.236.
The algorithm for selection of VLR from a pool area is based on the hash value computed on the IMSI digits. The SGSN derives a hash value (V) using procedure as defined in TS 23.236. Every hash value from the range 0 to 999 corresponds to a single MSC/VLR node. Typically many hash values may point to the same MSC/VLR node.

This command can be entered multiple times for different hash value.

Example

Following command configure the all non configured hash values to use VLR named *starvlr1* in this pool area:

```
hash-value non-configured-values use-vlr starvlr1
```

lac

This command defines a set of location area code (LAC) values for a pool area.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

lac *lac_id* **+**

no lac *lac_id*

no

Removes the configured LAC value from this pool area configuration.

lac *lac_id*

Specifies the subscribers' location area code (LAC) to be associated with this pool area and a specific VLR. This LAC is obtained from the radio area identity (RAI).
lac_id: Must be an integer from 1 through 65535.

+

More than one *lac_id*, separated by a space, can be entered within a single command.

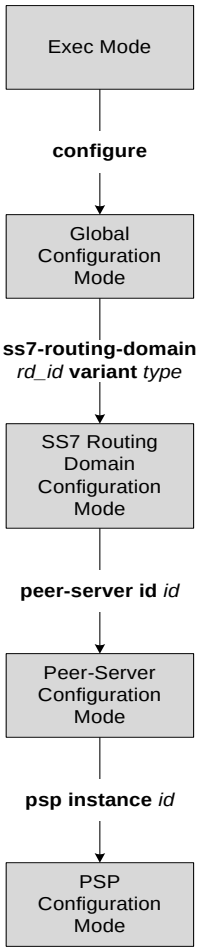
Usage

Use this command to specify a set of LACs to use for a pool area.
This command can be entered multiple times, subject to a limit of 32 LAC definitions (total for **non-pool-area** and **pool-area** configuration) per Gs service.

Important: LAC values across multiple pool areas and non-pool-areas must be unique within the Gs service.

Example

The following command configures LACs *101, 301,* and *222* for the pool area.



```
lac 101 301 222
```

Chapter 243
SGSN PSP Configuration Mode Commands

The Peer-Server Process (PSP) configuration mode provides the commands to create, configure, bind, and manage a specific PSP instance included in an SS7 routing domain configuration.

In this mode, where information in italics is customer-defined, the command prompt should appear similar to:

```
[local]hostname(config-ss7-rd-1-ps-1-psp-1)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

Defines an association between the PSP instance and an application server process (ASP) instance.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
associate { asp instance asp_num }

no associate [ asp ]
```

no

Removes the association, between the PSP and the ASP, from the routing domain configuration.

Important: Using the **no associate** command will most likely result in the termination of all current subscriber sessions active through the peer-server.

asp instance *asp_num*

Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.
asp_num is a digit from 1 to 4.

Usage

Use this command to create an association between a specific peer-server process (PSP) and a specific application server process (ASP) instance or a specific differentiated services code point (DSCP marking template).
Before using the **associate** command, the values for the **psp-mode** and **end-point** commands must be configured.
Before using the **associate** command, the M3UA end-point of the ASP must be configured. Use the commands defined in the *ASP Configuration Mode* chapter of the *Command Line Interface Reference.*

Example

Associate this PSP instance with ASP configuration instance *2* :

```
associate asp instance 2
```

Use the following command to terminate all associations with this PSP instance:

```
no associate
```

end

Exits the configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

end-point

This command defines or deletes the IP address to be associated with the local SCTP end-point for the application server process (ASP).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end-point { address ip_address | port port_number }

no end-point [ address ip_address ]
```

no

Removes the ASP end-point association configuration from the PSP configuration.

Important: This command can not be used as long as the PSP and the ASP are associated. Use the **no associate** command when entering any form of this command, including **no end-point**. When the change is made, re-enter the ASP association with the **association** command.

port *port_number*

Configures the M3UA's SCTP port number for the end-point.
port_number: Must be an integer from 1 to 65535.
Default: 2905.

Usage

Use this command to manage the ASP end-point. At least one address needs to be configured for the ASP before the end-point can be associated with the PSP.

Example

Set the ASP end-point to IP address *192.168.1.1* with the following command:

```
end-point address 192.168.1.1
```

exchange-mode

Configures the exchange-mode for the PSP communication.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exchange-mode [ double-ended | single-ended ]
```

Usage

Important: Before using this command to set a value or reset the default, you must disassociate the PSP instance with the **no associate** command. When you have modified your configuratioin with this command, then use the **associate** command to setup a new ASP association.

Use this command to toggle the exchange modes for the PSP to match the exchange mode supported by the ASP. The exchange mode specifies what type of ASP messages exchange is used in an IPSP communication. The **exchange-mode** must be configured for 'single-ended' if the **psp-mode** has been configured for 'client'.

Example

Change the exchange mode from the standard double-ended to single-ended:

```
exchange-mode single-ended
```

exit

Exits the current configuration mode and moves to the previous configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Peer-Service configuration mode.

psp-mode

Configures either client-mode or server-mode as the PSP's operational mode.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
psp-mode { client | server }
```

client

The PSP operates as a client.

server

The PSP operates as a server.

Usage

Important: Before using this command to change the configuration, you must disassociate the PSP instance with the **no associate** command. When you have modified your configuratioin with this command, then use the **associate** command to setup a new ASP association.

Example

Instruct the peer-server process to operate in either client or server mode.

Configure the PSP to operate in server mode:

```
psp-mode server
```

routing-context

Configures the behavior of the routing context in M3UA messages.

Important: This keyword function is only available in releases 8.1 and higher.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
routing-context { discard-inbound | process-inbound { insert-outbound | suppress-outbound
}
```

```
default routing-context
```

default

Include this keyword with the command, to reset the configuration to the system default for routing-context which is a combination of process-inbound and insert-outbound.

discard-inbound

Sets the routing context received in M3UA messages to be discarded.

process-inbound

Sets the routing context received in M3UA messages to be processed.

insert-outbound

Sets the routing context so that it is added in the M3UA messages.

suppress-outbound

Sets the routing context so that it is suppressed in the M3UA messages.

Usage

Important: Before using this command to change the configuration or reset the default, you must disassociate the PSP instance with the **no associate** command. When you have modified your configuratioin with this command, then use the **associate** command to setup a new ASP association.

In PSP (singled-ended) configuration mode, the settings for both the local routing context (the SGSN's routing context) and the peer routing context (the RNC's routing context) should be the same. If the routing contexts created at the SGSN and on the peer are different then this can cause the M3UA link to fail.

Example

Routing context is an optional parameter when an M3UA association has only one associated peer-server.

If the peer does not support routing context, then disable the routing context feature:

```
routing-context discard-inbound suppress-outbound
```

sctp-alpha

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines the RTO-Alpha value.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-alpha *value*

default sctp-alpha

value

Defines a percentage (%) that represents the RTO portion of the round-trip time (RTT) calculation. This percentage value must be an integer between 0 and 65535.

default

Resets the **sctp-alpha** to the default value of 5%.

Usage

sctp-alpha is used in conjunction with other commands, such as the **sctp-beta** command, to determine the round-trip time (RTT) calculations. The Alpha parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

Important: Before using this command to set a value or reset the default, you must disassociate the PSP instance with the **no associate** command. When you have modified your configuratioin with this command, then use the **associate** command to setup a new ASP association.

Example

Set the SCTP RTO-Alpha value to *256%* of the RTT calculation:

```
sctp-alpha 256
```

sctp-beta

This stream control transmission protocol (SCTP) retransmission time out (RTO) parameter defines the RTO-Beta value.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-beta *value*

default sctp-beta

value

Defines a percentage (%) that represents the RTO portion of the round-trip time (RTT) calculation. This percentage value must be an integer between 0 and 65535.

default

Resets the **sctp-beta** to the default value of 10%.

Usage

Use this command in conjunction with other commands, such as the **sctp-alpha** command, to determine the round-trip time (RTT) calculations. The Beta parameter is used to manage load balancing within the SS7 environment for multi-homed peers.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Set the SCTP RTO-Alpha value to *512%* of the RTT calculation:

```
sctp-beta 512
```

sctp-checksum-type

This command selects the type of checksum algorithm to be used.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sctp-checksum-type { adler32 | crc32 }

default sctp-checksum-type
```

adler32

Selects the Adler-32 type of algorithm as a faster checksum function.

crc32

Selects the CRC-32, a slower but more reliable 32-bit cyclic redundancy check.

default

Resets the **sctp-checksum-type** to the default of CRC-32.

Usage

Use this command to set which type of checksum algorithm the SGSN is to use to validate SCTP packets.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Set the checksum type for *CRC32*:

```
sctp-checksum-type crc32
```

sctp-cookie-life

This command sets the SCTP valid cookie life.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-cookie-life *value*

default sctp-cookie-life

value

Sets the valid cookie life value in increments of 100 milliseconds. The range is 50 to 1200 .

default

Resets the **sctp-cookie-life** value to the default, 600 (= .6 seconds).

Usage

Use this command to set the SCTP cookie life.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Set the SCTP cookie life to 1 second (*1000* milliseconds):

```
sctp-cookie-life 1000
```

sctp-init-rwnd

This command sets the size of the SCTP receiver window .

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-init-rwnd *window_size*

default sctp-init-rwnd

window_size

Sets an integer to configure the window size. The range is 32768 to 1048576.

default

Resets the **sctp-init-rwnd** window size to the default, 1048576.

Usage

Use this command to set the receiver window size in the configuration. Configuring this parameter enables the SCTP client to send configured 'sctp-init_rwnd' as a_rwnd parameter in the INIT message. For the SCTP server, the INIT ACK will be populated with sctp-init_rwnd as a_rwnd parameter per RFC 4960.
The command enables the operator to configure a reduced priority for LinkManager Control messages, thereby giving Timer messages the highest priority. The Timer messages are retained at the highest priority and Data messages are kept at a lower priority.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Use the following command to set the SCTP window size to *32786*:

```
sctp-init-rwnd 32768
```

sctp-max-assoc-retx

This command sets the maximum number of datagram retransmissions to be associated with this peer server configuration.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-assoc-retx *value*

default sctp-max-assoc-retx

value

Defines the maximum number of datagram retransmissions for an association. The value must be an integer between 0 and 255.

default

Resets the default for **sctp-max-assoc-retx** to 10.

Usage

Use this command to configure the maximum number of datagram retransmissions for an association. The endpoint will be declared unreachable after **sctp-max-assoc-retx** number of consecutive retransmissions to an endpoint on any transport address.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Set the maximum number to *3* datagram retransmissions:

```
sctp-max-assoc-retx 3
```

sctp-max-init-retx

This command sets the maximum number of retries to send the INIT datagram.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-init-retx *value*

default sctp-max-init-retx

value

Sets the maximum number of retries. This value must be an integer between 0 and 255.

default

Resets the default for **sctp-max-init-retx** to 5.

Usage

Use this command to set the maximum number of retries the SCTP layer should make to send the INIT datagram to the peer to open an association.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

sctp-max-init-retx *3*

sctp-max-mtu size

This command sets the number of bytes that comprise the maximum MTU size.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-mtu-size *value*

default sctp-max-mtu-size

value

Sets the maximum number of bytes for the SCTP MTU size. This value must be an integer between 508 and 65535.

default

Resets the default for **sctp-max-mtu-size** to 1500 bytes.

Usage

Use this command to configure the size of the MTU.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Set the maximum size of the MTU to 3000 bytes:

sctp-max-mtu-size *3000*

sctp-max-out-strms

This command sets the maximum number of outgoing streams through the PSP going towards the peer server.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-out-strms *max#_out_streams*

default sctp-max-out-strms

default

Resets the SGSN's **sctp-max-out-strms** value to the default of 16.

max#_out_streams

Usage

Use this command to balance the stream throughput from the PSP to the peer server. The value for this command is used to validate the incoming packets in the SCTP layer.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

Set a maximum SCTP out streams to *12*:

```
sctp-max-out-strms 12
```

Set a maximum SCTP out streams to the default of *16* streams:

```
default sctp-max-out-strms
```

sctp-max-path-retx

This command sets the maximum number of datagram retransmissions for this path.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-max-path-retx *value*

default sctp-max-path-retx

value

Sets the maximum number of datagram retransmission to a destination transport address. This value must be an integer from 0 to 255.

default

Resets the **sctp-max-path-retx** default to 5.

Usage

Use this command to set the maximum number of datagram retransmissions to a destination transport address. The destination transport address will be declared unreachable after the SGSN exhausts the **sctp-max-path-retx** number of consecutive retransmissions to a destination transport address.
Depending upon network conditions, lower values typically means faster detection of SCTP-Path failure.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

sctp-max-path-retx *10*

sctp-rto-initial

This command sets the initial retransmission timeout for the SCTP.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-rto-initial *value*

default sctp-rto-initial

default

Resets the system to the **sctp-rto-initial** default of 30 (3 seconds).

value

The value must be an integer between 1 and 50.

Usage

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Use this command to define the initial retransmission timer.
The value set for **sctp-rto-initial** should be greater than or equal to the minimum value set with **sctp-rto-min** (**sctp-rto-initial**=> **sctp-rto-min**).
The value set for **sctp-rto-initial** should be less than or equal to the maximum value set with **sctp-rto-max** (**sctp-rto-initial** <= **sctp-rto-max**).

Example

sctp-rto-initial *240*

sctp-rto-max

This command sets the maximum retransmission timeout value for the SCTP.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-rto-max *value*

default sctp-rto-max

default

Resets the system to the **sctp-rto-max** default of 600 (60 seconds).

value

Set the maximum retransmission timeout value in increments of 100 milliseconds (0.1 seconds) and the value must be an integer between 5 and 1200.

Usage

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Use this command to configure the maximum time for retransmissions.
The value set for **sctp-rto-max** should be greater than or equal to the value set for **sctp-rto-initial** (**sctp-rto-max** => **sctp-rto-initial**).

Example

The following sets the timeout for 45 seconds:

sctp-rto-max *450*

sctp-rto-min

This command sets the minimum retransmission timeout (RTO) value for the SCTP.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-rto-min [units-10ms] *value*

default sctp-rto-min

default

Resets the **sctp-rto-min** to the default of 10 (1 second).

units-10ms

Including this keyword, before entering a value, enables configuration with finer granuality - in 10 millisecond units.

value

If the **units-10ms** keyword is included, then set the timeout in increments of 10 milliseonds. The value must be an integer between 1 and 500.
If the **units-10ms** keyword is not included then set the timeout in increments of 100 milliseconds. The value must be an integer between 1 and 50.

Usage

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Use this command to set the minimum time for retransmission before timeout.
The value set for **sctp-rto-min** should be less than or equal to the value set for **sctp-rto-initial** (**sctp-rto-min** <= **sctp-rto-initial**)

Example

The following sets the timeout for 2 seconds:

sctp-rto-min *20*

sctp-sack-frequency

This command sets the frequency of transmission of SCTP selective acknowledgements (SACK).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-sack-frequency [units-10ms] *value*

default sack-frequency

value

Sets the maximum number of datagrams to be received prior to sending a SACK to the peer. The value must be an integer between 1 and 5.

default

Resets the **sctp-sack-frequency** default value of 2.

Usage

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Use this command to set the maximum number of datagrams to be received before a SACK must be sent to the peer. The **sctp-sack-frequency** is used in conjunction with the **sctp-sack-period** to control the generation of SACK, depending on which one occurs first.

Example

sctp-sack-frequency *3*

sctp-sack-period

This command sets the delay before sending an SCTP selective acknowledgement (SACK).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sctp-sack-period [units-10ms] *value*

default sack-period

units-10ms

Including this keyword, before entering a value, enables configuration with finer granuality - in 10 millisecond units.

value

If the **units-10ms** keyword is included, then set the timeout in increments of 10 milliseonds. The value must be an integer between 0 and 50.
If the **units-10ms** keyword is not included then set the timeout in increments of 100 milliseconds. The value must be an integer between 0 and 5.

default

Resets the system to the **sctp-sack-period** default value, 2 (=200 milliseconds).

Usage

Use this command to set the time the SCTP waits to send a SACK.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

sctp-sack-period *3*

sctp-suppress-alarm

This command enables/disables the suppression of alarms for SCTP path failure between two peer endpoints.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] sctp-suppress-alarm path-failure self-end-point-address *orig_ipv4_address***peer-end-point-address** *peer_ipv4_address*

no

Disables the pre-configured alarm suppression for SCTP path failure.

path-failure

This keyword specifies that the alarm suppression is for SCTP path failure between two peer nodes.

self-end-point-address *orig_ipv4_address*

This keyword specifies the IP address of the originating endpoint.
orig_ipv4_address is the IP address of originating endpoint in IPv4 dotted decimal notation.

peer-end-point-address *peer_ipv4_address*

This keyword specifies the IP address of the peer endpoint.
peer_ipv4_address is the IP address of peer endpoint in IPv4 dotted decimal notation.

Usage

Use this command to configure the path failure alarm suppression. This command ignores the alarms generated on SCTP path failure.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

The following command suppresses the path failure alarms occurred in SCTP path between originating peer address *1.2.3.4* and peer endpoint *6.7.8.9*:

```
sctp-suppress-alarm path-failure self-end-point-address 1.2.3.4 peer-end-point-address 6.7.8.9
```

timeout

This command sets the times for various timeout timers.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout {**m3ua-periodic-dest-audit** *dest_timeout* | **sctp-bundle** *bundle_time* | **sctp-heart-beat** *hrt_bt_timeout*}

default timeout sctp-heart-beat

default

Resets the system to the default value for the SCTP heartbeat interval.

m3ua-periodic-dest-audit *dest_timeout*

Sets the period (in increments of seconds) between the DAUD messages while auditing a destination state.
dest_timeout: Must be an integer from 1 to 65535. Default is 2.

sctp-bundle *bundle_time*

Enables SCTP bundling and sets the SCTP bundle timeout value in incremenets of 100 milliseconds. SCTP bundling provides better bandwidth utilization and less traffic, however, there is a 100 millisecond packet transmission delay.

Important: Peer end should also be configured to support SCTP bundling.

Default: SCTP bundling is disabled.
bundle_time : Enter an integer from 1 to 65535.

sctp-heart-beat *hrt_bt_timeout*

Sets the number of seconds in the SCTP heart-beat timer
hrt_bt_timeout: This value is an integer between 1 and 300. Default is 30.

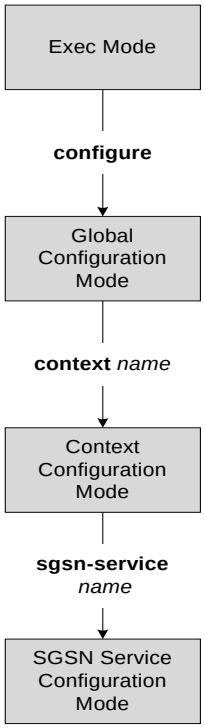
Usage

Use this command to configure timers. Repeat the command with each of the keywords to set values for each.

Important: Before using this command to set a value, you must disassociate the PSP instance with the **no associate** command. When you have set the value with this command, then use the **associate** command to setup a new association.

Example

```
timeout m3ua-periodic-dest-audit 120
```



Chapter 244
SGSN Service Configuration Mode Commands

The SGSN Service configuration mode is used within the global configuration mode to specify the 3G operations of the SGSN and the available SGSN services for a specific context.

SGSN Service works with MAP Service, SGTP Service, GTPP Group, and IuPS Service. All five of these services must be configured to enable a 3G SGSN to communicate with other elements within a UMTS network.

In this mode, the command prompt should appear like:

```
[<ctx_name>]hostname(config-sgsn-service)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

This command defines the accounting context name and enables/disables specific types of CDR generation for the accounting in the SGSN service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
accounting ( cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } }+ | context  cntx_name  }

default accounting cdr-types

no accounting ( cdr-types | context }
```

default

Returns the system to default settings for the selected type of CDR.

no

Removes the pre-configured type of CDR generation for accounting from the SGSN service.

cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } }

Default: enabled
Defines the types of CDRs to be generate:d within the specified SGSN service for accounting:

- **mcdr** Enables generation of M-CDRs.
- **scdr** : Enables generation of S-CDRs.
- **sms** : Enables generation of SMS-type CDRs based on one of the following:
  - **mo-cdr:** : SMS CDRs orignates from the mobile.
  - **mt-cdr:** SMS CDRs terminates at the mobile.

+

Specifies that the specified keywords with in the group can be entered multiple times with a single command.

context *cntx_name*

Specifies an accounting context to be associated with the SGSN service.
cntx_name: Define a string of 1 to 79 alphanumeric characters.

Usage

Use this command to define the type of CDRs to generate for SGSN service. By default all type of CDRs are generated. Note that change of this configuration will be applied to new call and/or to new PDP contexts only.
By default, the generation of all CDR types is enabled.

Example

The following command configures the system to generate CDRs of M-CDR type for accounting in the current SGSN service:

```
accounting cdr-types mcdr
```

admin-disconnect-behavior

This command defines some of the actions the SGSN will take during an Admin-Disconnect procedure.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
admin-disconnect-behavior { clear-subscription | detach-type { reattach-not-required |
reattach-required } }

[ default | no ] admin-disconnect-behavior { clear-subscription | detach-type }
```

clear-subscription

Including this keyword in the configuration instructs the SGSN to clear subscriber contexts and the subscription data database whenever the **clear subscribers all** command is issued (from the Exec mode) for attached subscribers. As well, the SGSN will issue an appropriate Map-Purge-MS-Req to the HLR if needed.
Default: disabled

detach-type

Including this keyword defines which type of detach instruction to include in the Detach-Request message during an Admin-Disconnect procedure. One of the following options must be included when this command is entered:

- **reattach-not-required**
- **reattach-required**

Default: reattach-required

default | no

Including either **default** or **no** keyword in the command, instructs the SGSN to use the default value for the specified parameter.

Usage

Include the **clear-subscription** keyword with this command configuration to ensure that more than attached MM-context and active PDP-contexts are cleared when the clear **subscribers all** command is issued for attached subscribers.
To clear subscription data for detached subscribers, refer to the **sgsn clear-detached-subscriptions** command described in the *Exec* mode chapter.
Including the **detach-type** keyword with this command instructs the SGSN to include either a 'reattach-required' or a 'reattach-no-required' instruction in the Detach-Request message.

Example

Configure the SGSN to clear data such as PTMSI allocated, auth-vectors received, and NGAF flag values stored in the subscriber database for attached subscribers:

```
admin-disconnect-behavior clear-subscription
```

cc profile

Configures the charging characteristic (CC) profile with the triggers for generating various types of CDR as defined with the **accounting** command.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

cc profile *profile_bits* **[buckets** *number* **| interval** *time* **| tariff time1** *mins hours* **[time2** *mins hours* **] [time3** *mins hours* **] [time4** *mins hours* **] | volume { downlink** *down_vol* **uplink** *up_vol* **| total** *total_vol* **}] +**

[no | default] cc profile *profile_bits* **[buckets | interval | tariff | volumne]**

no

Removes a previously configured CC profile.

default

Returns the specified CC profile to the original default system settings.

profile_bits

Defines the value of the profile bits for the SGSN service.
index can be configured to any integer value from 0 to 15. Some of the values have been predefined according to 3GPP standard:

- 1 for hot billing
- 2 for flat billing
- 4 for prepaid billing
- 8 for normal billing

buckets *number*

Specifies the number of statistics container changes in the CDR due to QoS changes or tariff times that can occur before an accounting record (CDR) is closed
Default: 4
number : Must be integer from 1 to 4.

interval *time*

Specifies the normal time duration (in seconds) that must elapse before closing an accounting record (CDR) provided that any or all of the following conditions occur:
time : Enter any integer from 60 to 40000000.

tariff time1 *mins hours* **[time2** *mins hours* **time3** *mins hours* **time4** *mins hours* **]**

Specifies the time-of-day (based on a 24-hour clock) to close the current statistics container in the CDR, but not necessarily the CDR itself. One tariff time must be defined and up to four tariff times can be specified.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

- *mins*: The minutes of the hour. Enter an integer from 0 to 59.
- *hours*: The hour of the day. Enter an integer from 0 to 23.

volume { downlink *down_vol* **uplink** *up_vol* **| total** *total_vol* **}**

Specifies the downlink, uplink, and total volumes octet counts that must be met for the closure of the CDR.
down_vol : Enter any integer from 100000 to 1345294336.
up_vol : Enter any integer from 100000 to 400000000.
total_vol : Enter any integer from 100000 to 400000000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures the profile index for the SGSN's charging characteristics. The SGSN supports up to 16 profile indexes.

Example

The following command configures a profile index of 10 with tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10  tariff time1 0 7 time2 30 19 time3 0 7 time4 30 19
```

check-imei

This command configures the action the SGSN will take if the route towards the EIR is down.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
check-imei { gf-failure-action | gf-timeout-action } { continue | reject }

default check-imei { gf-failure-action | gf-timeout-action }
```

default

Resets the default function to reject the Attach.

gf-failure-action

Coupled with either **continue** or **reject**, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and if the EIR is temporarily unreachable due to associated DPC/SSN inaccessible/out-of-service.

gf-timeout-action

Coupled with either **continue** or **reject**, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and the route to the EIR is available, but no response is received from the EIR.

continue

Instructs the SGSN to continue the Attach process.

reject

Instructs the SGSN to reject the Attach process.

Usage

Typically, the Attach process will be continued when there is an IMEI check timeout based on the configuration under the SGSN service configuration and/or the GPRS service configuration. But this works only if the route towards the EIR is UP and the IMEI request timer expires. This command configures the SGSN to allow the Attach process to continue in the case the route towards the EIR is down, that is the DPC / SSN is out-of-service.

Example

Use the following command to reset the default and reject Attach:

```
default check-imei gf-failure-action
```

check-imei-timeout-action

In Releases 12.0 and higher, this command has been replaced with enhanced functionality in the **check-imei** command, also available in this configuration mode.

core-network

This command specifies the numeric ID for a core network to identify which CN is to be used by the SGSN service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

core-network id *cn_id*

no core-network id

no

Removes the currently configured core network ID from the current SGSN configuration.

id *cn_id*

This number identifies the core network to connect the SGSN service.
cn_id : Must be an integer from 0 through 65535.

Usage

Use this command to set a global ID to identify this SGSN in the core network.

Example

The following command sets the core network ID for the current SGSN service to 127:

```
core-network id 127
```

disable/enable super-charger

This command has been deprecated and replaced by the **super-charger** command. For the commands to configure the SuperCharger feature, refer to the *Call-Control Profile Configuration Mode* chapter.

dns israu-mcc-mnc-encoding

Configures either decimal or hexadecimal format for the MCC and MNC values in the DNS query which is sent during the ISRAU.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
dns israu-mcc-mnc-encoding { decimal | hexidecimal }

default dns israu-mcc-mnc-encoding
```

default

Resets the SGSN to send the MCC and MNC values in decimal format for DNS queries.

decimal

Default.
Instructs the SGSN to send the MCC and MNC in decimal format in the DNS query.

hexadecimal

Instructs the SGSN to send the MCC and MNC in hexadecimal format in the DNS query.

Usage

Use this command to determine the type of encoding for the MCC and MNC to be included in the DNS query sent during the inter-SGSN RAU (ISRAU). The choice must match the format of the DNS server. For example:
In decimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc310.mcc722.gprs
```

In hexadecimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc0136.mcc02d2.gprs
```

Example

Use hexadecimal values for the MCC/MNC in the DNS query.

```
dns israu-mcc-mnc-encoding hexadecimal
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

gmm

This command defines the GPRS mobility management parameters for the SGSN service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gmm { T3302-timeout *t3302_dur* **| T3312-timeout** *t3312_dur* **| T3313-timeout initial** *t3313_init* **[decrease** *t3313_decrement* **| increase** *t3313_increment* **] | T3322-timeout** *t3322_dur* **| T3350-timeout** *t3350_dur* **| T3360-timeout** *t3360_dur* **| T3370-timeout** *t3370_dur* **| implicit-detach-timeout** *impli_detach_dur* **| max-auth-retransmission** *auth_retrans* **| max-identity-retransmission** *id_retrans* **| max-page-retransmission** *page_retrans* **| max-ptmsi-reloc-retransmission** *ptmsi_reloc_retrans* **| mobile-reachable-timeout** *ms_reach_dur* **| perform-identity-on-auth-failure | purge-timeout** *purge_dur* **| trau-timeout** *trau_dur* **}**

default gmm { T3302-timeout | T3312-timeout | T3313-timeout | T3322-timeout | T3350-timeout | T3360-timeout | T3370-timeout | implicit-detach-timeout | max-auth-retransmission | max-identity-retransmission | max-page-retransmission | max-ptmsi-reloc-retransmission | mobile-reachable-timeout | perform-identity-on-auth-failure | purge-timeout | trau-timeout }

no gmm { implicit-detach-timeout | max-auth-retransmission | max-identity-retransmission | perform-identity-on-auth-failure }

---

default

Sets the default value for the specified parameter.

T3302-timeout *t3302_dur*

Default: 10
Specifies the retransmission timer value to guard the GPRS attach or RAU procedure on MS side.
t3302_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3312-timeout *t3312_dur*

Default: 54
Specifies the retransmission timer value to guard the RAU procedure initiation on network side.
t3312_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 186.

T3313-timeout initial *t3313_init* **[decrease** *t3313_decrement* **| increase** *t3313_increment* **]**

Default: 5

Specifies the retransmission timer value to guard the for paging request procedure initiation on network side.
initial *t3313_init* - Specifies the initial wating duration in seconds before retransmitting the specific message. *t3313_init* must be an integer from 1 through 60.
decrease *t3313_decrement* - Specifies the decrement of the initial timer value in seconds. *t3313_decrement* must be an integer from 1 through 5.
increase *t3313_increment* - Specifies the increment of the initial timer value in seconds. *t3313_decrement* must be an integer from 1 through 5.

T3322-timeout *t3322_dur*

Default: 6
Specifies the retransmission timer value to guard the GPRS detach request procedure on network side.
t3322_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3350-timeout *t3350_dur*

Default: 6
Specifies the retransmission timer value to guard the GPRS attach accept/RAU accept/realloc request procedure sent with P-TMSI and/or TMSI on network side.
t3350_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3360-timeout *t3360_dur*

Default: 6
Specifies the retransmission timer value to guard the authentication and cipher request procedure on network side.
t3360_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

T3370-timeout *t3370_dur*

Default: 6
Specifies the retransmission timer value to guard the identity request procedure on network side.
t3370_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 20.

---

implicit-detach-timeout *impli_detach_dur*

Default: 3600
Specifies the retransmission timer value to guard the implicit detach procedure on network side.
impli_detach_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 86400.

---

max-auth-retransmission *auth_retrans*

Default: 4
Specifies the maximum retransmission of authentication requests allowed.
auth_retrans is the number of retries before declaring the authentication failure and must be an integer from 1 through 10.

---

max-identity-retransmission *id_retrans*

Default: 4

Specifies the maximum retransmission of identity requests allowed.
id_retrans is the number of retries before declaring the identity failure and must be an integer from 1 through 10.

max-page-retransmission *page_retrans*

Default: 5
Specifies the maximum retransmission of page requests allowed.
id_retrans is the number of retries before declaring the paging request failure and must be an integer from 1 through 5.

max-ptmsi-reloc-retransmission *ptmsi_reloc_retrans*

Default: 5
Specifies the maximum retransmission for P-TMSI relocation procedure allowed.
id_retrans is the number of retries before declaring the P-TMSI relocation procedure failure and must be an integer from 1 through 10.

mobile-reachable-timeout *ms_reach_dur*

Default: 58
Specifies the retransmission timer value to guard the mobile reachability procedure on network side.
impli_detach_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 4 through 1440.

perform-identity-on-auth-failure

Default: Enabled
Configures the SGSN service to perform an identity check to ascertain the IMSI after an authentication failure on a PTMSI-based message.

purge-timeout *purge_dur*

Default: 10080 (7 days)
Specifies the timer value to guard the detach of MM context procedure on network side.
impli_detach_dur is the waiting duration in minutes before retransmitting the specific message and must be an integer from 1 through 20160.
Define the purge timer to hold detached mm-contexts. Default is 10080 mins (7 days).

trau-timeout *trau_dur*

This timer is available in releases 9.0 and higher.
Default: 30
Specifies the number of seconds the “old” 3G SGSN waits to purge the MS’s data. This timer is started by the “old” SGSN after completion of the inter-SGSN RAU.
trau_dur : Must be an integer from 5 to 60.

Usage

Repeat this command as needed to configure multiple parameters for GPRS mobility management in a UMTS network. This command provides the configuration of timers for mobility procedures and retries for different messages. GMM layer is defined in the 3GPP TS 24.008 (Release 7).

Example

Following command configures the timer to wait for *5* mins before retransmitting the message for GPRS attach or RAU procedure on MS side with maximum number of retries as *6* for authentication:

gmm T3302-timeout *5* **max-auth-retransmission** *6*

gs-service

This command associates a previously defined Gs service configuration, for the Gs interface to an MSC/VLR, with this SGSN service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gs-service *gs_srvc_name* **context** *ctx_name*

no gs-service *gs_srvc_name*

no

Removes/disassociates the named Gs service from this SGSN service.

gs_srvc_name

Specifies the name of a specific Gs service for which to display information.
svc_name is the name of a configured Gs service and can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

context *ctx_name*

Specifies the specific context name where Gs service is configured. If this keywork is omitted, the named Gs service must be exist in the same context as the SGSN service.
ctx_name is name of the configured context of Gs service. This can be from 1 to 63 alpha and/or numeric characters and is case sensitive.

Usage

Use this command to associate a specific Gs service interface with this SGSN service instance.

Important: A single Gs service can be used with multiple SGSN and/or GPRS service.

Example

Following command associates a Gs service instance named *stargs1*, which is configured in context named *star_ctx*, with an SGSN service:

```
gs-service stargs1 context star_ctx
```

lac

This command defines the location area code (LAC) in hexadecimal format.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

lac *hex*

no lac

no

Erases the **lac** configuration statement.

hex

Enter a hexadecimal number between 0x0 and 0xFFFF

max-pdp-contexts

Configures the maximum number of PDP contexts for a MS (mobile station) that will be supported on this SGSN service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-pdp-contexts per-ms *number*

default max-pdp-contexts per-ms

default

Resets the maximum number of PDP contexts per mobile station to the default of 11 for the Gs service configuration

per-ms *number*

Default: 11
Defines the combined total number of primary and secondary PDP contexts for the SGSN service.
number can be an integer from 2 to 11.

Usage

The following example defines 5 as the maximum number of primary and secondary PDP contexts that this SGSN will support for any connected MS.

Example

max-pdp-contexts per-ms *5*

mobile-application-part

This command identifies an already defined MAP service (Mobile Application Part service) to associate with the SGSN service. Although the MAP service does not need to be defined in the same context as the SGSN service, there is a one-to-one relationship between a MAP service and an SGSN service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mobile-application-part service *map_srvc* **[context** *ctx_name*]

no mobile-application-part service

no

Remove the MAP service association from the SGSN service configuration.

service *map_srvc*

Specifies the name of the MAP service to be associated with this SGSN service.
map_srvc must be the name of a MAP service previously configured on the system.

context *ctx_name*

Specifies the name of the context where the MAP service is configured. If the MAP service is not configured in the current context, then the context where it is configured must be specified to enable the SGSN to reach the MAP service.
If this keyword is not specified, the current context is used.
ctxt_name: Must be the name of the context where the specified MAP service is configured.

Usage

Use this command to identify the MAP service configuration to be used by the SGSN service configuration. Also use this command to specify the context in which the MAP service configuration was created.
If the MAP service is not identified or if the correct context is not identified, then the SGSN service will not START.

Example

The following command specifies a MAP service named map1 that is configured in the same context as the current SGSN service:

```
mobile-application-part service map1
```

network-sharing cs-ps-coordination

Enables/disables the SGSN service to perform a CS-PS coordination check.

Important: This command is no longer available in all 12.0 and 12.2 releases. If you do not see this command in your release, look for the **network-sharing cs-ps-coordination** command in the IuPS Service configuration mode to accomplish the same task. Configuring in the IuPS Service configuration mode allows for the possibility of multiple IuPS services with network-sharing and differing CS-PS coordination requirements.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
network-sharing cs-ps-coordination

default network-sharing cs-ps-coordination

no network-sharing cs-ps-coordination
```

default

Including this keyword resets the SGSN service to allow the check to be performed.

no

Disables this feature for the SGSN service.

Usage

Use this command to facilitate the network sharing functionality. With this command, the SGSN can be instructed to perform a check to determine if CS-PS coordination is needed.
3GPP TS 25.231 section 4.2.5 describes the functionality of the SGSN to handle CS-PS (circuit-switching/packet-switching) coordination for attached networks not having a Gs-interface. In compliance with the standard, the SGSN rejects an Attach in a MOCN configuration with cause 'CS-PS coordination required', after learning the IMSI, to facilitate the RNC choosing the same operator for both CS and PS domains.

Example

Use the following syntax to disable the CS-PS coordination check:

```
no network-sharing cs-ps-coordination
```

nri length

This command defines the Network Resource Identifier (NRI) of the SGSN that is stored in the P-TMSI (bits 23 to 18).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

nri length *nri_length* **[nri-value** *nri_value* **| null-nri-value** *null_nri_value* **non-broadcast mcc** *mcc* **mnc** *mnc* **lac** *lac_id* **rac** *rac_id* **nri-value** *value* **]**

no nri

---

no

Releases prior to 14.0, this command removes the configured NRI value and location information in the P-TMSI that would be retrieved by this SGSN.

---

nri length *nri_length*

Specifies the number of bits to be used in the P-TMSI, bits 23 to 18. to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length will be of zero length.
nri_length : Must be an integer from 1 to 6 to identify the number of bits.

---

null-nri-value *null_nri_value*

This keyword is only available in releases 8.1 and higher.
Configures the null NRI value which must be unique across the pool areas. This keyword is used for the offloading procedure for SGSN pooling (enabled with the **sgsn offloading** command, see the Exec Mode chapter).
null_nri_value is an integer 0 (zero) to 63 which identifies the SGSN to be used for the offloading procedure for SGSN pooling. There is no default value for this parameter.

---

non-broadcast mcc *mcc* **mnc** *mnc* **lac** *lac_id* **rac** *rac_id*

This keyword set is only available in releases 8.1 and higher.
Defines the non-broadcast LAC/RAC to be used in combination with the null-NRI for the offloading procedure. Including the MCC and MNC to specify the PLMN because the Iu-Flex feature supports multiple IuPS Services.
mcc identifies the mobile country code, the first part of the PLMN ID. Must be an integer between 100 and 999.
mnc identifies the mobile network code portion of the PLMN ID. Must be a 2- or 3-digit integer between 01 and 999.
lac_id defines a location area code associated with an RNC. Must be an integer between 1 and 65535.
rac_id defines the remote area code to be associated with an RNC. Must be an integer between 1 and 255.

nri-value *nri_value*

Specifies the MS-assigned value of the NRI to retrieve from the P-TMSI. This value must not exceed the maximum possible value specified by the NRI length. The NRI value must be unique across the pool or across all overlapping pools.
nri_value must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.
Multiple NRI values can be identified by providing multiple nri-values separated by a blank space for example: **nri length** *6* **nri-value** *29 43 61*

Usage

Use this command to identify the SGSN identified with the NRI in the MS generated P-TMSI.
This command adds or removes the Iu Flex configuration for this SGSN service. When using Iu Flex, all keywords must be defined. The command can be repeated to specify different values for any of the keyword parameters. If more than one NRI is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.
Use this command to retrieve the NRI (identity of an SGSN) stored in in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). If more than one NRI value is configured, the SGSN service will round-robin between the available NRIs when new subscribers (re)connect.
When using MOCN mode for network sharing without SGSN pooling, the NRI length and the NRI value should both be used.

Example

The following command specifies the the NRI length as *5* bits, identifies SGSN *23* with MCC *123* and MNC *22* and LAC *222* and RAC *12* for offloading procedure with NRIs *6* and *41*:

```
nri length 5 null-nri-value 34 non-broadcast mcc 123 mnc 22 lac 222 rac
12 nri-value 6 41
```

override-lac-li

Refer to the *ASR 5000 Lawful Intercept Guide* for a description of thsi command.

override-rac-li

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

rac

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for a description of this command.

qos-modification

This command the provides flexibility to enable/ disable RAB set up followed by UPCQ towards GGSN / Modify towards UE based on whether or not RNC downgrades the QoS.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
qos-modification inform-rnc-before-ue

no qos-modification
```

no

The SGSN informs UE before RNC,this is also the default behavior.

inform-rnc-before-ue

When this keyword is used the SGSN informs RNC of new QoS before informing UE.

Usage

Use this command to override the current SGSN behavior during PDP modification procedure. On execution of this command the SGSN initiates a RAB assignment to inform RNC followed by UPCQ towards GGSN / Modify towards UE based on whether or not RNC downgrades the QoS.

Example

```
qos-modification inform-rnc-before-ue
```

ran-protocol

This command specifies the IuPS service for the SGSN service to use for communication with the RAN.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ran-protocol iups-service *iups_srvc* **[context** *ctx_name*]

no ran-protocol iups-service

no

Removes the IuPS service information from the SGSN service configuration.

iups-service *iups_srvc*

Specifies the name of an IuPS service already configured on the system.
iups_srvc : Enter an alphanumeric string of 1 to 63 characters.

ctx_name

ctx_name : Enter the name of the IuPS context, an alphanumeric string of 1 to 63 characters.

Usage

Use this command to configure the IuPS service context that the current SGSN service will use to communicate with the RAN. Up to 8 definitions can be defined for a single SGSN service to allow for multiple PLMNs support.

Example

The following command configures the SGSN service to use an IuPS service named **iups1** that has been configured. in the same context as the SGSN service:

```
ran-protocol iups-service iups1
```

reporting-action event-record

This command enables the SGSN to log GMM/SM events in EDR files for 3G services.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
reporting-action event-record

[ default | no ] reporting-action event-record
```

default

Disables the logging function.

no

Removes the logging function from the configuration file.

Usage

This command is one of the steps needed to enable the SGSN to create a log for events such as Attach, RAU, and Activations. The log is an EDR (event data record) in CSV format. For details about how this feature works, refer to the *GMM-SM Event Logging* chapter in the *SGSN Administration Guide*.

Related Commands:

- To enable GMM/SM event logging for 2G services, the **reporting-action event-record** command must be configured in the GPRS service configuration.
- To enable a log to be generated in an EDR file, the **edr-module active-charging-service** command must be enabled in the Context configuration mode.
- To configure parameters for the logging file characteristics and for file transfer, use the commands in the EDR Module Configuration Mode.

Example

Enable GMM/SM event logging for 3G services:

```
reporting-action event-record
```

sgsn-number

This command defines the E.164 number that identifies this particular SGSN service context.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-number *E.164_number*

no sgsn-number

no

Removes the SGSN number configuration from the SGSN service configuration.

E.164_number

Enter a maximum of 15 digits to define the 'phone' number associated with this SGSN service in the specified context.

Usage

The SGSN supports multiple SGSN numbers – different numbers in the 2G GPRS service configuration and the the 3G SGSN service configuration. If an HLR-initiated dialog is received, the SGSN will perform a lookup based on the IMSI and find the correct SGSN number with which the MS is associated. Subsequent messaging will use this address.

Example

To delete the sgsn-number associated with this SGSN service context, enter:

```
no sgsn-number
```

sgtp-service

This command creates an instance of an SGTP service and associates the SGTP service instance with this SGSN service.

Platform

ASR 5000

Product

SGSN

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

sgtp-service *sgtp_srvc_name*

no sgtp-service

sgtp_srvc_name

Enter the name of an SGTP service that will be used by this SGSN service
sgtp_srvc_name : Enter a string of 1 to 63 alphanumeric characters.

Usage

Use this command to access the SGTP Service configuration mode to configure SGTP parameters.

Example

sgtp-service *sgtp1*

sm

This command configures session management parameters for this SGSN service. This command can be repeated multiple times to configure each parameter individually.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sm { T3385-timeout *time* **| T3386-timeout** *time* **| T3395-timeout***time* **| guard-timer** *guard_seconds* **| max-actv-retransmission** *number* **| max-deactv-retransmission** *number* **| max-modf-retransmission** *number* **}**

default sm { T3385-timeout | T3386-timeout | T3395-timeout | guard-timer | max-actv-retransmission | max-deactv-retransmission | max-modf-retransmission }

default

Resets the selected timer to the system default value.

T3385-timeout

Retransmission timer for network-initiated Activate Request.
Default is 8 sec

T3386-timeout

Retransmission timer for network-initiated Modify Request.
Default is 8 sec

T3395-timeout

Retransmission timer for network-initiated Deactivate Request.
Default is 8 sec

max-actv-retransmission

Configures maximum retries for activate PDP ctxt request.
Default is 4

max-deactv-retransmission

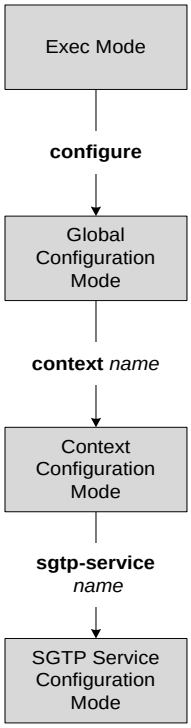
Configures maximum retries for deactivate PDP ctxt request.
Default is 4

max-modf-retransmission

Configures maximum retries for modify PDP ctxt request.
Default is 4

Usage

Repeat the command to configure multiple session management parameters for the SGSN service.



Example

Use a command similar to the following to set the expiry for *5* seconds for the session manager's T3385-timeout:

```
sm T3385-timeout 5
```

Chapter 245
SGTP Service Configuration Mode Commands

The SGSN GPRS Tunneling Protocol (SGTP) Service configuration mode provides the configuration of GTP-C and GTP-U related parameters.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

direct-tunnel-disabled-ggsn

This command makes it possible for the operator to disable direct tunneling on the basis of a GGSN.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

direct-tunnel-disabled-ggsn *ipv4/ipv6_address*

no direct-tunnel-disabled-ggsn [*ipv4/ipv6_address* **]**

no

Deletes the direct-tunnel-disabled-ggsn configuration which results in re-enabling direct tunneling to the GGSN.

- Including an IPv4 or IPv6 address for a specific GGSN, re-enables direct tunneling for that specific GGSN.
- Excluding any IPv4 or IPv6 address from this command removes all direct-tunnel-disabled-ggsn definitions from the SGTP service configuration.

Usage

By default, GGSNs and RNCs are assumed to be capable of direct tunneling.
This command disables direct tunneling for a specified GGSN. The command can be repeated to disable direct tunneling for multiple GGSNs, thereby creating a 'disabled GGSN' list. Checking for a direct-tunnel-disabled GGSN is actually the last step in the PDP Activation procedure.
Restricting direct tunneling by a GGSN for an entire APN would be configured with the appropriate command in the APN profile configuration mode.
Restricting direct tunneling at the RNC level would be configured with the appropriate command in the IuPS service configuration mode.
This command can only be used if:

- The Direct Tunnel license has been purchased and applied.
- The Direct Tunnel feature is appropriately enabled via configurations of the IMEI profile and/or the Call-Control and APN profiles.
- The RNC does not restrict direct tunnel.
- The subscriber is not requesting CAMEL services.

Example

Use the following command to disable direct tunnel for the GGSN with the IP address of *141.21.4.20*:

```
direct-tunnel-disabled-ggsn 141.21.4.20
```

disable-remote-restart-counter-verification

This command disables the SGSN's default behavior for verification of the remote peer's (GGSN) restart counter change values.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] disable-remote-restart-counter-verification
```

default

Enables the default behavior for verification of the GGSN's restart counter change values.

no

Disables the command configuration and enables the default behavior of verification.

Usage

This command disables the default behavior used to minimize PDP deactivations resulting from path failure detection due to erroneous restart counter change messages.

With the execution of this command, the SGSN stops verifying restart counters received in Create PDP Context Response or Update PDP Context Response or Update PDP Context Request (CPCR, CPCR, and UPCQ) messages. When the SGSN detects GTP-C path failure between the SGSN and the GGSN, the SGSN assumes PDP sessions at the GGSN are lost and the SGSN deactivates those PDP sessions towards the UE with an indication that the UE should activate the PDP session again. Potentially, this scenario could cause unnecessary traffic increases within the operator's network.

The SGSN default behavior provides the ability to manage GTP-C path failures detected as a result of spurious restart counter change value messages received from the GGSN. With the default behavior, path failure detection is based on receipt of restart counter change values in CPCR, CPCR, and UPCQ messages. The session manager informs the SGTPC manager about a changed restart counter value. The SGTPC manager verifies the PDP context status by performing an echo request and echo response with the GGSN. Only then is the path failure confirmed if the echo response contains a new restart counter value. Then the SGTPC manager informs all session managers about the path failure and the session managers begin deactivation of the PDP contexts.

Related commands:

- **max-remote-restart-counter-change**, also part of the SGTP service configuration mode, allows the operator to set a maximum variance between stored and received values for restart counter changes coming from the GGSN.
- **pdp-deactivation-rate**, in the SGSN Global configuration mode, allows the operator to modify the rate the SGSN deactivates PDP connections when GPT-C path failure is detected.
- **ignore-remote-restart-counter**, also part of the SGTP service configuration mode.

Example

Disable the default behavior and stop verification with echo request/response process:

```
disable-remote-restart-counter-verification
```

Use either of the following commands to enable the default verification behavior:

```
no disable-remote-restart-counter-verification
```

```
default disable-remote-restart-counter-verification
```

end

Exits the configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Changes the mode to the Exec mode.

exit

Exits the SGTP Service configuration mode and returns to the Context configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the previous mode.

ggsn-fail-retry-timer

This command sets the amount of time that a GGSN will be unavailable.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ggsn-fail-retry-timer *value*

no ggsn-fail-retry-timer

no

Removes the timer setting and disables the Local DNS feature.

value

Defines the amount of time, in seconds, that the GGSN is to be considered unavailable.
Enter an integer from 60 to 600. Default is 300.

Usage

Setting this timer to a valid value enables the Local DNS feature - described in the *SGSN Administration Guide*. Setting this timer marks a GGSN in the primary GGSN pool as unavailable for PDP context creation and causes the SGSN to forward a PDP Context Activation Request to a remote pool GGSN, identified via a local (on the SGSN) DNS check. Marking a GGSN unavailable can be done if there is a reason to believe the GGSN is unavailable; for example, lack of response to GTP messages. Marking a GGSN as unavailable is usually done for a limited period to allow the GGSN time to recover.

Example

Enable the Local DNS feature and mark the GGSNs in the primary pool as unavailable for 4 minutes (*240 seconds*):

```
ggsn-fail-retry-timer 240
```

gn-delay-monitoring

This command configures monitoring of Gn/Gp interface to check for the delay of packets between the SGSN and the GGSN.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gn-delay-monitoring [ num-delay number_delayed | num-no-delay-for-clear number_normal |
tolerance-seconds number_seconds ]

default gn-delay-monitoring [ num-delay | num-no-delay-for-clear | tolerance-seconds ]

no gn-delay-monitoring
```

default

Resets the specified parameter to the default value.

no

Disables Gn/Gp monitoring for delayed GTP-C packets.

num-delay *number_delayed*

Defines the number of response messages, coming from the GGSN, that can be delayed (delay time defined by tolerance-seconds parameter) before the delay is flagged to generate an SNMP trap.
number_delayed: Enter an integer from 1 to 500, default is 30.

num-no-delay-for-clear *number_normal*

Defines the number of consecutive response messages, coming from the GGSN, that must be received without delay (in normal response time) to clear the flag towards the GGSN.
number_normal: Enter an integer from 1 to 500, default is 15.

tolerance-seconds *number_seconds*

Defines the 'normal' number of seconds the SGSN should wait for a response from the GGSN. After this time, the response would be considered 'delayed'.
number_seconds: Enter an integer from 1 to 20, default is 4 seconds.

Important: The value for this parameter should be less than the value set for the **retransmission-timeout** parameter of the **gtpc** command, also in this configuration mode.

Usage

With this command, the SGSN can monitor the control plane packet delay for GTP-C signaling messages on the SGSN's Gn/Gp interface towards the GGSN. If the delay crosses this configurable threshold, an alarm will be generated to prompt the operator.
A delay trap is generated when the GGSN response to an ECHO message request is delayed more than a configured amount of time and for a configured number of consecutive responses. When this occurs, the GGSN will be flagged as experiencing delay.
A clear delay trap is generated when successive ECHO Response (number of successive responses to detect a delay clearance is configurable), are received from a GGSN previously flagged as experiencing delay.
This functionality can assist with network maintenance, troubleshooting, and early fault discovery.

Example

Enable Gn/Gp monitoring for GTP-C packets that arrive from the GGSN with a delay greater than *5* seconds:

```
gn-delay-monitoring tolerance-seconds 5
```

gtpc

Configure the GPRS Tunneling Protocol Control (GTP-C) settings for the SGTP service.

Platform

ASR 5000

Product

MME

PDG/TTG

SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpc { bind address *ipv4_address* **| dns-sgsn context** *context_name* **| echo-interval** *interval_seconds* **| guard-interval** *interval_seconds* **| ignore response-port-validation | ip qos-dscp** *dscp_marking* **| max-retransmissions** *max_retransmissions* **| retransmission-timeout** *timeout_seconds* **| send { common flags | rab-context | target-identification-preamble } }**

no gtpc { bind address | dns-sgsn context | echo-interval | send { common-flags | rab-context | target-identification-preamble } }

default gtpc { echo-interval | guard-interval | ignore response-port-validation | ip qos-dscp | max-retransmissions | retransmission-timeout | send { common-flags | rab-context | target-identification-preamble } }

no

Disables the configured GTP-C setting.

default

Resets the specified parameter to its default value.

bind address *ipv4_address*

Binds SGTP service to the IP address of the interface.
The bind address for the **gtpc** and **gtpu** commands should be the same.
ipv4_address must be a standard IPv4 address.

dns-sgsn context *context_name*

Enter a string of 1 to 79 alphanumeric characters to identify the context.

echo-interval *interval_seconds*

Configures the duration between echoes.
seconds Enter an integer from 0 through 3600.
Default: 60

echo-retransmission { exponential-backoff [[min-timeout *timeout_seconds* **] [smooth-factor** *smooth_factor* **] +] | timeout** *timeout_seconds* **}**

Configures the retransmission parameters for GTP-C echo messages. The operator can choose to use either an "exponential-backoff" timers or a "fixed-retransmission" timer:

- The **exponential-backoff** timer uses an exponential backoff algorithm to better manage the GTP-C path during periods of network congestion and to perform exponential-backoff echo timing. The exponential-backoff timer uses a calculated round-trip time (RTT), as well as a configurable factor or a multiplier to be applied to the RTT statistic. Different paths can each have a different RTT, so the exponential-backoff timer can be configured for multiple paths. One or both of the following parameters can be configured to refine the exponential-backoff timer configuration:
  - **min-timeout** *timeout_seconds*: Specifies the minimum time period (in seconds) for the exponential-backoff echo timer. If the RTT multiplied by the smooth factor is less than this minimum timeout value, then the node uses the value set with this keyword. Range is 1-20. Default is 5.
  - **smooth-factor** *smooth_factor*: Specifies the multiplier that the exponential-backoff echo timer uses when calculating the time to wait to send retries, when the gateway has not received a response from the peer within value defined for the path echo interval. Range is 1-5. Default is 2.
- **timeout** *timeout_seconds*: Configures the number of seconds for the fixed retransmission timeout value for GTP-C echo messages. Range from 1 to 20. Default is 5.

guard-interval *interval_seconds*

Configures the interval (in seconds) for which the SGTP maintains responses sent to gateway. This optimizes the handling of retransmitted messages. This value should be configured to be greater than the gateway's configuration for max-retries multiple by retry-interval.
interval_seconds: Enter an integer from 10 to 3600.
Default: 100

ignore response-port-validation

This keyword instructs the gateway to ignore the response port validation.
For the gateway to process incoming GTP responses to an *incorrect* port, this keyword must be entered, and the same **bind address** must be configured for GTPC and GTPU in the SGTP service.
Default: Disabled. To reset the default for this parameter, you must enter the following command: **no gtpc ignore response-port-validation**.

ip qos-dscp *dscp_marking*

Configures the diffserv code point marking to be used when sending GTP-C messages originating from the session manager and SGTPC manager.
dscp_marking: Enter one of the following values:

- **af11**: Marks traffic as Assured Forwarding 11 PHB (high throughput data)
- **af12**: Marks traffic as Assured Forwarding 12 PHB (high throughput data)
- **af13**: Marks traffic as Assured Forwarding 13 PHB (high throughput data)
- **af21**: Marks traffic as Assured Forwarding 21 PHB (low latency data)
- **af22**: Marks traffic as Assured Forwarding 22 PHB (low latency data)
- **af23**: Marks traffic as Assured Forwarding 23 PHB (low latency data)
- **af31**: Marks traffic as Assured Forwarding 31 PHB (multimedia streaming)
- **af32**: Marks traffic as Assured Forwarding 32 PHB (multimedia streaming)
- **af33**: Marks traffic as Assured Forwarding 33 PHB (multimedia streaming)

- **af41**: Marks traffic as Assured Forwarding 41 PHB (multimedia conferencing).
- **af42**: Marks traffic as Assured Forwarding 42 PHB (multimedia conferencing)
- **af43**: Marks traffic as Assured Forwarding 43 PHB (multimedia conferencing)
- **be** : Designates use of Best Effort forwarding PHB. This is the default value.
- **ef** : Designates use of Expedited Forwarding PHB

Default: **be** (best effort)

---

max-retransmissions *max_retransmissions*

Configures the maximum number of retries for packets.
max_retransmissions: Enter an integer from 0 to 15.
Default: 4

---

retransmission-timeout *timeout_seconds*

Configures the control packet retransmission timeout in GTP, in seconds.
timeout_seconds: Enter an integer value from 1 through 20.
Default: 5

---

send { common-flags | rab-context | target-identification-preamble }

- **common-flags** : This option configures the SGTP service to include or exclude the common flags IE during an Inter-SGSN RAU. When selected, the default is to send the common flags IE.

Important: Sending of common flags must be enabled to configure dual PDP type (IPv4v6) addressing with the **dual-address-pdp** command in the SGSN global configuration mode.

- **rab-context** : This option configures the SGTP service to include/exclude the radio access bearer (RAB) context IE in SGSN 'context response' message during Inter-SGSN Routing Area Update procedure. Default is to send the RAB context IE.
- **target-identification-preamble** : This option configures the SGTP service to include the Target Identification IE preamble byte in the target-id of Relocation Requests that it sends. By default, the preamble is not included. In accordance with 3GPP TS 29.060, v9.2.0, if the preamble is included then multiple optional parameters, such as Extended RNC ID, are encoded. Extended RNC ID expands the ID range from 4095 to 65535.

  In situations of MME interaction with the SGSN during SRNS procedures via GTPv1, the SGSN can use this Extended RNC ID field to indicate the Target RNC ID associated with the MME and vice versa.

Default: sending RAB context IE.

Usage

Use this command to configure GTP-C settings for the current SGTP service. Repeat the command as needed to configure all required GTP-C parameters.

Example

Following command excludes the radio access bearer (RAB) context IE in the SGSN Context Response message during the inter-SGSN RAU procedure:

```
no gtpc send rab-context
```

Configure the SGSN to send *common flags* with all GTP-C messages:

```
gtpc send common-flags
```

Set the SGSN to use GTPC echo-retransmission with exponential-backoff and both filters set for default:

```
gtpc echo-retransmission exponential-backoff
```

gtpu

This command configures the GPRS Tunneling Protocol user data plane parameters (GTP-U) for this SGTP service.

Platform

ASR 5000

Product

PDG/TTG

SGSN

Privilege

Security Administrator, Administrator

Syntax

gtpu { bind address *ipv4_address* **| echo-interval** *interval_seconds* **} | max-retransmissions** *max_retransmissions* **| retransmission-timeout** *timeout_seconds* **}**

no gtpu { bind address *ipv4_address* **| echo-interval }**

default gtpu { echo-interval | max-retransmissions | retransmission-timeout }

no

Removes the configuration for the specified parameter from the current SGTP service configuration.

default

Resets the specified GTP-U parameter to its factory default.

bind address *ipv4_address*

Defines the GTP-U Gn' interface IP address that binds to this SGTP service.
The **gtpu** and the **gtpc** commands should be configured with the same bind address.
ipv4_address: Enter a standard dotted-quad IPv4 address.

echo-interval *interval_seconds*

Configures the echo interval.
interval_seconds: Enter an integer from 60 through 3600.
Default: 60

max-retransmissions *max_retransmissions*

Configures the maximum number of retries for retransmitting packets.
max_retransmissions: Must be an integer from 0 through 15.
Default: 4

retransmission-timeout *timeout_seconds*

Configures the retransmission timeout of packets, in seconds.
timeout_seconds: Must be an integer from 1 through 20.
Default: 5

Usage

Use this command to configure the GTP-U settings for the SGTP service.

Example

Set the GTPU echo-interval for *5* seconds:

```
gtpu echo-interval 5
```

Set the gateway to use GTP-U echo-retransmission with exponential-backoff and the smooth-factor set for *4*:

```
gtpc echo-retransmission exponential-backoff smooth-factor 4
```

ignore-remote-restart-counter-change

With the inclusion of the **disable-remote-restart-counter-verification** command, this command has been deprecated.

max-remote-restart-counter-change

Use this command to set a restart counter change window to avoid service deactivations and activations that could cause large bursts of network traffic if the restart counter change messages from the GGSN are erroneous.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

max-remote-restart-counter-change *variance*

default max-remote-restart-counter-change

default

If this keyword is used or if a variance window is not configured, then the default value will be 255 and the default behavior will be to detect a restart on any change.

variance

Set a number (an 8-bit value) that will define the variance range for restart counter change values compared between the gateway's stored value and the value received in messages from the GGSN. Valid entry is an integer from 1 to 255; default is 255.
Value of 32 is recommended as it provides a sufficient window to allow the gateway to handle delayed messages with old restart counters.

Usage

When the gateway detects GTP-C path failure between the gateway and the GGSN, the gateway assumes PDP sessions at the GGSN are lost and the gateway deactivates corresponding PDP sessions towards the UE with an indication that the UE should activate the PDP session again. Detection is based on receipt of restart counter change values in Create PDP Context Response or Update PDP Context Response or Update PDP Context Request (CPCR/UPCR/UPCQ) messages. Potentially, this scenario can cause major traffic increases within the operator's network. It is possible that the messages received from the GGSN are spurious.
The gateway default behavior provides the ability to verify possible GTP-C path failures detected as a result of spurious restart counter change messages received from the GGSN. With the default behavior, the session manager informs the SGTPC manager about a changed restart counter value. The SGTPC manager responds by verifying the PDP context status by performing an Echo Request / Echo Response with the GGSN. If the Echo Response includes a new restart counter change value, then the session manager considers the path failure confirmed and begins the PDP context deactivation sequence.
Use this command to avoid unnecessary path failures and deactivations by setting a restart counter change value ‘window’ or range of values. With this window, the gateway only accepts linearly increasing values for restart counter change values that are within the specified range of accepted changes before the SGTPC manager verifies. For example, if the allowed window for restart counter change value is set to 32 and the last learnt restart counter change value from the GGSN is 15, then the gateway should detect a restart only if the new restart counter value is between 16 and 47 (range of 32) and then the gateway would verify with the

Echo Request/Response. If the received restart counter change value was 200 and the current learnt value was 15 with a window of 32, then the 200 would be ignored as a spurious value.
Also, use this command to set a restart counter change values window to avoid possible 'race conditions' (as defined in 3GPP TS 23.007 v8.7.0) where a new message arrives prior to an older message. This 'race condition' occurs when the gateway's stored restart counter value for the GGSN is larger than the restart counter value received in the messages received from the GGSN.
Related commands:

- **`disable-remote-restart-counter-verification`** - also part of the SGTP service configuration mode, this command allows the operator to disable the default behavior.
- **`pdp-deactivation-rate`**, in the SGSN Global configuration mode, this allows the operator to modify the rate the gateway deactivates PDP connections when GPT-C path failure is detected.
- **`ignore-remote-restart-counter`**, also part of the SGTP service configuration mode.

Example

Use the following command to configure an allowed restart counter change value window of *32*:

```
max-remote-restart-counter-change 32
```

mbms

Enables / disables the Multimedia Broadcast Multicast Service.

Important: The **mbms** command and parameter-configuring keywords are under development for future release and should not be used or included in your configuration at this time.

path-failure

This command specifies the method for determining if path failure has occurred.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
path-failure detection-policy gtp { echo | non-echo } +

{ default | no } path-failure detection-policy
```

default

Resets the specified path failure parameter to default.
Default: echo (for both GTPC and GTPU)

no

Deletes the path-failure definition from the configuration.

echo

Path failure is detected when the retries of echo messages time out.

non-echo

Path failure is detected when the retries of non-echo messages time out.

Usage

Use this command to define the policy to detect gtp path failure.

Example

Set *echo* as the polity detection type:

```
path-failure detection-policy gtp echo
```

pool

This command enables the default SGSN functionality for (flex) pooling and enables inclusion of the configured pool hop-counter count in new SGSN context/identify request messages.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
pool { default-sgsn | hop-counter count }

no pool { default-sgsn | hop-counter }

default pool hop-counter
```

no

Disables the default SGSN pooling functionality or removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

default

Removes the SGSN pool hop-counter IE from the GTP Identity/context requests.

default-sgsn

Enables default SGSN pooling functionality.

hop-counter *count*

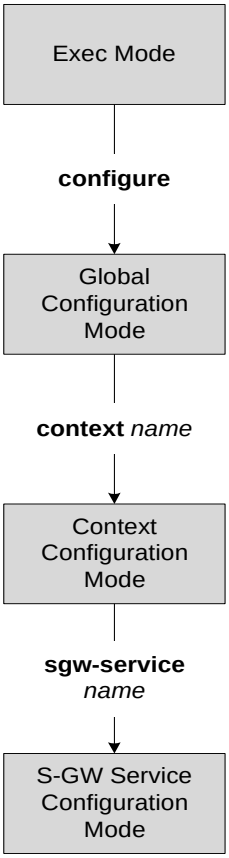
Enables and configures the SGSN pool hop-counter to set the number of hops and to include the configured count in the **new** SGSN Context Requests or the **new** SGSN Identify Requests.
If **default-sgsn** is enabled, then any messages relayed will have the default value of 4 for the counter if the message does not include this hop-counter ID.
count: Enter an integer from 1 to 255.
Default: 4

Usage

Use this command to enable the default flex functionality without exposing the pool (flex) structure. This functionality provides a means for SGSNs outside of the pool to reach a pooled SGSN on the basis of its NRI. Once the pooling has been enabled. Repeat the command using the **hop-counter** keyword to enable inclusion of the hop-counter IE in SGSN context/identify request messages and to configure the count for the pooling hop-counter. If the SGSN is behaving as the 'default SGSN', this SGSN will forward (relay) requests with the hop-count included to the target SGSN.

Example

Enable the default pooling functionality which allows an outside SGSN to reach a pooled SGSN:



```
pool default-sgsn
```

Set the hop-count to be included in messages to *25*:

```
pool hop-count
```

Chapter 246
S-GW Service Configuration Mode Commands

The S-GW (Serving Gateway) Service Configuration Mode is used to create and manage the relationship between an eGTP service used for either ingress or egress control plane and user data plane network traffic.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting context

Configures the GTPP accounting context and group selection for S-GW service.

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Syntax

accounting context *name* **[gtpp group** *name* **]**

no accounting context

no

Removes the configured accounting context from this service.

context *name*

Specifies the context where GTPP accounting is performed.
name must be an existing context configured on the system expressed as an alphanumeric string of 1 through 79 characters.
If an accounting context name is not configured in the S-GW service, the context where the S-GW service resides is considered the accounting context and the default GTPP group is used.

gtpp group *name*

Specifies a GTPP group used to perform GTPP accounting.
name must be an existing GTPP group configured on the system expressed as an alphanumeric string of 1 through 79 characters.
If a GTPP group is not configured, the system will use the default GTPP group in the specified accounting context. If the accounting context is not specified, the system will use default GTPP group in the context where the S-GW service resides.

Usage

Use this command to specify the accounting context and/or GTPP accounting group the S-GW service will use to perform GTPP accounting.

Example

The following command specifies a GTPP accounting context named *acct-2* and a GTPP accounting group named *gtpp-grp-3* as the context and group the S-GW service will use:

```
accounting context acct-2 gtpp group gtpp-grp-3
```

associate

Associates the S-GW service with QoS and policy control and charging configurations.

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Syntax

```
associate { accounting-policy name | egress-proto { gtp | gtp-pmip | pmip } [ egress-
context name [ egtp-service name ] [ mag-service name ] ] | ims-auth-service name |
ingress egtp-service name | qci-qos-mapping name | subscriber-map name

no associate { accounting-policy | egress-proto [ egress-context [ egtp-service ] [ mag-
service ] ] | ims-auth-service | ingress egtp-service | qci-qos-mapping | subscriber-map
}
```

no

Removes the specified association form the S-GW service.

accounting-policy *name*

Associates the S-GW service with an accounting policy configured in the same context.
name must be an existing accounting policy expressed as an alphanumeric string of 1 through 63 characters.
Accounting policies are configured through the **policy accounting** command in the Context Configuration Mode.

egress-proto { gtp | gtp-pmip | pmip } [egress-context *name* **[egtp-service** *name* **] [mag-service** *name* **]]**

Associates and configures the egress protocol for this S-GW service.
gtp: Specifies that GTP is to be used for the S-GW service egress.
gtp-pmip: Specifies that either GTP or PMIP is to be used for the S-GW service egress.
pmip: Specifies that PMIP is to be used for the S-GW service egress.
egress-context *name*: Specifies that the context in this keyword is to be used for the S-GW service egress. *name* must be an existing context on this system expressed as an alphanumeric string of 1 through 63 characters.
egtp-service *name*: Specifies that the service in this keyword is to be used for the S-GW service egress. *name* must be an existing eGTP service on this system expressed as an alphanumeric string of 1 through 63 characters.
mag-service *name*: Specifies that the service in this keyword is to be used for the S-GW service egress. *name* must be an existing MAG service on this system expressed as an alphanumeric string of 1 through 63 characters.

ims-auth-service *name*

Associates the S-GW service with an IMS authorization service configured in the same context.
name must be an existing IMS auth service and be from 1 to 63 alphanumeric characters.

IMS authorization services are configured through the **ims-auth-service** command in the Context Configuration Mode.

ingress egtp-service *name*

Associates and configures the eGTP service ingress for this S-GW service.
name must be an existing eGTP service on this system expressed as an alphanumeric string of 1 through 63 characters.

qci-qos-mapping *name*

Associates the S-GW service with QCI to QoS mapping parameters.
name must be an existing QCI-QoS mapping configuration expressed as an alphanumeric string of 1 through 63 characters.
QCI-QoS mapping is configured through the **qci-qos-mapping** command in the Global Configuration Mode.

subscriber-map *name*

Associates the S-GW service with subscriber map parameters.
name must be an existing subscriber map configuration expressed as an alphanumeric string of 1 through 63 characters.
Subscriber maps are configured through the **subscriber-map** command in the LTE Policy Configuration Mode.

Usage

Use this command to select a pre-configured QoS mapping and/or policy control and charging configuration to be used by the S-GW service.

Example

The following command associates the S-GW service with an IMS authorization service named *ims-23*:

```
associate ims-auth-service ims-23
```

egtp-service

Configures an eGTP service to use as either an ingress (S1-U) or egress (S5/S8) service for the S-GW.

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Syntax

egtp-service { egress { context *name* **| service** *name* **} | ingress service** *name* **}**

no egtp-service { egress { context | service } | ingress service }

no

Removes the selected EGTP service from this service.

egress { context *name* **| service** *name* **}**

Specifies the egtp-service to be used as the egress eGTP service on a GTP-based S5/S8 interface.
context *name*: Specifies the name of the context where the eGTP service resides.
name must be an existing context name where an eGTP service resides expressed as an alphanumeric string of 1 through 63 characters.

Caution: **context** *name* is not supported in this release.

service *name*: Specifies the name of the egress eGTP service.
name must be an existing eGTP service name expressed as an alphanumeric string of 1 through 63 characters.

ingress service *name*

Specifies the egtp-service to be used as the ingress eGTP service on the S11 interface.
name must be an existing eGTP service name expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the eGTP service to use with this S-GW service. The eGTP service must be existing and be configured with the appropriate parameters supporting the intended service type.

Example

The following command configures the S-GW service to use an eGTP service named *s1u-egtp* as its ingress service:

```
egtp-service ingress service slu-egtp
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

gtpu-error-ind

Configures the actions to be taken upon receiving a GTP-U error indication from an RNC, eNodeB, SGSN, or P-GW.

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Syntax

```
gtpu-error-ind { { s12 | s1u } { local-purge | page-ue [ custom1-behavior ] } | { s4u |
s5u } { local-purge | signal-peer } }

default gtpu-error-ind { s12 | s1u | s4u | s5u }
```

default

Resets the command to the default action for the specified interface. For S12 and S1-U, **page-ue** is the default action. For S4-U and S5-U, **local-purge** is the default action.

{ s12 | s1u } { local-purge | page-ue [custom1-behavior] }

Specifies the action to take when a GTP-U error indication is received from a Radio Network Controller (RNC) over an S12 interface or from an eNodeB over the S1-U interface.
local-purge: The S-GW clears the affected bearer (or PDN if error-indication is received on default bearer) locally without informing peer.
page-ue [custom1-behavior]: The S-GW moves the complete UE state to S1-Idle and starts paging for this UE. If the custom1-behavior option is specified, the S-GW will guard the paging attempt with a timer of 60 seconds. Within this time the bearer must have the eNodeB TEID refreshed by an MME. Otherwise, the S-GW will clear the affected bearer with signaling. This is the default action for GTP-U error indication messages received on the S12 and S1-U interfaces.

{ s4u | s5u } { local-purge | signal-peer }

Specifies the action to take when a GTP-U error indication is received from an SGSN over an S4-U interface or from a P-GW over the S5-U interface.
local-purge: The S-GW clears the affected bearer (or PDN if error-indication is received on a default bearer) locally without informing the peer. This is the default action for GTP-U error indication messages received on the S4-U and S5-U interfaces.
signal-peer: The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:

- For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.
- For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.
- The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

Usage

Use this command to specify the action to taken upon receiving a GTP-U error indication from an RNC over an S12 interface, an eNodeB across an S1-U interface, an SGSN over an S4-U interface, or from a P-GW across an S5-U interface.

Example

The following command sets the action to take upon receipt of a GTP-U error indication from the eNodeB to clear affected bearer:

```
gtpu-error-ind s1u local-purge
```

mag-service

Identifies the Mobile Access Gateway (MAG) egress service through which calls are to be routed for this S-GW service.

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Syntax

mag-service egress service *name*

no mag-service egress service

no

Removes the configured MAG egress service from this service.

egress service *name*

Specifies the MAG service name to be used as the egress MAG service on a Proxy Mobile IPv6 (PMIP) based S5/S8 interface.
name must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the name of the MAG service where calls are to be routed.

Example

The following command specifies that an existing MAG service named *mag3* is to be used to route call through for this S-GW service:

```
mag-service egress service mag3
```

path-failure

Configures the action to take upon the occurrence of a path failure between the S-GW and the MME, P-GW, RNC, SGSN, or eNodeB.

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Syntax

```
path-failure { s11 | s12 | s1u | s4 | s4u | s5 | s5u } ( local-purge | signal-peer }

default path-failure { s11 | s12 | s1u | s4 | s4u | s5 | s5u }
```

default

Returns the command to the default setting of "local purge" for the selected interface.

{ s11 | s12 | s1u | s4 | s4u | s5 | s5u }

Specifies the interface to which the action will be applied.
s11: Applies the path failure action to the S11 interface between the S-GW and the MME.
s12: Applies the path failure action to the S12 interface between the S-GW and the RNC.
s1u: Applies the path failure action to the S1-U interface between the S-GW and the eNodeB.
s4: Applies the path failure action to the S4 control plane interface between the S-GW and the SGSN.
s4u: Applies the path failure action to the S4-U user plane interface between the S-GW and the SGSN.
s5: Applies the path failure action to the S5 interface between the S-GW and the P-GW.
s5u: Applies the path failure action to the S5-U user plane interface between the S-GW and the P-GW.

{ local-purge | signal-peer }

Specifies the action to apply to the selected interface.
local-purge: The S-GW clears the affected bearer (or PDN if path failure is received on a default bearer) locally without informing the peer. This is the default action for all interface.
signal-peer: The S-GW initiates control signalling towards the peer MME and P-GW. When signalling:

- For a bearer deletion, the S-GW sends a Delete-Bearer-Command message to the P-GW and a Delete-Bearer-Request (with EBI) message to the MME.
- For PDN deletion, the S-GW sends a Delete-Session-Request message to the P-GW and a Delete-Bearer-Request (with LBI) message to the MME.
- The S-GW will not wait for Delete replies from the peer. The request will be sent only once and local resources will be reset.

Usage

Use this command to specify the type of action to take when a path failure occurs on one of the supported interfaces.

Example

The following command sets the path failure action for the S5 interface to “signal peer”:

```
path-failure s5 signal-peer
```

plmn

Configures the public land mobile network (PLMN) identifier for this S-GW service

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Syntax

plmn id mcc *number* **mnc** *number* **[primary]**

no plmn id mcc *number* **mnc** *number*

no

Removes the configured PLMN ID for this S-GW service.

mcc *number*

Configures the Mobile Country Code for this PLMN ID.
number must be an integer from 100 through 999.

mnc *number*

Configures the Mobile Network Code for this PLMN ID.
number must be a 2- or 3-digit integer from 00 through 999,

primary

Specifies that this is the primary PLMN ID for this S-GW service.

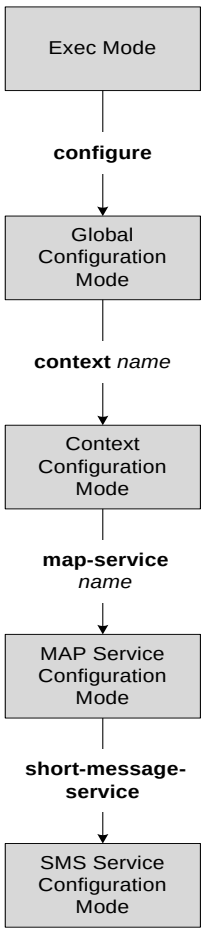
Usage

Use this command to configure PLMN IDs for this S-GW service

Example

The following command configures a “primary” PLMN ID for this S-GW service with an MCC of *123* and an MNC of *12*:

```
plmn id mcc 123 mnc 12 primary
```



Chapter 247
SMS Service Configuration Mode Commands

The SMS (short message service) Service configuration mode is used to create and manage properties of the SMS Service configuration.

The SGSN uses the SMS Service component to communicate via the Gd interface with a gateway message service controller (GMSC) to send short text messages (up to 140 octets in length) to a mobile (SMS-MT) and/or receive messages from a mobile (SMS-MO) .

When this mode is accessed, the command line will appear similar to

```
[<ctx_name>]asr5000(config-map-service-<map_service_name>-sms-service)#
```

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cp-data

Enables the SGSN to send and/or receive cp-data (text messages).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

cp-data max-retransmission *retries_num*

default cp-data max-retransmissions

default

This keyword resets the SGSN's max-retransmission to the default number of retries.

max-retransmission *retries_num*

retries_num: enter an integer from 1 to 3.

Usage

Use this command to configure the number of times the SGSN will attempt to retransmit a message.

Example

```
cp-data max-retransmission 2
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

mo-message-forwarding-destination

This command defines the SGSN's handling policy for MO (mobile originating) message.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default ] mo-message-forwarding-destination { gmsc-selected-from-imsi | smsc-supplied-by-subscriber }
```

default

Resets the SMS service configuration to the default message forwarding technique.

gmsc-selected-from-imsi

Entering this keyword enables SMS-MO messages to be forwarded on the basis of their IMSI prefix.

smsc-supplied-by-subscriber

Entering this keyword enables SMS-MO messages to be forwarded on the basis of the SMSC (SMS controller) address provided by the subscriber.

Usage

Use this command to define how the mobile originated SMS are to be routed.

Example

```
mo-message-forwarding-destination gmsc-selected-from-imsi
```

smsc-address-restiction-list

Define the list of SMS-C addresses to be screened.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

smsc-address-restriction-list *isdn-no +*

no smsc-address-restriction-list *isdn-no*

no

Delete an SMS-C address (ISDN number) from the list.

isdn-no +

Enter up to 10 ISDN numbers, each up to 15 digits. Put a single space, without a comma, between each ISDN number being added to the list with one command.

Usage

Use this command to identify a list of SMS-C that are to be screened and restricted from receiving forwarded SMS. This list is part of the SMS-C address denial mechanism. For the mechanism to actually function, a second command must be configured, the **smsc-address-restriction-list** command.

Example

Add 3 ISDN numbers to the list of restricted SMS-C addresses.

```
smsc-address-restriction-list 443719933751427 422311198977765
901231445513131
```

Remove an ISDN number from the list of restricted SMS-C addresses.

```
no smsc-address-restriction-list 443719933751427
```

smsc-address-restiction-type

Define the list of SMS-C addresses to be screened.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
smsc-address-restriction-type { mo-mt-sms | mo-sms | mt-sms }

default smsc-address-restriction-type
```

default

Resets the restriction type to the default of both MT and MO types.

mo-mt-sms

Sets the restriction for both types of messages - mobile-originated (MO-SMS) and mobile-terminated (MT-SMS).

mo-sms

Sets the restriction for the mobile-originated (MO-SMS) messages.

mo-mt-sms

Sets the restriction for the mobile-terminated (MT-SMS) messages.

Usage

Use this command to identify the types of messages that are to be denied to the SMS-C identified in the **smsc-address-restriction-type**. Both commands must be configured for the SMS-C address denial mechanism to function.

Example

Restrict MO-SMS messages from being forwarded to the SMS-C listed in the restriction list:

```
smsc-address-restriction-type mo-sms
```

Reset the restriction to both types of messages:

```
default smsc-address-restriction-type
```

smsc-address-selection-prioritization

Define the routing selection priority for the SMSC (short message service center) address to be used for all MO-SMS.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

smsc-address-selection-prioritization from-ms *priority* **imsi-prefix** *priority* **msisdn-prefix** *priority*

default smsc-address-selection-prioritization

from-ms *priority*

Configures a priority for the SMSC address send from the MS.
priority : Value must be a single digit, range 1-3.

imsi-prefix *priority*

Configures a priority for the SMSC address that is based on the IMSI-prefix.
priority : Value must be a single digit, range 1-3.

msisdn-prefix *priority*

Configures a priority for the SMSC address that is based on the MSISDN-prefix.
priority : Value must be a single digit, range 1-3.

default

By including the **default** keyword with the command, the SGSN knows to use the encoded default priorities for SMSC address selection for SMSC routing:

- *from-ms* priority 1,
- *imsi-prefix* priority 2,
- *msisdn-prefix* priority 3.

Usage

Use this command to define SMSC address routing priorities. Priorities must be defined for all parameters, all keywords, but they can be entered in any order. The addresses for the SMSCs are defined with the smsc-routing command.

An operator can use this configuration to prevent subscribers from using unauthorized SMSC addresses, for example, an unauthorized international SMSC.

Example

The keywords can be entered in any order but all keywords must be included in the command:

smsc-address-selection-prioritization msisdn-prefix *3* **from-ms** *1* **imsi-prefix** *2*

smsc-routing

This command configures the routing to the short message service center (SMSC).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] smsc-routing { { any | imsi-starts-with | msisdn-starts-with } { isdn *isdn_number* **| mobile-global-title** *mgt_number* **[max-gt-address-len** *max_gt_length* **] | point-code** *pt_code* **} }**

any

Configures routing according to any IMSI prefix.

imsi-starts-with *IMSI_prefix*

Defines the IMSI prefix. Enter a string of up to 15 digits.

msisdn-starts-with *msisdn_prefix*

Defines the MSISDN prefix. Enter a string of up to 15 digits.

isdn *isdn_number*

Defines the ISDN E.164 number (up to 15 digits) of the SMSC.

mobile-global-title *mgt_number* **[max-gt-address-len** *max_gt_length* **]**

Defines the mobile global title (MGT) E.214 address to be used for IMSI conversion.
Optionally, the maximum length of the GT address can be defined. If the length of the MGT string is greater than the defined max, then the least significant digits will be omitted.
mgt_number is a string of digits, up to 18 digits.
max_gt_address is an integer from 1 to 32.

point-code *pt_code*

Defines the point code for the SMSC. Enter a string of up to 11 digits in SS7 dotted decimal or decimal format

Usage

This command defines the address format (IMSI, point code, mobile global title) and the address for SMSC routing.

Example

Use this command to define routing to the SMSC based on any point code.

```
smsc-routing any point-code 1.222.1
```

timeout

This command defines the SMS service timers.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout { tc1n-timer*time* **| tr1n-timer** *time* **| tr2n timer** *time* **}**

default timeout { tc1n-timer | tr1n-timer | tr2n timer }

default

Resets the configuration to the default value for the specified timer.

tc1n-timer *time*

Configures the TC1N timer in seconds.
time: Must an integer from 1 to 255. The default is 5 seconds.

tr1n-timer *time*

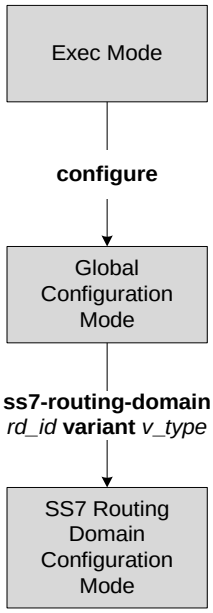
Configures the TR1N timer in seconds.
time: Must an integer from 1 to 255. The default is 30 seconds.

tr2n-timer *time*

Configures the TR2N timer in seconds.
time: Must an integer from 1 to 255. The default is 30 seconds.

Usage

Use this command to set SMS service timers. The command can be repeated to set all of the timers, one-at-a-time.



Example

tr1n-timer *25*

Chapter 248
SS7 Routing Domain Configuration Mode Commands

The SS7 Routing Domain configuration mode is used to configure Signaling System 7 (SS7) parameters. For convenience in configuration management, all SS7 parameters have been collected into a proprietary grouping called an *SS7 routing domains*.

`[local]`*`hostname`*`(config-ss7-routing-domain-<`*`ss7rd_id`*`>)#`

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

asp

This command creates or removes an M3UA Application Server Process (ASP) instance and enters the ASP configuration mode. See the *SGSN ASP Configuration Mode* chapter in the *Command Line Interface Reference* for command details.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

asp instance *asp_inst*

no asp instance *asp_inst*

default asp instance *asp_inst* **end-point port**

no

Deletes the ASP instance for the SS7 routing domain configuration.

default

Sets the ASP instance parameters to the end-point port value of 2905.

instance *asp_inst*

Identifies a specific ASP configuration. Up to four ASP instances can be configured for a single SS7 routing domain.
asp_inst : Must be an integer from 1 through 4.

Usage

Use this command to create an ASP instance or enter the ASP configuration mode.

Example

The following command enters the ASP configuration mode for a specific ASP.

```
asp instance 1
```

description

This command defines an alphanumeric string that describes the current SS7 routing domain. This is used for operator reference only.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

description *string*

no description

no

Removes the description string from the current SS7 routing domain configuration.

string

Specifies the alphanumeric string that is stored. Strings with spaces must be enclosed in double-quotes (see the example below).
string: Must be from 1 to 255 alphanumeric characters.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify a routing domain for messages transmitted within a national boundary.

description *"National Service Routing Domain"*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

inbound-asp-identifier validate

This command enables validation of ASP identifiers inbound to the SGSN via routes defined with this SS7 routing domain.

Important: This command is only available in Release 8.1 and higher releases.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
inbound-asp-identifier validate

default inbound-asp-identifier validate

no inbound-asp-identifier validate
```

default

Validates the inbound ASP Id.

no

Disables validation of the inbound ASP Id.

Usage

The standard is to validate the ASP Id. However, in some circumstances it is necessary to skip such validation. For example, if the same ASP Id is assigned to more than one RNC (peer-server).

Example

Use the following command to skip validation of inbound ASP Ids:

```
no inbound-asp-identifier validate
```

Use either of the following commands to enable validation if it has been disabled:

```
default inbound-asp-identifier validate

inbound-asp-identifier validate
```

linkset

This command creates an instance of an MTP3 linkset and enters the Linkset configuration mode. See the Linkset configuration mode chapter for the commands to configure the linkset.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

linkset id *id*

no linkset id *id*

no

Removes the identified linkset definition from the system configuration.

id

This value uniquely identifies a linkset for the specific SS7 routing domain.
id : Must be an integer of 1 to 49.

Usage

This command creates instances of linkset configurations and provides access to the linkset configuration mode.

Example

Use the following command to create the 12th linkset:

linkset id *12*

MTU-size

This command has been deprecated.

peer-server

This command creates a peer-server instance to setup a SIGTRAN peer for sending and receiving M3UA traffic. Completing the command automatically enters the peer- server configuration mode. To define 1 or more (up to 145) peer servers, use the commands documented in the *Peer-Server Configuration Mode* chapter in this reference.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

peer-server id *srvr_id*

no peer-server id *srvr_id*

no

Removes the identified peer-server definition from the system configuration.

srvr_id

srvr_id uniquely identifies a peer-server. The id must be an integer from 1 to 144.

Usage

Use the following command to create a definition for peer-server 2 and enter the configuration mode to configure the communication parameters for peer-server 12.

Example

```
peer-server id 12
```

route

This command configures SS7 routes for the current SS7 routing domain.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

route destination-point-code *dp_code* **{ linkset id** *id* **[priority** *pri_value* **] | peer-server-id** *srvr_id* **}**

no route destination-point-code *dp_code* **{ linkset id** *id* **| peer-server-id** *srvr_id* **}**

no

Removes the SS7 route from the current SS7 routing domain configuration.

destination-point-code *dp_code*

Specifies the SS7 destination point code for this route.
Reminder: the point-code structure must match the variant defined for the SS7 routing domain when the SS7RD was configured in the global configuration mode.

linkset id *id*

This keyword identifies a linkset instance, created and configured with the **linkset** command.
This keyword identifies a linkset instance, created and configured with the **linkset** command.
id : Must be an integer from 1 to 49.

peer-server-id *srvr_id*

This keyword identifies a peer-server configuration instance, created and configured with the **peer-server** command.
srvr_id must be an integer from 1 to 49.

Usage

This command associates the previoiusly configured linksets and peer servers and the destination point codes with a specified SS7 route.

Example

Define a route setting an ITU-type destination point-code address for the linkset Id 12:

route destination-point-code *6.211.6* **linkset id** *12*

routing-context

Identifies the routing context for this SS7 routing domain.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

routing-context *value*

default routing-context

default

Resets the local routing context value to the index (instance ID) for this SS7 routing domain.

value

An integer that uniquely identifies the routing context for this SS7 routing domain.
value : Must be integers from 1 to 65535 (for releases 8.0) or 1 to 4294967295 (for releases 8.1 and higher) .

Usage

Use this command to set the routing context IDs for a specific SS7 routing domain configuration.

Example

routing-context *2355*

ssf

This command sets the network indicator in the subservice field for SS7 message signal units (MSUs).

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

```
ssf ( international | national | reserved | spare }
```

international

The network indicator identifies the message as international with a point code structure that does not match the national point code structure,

national

The network indicator identifies the messages as having a national point code structure.

reserved

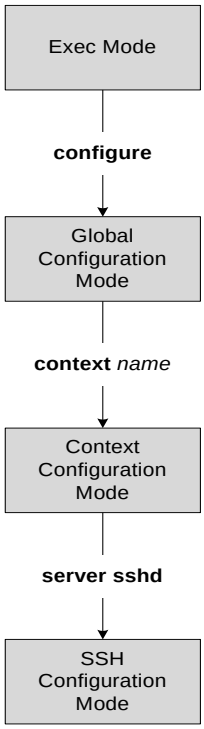
Provides an alternate network indicator for national messages.

spare

Provides an alternate network indicator for international messages.

Usage

In SS7 signaling, the Message Transfer Part (MTP) Level 2 message signal units (MSUs) contain a service information octet (SIO). The SIO field in an MSU contains a 4-bit subservice field (SSF) followed by a 4-bit service indicator. The indicator carried in the message's routing information typically identifies the structure of the point code as a message from within a nation or as a message coming from outside the nation - international. As well, the 4-bit SSF determines the point code structure of the messages transmitted from the SGSN.



Example

For messages being transmitted within a country, set the indicator to national with the following command.

```
ssf national
```

Chapter 249
SSH Configuration Mode Commands

The Secure Shell Configuration Mode is used to manage the SSH server options for the current context.

Important: You must use the **`ssh generate key`** command in Context Configuration Mode to generate the sshd keys before you can configure the sshd server

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

authorized-key

Sets or removes a user name having authorized keys for access to the sshd server in the current context.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

authorized-key username *user_name* **host** *host _name* **[type { v2-dsa | v2-rsa }]**

default

Resets the parameter to the default value.

username

Sets a username as having authorized keys for access to the sshd server.

user_name

Specifies the username entered as an alphanumeric string of 1 through 255 characters.

host

Associates an SSH host having the authorization keys for the username.

host_name

Specifies the host name entered as an alphanumeric string of 1 through 255 characters.

[type { v2-dsa | v2-rsa }]

Specifies which type of SSH authorization key will be accepted instead of all key types. The options are: **v2-dsa** (SSHv2 Digital Signature Algorithm), or **v2-rsa** (SSHv2 Rivest, Shamir and Adleman).

Usage

Use this command to set a username with authorized keys for access to the sshd server within the current context.

Example

The following command specifies that username *dbailey* with authorization keys at *sshserver* can access the system with all types of authorization keys:

```
authorized-key username dbailey host sshserver
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

listen

Configures the SSH server in the current context to only listen for connections from the interface with the specified IP address. The default behavior is to listen on all interfaces.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

listen *ip_address*

no listen

no

Disable listening for a specific interface address and enable listening on all interfaces.

ip_address

Enables listening only on the interface with the specified IP address. *ip_address* must be entered using IPv4 dotted-decimal notation.

Usage

Use this command to configure the SSH server for the current context to only listen for connections from the interface with the specified IP address. Only one IP address may be set for listening.

Example

The following command specifies that the Server should only listen for connections in the interface with the IP address of *192.168.0.10*:

```
listen 192.168.0.10
```

max servers

Configures the maximum number of SSH servers that can be started within any 60-second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

max servers *number*

number

Default: 40
Specifies the maximum number of servers that can be spawned in any 60-second interval. *number* must be an integer from 1 through 100.

Usage

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

Example

```
max servers 50
```

subsystem

Configures the system to perform file transfers using secure FTP (SFTP) over ssh v2. Administrator users must be configured with the FTP attribute privilege to issue this command.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] subsystem { cli | sftp }
```

no

Disables either the SFTP ssh file transfer method or disables access to the CLI via ssh.

cli

Default: Enabled
Configures the SSH system for the current context to allow access to the CLI.

sftp

Default: Disabled
Enables the SSH system for the current context to perform file transfers using secure FTP (SFTP) over ssh v2.

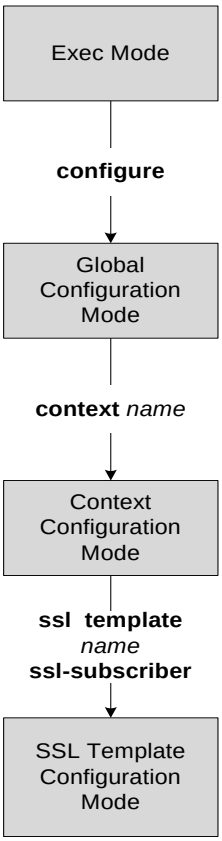
Usage

Use this command to enable or disable file transfers using secure ftp over an ssh v2 tunnel.
Also use this command to enable or disable access to the CLI over an SSH connection.

Example

The following command enables SFTP for the current context:

```
subsystem sftp
```



The following command disables access to the CLI through an SSH session for the current context:

```
no subsystem cli
```

Chapter 250
SSL Template Configuration Mode Commands

The SSL Template Configuration Mode is used to configure an SSL cryptographic policy. It includes most of the SSL parameters for cryptographic and authentication algorithms.

A P-CSCF service for SSL access will not function without a configured SSL template. Only one SSL template can be configured per P-CSCF service.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

ca-certificate

Specifies a list of ca-certificates.

Platform

ASR 5000

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

ca-certificate list *name*

list *name*

Specifies the name(s) of ca-certificate(s), which can be an alpha and/or numeric string of 1 to 129 characters.

Usage

Use this command to specify a list of ca-certificates for the SSL template.

Example

The following command specifies the ca-certificate *ca_certificate_1* for the SSL template:

ca-certificate list *ca_certificate_1*

certificate

Used to bind an X.509 trusted certificate to the SSL template.

Platform

ASR 5000

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

certificate *name*

name

Specifies the name of a certificate, which can be an alpha and/or numeric string of 1 to 127 characters.

Usage

Use this command to bind an X.509 certificate to the SSL template.

Example

The following command binds the X.509 certificate *certificate_1* to the SSL template:

certificate *certificate_1*

cipher-suites

Specifies a list of SSL cipher suites.

Platform

ASR 5000

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

cipher-suites list *name*

list *name*

Specifies the name of an SSL cipher suite, which can be an alpha and/or numeric string of 1 to 127 characters.

Usage

Use this command to specify an SSL cipher suite for the SSL template.

Important: Currently, the system supports only one SSL cipher suite per SSL template.

Example

The following command specifies the SSL cipher suite *cipher_suite_1* for the SSL template:

cipher-suites list *cipher_suite_1*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

version

Specifies the supported version(s) of SSL protocol on the P-CSCF/A-BG.

Platform

ASR 5000

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
version list { tlsv1 }

default version
```

list { tlsv1 }

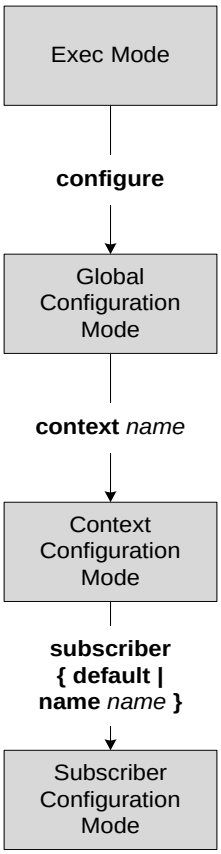
Specifies the supported version of SSL protocol to be TLS v0.1.

default

Sets the supported version of SSL protocol to its default value of TLS v0.1.

Usage

Use this command to specify the supported version(s) of SSL protocol on the P-CSCF/A-BG. Currently, there is only one supported version of SSL protocol, which is TLS v0.1.



Example

The following command sets the supported version of SSL protocol to TLS v0.1:

```
version list tlsv1
```

Chapter 251
Subscriber Configuration Mode Commands

The Subscriber Configuration Mode is used to create local subscribers as well as to set default subscriber options for the current context.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa

This command configures authentication, authorization and accounting (AAA) functionality at the subscriber level.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa { accounting interim { interval-timeout interval_timeout | normal | suppress }
| group aaa_group_name | secondary-group aaa_secondary_group_name }

default aaa { accounting interim [ interval-timeout ] | group | secondary-group }

no aaa { accounting interim [ interval-timeout ] | group [ aaa_group_name ] | secondary-
group }
```

default

Configures the default setting for the specified parameter.

- **accounting**: Enables AAA accounting for subscribers.
- **group**: Uses the default AAA group—the one specified at the context level or in the default subscriber profile.
- **secondary-group**: Removes the secondary AAA group from the subscriber configuration.

no

- **accounting**: Disables AAA accounting for subscribers.
- **group**: Uses the default AAA group—the one specified at the context level or in the default subscriber profile.
- **secondary-group**: Removes the secondary AAA group from the subscriber configuration.

accounting interim { interval-timeout *interval_timeout* **| normal | suppress }**

Specifies when system should send an interim accounting record to the server.

- **interval-timeout**: Specifies the time interval (in seconds) at which to send an interim accounting record.

  interval_timeout must be an integer from 50 through 40000000.

- **normal**: If RADIUS accounting is enabled, send this Acct-Status-Type message when normally required by operation.
- **suppress**: If RADIUS accounting is enabled, suppress the sending of Acct-Status-Type message.

group *aaa_group_name*

Specifies the AAA server group for the subscriber for authentication and/or accounting.
aaa_group_name must be an alphanumeric string of 1 through 63 characters.

secondary-group *aaa_secondary_group_name*

Specifies the secondary AAA server group for the subscriber.
aaa_secondary_group_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure AAA functionality at the subscriber level.
Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual server group for subscribers in that context. Each server group consists of a list of AAA servers for each AAA function (accounting, authentication, charging, etc.).
The AAA secondary server group supports the No-ACK RADIUS Targets feature in conjunction with PDSN/HA for secondary accounting (with different RADIUS accounting group configuration) to the RADIUS servers without expecting the acknowledgement from the server, in addition to standard RADIUS accounting. This secondary accounting will be an exact copy of all the standard RADIUS accounting message (RADIUS Start/Interim/Stop) sent to the standard AAA RADIUS server.
If the same AAA group is configured with both the **aaa group** *aaa_group_name* and the **aaa secondary-group** *aaa_group_name* commands, then this configuration will have no effect and secondary accounting will not happen.
The AAA secondary server group configuration takes effect only when used with subscriber accounting-mode set to radius-diameter. The RADIUS accounting triggers for both standard RADIUS accounting and secondary accounting will be taken from the AAA group configured with the **aaa group** *aaa_group_name* command. On the fly change of this configuration is not supported. Any change to the configuration will have effect only for new calls.

Example

The following command applies the AAA server group *star1* to subscribers:

```
aaa group star1
```

access-link ip-fragmentation

Configures IP fragmentation processing over the Access-link.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
access-link ip-fragmentation { normal | df-ignore | df-fragment-and-icmp-notify }
```

df-ignore

Default: Enabled
Ignores the DF (Don’t Fragment) bit setting. Fragments and forwards the packet over the access link.

df-fragment-and-icmp-notify

Default: Disabled
Partially ignores the DF bit. Fragments and forwards the packet, but also returns an ICMP error message to the source of the packet. The number of ICMP errors sent like this is rate-limited to one ICMP error packet per second per session.

normal

Default: Disabled
Normal processing. Drops the packet and sends an ICMP unreachable message to the source of packet. This is the default behavior.

Usage

If the IP packet to be forwarded is larger than the access-link MTU and if the DF (Don't Fragment) bit is set for the packet, then the fragmentation behavior configured by this command is applied. Use this command to fragment packets even if they are larger than the access-link MTU.

Example

Set fragmentation so that the DF bit is ignored and the packet is forwarded anyway by entering the following command:

```
access-link ip-fragmentation df-ignore
```

accounting-mode

Sets the accounting mode for the current local subscriber configuration.

Platform

ASR 5000

Product

PDSN, HA, ASN-GW, S-GW

Privilege

Administrator

Syntax

```
accounting-mode { flow-based | gtpp [ radius-diameter ] | none | radius-diameter [ gtpp ]
| rf-style }

default accounting-mode
```

default

Sets the type of accounting to be performed for the current local subscriber to the default setting.
Default: **radius-diameter**

flow-based

Diameter flow-based accounting is enabled for the current local subscriber.

gtpp [radius-diameter]

GTPP CDR RADIUS accounting is enabled for the current local subscriber. The **radius-diameter** keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.

none

Accounting is disabled for the current local subscriber and no charging records will be generated.

radius-diameter [gtpp]

RADIUS-Diameter accounting is enabled for the current local subscriber. The **gtpp** keyword is available if both GTPP RADIUS and RADIUS-Diameter accounting are to be used.

rf-style

Diameter Rf interface accounting is enabled for the current local subscriber.

Usage

This command specifies which protocol, if any, will be used to provide accounting for PDP contexts accessing the APN profile.
Use this command to enable or disable RADIUS/Diameter accounting for any subscribers that use the current local subscriber configuration.
If the **gtpp** option is used, then GTPP RADIUS is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode and GTPP charging records will be enabled.

If the **radius-diameter** option is used, either the RADIUS or the Diameter protocol is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode.
RADIUS accounting can also be enabled and disabled at the context level with the **aaa accounting** command in the Context Configuration Mode. If RADIUS accounting is enabled at the context level, the accounting-mode command can be used to disable RADIUS accounting for individual local subscriber configurations.
If the accounting mode is set to **rf-style**, then BM will generate accounting records corresponding to AIMS RF.

Example

To disable accounting for the current subscriber, enter the following command:

```
accounting-mode none
```

active-charging bandwidth-policy

Configures the bandwidth policy to be used for the subscriber.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

active-charging bandwidth-policy *bandwidth_policy_name*

{ default | no } active-charging bandwidth-policy

default

Specifies that the default bandwidth policy configured in the rulebase be used for this subscriber.

no

Disables bandwidth control for this subscriber.

active-charging bandwidth-policy *bandwidth_policy_name*

Specifies name of the bandwidth policy.
bandwidth_policy_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure bandwidth policy to be used for subscribers.

Example

The following command configures a bandwidth policy named *standard* for the subscriber:

```
active-charging bandwidth-policy standard
```

active-charging link-monitor tcp

Enables the TCP link monitoring feature on the Mobile Video Gateway. This command can be configured in either APN Configuration Mode or Subscriber Configuration Mode.

Platform

ASR 5000

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] active-charging link-monitor tcp [ log [ rtt [ histogram | time-series ]
[ bitrate [ histogram | time-series ] ] | bitrate [ histogram | time-series ] [ rtt [
histogram | time-series ] ] ] ][ -noconfirm ]
```

default

Sets TCP link monitoring to its default value, which is the same as **[no]**.

no

Deletes the TCP link monitoring settings and disables TCP link monitoring if previously configured.

active-charging link-monitor tcp

Enables the TCP link monitoring feature on the Mobile Video Gateway. Note that TCP link monitoring is not enabled by default. Also note that when this command is configured without the **log** option, TCP link monitoring is enabled without logging, and the output from TCP link monitoring is only used by the dynamic translating feature.

log [rtt [histogram | time-series] [bitrate [histogram | time-series]] | bitrate [histogram | time-series] [rtt [histogram | time-series]]]

This option enables statistical logging for TCP link monitoring.
The **rtt** option can be used to enable either **histogram** or **time-series** logging for round-trip time (RTT).
Similarly, the **bitrate** option can be used to enable either **histogram** or **time-series** logging for bit rate.
When **rtt** and **bitrate** options are used without additional options, histogram and time-series logging are enabled for round-trip time (RTT) and/or bit rate respectively.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to enable TCP link monitoring on the Mobile Video Gateway.

Examples

The following command enables TCP link monitoring with statistical logging, with histogram and time-series logging enabled for both RTT and bit rate:

```
active-charging link-monitor tcp log
```

The following command enables TCP link monitoring with statistical logging, with histogram and time-series logging enabled for RTT:

```
active-charging link-monitor tcp log rtt
```

The following command enables TCP link monitoring with statistical logging, with histogram logging enabled for RTT:

```
active-charging link-monitor tcp log rtt histogram
```

The following command enables TCP link monitoring with statistical logging, with histogram logging enabled for RTT and time-series logging enabled for bit rate:

```
active-charging link-monitor tcp log rtt histogram bitrate time-series
```

active-charging rulebase

Specifies the rulebase to be used for this subscriber.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

active-charging rulebase *rulebase_name*

no active-charging rulebase

no

Removes the previously configured rulebase for the subscriber.

active-charging rulebase *rulebase_name*

Specifies name of the ACS rulebase.
rulebase_name must be the name of an ACS rulebase expressed as an alphanumeric string of 1 through 63 characters.

Usage

This command specifies the name of the rulebase for specific subscriber (reals).
If the specified rulebase does not exist in the Active Charging service, the call will be rejected.

Example

The following command configures the ACS rulebase named *rule1* for the subscriber:

```
active-charging rulebase rule1
```

always-on

Once the idle timeout limit is reached, keeps the current subscriber session connected as long as the subscriber is reachable.

Caution: When always-on is enabled, the subscriber must have an idle time-out period configured (default is 0, no time-out). Failure to configure an idle time-out results in a subscriber session that is indefinite.

Two timers and a counter are associated with this feature. Refer to the **timeout** command in this chapter and the **ppp echo-retransmit-timeout msec** and **ppp echo-max-retransmissions num_retries** commands.

Default: Disabled.

Platform

ASR 5000

Product

PDSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
always-on

no always-on
```

always-on

Specifies that the user will remain connected after the idle time expires.

no

Disables **always-on**. The user is disconnected after the idle time expires.

Usage

If this parameter is enabled for a subscriber, when the idle time-out limit is reached the subscribers IP/PPP session remains connected as long as the subscriber is reachable. This is true even if the airlink between the mobile device and the RN (Radio Node) is moved from active to dormant (inactive) status. When the idle timeout limit is reached, the PDSN determines availability using link control protocol (LCP) keepalive messages. A response to these messages indicates that the “always-on” status should be maintained. Failure to respond to a predetermined number of LCP keepalive messages causes the PDSN to tear-down (disconnect) the subscriber session.

Example

Enable always on for the current subscriber by entering the following command:

```
always-on
```

asn-header-compression-rohc

Negotiates Robust Header Compression (ROHC) support for subscriber calls with AAA and WiMAX. This configuration indicates the type of header compression supported and enabled on the ASN.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] asn-header-compression rohc
```

no

Removes or disables the configured identifiers for ROHC in ASN-GW service.

default

The default is *disabled*.

Usage

Network Attached Storage (NAS) uses this configuration to indicate and pack ROHC support the subscriber TLV in the WiMAX-capability attribute in the Access Request. The ROHC header compression is applied only when the ROHC is supported on the ASNGW and ROHC support is indicated by the AAA.

asn nspid

Specifies the network service provider (NSP) associated with a WiMAX subscriber in an ASN-GW service. When configured, the NSP ID is sent in the Access-Request and Accounting messages.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] asn nspid *nsp_id*

no

Removes or disables the configured identifiers for this network service provider in ASN-GW service.

asn nspid *nsp_id*

Specifies the network service provider for this subscriber. This enables the MS to discover all accessible NSPs, and to indicate the NSP selection during connectivity to the ASN.

Usage

Use this command to specify the NSP associated with a subscriber in an ASN-GW service. *nsp_id* is three bytes in hexadecimal format. For example: FF-EE-01

Example

The following command specifies the NSP for a subscriber in an ASN service:

```
asn nspid 0F-01-FE
```

asn-pdfid

Configures the identifiers for packet data flow, service data flow, and service profile in an ASN-GW service.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] asn-pdfid *pdf_id* **asn-service-profile-id** *svc_profile_id* **asn-sdfid** *sdf_id*

no

Removes/disables the configured identifiers for this subscriber in ASN-GW service.

asn-pdfid *pdf_id*

Specifies the an unique ASN Packet Data Flow identifier for this subscriber.
pdf_id must be an integer from 1 through 65535.

asn-service-profile-id *svc_profile_id*

Specifies a unique ASN Service Profile Identifier for this subscriber.
svc_profile_id is a Service Profile Identifier configured in the Context Configuration Mode.

asn-sdfid *sdf_id*

Specifies the an unique ASN Service Data Flow identifier for this subscriber.
sdf_id must be an integer from 1 through 65535.

Usage

Use this command to configure subscriber profile for QoS parameters in an ASN-GW service.
A maximum of four QoS profiles can be configured for a subscriber.

Example

The following command configures the QoS profile for a subscriber as PDF id 1, Service Profile id 3, and Service Data Flow id 2:

```
asn-pdfid 1 asn-service-profile-id 3 asn-sdfid 2
```

asn-policy

Configures the identifiers for packet data flow, service data flow, and service profile in an ASN-GW service.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
asn-policy [classifiers downlink { strict | loose} | idle-mode { allow | disallow } |
notification-idle-mode {allow | disallow} | notification-handoff { allow | disallow
}auth-only {allow | disallow } | ms-requested-classifiers {allow | dissalow}]

[ default ] asn-policy classifiers downlinkidle-mode
```

no

Removes or disables the configured policy for this subscriber in ASN-GW service.

default

Sets the ASN policy to default for this subscriber.
For downlink traffic classifier default policy is “loos” and for idle mode policy the default action is to allow idle mode operation in an ASN-GW service.

idle-mode

Sets the idle mode policy for this subscriber in an ASN-GW service. If enabled, Interim-Update is sent with the BSID and WiMAX-Idle_Mode Transition as Idle. If disabled, the Interim can be sent when the call is in the idle mode based on the interim timer. At this point, the last known BSID is reported to the RADIUS server.

notification-idle-mode

Default: allow
Use to enable or disable Idle-Mode-Notification capabilities. When you enable this command, when the call moves from active to idle, or idle to active, Accounting Interim is sent.

notification-handoff

Default: allow
If enabled, the Interim-Update is sent with the BSID and SN-Handoff-Indicator as Active Handoff.

allow

Default: enabled
Enables the policy for this subscriber to allow idle mode operation in an ASN-GW service.

disallow

Default: disabled
Enable the policy for this subscriber to disallow idle mode operation in an ASN-GW service.

classifiers downlink

Sets the classifier policy for all service flows coming from HA to FA for this subscriber's matching classifier.

strict

Default: disabled
This option discards all the service flows coming from HA to FA and any other packets not matching to any of the classifiers set for this subscriber.

loose

Default: enabled
This option allows all the service flows coming from HA to FA and any other packet does not matching to any of the classifiers set for this subscriber and sent to the BS/MS over downlink flow

auth-only

Specifies whether the call is Auth only or not.

allow

Enables the policy for this subscriber to allow auth-only in an ASN-GW service.

disallow

Default
Disables the policy for this subscriber to allow auth-only in an ASN-GW service.

ms-requested classifiers

Default: allow
By default ASNGW allows dynamic addition of classifiers by the MS during MS-initiated service flow creation or modification.

Usage

Use this command to configure subscriber policy to allow/disallow the idle mode operation or the downlink traffic flow for a subscriber in an ASN-GW service.
For authentication configuration, the ASN-GW supports the Initial Network Entry (INE) for Ethernet CS calls. The base station supports Ethernet CS traffic to the network. The INE procedure includes the Authentication of the service flows and IP-Address allocation through DHCP. Authentication is based on the Extensible Authentication Protocol (EAP).
This command allows MS to transition to idle mode with an ASN-GW.

Example

The following command configures the policy to allow the idle mode for an MS with an ASN-GW:

```
default asn-policy idle-mode
```

authorized-flow-profile-id

When a profile ID is requested by the Mobile Node (MN), this command sets the value that is authorized by the Access Gateway (AGW).

Platform

ASR 5000

Product

PDSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

authorized-flow-profile-id *profile_id* **direction { bidirectional | forward | reverse }**

no authorized-flow-profile-id *profile_id*

no

Removes the existing profile ID setting specified by *profile_id*. *profile_id* must be an integer from 0 through 65535.

authorized-flow-profile-id *profile_id*

The profile ID number that is authorized for the current subscriber. *profile_id* must be an integer from 0 through 65535.

direction { bidirectional | forward | reverse }

This specifies in which data direction the profile ID should be applied.

- **bidirectional**: This profile ID pertains to both the forward and reverse directions.
- **forward**: This profile ID pertains to data going to the MN.
- **reverse**: This profile ID pertains to data coming from the MN.

Usage

Use this command to set the profile ID that the AGW will authorize for a subscriber.

Example

Set the profile ID for both directions to 3 for the current subscriber by entering the following command:

```
authorized-flow-profile-id 3 direction bidirectional
```

content-filtering category

Enables or disables the specified preconfigured Category Policy Identifier for policy-based Content Filtering support to the subscriber.

Platform

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id*

no content-filtering category policy-id

no

Disables the configured category policy ID for content filtering support to the subscriber. This is the default setting.

content-filtering category policy-id *cf_policy_id*

Applies the content filtering category policy ID, configured in ACS Configuration Mode, to this subscriber. *cf_policy_id* must be a category policy ID expressed as an integer from 1 through 4294967295.
If the specified category policy ID is not configured in the ACS Configuration Mode, all packets will be passed regardless of the categories determined for such packets.

Important: Category Policy ID configured through this mode overrides the Category Policy ID configured using the **content-filtering category policy-id** command in the ACS Rulebase Configuration Mode.

Usage

Use this command to enter the Content Filtering Policy Configuration Mode and enable or disable the Content Filtering Category Policy ID for a subscriber.

Important: If Content Filtering Category Policy ID is not specified here, the similar command in the ACS Rulebase Configuration Mode determines the policy.

Up to 64 different policy identifier can be defined in a Content Filtering support service.

Example

The following command enters the Content filtering Policy Configuration Mode and enables the Category Policy ID *101* for Content Filtering support:

```
content-filtering category policy-id 101
```

credit-control-group

Configures the credit-control group for this subscriber.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

credit-control-group *cc_group_name*

no credit-control-group

no

Removes the credit-control group from the subscriber configuration, if configured.

credit-control-group *cc_group_name*

Specifies name of the credit-control group.
cc_group_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the credit-control group for the subscriber.

Example

The following command configures the credit-control group named *test12* for the subscriber:

```
credit-control-group test12
```

credit-control-service

Configures the credit-control service for this subscriber.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] credit-control-service *cc_service_name*

no

Disables the credit-control service, if configured.

credit-control-service *cc_service_name*

Specifies the name of the credit-control service.
cc_service_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the credit-control service for subscribers.

Example

The following command configures the credit-control service named *test12* for the subscriber:

```
credit-control-service test12
```

cscf core-service

CSCF/A-BG core service that maps to the current domain.

Platform

ASR 5000

Product

SCM (CSCF, A-BG)

Privilege

Security Administrator, Administrator

Syntax

cscf core-service name *name*

no cscf core-service

cscf core-service name *name*

Specifies the name of the CSCF/A-BG core service.
name must be an alphanumeric string of 1 through 63 characters.

no cscf core-service

Removes the CSCF/A-BG core service from the domain.

Usage

Use this command to map a CSCF/A-BG core service to the current domain.

Example

The following command creates a CSCF core service named *cs1*:

```
cscf core-service name cs1
```

The following command removes the CSCF core service from this domain:

```
no cscf core-service
```

cscf county-name

Assigns a Last Routing Option (LRO) profile county name to the subscriber for finding the correct Public Safety Answering Point (PSAP) during emergency calls.

Platform

ASR 5000

Product

SCM (S-CSCF)

Privilege

Security Administrator, Administrator

Syntax

[no] cscf county-name *name*

cscf county-name *name*

Specifies the LRO profile county name of the subscriber.
name must be an existing LRO profile county name expressed as an alphanumeric string of 1 through 127 characters.

no

Removes the LRO profile county name from the subscriber.

Usage

Use this command to assign an LRO profile county name to the subscriber.

Example

The following command assigns county name *norfolk* to the subscriber:

```
cscf county-name norfolk
```

The following command removes county name *norfolk* from the subscriber:

```
no cscf county-name norfolk
```

cscf nat-applicable

Indicates if NAT (Network Address Translation) processing is required for this domain.

Platform

ASR 5000

Product

SCM (CSCF/A-SBC)

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] cscf nat-applicable
```

no

Disables NAT processing for this domain.

cscf nat-applicable

Enables NAT processing for this domain.

Usage

Use this command to indicate whether NAT processing is required for this domain.

Example

The following command indicates NAT processing is required for this domain:

```
cscf nat-applicable
```

The following command disables NAT processing for this domain:

```
no cscf nat-applicable
```

cscf private-user-id

Assigns a private user identity to the subscriber.

Platform

ASR 5000

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Security Administrator, Administrator

Syntax

[no] cscf private-user-id *user_id*

no

Removed the private user identity of the subscriber.

cscf private-user-id *user_id*

Specifies the private user identity of the subscriber.
user_id must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to assign a private user identity to the subscriber.

Example

The following command assigns a private user identity named *user007* to the subscriber:

```
cscf private-user-id user007
```

The following command removes private user identity named *user007* from the subscriber:

```
no cscf private-user-id user007
```

cscf session-template

Assigns a CSCF session template to the subscriber profile.

Platform

ASR 5000

Product

SCM (P-CSCF, S-CSCF, SIP Proxy)

Privilege

Security Administrator, Administrator

Syntax

cscf session-template name *name*

no cscf session-template

cscf session-template name *name*

Specifies the name of the CSCF session template.
name must be an existing CSCF session template name expressed as an alphanumeric string of 1 through 79 characters.

no cscf session-template

Removes the assignment of a session template to the subscriber profile.

Usage

Use this command to bind a CSCF session template to a subscriber profile.

Example

The following command assigns a CSCF session template named *template4* to the subscriber profile:

```
cscf session-template name template4
```

The following command removes the assignment of a session template to the subscriber profile:

```
no cscf session-template
```

data-tunneling ignore df-bit

Controls the handling of the DF (Don't Fragment) bit present in the user IPv4/IPv6 packet for GRE, IP-in-IP tunneling used for the MIP data path. If this feature is enabled, and fragmentation is required for the tunneled user IPv4/IPv6 packet, then the DF bit is ignored and the packet is fragmented. Also the DF bit is not copied to the outer header. Default is enabled.

Platform

ASR 5000

Product

PDSN, HA, FA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
data-tunneling ignore df-bit

no data-tunneling ignore df-bit
```

no

Disables this option. The DF bit in the tunneled IP packet header is not ignored during tunneling.

data-tunneling ignore df-bit

Ignores the DF bit in the tunneled IP packet header.

Usage

Use this command to configure a user so that during Mobile IP tunneling the DF bit is not ignored and packets are not fragmented.

Example

To disable fragmentation of a subscribers packets over a MIP tunnel even when the DF bit is present, enter the following command:

```
no data-tunneling ignore df-bit
```

dcca origin host

This command is obsolete. Refer to the **dcca origin endpoint** command.

dcca origin endpoint

This command is obsolete. To configure the Diameter Credit Control Origin Endpoint, in the Credit Control Configuration Mode, use the **diameter origin endpoint** command.

dcca peer-select

Specifies the Diameter credit control primary and secondary peer for credit control.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

dcca peer-select peer *host_name* **[realm** *realm_name* **] [secondary-peer** *host_name* **[realm** *realm_name* **]]**

no dcca peer-select

no

Removes the previously configured Diameter credit control peer selection.

peer *host_name*

Specifies a unique name for the peer. *peer_name* must be an alphanumeric string of 1 through 63 characters that allows punctuation marks.

secondary-peer *host_name*

Specifies a back-up host that is used for fail-over processing. When the route-table does not find an available route, the secondary host performs a fail-over processing. *host_name* must be an alphanumeric string of 1 through 63 characters that allows punctuation marks.

realm *realm_name*

The *realm_name* must be an alphanumeric string of 1 through 63 characters that allows punctuation marks. The realm may typically be a company or service name.

Usage

Use this command to select a Diameter credit control peer and realm.

WARNING: This configuration completely overrides all instances of **diameter peer-select** that have been configured with in the Credit Control Configuration Mode for an Active Charging service.

Example

The following command selects a Diameter credit control peer named *test* and a realm of *companyx*:

```
dcca peer-select peer test realm companyx
```

default

Restores the default value for the option specified for the current subscriber.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { access-link ip-fragmentation | accounting-mode | data-tunneling ignore df-bit |
idle-timeout-activity dormant-downlink-data | inter-pdsn-handoff | ip { alloc-method |
allowed-dscp | header-compression | hide-service-address | multicast discard | qos-dscp |
source-validation } | loadbalanace-tunnel-peers | long-duration-action | mobile-ip {
home-agent | mn-aaa-removal-indication | mn-ha-hash-algorithm | reverse-tunnel |
security-level | send { dns-address | terminal-verification } } | permission | ppp {
always-on-vse-packet | data-compression { mode | protocols } | keepalive | min-
compression-size | mtu } | radius accounting interim interval-timeout | timeout {
absolute | idle } }
```

access-link ip-fragmentation

Sets the method for fragmenting packets over the MN access link to its default of normal. Drop the packet and send ICMP unreachable to the source of packet.

accounting-mode

Enables Radius accounting for the current local subscriber configuration.

data-tunneling ignore df-bit

Sets this option to the default behavior, which is to send an *ICMP unreachable - need to frag* message back to the sender and drop the packet, in the case that fragmentation is required but the DF bit is set.

idle-timeout-activity dormant-downlink-data

Sets this option to the default behavior. When downlink data packets are transmitted to the Mobile node and the session is in dormant mode the session idle timer is reset.

inter-pdsn-handoff

During a handoff from one PDSN to another, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address the PDSN will not disconnect the session immediately. The PDSN tries to assign the proposed address of the session in the IPCP configuration NAK.

ip { | allowed-dscp | dhcp-relay | header-compression | hide-service-address | multicast discard | qos-dscp | source-validation | user-datagram-tos copy }

allowed-dscp: resets the allowed DSCP parameters to the system defaults: class none, max-class be.

hide-service-address: specifies the default setting for hide the ip-address of the service from the subscriber. Default is Disabled
dhcp-relay: Configured with the DHCP server address during MS authentication. The AAA server sends the address of the DHCP server in the Access-Accept message. The DHCP relay uses this address to relay the DHCP messages from the MS to the DHCP server.
multicast discard: Configures the default multicast settings which is to discard PDUs
qos-dscp: Sets the quality of service setting to the system default.
source-validation: Specifies the default IP source validation. Default is Enabled.
user-datagram-tos copy: Disables copying of the IP TOS octet value to all tunnel encapsulation IP headers.

---

loadbalance-tunnel-peers

Sets the tunnel load balancing algorithm to the system default.

---

long-duration-action

Sets the action that is taken when the long duration timer expires to the default: detection.

---

mobile-ip { home-agent | mn-aaa-removal-indication | mn-ha-hash-algorithm | reverse-tunnel | security-level | send { dns-address | terminal-verification } }

allow-aaa-address-assignment: Disables the FA from accepting a home address assigned by an AAA server.
home-agent: Sets home agent IP address to its default of 0.0.0.0.
match-aaa-assigned-address: Disables the FA validating the home address in the RRQ against the one assigned by AAA server.
mn-aaa-removal-indication: Sets this parameter to its default of disabled.
mn-ha-hash-algorithm: Sets the encryption algorithm to the default of hmac-md5.
reverse-tunnel: Sets this parameter to its default of enabled.
security-level: Sets this parameter to its default of none.
send dns-address: Disables the HA from sending the DNS address NVSE in the RRP.
send terminal-verification: Disables the FA from sending the terminal verification NVSE in the RRQ.

---

permission

Restores the subscriber's service usage defaults.

---

ppp { always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation | keepalive | min-compression-size | mtu }

Sets the point-to-point protocol option defaults.
always-on-vse-packet: Re-enables the PDSN to send special 3GPP2 VSE PPP packets to the Mobile Node with a max inactivity timer value for always on sessions. This configuration is applicable only for PDSNsessions.
data-compression { **mode** | **protocols** }: restores the default value for either the data compression **mode** or compression **protocols** as follows:

- mode stateless
- all protocols enabled

ip-header-compression negotiation: Sets the IP header compressions negotiation to the system default: force.

keepalive: sets the subscriber's PPP keep alive option to the system default: 30 seconds.
min-compression-size: Restores the PPP minimum packet size for compression: 128 octets.
mtu: Sets the maximum message transfer unit packet size to the system default: 1500 octets.

radius accounting interim interval-timeout

Disables the RADIUS accounting interim interval for the current subscriber.

timeout [absolute | idle | long-duration]

When a keyword is entered, this command resets the specified timeout to the system default: 0. When no keyword is specified, all timeouts are reset to the system defaults: 0.

Usage

Use this keyword to reset subscriber data to the system defaults. This is useful in setting the subscriber back to the basic values to possibly aid in trouble shooting or tuning a subscriber's access and options.

Example

```
default ip qos-dscp

default permission

default data-compression mode
```

dhcp dhcpv6

Specifies the DHCPv6 service to be used for this subscriber.

Platform

ASR 5000

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

dhcp dhcpv6 service-name *service_name*

no dhcp dhcpv6 service-name

no

Removes the DHCPv6 service for the subscriber.

dhcpv6 service-name *service_name*

Specifies the name of an existing DHCPv6 service to be used for this subscriber.
service_name must be the name of a DHCPv6 service expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to apply or remove an existing DHCPv6 service to a subscriber template.

Example

The following command applies a previously configured DHCPv6 service named *dhcpv6_1* to a subscriber template:

```
dhcp dhcpv6 service-name dhcpv6_1
```

dhcp options

Specifies the DHCP options which can be sent from the DHCP server for this subscriber.

Platform

ASR 5000

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

dhcp options code 43 hex-values *hex_values*

no dhcp options

no

Removes the DHCP options for the subscriber.

options code 43 hex-values *hex_values*

Specifies hex values for DHCP option 43.
hex_values must be a dash-delimited list of hex data of size smaller than 506 datum.

Usage

Use this command to specify the DHCP options which can be sent from the DHCP server for this subscriber.

Example

The following command applies hex values *ff-fe* for DHCP option 43:

```
dhcp options code 43 hex-values ff-fe
```

dns

Configures the domain name servers for the current subscriber.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] dns { primary | secondary } *ip_address*

no

Indicates the IP address is to be removed as either a primary or secondary domain name server.

dns primary | secondary

dns primary: Updates the primary domain name server for the subscriber.
dns secondary: Updates the secondary domain name server for the subscriber.

ip_address

Specifies the IP address of the domain name server using IPv4 dotted-decimal notation.

Usage

Set the subscriber DNS server lists as not all users will have the same set of servers.

Example

```
dns primary 10.2.3.4

no dns primary 10.2.3.4

dns secondary 10.2.5.6

no dns secondary 10.2.5.6
```

eap

Specifies the lifetime for a master session key (MSK) for extensible authentication protocol (EAP) authentication.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[default] eap msk-lifetime *dur*

default

Sets the lifetime duration to default value of 3600 seconds for master session key.

msk-lifetime *dur*

Specifies the lifetime duration (in seconds) on Master Session Key (MSK) in seconds for a WiMAX subscriber EAP authentication.
dur is an integer from 60 through 65535.

Usage

This command is used to set the lifetime for MSK in EAP authentication for WiMAX subscriber.

Example

The following command sets the lifetime for MSK key to *4800* seconds for a WiMAX subscriber through EAP authentication:

```
eap msk-lifetime 4800
```

encrypted password

Designates use of password encryption.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

encrypted password *password*

encrypted password *password*

password is the encrypted password and must be an alphanumeric string of 1 through 132 characters.

Usage

This command is normally used only inside configuration files.

Example

The following command sets an encrypted password of *qsdf12d4*:

```
encrypted password qsdf12d4
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

external-inline-server

This is a restricted command.

firewall policy

Important: This command is only available in StarOS 8.0. In StarOS 8.1 and later releases, this configuration is available in the ACS Rulebase Configuration Mode.

This command enables or disables Stateful Firewall support for the subscriber.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

{ default | no } firewall policy
```

no

Disables Stateful Firewall support for this subscriber.

default

Configures the default setting for Stateful Firewall support.
Default: Disabled

firewall-required

Enables Stateful Firewall support for this subscriber.

Usage

Use this command to enable or disable Stateful Firewall support for this subscriber.

Important: Unless Stateful Firewall support for this subscriber is enabled using this command, firewall processing for this subscriber is disabled.

Important: If firewall is enabled, and the rulebase has no firewall configuration, Stateful Firewall will cause all packets to be discarded.

Example

The following command enables Stateful Firewall support for this subscriber:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support for this subscriber:

```
no firewall policy
```

fw-and-nat policy

Important: This command is only available in StarOS 8.1. This customer-specific command must be used to configure the Policy-based Firewall-and-NAT feature.

Platform

ASR 5000

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat policy *fw_nat_policy*

{ default | no } fw-and-nat policy

default

Specifies that the default Firewall-and-NAT policy configured in the rulebase be used for the subscriber.

no

Disables Firewall and NAT processing for the subscriber.

fw_nat_policy

Specifies the Firewall-and-NAT policy for the subscriber.
fw_nat_policy must be an alphanumeric string of 1 through 63 characters. Note that this policy will override the **default Firewall-and-NAT policy** configured in the ACS rulebase.

Usage

Use this command to configure the Firewall-and-NAT policy for subscribers. Note that the policy configured in the subscriber mode will override the default policy configured in the ACS rulebase. If a policy is not configured in the subscriber mode, the default policy configured in the ACS rulebase will be applied.

Example

The following command configures a Firewall-and-NAT policy named *standard* for the subscriber:

```
fw-and-nat policy standard
```

idle-timeout-activity

Defines whether downlink (towards Mobile Node) data packets transmitted when the session is dormant are treated as activity for the idle-timer (inactivity timer).

By default, downlink data transmitted over a dormant session restarts the idle-timer for that session; it is treated as activity for the session.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] idle-timeout-activity dormant-downlink-data
```

no

Dormant mode downlink data is not treated as activity for the session idle-timer. The session idle timer is not reset.

idle-timeout-activity dormant-downlink-data

Treats dormant mode downlink data as activity for the session idle-timer. The session idle timer is reset.

Usage

Use this command to disable or re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode.

Example

Use the following command to disable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

```
no idle-timeout-activity dormant-downlink-data
```

Use the following command to re-enable restarting the session idle timer when downlink data packets are transmitted to the Mobile Node when the session is in dormant mode:

```
idle-timeout-activity dormant-downlink-data
```

ims application-manager

Specifies the IP Multimedia Subsystem (IMS) application manager for the subscriber.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[no] ims application-manager { domain-name *domain-name* **| ipv4-address** *ipv4_address* **}**

no

Disables the IMS application manager for this subscriber.

ims application-manager

Enables the IMS application manager for this subscriber.

domain-name *domain-name*

Specifies the domain name of the application manager.
domain-name must be an alphanumeric string of 1 through 63 characters.

ipv4-address *ipv4_address*

Specifies the IP address of the application manager using IPv4 dotted-decimal notation.

Usage

The IMS application manager address is returned by HA to MN in DHCP Ack when it receives the DHCP inform from an AIMS subscriber.

Example

```
ims application-manager domain-name domain23ims application-manager ipv4-
address 192.168.23.1
```

ims-auth-service

Enables IP Multimedia Subsystem (IMS) authorization support for subscriber. The specified IMSA service will be used for performing IMS authorization and flow-based charging procedures.

Platform

ASR 5000

Product

PDSN, GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

[default | no] ims-auth-service *auth_svc_name*

default

Configures default setting.
Default: Disabled or as specified at the context or network access service level or in subscriber template.

no

Removes the specified IMS authorization service from the subscriber configuration.

ims-auth-service *auth_svc_name*

Specifies name of the IMS authorization service.
auth_svc_name must be an alphanumeric string of 1 through 63 characters preconfigured within the same context of this subscriber.

Usage

This feature provides the IMS authorization service configuration for Gx interface in IMS service node.

Example

Following command applies a previously configured IMS authorization service named *ims_interface1* to a subscriber within the specific context.

```
ims-auth-service ims_interface1
```

inter-pdsn-handoff

Configure the system to force the MN to use its assigned IP address during Internet Protocol Control Protocol (IPCP) negotiations resulting from inter-PDSN handoffs.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] inter-pdsn-handoff require ip-address
```

no

Disables the rejecting of sessions when the MN uses a non-allocated IP address during IPCP re-negotiations.

inter-pdsn-handoff require ip-address

Rejects sessions when the MN uses a non-allocated IP address during IPCP re-negotiations.

Usage

This command is used to configure the system to reject sessions that are re-negotiating IPCP after an inter-PDSN handoff if the IP address they propose does not match the one initially provided by the PDSN. The session would be rejected even if the proposed address was 0.0.0.0.
If this parameter is disabled, the PDSN will attempt to re-assign the IP address initially provided.

Example

To set the PDSN to not allow a mismatched IP address during a PDSN to PDSN handoff of a MIP call, use the following command:

```
inter-pdsn-handoff require ip-address
```

To set the PDSN so that it will not disconnect the session immediately, if the Mobile requests an IP address of 0.0.0.0 or a mismatched IP address after inter-pdsn handoff, use the following command:

```
no inter-pdsn-handoff require ip-address
```

ip access-group

Configures IP access group for the current subscriber.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip access-group *group_name* **[in | out]**

no

Indicates the access group specified is to be cleared from the subscribers configuration.

ip access-group *group_name*

Specifies the name of the IPv4/IPv6 access group. *acl_group_name* is a configured ACL group expressed as an alphanumeric string of 1 through 79 characters.

in | out

Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords **in** and **out**, respectively. If neither of these key words is specified, the command associates the *group_name* access group with the current subscriber for both inbound and outbound access.

Usage

Set the subscriber access group to manage the access control for subscribers as a logical group.

Example

The following command associates the *sampleGroup* access group with the current subscriber for both inbound and outbound access:

```
ip access-group sampleGroup
```

The following removes the outbound access group flag for *sampleGroup*:

```
no ip access-group sampleGroup out
```

ip address

Configures a static IPv4 address for use by the subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, HA, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ip address *ip_address netmask*

no

Removes a previously configured IP address assignment.

ip address *ip_address*

Specifies the IP address assigned to the subscriber using IPv4 dotted-decimal notation.

netmask

The subnet mask that corresponds to the assigned IPv4 address.

Usage

Use this command to assign a static IPv4 address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example

The following command configures a static IP address of *192.168.1.15* with a subnet mask of *255.255.255.0* to the subscriber:

```
ip address 192.168.1.15 255.255.255.0
```

ip address pool

Configures IP address pool properties for the subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, HA, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ip address pool name *pool_name*

no

Removes a previously configured static address.

ip address pool name *pool_name*

Specifies the IP address pool or IP address pool group from which the subscribers IP address is assigned. *pool_name* must be the name of an existing IP pool or IP pool group expressed as an alphanumeric string of 1 through 31 characters.

Usage

Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to sessions from this subscriber.
This command can be issued multiple times to specify multiple address pools for the subscriber. If multiple pools are specified, addresses are assigned for subscriber sessions from the pools based on the order in which the pools were configured.
If an address cannot be provided from the first-specified pool for whatever reason, the system attempts to assign an address from the second-specified pool, and so on. This operation is independent of the priorities configured for the pools. For example, if pool1 was specified for the subscriber first, and pool2 second, the system always attempts to assign addresses from pool1. If an address can not be assigned from pool1 (i.e. all addresses are in use), the system then attempts to assign an address from pool2.

Example

The following command configures the subscriber to receive IP addresses from an IP address pool named *public1*:

```
ip address pool name public1
```

ip address secondary-pool

Configures secondary IP address pool properties for the subscriber to provide multiple IP host configuration behind one WiMAX Customer Premise Equipment (CPE).

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ip address secondary-pool name *aux_pool_name*

no

Removes a previously configured auxiliary pool named *aux_pool_name* for multiple host support in ASN-GW service.

ip address secondary-pool name *aux_pool_name*

Specifies the secondary/auxiliary IP address pool or IP address pool group from which the IP address is assigned to host behind a WiMAX CPE having primary IP address.
pool_name must be the name of an existing IP pool or IP pool group expressed as an alphanumeric string of 1 through 31 characters.

Usage

Use this command to specify the name of an IP address pool configured on the system from which IP addresses are to be dynamically assigned to host behind a WiMAX CPE for multiple host session support. This command designates the IP address to secondary hosts from locally configured secondary IP address pool. To enable multiple host support behind a WiMAX CPE and configure maximum number of supported hosts use **secondary-ip-host** command in ASN Gateway Service Configuration mode.

Example

The following command configures the subscriber to receive IP addresses from a secondary IP address pool named *auxiliary1* for secondary hosts behind the WiMAX CPE:

```
ip address secondary-pool name auxiliary1
```

ip allowed-dscp

Sets the Quality of Service (QoS) Differentiated Services (DiffServ) marking that a subscriber session is allowed. The DSCP is disabled by default.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip allowed-dscp class *class* **max-class maxclass [rt-marking** *marking* **]**

no ip allowed-dscp class

---

no

Resets the parameters to the defaults: class none, max-class **be**. This indicates that all packets are let through without any dscp checking

---

ip allowed-dscp class *class*

Specifies the Differentiated Services Codepoint (DSCP) class with which the subscriber session may mark its packets. If the subscriber sessions packets request a code point class higher than the code point class specified, the PDSN service re-marks the packets with the QOS-DSCP value specified by the **ip qos-dscp** command.
Default: none
class must be one of the following;
a: allow packets with AF DSCPs
e: allow packets with EF DSCP
o: allow packets for experimental or local use
ae: allow packets with AF and EF DSCPs
ao: allow packets with AF DSCPs or packets for experimental or local use
eo: allow packets with EF DSCPs or packets for experimental or local use
aeo: allow packets with AF or EF DSCPs or packets for experimental or local use
none: allow only the **be** and **sc1** through **sc7** code points

---

max-class *maxclass*

This parameter specifies the maximum code point with which a subscriber session may mark its packets. The subscriber sessions packets must be marked with a code point equal to or less than the code point specified. If the subscriber sessions packets request a code point higher than the code point specified, the PDSN service re-marks the packets with the QOS-DSCP value specified by the lower of the max-class and the **ip qos-dscp** command.
The list below identifies the code points from lowest to highest precedence. For example, if the **maxclass** is set to af22, that becomes the maximum code point that the subscriber session may mark it's packets with and only **be, af13, af12, af11,af23**, and **af22** are allowed. If a subscriber session marks its packets with anything after af22 in this list, the PDSN service re-marks the packets with the QOS-DSCP value specified by the lower of the maxclass and the **ip qos-dscp** command.

If class is set to none only the be and sc1 through sc7 codepoints are allowed. For example; if **class** is set to none and you set **max-class** to **sc1**, only the **sc1** and **be** codepoints are allowed.
Default: **be**
maxclass must be one of the following;
be: best effort forwarding
af13: assured Forwarding 13
af12: assured Forwarding 12
af11: assured Forwarding 11
af23: assured Forwarding 23
af22: assured Forwarding 22
af21: assured Forwarding 21
af31: assured Forwarding 31
af32: assured Forwarding 32
af33: assured Forwarding 33
af41: assured Forwarding 41
af42: assured Forwarding 42
af43: assured Forwarding 43
ef: expedited forwarding
sc1: selector class 1
sc2: selector class 2
sc3: selector class 3
sc4: selector class 4
sc5: selector class 5
sc6: selector class 6
sc7: selector class 7

---

rt-marking *marking*

This parameter is used for Mobile IP (MIP) reverse tunnels. When MIP session packets do not have a DSCP marking, the Foreign Agent (FA) marks the packets with the value specified by **rt-marking** *marking*.
If MIP sessions packets have a DSCP marking, the marking is subjected to the conformance rules for the values of class and max-class; the final DSCP marking is then copied from the inner IP header to the outer IP header.
Default: **be**
marking must be one of the following;
be: best effort forwarding
af11: assured Forwarding 11
af12: assured Forwarding 12
af13: assured Forwarding 13
af21: assured Forwarding 21
af22: assured Forwarding 22
af23: assured Forwarding 23
af31: assured Forwarding 31
af32: assured Forwarding 32
af33: assured Forwarding 33
af41: assured Forwarding 41
af42: assured Forwarding 42
af43: assured Forwarding 43
ef: expedited forwarding
sc1: selector class 1
sc2: selector class 2
sc3: selector class 3

sc4: selector class 4
sc5: selector class 5
sc6: selector class 6
sc7: selector class 7

Usage

Use this command to configure Quality of Service (QoS) for a subscriber session to allow a Differentiated Services (DiffServ) Code Point (DSCP) marker in the header of each IP packet that prompts network routers to apply differentiated grades of service to various packet streams.
This command uses **class** and type of marker (**rt-marking** for reverse tunnels) for configuration with **max-class** maximum code point that a subscriber session may mark its packets with.

Example

The following command will allow *o* packets for experimental or local use with best effort forwarding *be*:

```
ip allowed-dscp class o max-class be
```

ip context-name

Configures the context to which the subscriber is assigned upon authentication. The assigned context is considered the destination context that provides the configuration options for the services the subscriber is allowed to access.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip context-name *name*

no

Removes the current assigned context from the subscriber's data.

ip context-name *name*

Specifies the name of the context to assign the subscriber to once authenticated. *name* must be an alphanumeric string of 1 trough 79 characters.

Usage

Set the subscriber IP context to a common context when all subscribers from one or more contexts will use the same egress context.

Example

```
ip context-name sampleName

no ip context-name sampleName
```

ip header-compression

Configures the IP packet header compression options for the current subscriber. Although this command configures IP header compression algorithms, the Internet Protocol Control Protocol (IPCP) negotiations determine when the header compression algorithm is applied.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
ip header-compression { rohc [ any [ mode { optimistic | reliable | unidirectional } ] |
cid-mode { { large | small } [ marked-flows-only | max-cid | max-hdr value | mrru value ]
} | marked flows-only | max-hdr value | mrru value | downlink | uplink ] | vj } +

[ default | no ] ip header-compression
```

default

Restores this command's default setting to the Van Jacobsen (VJ) header compression algorithm.

no

Disables all IP header compression.

ip header-compression { rohc [any [mode { optimistic | reliable | unidirectional }] | cid-mode { { large | small } [marked-flows-only | max-cid | max-hdr *value* | mrru *value*] } } | marked flows-only | max-hdr *value* | mrru *value* | downlink | uplink] | vj }

Specifies that the Robust Header Compression (ROHC) algorithms is used for data.

Important: ROHC is only supported for use with the PDSN.

any: Apply ROHC header compression in both the uplink and downlink directions.

mode { optimistic | reliable | unidirectional }:

- **optimistic**: Sets the ROHC mode to Bidirectional Optimistic mode (O-mode). In this mode packets are sent in both directions. A feedback channel is used to send error recovery requests and (optionally) acknowledgments of significant context updates from decompressor to compressor. Periodic refreshes are not used in the Bidirectional Optimistic mode.
- **reliable**: Sets the ROHC mode to Bidirectional Reliable mode (R-mode). This mode applies an intensive usage of a feedback channel and a strict logic at both the compressor and the decompressor that prevents loss of context synchronization between the compressor and the decompressor. Feedback is sent to acknowledge all context updates, including updates of the sequence number field.
- **unidirectional**: Sets the ROHC mode to Unidirectional mode (U-mode). With this mode packets are sent in one direction only, from the compressor to the decompressor. This mode therefore makes

ROHC usable over links where a return path from the decompressor to the compressor is unavailable or undesirable.

cid-mode { { large | small } [marked-flows-only | dm | max-hdr *value* **| mrru** *value* **] }**: Specifies the ROHC packet type to be used.

- **large | small [marked-flows-only | max-cid | max-hdr** *value* **| mrru** *value* **]**: Defines the ROHC packet type as large or small and optionally sets the following parameters for the packet type selected:
- **marked-flows-only**: Specifies that ROHC is to be applied only to marked flows.
- **max-cid** *integer*: Default: 0 The highest context ID number to be used by the compressor. *integer* must be an integer from 0 through 15 when small packet size is selected and must be an integer from 0 through 31 when large packet size is selected.
- **max-hdr** *value*: Specifies the maximum header size to use. Default: 168. *value* must be an Integer from 0 through 65535.
- **mrru** *value*: Specifies the maximum reconstructed reception unit to use. Default: 65535. *value* must be an Integer from 0 through 65535.

marked-flows-only: Specifies that ROHC is to be applied only to marked flows.
max-hdr *value*: Specifies the maximum header size to use. Default: 168. *value* must be an Integer from 0 through 65535.
mrru *value*: Specifies the maximum reconstructed reception unit to use. Default: 65535. *value* must be an Integer from 0 through 65535.
downlink: Apply the ROHC algorithm only in the downlink direction.
uplink: Apply the ROHC algorithm only in the uplink direction.

Important: When ROHC is enabled for downlink or uplink only the operational mode is Unidirectional.

vj

Specifies that the VJ algorithm is used for header compression.

+

Either one or both of the keywords may be entered in a single command.
If both **vj** and **rohc** are specified, **vj** must be specified first.

Important: If both VJ and ROHC header compression are specified, the optimum header compression algorithm for the type of data being transferred is used for data in the downlink direction.

Usage

Header compression can be used to provide a higher level of security in IP traffic enhance bandwidth usage and lower bit errors.
By default the header compression algorithm is set to **vj**.

Example

The following command disables all IP packet header compression:

```
no ip header-compression
```

The following command sets IP header compression to default vj algorithm:

```
default ip header-compression
```

The following command also sets the IP header compression to the vj algorithm:

```
ip header-compression vj
```

The following command enables the Internet Protocol Control Protocol (IPCP) to determine which protocol is the optimum algorithm for data in the downlink direction and use either VJ or ROHC as needed:

```
ip header-compression vj rohc
```

The following command enables ROHC for the downlink direction only:

```
ip header-compression rohc downlink
```

The following command enables ROHC in any direction using Bidirectional Optimistic mode:

```
ip header-compression rohc any mode Optimistic
```

ip hide-service-address

Hide the IP address of the service from the subscriber.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip hide-service-address
```

no

Does not hide the IP address of the service from the subscriber. This is the default behavior.

ip hide-service-address

Hides the IP address of the service from the subscriber.

Usage

Use this command to prevent subscribers from using traceroute to discover the network addresses that are in the public domain and configured on services. This prevent users from pinging such addresses.

ip local-address

Configures the local-side IP address of the subscriber's point-to-point connection.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip local-address *ip_address*

no ip local-address

no

Removes a previously configured IP local-address.

ip_address *ip_address*

Specifies an IP address configured in a destination context on the system through which a packet data network can be accessed. *ip_address* is entered using IPv4 dotted-decimal notation.

Usage

This parameter specifies the IPv4 address on the system that the MS uses as the remote-end of the PPP connection. If no local address is configured, the system uses an "unnumbered" scheme for local-side addresses.

Example

The following command configures a local address of 192.168.1.23 for the MS:

```
local-address 192.168.1.23
```

ip multicast discard

Configures the IP multicast discard packet behavior.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip multicast discard
```

no

Does not discard IP multicast packets.

ip multicast discard

Discards IP multicast packets.

Usage

This command specifies if IP multicast packets will be discarded.

ip qos-dscp

Configures quality of service (QoS) options for the current subscriber using the differentiated services code point (DSCP) method. This functionality is disabled by default.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip qos-dscp *option*

no ip qos-dscp

no

Sets the quality of service option to its default value.

ip qos-dscp *option*

Default: be (Best Effort)
Specifies the subscriber's per hop quality of service setting as one of:

- **af11**: assured Forwarding 11
- **af12**: assured Forwarding 12
- **af13**: assured Forwarding 13
- **af21**: assured Forwarding 21
- **af22**: assured Forwarding 22
- **af23**: assured Forwarding 23
- **af31**: assured Forwarding 31
- **af32**: assured Forwarding 32
- **af33**: assured Forwarding 33
- **af41**: assured Forwarding 41
- **af42**: assured Forwarding 42
- **af43**: assured Forwarding 43
- **be**: best effort forwarding
- **ef**: expedited forwarding

Usage

Set the quality of service for a subscriber based upon the service level agreements.

Example

```
ip qos-dscp ef

no ip qos-dscp
```

ip route

Configures the static route to use to reach the subscriber's network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip route ip_address ip_mask [ gateway_address ]
```

no

Removes the configured route information from the subscriber data.

ip route *ip_address*

Specifies the target IP address for which the route information applies using IPv4 dotted-decimal notation.

ip_mask

Specifies the networking mask for the route.
1 bits in the *ip_mask* indicate that bit position in the *ip_address* must also have a value of 1.
0 bits in the *ip_mask* indicate that bit position in the *ip_address* does not need to match, such as the bit can be either a 0 or a 1.
For example, if the IP address and mask were specified as 172.168.10.0 and 255.255.255.224, respectively, the network mask will be 172.168.0.0 (obtained by logically ANDing the IP address with the IP mask).

gateway_address

Default: assigned remote IP address will be used as the gateway address.
Specifies the IP address of the next hop gateway for the route using IPv4 dotted-decimal notation.

Usage

The static routes are also known as framed IP routes for subscribers. Static routes are typically applicable for subscribers connecting via other networks or when the mobile device acts as a gateway to a network on the far side of the device.
For example, if the mobile device is assigned IP address 10.2.3.4 and it acts as a gateway for the network 10.2.3.0 (with a network mask of 255.255.255.0) a static route would be configured with the *ip_address* being 10.2.3.0, *ip_mask* being 255.255.255.0, and *gateway_address* being 10.2.3.4.

Example

```
no ip route 10.2.3.4 255.255.255.0
```

ip source-validation

Enables or disables packet source validation for the current subscriber. Source validation requires that the source address of the received packets match the IP address assigned to the subscriber (either statically or dynamically) during the session.

If an incorrect source address is received from the mobile node, the system attempts to renegotiate the PPP session. The parameters for IP source validation can be set by the **ip source-violation** command.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip source-validation
```

no

Disables source validation.

ip source-validation

Enables source validation.

Usage

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Example

The following command enables IP source validation:

```
ip source-validation
```

The following command disables IP source validation:

```
no ip source-validation
```

ip user-datagram-tos copy

Controls copying of the IP TOS octet value from IPv4/IPv6 datagrams to the IP header in tunnel encapsulation. This is disabled by default.

Platform

ASR 5000

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
ip user-datagram-tos copy [ access-link-tunnel | both | data-tunnel ]

no ip user-datagram-tos copy
```

no

Disable copying of the IP TOS octet value to all tunnel encapsulation IP headers.

ip user-datagram-tos copy

Enables copying of the IP TOS octet value to all tunnel encapsulation IP headers.

access-link-tunnel

Copies the IP TOS octet value to the tunnel encapsulation IP header on the access side (RP) tunnel.

both

Uses both the access-link-tunnel and data-tunnel.

data-tunnel

Copies the IP TOS octet value to the tunnel encapsulation IP header on the MIP data tunnel or L3 tunnel (IP-in-IP, GRE).

Usage

Use this command to enable the copying of the IP TOS octet value to the tunnel encapsulation IP header. This functionality allows PCF to detect special TOS marking in the outer IP header of A11 packets and to identify certain packets as QChat control messages. The Base Station Controller/Packet Control Function (BSC/PCF) must give higher priority to QChat control messages.

Example

The following command enables copying of the IP TOS octet value to the tunnel encapsulation IP header for the access side tunnel:

```
ip user-datagram-tos copy access-link-tunnel
```

The following command disables copying of the IP TOS octet value to all tunnel encapsulation IP headers:

```
no ip user-datagram-tos copy
```

ip vlan

Configures subscriber-to-Virtual LAN (VLAN) associations.

Platform

ASR 5000

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

ip vlan *vlan-id*

[default | no] ip vlan

default

Resets the VLAN ID to the default setting.

no

Disables the VLAN ID for the subscriber.

ip vlan *vlan-id*

Specifies the VLAN ID that is associated with the IP address for that session. *vlan-id* is an integer from 1 through 4094.

Usage

This command configures the subscriber vlan ID which is used with the assigned address for the subscriber session to receive packets. If the IP pool from which the address is assigned is configured with a VLAN ID, this subscriber configured VLAN ID overrides it.
Subscriber traffic can be routed to specific VLANs based on the configuration of their user profile. Using this functionality provides a mechanism for routing all traffic from a subscriber over the specified VLAN. All packets destined for the subscriber must also be sent using only IP addresses valid on the VLAN or they will be dropped.

Example

Set the vlan ID to the default setting by entering the following command:

```
default ip vlan
```

ipv6 access-group

Configures the IPv6 access group for a subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 access-group *name* **[in | out]**

ipv6 access-group *name*

Defines the access group name. *name* is an alphanumeric string of 1 through 47 characters.

in

Defines the access group as inbound.

out

Defines the access group as outbound.

Usage

Used to create an access group for a subscriber.

Example

The following command provides an example of an IPv6 access group with the name *list_1*:

```
ipv6 access-group list_1
```

ipv6 address

Configures a static IP address for use by the subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 address { prefix *address* **| prefix-pool** *name* **}**

no

Deletes a previously configured ipv6 address.

ipv6 address *address*

Specifies an IPv6 address. *address* is entered using IPv6 colon-separated-hexadecimal notation.

prefix

Specifies a static IPv6 address.

prefix-pool *name*

Specifies an IPv6 prefix pool name. *name* is an alphanumeric string of 1 through 31 characters.

Usage

Use this command to assign a static IPv6 address to the subscriber. This address will be used each time the subscriber establishes data sessions.

Example

The following command configures a static IP address of *2001:4A2B::1f3F* with a mask length of *24* to the subscriber:

```
ipv6 address 2001:4A2B::1f3F/24
```

ipv6 dns

Configures the IPv6 Domain Name Service (DNS) servers.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 dns { primary | secondary } { *ipv6_dns_address* **}**

no

Deletes a previously configured DNS server.

ipv6 dns *ipv6_dns_address*

Specifies an IP address for the DNS server. *ipv6_dns_address* is entered using IPv6 colon-separated-hexadecimal notation.

primary

Configures the primary DNS server for the subscriber.

secondary

Configures the secondary DNS server for the subscriber. Only one secondary DNS server can be configured.

ipv6_dns_address

Configures the IP address of the DNS server.

Usage

DNS servers are configured on a per subscriber basis. This allows each subscriber to use specific servers.

Example

The following command provides an example of setting the primary IPv6 DNS server:

```
ipv6 dns primary fe80::c0a8:a04
```

ipv6 dns-proxy

Configures the system to act as a domain name server proxy for the current subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ipv6 dns-proxy
```

default

Disables IPv6 DNS proxy functionality for a subscriber.

no

Removes the pre-enabled functionality of IPv6 DNS proxy for a subscriber.

ipv6 dns-proxy

Enables IPv6 DNS proxy functionality for a subscriber. If enabled, the system will act as a proxy DNS server. Default: disabled.

Usage

Used to enable or disable IPv6 DNS proxy for the subscriber. When enabled, the PDSN acts as a proxy DNS server for DNS IPv6 queries coming from the mobile station to the PDSN's local PPP link address.

Example

The following command disables the IPv6 DNS proxy function for the subscriber:

```
no ipv6 dns-proxy
```

ipv6 egress-address-filtering

Configures the system to perform egress address filtering for the subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 egress-address-filtering
```

no

Disables IPv6 egress address filtering.

ipv6 egress-address-filtering

Enables IPv6 egress address filtering.

Usage

Used to enable the filtering of packets that arrive from the Internet to a particular site.

Example

The following command disables egress address filtering:

```
no ipv6 egress-address-filtering
```

ipv6 initial-router-advt

Creates an IPv6 initial router advertisement interval for the subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 initial-router-advt { interval *value* **| num-advts** *value* **}**

default ipv6 initial-router-advt { interval | num-advts }

default

Resets the command to its default settings.

no ipv6 initial-router-advt router-solicit-wait-timeout

Disables running timer to wait for router solicit and sends the initial router advertisement immediately once session is up.

ipv6 initial-router-advt

Enables an initial router advertisement interval in milliseconds.

interval *value*

Default: 3000
The time interval the initial IPv6 router advertisement is sent to the mobile node in milliseconds.
value is an integer between 100 and 16000 milliseconds.

num-advts value *value*

Default: 3
The number of initial IPv6 router advertisements sent to the mobile node. *value* is an integer between 1 to 16.

Usage

This command is used to set the advertisement interval and the number of advertisements. Using a smaller advertisement interval increases the likelihood of router being discovered more quickly when it first becomes available.

Example

The following command specifies the initial ipv6 router interval to be 2000ms:

```
ipv6 initial-router-advt interval 2000
```

ipv6 interface-id

Provides an IPv6 interface identifier for the subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 interface-id *ifid*

[default | no] ipv6 interface-id

default

No interface ID set for IPv6CP negotiation to subscriber.

no

Deletes a previously configured IPv6 interface ID.

interface-id *ifid*

Specifies the interface ID assigned to the Mobile during IPv6 Control Protocol (IPv6CP) negotiation. *ifid* is a 64-bit unsigned integer.

Usage

Used to provide a IPv6 ifid for the subscriber when using IPv6-to-IPv4 (6to4)routing.

Example

The following command provides an example of assigning an IPv6 interface ID of *00-00-00-05-47-00-37-44* to the subscriber:

```
ipv6 interface-id 00-00-00-05-47-00-37-44
```

ipv6 minimum-link-mtu

Configures the IPv6 minimum link maximum transmission unit (MTU) value.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 minimum-link-mtu *value*

default ipv6 minimum-link-mtu

default

Resets minimum link MTU to its default setting: 1280.

ipv6 minimum-link-mtu *value*

Specifies the MTU (in bytes) as a minimum link value. *value* is an integer between 100 and 2000.

Usage

Used to override the IPv6 minimum link MTU values recommended by the standard.

Example

The following command provides an example of assigning an IPv6 minimum link MTU to *1580* to the subscriber:

```
ipv6 minimum-link-mtu 1580
```

ipv6 secondary-address

Configures additional IPv6 4-bit prefixes to the subscriber session.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] ipv6 secondary-address { prefix *ipv6_address_prefix* **| prefix-pool** *pool_name* **}**

no

Deletes a previously configured ipv6 secondary address.

ipv6 secondary-address *ipv6_address_pref*

Specified the secondary IPv6 address using IPv6 colon-separated-hexadecimal notation.

pool_name

Specifies the name given to the secondary address prefix pool as an alphanumeric string of of 1 through 31 characters.

Usage

An IPv6 prefix pool name may be configured for a dynamic prefix, while the prefix is static. This command may be executed multiple times to configure multiple prefixes.

Example

The following command assigns an IPv6 secondary address prefix-pool name of *eastcoast* to the subscriber:

```
ipv6 secondary-address prefix-pool eastcoast
```

l2tp send accounting-correlation-info

Enables the sending of accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) by the L 2TP Access Concentrator (LAC) in L2TP control messages (ICRQ) during session setup to an L2TP Network Server (LNS).

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] l2tp send accounting-correlation-info
```

no

Disables the sending of accounting correlation information by the LAC.

default

Sets the setting to default mode: disable.

l2tp send accounting-correlation-info

Enables the sending of accounting correlation information by the LAC.

Usage

Use this command to enable the LAC to send accounting correlation information (Correlation-Id, NAS-IP-Address and NAS-ID) in L2TP control message (ICRQ) during session setup to LNS for this subscriber. LNS can be configured to include this information in ACS billing records, so that billing servers can easily correlate accounting records from PDSN/LAC and LNS.
By default, this mode is disabled.

Example

The following command disables the inclusion of accounting correlation information in control messages during session setup to an LNS for a subscriber:

```
default l2tp send accounting-correlation-info
```

l3-to-l2-tunnel address-policy

Configure the subscriber address allocation/validation policy, when subscriber Layer 3 (IPv4) sessions are tunneled using Layer 2 tunneling protocol (L2TP).

Platform

ASR 5000

Product

HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
l3-to-l2-tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default l3-to-l2-tunnel address-policy
```

default

Restores the default value for Layer 3-to-Layer 2 tunnel addressing: **no-alloc-validate**.

l3-to-l2-tunnel address-policy

Sets the policy for Layer 3-to-Layer 2 sessions to one of the following options.

alloc-only

Only allocates an address in the case of dynamic address assignment. Does not validate static addresses.

alloc-validate

Locally allocates and validates the subscriber addresses.

no-alloc-validate

Does not allocate or validate subscriber addresses locally for current subscribers sessions. Passes the address between the remote tunnel terminator and the Mobile Node. This is the default behavior.

Usage

Use this command to configure the L3 to L2 tunnel address policy for MIP HA sessions tunneled from the system using L2TP tunnels or for GGSN IP Context sessions tunneled using L2TP to a remote LNS. Also refer to the **resource** keyword of the Context Configuration mode **ip pool** command.

Example

the following command sets the L3-to-L2 tunnel address policy so that the current subscriber must have IP addresses allocated and validated locally on the system:

```
l3-to-l2-tunnel address-policy alloc-validate
```

loadbalance-tunnel-peers

Configures the load balancing of traffic bound for L2TP tunnels configured on the system for the selected subscriber.

Platform

ASR 5000

Product

L2TP

Privilege

Security Administrator, Administrator

Syntax

```
loadbalance-tunnel-peers { balanced | prioritized | random }
```

loadbalance-tunnel-peers

Enables load balancing of L2TP traffic using one of the methods described below.

balanced

Enables the equal use of all configured tunnel peers (LNSs) for the selected subscriber.

prioritized

Enables the use of all configured tunnel peers (LNSs) for the selected subscriber based on the preference number assigned to the peer address.

random

Default: Enabled
Enables the random use of all configured tunnel peers (LNSs) for the selected subscriber.

Usage

Use to manage traffic loads on L2TP Access Concentrator (LAC) ports and their respective L2TP Network Servers (LNSs).

Example

Use the following command to randomly use all configured tunnel peers (LNSs):

```
loadbalance-tunnel peers random
```

long-duration-action

Specifies what action is taken when the long duration timer expires.

Platform

ASR 5000

Product

All

Privilege

Administrator

Syntax

```
long-duration-action { detection | disconnection [ dormant-only ] [ suppress-notification ] }
```

detection

Default: Enabled
Detects long duration sessions and sends SNMP TRAP and CORBA notification. This is the default behavior. Use this command to detect a session exceeding the limit set by the long duration timer.

disconnection [dormant-only] [suppress-notification]

Default: Disabled
Detects a long duration session and disconnects the session after sending SNMP trap and CORBA notification.
suppress-notifiaction: Suppresses the SNMP trap and CORBA notification after detecting and disconnecting a long duration session. Default: Disabled
dormant only: Disconnects the dormant sessions after long duration timer and inactivity time with idle time-out duration expires. If the long duration timeout is fired and the call is not dormant, the call is disconnected when the call later moves to dormancy.

Important: For HA calls, the inactivity-time is considered as gauge for dormancy.

It sends the SNMP trap and CORBA notification after disconnecting a long duration session. Default: Disabled

Usage

Use this command to determine what action is taken when a session exceeds the limit set by the long duration timer.

Example

Use the following command to enable disconnecting sessions that exceed the long duration timer:

```
long-duration-action disconnection
```

Use the following command to disconnect the session that exceed the long duration timer without sending SNMP trap and CORBA notification:

```
long-duration-action disconnection suppress-notification
```

Use the following command to disconnect the session that is in dormant and exceed the long duration timer and send SNMP trap and CORBA notification:

```
long-duration-action disconnection dormant-only
```

Note that in case of HA calls, the inactivity-time is considered as gauge for dormancy.

mediation-device

Enables the use of a mediation device for subscribers, and specifies the system context to use for communicating with the device. A mediation device can be the initial point of contact for all IT systems that need to receive Charging Data Records (CDRs). Mediation devices can also be deep-packet inspection servers or transaction control servers.

Platform

ASR 5000

Product

GGSN, P-GW, PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

mediation-device context-name *<context-name>* **[no interims]**

[no | default] mediation-device

no

Deletes the mediation-device configuration.

default

Changes the mediation device to no context-name configured and restores the mediation device's default properties.

mediation-device context-name *context-name*

Default: The subscriber's destination context.
Configures the mediation VPN context for the subscriber.
context-name must be an alphanumeric string of 1 through 79 characters that is case sensitive. If not specified, the mediation context is same as the destination context of the subscriber.

no-interims

Disables sending of Interim messages to the mediation device.
Default: Disabled

Usage

This command is used to enable mediation device support for subscribers.
Keywords to this command can be used in combination to each other, depending on configuration requirements.

Example

The following command enables mediation device support for the subscriber and uses the protocol configuration located in an system context called *ggsn1*:

```
mediation-device context-name ggsn1
```

mobile-ip

Enables or disables access to mobile IP services by the subscriber.

Platform

ASR 5000

Product

HA, FA

Privilege

Security Administrator, Administrator

Syntax

[no] mobile-ip { allow-aaa-address-assignment | dns-address source-priority { aaa | home-agent } | gratuitous-arp aggressive | home-agent *ip_address* **[alternate] | match-aaa-assigned-address | mn-aaa-removal-indication | mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 } | mn-ha-shared-key** *key* **| mn-ha-spi** *spi_num* **| reverse-tunnel | security-level { ipsec | none } | send {access-technology | accounting-correlation-info bsid | dns-address | host-config | imsi | terminal-verification } }**

no

Disables the mobile IP option specified.

allow-aaa-address-assignment

Default: Disabled.
Enables the FA to accept a home address assigned by an AAA server. This should only be configured on the FA side.

dns-address source-priority { aaa | home-agent }

Sets the priority behavior on the FA to use either the DNS IP address information from the HA or the AAA server to include in the RRP to the MN.
When the **no** keyword is used in conjunction with the **dns-address** keyword, information received from both the home-agent and the AAA server is sent if available.
DNS IP address information from the HA comes from the DNS Normal Vendor/Organization Specific Extension (NVSE) in the Registry Registrar Protocol (RRP).
DNS IP address information from the AAA server is in the access accept message.
home-agent: If the DNS address is received from the home-agent only that information is sent to the MN. Otherwise the DNS address received from the AAA server is sent.
aaa: If the DNS address is received from the AAA server only that information is sent to MN. Otherwise the DNS address received from the home-agent is sent.

gratuitous-arp aggressive

Default: Disabled.
When enabled, this mode will cause the HA to send out gratuitous ARP (Address Resolution Protocol) messages for all Mobile IP (MIP) registration renewals and handoffs.
To disable this mode, use the **no** form of this command.

Important: This mode will only work for IP addresses that have been assigned from a static IP address pool.

home-agent *ip_address* **[alternate]**

Specifies the IP address of the mobile IP user's home agent. *ip_address* must be entered using IPv4 dotted-decimal or IPv6 colon -separated notation.
alternate - Specifies the secondary, or alternate, Home Agent to use when Proxy Mobile IP HA Failover is enabled.

match-aaa-assigned-address

Default: Disabled.
Enables the FA to validate the home address in the RRQ against the one assigned by AAA server. This should only be configured on the FA side.

mn-aaa-removal-indication

Default: Disabled.
When enabled, the MN-FA challenge and MN-AAA Authentication extensions are removed when relaying a Registration Request (RRQ) to the Home Agent (HA)

mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Speechifies the encryption algorithm to use.
Default: **hmac-md5**
hmac-md5: Uses HMAC-MD5 hash algorithm, as defined in RFC-2002bis. This is the default algorithm.
md5: Uses the MD-5 hash algorithm.
rfc2002-md5: Uses the MD-5 hash algorithm variant as defined in RFC-2002.

mn-ha-shared-key *key*

Verifies the MN-HA Authentication for a local subscriber in the current context. *key* is an alphanumeric string or a hexadecimal number beginning with "0x" up to 127 bytes

mn-ha-spi *spi_num*

Specifies the Security Parameter Index (SPI) number. *spi_num* must be an integer from 256 through 4294967295.

reverse-tunnel

Default: enabled.
All the mobile IP user to use reverse IP tunnels. The **no** keyword disables this option.

security-level { ipsec | none }

Default: none
Configures the security level needed for the subscriber's traffic.
ipsec: secures both MIP control and data traffic with IPSec.
none: none of the traffic is secured

Important: This keyword corresponds to the 3GPP2-Security-Level RADIUS attribute. This attribute indicates the type of security that the home network mandates on the visited network.

Important: For this attribute, the integer value "3" enables IPSec for tunnels and registration messages, "4" Disables IPSec

send {access-technology | accounting-correlation-info bsid | dns-address | host-config | imsi | terminal-verification }

access-technology: Configures FA to sends the access-technology type extension in the RRQ, by default it is disabled.
accounting-correlation-info: Configures whether the FA sends the correlation info to the NVSE in the RRQ. Default is disabled.
dns-address: Enables the HA to send the DNS address NVSE in the RRP. Default is disabled. This should only be enabled on the HA side.
host-config: Configures by sending the Host Config NVSE in RRQ. By default it is disabled.
imsi: Configures sending the IMSI NVSE in the RRQ. Default is sending IMSI in custom-1 format.
terminal-verification: Enables the FA to send the terminal verification NVSE in the RRQ. Default is disabled. This should only be enabled on the FA side.

Important: **send dns-address** is a proprietary feature developed for a specific purpose and requires the MN to be able to renegotiate IPCP for DNS addresses and reregister MIP if necessary. Since this feature needs the MN to support certain PPP/MIP behavior, and not all MNs support that particular behavior, **send dns-address** should be enabled only after careful consideration.

Usage

Use as subscriber service contracts change.

Example

```
mobile-ip home-agent 10.2.3.4

no mobile-ip reverse-tunnel
```

mobile-ip ha

Accommodates two Mobile IP (MIP) Home Agent (HA) options in subscriber mode.

Platform

ASR 5000

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] mobile-ip ha { assignment-table name | ignore-unknown-ha-addr-error }
```

no

Disables the mobile IP HA option specified.

assignment-table *name*

Specifies the name of an existing MIP HA Assignment table. *name* must be an alphanumeric string of 1 through 63 characters.

ignore-unknown-ha-addr-error

Default is disabled.
Enables or disables the HA to accept or reject the RRQ from a particular subscriber.

Usage

Use this command to assign a MIP HA Assignment table to the current subscriber.
Use this command to disable or enable the HA to accept or reject the RRQ from a particular subscriber when the HA address in the incoming MIP RRQ is not the same as the HA service address. The feature is off by default which causes the RRQ to be rejected with the error code UNKNOWN_HOME_AGENT.

Example

The following command assigns the MIP HA Assignment table named *Atable1* to the current subscriber:

```
mobile-ip ha assignment-table Atable1
```

The following command sets **ignore-unknown-ha-addr-error** to its default disabled state:

```
no mobile-ip ha ignore-unknown-ha-addr-error
```

mobile-ip reg-lifetime-override

Overrides the Mobile IP (MIP) registration lifetime from HA with value configured for subscriber.

Platform

ASR 5000

Product

PDSN, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

mobile-ip reg-lifetime-override [*dur* **| infinite]**

[default | no] mobile-ip reg-lifetime-override

mobile-ip reg-lifetime-override*dur*

Default: 100 seconds.
Overrides the MIP registration lifetime from HA for the specified period of time in seconds. *dur* must be an integer from 1 through 65534.

infinite

Sets the MIP registration lifetime override value to infinite for a particular subscriber.

default

Sets the value of mobile IP registration lifetime override option to 100 seconds.

no

Disables the MIP registration lifetime override option.

Usage

Use this command to configure MIP registration-lifetime per realm/domain. This value overrides the default lifetime configured under HA service.

Example

The following command overrides the MIP registration lifetime value from HA service and defaults the MIP registration lifetime to 100 seconds for the current subscriber:

```
default mobile-ip reg-lifetime-override
```

mobile-ip send accounting-correlation-info

Enables the sending call correlation information Normal Vendor/Organization Specific Extensions (NVSEs) to the HA in the MIP Registry Registrar Protocol (RRP).

Platform

ASR 5000

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] mobile-ip send accounting-correlation-info
```

default

Disables the support for sending call correlation information NVSEs to the HA in MIP RRQ.
This is the default mode.

no

Removes the configured support for sending call correlation information.

Usage

Use this command to support PDSN-Correlation-ID VSE and send the call correlation information.

Example

The following command enables sending call correlation information NVSEs to the HA in MIP RRQ

```
mobile-ip send accounting-correlation-info
```

mobile-ipv6

Configures Mobile IPv6 related parameters for a subscriber.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

[default | no] mobile-ipv6 { home-address *ipv6_address* **| home-agent** *ipv6_address* **| home-link-prefix** *ipv6_address* **| tunnel mtu** *value* **}**

default

Disables the support for sending call correlation information NVSEs to the HA in MIP RRQ.
This is the default mode.

no

Removes the configured support for sending call correlation information.

home-address *ipv6_address*

Specifies the home address for the subscriber. *ipv6_address* must be entered using IPv6 colon-separated-hexadecimal notation.

home-agent *ipv6_address*

Specifies the IPv6 address of the mobile IP user's home agent. *ipv6_address* must be entered using IPv6 colon-separated-hexadecimal notation.

home-link-prefix *ipv6_address*

Specifies the IPv6 address of the mobile IP user's home link. *ipv6_address* must be entered using IPv6 colon-separated-hexadecimal notation.

tunnel mtu *value*

Configures the tunnel MTU (in bytes) for the IPv6 tunnel between the HA and the mobile node. *value* must be an integer from 1024 through 2000. The default is 1500.

Usage

This command sets the mobile-ipv6 parameters for a subscriber. Use this command to set the home-address, home-agent, and home-link prefix

Example

Use the following command to set the tunnel MTU value to *1800*:

```
mobile-ipv6 tunnel mtu 1800
```

nai-construction-domain

After authentication, the domain name specified by this command replaces the Network Access Identifier (NAI) constructed for the subscriber.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

nai-construction-domain *domain_name*

no nai-construction-domain

nai-construction-domain *domain_name*

Defines the domain name to use to replace the NAI constructed domain name. *domain_name* must be an alphanumeric string of 1 through 79 characters.

no

Deletes the defined domain name.

Usage

Define or delete a domain name to use to replace the NAI constructed domain name after authentication.

Example

the following command sets the domain name to *private1*:

```
nai-construction-domain private1
```

To delete the previously configured domain name, use the following command:

```
no nai-construction-domain
```

nbns

Configures and enables use of NetBIOS Name Service for the subscriber.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

nbns { primary *IPv4-address* **| secondary** *IPv4-address* **}**

no nbns { primary [*IPv4-address* **] | secondary [** *IPv4-address* **] }**

nbns primary

Designates primary NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

nbns secondary

Designates secondary/failover NBNS server. Must be followed with IPv4 address in dotted-decimal notation.

IPv4-address

Specifies the IP address used for this service using IPv4 dotted-decimal notation.

no

Removes/disables use of a previously configured NetBios Name Service.

Usage

This command specifies NBNS parameters. The NBNS option is present for both PDP type IP and PDP type PPP for GGSN.
The system can be configured to use of NetBIOS Name Service for the Access Point Name (APN).

Example

The following command configures the subscriber's NetBIOS Name Service to primary IP *192.168.1.15*:

```
nbns primary 192.168.1.15
```

nexthop-forwarding-address

Configures the next hop forwarding address for the subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

nexthop-forwarding-address *ip_address*

no nexthop-forwarding-address

nexthop-forwarding-address *ip_address*

Configures the IP address of the nexthop forwarding address. *ip_address* must be entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

no

Disables this function. This is the default setting.

Usage

Use this command to configure the next hop forwarding address for the subscriber.

Example

The following command configures the next hop forwarding address to *10.1.1.1* (IPv4):

```
nexthop-forwarding-address 10.1.1.1
```

npu qos

Configures an Network Processing Unit (NPU) QoS priority queue for packets from the subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
npu qos traffic priority { best-effort | bronze | derive-from-packet-dscp | gold | silver }
```

best-effort

Assigns the best-effort queue priority. This is the lowest priority.

bronze

Assigns the bronze queue priority. This is the third-highest priority.

derive-from-packet-dscp

Default: Enabled
Specifies that the priority is to be determined from the DS field in the packet's TOS octet.

gold

Assigns the gold queue priority. This is the highest priority.

silver

Assigns the silver queue priority. This is the second-highest priority.

Usage

This command is used in conjunction with the Network Processing Unit (NPU) Quality of Service (QoS) functionality.
The system can be configured to determine the priority of a subscriber packet either based on the configuration of the subscriber, or from the differentiated service (DS) field in the packet's TOS octet (representing the differentiated service code point (DSCP) value).
Refer to the *System Administration Guide* for additional information on NPU QoS functionality.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command configures the subscriber's priority queue to be gold:

```
npu qos traffic priority gold
```

nw-reachability-server

Binds the name of a configured network reachability server to the current subscriber and enables network reachability detection.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
nw-reachability server server_name

no nw-reachability server
```

`nw-reachability server server_name`

Specifies the name of a network reachability server that has been defined in the current context. *`server_name`* is an alphanumeric string of 1 through 16 characters.

`no nw-reachability server`

Deletes the name of the network reachability server from the current subscribers configuration and disable network reachability failure detection for the current subscriber.

Usage

Use this command to define the network reachability server for the current subscriber and enable network reachability failure detection for the current subscriber. If a network reachability server is defined in an IP pool, that setting takes precedence over this command.

Important: Refer to the HA configuration mode command **`policy nw-reachability-fail`** to configure the action that should be taken when network reachability fails.

Important: Refer to the context configuration mode command **`nw-reachability server`** to configure network reachability servers.

Important: Refer to the **`nw-reachability server server_name`** keyword of the **`ip pool`** command in the *Context Configuration Mode Commands* chapter to bind the network reachability server to an IP pool.

Example

To bind a network reachability server named *`InternetDevice`* to the current subscriber, enter the following command:

```
nw-reachability server InternetDevice
```

outbound

Configures the subscriber host password for use when authenticating PPP sessions.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

outbound [encrypted] password *pwd*

no outbound password

[outbound encrypted] password *pwd*

Specifies the password to use for point-to-point protocol session host authentication. The **encrypted** keyword indicates the password specified uses encryption.
The password specified as *pwd* must be an alphanumeric string of 1 through 63 characters without encryption, or 1 through 127 characters with encryption.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

no outbound password

Clears the outbound password configuration from the subscriber data.

Usage

Sets the outbound (egress) password for increased security.

Example

outbound password *secretPwd*

outbound encrypted password *scrambledPwd*

no outbound password

overload-disconnect

Sets the threshold parameter for overload disconnect.

Platform

ASR 5000

Product

ASN-GW, HA, PDIF, PDSN, PHS GW, PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

overload-disconnect [threshold { inactivity-time *inactivity_time_threshold* **| connect-time** *connect_time_threshold* **}]**

[default | no] overload-disconnect [threshold { inactivity-time | threshhold connect-time }]

threshold inactivity-time *inactivity_time_threshold*

Sets the inactivity time threshold (in seconds) as an integer from 0 through 4294967295. The default value of zero disables this feature. If *inactivity-time* for the subscriber's session is greater than *inactivity_time_threshold*, the session becomes a candidate for disconnection.

threshold connect-time *connect_time_threshold*

Sets the connection time threshold (in seconds) as an integer from 0 through 4294967295. A value of zero disables this feature. If connect-time for the subscriber's session is greater than *connect_time_threshold*, the session becomes a candidate for disconnection.

default

Enables the default condition for this subscriber.

no

Disables the overload disconnect feature for this subscriber. This is the default condition for PDIF.

Usage

Set a subscriber's overload disconnect threshold in seconds, based on either inactivity or connection time. When this threshold is exceeded during a session, the subscriber's session becomes a candidate for disconnection. To set overload-disconnect policies for the entire chassis, see **congestion-control overload-disconnect** in the *Global Configuration Mode Commands* chapter.

Example

```
overload-disconnect threshold inactivity-time 120

default overload disconnect threshold connect-time

no overload-disconnect threshold connect-time
```

```
no overload disconnect
```

password

Configures the subscribers password for the current context.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ encrypted ] password pwd

no password
```

encrypted

Indicates the password provided is encrypted.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

pwd

Specifies the user's password for authentication. *pwd* must be an alphanumeric string of 1 through 63 characters without encryption, or from 1 through 127 characters with encryption. A "null" password is allowed and is entered as consecutive double quotes (" "). See Example(s) for correct syntax.

Important: Subscribers configured with a null password will be authenticated using PAP and CHAP (MD5) only. Subscribers configured without a password (**no password**) will only be able to access services if the service is configured to allow no authentication.

no

Used to clear the subscriber password configuration from the subscriber data.

Important: Subscribers with no password will only be able to access services if the service is configured to grant access with no authentication.

Usage

Password management is critical to system security and all precautions should be taken to ensure passwords are not shared or to easily deciphered.

Example

```
password secretPwd
```

```
password ""

no password
```

pdif mobile-ip

Configures PDIF subscriber call setup parameters.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] pdif mobile-ip { release-tia | required | simple-ip-fallback }
```

`[ default | no ]`

Disables the option specified.

`release-tia`

Specifies that after subscriber call setup is complete, the tunnel inner address (TIA) is released. If SImple IP is enabled, the TIA becomes the principal communications tunnel and the restriction that it is only to be used to set up a Mobile-IP call is lifted. This parameter is disabled by default.

`required`

Specifies that Mobile IP is required for this subscriber whenever a call is set up. This parameter is disabled by default.

`simple-ip-fallback`

Specifies that Simple IP should be used when Mobile IP could not be established. This parameter is disabled by default.

Usage

Use this command to configure specific behavior for the PDIF subscriber during call setup.

Example

The following command enables the system to fall back to Simple IP when Mobile IP fails for this subscriber during call setup:

```
pdif mobile-ip simple-ip-fallback
```

permission

Enables or disables the subscriber's ability to access wireless data services.

Platform

ASR 5000

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] permission { ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip }
```

no

Disables the usage of the specified service.

ha-mobile-ip | pdsn-mobile-ip | pdsn-simple-ip

ha-mobile-ip: enables or disables the Home Agent (HA) support for Mobile IP (MIP) service.
pdsn-mobile-ip: enables or disables packet data and Foreign Agent (FA) support for MIP service.
pdsn-simple-ip: enables or disables packet data support for simple IP service.

Usage

Grants the subscriber access to services in the current context.

Example

```
permission pdsn-mobile-ip

no permission ha-mobile-ip
```

policy ipv6 tunnel

Sets maximum transmission unit (MTU) behavior for the IPv6 tunnel between the HA and Mobile Node.

Platform

ASR 5000

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
policy ipv6 tunnel mtu exceed { fragment | notify-sender }
```

```
mtu exceed { fragment | notify-sender }
```

fragment: Adjusts tunnel MTU and fragment packets
notify-sender: Sends an ICMPv6 Packet Too Big message to the original sender

Usage

Use this command to configure MTU behavior for an IPv6 tunnel between the HA and Mobile Node.

Example

```
policy ipv6 tunnel mtu exceed fragment
```

policy-group

Assigns or removes a flow-based traffic policy group to a subscriber.

Platform

ASR 5000

Product

PDSN, HA, ASN-GW, HSGW

Privilege

Security Administrator, Administrator

Syntax

[no] policy-group *policy_group_name* **direction { in | out }**

no

Removes assigned policy group from a subscriber configuration.

policy-group *policy_group_name*

Specifies the traffic policy group name for a subscriber session flow pre-configured within a destination context. *policy_group_name* is an alphanumeric string of 1 through 15 characters that is case sensitive.

direction { in | out }

Specifies the direction of flow in which the traffic policies need to be applied.

- **in**: specifies the incoming traffic
- **out**: specifies the outgoing traffic

Usage

Use this command to assign a traffic policy group to a subscriber for traffic policing.

Example

```
policy-group traffic_policy_group1 direction in
```

ppp

Configures the point-to-point protocol (PPP) options for the current subscriber.

Platform

ASR 5000

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression { mode { normal | stateless } | protocols { *protocols* [*protocols*] } | ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } } | ipv4 { disable | enable | passive } | ipv6 { disable | enable | passive } | keepalive *seconds* | min-compression-size *min_octets* | mtu *max_octets* | remote-renegotiation disconnect { always | nai-prefix-msid-mismatch } }

default ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression { mode | protocols } | ip-header-compression negotiation [vj compress-slot-id] | ipv4 | ipv6 | keepalive | min-compression-size | mtu | remote-renegotiation disconnect }

no ppp { accept-peer-ipv6-ifid | always-on-vse-packet | data-compression protocols | ipv4 | ipv6 | keepalive | mtu | remote-renegotiation disconnect }

default

Restores the default value for the option specified.

no

Resets the option specified to its default.

always-on-vse-packet

Default: Enabled
If this feature is enabled, the PDSN sends special 3GPP2 VSE PPP packets to the Mobile Node with a maximum inactivity timer value. This configuration is applicable only for PDSNsessions.

accept-ipv6-peer-ifield

Default: None
Configures an IPv6-to-IPv4 (6to4) tunnel and controls the behavior of IPv6CP negotiation for the Interface ID. If enabled, PDSN will accept a valid interface-id proposed by the peer.

data-compression { mode { normal | stateless } | protocols { *protocols* [*protocols*] }

Default: all protocols enabled.
Specifies the subscriber's mode of data compression or the compression protocol to use.
mode: sets the mode of compression where *modes* must be one of:

- **normal**: Packets are compressed using the packet history for automatic adjustment for best compression.
- **stateless**: Each packet is compressed individually.

protocols *protocols*: sets the compression protocol where *protocols* must be one of:

- **deflate**: DEFLATE algorithm
- **mppc**: Microsoft PPP algorithm
- **stac**: STAC algorithm

---

ip-header-compression negotiation { detect | force | vj compress-slot-id { both | none | receive | transmit } }

Default: **force**
detect: The local side does not include the Van Jacobson (VJ) Compression option in its IPCP configuration request unless the peer sends an Internet Protocol Control Protocol (IPCP) NAK including a VJ compression option. If the peer requests the VJ compression option in its IPCP request the local side will ACK/NAK.
force: The IP header compression negotiation in IPCP happens normally. The local side requests the VJ compression option in its IPCP configure request. If the peer side requests VJ compression in its IPCP request, the local side will ACK/NAK the option.
vj compress-slot-id [both | none | receive | transmit]: Configures the direction in which VJ slotid compression should be negotiated.

- **both** - If the client proposes VJ slotid compression, accept it and propose slotid compression for the downlink and uplink.
- **none** - If the client proposes VJ slotid compression, NAK the offer, do not propose slotid compression for the downlink.
- **receive** - (Default) If the client proposes VJ slotid compression in the uplink direction accept the configuration.
- **transmit** - Propose VJ slotid compression for uplink.

---

ipv4 { disable | enable | passive }

Default: enable
Controls IPCP negotiation during PPP negotiation.
disable: The PDSN does not negotiate IPCP with the mobile.
enable: The PDSN negotiates IPCP with the mobile.
passive: The PDSN initiates IPCP only when the mobile sends an IPCP request.

---

ipv6 { disable | enable | passive }

Default: enable
Controls IPv6CP negotiation during PPP negotiation.
disable: The PDSN does not negotiate IPCP with the mobile.
enable: The PDSN negotiates IPCP with the mobile.
passive: The PDSN initiates IPCP only when the mobile sends an IPCP request.

---

keepalive *seconds*

Default: 30
Specifies the frequency of sending the Link Control Protocol keepalive messages. *seconds* must be either 0 or an integer from 5 through 14400. The special value 0 disables the keepalive messages entirely.

min-compression-size *min_octets*

Default: 128
Specifies the smallest packet (in octets) to which compression may be applied. *min_octets* must be an integer from 0 through 2000.

mtu *max_octets*

Default: 1500
Specifies the maximum transmission unit (MTU) [in octets] for packets. *max_octets* must be an integer from 100 through 2000.

remote-renegotiation disconnect { always | nai-prefix-msid-mismatch }

Default: Disabled
Terminates the already established PPP sessions if they are renegotiated by the remote side by sending LCP Conf-req/nak/ack. The following termination conditions are available:

- **always**: Automatically disconnects the session.
- **nai-prefix-msid-mismatch**: Disconnects the session only if the MSID of the session does not match NAI-Prefix (prefix before "@" for the NAI). The configuration of the renegotiated (new) NAI is used for the matching process.

Usage

Adjust packet sizes and compression to improve bandwidth utilization. Each network may have unique characteristics such that determining the best packet size and compression options may require system monitoring over an extended period of time.

Example

```
ppp data-compression protocols mode stateless

ppp mtu 500

no ppp data-compression protocols

no ppp keepalive
```

prepaid 3gpp2

Enables 3GPP2 compliant prepaid billing support for a subscriber to be configured by 3GPP2 attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored.

Platform

ASR 5000

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
prepaid 3gpp2 { accounting [ no-final-access-request ] | duration-quota final-duration-
algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time }
| preference { duration | volume } }

default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }

no prepaid 3gpp2 accounting
```

---

default prepaid 3gpp2 { duration-quota final-duration-algorithm | preference }

Sets the 3GPP2 Pre-paid settings to the default values.
duration-quota final-duration-algorithm: Resets the end of billing duration quota algorithm to the default of current-time.
preference: Resets the preference to duration, If both duration and volume attributes are present.

---

no prepaid 3gpp2 accounting

Disables 3GPP2 prepaid accounting. All 3GPP2 Prepaid attributes received from a RADIUS server are ignored.

---

accounting [no-final-access-request]

Default: Disabled
Enables 3GPP2 prepaid accounting behavior.
Sets the low-watermark for remaining byte credits. *percentage* is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. *percentage* must be an integer from 1 through 99.
no-final-access-request: Stops sending final online access-request on termination of 3GPP2 prepaid sessions. By default, this option is disabled.

---

duration-quota final-duration-algorithm { current-time | last-airlink-activity-time | last-user-layer3-activity-time }

Defines what behavior marks the end of the billing duration for duration-based quota usage accounting. The default behavior sets the duration quota algorithm to current-time.
Default: current-time
current-time: Selects the duration quota as the difference between the session termination timestamp and the session setup timestamp.

last-airlink-activity-time: Selects the duration quota as the difference between the last-user-activity timestamp (G17) and the session setup timestamp.
last-user-layer3-activity-time: Selects the duration quota as the difference between the timestamp of the last layer-3 packet sent to or received from the user and the session setup timestamp.

preference { duration | volume }

If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.
Default: duration
duration: The duration attribute takes precedence.
volume: The volume attribute takes precedence

Usage

Use this command to enable prepaid support for a default user or for the default user of a domain alias.

Example

The following command enables 3GPP2 prepaid support for the default user:

```
prepaid 3gpp2 accounting
```

prepaid custom

Enables custom prepaid billing support for a subscriber to be configured by attributes sent from a RADIUS server. If not enabled, prepaid attributes received from the RADIUS server are ignored. The keywords set prepaid values that are used if the corresponding RADIUS attribute is not present. If the RADIUS attribute is present, it takes precedence over these values.

Platform

ASR 5000

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

```
prepaid custom { accounting | byte-count compressed | low-watermark percent percentage |
renewal interval seconds } | preference { duration | volume }

default prepaid custom { byte-count | low-watermark }

no prepaid custom { accounting | byte-count compressed | low-watermark | renewal }
```

default prepaid custom { byte-count | low-watermark }

Resets custom prepaid settings to the default values.
byte-count: Resets to the default of basing the prepaid byte credits on the flow of uncompressed traffic.
low-watermark: Disables sending an access request to retrieve more credits when a low watermark is reached.

no prepaid custom { accounting | byte-count compressed | low-watermark | renewal}

byte-count compressed: The prepaid byte credits are based on the flow of uncompressed traffic. This is the default.
low-watermark: Disables the low watermark feature. An access-request is not sent to the RADIUS server until the credits granted for the subscriber session are depleted.
renewal: Disables time-based renewals for prepaid accounting.

accounting

Default: Disabled
Enables custom prepaid accounting behavior.

byte-count compressed

Default: uncompressed.
When compression is used, the prepaid byte credits are based on the flow of compressed traffic. The default is to base the prepaid byte credits on the flow of uncompressed traffic.

low-watermark percent *percentage*

Default: Disabled.

Sets the low-watermark for remaining byte credits. *percentage* is a percentage of the subscriber sessions total credits. When the low-watermark is reached a new RADIUS access-request is sent to the RADIUS server to retrieve more credits. *percentage* must be an integer from 1 through 99.

renewal interval *seconds*

Default:
The time in seconds to wait before sending a new RADIUS access-request to the RADIUS server to retrieve more credits. *seconds* must be an integer from 60 through 65535.

preference { duration | volume }

If both duration and volume RADIUS attributes are present this keyword specifies which attribute has precedence.
Default: duration
duration: The duration attribute takes precedence.
volume: The volume attribute takes precedence

Usage

Use this command to enable prepaid support for a default user or for the default user of a domain alias.

Example

The following command enables custom prepaid support for the default user:

```
prepaid custom accounting
```

prepaid unclassify

This command provides customer specific functionality.

prepaid voice-push

This command provides customer specific functionality.

prepaid wimax

Enables WiMAX prepaid accounting for this subscriber. This feature is disabled by default.

Platform

ASR 5000

Product

ASN-GW

Privilege

Administrator

Syntax

```
[ no ] prepaid wimax accounting
```

no

Disables WiMAX prepaid accounting for this subscriber.

Usage

Use this command to enable WiMAX prepaid accounting for this subscriber.

proxy-dns intercept list-name

Identifies a proxy DNS intercept rules list for the selected subscriber.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Syntax

[no] proxy-dns intercept list-name *name*

no

Removes the intercept list from the subscribers profile.

proxy-dns intercept list-name *name*

Specifies a name of a proxy DNS intercept list used for the selected subscriber.
name is the name of the intercept list expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to identify a proxy DNS rules list for the selected subscriber. For a more detailed explanation of the HA Proxy DNS Intercept feature, see the **proxy-dns intercept-list** command in the *Context Configuration Mode Commands* chapter.

proxy-mip

Configures support for Proxy Mobile IP for the subscriber.

Platform

ASR 5000

Product

PDSN, GGSN, ASN-GW, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] proxy-mip required
```

no

Disables support for Proxy Mobile IP.

required

Enables support for Proxy Mobile IP.

Usage

When enabled through the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP. For subscriber sessions using Proxy Mobile IP, R-P and PPP sessions are established as they would for a Simple IP session. However, the AGW/FA performs Mobile IP operations with an HA (identified by information stored in the subscriber's profile) on behalf of the MN while the MN performs only Simple IP processes.

Example

The following command enables proxy mobile IP for the current subscriber:

```
proxy-mip required
```

qos rate-limit

Configure the action on subscriber traffic flow that violates or exceeds the peak/committed data rate under traffic policing functionality. When configured, the PDG/TTG performs traffic policing for the subscriber session. If the GGSN changes the QoS via an Update PDP Context Request, the PDG/TTG uses the new QoS values for traffic policing.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Syntax

```
qos rate-limit { downlink | uplink } [ qci qci_val ] [ burst-size { bytes | auto-readjust
[ duration dur ] } ] [ exceed-action { drop | lower-ip-precedence | transmit } [ violate-
action { drop | lower-ip-precedence | shape [ transmit-when-buffer-full ] | transmit } ]
] | [ violate-action { drop | lower-ip-precedence | shape [ transmit-when-buffer-full ] |
transmit } [ exceed-action { drop | lower-ip-precedence | transmit } ] ] +no qos rate-
limit direction { downlink | uplink } [ qci qci_val ]
```

no

Disables the QoS data rate limit configuration for the subscriber.

---

downlink

Applies the specified limits and actions to the downlink (to the data coming from the GGSN over the Gn' interface).

---

uplink

Applies the specified limits and actions to the uplink (to the data coming from the UE over the IPSec tunnel).

Important: If this keyword is omitted, the same values are used for all classes.

---

qci *qci_val*

qci_val is the QoS Class identifier (QCI) for which the negotiate limit is being set expressed as an integer from 1 through 9. If no qci-val is configured, it will be taken as undefined-qci (same as undefined-qos class).

---

burst-size { *bytes* | auto-readjust [duration *dur*] }

Default: See the *Usage* section for this command
The burst size allowed (in bytes) for peak data rate and committed data rate.
bytes must be an integer from 1 through 6000000.

Important: The minimum value of this parameter should be configured to the greater of the following two values: 1) three times greater than the packet MTU for the subscriber connection, OR 2) three seconds worth of token

accumulation within the "bucket" for the configured peak-data-rate. If the committed-data-rate parameter is specified, the burst-size is applied to both the committed and peak rates.

auto-readjust [duration *dur* **]** provides the option to calculate the Burst size dynamically while configuring rate-limit. When enabled. the system calculates the burst size using the GGSN QoS-negotiated rate that will be enforced.
Every time there is a change in the rates (due to an updated QoS), the burst sizes will be updated accordingly. This keyword also provides two different burst sizes. One burst size for peak rate and another for committed rate.
By default this keyword is disabled.
duration *dur* specifies the duration of burst in seconds. If the duration is not specified, the default is 1 second. *dur* must be an integer from 1 through 30.

exceed-action { drop | lower-ip-precedence | transmit }

Default: See the *Usage* section for this command
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **drop**: Drops the packets.
- **lower-ip-precedence**: Transmits the packets after lowering the ip-precedence.
- **transmit**: Transmits the packets.

violate-action { drop | lower-ip-precedence | transmit }

Default: See the *Usage* section for this command
Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **drop**: Drops the packets.
- **lower-ip-precedence**: Transmits the packets after lowering the IP precedence.
- **transmit**: Transmits the packet after lowering the IP precedence.

shape [transmit-when-buffer-full]: Enables traffic shaping and buffers user packets when subscriber traffic violates the allowed peak/committed data rate. The **[transmit-when-buffer-full]** keyword allows the packets to be transmitted when buffer memory is full.
transmit: Transmits the packet

Usage

This command configures APN quality of service (QoS) data rate shaping through traffic policing. This command specifies the actions to take on subscriber flows exceeding or violating allowed peak or committed data rates. The shaping function also provides an enhanced function to buffer the excessive user packets and send them to the subscriber when subscriber traffic drops below the committed or peak data rate limit.

Important: The buffering of user packets in traffic shaping does not apply for real-time traffic.

Important: If the exceed/violate action is set to "lower-ip-precedence", this command may override the configuration of the **ip qos-dscp** command in the GGSN service Configuration mode for packets from the GGSN to the PDG/TTG. In addition, the GGSN service **ip qos-dscp** command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that this command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the PDG/TTG; it accepts all of the PDG/TTG-provided values for the PDP context.

Important: This command should be used in conjunction with the max-contexts command to limit the maximum possible bandwidth consumption by the APN.

For additional information on QoS traffic shaping and policing, see the *System Administration Guide.*

Default Values

The following table displays the default values for each of the traffic classes:

Class: Conversational	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): 16000000 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): 8640000 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Streaming	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): 16000000 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): 8640000 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Interactive, Traffic Handling Priority: 1	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 2	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 3	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop
Class: Background	

Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Exceed Action: n/a Violate Action: drop

Usage

This command configures the APN quality of service (QoS) data rate shaping through traffic policing/shaping. This command specifies the actions to take on subscriber flows exceeding or violating allowed peak/committed data rates. The shaping function also provides an enhanced function to buffer the excessive user packets and send them to the subscriber when subscriber traffic drops below the committed or peak data rate limit.

Important: The buffering of user packets in traffic shaping does not apply for real-time traffic.

Important: If the exceed/violate action is set to "lower-ip-precedence", this command may override the configuration of the **ip qos-dscp** command in the GGSN service configuration mode for packets from the GGSN to the SGSN. In addition, the GGSN service **ip qos-dscp** command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (i.e. it accepts all of the SGSN-provided values for the PDP context.

Important: This command should be used in conjunction with the **max-contexts** command to limit the maximum possible bandwidth consumption by the APN.

Default Values:

To calculate the burst size dynamically a new optional keyword **auto-readjust** [**duration** *dur*] is provided with **burst-size** keyword. By default the burst size is fixed if defined in bytes with this command. In other words irrespective of the rate being enforced, burst-size fixed as given in the **burst-size** *bytes* parameter.

For the need of variable burst size depending on the rate being enforced this new keyword **auto-readjust** [**duration** *dur*] is provided. Use of this keyword enables the calculation of burst size as per token bucket algorithm calculation as T=B/R, where T is the time interval, B is the burst size and R is the Rate being enforced.

It also provides different burst size for Peak and Committed data rate-limiting.

If **auto-readjust** keyword is not used a fixed burst size must be defined which will be applicable for peak data rate and committed data rate irrespective of rate being enforced.

If **auto-readjust** keyword is provided without specifying the duration a default duration of 1 second will be taken for burst size calculation.

Example

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak or committed data-rate bps in uplink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```
qos rate-limit direction uplink violate-action shape transmit-when-
buffer-full
```

qos traffic-police

Enables and configures traffic policing through bandwidth limitations and action for the subscriber traffic if it exceeds or violates the peak or committed data rate. Uplink and downlink limits are configured separately.

Platform

ASR 5000

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

qos traffic-police direction { downlink | uplink } [burst-size *bytes* **] [committed-data-rate** *bps* **] [exceed-action { drop | lower-ip-precedence | transmit }] [peak-data-rate** *bps* **] [violate-action { drop | lower-ip-precedence | transmit }]**

no qos traffic-police direction { downlink | uplink }

downlink

Applies the specified limits and actions to the downlink (data to the subscriber).

uplink

Apply the specified limits and actions to the uplink (data from the subscriber).

burst-size *bytes*

Default: 3000
Specifies the allowed peak burst size allowed in bytes.
bytes must be an integer from 0 through 4294967295.

Important: This parameter should be configured to at least the greater of the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the "bucket" for the configured peak-data-rate.

committed-data-rate *bps*

Default: 144000
Specifies the committed data rate (guaranteed-data-rate) in bits per second (bps).
bps must be an integer from 0 through 4294967295).

exceed-action { drop | lower-ip-precedence | transmit }

Default: lower-ip-precedence
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the ip-precedence
transmit: Transmits the packet

peak-data-rate *bps*

Default: 256000
Specifies the peak data-rate for the subscriber in bits per second (bps).
bps must be an integer from 0 through 4294967295).

violate-action { drop | lower-ip-precedence | transmit }

Default: drop
Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the IP precedence
transmit: Transmits the packet

no

Disables traffic policing in the specified direction for the current subscriber.

Usage

Use this command to limit the bandwidth a subscriber uses in the uplink and downlink directions.

Important: If the exceed/violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed/violate the traffic limits regardless of what the **ip user-datagram-tos copy** command is configured to. In addition, the "lower-ip-precedence" option may also override the configuration of the **ip qos-dscp** command. Therefore, it is recommended that command not be used when specifying this option.

Details on the QoS traffic policing can be found in the *System Administration Guide*.

Example

The following command sets an uplink peak data rate of *128000* bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-police direction uplink peak-data-rate 128000 violate-action
lower-ip-precedence
```

The following command sets a downlink peak data rate of *256000* bps and drops packets when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-police direction downlink peak-data-rate 256000 violate-
action drop
```

qos traffic-shape

Enables and configures traffic shaping functionality when buffering the data packets during congestion or when the subscriber exceeds the configured peak or committed data rate limit. The system buffers the data packets during an instantaneous burst and deliver them to the subscriber when traffic flow drops below the peak or committed data rate. Uplink and downlink traffic shaping are configured separately.

Important: This feature is NOT supported for real-time traffic.

Platform

ASR 5000

Product

PDSN, HA, GGSN, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

qos traffic-shape direction { downlink | uplink } [burst-size *bytes* **] [committed-data-rate** *bps* **] [exceed-action { drop | lower-ip-precedence | transmit }] [peak-data-rate** *bps* **] [violate-action { drop | lower-ip-precedence | buffer [transmit-when-buffer-full] | transmit }] +**

no qos traffic-shape direction { downlink | uplink }

downlink

Applies the specified limits and actions to the downlink (data to the subscriber).

uplink

Applies the specified limits and actions to the uplink (data from the subscriber).

burst-size *bytes*

Default: 3000
Specifies the allowed peak burst size in bytes.
bytes must be an integer from 0 through 4294967295.

Important: It is recommended that this parameter be configured to at least the greater of the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

committed-data-rate *bps*

Default: 144000
Specifies the committed data rate (guaranteed-data-rate) in bits per second (bps).
bps must be an integer from 0 through 4294967295).

exceed-action { drop | lower-ip-precedence | transmit }

Default: lower-ip-precedence
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the ip-precedence
transmit: Transmits the packet

peak-data-rate *bps*

Default: 256000
Specifies the peak data-rate for the subscriber in bits per second (bps).
bps must be an integer from 0 through 4294967295).

violate-action { drop | lower-ip-precedence | buffer [transmit-when-buffer-full] | transmit }

Default: See the *Usage* section for this command
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the IP precedence
buffer [transmit-when-buffer-full]: Enables traffic shaping and buffers user packets when subscriber traffic violates the allowed peak/committed data rate. The **[transmit-when-buffer-full]** keyword allows the packet to be transmitted when buffer memory is full.
transmit: Transmits the packet

+

More than one of the above keywords can be entered within a single command.

no

Disables traffic policing for the specified direction for the current subscriber.

Usage

Use this command to provide the traffic shaping function to a subscriber in the uplink and downlink directions. This feature is providing a traffic flow control different to QoS traffic policing. When a subscriber violates or exceeds the peak data rate instead of dropping the packets, as in QoS traffic policing, this feature buffers subscriber data packets and sends the buffered data when the traffic flow is low or not in congestion state.

Important: If the exceed or violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed or violate the traffic limits regardless how the **ip user-datagram-tos copy** command is configured. In addition, the "lower-ip-precedence" option may also override the configuration of the **ip qos-dscp** command. Therefore, this command should not be used when specifying this option.

Details on the QoS traffic policing functionality is located in the System Administration Guide.

Example

The following command sets an uplink peak data rate of *128000* bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```
qos traffic-shape direction uplink peak-data-rate 12800 violate-action
lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak-data-rate *256000* bps in downlink direction. Once the peak/committed data rate for that subscriber goes below the configured limit it transmit them. It also transmits them if buffer memory is full:

```
qos traffic-shape direction downlink peak-data-rate 256000 violate-action
buffer transmit-when-buffer-full
```

radius accounting

Sets the RADIUS accounting parameters for the subscriber or domain. This command takes precedence over the similar Context Configuration command and is disabled by default.

Platform

ASR 5000

Product

All

Privilege

Administrator

Syntax

radius accounting { interim { interval-timeout *timeout* **| normal | suppress } | ip remote-address list-id** *list_id* **| mode { session-based | access-flow-based { none | auxillary-flows | all-flows | main-a10-only } } | start { normal | suppress } | stop { normal | suppress } }**

no radius accounting { ip remote-address list-id *list_id* **| interim [interval-timeout] }**

interim { interval-timeout *timeout* **| normal | suppress }**

interval-timeout *timeout*: Indicates the time (in seconds) between updates to session counters (log file on RADIUS or AAA event log) during the session. *timeout* must be an integer from 50 to 40000000.

Caution: Interim interval settings received from the RADIUS server take precedence over this setting on the system. While the low limit of this setting on the system is a minimum of 50 seconds, the low limit setting on the RADIUS server can be as little as 1 second. To avoid increasing network traffic unnecessarily and potentially reducing network and system performance, do not set this parameter to a value less than 50 on the RADIUS server.

normal: If RADIUS accounting is enabled, sends this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppresses the sending of this Acct-Status-Type message.

ip remote-address list-id *list_id*

Specifies the identification number of the IP address list to use for the subscriber for remote address-based accounting.
list_id: Specifies the RADIUS accounting remote IP address list identifier for remote-address accounting for the subscriber. *list_id* must be an integer from 1 through 65535.
This command is used as part of the Remote Address-based accounting feature and associates the subscriber with a list of remote addresses. Remote address accounting data is collected each time the subscriber communicates with any of the addresses specified in the list.
Remote address lists are configured using the **list** keyword in the **radius accounting ip remote-address** command in the Context Configuration mode.

mode { session-based | access-flow-based { none | auxillary-flows | all-flows | main-a10-only } }

Default: **session-based**
Specifies if the radius accounting mode is either session-based or access-flow-based.

session-based: configures session-based RADIUS accounting behavior for the subscriber - which means a single radius accounting message generated for the subscriber session not separate accounting messages for individual A10 connections or flows.
access-flow-based: configures access-flow-based RADIUS accounting behavior for the subscriber. This offers flexibility by generating separate accounting messages for flows and A10 sessions.

- **all-flows**: Generates separate RADIUS accounting messages per access flow. Separate accounting messages are not generated for data path connections. (For example, separate messages are not sent for the main A10 or auxiliary connections.).
- **auxillary-flows**: Generates RADIUS accounting records for the main data path connection and for access-flows for all auxiliary data connections. (For example, separate RADIUS accounting messages are generated for the main A10 session and for access-flows within auxiliary A10 connections. The main A10 session accounting does not include octets or other accounting information from the auxiliary flows.)
- **main-a10-only**: Configures access-flow-based single accounting messages (for example only single start/interim/stop) are generated for the main A-10 flows only.
- **none**: Generates separate RADIUS accounting messages for all data path connections (for example, PDSN main or auxiliary A10 connections) but not for individual access-flows. This is essentially A10 connection-based accounting.

---

start { normal | suppress }

normal: If RADIUS accounting is enabled, sends this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppresses the sending of this Acct-Status-Type message.

---

stop { normal | suppress }

normal: If RADIUS accounting is enabled, sends this Acct-Status-Type message when required by normal operation
suppress: If RADIUS accounting is enabled, suppresses the sending of this Acct-Status-Type message.

---

no

ip remote-address list-id *list_id*: Deletes the entry for the specified *list_id*.
interim [interval-timeout]: Disables the interim interval setting.

Usage

Use this command to allow a per-domain setting for the RADIUS accounting.

Example

Set the accounting interim interval to one minute (*60* seconds) for all sessions that use the current subscriber configuration:

```
radius accounting interim interval-timeout 60
```

Do not send RADIUS interim accounting messages:

```
radius accounting interim suppress
```

Sets the accounting message start normal for main A-10 flows only.

```
radius accounting mode main-a10-only start normal
```

radius group

Applies a RADIUS server group at the subscriber level for AAA functionality.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius group *group_name*

{ default | no } radius group

radius *group_name*

Specifies the name of the server group that is used for authentication and/or accounting for the specific subscriber. *group_name* must be an alphanumeric string of 1 through 63 characters. It must have been preconfigured within the same context of subscriber.

default

Sets or restores the default RADIUS server group specified at the context level or in the default subscriber profile.

no

Disables the applied RADIUS group for specific subscriber.

Usage

This feature provides the RADIUS configurables under radius group node. Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual RADIUS server group for subscriber in that context. Each server group consists of a list of AAA servers. IF no RADIUS group is applied for this subscriber or the default subscriber profile, the default server group available at context level is used for accounting and authentication of the subscriber.

Example

Following command applies a previously configured RADIUS server group named *star1* to a subscriber within the specific context:

```
radius group star1
```

Following command disables the applied RADIUS server group for the specific subscriber.

```
no radius group
```

radius returned-framed-ip-address

Sets the policy whether or not to reject a call when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius returned-framed-ip-address 255.255.255.255-policy { accept-call-when-ms-ip-not-supplied | reject-call-when-ms-ip-not-supplied }

default radius returned-framed-ip-address 255.255.255.255-policy
```

accept-call-when-ms-ip-not-supplied

Accepts calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.

reject-call-when-ms-ip-not-supplied

Rejects calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.

default

Sets the policy to its default of rejecting calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.

Usage

Use this command to set the behavior for the current subscriber when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Example

The following command sets the subscriber profile to reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address:

```
radius returned-framed-ip-address 255.255.255.255-policy reject-call-when-ms-ip-not-supplied
```

rohc-profile-name

Identifies the robust header compression (RoHC) profile configuration that will be applied to bearer sessions belonging to this subscriber.

Platform

ASR 5000

Product

HSGW,PDSN

Privilege

Administrator

Syntax

rohc-profile-name *name*

name

Specifies the name of the RoHC profile that the system will use to apply header compression and decompression parameters to bearer session data for this subscriber. *name* must be an existing RoHC profile expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify a RoHC configuration profile to be applied to bearer sessions belonging to this subscriber. RoHC profiles are configured through the Global Configuration Mode using the **rohc-profile** command.

Example

The following command specifies that the RoHC profile named *rohc-cfg1* is to be applied to all bearer sessions belonging to this subscriber:

```
rohc-profile-name rohc-cfg1
```

secondary ip pool

Specifies a secondary IP pool to be used as backup pool for Network Address Translation (NAT).

Important: This command requires the purchase and installation of a license. Please contact your Cisco sales representative for more information.

Platform

ASR 5000

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

secondary ip pool *pool_name*

no secondary ip pool

no

Removes the previous secondary IP pool configuration.

secondary ip pool *pool_name*

Specifies the secondary IP pool name.
pool_name must be an alphanumeric string of 1 through 31 characters.

Usage

Use this command to configure a secondary IP pool for NAT subscribers, which is not overwritten by the RADIUS supplied list. The secondary pool will be appended to the RADIUS supplied IP pool list or subscriber template provided IP pool list, as applicable, during call setup.

Example

The following command configures a secondary IP pool named *test123*:

```
secondary ip pool test123
```

simultaneous

Enables or disables the simultaneous use of both Mobile and Simple IP services.

Platform

ASR 5000

Product

PDSN, FA, HA, ASN-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] simultaneous simple-and-mobile-ip
```

no

Disables the simultaneous use.

Usage

Subscribers with mobile devices that concurrently support mobile and simple IP services require this option to be set.

Example

```
no simultaneous simple-and-mobile-ip
```

```
simultaneous simple-and-mobile-ip
```

timeout

Configures the subscriber session timeouts.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout { absolute | idle } *seconds*

no timeout [absolute | idle]

timeout absolute

Default: 0
Specifies the absolute maximum time a session may exist (in seconds) in any state (active or dormant).

timeout idle

Default: 0
Specifies the maximum duration of the session (in seconds) before the system automatically terminates the session due to inactivity.

seconds

Specifies the maximum amount of time (in seconds) before the specified timeout action is activated. *seconds* must be an integer from 0 through 4294967295. The special value 0 disables the timeout specified.

no

Indicates the timeout specified is to be returned to its default behavior. If a timeout value is not specified, all timeouts are set to their default values.

Usage

Reduce the idle timeout to free session resources faster for use by new requests.

Example

```
timeout absolute 18000

no timeout
```

timeout long-duration

Configures the long duration timeout and optionally the inactivity duration of HA subscriber session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout long-duration *ldt_timeout* **[inactivity-time** *inact_timeout* **]**

[no | default]timeout long-duration

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

long-duration *ldt_timeout*

Default: 0
Designates the maximum duration of the session (in seconds) before the system automatically reports/terminates the session.
ldt_timeout must be a value in the range from 0 through 4294967295. The special value 0 disables the timer.

inactivity-time *inact_timeout*

Specifies the maximum amount of time (in seconds) before the specified session is marked as dormant.
inact_timeout must be a value in the range from 0 through 4294967295. The special value 0 disables the inactivity time specified.

Usage

Use this command to set the long duration timeout period and inactivity timer for subscriber sessions. Reduce the idle timeout to free session resources faster for use by new requests.
Refer to the **long-duration-action detection** and **long-duration-action disconnection** commands for more information.

Example

The following command sets the long duration timeout duration to *300* seconds and inactivity timer for subscriber session to *45* seconds:

```
timeout long-duration 300 inactivity-time 45
```

tpo policy

Specifies the Traffic Performance Optimization (TP)) policy for subscribers.

Platform

ASR 5000

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

tpo policy *tpo_policy_name*

{ default | no } tpo policy

default

Configures the default setting.
Default: Use the default TPO policy configured in the rulebase.

no

Deletes TPO policy from the subscriber configuration.

tpo policy *tpo_policy_name*

Specifies the name of the TPO policy as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the TPO policy for the subscriber template.

Example

The following command specifies to use the TPO policy named *tpo_policy_110*:

```
tpo policy tpo_policy_110
```

tunnel address-policy

Specifies the policy for address allocation and validation for all tunneled calls (IP-IP, IP-GRE) except L2TP calls. With this command enabled, GGSN IP address validation could be disabled for specified incoming calls.

For GGSN systems, this command can also be specified in the APN Configuration mode (**tunnel address-policy**) which would mean the system defers to the old **l3-to-l2-tunnel address policy** command for calls coming through L2TP tunnels.

Platform

ASR 5000

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default tunnel address-policy
```

alloc-only

Allocates IP addresses locally without validation.

alloc-validate

Default.
The VPN Manager allocates and validates all incoming IP addresses from a static pool of IP addresses.

no-alloc-validate

No IP address assignment or validation is done for calls coming in via L3 tunnels. Incoming static IP addresses are passed. This option allows for the greatest flexibility.

default

Resets the tunnel address-policy to **alloc-validate**.

Usage

This command supports scalable solutions for Corporate APN deployment as many corporations handle their own IP address assignments. In some cases this is done to relieve the customer or the mobile operators from the necessity of reconfiguring the range of IP addresses for the IP pools at the GGSN.

Example

The following command resets the IP address validation policy to validate against a static pool of address:

```
default tunnel address-policy
```

The following command disables IP address validation for calls coming through tunnels:

```
tunnel address-policy no-alloc-validate
```

tunnel ipip

Configures IP-in-IP tunnelling parameters for the current subscriber.

Platform

ASR 5000

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

tunnel ipip peer-address *peer_address* **local-address** *local_addr* **]**

no tunnel ipip

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the IP-in-IP tunnel.

local-address *local_addr*

Specifies the IP address of the interface in the destination context originating the IP-in-IP tunnel.

no

Disables IP-in-IP tunneling for the current subscriber.

Usage

Subscriber IP payloads are encapsulated with IP-in-IP headers and tunneled by the GGSN or PDSN to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using IP-in-IP and tunnel it from a local address of *192.168.1.100* to a gateway with an IP address of *192.168.1.225*:

```
tunnel ipip peer-address 192.168.1.225 local-address 192.168.1.100
preference 1
```

tunnel ipsec

Configures sessions for the current subscriber to use an IPSec tunnel based on the IP pool corresponding to the subscriber's assigned IP address.

Platform

ASR 5000

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
tunnel ipsec use-policy-matching-ip-pooler-address

no tunnel ipsec use-policy-matching-ip-pooler-address
```

no

Disables the use of the IPSec policy that matches the IP pool that the assigned IP address relates to.

Usage

Use this command to set the current subscribers sessions to use an IPSec policy that is assigned to the IP pool that the subscribers assigned IP address relates to.

Example

The following command enables the use of the policy that matches the IP pool address:

```
tunnel ipsec use-policy-matching-ip-pooler-address
```

tunnel l2tp

Configures L2TP tunnel parameters for the subscriber.

Platform

ASR 5000

Product

All products supporting L2TP

Privilege

Security Administrator, Administrator

Syntax

tunnel l2tp [peer-address *ip address* **[[encrypted] [secret** *secret*]] [**preference** *number*] **[tunnel-context** *context* **] [local-address** *ip_address* **] [crypto-map** *map_name* **{ [encrypted] isakmp-secret** *secret* **}]]**

no tunnel l2tp [peer-address *ip_address* **]**

---

peer-address *ip_address*

A peer L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *ip_address* must be an IP address entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal format.

[encrypted] secret *secret*

Specifies the shared key (secret) between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *secret* must be an alphanumeric string of 1 through 63 characters that is case sensitive.
encrypted: Specifies the encrypted shared key between the L2TP Network Server (LNS) associated with this LAC (L2TP Access Concentrator). *secret* must be an alphanumeric string of 1 through 128 characters that is case sensitive.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

---

preference *number*

Default: 1
Specifies the order in which a group of tunnels configured for this subscriber will be tried. *number* must be an integer from 1 through 65535.

---

tunnel-context *context*

Specifies the name of the context containing ports through which this subscriber's data traffic is to be communicated between this LAC and the LNS. *context* must be an alphanumeric string of 1 through 79 characters.

local-address *ip_address*

Specifies a LAC service bind address which is given as a hint that is used to select a particular LAC service. *ip_address* must be an IP address entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

crypto-map *map_name* **{ [encrypted] isakmp-secret** *secret* **}**

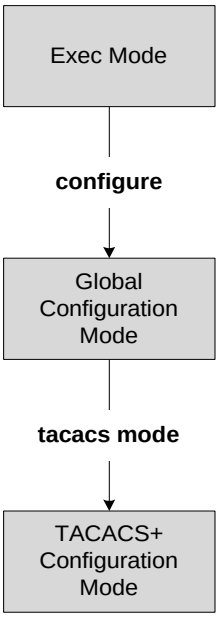
Specifies the name of a crypto map that has been configured in the current context. *map_name* must be an alphanumeric string from 1 to 127 alphanumeric characters.
isakmp-secret *secret*: Specifies the pre-shared key for the Internet Key Exchange (IKE). *secret* must be an alphanumeric string of 1 through 127 characters.
encrypted isakmp-secret *secret*: Specifies the pre-shared key for IKE. Encryption must be used when sending the key. *secret* must be an alphanumeric string of 1 through 127 characters.

no

Disables tunneling for the current subscriber. When peer-address is included, the tunneling for that specific L2TP Network Server (LNS) is disabled but tunneling to other configured LNSs is still enabled.

Usage

Use this command to configure specific L2TP tunneling parameters for the current subscriber.



Example

To specify L2tp tunneling to the LNS peer at the IP address *198.162.10.100* with a shared secret of *bigco* and preference of *1*, enter the following command:

```
tunnel l2tp peer-address 198.162.10.100 secret bigco preference 1
```

Chapter 252
TACACS+ Configuration Mode Commands

This chapter describes all commands available in the TACACS+ Configuration Mode. TACACS+ (Terminal Access Controller Access-Control System Plus) is a secure, encrypted protocol. By remotely accessing TACACS+ servers that are provisioned with the administrative user account database, the ASR 5000 and ASR 5500 support TACACS+ accounting and authentication services for system administrative users.

Important: TACACS Configuration Mode is available in releases 11.0 and later.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

Enables the recording of the start and the stop time each command issued during a TACACS+-authenticated CLI session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] accounting { start-stop | command }
```

no

Disables a configured TACACS+ accounting setting (either **accounting start-stop** or **accounting command**).

{start-stop | command}

Specifies the type of accounting records to be recorded.

- **start-stop**: Records the time at which the session starts (the time at which the user passes authentication) and the time at which the user exits. If a user exits before passing authentication, only a stop time is recorded.
- **command**: Enables accounting on a command-by-command basis. The TACACS+ server is contacted prior to the execution of the command and the command which is about to be executed is recorded. Only commands which are valid for the user privilege and context (mode) in which they are about to be executed will be recorded. Note that the ASR 5000 and ASR 5500 do not record whether the command itself succeeded or failed. For security reasons, some secure or restricted commands are not recorded. In such cases, the accounting record will record the command as three asterisks ("***").

Usage

Use this command to configure the accounting method for TACACS+-based CLI sessions.

authorization

Enables the authorization of TACACS+ CLI users on a command-by-command, command + command argument, or command prompt basis. If the user is not authorized to execute the command, the command will fail.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] authorization { command | prompt | arguments }
```

no

Disables a configured TACACS+ authorization **command**, **prompt**, or **arguments** setting.

{ command | prompt | arguments }

Specifies the type of authorization behavior to enforce:

- **command**: Enables per-command authorization. The TACACS+ server is contacted for each command and each command is authorized for the user. If the user is not authorized to execute the command, then the command fails. If the user is authorized for the command, the command is executed.
- **prompt**: Enables per-command authorization, as described for the **command** option above. However, since commands may be duplicated in different CLI modes, this version of the command authorization also passes the command prompt string to the server. The TACACS+ server is contacted for each prompt and command and must have a matching string for the prompt/command combination. Enabling **prompt** authorization supersedes **command** authorization, since the prompt and command must be authorized together.
- **arguments**: Enables per-command and command + argument authorization. The TACACS+ server authorizes each command and its arguments for the user. If the user is not authorized to execute the command and the corresponding arguments, the command fails. If the command does not contain any arguments, then the command only is passed to the authorization server.

Usage

Use this command to configure the authorization method for TACACS+-based CLI sessions.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

on-authen-fail

Defines system behavior when an administrative login fails due to a TACACS+ authentication failure. This command also can be used to configure system behavior separately for TACACS+ authentication failures for administrative users accessing the system via the ASR 5000 or ASR 5500 console port.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
on-authen-fail { continue | stop } [ tty console ]
```

`{ continue | stop }`

Specifies the type of authentication behavior to enforce:

- **`continue`**: After a TACACS+ authentication failure, the system will continue with authentication using non-TACACS+ authentication services.
- **`stop`**: After a TACACS+ authentication failure, the system forces the failed TACACS+ user to exit.

`tty console`

Release 12 and later systems only: Used after the **`stop`** or **`continue`** parameters to specify system behavior for users being authenticated via the ASR 5000 or ASR 5500 console port:

- **`stop tty console`**: Forces the failed TACACS+ user to exit.
- **`continue tty console`**: The system will continue with authentication using non-TACACS+ authentication services.

Usage

Use this command to configure system behavior for users that fail TACACS+ authentication.

on-network-error

Configures ASR 5000 or ASR 5500 behavior when a TACACS+ login fails due to a network error. This command also can be used to configure system behavior separately for TACACS+ network error login failures for administrative users accessing the system via the ASR 5000 or ASR 5500 console port.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
on-network-error { continue | stop } [ tty console ]
```

`continue`

The system will continue with authentication using non-TACACS+ authentication services.

`stop`

The system forces the failed TACACS+ user to exit.

`tty console`

Release 12 and later systems only: Can be used after the **`continue`** or **`stop`** options to specify system behavior for TACACS+ CLI users being authenticated via the console port on the chassis:

- **`stop tty console`**: Forces the failed user to exit when authentication fails.
- **`continue tty console`**: The system will continue with authentication using non-TACACS+ authentication services.

Usage

Use this command to configure system behavior for users who fail TACACS+ authentication due to a network error.

on-unknown-user

Configures ASR 5000 or ASR 5500 behavior when a TACACS+ server cannot authenticate a given user name. This command also can be used to configure system behavior separately for TACACS+ unknown user login failures for administrative users accessing the system via the ASR 5000 or ASR 5500 console port.

Important: Some TACACS+ server implementations will not send a Reply message indicating that the user name is invalid. Instead, these types of implementations will accept the username, whether valid or not, and then examine the username and password in combination before sending a Reply message indicating a failed TACACS+ login. In these cases, specifying **on-unknown-user** will not enforce the desired system behavior. To avoid this scenario, determine the method the configured TACACS+ servers will use to validate user names before deciding whether specifying the **on-unknown-user** command will provide the desired result.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

on-unkown-user { continue | stop } [tty console]

{ continue | stop }

Specifies the particular behavior to enforce:

- **continue**: The system continues with authentication using non-TACACS+ authentication services.
- **stop**: The system forces the failed TACACS+ user to exit.

[

tty console

Release 12 and later systems only: Can be used after the **continue** or **stop** options to specify the behavior of the system for TACACS+ CLI users being authenticated via the console port on the chassis.

- **stop tty console**: The system forces the failed user to exit when authentication fails.
- **continue tty console**: The system will continue with authentication using non-TACACS+ authentication services.

Usage

Use this command to configure ASR 5000 or ASR 5500 behavior for users who fail TACACS+ user name authentication.

server

Configures TACACS+ AAA service-related parameters for use in authenticating ASR 5000 or ASR 5500 administrative users via a TACACS+ server.

Important: Once a TACACS+ server is configured with the **server** command, TACACS+ AAA services for the ASR 5000 or ASR 5500 must be enabled using the **aaa tacacs+** command in Global Configuration mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] server priority *priority_number* **ip-address** *ip_address* **[service { authentication | authorization | accounting }] [port** *port_number* **] [{ encrypted password** *shared_secret* **| password** *text_password* **| key** *text_password* **}] [timeout** *seconds* **] [retries** *num_retries* **] [nas-source-address** *ip_address* **]**

no

Removes a specified **server priority** from the TACACS+ server list.

priority

Specifies the order in which TACACS+ servers are to be tried. A maximum of three TACACS+ AAA servers can be configured. *priority_number* can be an integer from 1 (highest priority) to 3 (lowest priority). If no server with priority 1 is specified, the next highest priority is used. If the specified priority matches that of a TACACS+ server already configured, any previously defined server configuration parameter(s) for that priority are returned to the default setting(s).

ip-address

Specifies the IP address of the TACACS+ server in IPv4 dotted-decimal notation. Only one IP address can be defined for a given **server priority**

[service { authentication | authorization | accounting }]

service: *Release 12 and later systems only*: Specifies one or more of the AAA services that the specified TACACS+ server will provide. Use of the **service** keyword requires that at lease one of the available services be specified. If the **service** keyword is not used, the ASR 5000 or ASR 5500 will use the TACACS+ server for all AAA service types. The default is to use authentication, authorization and accounting. Available service types are:

- **authentication**: The specified TACACS+ server should be used for authentication. If a TACACS+ authentication server is not available, TACACS+ will not be used for authorization or accounting.
- **authorization**: The specified TACACS+ server should be used for authorization. If TACACS+ authentication is not used, TACACS+ authorization will not be used. If no authorization server is specified and the user is authenticated, the user will remain logged in with minimum privileges (Inspector level).

- **accounting**: The specified TACACS+ server should be used for accounting. If TACACS+ authentication is not used, TACACS+ accounting will not be used. If no accounting server is specified and the user is authenticated, no accounting will be performed for the user.

port

Specifies the TCP port number to use for communication with the TACACS+ server. *port_number* can be an integer from 1 through 65535. If a port is not specified, the ASR 5000 or ASR 5500 will use port 49.

[{ encrypted password *shared_secret* **| password** *text_password* **| key** *text_password* **}]**

Specify the encrypted or plain-text password:

- **encrypted password** *shared_secret*: Specifies the encrypted value of the shared secret key. The server-side configuration must match the decrypted value for the protocol to work correctly. If **encrypted password** is specified, specifying **password** is invalid. No encryption is used if this value is null (""). The encrypted password can be an alphanumeric string of 1 through 100 characters. If neither an **encrypted password** or **password** is specified, the ASR 5000 or ASR 5500 will not use encryption
- **password** *plain_text_password*: **Release 12.0 and later systems**. Instead of using an encrypted password value, the user can specify a plain-text value for the password. If the **password** keyword is specified, specifying **encrypted password** is invalid. A null string (“”) represents no encryption. The password can be an alphanumeric string of 1 through 32 characters. If neither an **encrypted password** or **password** is specified, then the ASR 5000 or ASR 5500 will not use encryption.
- **key** *plain_text_password*: **Release 11.0 systems only**. Instead of using an encrypted password value, the user can specify a plain-text key value for the password. If the **key** keyword is specified, then specifying **encrypted password** is invalid. A null string represents no encryption. The password can be from 1 to 32 alphanumeric characters in length. If neither an **encrypted password** or **key** is specified, then the ASR 5000 or ASR 5500 will not use encryption.

[timeout *seconds* **]**

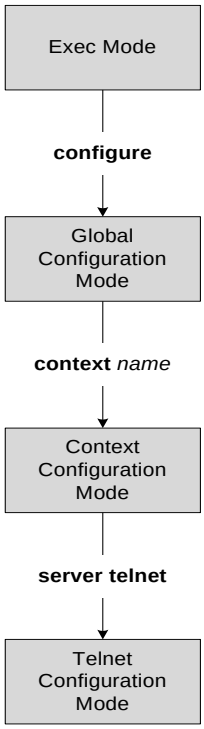
Specifies the number of seconds to wait for a connection timeout from the TACACS+ server. *seconds* can be an integer from 1 through 1000. If no timeout is specified, the ASR 5000 or ASR 5500 will use the default value of 10 seconds.

[

retries *number*

Release 12 and later systems only: Specifies the number of retry attempts at establishing a connection to the TACACS+ server if the initial attempt fails. **retries** *number* can be an integer from 0 through 100. The default is 3. Specifying 0 (zero) retries results in the ASR 5000 or ASR 5500 trying only once to establish a connection. No further retries will be attempted.

nas-source-address *ip_address*



Release 12 and later systems only: Sets the IPv4 address to be specified in the Source Address of the IP header in the TACACS+ protocol packet sent from the NAS to the TACACS+ server. *ip_address* is entered using IPv4 dotted-decimal notation and must be valid for the interface.

Usage

Use this command to specify TACACS+ service parameters for a specified TACACS+ server.

Chapter 253
Telnet Configuration Mode Commands

The Telnet Configuration Mode is used to manage the telnet server options for the current context.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

max servers

Configures the maximum number of telnet servers that can be started within any 60-second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

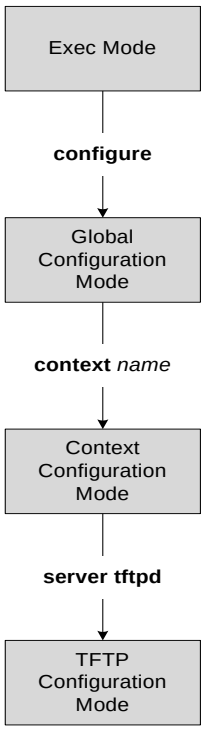
Syntax

max servers *count*

count

Default: 40
Specifies the maximum number of servers that can be spawned in any 6- second interval. *count* must be an integer from 1 through 100.

Usage



Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that telnet services do not cause excessive system impact to other services.

Example

```
max servers 50
```

Chapter 254
TFTP Configuration Mode Commands

The TFTP configuration mode is used to manage the TFTP (Trivial File Transfer Protocol) servers for the current context.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

policy

Assigns traffic policies, pre-configured in Policy-Map Configuration mode, to a Policy Group for flow-based traffic policing of a subscriber session flow.

Platform

ASR 5000

Product

HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

[no] policy *policy_map_name* **precedence** *value* **direction [in | out]**

no

Disables/removes configured policy for traffic policing.

direction [in | out]

Specifies the direction in which the policies need to be applied.

policy *policy_map_name*

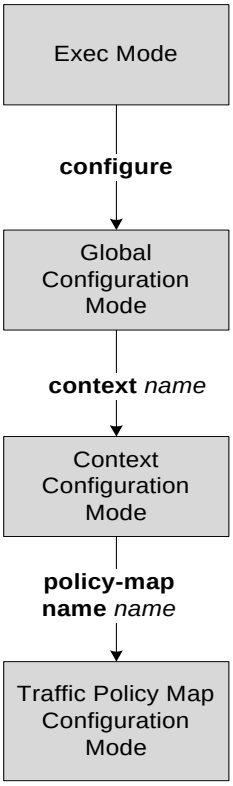
Specifies the policy name as an alphanumeric string of 1 through 15 characters.

precedence *value*

Specifies the precedence of traffic policies to resolve.
value is an integer from 1 through 16. If a session flow matches multiple policies, this keyword resolves them.

Usage

Use this command to form a policy-group with a set of pre-configured Policy-Maps.



Example

The following commands assigns the traffic policy *policymap1* with precedence *2*.

```
policy policymap1 precedence 2
```

Chapter 256
Traffic Policy-Map Configuration Mode Commands

A Policy-Map imposes a flow-based traffic policy for Traffic Policy feature within a destination context. It designates the flow treatment based on the classification rules configured in Class-Map mode for a subscriber session flow.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

3gpp2 data-over-signaling

Configures 3GPP2-related flow treatment policy for the flow-based traffic policing of subscriber sessions.

Platform

ASR 5000

Product

HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

3gpp2 data-over-signaling marking [class-map *class_name* **]**

no 3gpp2 data-over-signaling marking

no

Disables configured 3GPP2-related flow treatment policy.

class-map *class_name*

Associates class map to be used for selective data over signaling (DOS) marking. *class_name* is an alphanumeric string of 1 through 15 characters.

marking

Indicates 3GPP2-related traffic flow for data over signaling channel.

Usage

Use this command to mark traffic flows for 3GPP2-related policy.

Example

```
3gpp2 data-over-signaling marking
```

access-control

Configures the access control action for traffic flows matching the Class-Map rules.

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
access-control { allow | discard }
```

allow

Allows the packets, if the policy matches with the criteria defined in the Class-Map assigned to the specific traffic policy.

discard

Discards the packets, if the policy matches with the criteria defined in the Class-Map assigned to the specific traffic policy.

Usage

Configures the action or treatment for traffic flows match criteria specified in the assigned Class-Map.

Example

The following command allows the packets or traffic flow on matching with criteria specified in assigned Class-Map for specific traffic policy.

```
access-control allow
```

accounting suppress

Suppresses accounting action for traffic flows matching the policy map.

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] accounting suppress
```

no

Removes the suppression of accounting for traffic flow matching this policy map.

Usage

Use this command to suppress accounting action on traffic flow matching this policy map.
Policy maps configured for accounting suppression are used to implement the QChat Billing Suppression feature that selectively starts and terminates accounting sessions based on the categorization of traffic as being interesting or non-interesting. See the **accounting trigger** command.

Example

The following command configures suppression of accounting on traffic flows matching this policy map:

```
accounting suppress
```

accounting trigger

Configures an accounting trigger policy map to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting. This command supports the QCHAT Billing Suppression feature.

Platform

ASR 5000

Product

HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] accounting trigger { inactivity-timeout | interesting-traffic | intra-service-handoff }
```

default

Sets or restores the default value assigned for specified parameter.

no

Disables previously configured triggers.

inactivity-timeout

Generates an accounting Stop message if there has been no data activity on the session for the interim accounting timeout interval.
Default: disabled

interesting-traffic

Generates an accounting Start message upon arrival of interesting traffic.
Default: disabled

intra-service-handoff

Generates accounting Start and Stop messages during intra-service handoffs.
Default: enabled
If disabled, the messages are suppressed during the handoffs. The current accounting session continues and no Stop or Start messages are generated during the intra-service handoff.

Usage

Use this command to configure an accounting trigger policy map (ATPM) to selectively start and terminate accounting sessions based on the categorization of traffic as being interesting or non-interesting. This command supports the QChat Billing Suppression feature.
Interesting traffic is identified as traffic that does not match any of the other Accounting Policy Maps (APMs) configured for accounting suppression. See the **accounting suppress** command.
An ATPM is similar to an APM, but without the class map rules. The ATPM is configured as of type accounting using the **type accounting** command.

Optionally, timeout can be triggered when there is no data traffic for the interim accounting timeout interval using the **accounting trigger inactivity-timeout stop** command. On timeout, the accounting session is terminated and an Accounting Stop message is sent. A new accounting session is created if interesting traffic resumes.
In the ATPM, the trigger to start accounting for interesting traffic is configured using the **accounting trigger interesting-traffic** command. Accounting Start is triggered on arrival of interesting traffic, or change in airlink parameters conveyed through active-start airlink record. If an active-start record was included in the initial connection setup, Accounting Start is not triggered. But if the active-start comes separately and is the first one for the session, it is treated as airlink change and an Accounting Start is sent. The ATPM should have the lowest precedence among the APMs.
As the airlink events are generated on the ingress side, the ATPM must be included in a policy group that is applied to the ingress direction in the subscriber profile. The configuration is applicable only for standard trigger policy and session based accounting mode.

Example

The following command sets the trigger to generate accounting start message upon arrival of interesting traffic:

```
accounting trigger interesting-traffic
```

class-map

Assigns a traffic classification rule (Class-Map) to the policy map.

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

[no] class-map *name*

no

Enables or disables **class-map**.

name

Specifies the name of the class map assigned for this policy map. The class map should have been preconfigured via the Class Map Configuration Mode.
name must be an alphanumeric a string of 1 through 15 characters.

Usage

Use this command to assign a class map to the policy map for traffic policing. The class map is configured in the Class Map Configuration Mode.

Example

The following command assigns the class map *classification1* to the current policy map:

```
class classification1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

flow-tp-trigger

This command specifies that the traffic volume will be calculated based on the traffic on the flow.

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

flow-tp-trigger volume *traffic_volume_threshold*

no flow-tp-trigger volume

traffic_volume_threshold

Specifies the volume threshold to trigger traffic policing. *volume* must be an integer from 1 through 4294967295.

Usage

This command is available if you have purchased and installed the Intelligent Traffic Control License on your system. Use this command to calculate the traffic volume based on the traffic on the flow.

Example

```
flow-tp-trigger volume 500
```

ip header-compression

Enables the system to mark IP flows for Robust Header Compression (RoHC).

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip header-compression rohc flow-marking
```

no

Disables the setting.

rohc flow-marking

Marks the IP flow for SO67 and PPP RoHC.

Usage

Use this command to mark IP flows for SO67 and PPP RoHC.

Example

```
ip header-compression rohc flow-marking
```

qos encaps-header

Enables and configures Quality of Service (QoS) policy to use Differentiated Service Code Point (DSCP) marking in IP header fields for the flow-based traffic policing to subscriber session flow.

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
qos encaps-header dscp-marking { dscp_code | copy-from-user-datagram [ ignore-pcf-signaled-dscp ] | user-datagram }

no qos encaps-header dscp-marking { dscp_code | copy-from-user-datagram [ ignore-pcf-signaled-dscp ] }
```

no

Enables/Disables the **qos encaps-header**.
The value must be expressed as a hexadecimal value from 0x00 through 0x3F.

dscp-marking *dscp_code*

Uses the DSCP code value marked in the IP header of packet/flow to determine the QoS for traffic policing. *dscp_code* must be expressed as a hexadecimal number from 0x00 through 0x3F.

copy-from-user-datagram

Uses the DSCP code value from the user datagram (UDP header) to determine the QoS for traffic policing.

ignore-pcf-signaled-dscp

Overrides the highest priority DSCP value signaled by the PCF.

user-datagram

Uses the DSCP value copied from the user datagram.

Usage

Use this command to apply the QoS policy based on the DSCP value encapsulated in the IP packet header to police subscriber session traffic flows.

Important: For more information on the QoS traffic policing, see the *System Administration Guide*.

Example

The following command sets QoS policy with DSCP code value to *0x0C* for Class 1, silver (AF12):

```
qos encaps-header dscp-marking 0x0c
```

qos traffic-police

Enables and configures Quality of Service (QoS) policy for flow-based traffic policing of subscriber session flows on a per-flow basis.

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
qos traffic-police committed bps peak bps burst-size byte exceed-action { drop | lower-ip-precedence | allow } violate-action { drop | lower-ip-precedence | allow }

no qos traffic-police
```

no

Enables/Disables the **qos traffic-police**

Important: This parameter should be configured to be greater than the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the "bucket" for the configured peak-data-rate.

burst-size *bytes*

Default: 3000
Specifies the allowed peak burst size in bytes. *bytes* must be an integer from 0 through 4294967295.

Important: This parameter should be configured to be greater than the following two values: 1) three times greater than the packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the "bucket" for the configured peak-data-rate.

committed *bps*

Default: 144000
Specifies the committed data rate (guaranteed-data-rate) in bits per second (bps).
bps must be an integer from 0 through 4294967295.

exceed-action { drop | lower-ip-precedence | allow }

Default: **lower-ip-precedence**
Specifies the action to take on packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the ip-precedence
allow: Transmits the packet

peak *bps*

Default: 256000
Specifies the peak data-rate for the subscriber in bits per second (bps).
bps must be an integer from 0 through 4294967295.

violate-action { drop | lower-ip-precedence | allow }

Default: drop
Specifies the action to take on the packets that exceed both the committed-data-rate and the peak-data-rate.
The following actions are supported:
drop: Drops the packet
lower-ip-precedence: Transmits the packet after lowering the IP precedence
allow: Transmits the packet

Usage

Use this command to apply the QoS policy to a subscriber session flow for flow-based traffic policing.

Important: For additional information on the QoS traffic policing, see the *System Administration Guide*.

Example

The following command sets the committed data rate to *102400* bps with a peak data rate of *128000* bps and a burst size of *2048* bytes. This lowers the IP precedence when the committed-data-rate is exceeded and drops the packets when the peak-data-rate are violated:

```
qos traffic-police commited 102400 peak 128000 burst-size 2048 exceed-
action lower-ip-precedence violate-action drop
```

qos user-datagram dscp-marking

Enables and configures Quality of Service (QoS) policy related to differentiated service code point (DSCP) marking in the user datagrams of subscriber session flows on a per-flow basis.

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

qos user-datagram dscp-marking *dscp_code*

no qos user-datagram dscp-marking

dscp_code

Specifies the use of the DSCP code value marked in the IP header of packet/flow to determine the QoS for traffic policing. *dscp_code* must be expressed as a hexadecimal number from 0x00 through 0x3F.

Usage

Use this command to apply the QoS policy to subscriber session flow by DSCP marking in user datagram.

Example

The following command sets DSCP marking for user datagram as *0x01* for QoS to subscriber session flow:

```
qos user-datagram dscp-marking 0x01
```

sess-tp-trigger

Configures the trigger for traffic policing based on the traffic volume for a subscriber session.

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

sess-tp-trigger volume *volume* **direction { both | downlink | uplink }**

no sess-tp-trigger

no

Enables or disables the **sess-tp-trigger**

volume

Specifies the traffic volume threshold (in bytes) that triggers traffic control. *volume* is an integer from 1 through 4294967295.

Usage

Use this command to trigger traffic control based on the traffic volume for a subscriber session. This command requires the purchase and installation of a license.

Example

```
sess-tp-trigger 500
```

type

Specifies the type of traffic policy within a specific Policy-Map.

Platform

ASR 5000

Product

ASN GW, HA, HSGW, PDSN, P-GW, SCM

Privilege

Administrator

Syntax

type { accounting | dynamic { three-gpp2 rev-A profile-id { any | id *profile_id* **| range** *low_value* **to** *high_value* **} flow-id { any | id** *flow_id* **| range** *low_value* **to** *high_value* **} | pre-provisioned wimax asn-service-profile-id { any | id** *service_id* **} asn-pdfid { any | id** *pdf_id* **} | static | template }**

accounting

Specifies the type of traffic policing as accounting for this specific policy map. This configuration is used for enabling/disabling the accounting of different flows matching conditions within this Policy-Map.

dynamic

Identifies the type of policy map as dynamic.

three-gpp2 rev-A

Configures the dynamic policy map type for CDMA2000-3GPP2 RevA service.

profile-id { any | id *profile_id* **| range** *low_hex* **to** *high_hex* **}**

Specifies the profile id matching within this policy map.
any: allows any profile identifier matching this policy map.
id *profile_id*: allows specific profile identifier matching with in this policy map. *profile_id* must be a hexadecimal number from 0x0 to 0xFFFF.
range *low_value* **to** *high_value*: identifies a range in which a profile identifier must fall within to be considered a match. *low_value* and *high_value* must be either a hexadecimal number from 0x0 to 0xFFFF, or an integer from 0 through 65535 characters.

flow-id { any | id *flow_id* **| range** *low_hex* **to** *high_hex* **}**

Specifies the flow id matching in this policy map.
any allows any flow identifier matching with in this policy map.
id *flow_id* allows specific flow identifier matching with in this policy map. *flow_id* must be either a a hexadecimal number from 0x0 to 0xFFFF, or an integer from 0 to 65535.
range *low_value* **to** *high_value*: identifies a range in which a flow identifier must fall within to be considered a match. *low_value* and *high_value* must be either a hexadecimal number from 0x0 to 0xFFFF, or an integer 0 to 65535.

pre-provisioned

Identifies the type of policy map as pre-provisioned.

wimax

Configures WiMAX service policy map in an ASN-GW service.

asn-service-profile { any | id *service_id* **}**

Specifies the ASN Service profile identifier to match with in this policy map.
any: Allows any ASN Service Profile Identifier matching within this policy map.
id *service_id*: Allows specific Service Profile matching to a specified identifier. *service_id* must be an integer from 1 to 65535 that matches a service ID that was configured in the Subscriber Configuration Mode.

asn-pdfid { any | id *pdf_id* **}**

Specifies the ASN Packet Data Flow Identifier to match with in this policy map.
any: Allows any ASN Packet Data Flow Identifier matching within this policy map.
id *pdf_id*: Allows specific Packet Data Flow matching to a specified identifier. *pdf_id* must be an integer from 1 to 255 that matches a PDF ID that was configured in the Subscriber Configuration Mode.

static

Specifies the type of traffic policing as static for this specific Policy Map. In this type of policy, the traffic flow classification and flow treatment is pre-defined with classification rules through Class-Map configuration.
This is the detailed type of policy map.

template

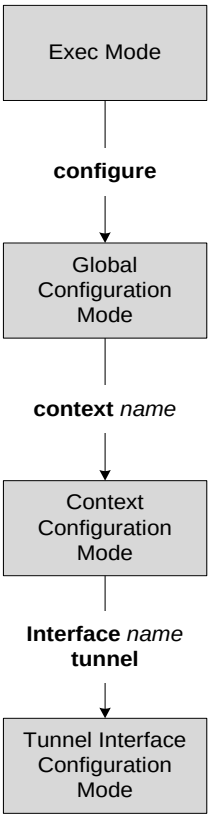
Specifies the type of traffic policy to as a template to all subscribers associated with this policy map.

Usage

Specifies the type of traffic policy within the specific Policy-Map.

Example

The following commands configures the traffic policy for this Policy-Map as static:



```
type static
```

The following commands configures the traffic policy for this Policy-Map as pre-provisioned for WiMAX service requiring a match of any service profile and PDF id of *3*:

```
type pre-provisioned wimax asn-service-profile any asn-pdfid id 3
```

Chapter 257
Tunnel Interface Configuration Mode Commands

The Tunnel Interface Configuration Mode is used to create and manage the IP interfaces for various types of tunnels including associated parameters, such as addresses and address resolution options.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

description

Enters descriptive text for the current interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Clears the description for the interface.

text

Contains the descriptive text for this interface. *text* must be an alphanumeric string of 0 through 79 characters. If spaces are required, the string must be bracketed with double quotation marks (“). The interface description is case sensitive.

Usage

Set the description to provide useful information regarding the interface’s primary function, services, end users, etc.

Example

The following command describes this interface:

```
description sampleInterfaceDescriptiveText
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ip address

Configures the IPv4 address for this tunnel interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip address [*ip_address***/***ip_mask* **|** *ip_address ip_mask***]**

no ip address *ip_address*

no

Removes the configured IPv4 address bound to a tunnel interface.

*ip_address***/***ip_mask* **|** *ip_address ip_mask*

Specifies a destination IP address or group of addresses that will use this route.
*ip_address***/***ip_mask*: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. *ip_address***/***ip_mask* must be specified using IPv4 dotted-decimal and CIDR notation. *ip_mask*is an integer which is the number of bits in the subnet mask.
ip_address ip_mask: Specifies an IP address and the networking (subnet) mask pair which is used to identify the set of IP addresses to which the route applies. *ip_address* must be specified using the IPv4 dotted-decimal notation. *ip_mask* must be specified using the IPv4 dotted-decimal notation as network mask for subnets.
The mask as specified by *ip_mask* or resulting from *ip_address***/***ip_mask* is used to determine the network for packet routing.
Zeroes ("0") in the resulting mask indicate that the corresponding bit in the IP address is not significant in determining the network for packet routing.
Ones ("1") in the resulting mask indicate the corresponding bit in the IP address is significant in determining the network.

Usage

Use this command to bind the IPv4 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

Example

The following command will assign the *10.2.3.4* as IPv4 address to this tunnel interface:

```
ip address 10.2.3.4
```

ipv6 address

Configures the IPv6 address for the specific tunnel interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

ipv6 address *ipv6_address/ipv6_mask*

no ipv6 address *ipv6_address*

no

Removes the configured IPv6 address bound to a tunnel interface.

*ipv6_address***/***ipv6_mask*

Specifies a destination IP address or group of addresses that will use this route.
*ipv6_address***/***ipv6_mask*: Specifies a combined IP address subnet mask bits to indicate what IP addresses to which the route applies. *ipv6_address***/***ipv6_mask* must be specified usingIPv6 colon-separated-hexadecimal and CIDR notation. *ipv6_mask* is a numeric value which is the number of bits in the subnet mask.

Usage

Use this command to bind the IPv6 address to a tunnel interface. This address does not affect the encapsulation of packets going out on the tunnel interface.

Example

The following command will assign the *1001::2:010:1234* as IPv6 address to this tunnel interface:

```
ipv6 address 1001::2:010:1234
```

tunnel-mode

Configures the tunnel mode type for this tunnel interface. It also enters the specific tunnel configuration mode, if required.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
tunnel-mode { gre | ipv6ip }

defualt tunnel-mode
```

default

Sets the default tunnel mode for this interface. By default, the tunnel mode is set to IPv6-to-IPv4 type.

gre

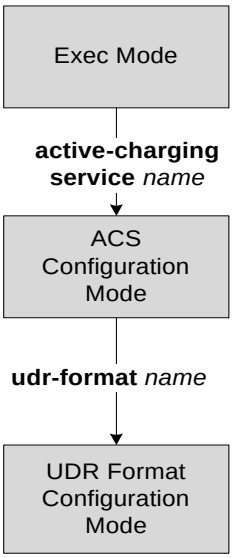
Default: Disabled
Sets the tunnel interface mode to Generic Routing Encapsulation (GRE) type and enters the GRE Tunnel Configuration mode, if required.

ipv6ip

Default: Enabled
Sets the tunnel interface mode to IPv6-to-IPv4 type and creates the IPv6-to-IPv4 Tunnel Configuration mode, if required.

Usage

Use this command to set the tunnel mode type of GRE or IPv6-to-IPv4 for the tunneling interface.



Example

The following command sets the tunnel mode to GRE for specific interface:

```
tunnel-mode gre
```

Chapter 258
UDR Format Configuration Mode Commands

The UDR Format Configuration Mode enables configuring User Detail Record (UDR) formats.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

attribute

This command allows you to specify the fields and their order in UDRs.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
attribute attribute { [ format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-
HH:MM:SS | YYYYMMDDHHMMSS | seconds } [ localtime ] | [ { bytes | pkts } { downlink |
uplink } ] ] priority priority }

no attribute attribute [ priority priority ]
```

no

If added previously, removes the specified attribute from the UDR format.

attribute *attribute*

Specifies the attribute.
attribute must be one of the following:

Attribute	Description
diameter-session-id	This attribute reports Diameter session identifier. **Important:** This attribute is customer specific, and is only available in 8.3 and later releases.
failure-handling-mode	This attribute reports failure handling mode in case the Online Charging System (OCS) goes abnormal.
radius-called-station-id	This attribute reports the Called Station ID of the mobile handling the flow.
radius-calling-station-id	This attribute reports the Calling Station ID of the mobile handling the flow.
radius-fa-nas-identifier	This attribute reports the RADIUS NAS identifier of Foreign Agent (FA).
radius-fa-nas-ip-address	This attribute reports the RADIUS IP address of Foreign Agent (FA).
radius-nas-identifier	This attribute reports the RADIUS NAS identifier.
radius-nas-ip-address	This attribute reports the RADIUS NAS IP address. Note that this attribute is interchangeable with **sn-st16-ip-addr** for the user.

Attribute	Description
radius-user-name	This attribute reports the user name associated with the flow.
sn-3gpp2-bsid	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-3gpp2-carrier-id	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-3gpp2-esn	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-3gpp2-meid	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-3gpp2-service-option	This option has been deprecated. To configure this attribute see the rule-variable command.
sn-acct-beginning-session	This attribute reports the Session Beginning information. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-acct-session-continue	This attribute reports the Session Continue information. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-acct-session-id	This attribute reports the Accounting Session identifier.
sn-acct-session-time	This attribute reports the duration from acct-status-type:start to acct-status-type:stop. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-acct-status-type	This attribute reports the Accounting Status identifier. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-charging-type	This attribute reports the charging type: offline or online. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.

Attribute	Description
sn-closure-reason	This attribute reports the reason for termination of the flow/UDR: • 0 = CALL_TERMINATION — normal, such as subscriber session ended • 1 = PDSN_HO — handoff control processing specified • 2 = TIME_LIMIT • 3 = VOLUME_LIMIT • 4 = MGMT_INTERVENTION • 5 = ACCT_SESS_START • 6 = CCRU_RESPONSE • 7 = OFFLINE_CHARGING — for UDRs generated when offline charging trigger is received from DCCA
sn-content-id	This attribute reports the unique identifier for the content-id.
sn-content-label	This attribute reports the identifier for text label for content-id.
sn-content-vol	This attribute reports the identifier for content volume.
sn-correlation-id	This attribute reports the RADIUS correlation identifier.
sn-duration	This attribute reports the time difference between the first and last packet of a single data flow accounted in the UDR record. For example, the time difference between the first ICMP echo request and the last ICMP echo response before the record gets written for the content-id.
sn-end-time [format *format*]	This attribute reports the timestamp for last packet of flow in UTC.
sn-fa-correlation-id	This attribute reports the RADIUS Correlation Identifier of the Foreign Agent (FA).
sn-fa-ip-address	This attribute reports IP address of the FA.
sn-filler-blank	This attribute inserts a blank filler field, generates an empty UDR field.
sn-filler-zero	This attribute inserts a “0” in the UDR field.
sn-format-name	This attribute reports name of the UDR format used.
sn-group-id	This attribute reports the sequence group identifier for the records.
sn-ha-ip-address	This attribute reports IP address of the Home Agent (HA). ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-local-seq-no	This attribute reports unique local sequence number of UDR identifier per ACSMgr/SessMgr and linearly increasing in UDR file.

Attribute	Description
sn-ocs-ip-address	This attribute reports IP address of the Online Charging Server. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-rulebase	This attribute reports name of the ACS rulebase used.
sn-sequence-no	This attribute reports unique sequence number (per **sn-sequence-group** and **radius-nas-ip-address**) of UDR identifier and linearly increasing in UDR file.
sn-served-bsa-addr	This attribute reports address of Base Station Area being served.
sn-service-name	This attribute reports name of the ACS service.
sn-st16-ip-addr	This option has been deprecated. This attribute reports IP address of the chassis handling this flow. This attribute is interchangeable with **radius-nas-ip-address** for other systems.
sn-start-time [format *format* **]**	This attribute reports timestamp for first packet of flow in UTC.
sn-stream-number	This attribute reports unique UDR billing record identifier. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.
sn-subscriber-id	This attribute reports subscriber ID.
sn-subscriber-nat-flow-ip	This attribute reports NAT IP address(es) of NAT-enabled subscriber.
sn-timestamp	This attribute reports timestamp when the UDR is actually generated. ***Important:*** This attribute is customer specific, and is only available in 8.3 and later releases.

format { MM/DD/YY-HH:MM:SS | MM/DD/YYYY-HH:MM:SS | YYYY/MM/DD-HH:MM:SS | YYYYMMDDHHMMSS | seconds }

Specifies the timestamp format.

localtime

Specifies the local time. By default, timestamps are displayed in Coordinated Universal Time (UTC).

{ bytes | pkts } { downlink | uplink }

Specifies bytes/packets sent/received from/by mobile.

priority *priority*

Specifies the position priority of the field within the UDR. Lower numbered priorities (across all attribute, event-label, and rule-variable) occur first.
priority must be an integer from 1 through 65535. Up to 50 position priorities (across all attribute, event-label, and rule-variable) can be configured.

Usage

Use this command to set the attributes and priority for UDR file format.
A particular field in UDR format can be entered multiple times at different priorities. While removing the UDR field using the **no attribute** command, you can either remove all occurrences of a particular field by specifying the field name or remove a single occurrence by additionally specifying the optional **priority** keyword.
Consider the following scenario. If the volume/time threshold interval is large enough (or disabled). At time t=0, 10 ICMP packets are sent, which takes 9 seconds. There is nothing for the next 100 seconds, and then again 10 ICMP packets are sent which takes 10 seconds, and then again nothing for next the 60 seconds and then the session is terminated.
In this scenario:

- sn-start-time should be t = 0.
- sn-end-time should be t = 0+9+100+10 (sn-end-time would be the last ICMP packet sent).
- sn-duration should be sn-end-time minus sn-start-time, i.e. 0+9+100+10 – 0 = 119 seconds (since the ICMP flow would exist between the two intervals of sending ICMP packets, the sn-start-time would be that of the first packet of the flow and sn-end-time of the last packet (20th packet). Hence, sn-duration would take into account all the seconds between the first and last packet of the flow).

Example

The following is an example of this command:

```
attribute radius-user-name priority 12
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

event-label

This command allows you to specify an optional event label/identifier to be used as an attribute in the UDRs.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

event-label *event_label* **priority** *priority*

no event-label

no

If previously configured, removes the event label configuration.

event_label

Specifies the event label/identifier to be used as UDR attribute.
event_label must be an alphanumeric string of 1 through 63 characters.

priority *priority*

Specifies the Comma Separated Value (CSV) position of the attribute (label/identifier) in the UDR.
priority must be an integer from 1 through 65535.

Usage

Use this command to configure an optional event label/identifier as an attribute in the UDR and its position in the UDR.

Example

The following is an example of this command:

```
event-label radius_csv1 priority 23
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

rule-variable

This command allows you to specify fields and their order in UDRs.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

rule-variable *rule_variable* **priority** *priority*

no rule-variable *rule_variable* **[priority** *priority* **]**

no

If previously configured, removes the specified rule variable configuration.

rule-variable *rule_variable*

Specifies the rule variable for the UDR format.
rule_variable must be one of the following options:

- **bearer 3gpp2**: Bearer-related configuration:
  - **always-on**
  - **bsid**
  - **carrier-id**
  - **esn**
  - **ip-qos**
  - **ip-technology**
  - **meid**
  - **release-indicator**
  - **serv-MDN**
  - **service-option**
  - **session-begin**
  - **session-continue**

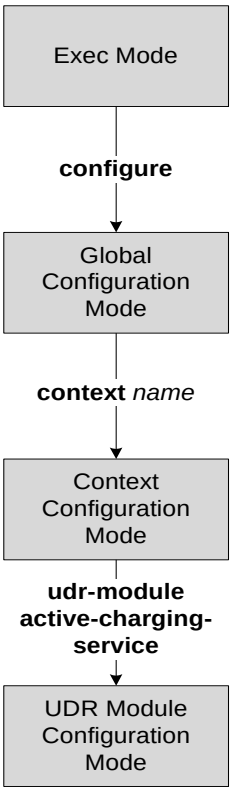
Important: For more information on protocol-based rules see the *ACS Ruledef Configuration Mode Commands* chapter.

priority *priority*

Specifies the CSV position of the field (protocol rule) in the UDR.
priority must be an integer from 1 through 65535.

Usage

Use this command to specify what field appears in which order in the UDR.
A particular field in UDR format can be entered multiple times at different priorities. While removing the UDR field using the **no rule-variable** command, you can either remove all occurrences of a particular field by specifying the field name, or remove a single occurrence by additionally specifying the optional priority keyword.



Example

The following is an example of this command:

```
rule-variable bearer 3gpp2 bsid priority 36
```

Chapter 259
UDR Module Configuration Mode Commands

The UDR Module Configuration Mode allows you to configure Usage Data Record (UDR) file transfer parameters.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cdr

This command allows you to configure EDR/UDR file transfer parameters.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cdr { push-interval push_interval | push-trigger space-usage-percent trigger_percentage |
remove-file-after-transfer | transfer-mode { pull | push primary { encrypted-url
encrypted_url | url url } [ [ secondary { encrypted-secondary-url encrypted_secondary_url
| secondary-url secondary_url } ] [ via local-context ] + ] | use-harddisk }

default cdr [ push-interval | push-trigger space-usage-percent | remove-file-after-
transfer | transfer-mode [ push via ] | use-harddisk ] +

no cdr [ remove-file-after-transfer | use-harddisk ] +
```

default

Configures the default setting for the specified keyword(s):

- **push-interval**: 300 seconds
- **push-trigger**: 80 percent
- **remove-file-after-transfer**: Disabled
- **transfer mode**: Pull
- **push via**: line card is used for push
- **use-harddisk**: Disabled

Important: The **use-harddisk** keyword is only available on ASR 5000 chassis.

no

If previously configured, disables the specified configuration:

- **remove-file-after-transfer**: Retains a copy of the file even after it has been pushed or pulled to another server.
- **use-harddisk**: Disables data storage on the SMC hard disk.

Important: The **use-harddisk** keyword is available only on the ASR 5000 chassis.

push-interval *value*

Specifies the transfer interval (in seconds) to push UDR/EDR files to an external file server.
value must be an integer from 60 through 3600.

Default: 300

push-trigger space-usage-percent *trigger_percentage*

Specifies the UDR/EDR disk space utilization percentage, upon reaching which an automatic push is triggered and files are transferred to the configured external server.
trigger_percentage specifies the UDR/EDR disk utilization percentage for triggering push, and must be an integer from 10 through 80.
Default: 80%

remove-file-after-transfer

Specifies that the system must delete UDR/EDR files after they are transferred to the external file server.
Default: Disabled

transfer-mode { pull | push primary { encrypted-url *encrypted_url* **| url** *url* **} [[secondary { encrypted-secondary-url** *encrypted_secondary_url* **| secondary-url** *secondary_url* **}] [via local-context] +]**

Specifies the UDR/EDR file transfer mode.

- **pull**: Specifies that the L-ESS is to pull the UDR files.
- **push**: Specifies that the system is to push UDR files to the configured L-ESS.
- **primary encrypted-url** *encrypted_url*: Specifies the primary location in encrypted format to which the system pushes the UDR files.

  encrypted_url must be the primary location name in an encrypted format, and must be an alphanumeric string of 1 through 1024 characters.
- **primary url** *url*: Specifies the primary location to which the system pushes the UDR files.

  url must be the primary location, and must be an alphanumeric string of 1 through 1024 characters in the format: *//user:password@host:[port]/directory*.
- **secondary encrypted-secondary-url** *encrypted_secondary_url*: Specifies the secondary location in encrypted format to which the system pushes the UDR files when the primary location is unreachable or fails.

  encrypted_secondary_url must be the location in an encrypted format, and must be an alphanumeric string of 1 through 1024 characters.
- **secondary secondary-url** *secondary_url*: Specifies the secondary location to which the system pushes the UDR files when the primary location is unreachable or fails.

  secondary_url must be the secondary location, and must be an alphanumeric string of 1 through 1024 characters in the format: *//user:password@host:[port]/directory*.
- **via local-context**: Selects the LC/SPIO for transfer of UDRs. The system pushes the UDR files via SPIO in the local context.

use-harddisk

Important: The **use-harddisk** keyword is available only on the ASR 5000 chassis.

Specifies that on an ASR 5000 chassis, the hard disk on the SMC will be used to store UDR/EDR files. When configured to use the hard disk for UDR/EDR storage, UDR/EDR files are transferred from packet processing cards to the hard disk on the SMC.

Default: Disabled

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure how UDRs are moved and stored.
On the ASR 5000 chassis, run this command only from the local context. Running in any other context would fail and deliver an error message.
If PUSH transfer mode is configured, the L-ESS server URL to which the UDR files need to be transferred to must be specified. The configuration allows a primary and a secondary server to be configured. Configuring the secondary server is optional. Whenever a file transfer to the primary server fails for four consecutive times, the files will be transferred to the secondary server. The transfer will switch back to the original primary server when:

- Four consecutive transfer failures to the secondary server occur
- After switching from the primary server, 30 minutes elapses

When changing the transfer-mode from pull to push, disable the PULL from L-ESS and then change the transfer mode to push. Make sure that the push server URL configured is accessible from the local context. Also, make sure that the base directory that is mentioned contains udr directory created within it.
When changing the transfer-mode from push to pull, after changing, enable PULL on the L-ESS. Any of the ongoing PUSH activity will continue till all the scheduled file transfers are completed. If there is no PUSH activity going on at the time of this configuration change, all the PUSH related configuration is nullified immediately.
The **cdr use-harddisk** command is available only on the ASR 5000 chassis. This command can be run only in a context where CDRMOD is running. Configuring in any other context will result in failure with the message *"Failure: Please Check if CDRMOD is running in this context or not."*
The **cdr use-harddisk** command can be configured either in the UDR or EDR module, but will be applicable to both record types. Configuring in one of the modules will prevent the configuration to be applied in the other module. Any change to this configuration must be done in the module in which it was configured, the change will be applied to both record types.

Example

The following command configures the system to retain a copy of the data file after it has been transferred to the storage location:

```
no cdr remove-file-after-transfer
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

file

This command allows you to configure UDR file parameters.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Syntax

file [charging-service-name { include | omit }] [compression { gzip | none }] [current-prefix *string* **] [delete-timeout** *seconds* **] [directory** *directory_name* **] [exclude-checksum-record] [field-separator { hyphen | omit | underscore }] [file-sequence-number rulebase-seq-num] [headers] [name** *file_name* **] [reset-indicator] [rotation [num-records** *number* **| time** *seconds* **| volume** *bytes* **]] [sequence-number { length** *length* **| omit | padded | padded-six-length | unpadded }] [storage-limit** *limit* **] [time-stamp { expanded-format | rotated-format | unix-format }] [trailing-text** *string* **] [trap-on-file-delete] [udr-seq-num] [xor-final-record] +**

default file [charging-service-name] [compression] [current-prefix] [delete-timeout] [directory] [field-separator] [file-sequence-number] [headers] [name] [reset-indicator] [rotation { num-records | time | volume }] [sequence-number] [storage-limit] [time-stamp] [trailing-text] [udr-seq-num]

---

default

Configures the default setting for the specified keyword(s). Using the **default file** command will reset some but not all keyword parameters to their default values. To ensure that the default is reset for a specific parameter, include the corresponding keyword in the command.

---

charging-service-name { include | omit }

Specifies to include/exclude name of the charging service in the file name.

- **include**: Includes name of the charging service in the UDR file name.
- **omit**: Excludes name of the charging service in the UDR file name.

Default: **include**

---

compression { gzip | none }

Configures gzip compression of the UDR file.

- **gzip**: Enables GNU zip compression of the UDR file at approximately 10:1 ratio.
- **none**: Disables Gzip compression.

Default: **none**

---

current-prefix *string*

Specifies a string to add to the beginning of the UDR file that is currently being used to store UDR records.

string must be an alphanumeric string of 1 through 31 characters.
Default: curr

delete-timeout *seconds*

Specifies a timeout period (in seconds) when completed UDR files are deleted. By default, files are never deleted.
seconds must be an integer from 3600 through 31536000.
Default: Disabled

directory *directory_name*

Specifies a subdirectory in the default directory in which to store UDR files.
directory_name must be an alphanumeric string of 1 through 191 characters.
Default: /records/udr

exclude-checksum-record

When entered, this keyword excludes the final record containing #CHECKSUM followed by the 32-bit Cyclic Redundancy Check (CRC) of all preceding records from the UDR file.
Default: Disabled, inserts checksum record into the UDR file header.

field-separator { hyphen | omit | underscore }

Specifies the field separators to be used between two fields of a UDR file name.

- **hyphen**: Specifies to use '-' (hyphen) as the field separator.
- **omit**: Excludes the field separator.
- **underscore**: Specifies to use '_' (underscore) as the field separator.

Default: **underscore**

file-sequence-number rulebase-seq-num

Generates unique file sequence numbers for different rulebase-format-name combinations.

headers

Includes a file header summarizing the record layout.

name *file_name*

Default: udr
Specifies a string to use as the base file name for UDR files.
file_name must be an alphanumeric string of 1 through 31 characters. The file name format is as follows:
base_rulebase_format_sequencenum_timestamp

- *base*: Specifies type of record in file or contains the operator-specified string. Default: udr
- *rulebase*: Specifies the name of the ACS rulebase. UDRs from different rulebases go into different UDR files.
- *format*: Specifies the name of the UDR format if **single-udr-format** is specified, else the format field (and the trailing underscore) is omitted from the file name.
- *sequencenum*: This is a 5-digit sequence number to detect the missing file sequence. It is unique among all UDR files on the system.

- *timestamp*: Contains a timestamp based on file creation time in UTC formatted as: MMDDYYYYHHMMSS.

UDR files that have not been closed have a string added to the beginning of their file names.
File name for a UDR file in CSV format that contains information for a rulebase named *rulebase1* and a UDR schema named *udr_schema1* appears as follows:
udr_rulebase1_udr_schema1_00005_01302006143409
If file name is not configured, the system creates files for EDRs/UDRs/FDRs (xDRs) using the following name template with limits to 256 characters:
basename_ChargSvcName_ timestamp_SeqNumResetIndicator_FileSeqNumber

- *basename*: A global-based configurable text string that is unique per system that uniquely identifies the global location of the system running ACS.
- *ChargSvcName*: A system context-based configurable text string that uniquely identifies a specific context-based charging service.
- *timestamp*: Date and time at the instance of file creation. Date and time in the format: "MMDDYYYYHHmmSS", where HH is a 24-hour value from 00-23.
- *SeqNumResetIndicator*: A one-byte counter used to discern the potential for duplicated FileSeqNumber with a range of 0 through 255, which is incremented by a value of 1 for the following conditions:
  - Failure of an ACS software process on an individual packet processing card
  - Failure of the system such that a second system takes over (for example, a standby or backup chassis put in place according to Inter-chassis Session Recovery)
  - File Sequence Number (FileSeqNumber) rollover from 999999999 to 0
- *FileSeqNumber*: unique file sequence number for the file is a 9-digit integer from 000000000 through 999999999. It is unique on each chassis.

File name for a closed xDR file in CSV format that contains information for ACS *xyz_city1* and charging service name *preapaid2* with timestamp *12311969190000*, and file sequence number counter reset indicator to *002* for file sequence number *034939002* appears as follows:
xyz_city1_preapaid2_12311969190000_002_034939002
File name for a running xDR file in CSV format that contains information for the same parameters for file sequence number *034939003* prefixed with *curr_* and appears as follows:
curr_xyz_city1_preapaid2_12311969190000_002_034939002

Important: When the "rulebase name" and "edr-format-name" options are enabled through this **file** command, if the "field-separator" value is "underscore" (default value) then, in the filename, the fields Rulebase name and EDR format name will be separated by "hyphen". If the "field-separator" value is "hyphen" then, in the filename, the fields Rulebase name and EDR format name will be separated by "underscore". This will ensure that the number of the fields in the filename is not increased and does not affect the backend billing system.

reset-indicator

Specifies to include the reset indicator counter value, from 0 to 255, in the UDR file name and is incremented (by one) whenever any of the following conditions occur:

- An ACSMgr/SessMgr process fails.
- An Inter-chassis Session Recovery (ICSR) peer chassis has transitioned from standby to active.
- The sequence number in sequence-number keyword has rolled over to zero.

rotation { num-records *records* **| time** *seconds* **| volume** *bytes* **}**

Specifies when to close a UDR file and create a new one.

- **num-records** *records*: Specifies the number of records that should be added to the file. When the number of records in the file reaches this specified value, the file is complete.

  records must be an integer from 100 through 10240.

  Default: 1024

- **time** *seconds*: Specifies the period of time to wait before closing the UDR file and creating a new one.

  seconds must be an integer from 30 through 86400.

  Default: 3600 seconds

- **volume** *bytes*: Specifies the maximum size of the UDR file before closing it and creating a new one.

  bytes must be an integer from 51200 through 62914560.

  Default: 102400 bytes

  Note that higher settings may provide the best compression ratio when the **compression** keyword is set to *gzip*.

sequence-number { length *length* **| omit | padded | padded-six-length | unpadded }**

Specifies including or excluding the sequence number in the file name.

- **length** *length*: Includes the sequence number with the specified length.

  length must be the length of the file sequence number with preceding zeroes in the file name, and must be an integer from 1 through 9.

  Important: The **length** configuration is applicable in both UDR and EDR modules. When applied in both modules without the **file udr-seq-num** configuration, the minimum among the two values will come into effect for both modules. With the **file udr-seq-num** config, each module will use its own value of length.

- **omit**: Excludes the sequence number from the file name.
- **padded**: Includes the padded sequence number with preceding zeros in the file name. This is the default setting.
- **padded-six-length**: Includes the padded sequence number with six preceding zeros in the file name.
- **unpadded**: Includes the unpadded sequence number in the file name.

Default: **padded**

storage-limit *limit*

Specifies deleting files when the specified amount of space, in bytes, is used up for UDR/EDR file storage on packet processing card RAM.
On an ASR 5000 chassis, *limit* must be an integer from 10485760 through 536870912.
Default: 33554432

Important: On the ASR 5000 chassis, the total storage limit is 536870912 bytes (512 MB). This limit is for both UDR and EDR files combined.

time-stamp { expanded-format | rotated-format | unix-format }

Specifies the timestamp of when the file was created be included in the file name.

- **expanded-format**: Specifies the UTC MMDDYYYYHHMMSS format.
- **rotated-format**: Specifies the YYYYMMDDHHMMSS format.
- **unix-format**: Specifies the UNIX format of *x*.*y*, where *x* is the number of seconds since 1/1/1970 and *y* is the fractional portion of the current second that has elapsed.

trailing-text *string*

Specifies the inclusion of arbitrary text string in the file name.
string must be an alphanumeric string of 1 through 30 characters.

trap-on-file-delete

Instructs the system to send an SNMP notification (starCDRFileRemoved) when an UDR/EDR file is deleted due to lack of space.
Default: Disabled

udr-seq-num

Specifies that the file sequence numbers that are part of the UDR file names be independently generated. If disabled, a single set of sequence numbers are shared by both UDR and EDR files.
Default: Disabled

xor-final-record

Specifies inserting an XOR checksum (in place of the CRC checksum) into the UDR file header if the **exclude-checksum-record** keyword is left at its default setting.
Default: Disabled

+

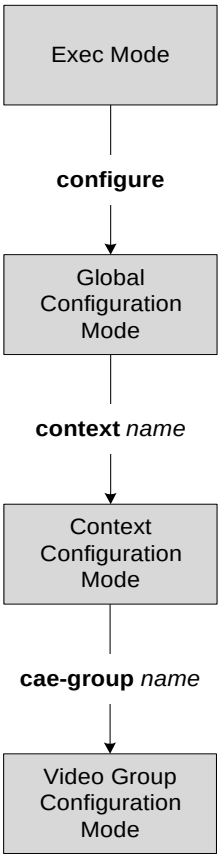
More than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure UDR file characteristics.

Example

The following command sets the prefix of the current active UDR file to *current*:



```
file current-prefix current
```

The following command sets the base file name to *UDRfile*:

```
file name UDRfile
```

Chapter 260
Video Group Configuration Mode

The Video Group Configuration Mode is used to add CAEs to a CAE group and configure the CAEs for load balancing and health-check monitoring. The CAE (Content Adaptation Engine) is an optional component of the Mobile Videoscape. For additional information, refer to the *Mobile Video Gateway Administration Guide*.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

keepalive-server

Specifies keep-alive messaging information for Content Adaptation Engine (CAE) health-check monitoring, which is part of CAE load balancing on the Mobile Video Gateway. Note that this command and its options configure settings that apply to all CAEs in the CAE group, not to an individual CAE.

Platform

ASR 5000

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

[default] keepalive-server deadtime *seconds* **interval** *seconds* **num-retry** *num-retries* **port** *port_number* **timeout** *seconds* **[-noconfirm]**

default keepalive-server

Sets the CAE keep-alive settings to their default values.

keepalive-server deadtime *seconds* **interval** *seconds* **num-retry** *num-retries* **port** *port_number* **timeout** *seconds* **[-noconfirm]**

Specifies keep-alive messaging information for CAE health-check monitoring.

deadtime *seconds*

Specifies the periodic retry interval (in seconds) after a CAE is detected down. *seconds* is an integer from 1 through 1800. The default value is 120 seconds.

interval *seconds*

Specifies the interval (in seconds) for how often the Mobile Video Gateway sends a keep-alive message to the CAEs. *seconds* is an integer from 0 through 120. The default value is 10 seconds. A value of 0 turns off keep-alive detection and marks the state of all CAEs to Up.

num-retry *num_retries*

Specifies the number of keepalive retries after a CAE does not respond. *num_retries* is an integer from 1 through 20. The default value is 3 retries.

port *port_number*

Specifies the TCP port number for health-check monitoring, which is an integer from 1 through 65535. The default value is 5100.

timeout *seconds*

Specifies the keep-alive timeout (in seconds) which is an integer from 1 through 30. The default value is 3 seconds.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to specify keep-alive messaging information for CAE health-check monitoring, which is part of CAE load balancing on the Mobile Video Gateway.

Example

The following command specifies keep-alive messaging information for the CAEs in the CAE group:

```
keepalive-server deadtime 120 interval 10 num-retry 3 port 5100 timeout 3
```

local-address

Specifies the local IPv4 address on the Mobile Video Gateway for the keepalive TCP connection used for Content Adaptation Engine (CAE) load balancing.

Platform

ASR 5000

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

[no] local-address *IPv4_address* **[-noconfirm]**

no local-address *IPv4_address*

Deletes the local IPv4 address if previously specified.

local-address *IPv4_address*

Specifies the local IPv4 address on the Mobile Video Gateway for the keep-live TCP connection used for CAE load balancing. *IPv4_address* must be in dotted decimal notation.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to specify the local IPv4 address on the Mobile Video Gateway, in dotted-decimal notation.

Example

The following command specifies the local IPv4 address on the Mobile Video Gateway:

```
local-address 10.2.3.4
```

server

Adds a CAE (Content Adaptation Engine) and its IPv4 address and port number to the associated CAE group. The Mobile Video Gateway uses this information for CAE load balancing. The Mobile Video Gateway has a system limit of 64 CAEs.

Platform

ASR 5000

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

[no] server *cae_name* **address** *IPv4_address* **port** *port_number* **[-noconfirm]**

---

no server *cae_name*

Deletes the CAE from the CAE group if previously configured.

---

server *cae_name* **address** *IPv4_address* **port** *port_number*

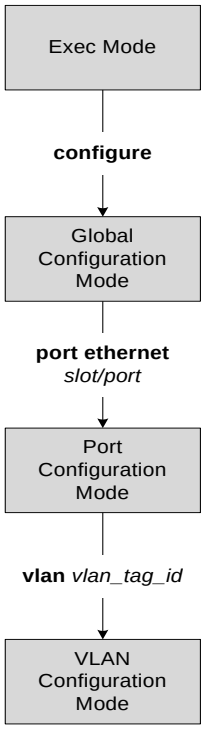
Adds a CAE and its IPv4 address and port number to the associated CAE group. *cae_name* is an alphanumeric string of 1 through 15 characters. *IPv4_address* must be in dotted-decimal notation. *port_number* is an integer from 1 through 5535. The default value is 80.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to add a CAE and its IPv4 address and port number to the associated CAE group.



Example

The following command adds a CAE named *cae_1* and its IPv4 address and port number to the associated CAE group:

```
server cae_1 address 10.2.3.4 port 80
```

Chapter 261
VLAN Configuration Mode Commands

The VLAN Configuration Mode is used to create and manage Virtual LANs and their bindings with contexts.

Important: Availabe commands or keywords/variables vary based on platform type, product version, and installed license(s).

bind interface

Associates a VLAN interface with a context.

Platform

ASR 5000

Product

HA, HSGW, PDSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] bind interface *interface_name context_name*

no

Disasscoiates the VLAN interface from the context.

interface_name context_name

Specifies the name of the virtual interface and the context to which it will be bound.
interface_name must be an alphanumeric string of 1 through 79 characters.
context_name must refer to a previously configured context expressed as an alphanumeric string of 1 through 79 characters.

Usage

Bind a VLAN interface to a context to suport VLAN service.

Example

```
bind interface sampleVirtual sampleContext

no bind interface sampleVirtual sampleContext
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ingress-mode

Enables or disables port ingress (incoming) mode for this VLAN ID on this port.

Platform

ASR 5000

Product

HA, HSGW, PDSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ingress-mode
```

no

Disables the port ingress mode.

Usage

Use this command to enable or disable the VLAN ingress mode for this port.

Example

```
ingress-mode
```

priority

Sets the 802.1p VLAN priority bit for ASN-GW service only.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

priority *value*

no priority

no

Disables the setting of the 802.1p priority bit.

value

Sets the value of the 802.1p priority bit as an integer from 0 through 7, with 7 being the highest priority.

Usage

Set a value for the VLAN priority bit as used in the ANS-GW.
Refer to the *ASN-GW Administration Guide* for additional information on support for 802.1p.

Example

To set a VLAN priority bit value, use the following command:

```
priority 3
```

To disable the use of a VLAN priority bit, use the following command:

```
no priority
```

shutdown

Disables or enables traffic over this VLAN.

Platform

ASR 5000

Product

HA, HSGW, PDSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the VLAN. When omitted the VLAN is shutdown.

Usage

Shut down a VLAN.
To bring a VLAN into service, execute this command using the **no** keyword.

Example

To disable a VLAN from sending or receiving network traffic use the following command:

```
shutdown
```

To enable a VLAN use the following command:

```
no shutdown
```

vlan-map

Associates an IP interface having a VLAN ID with a context.

Platform

ASR 5000

Product

HA, HSGW, PDSN, P-GW, SGSN

Privilege

Security Administrator, Administrator

Syntax

vlan-map interface *if_name context_name*

interface *if_name context_name*

Associates the specified VLAN interface with a context.
if_name is an exisitng interface name specified as an alphanumeric string of 1 through 79 characters.
context_name is an exisitng context name specified as an alphanumeric string of 1 through 79 characters.

Usage

Use **vlan-map** to associate multiple VLAN interfaces with a single context. This feature is used in conjunction with nexthop forwarding and overlapping IP pools.

Example

```
vlan-map interface vlan234 ingress
```
