For more information on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Reference*.

Usage

This command can display either a summarized or full (verbose) view of statistics collected for the traffic that has gone through the LLC layer for either all GPRS services or for a specified GPRS service.

Example

The following command displays the frame Tx/Rx LLC statistics for GPRS service *gprs1*:

```
show llc statistics gprs-service gprs1
```

show lma-service

Displays statistic and counter information for Local Mobility Anchor (LMA) services on this system.

Platform

ASR 5000

Product

P-GW

Privilege

Inspector

Mode

Exec

Syntax

show lma-service all

show lma-service name *service_name*

show lma-service session [all | callid *id* **| counters | full | ipv6-address { <** *address* **| >** *address* **|** *address* **| greater-than** *address* **[less-than** *address* **] | less-than** *address* **[greater-than** *address* **] } | summary | username** *name* **]**

show lma-service statistics [lma-service *name* **] } [| { grep** *grep_options* **| more }]**

---

all

Displays information about all configured LMA services on this system.

---

name *service_name*

Displays configuration information for an existing LMA service specified as an alphanumeric string of 1 through 63 characters.

---

session [all | callid *id* **| counters | full | ipv6-address { <** *address* **| >** *address* **|** *address* **| greater-than** *address* **[less-than** *address* **] | less-than** *address* **[greater-than** *address* **] } | summary | username** *name* **]**

Displays session information filtered by the following parameters:
all: Displays all active LMA sessions using LMA services on the system.
callid *id*: Displays available session information for the call identification number specified as an eight-byte hexadecimal number.
counters: Displays session counters for active LMA sessions using LMA services on the system. This keyword can also be filtered by the following:

- **all**
- **callid**
- **ipv6-address**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.

full: Displays additional session information for active LMA sessions using LMA services on the system. This keyword includes the information in the output of the **all** keyword plus additional information. This keyword can also be filtered by the following:

- **all**
- **callid**
- **ipv6-address**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.

ipv6-address:

- **<** *address* and **less-than** *address*: Displays summarized information for a group of IPv6 addresses that are less than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the **greater-than** option. *address* must be specified in IPv6 colon-separated-hexadecimal notation.
- **>** *address* and **greater-than** *address*: Displays summarized information for a group of IPv6 addresses that are greater than the specified IPv6 address using one of these keywords. A range can be specified by including an address with the **less-than** option. *address* must be specified in IPv6 colon-separated-hexadecimal notation.
- *address*: Displays summarized information for a specific IPv6 address using an LMA service on this system. *address* must be specified in IPv6 colon-separated-hexadecimal notation.

summary: Displays the number of LMA sessions currently active for LMA services configured on the system.

username *name*: Displays available session information for an existing user specified as an alphanumeric string of 1 through 127 characters.

---

statistics [lma-service *name* **]**

lma-service *name*: Displays LMA service statistics for an existing LMA service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for LMA services on this system.

Example

The following command displays service statistics for the LMA service named *lma1*:

```
show lma-service name lma1
```

show lns-service

Displays the information for all L2TP Network Server (LNS) services or for a particular LNS service.

Platform

ASR 5000

Product

PDSN

HA

GGSN

LNS

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show lns-service { all | name *service_name* **} [| { grep** *grep_options* **| more }]**

all

Display information for all LNS services.

name *service_name*

Displays information only for an existing LNS service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to list information for LNS services configured on this system.

Example

The following commands display information for all LNS services and the LNS service named *lns1*, respectively.

```
show lns-service all

show lns-service name lns1
```

show local-policy

Displays information pertaining to local QoS policy services.

Platform

ASR 5000

Product

P-GW

Privilege

Security Administrator

Mode

Exec

Syntax

show local-policy statistics { all | service *service_name* **| summary } | { grep** *grep_options* **| more }**

statistics { all | service *service_name* **| summary }**

Display statistics pertaining to local QoS services.
all: Displays information for all local QoS services.
service *service_name*: Displays statistics only for an existing local QoS service specified as an alphanumeric string of 1 through 64 characters.
summary: Displays summarized statistics all local QoS services.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistics for local QoS policies on this system.

Example

The following command displays statistics for the local QoS policy named *sample1*.

```
show local-policy statistics service sample1
```

show local-user

Displays information pertaining to local-user accounts.

Platform

ASR 5000

Product

All

Privilege

Security Administrator

Mode

Exec

Syntax

show local-user [[username *name* **] [inactive** *filter* **] [verbose | wide] | statistics [verbose]]**

---

username *name*

Displays information for an existing local-user administrative account specified as an alphanumeric string of 3 through 16 characters that is case sensitive. If a username is not specified, information is displayed for all local users.

---

inactive *filter*

Specifies a filter for displaying inactive local-user accounts:

- **<** *days*: Displays accounts that have been inactive less than the specified number of days.
- **>** *days*: Displays accounts that have been inactive more than the specified number of days.
- **greater-than** *days*: Displays accounts that have been inactive more than the specified number of days.
- **less-than** *days*: Displays accounts that have been inactive less than the specified number of days.

days can be configured to an integer from 1 through 365.

[verbose | wide]

Specifies how the information is to be displayed as one of the following options:

- **verbose**: The data is displayed in list format. Additional information is provided beyond what is displayed when the **wide** option is used.
- **wide**: The data is displayed in tabular format. This is the default setting.

---

statistics [verbose]

Displays local-user statistics.
Using the **verbose** keyword displays additional statistics.

Usage

Use this command to display information and statistics on local-user administrative accounts.

Example

The following command displays detailed information on local-user administrative accounts that have been inactive for more than 10 days:

```
show local-user inactive greater-than 10 verbose
```

The following command displays detailed information for a local-user account named *Test*:

```
show local-user username Test verbose
```

The following command displays detailed local-user account statistics:

```
show local-user statistics verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show logging

Displays the defined logging filters for the current context.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show logging [active | verbose] [| { grep *grep_options* **| more }]**

active | verbose

active: Displays only active CLI logging filter information in concise format.
verbose: Displays as much information as possible.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View log filters to troubleshoot disk utilization issues.

Example

```
show logging

show logging active

show logging verbose

show logging active verbose
```

show logical-port utilization table

Displays logical port (VLAN and NPU) utilization for a specified interface port.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show logical port utilization table *slot/port* **[vlan { 5-minute | hourly }] [| { grep** *grep_options* **| more }]**

slot/port

Specifies the port for which logical-port statistics will be displayed. The slot and port must refer to an installed card and port.

vlan { 5-minute | hourly }

Displays only active VLAN information for the specified collection interval.

- **5-minute**: Displays 5-minute utilization intervals for the past 24 hours.
- **hourly**: Displays hourly utilization intervals for the past 24 hours.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View logical port (VLAN) statistics for 5-minute intervals on port 17/1.

Example

```
show logical-port utilization table 17/1 vlan 5-minute
```

show logs

Displays active and inactive logs filtered by the options specified.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show logs [active] [inactive] [callid *call_id* **] [event-verbosity** *evt_verboseness* **] [facility** *facility* **] [level** *severity_level* **] [pdu-data** *pdu_format* **] [pdu-verbosity** *pdu_verboseness* **] [proclet** *facility* **] [since** *from_date_time* **[until** *to_date_time* **]] [| { grep** *grep_options* **| more }]**

active

Displays data from active logs.

inactive

Displays data from inactive logs.

callid *call_id*

Displays log information only for a call ID specified as a 4-digit hexadecimal number.

event-verbosity *evt_verboseness*

Specifies the level of verboseness to use in displaying of event data as one of:

- **min** - displays minimal information about the event. Information includes event name, facility, event ID, severity level, date, and time.
- **concise** - displays detailed information about the event, but does not provide the event source within the system.
- **full** - displays detailed information about event, including source information, identifying where within the system the event was generated.

facility *facility*

Specifies the facility to modify the filtering of logged information for as one of:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: Authentication, Authorization and Accounting (AAA) client facility
- **aaamgr**: AAA manager logging facility

- **aaaproxy**: AAA Proxy facility
- **aal2**: ATM Adaptation Layer 2 (AAL2) protocol logging facility
- **acl-log**: Access Control List (ACL) logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: ACS Manager facility
- **alarmctrl**: Alarm Controller facility
- **alcap**: Access Link Control Application Part (ALCAP) protocol logging facility
- **alcapmgr**: ALCAP manager logging facility
- **all**: All facilities
- **asngwmgr**: Access Service Network (ASN) Gateway Manager facility
- **asnpcmgr**: ASN Paging Controller Manager facility
- **bfd**: Bidirectional Forwarding Detection (BFD) protocol logging facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **bssap+**: Base Station Sub-system Application Part+ protocol facility for the login interface between the SGSN and the MSC/VLR (2.5G and 3G)
- **bssgp**: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)
- **callhome**: Call Home application logging facility
- **cap**: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
- **cli**: Command Line Interface (CLI) logging facility
- **credit-control**: Credit Control (CC) facility
- **cscf**: IMS/MMD Call Session Control Function (CSCF)
- **cscfmgr**: SIP CSCF Manager facility
- **cscfnpdb**: CSCF Number Portability Database (NPDB) logging facility
- **cscfttmgr**: SIP CSCF Tunnel and Transport Manager facility
- **csp**: Card/Slot/Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: CSS RADIUS Signaling facility
- **cx-diameter**: Cx Diameter Messages facility
- **dcardctrl**: IPSec Daughter Card Controller logging facility
- **dcardmgr**: IPSec Daughter Card Manager logging facility
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: Dynamic Host Configuration Protocol (DHCP) logging facility
- **dhcpv6**: DHCPv6
- **dhost**: Distributed Host logging facility
- **diabase**: Diabase messages facility

- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-dns**: Diameter DNS subsystem
- **diameter-ecs**: ACS Diameter signaling facility
- **diameter-hdd**: Diameter Horizontal Directional Drilling (HDD) Interface facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSec Data Path facility
- **drvctrl**: Driver Controller facility
- **eap-ipsec**: Extensible Authentication Protocol (EAP) IPSec facility
- **eap-sta-s6a-s13-s6b-diameter**: EAP/STA/S6A/S13/S6B Diameter messages facility
- **ecs-css**: ACSMGR <-> Session Manager Signalling Interface facility
- **egtpc**: eGTP-C logging facility
- **egtpmgr**: enhanced GPRS Tunneling Protocol (eGTP) manager logging facility
- **egtpu**: eGTP-U logging facility
- **epdg**: evolved Packet Data (ePDG) gateway logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **fng**: Femto Network Gateway (FNG) logging facility
- **gmm**:
  - For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
  - For 3G: Logs the access application layer (above the RANAP layer)
- **gprs-app**: GPRS Application logging facility
- **gprs-ns**: GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
- **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages facility
- **gss-gcdr**: GTPP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility
- **gtpcmgr**: GTP-C protocol manager logging facility
- **gtpp**: GTP-prime protocol logging facility
- **gtpu**: GTP-U protocol logging facility
- **gtpumgr**: GTP-U Demux manager
- **gx-ty-diameter**: Gx/Ty Diameter messages facility
- **gy-diameter**: Gy Diameter messages facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility

- **hdctrl**: HD Controller logging facility
- **hnb-gw**: HNB-GW (3G Femto GW) logging facility
- **hnbmgr**: HNB-GW Demux Manager logging facility
- **hss-peer-service**: Home Subscriber Server (HSS) Peer Service facility
- **igmp**: Internet Group Management Protocol (IGMP)
- **ikev2**: Internet Key Exchange version 2 (IKEv2)
- **ims-authorizatn**: IP Multimedia Subsystem (IMS) Authorization Service facility
- **ims-sh**: HSS Diameter Sh Interface Service facility
- **imsimgr**: SGSN IMSI Manager facility
- **imsue**: IMS User Equipment (IMSUE) facility
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipms**: Intelligent Packet Monitoring System (IPMS) logging facility
- **ipsec**: IP Security logging facility
- **ipsg**: IP Service Gateway interface logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ipsp**: IP Pool Sharing Protocol logging facility
- **kvstore**: Key/Value Store (KVSTORE) Store facility
- **l2tp-control**: Layer 2 Tunneling Precool (L2TP) control logging facility
- **l2tp-data**: L2TP data logging facility
- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility
- **lagmgr**: Link Aggregation Group (LAG) manager logging facility
- **li**: Refer to the *Lawful Intercept Interface Reference* for a description of this command.
- **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
- **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
- **local-policy**: Local Policy Service facility
- **location-service**: Location Services facility
- **m3ua**: M3UA Protocol logging facility
- **magmgr**: Mobile Access Gateway manager logging facility
- **map**: Mobile Application Part (MAP) protocol logging facility
- **megadiammgr**: MegaDiameter Manager (SLF Service) logging facility
- **mme-app**: Mobility Management Entity (MME) Application logging facility
- **mme-misc**: MME miscellaneous logging facility
- **mmedemux**: MME Demux Manager logging facility

- **mmemgr**: MME Manager facility
- **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 logging facility
- **mpls**: Multiprotocol Label Switching (MPLS) protocol logging facility
- **mtp2**: Message Transfer Part 2 (MTP2) Service logging facility
- **mtp3**: Message Transfer Part 3 (MTP3) Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **npumgr-acl**: NPUMGR ACL logging facility
- **npumgr-flow**: NPUMGR FLOW logging facility
- **npumgr-fwd**: NPUMGR FWD logging facility
- **npumgr-init**: NPUMGR INIT logging facility
- **npumgr-port**: NPUMGR PORT logging facility
- **npumgr-recovery**: NPUMGR RECOVERY logging facility
- **ntfy-intf**: Notification Interface logging facility [Release 12.0 and earlier versions only]
- **ogw-app**: Offload Gateway (OGW) application logging facility [Release 12.0 and earlier versions only]
- **ogw-gtpc**: OGW GTP-C application logging facility [Release 12.0 and earlier versions only]
- **ogw-gtpu**: OGW GTP-U application logging facility [Release 12.0 and earlier versions only]
- **ogwmgr**: OGW Demux Manager logging facility [Release 12.0 and earlier versions only]
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF protocol logging facility
- **ospfv3**: OSPFv3 protocol logging facility
- **p2p**: Peer-to-Peer Detection logging facility
- **pdg**: Packet Data Gateway (PDG) logging facility
- **pdgdmgr**: PDG Demux Manager logging facility
- **pdif**: Packet Data Interworking Function (PDIF) logging facility
- **pgw**: Packet Data Network Gateway (PGW) logging facility
- **phs**: Payload Header Suppression (PHS)
- **phs-control**: PHS X1/X5 and X2/X6 Interface logging facility
- **phs-data**: PHS Data logging facility
- **phs-eapol**: PHS EAP over LAN (EAPOL) logging facility
- **phsgwmgr**: PHS Gateway Manager facility
- **phspcmgr**: PHS Paging Controller Manager facility
- **pmm-app**: Packet Mobility Management (PMM) application logging facility

- **ppp**: Point-To-Point Protocol (PPP) link and packet facilities
- **pppoe**: PPP over Ethernet logging facility
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Diameter Rf interface messages facility
- **rip**: Routing Information Protocol (RIP) logging facility [RIP is not supported at this time.]
- **rohc**: Robust Header Compression (RoHC) facility
- **rsvp**: Reservation Protocol logging facility
- **rua**: RANAP User Adaptation (RUA) [3G Femto GW - RUA messages] logging facility
- **s1ap**: S1 Application Protocol (S1AP) Protocol logging facility
- **sccp:** Signalling Connection Control Part (SCCP) Protocol logging (connection-oriented messages between RANAP and TCAP layers).
- **sct**: Shared Configuration Task logging facility
- **sctp**: Stream Control Transmission Protocol (SCTP) Protocol logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sesstrc**: session trace logging facility
- **sft**: Switch Fabric Task logging facility
- **sgs**: SGs interface protocol logging facility
- **sgsn-app**: SGSN-APP logging various SGSN “glue” interfaces (for example, between PMM, MAP, GPRS-FSM, SMS).
- **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
- **sgsn-gtpc**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
- **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
- **sgsn-mbms-bearer**: SGSN Multimedia Broadcast/Multicast Service (MBMS) Bearer app (SMGR) logging facility
- **sgsn-misc**: Used by stack manager to log binding and removing between layers
- **sgsn-system**: SGSN System Components logging facility (used infrequently)
- **sgsn-test**: SGSN Tests logging facility; used infrequently
- **sgtpcmgr**: SGSN GTP-C Manager logging information exchange through SGTPC and the GGSN
- **sgw**: Serving Gateway facility

- **sh-diameter**: Sh Diameter messages facility
- **sitmain**: System Initialization Task main logging facility
- **sm-app**: SM Protocol logging facility
- **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
- **sndcp**: Sub Network Dependent Convergence Protocol (SNDCP) logging facility
- **snmp**: SNMP logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **sscfnni**: SSCFNNI Protocol logging facility
- **sscop**: SSCOP Protocol logging facility
- **ssh-ipsec**: SSH IP Security logging facility
- **ssl**: Secure Socket Layer (SSL) message logging facility
- **stat**: Statistics logging facility
- **system**: System logging facility
- **tacacsplus**: TACACS+ Protocol logging facility
- **tcap**: TCAP Protocol logging facility
- **testctrl**: Test Controller logging facility
- **testmgr**: Test Manager logging facility
- **threshold**: threshold logging facility
- **ttg**: Tunnel Termination Gateway (TTG) logging facility
- **tucl**: TCP/UDP Convergence Layer (TUCL) logging facility
- **udr**: User Data Record (UDR) facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User Layer 3 tunnel logging facility
- **usertcp-stack**: User TCP Stack
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

---

level *severity_level*

level *severity_level*: Specifies the level of information to be logged from the following list which is ordered from highest to lowest:

- **critical** - display critical events
- **error** - display error events and all events with a higher severity level
- **warning** - display warning events and all events with a higher severity level
- **unusual** - display unusual events and all events with a higher severity level
- **info** - display info events and all events with a higher severity level
- **trace** - display trace events and all events with a higher severity level

- **debug** - display all events

pdu-data *pdu_format*

Specifies output format for the display of packet data units as one of:

- **none** - output is in raw format (unformatted).
- **hex** - output being displayed in hexadecimal format.
- **hex-ascii** - output being displayed in hexadecimal and ASCII similar to a main-frame dump.

pdu-verbosity *pdu_verboseness*

Specifies the level of verboseness to use in displaying of packet data units as an integer from 1 through 5, where 5 is the most detailed.

proclet *facility*

Shows the logs from a specific proclet facility. The available facilities are the same as those listed earlier.

since *from_date_time* **[until** *to_date_time* **]**

Default: no limit.
since *from_date_time*: indicates only the log information which has been collected more recently than *from_date_time* is to be displayed.
until *to_date_time*: indicates no log information more recent than *to_date_time* is to be displayed.
until defaults to current time when omitted.
from_date_time and *to_date_time* must be formatted as YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss. Where:

- YYYY = 4-digit year
- MM = 2-digit month in the range 01 through 12
- DD = 2-digit day in the range 01 through 31
- HH = 2-digit hour in the range 00 through 23
- mm = 2-digit minute in the range 00 through 59
- ss = 2-digit second in the range 00 through 59

to_date_time must be a time which is more recent than *from_date_time*.
The use of the **until** keyword allows for a time range of log information while only using the **since** keyword will display all information up to the current time.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View log files for general maintenance or troubleshooting system issues.

Example

The following command displays log information for the *a11mgr* facility starting with July 1th, 2011 at midnight.

```
show logs facility allmgr since 2011:07:11:00:00
```

The following command displays the log information for call ID *FE881D32* only in active logs.

```
show logs active callid FE881D32
```

show lte-policy

Displays information for Long term Evolution (LTE) policy configurations on this system including handover restriction lists, subscriber maps, and tracking area identifiers (TAIs).

Platform

ASR 5000

Product

MME

S-GW

Privilege

Inspector

Mode

Exec

Syntax

```
show lte-policy {  ho-restriction-list { name ho_list_name | summary }  | summary } |
subscriber-map { name sub_map_name | summary } | tai-mgmt-db { name tai_name | summary }
} [ | { grep grep_options | more } ]
```

ho-restriction-list { name *list_name* **| summary }**

Displays information about handover restriction lists configured on this system.
name *ho_list_name*: Displays information about a specific handover restriction list configured on this system. *name* must be an existing HO restriction list, expressed as an alphanumeric string of 1 to 64 characters.
summary: Displays summarized information about all handover restriction lists configured on this system.

subscriber-map { name *name* **| summary }**

Displays information about subscriber maps configured on this system.
name *sub_map_name*: Displays information about an existing subscriber map specified as an alphanumeric string of 1 through 64 characters.
summary: Displays summarized information about all subscriber maps configured on this system.

tai-mgmt-db { name *name* **| summary }**

Displays information about TAI management databases configured on this system.
name *tai_name*: Displays information about an existing TAI management database specified as an alphanumeric string of 1 through 64 characters.
summary: Displays summarized information about all TAI management databases configured on this system.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *CLI Overview* chapter.

Usage

Use this command to display information for LTE policy configurations on this system including handover restriction lists, subscriber maps, and tracking area identifiers (TAIs).

Example

The following command displays information about a subscriber map named *map3*:

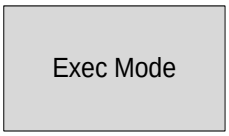
```
show lte-policy subscriber-map name map3
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

Chapter 114
Exec Mode show Commands (M-P)

This section includes the commands **`show mag-service`** through **`show ps-network statistics`**.

The Exec Mode is the initial entry point into the command line interface system. Exec mode **show** commands are useful in troubleshooting and basic system monitoring.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

show mag-service

Displays statistic and counter information for Mobile Access Gateway (MAG) services on this system.

Platform

ASR 5000

Product

HSGW

S-GW

Privilege

Inspector

Mode

Exec

Syntax

show mag-service { all | name *service_name* **| session [all | callid** *id* **| counters | full | ip-address** *home_ip_address* **| msid** *id* **| summary | username** *name* **] | statistics [name** *service_name* **] } [| { grep** *grep_options* **| more }]**

---

all

Displays information for all configured MAG services on this system.

---

name *service_name*

Displays configuration information for a specific MAG service configured on this system.
service_name must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

---

session [all | callid *id* **| counters | full | ip-address** *home_ip_address* **| msid** *id* **| summary | username** *name* **]**

all: Displays all active MAG sessions using MAG services on the system.
callid *id*: Displays available session information for the specific call identification number.
id must be an 8-digit hexadecimal number.
counters: Displays counters for all MAG services on the system.This keyword can also be filtered by the following:

- **all**
- **callid**
- **ip-address**
- **msid**
- **summary**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.
full: Displays additional session information for all active MAG sessions using MAG services on the system. This keyword includes the information in the output of the **all** keyword plus additional information. This keyword can also be filtered by the following:

- **all**

- **callid**
- **ip-address**
- **msid**
- **summary**
- **username**

Refer to the keyword descriptions in this command for information regarding these filters.
ip-address *home_ip_address*: Displays available session information for a specific home IPv4 or IPv6 address of a subscriber in a service session.
msid *id*: Displays available information for a specific mobile station identification number or group of numbers based on wildcard entry.
id must be a valid MSID number and can be a sequence of characters and/or wildcard characters ('$' and/or '*'). The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘). For example: ‘$’.
summary: Displays the number of MAG sessions currently active for MAG services configured on the system.
username *name*: Displays available session information for a specific user in a service session.
name must be followed by an existing user name expressed as an alphanumeric string of 1 through 127 characters.

---

statistics [name *service_name* **]**

name *service_name*: Displays MAG service statistics for an existing MAG service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command’s Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for MAG services on this system.

Example

The following command displays service statistics for the MAG service named *mag1*:

```
show mag-service name mag1
```

show map-service

Displays information configured for the Mobile Application Part (MAP) services, including MAP service features and operational configuration. Also includes some related configuration information for the HLR and EIR configuration parameters.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show map-service [all | name *srvc_name* **] [| { grep** *grep_options* **| more }]**

name *srvc_name*

Specifies an existing MAP service as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display all MAP service or the statistics for a particular MAP service.

Example

The following command displays configuration information for the MAP service named *map-svc-1*:

```
show map-service name map-srv-1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show map statistics

Displays Mobile Application Part (MAP) statistics.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show map statistics [name *srvc_name* **[| { grep** *grep_options* **| more }]**

name *srvc_name*

Specifies an existing MAP service as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display all MAP statistics or the statistics for a particular MAP service.

Example

The following command displays statistics for the MAP service named *map-svc-1*:

```
show map statistics name map-svc-1
```

The following command displays combined statistics for all MAP services in the current context:

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show maximum-temperatures

Shows the maximum temperature reached by each card since the last temperature timestamp reset.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show maximum-temperatures [verbose] [| { grep *grep_options* **| more }]**

verbose

Indicates that the output is to contain detailed information.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Verify the maximum temperature reached by components in the chassis since the indicated timestamp.

Important: This command is not supported on all platforms.

Example

```
show maximum-temperatures

show maximum-tempteratures verbose
```

show mbms bearer-service

Displays configuration information for bearer services configured for the multimedia broadcast multicast service (MBMS) running on this system.

Platform

ASR 5000

Product

GGSN

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show mbms bearer-service [all] [apn *apn_name* **mcast-addr** *ip_address* **] [full] [instance** *instance_id* **] [service-type { broadcast | multicast }] [sgsn-sessions] [summary] [| { grep grep_options | more }]**

all

Displays information on all bearer services configured on the system.

apn *apn_name* **mcast-addr** *ip_address*

Displays bearer service information of the MBMS for a specific Access Point Name (APN). *apn_name* is bound to a given BM-SC (Broadcast Multicast - Service Center) server address *ip_address*.
apn_name is the name of the APN expressed as an alphanumeric string of 1 through 62 characters that is case sensitive.
ip_address is the IP address of the BM-SC server in IPv4 dotted-decimal notation bound to the APN.

full

Displays full information for specific or all instances of bearer service in MBMS feature on system.

instance *instance_id*

Displays session information filtered for an instance of a bearer service running as an MBMS session and specified an integer from 1 through 64.

service-type { broadcast | multicast }

Displays information for a specific type of service for MBMS.
broadcast: Specifies the MBMS service type as broadcast only.
multicast: Specifies the MBMS service type as multicast only.

sgsn-sessions

Displays summary information for all the SGSN multicast sessions.

summary

Displays summary information for specific or all instances of a bearer service.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more** options, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to verify the configuration of one or all bearer services and active instances of bearer services under MBMS. It is also useful for monitoring or troubleshooting purposes.
If this command is executed from within the local context with the **all** keyword, information for all bearer service instances running under MBMS will be displayed.

Example

The following command displays configuration information for all bearer service instances running on system:

```
show mbms bearer-service full all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mipfa

Displays information for specified Mobile IP Foreign Agent (MIP-FA) calls.

Platform

ASR 5000

Product

PDSN

GGSN

ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show mipfa { [[counters | full | summary] { all | callid *call_id* **| msid** *ms_id* **| peer-address [** *operator* **]** *peer_address* **| reverse-tunnel { on | off } | username** *user_name* **} | statistics [fa-service** *fa_name* **| peer-address [** *peer_address* **| greater-than** *peer_address* **| less-than** *peer_address* **| >** *peer_address* **| <** *peer_address* **] }] | peers fa-service** *service_name* **[current-sessions { { > | greater-than }** *sessions* **[<** *sessions* **] | { < | less-than }** *sessions* **[>** *sessions* **] |** *sessions* **}] [peer-address** *address* **] } [| { grep** *grep_options* **| more }]**

---

counters | full | summary

counters: Displayed output includes the statistical counters.
full: Displays detailed information.
summary: Displays only summary information. this is the default setting.
These options are not available in conjunction with the **statistics** keyword.

---

all | callid call_id | msid *ms_id* **| peer-address** *peer_ip_address* **| reverse-tunnel { on | off } | username** *user_name*

all: Displays all available information.
callid *call_id*: Displays information only for calls with the call ID specified as a 4-byte hexadecimal number.
msid *ms_id*: Displays information for a mobile subscriber ID expressed as a string from 7 to 16 digits for an IMSI, MIN, or RMI and/or characters $ and * for wildcard filter.
show mipha msid *01234567$$*
Shows any subscriber with an MSID that matches the upper 8 digits of the supplied MSID, such as 01234567, and any two digits at the remaining two places.
peer-address *peer_ip_address*: Displays information for the MIP call for the peer IP address specified using IPv4 dotted-decimal notation.
reverse-tunnel { **on** | **off** }: Enables the display of reverse IP tunnel information.
username *user_name*: Displays MIP call user information for the username specified as an alphanumeric string of 1 through 127 characters that may include wildcard characters ($ and *).

statistics [fa-service *fa_name* **| peer-address [peer_address | greater-than** *peer_address* **| less-than** *peer_address* **| >** *peer_address* **| <** *peer_address* **]**

Displays information for the foreign agent service specified by name or peer IP address.
fa-service *fa_name* must be an alphanumeric string of 1 through 63 characters.
peer-address *peer_address* must be specified using IPv4 dotted-decimal notation.
greater-than *peer_address*: Specifies the range of IPv4 addresses greater than *peer_address.*
less-than *peer_address*: Specifies the range of IPv4 addresses less than *peer_address.*
> *peer_address*: Specifies the range of IPv4 addresses greater than *peer_address.*
< *peer_address*: Specifies the range of IPv4 addresses less than *peer_address.*

peer-address [*operator* **]** *peer_address*

In conjunction with the **mipfa [summary] peer-address** keyword, indicates a range of peers is to be displayed.
peer-address [*operator* **]** *peer_address* must be specified using IPv4 dotted-decimal notation.
operator implies how to logically specify a range of peer-address and it must be one of the following:

- **<**: IP address is less than the specified *peer_address*
- **>**: IP address is greater than the specified *peer_address*
- **greater-than**: IP address is greater than the specified *peer_address*
- **less-than**: IP address is less than the specified *peer_address*

peers fa-service *service_name* **[current-sessions { { > | greater-than }** *sessions* **[<** *sessions* **] | { < | less-than }** *sessions* **[>** *sessions* **] |** *sessions* **}] [peer-address** *address* **]**

Displays peer servers for the specified FA service.
fa-service *service_name*: Specifies the name of an existing FA service for which the associated peer servers are to be displayed as an alphanumeric string of 1 through 63 characters.
current-sessions: Displays only peer servers with current sessions meeting the following criteria:

- > | greater-than *sessions*: Displays only peer servers currently running sessions higher than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword "**greater-than**" and the "**>**" symbol are interchangeable in this instance of the command.
- **<** *sessions*: Displays only peer servers that are currently running sessions l than the **greater-than** parameter but less than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- < | less-than *sessions*: Displays only peer servers currently running sessions lower than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword "**less-than**" and the "**<**" symbol are interchangeable in this instance of the command.
- > *sessions*: Displays only peer servers that are currently running sessions lower than the **less-than** parameter but more than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- *sessions*: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.

peer-address *address*: Displays only peer servers matching the IP address entered in this parameter. *address* must be specified using IPv4 dotted-decimal notation and can be followed by the netmask of the address.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View MIP foreign agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example

The following displays the call information for all mobile IP FA calls and statistics for *fa1*, respectively:

```
show mipfa all
```

The following command displays the statistics for the foreign agent service *fa1*:

```
show mipfa statistics fa-service fa1
```

The following commands displays call information for user *user6@aaa* in full detail and in summary:

```
show mipfa full username user6@aaa
```

```
show mipfa summary username user1
```

The following displays MIP FA call information for calls from mobile subscriber *4412345678* and peer address *10.2.3.4*, respectively:

```
show mipfa msid 4412345678 4412345678
```

```
show mipfa peer-address 10.2.3.4
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mipha

Displays information for specified Mobile IP Home Agent (MIP-HA) calls.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show mipha { [[counters | full | summary] { all | callid *call_id* **| imsi** *imsi_num* **| ip-address** *ip_addr* **| msid** *msid_num* **| peer-address [** *operator* **]** *peer_address* **| reverse-tunnel { on | off } | username** *user_name* **} | statistics [ha-service** *ha_name* **| peer-address** *peer_address* **] }] | peers ha-service** *service_name* **[current-sessions { { > | greater-than }** *sessions* **[<** *sessions* **] | { < | less-than }** *sessions* **[>** *sessions* **] |** *sessions* **}] [peer-address** *address* **] } [| { grep** *grep_options* **| more }]**

---

counters | full | summary

Default: concise output.
counters: Displayed output includes the statistical counters.
full: Displays detailed information.
summary: Displays only summary information.
These options are not available in conjunction with the **statistics** keyword.

---

msid *msid_num*

Displays information for the subscriber with the supplied MSID on HA.
msid *msid_num* specifies a mobile subscriber ID for which information is to be displayed. *ms_id* must be from 7 to 16 digits for an IMSI, MIN, or RMI and /or characters $ and * for wildcard filtering.
If **enforce imsi-min equivalence** is enabled on the chassis and MIN or IMSI numbers are supplied, this keyword/ filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches the lower 10 digits of the supplied MSID.
show mipha msid *ABCD0123456789* or
show mipha msid *0123456789*
Shows any subscriber with a MSID that match the lower 10 digits of MSID supplied, such as 0123456789.
show mipha msid *01234567$$*
Shows any subscriber with a MSID that match the upper 8 digits of the supplied MSID, such as 01234567 and any two digits at the remaining two places.

---

all | callid *call_id* **| imsi** *imsi_num* **| ip-address** *ip_addr* **| msid** *msid_num* **| peer-address [** *operator* **]** *peer_address* **| reverse-tunnel { on | off } | username** *user_name*

all: Displays all available information.
callid *call_id*: Displays information only for calls with the call ID specified as a 4-byte hexadecimal number.

imsi *imsi_num*: Specifies an IMSI (international mobile subscriber ID) for which information is to be displayed. The IMSI is a 15-character field which identifies the subscriber's home country and carrier.
ip-address *ip_addr*: Displays statistics for a call with the IP address specified in IPv4 dotted-decimal notation.
msid *msid_num*: Specifies a mobile subscriber ID only for which information is to be displayed. *ms_id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI.
peer-address *peer_address*: Displays statistical information for the peer IP address specified using IPv4 dotted-decimal notation.
reverse-tunnel { **on** | **off** }: Enables the display of reverse IP tunnel information.
username *user_name*: Displays user MIP call information for the username specified as an alphanumeric string of 1 through 127 characters including wildcard characters ($ and *).

---

peer-address [*operator* **]** *peer_address*

In conjunction with **mipha [summary] peer-address** keyword, indicates a range of peers is to be displayed.
peer_address must be specified using IPv4 dotted-decimal notation.
operator implies how to logically specify a range of peer-addresses and it must be one of the following:

- **<**: IP address is less than the specified *peer_address*
- **>**: IP address is greater than the specified *peer_address*
- **greater-than**: IP address is greater than the specified *peer_address*
- **less-than**: IP address is less than the specified *peer_address*

---

statistics [ha-service *ha_name* **| peer-address** *peer_address* **]**

Displays statistical information for the home agent service specified by its name (an alphanumeric string of 1 through 63 characters) or peer IP address (IPv4 notation).

---

peers ha-service *service_name* **[current-sessions { { > | greater-than }** *sessions* **[<** *sessions* **] | { < | less-than }** *sessions* **[>** *sessions* **] |** *sessions* **}] [peer-address** *address* **]**

Displays peer servers for the specified HA service.
ha-service *service_name*: Specifies the name of an existing HA service for which the associated peer servers are to be displayed as an alphanumeric string of 1 through 63 characters.
current-sessions: Displays only peer servers with current sessions meeting the following criteria:

- > | greater-than *sessions*: Displays only peer servers currently running sessions higher than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword "**greater-than**" and the "**>**" symbol are interchangeable in this instance of the command.
- **<** *sessions*: Displays only peer servers that are currently running sessions higher than the **greater-than** parameter but less than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- < | less-than *sessions*: Displays only peer servers currently running sessions lower than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000. **Note**: the keyword "**less-than**" and the "**<**" symbol are interchangeable in this instance of the command.
- > *sessions*: Displays only peer servers that are currently running sessions lower than the **less-than** permitter but more than the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.
- *sessions*: Displays only peer servers currently running sessions that are equal to the value entered in this parameter. *sessions* must be an integer from 1 to 3000000.

peer-address *address*: Displays only peer servers matching the IP address entered in this parameter. *address* must be specified using IPv4 dotted-decimal notation and can be followed by the netmask of the address.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View MIP home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example

The following displays the call information for all mobile IP HA calls and statistics for *ha1*, respectively:

```
show mipha all

show mipha statistics ha-service ha1
```

The following commands displays call information for user *isp1user1* in full detail and in summary:

```
show mipha full username isp1user1

show mipha summary username user1
```

The following displays MIP-HA call information for calls from mobile subscribers with reverse tunneling *off* and peer address *10.2.3.4*, respectively:

```
show mipha reverse-tunnel off

show mipha peer-address 10.2.3.4
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mipv6ha

Displays information for specified Mobile IPv6 Home Agent (MIPv6-HA) calls.

Platform

ASR 5000

Product

PDSN

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show mipv6ha [all | callid *callid* **| counters** *filter* **| full** *filter* **| ipv6-address** *ip_addr*| **statistics mipv6ha-service** *mipv6ha-service_name* **| summary** *filter* **| username** *user_name* **]**

---

all

Displays all information for MIPv6-HA calls.

---

callid *call_id*

Specifies the Call Identification number as an 8-digit hexadecimal number.

---

counters [all | callid | ipv6-address | username]

Displays the counters associated with the MIPv6-HA service. The following filters are available:

- **all**
- **callid:**
- **ipv6-address**
- **username**

---

full [all | callid | ipv6-address | username]

Displays all available information for the associated display or filter keyword.
The following filters are available:

- **all**
- **callid:**
- **ipv6-address**
- **username**

---

ipv6-address *ip_addr*

Displays information for subscribers connected via the packet control function for a specific or range of IPv6 addresses. The address must be specified using the IPv6 colon-separated-hexadecimal notation.

- **<**: Filters output so that only information less than the specified IPv6 address value is displayed.

- **>**: Filters output so that only information greater than the specified IPv6 address value is displayed.
- **less-than**: Filters output so that only information less than the specified IPv6 address value is displayed.
- **greater-than**: Filters output so that only information greater than the specified IPv6 address value is displayed.

statistics [mipv6ha-service *mipv6ha-service_name* **]**

Displays all information collected for specific protocol since last the **restart** or **clear** command. This can be filtered according to a specified **mipv6ha-service**.

summary [all | callid | ipv6-address | username]

Displays summary information for defined sessions, based on defined parameters.
The following filters are available:

- **all**
- **callid:**
- **ipv6-address**
- **username**

username *user_name*

Displays session information for a specific username.

Usage

View MIPv6 home agent information to support troubleshooting subscriber issues by viewing call information and filtering on the subscriber information using various methods.

Example

The following displays the call information for all mobile IPv6 HA calls:

```
show mipv6ha all
```

The following command displays call information for user *mipv6hauser1* in full detail and in summary:

```
show mipv6ha full username mipv6hauser1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service

Displays configuration information for Mobility Management Entity (MME) services on this system.

Platform

ASR 5000

Product

MME

Privilege

Inspector

Mode

Exec

Syntax

show mme-service { all | name *svc_name* **[offload statistics] } [| { grep** *grep_options* **| more }]**

all

Displays configuration information for all MME services configured on this system.

name *service_name*

Displays configuration information for an existing MME service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for MME services on this system.

Example

The following command displays service statistics for the MME service named *mme1*:

```
show mme-service name mme1
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

show mme-service db record

Displays the Mobile Management Entity (MME) database records for MME sessions grouped in session instances on this system and filtered with IMSI or GUTI as criteria.

Platform

ASR 5000

Product

MME

Privilege

Inspector

Mode

Exec

Syntax

show mme-service db record { all | call-id *call_id* **| guti plmn** *plmn_id* **group-id** *mme_grp_id* **code** *mme_code* **m-tmsi** *mtmsi_value***| imsi** *imsi_identifier*

all

Displays all database records of a session instance used for MME service.

call-id *call_id*

Displays database records filtered by the call ID specified as an 8-digit hexadecimal number

guti plmn *plmn_id* **group-id** *mme_grp_id* **code** *mme_code* **m-tmsi** *mtmsi_value*

Displays database records filtered by the Globally Unique Temporary Identifier (GUTI). The GUTI is constructed from the GUMMEI and the M-TMSI.
The GUMMEI is constructed from the public land mobile network (PLMN) ID [MMC and MNC] and the MME Group ID (MMEGI). Within the MME, the mobile is identified by the M-TMSI.
A GUTI has: 1) a unique identity for the MME which allocated the GUTI; and 2) the unique identity of the UE within the MME that allocated the GUTI.
The MME Identifier (MMEI) is constructed from an MME Group ID (MMEGI) and an MME Code (MMEC).

imsi *imsi_identifier*

Displays database records filtered by International Mobile Subscriber Identity (IMSI).
imsi_identifier is a 15-character IMSI field which identifies the subscriber's home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

Usage

Use this command to view database records for all or a particular instance of session manager for MME services on this system with IMSI or GUTI as a filter criteria.

Example

The following command displays the summary database records of a session instance for a subscriber having IMSI as *123455432112345* in the MME service:

```
show mme-service db record imsi 123455432112345
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

show mme-service db statistics

This command displays the Mobile Management Entity (MME) database statistics for all or specific MME sessions on this system.

Platform

ASR 5000

Product

Privilege

Inspector

Mode

Exec

Syntax

show mme-service db statistics [instance *smgr_instance* **]**

instance *smgr_instance*

Displays MME database statistics for a specific instance of a session manager running the MME service. *smgr_instance* is an instance ID specified as an integer from 0 through 4294967295. If an instance is not specified, summary statistics are displayed.

Usage

Use this command to view database statistics for all or a particular instance of session manager for MME services on this system.

Example

The following command displays summary database statistics for the MME service running on a system:

```
show mme-service db statistics
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

show mme-service enodeb-association

Displays configuration information for an eNodeB association within an MME service.

Platform

ASR 5000

Product

MME

Privilege

Inspector

Mode

Exec

Syntax

show mme-service enodeb-association [summary | full] [all | | ipsec | mme-service-name *mme_svc_name* **| peer-address** *peer_ip_address* **| peer-id** *peer_identifier* **] [| { grep** *grep_options* **| more }]**

summary

Displays summarized output for this command.

full

Displays detailed output for this command.

all

Displays information of all eNodeBs associated with MME services on this system.

ipsec

Displays information of all IPSec enabled eNodeBs associated with MME services on this system.

mme-service-name *mme_svc_name*

Displays summarized or detailed configuration information for eNodeBs associated with an existing MME service specified as an alphanumeric string of 1 through 63 characters.

peer-address *peer_ip_address*

Displays summarized or detailed configuration information of eNodeBs associated with an existing MME peer IP address configured with an MME service and expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

peer-id *peer_identifier*

Displays summarized or detailed configuration information for eNodeBs associated with a an existing MME peer ID configured with an MME service and specified as an integer from 1 through 4294967295.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information of eNodeBs associated with an MME service on this system.

Example

The following command displays detailed service statistics for associated eNodeBs within the MME service named *mme1*:

```
show mme-service enodeb-association full mme-service-name mme1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show mme-service session

Displays session information for Mobile Management Entity (MME) service(s) running on a peer or local system.

Platform

ASR 5000

Product

MME

Privilege

Inspector

Mode

Exec

Syntax

show mme-service session [summary | full | counters] [all | callid *call_identifier* **| imei** *imei_id* **| imsi** *imsi_id* **| ipsec | mme-service** *service_name* **| msisdn** *number* **| pdn-address** *pdn_ip_address* **| s1-peer** *s1_peer_ip_address* **| s11-peer** *s11_peer_ip_address* **| vlr-name** *vlr_name* **| ue-ecm-state { connected | idle }] [| { grep** *grep_options* **| more }]**

summary

Displays summarized output for this command.

full

Displays detailed output for this command.

counters

Displays all counters for related events and messages for an MME session running on a system.

all

Displays information for all MME sessions running on this system.

callid *call_identifier*

Displays summarized or detailed configuration information for an MME session filtered by a call identifier within an MME service configured on this system.
call_identifier must be an existing call identity in 8-digit hexadecimal format running in an MME service on this system.

imei *imei_id*

Displays summarized or detailed configuration information about MME sessions running and filtered by an International Mobile Equipment Identification (IMEI) number within an MME service configured on this system.
imei_id must be an existing IMEI in an existing MME service on the system. *imei_id* must contain an 8-digit TAC (Type Allocation Code) and a 6-digit SNR (Serial Number).

imsi *imsi_id*

Displays summarized or detailed configuration information about MME sessions running and filtered by an International Mobile Subscriber Identity (IMSI) number within an MME service configured on the system.
imsi_id must be an existing IMSI in an existing MME service on the system. *imsi_id* is a 15-character IMSI field which identifies the subscriber's home country and carrier.
Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

ipsec

Displays information for all IPSec enabled sessions using MME services on the system.

mme-service *service_name*

Displays summarized or detailed configuration information about MME sessions running and filtered by an MME service name configured on the system.
service_name must be a configured MME service on the system, expressed as an alphanumeric string of 1 through 63 characters.

msisdn *number*

Displays summarized or detailed configuration information about MME sessions running and filtered by a Mobile Station International ISDN Number.
number must be a combination of the CC (Country Code) and National (significant) mobile number, not exceeding 15 digits.

pdn-address *pdn_ip_address*

Displays summarized or detailed configuration information about MME sessions running and filtered by the IP address of a connected PDN(s) within an MME service configured on this system.
pdn_ip_address must be a configured IP address of a PDN expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation within an existing MME service on the system.

s1-peer *s1_peer_ip_address*

Displays summarized or detailed configuration information of MME sessions running and filtered by the IP address of a peer connected through an S1 interface within an MME service configured on this system.
s1_peer_ip_address must be a configured IP address of a peer on S1 interface expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation within an existing MME service on this system.

s11-peer *s11_peer_ip_address*

Displays summarized or detailed configuration information of MME sessions running and filtered by IP address of a peer connected through S11 interface with an MME service configured on this system.
s11_peer_ip_address must be a configured IP address of a peer on S11 interface expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation within an existing MME service on this system.

ue-ecm-state { connected | idle }

Displays summarized or detailed configuration information about MME sessions running and filtered by the UE's EPS Connected Management (ECM) state.
connected: Specifies that summarized or detailed configuration information about MME sessions is to be displayed based on the UE ECM state of “connected”.

idle: Specifies that summarized or detailed configuration information about MME sessions is to be displayed based on the UE ECM state of "idle".

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to view information for MME sessions within MME services on this system.

Example

The following command displays detailed session statistics for an MME service running on this system:

```
show mme-service session full
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

The following command displays detailed session counters for an MME service running on this system:

```
show mme-service session counters
```

show mme-service statistics

This command displays the service statistics of an MME service specified by various criteria.

Platform

ASR 5000

Product

MME

Privilege

Security Administrator, Administrator

Mode

Exec

Syntax

show mme-service statistics [sctp [mme-service *mme_svc_name* **] | s1ap [mme-service** *mme_svc_name* **| peer-id** *peer_identifier* **] | [emm-only | esm-only] [mme-service** *mme_svc_name* **| peer-id** *peer_identifier* **] [verbose] [| { grep** *grep_options* **| more }]**

emm-only

Filters the output of EPS mobility management (EMM) related statistics by an MME service name or peer MME identifier.

esm-only

Filters the output of EMM related statistics by MME service name or peer MME identifier.

s1ap

Filters the output of S1-AP statistics by MME service name of peer MME identifier.

sctp

Filters the output of SCTP statistics by MME service name of peer MME identifier.

mme-service *mme_svc_name*

Filters the output of all MME service statistics (such as EMM, ESM, SCTP, S1-AP, and SCTP) by MME service name.

peer-id *peer_identifier*

Filters the output of all MME service statistics (such as EMM, ESM, SCTP, S1-AP, and SCTP) by MME peer identifier.

verbose

Displays comprehensive information for a specific argument or set of arguments.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

This command is used to display the statistical information of an MME service based on various filter criteria as a local MME service or a peer MME related to EMM, ESM, SCTP, S1-AP, and SCTP.

Example

The following command displays the service session statistics of all MME service on a system related to all; such as EMM, ESM, SCTP, S1-AP, and SCTP:

```
show mme-service statistics
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

The following command displays the service session statistics of all MME services on a system related to S1-AP:

```
show mme-service statistics s1ap
```

The following command displays the service session statistics of all MME services on a system related to EMM only:

```
show mme-service statistics emm-only
```

show mpls cross-connect

Displays Multiprotocol Label Switching (MPLS) cross-connect information.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec

Syntax

show mpls cross-connect [| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

This command displays MPLS cross-connect information. MPLS tunnel cross-connects between interfaces and Label-Switched Paths (LSPs) connect two distant interface circuits of the same type by creating MPLS tunnels that use LSPs as the conduit.

Example

The following command displays MPLS cross-connect information:

```
show mpls cross-connect
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

show mpls ftn

Displays MPLS FEC-to-NHLFE (FTN) table information.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec

Syntax

show mpls ftn [vrf *vrf_name* **] [| { grep** *grep_options* **| more }]**

vrf *vrf_name*

Displays FTN information for the Virtual Routing and Forwarding (VRF) specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

This command displays MPLS FEC (Forward Error Correction)-to-NHLFE (Next-Hop label Forwarding Entry) table information.

Example

The following command displays MPLS FTN information:

```
show mpls ftn
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

show mpls ilm

Displays MPLS Incoming Label Map (ILM) table information.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec

Syntax

show mpls ilm [| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

This command displays MPLS Incoming Label Map (ILM) table information.

Example

The following command displays MPLS ILM information:

```
show mpls ilm
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

show mpls ldp

Displays MPLS Label Distribution Protocol (LDP) information.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec

Syntax

show mpls ldp { bindings { ldp-id *IPv4_add* **| local [** *ldp-id* **|** *local* **|** *prefix* **|** *remote* **] | prefix** *IPv4_addr* **| remote } | discovery | neighbor { detail | ldp-id } }**

bindings

Displays the MPLS LDP label bindings.

ldp-id

Displays label values for a specific peer LDP ID.

local

Displays locally assigned label values.

prefix

Displays label values for a specific prefix.

remote

Displays remotely assigned label values.

discovery

Displays the MPLS LDP discovery information.

neighbor

Displays the MPLS LDP peer information.

detail

Displays the MPLS LDP peer information in details. The displayed information includes, Local LDP ID, Peer LDP ID, Transport address, State (for example, Established), Role (for example, Active), Uptime, Keepalive negotiated hold time, Proposed Local/Peer, Remaining Keepalive hold time, and Address advertised.

Usage

This command displays statistical information for an MPLS Label Distribution Protocol configuration. The information includes Prefix, LDP ID, Label, Nexthop, and Egress_if_index for all MPLS LDP Bindings configurations.

Example

The following command displays information about MPLS LDP protocol related configurations:

```
show mpls ldp discovery neighbor ldp-id 10.2.3.4 detail bindings ldp-id
31.32.33.34 prefix 192.168.102.232 local remote
```

The following command displays the MPLS LDP discovery information, including, LDP Peer IDs, Hold time (in seconds), Proposed Local/Peer, and Remaining (time in seconds):

```
show mpls ldp discovery
```

The following command displays the remotely assigned label values in the MPLS LDP binding configuration:

```
show mpls ldp bindings remote
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

show mpls nexthop-label-forwarding-entry

Displays MPLS Next-Hop Label Forwarding Entry (NHLFE) table information.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec

Syntax

show mpls nexthop-label-forwarding-entry [| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

This command displays MPLS Next-Hop Label Forwarding Entry (NHLFE) table information.

Example

The following command displays MPLS NHLFE information:

```
show mpls nexthop-label-forwarding-entry
```

Important: Output descriptions for these commands are available in the *Statistics and Counters Reference*.

show multicast-sessions

Displays information for multicast sessions defined by the specified keywords.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show multicast-sessions [*command_keyword* **] [** *filter_keywords* **] [| { grep** *grep_options* **| more }**

command_keyword

The following keywords are base commands that each have a distinct display output. Only one keyword can entered on the command line.

debug-info { callid *id* **| flowid** *id* **}**

Displays internal call troubleshooting information for multicast sessions defined by the specified keywords.
callid *id:* Displays subscriber information for the call specified as an 8-digit hexadecimal number.
flowid *id:* Displays information for a specific BCMCS flow, defined by The flow ID as a hexadecimal number.

full

Displays all available multicast session information. The following filter keywords are valid for this command: active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

summary

Only displays a summary of multicast session information. The following commands are valid for this command: active, all, callid, card-num, dormant, flowid, flowid-type, mcast-address, pcf, pdsn-service, grep, more

filter_keywords

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.

active

Only displays information for multicast sessions that are currently active.

all

If no keywords are specified before **all**, information for all multicast sessions is displayed. If keywords are specified before **all**, all information is displayed with no further options being allowed.

callid *id*

Displays multicast session information for the call specified by *id*. The call must be specified as an 8-digit hexadecimal number.

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. *card_num* is a slot number from 1 through 7 or 10 through 16 on the ASR 5000, or 1 through 4 or 7 through 10 on the ASR 5500.

dormant

Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

flowid *id*

Displays information for a specific BCMCS flow, defined by *id*. The flow ID must be a hexadecimal number.

flowid-type [flow | program]

Displays information for multicast sessions according to the type of flow.
flow: Shows all multicast sessions for the flow ID type "flow".
program: Shows all multicast sessions for the flow ID type "program".

mcast-address *ipv4_address*

Show multicast sessions for a specific multicast address. Must be followed by the IP address of an interface, using IPv4 dotted-decimal notation.

pcf *ipv4_address*

Displays information for multicast sessions connected via the packet control function, defined by *ipv4_address*. The address must be specified using IPv4 dotted-decimal notation.

pdsn-service *svc_name*

Displays information for multicast session connected to the packet data service *svc_name*.The packet data service must have been previously configured and expressed as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
Please refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to view information about multicast sessions.
The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant sessions.

Example

The following command displays the all broadcast-multicast sessions active in a context/system:

```
show multicast-sessions all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show network-requested-pdp-context

Displays information for the specified network-requested packet data protocol (PDP) context.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show network-requested-pdp-context imsi *imsi_value*

imsi *imsi_value*

Specifies that information will be displayed for a particular International Mobile Subscriber Identity (IMSI). *imsi_value* is an integer from 1 to 15 digits.

Usage

USe this command to display information pertaining to network-requested PDP contexts.

Example

The following command displays network-requested PDP context information for a subscriber with an IMSI of *123456789*:

```
show network-requested-pdp-context imsi 123456789
```

show network-service-entity

Displays information regarding the network service entities (NSEs) in the network.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show network-service-entity { consolidated-status | fr-config [peer-nsei *nsei*] **| ip-config [nsvl { all | instance** *value* **} }**

consolidated-status

Displays Network Service Virtual Connection (NSVC) status information for all network service entities in the network. This keyword is particularly useful for troubleshooting.

fr-config [peer-nsei *nsei*]

Displays network service configurations for NSEs using Frame Relay configurations.
peer-nsei *nsei* limits the display to a specific peer NSE identified as an integer from 0 through 65535.

ip-config [nsvl { all | instance *value* **}**

Displays network service configurations for NSEs using IP configurations.
Including the **nsvl** keyword limits the display to all or a single (instance 0 to 3) of a network service virtual link.

Usage

Use this command to display NSE information pertaining to the NSVCs of the NSEs in the networks or NSEs configured for Frame Relay or IP.

Example

The following command displays the status of all the NSVCs for all the NSEs in the network.

```
show network-service-entity consolidated-status
```

show npu utilization

Displays NPU information utilization.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show npu utilization table [| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View network timing protocol information to troubleshooting system clock issues by displaying the associations and status of the local NTP client.

Example

The following displays the NPU information.

show npu utilization table

show npu utilization table | grep *qwe*

show ntp

Displays the network timing protocol (NTP) associations and status.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show ntp { associations | status } [address *ip_address* **] [| { grep** *grep_options* **| more }]**

associations

Displays the current NTP server associations and related statistics.

status

Displays the client permeates configured and the synchronization status.

address *ip_address*

Specifies the IP address of an NTP server/client in the current context in IPv4 dotted-decimal notation.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View network timing protocol information to troubleshooting system clock issues by displaying the associations and status of the local NTP client.

Example

The following displays the NTP associations and status, respectively.

```
show ntp associationsshow ntp status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show nw-reachability server

Displays the configuration of network reachability servers for the current context.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show nw-reachability server { all | name server_name }
```

all

Displays configuration information for all network reachability servers in the current context.

name *server_name*

Displays configuration information for an existing network reachability server specified as an alphanumeric string of 1 through 15 characters.

Usage

Use this command to display configuration information on network reachability servers configured in the current context.

Example

The following command displays information on all network reachability servers in the current context:

```
show nw-reachability server all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show operator-policy

Displays the information configured for an operator policy.

Platform

ASR 5000

Product

MME

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show operator-policy { all | full { all | name *op_policy_name* **} | name** *op_policy_name* **} [| { grep** *grep_options* **| more }]**

all

Displays a list of all operator policies configured on the system.

full { all | name *op_policy_name* **}**

full:Displays a full set of available information for the specified operator policy (policies).
all: Displays a full set of available information for all operator policies configured on the system.
name *op_policy_name*: Displays a full set of available information for an existing operator policy specified as an alphanumeric string of 1 through 64 characters.

name *op_policy_name*

Displays a full set of available information for an existing operator policy specified as an alphanumeric string of 1 through 64 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for operator policies configured on the system. Operator policies are configured through the Global Configuration Mode and in the Operator Policy Configuration Mode. For more information regarding operator policy commands, refer to the *Operator Policy Configuration Mode Commands* chapter.

Example

The following command displays all available information for an operator policy named *policy-5*:

```
show operator-policy full name policy-5
```

show orbem

Displays information and statistics for the Object Request Broker Element Manager (ORBEM) interface in the current context.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show orbem { client { id *client_name* **| table } | event-notif-service filters | session { id** *session_name* **| table } | status } [| { grep** *grep_options* **| more }]**

client { id *client_name* **| table }**

Indicates the Common Object Request Broker Architecture (CORBA) client information is to be displayed. The keyword **table** is used to output to the display information on all configured clients. The keyword **id** is used to specify a specific client for which information is to be displayed specified as *client_name*.
client_name must refer to an existing client which is found using the **table** keyword option.

event-notif-service filters

Displays information pertaining to filters configured for the ORB Notification Service.

session { id *session_name* **| table }**

Indicates session information is to be displayed. The keyword **table** is used to output to the display information on all configured clients. The keyword **id** is used to specify a specific session for which information is to be displayed specified as *session_name*.
session_name must refer to an existing session which is found using the **table** keyword option.

status

Indicates that the ORBEM server status information is to be displayed.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Display current sessions when ORBEM system response may appear sluggish. This command is also useful in periodic verification of the server status.

Example

The following commands will display the information for all clients.

show orbem client table

The following commands display the information for the *clientName* and *sessionID*, respectively:

show orbem client id *clientName*

show orbem session id *sessionId*

The following command displays the ORBEM server status:

show orbem status

The following command displays the information for all sessions:

show orbem session table

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show patch progress

Displays the status of the on-going software patch installation.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show patch progress
```

Usage

Use this command to show the status of an on-going software patch installation.

Important: Software Patch Upgrades are not supported in this release.

show pdg-service

Displays configuration information about PDG services configured on the system.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show pdg-service { all | name *service_name* **}**

all

Displays information for all configured Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG) services.

name *service_name*

Displays information only for an existing PDG service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for PDG services.

Example

The following command displays available information for all active PDG services:

```
show pdg-service all
```

show pdg-service statistics

Displays statistics for the Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG) since the last **restart** or **clear** command. The output includes the number of each type of Extensible Authentication Protocol (EAP) messages.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show pdg-service statistics [name *service_name* **| peer-address** *ipv4_address* **]**

name *service_name*

Displays statistics for an existing PDG service specified an alphanumeric string of 1 through 63 characters.

peer-address *ipv4_address*

Displays statistics for a specific subscriber with the WLAN IP address specified in IPv4 dotted-decimal notation.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to display PDG service statistics.

Example

The following command displays statistics for all active PDG services:

```
show pdg-service statistics
```

show pdif-service

Displays configuration information about Packet Data Interworking Function (PDIF) services configured on the system.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show pdif service { all [counters] | name *name* **[counters] | statistics [name** *name* **| peer-address** *address* **] } [| { grep** *grep_options* **| more }]**

all [counters]

Displays configuration information and statistical counters for all PDIF services in the system.

name *name* **[counters]**

Displays configuration information and statistical counters for an existing PDIF service specified as an alphanumeric string of 1 through 63 characters.

statistics [name *name* **| peer-address** *address* **]**

name *name*: Displays service statistics for a an existing PDIF service specified as an alphanumeric string of 1 through 63 characters.
peer-address *address*: Displays service statistics for a peer server IP address specified in IPv4 dotted-decimal notation.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to display configuration information and statistics about PDIF services on the system.

Example

The following example displays configuration information about a PDIF service named *pdif23*:

```
show pdif service name pdif23
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show pdsn-service

Displays information for configured packet data services in the current context.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show pdsn-service { all | name pdsn_name } [ pcf-status [ address ip_address | filter [
all | icmp-monitored | no-calls | summary | up ] ] ] [ | { grep grep_options | more } ]
```

---

all | name *pdsn_name*

all: Displays information for all configured packet data services.
name *pdsn_name*: Displays information only for an existing PDSN service specified as an alphanumeric string of 1 through 79 characters.

---

pcf-status [address *ip_address* **| filter [all | icmp-monitored | no-calls | summary | up]]**

pcf-status: Displays summary information for all Packet Control Functions (PCFs).
address *ip_address:* Only lists information for the PCF with the IP address specified in IPv4 dotted-decimal notation.
filter: Filters the output so only the specified information is displayed. If a filter is specified with no keywords, summary information for all PCFs is displayed.

- **all**: Displays information for all the PCFs
- **icmp-monitored**: Displays information only for PCFs which are ICMP monitored
- **no-calls**: Displays information only for PCFs which have no active sessions
- **summary**: Displays only a summary of the status of the PCFs
- **up**: Displays information only for PCFs which are alive

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Show the PDSN service information for standard system monitoring or troubleshooting.

Example

The following will display the information for all configured services and *sampleService*, respectively:

show pdsn-service all

show pdsn-service name *sampleService*

show pgw-service

Displays configuration information for PDN Gateway (P-GW) services on this system.

Platform

ASR 5000

Product

P-GW

Privilege

Inspector

Mode

Exec

Syntax

show pgw-service { all | name *service_name* **| statistics { all | name** *service_name* **} [verbose] } [| { grep** *grep_options* **| more }]**

all

Displays configuration information for all P-GW services configured on this system.

name *service_name*

Displays configuration information for an existing P-GW service specified as an alphanumeric string of 1 through 63 characters.

statistics { all | name *service_name* **} [verbose]**

Displays P-GW service statistics.
all: Displays statistics for all P-GW services on the system.
name *service_name*: Displays statistics for an existing P-GW service specified as an alphanumeric string of 1 through 63 characters.
If **verbose** is also specified, the information is displayed in more detail.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for P-GW services on this system.

Example

The following command displays service statistics for the P-GW service named *pgw1*:

```
show pgw-service name pgw1
```

show port

Displays information on configured parameters and operational statistics for physical and logical ports in the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show port { datalink counters [*slot/port* **] | info [** *slot/port* **] [vlan** *vlan_id* **] | npu counters [** *slot/port* **[tagged | untagged | vlan** *tag_id* **]] | table | utilization table } [| { grep** *grep_options* **| more }]**

datalink counters *slot/port*

Displays the information for all data links or only the one specified by the slot/port location of a previously configured port.

info [*slot/port* **] [vlan** *vlan_id* **]**

Displays detailed information for all ports within the chassis or only the one specified by slot/port location of a previously configured port.
vlan *vlan_id*: Displays detailed information about all Virtual Local Area Networks (VLANs) in the port/slot. If the optional vlan_id is not specified, this keyword displays port information for all VLANs in the slot/port location.

npu counters [*slot/port* **[tagged | untagged | vlan** *tag_id* **]] | bound | unbound]**

Displays the information for Network Processing Unit (NPU) ports. The information for all ports is output or only the one specified by the slot/port location of a previously configured port.
tagged: Display statistics for all tagged packets.
untagged: Display statistics for all untagged packets.
vlan *tag_id*: Display NPU counters for a previously configured VLAN ID.
bound: Displays individual and cumulative NPU port counters for the bound ports within the current context. If the command is invoked in the local context, all of the bound ports for all contexts and cumulative counter values for all contexts are displayed.
unbound: Displays individual and cumulative NPU port counters for all unbound ports within system.

table

Displays information for all physical ports on rear-installed cards with physical interfaces.

utilization table

Shows average port utilization in Mbps. The output is a table that lists the current utilization average, a 5-minute average, and a 15-minute average, for all enabled ports.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Display port information for troubleshooting of network communications by viewing statistics and configuration information for physical ports.

Example

The following displays detailed information for port 1 in slot 17:

```
show port info 17/1show port table
```

The following displays information for the data link port 33/1:

```
show port datalink counters 33/1
```

```
show port npu counters 33/1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show power

Displays information about the power on/off status of individual cards and the operating status of installed power filter units.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show power [all | chassis | *card_num* **] [| { grep** *grep_options* **| more }]**

all | chassis | *card_num* **]**

all: Displays power on/off state for all cards in the chassis.
chassis: Displays the operating status of installed power filter units. This is the default setting.
card_num: Displays the power on/off state for a single card specified an integer from 1 through 48 for the ASR 5000 or 1 through 20 for the ASR 5500.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

View power source information to quickly check the power for all cards within a chassis.

Important: On some platforms, only **show power** is supported with no other keywords or variables.

Example

The following displays power supply status for the chassis:

```
show power
```

The following command displays the power status for all slots:

```
show power all
```

show ppp

Displays the point-to-point protocol (PPP) information, detailed or summarized, for one or all connections by the use of filtering options.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show ppp { [counters | full | summary] { all | callid *call_id* **| imsi** *id* **| msid** *ms_id* **| username** *user_name* **} | statistics [pcf-address [** *pcf_ip_addr* **| all] | pdsn-service** *pdsn_name* **] } [| { grep** *grep_options* **| more }]**

---

counters | full | summary

Filters the output for the level and type of information with the options described below.
counters: Displays PPP statistics.
full: Displays all available information.
summary: Displays only a summary of available information.

---

all | callid *call_id* **| imsi** *imsi_id* **| msid** *ms_id* **| username** *user_name* **}]**

all: Displays all available information.
callid *call_id*: Displays PPP information only for the call ID specified as a 4-digit hexadecimal number.
imsi *id*: Displays PPP information only for the subscriber with the specified IMSI (International Mobile Subscriber Identity). *id* is a 15-digit field which identifies the subscriber's home country and carrier.
msid *ms_id*: Displays information for a mobile subscriber ID specified as 7 to 16 digits for an IMSI, MIN, or RMI.
username *user_name*: Displays user PPP information for the specified username.

---

statistics [pcf-address [*pcf_ip_addr* **| all] | pdsn-service** *pdsn_name* **]**

Displays statistics for all packet data services.
pcf-address [*pcf_ip_addr* **| all**]: Displays statistics only for the time the session is connected to the specified PCF (Packet Control Function) or for all PCFs. *pcf_ip_addr* must be specified using IPv4 dotted-decimal notation.
pdsn-service *pdsn_name*: Display statistics only for an existing PDSN service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

View Point-to-Point Protocol information to support troubleshooting subscriber connections by viewing information on PPP connections for a specific subscriber.

Example

The following displays the PPP summary for all connections.

```
show ppp summary all
```

The following outputs the point-to-point detailed information for the user *user1*.

```
show ppp full username user1
```

The following command displays the standard information for the call with ID *FF0E11CD*.

```
show ppp callid ff0e11cd
```

The following command displays the PPP statistics for *pdsn1*.

```
show ppp statistics pdsn-service pdsn1
```

The following command provides summarized information for the PPP statistics.

```
show ppp
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show prepaid 3gpp2

Displays prepaid accounting information for all services or only the service specified.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show prepaid 3gpp2 statistics all [| { grep *grep_options* **| more }]**

show prepaid 3gpp2 statistics { ggsn-service | ha-service | lns-service | pdsn-service { all | name *service_name* **} [| { grep** *grep_options* **| more }]**

show prepaid 3gpp2 statistics per-service-summary } [| { grep *grep_options* **| more }]**

all

Displays prepaid statistics for all services.

ggsn-service

Displays statistics for GGSN service(s).

ha-service

Displays statistics for HA service(s).

lns-service

Displays statistics for LNS service(s).

pdsn-service

Displays statistics for PDSN service(s).

{ all | name *service_name* **}**

all: Displays statistics for all services of the specified type.
name *service_name*: Displays statistics for an existing service specified an alphanumeric string of 1 through 63 characters.

per-service-summary

Displays prepaid statistics per service summary for all services.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter in the *Command Line Interface Reference*.

Usage

Displays Pre-paid statistics for a particular named service or for all services.

Example

To display statistics for a PDSN service named *PDSN1*, enter the following command:

show prepaid 3gpp2 statistics pdsn-service name *PDSN1*

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show prepaid wimax

This command displays prepaid WiMAX accounting information for all services or only the service specified.

Platform

ASR 5000

Product

ASN-GW

Privilege

Inspector

Mode

Exec

Syntax

show prepaid wimax statistics { all | asngw-service { all | name *service_name* **} | ha-service { all | name** *service_name* **} | per-service-summary } [| { s** *grep_options* **| more }]**

all

This keyword displays prepaid statistics for all services.

asngw-service

Displays prepaid statistics for Access Service Network-Gateway (ASN-GW) service(s).

ha-service

Displays prepaid accounting statistics for Home Agent (HA) service(s).

{ all | name *service_name* **}**

all: Displays statistics for all services of the specified type.
name *service_name*: Displays statistics for an existing service specified as an alphanumeric string of 1 through 63 characters.

per-service-summary

Displays prepaid statistics per service summary for all services.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to display prepaid WiMAX accounting statistics for named service or for all services.

Example

The following command displays prepaid WiMAX accounting statistics for an ASN-GW service named *asn1*:

```
show prepaid wimax statistics asngw-service name asn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show profile-id-qci-mapping

Displays QoS Class Identifier-Radio Access Network (QCI-RAN) mapping tables configured on this system.

Platform

ASR 5000

Product

HSGW

Privilege

Inspector

Mode

Exec

Syntax

show profile-id-qci-mapping table { all | name *table_name* **} [| { grep** *grep_options* **| more }]**

all

Displays information for all QCI-RAN mapping tables configured on this system.

name *table_name*

Displays information for an existing QCI-RAN table specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of **grep** and **more**, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to display the contents of a specific QCI-RAN mapping table or all mapping tables configured on this system.

Example

The following command displays the contents of a QCI-RAN mapping table named *table1*:

```
show profile-id-qci-mapping table name table1
```

show ps-network

Displays statistics for the Packet Switched (PS)-network(s) instance configured on a chassis for HNB-GW service sessions.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator, Operator

Mode

Exec

Syntax

show ps-network { all | name *ps_name* **} [status] [| { grep** *grep_options* **| more }]**

all

Displays status counters for all PS (packet switched) networks configured for HNB-GW service sessions on a chassis.

name *ps_name*

Displays status counters for a PS network configured for HNB-GW service specified as an alphanumeric string of 1 through 127 characters that is case sensitive

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
Refer to *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter for details on the usage of **grep** and **more**.

Usage

Use this command to display the status of any or all PS-network(s) instance configured on a chassis for HNB-GW service sessions.

Example

The following command displays the output for PS network instance status named *ps_1_hnb*:

```
show ps-network name ps_1_hnb status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ps-network counters

Displays the session counter information for a PS Network associated with Home-NodeB Gateway (HNB-GW) services configured and running on a system.

Platform

ASR 5000

Product

HNB-GW

Privilege

Inspector

Mode

Exec

Syntax

show ps-network counters [name *ps_svc_name* **[sgsn** *sgsn_point_code* **]] [| { grep** *grep_options* **| more }]**

name *ps_svc_name*

Filters the counter display based on an existing HNB-PS Network service name associated with an HNB-GW service running on system. *ps_svc_name* is an alphanumeric string of 1 through 63 characters.

sgsn *sgsn_point_code*

Filters the counter display filtered on the basis of SGSN address provided in the SS7 point code that is connected to a particular HNB-PS Network service. *sgsn_point_code* must be the address of an SGSN in SS7 point code notation.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter.

Usage

Use this command to view the session counter information for HNB-PS Network services configured and SGSNs connected on a system.

Example

The following command displays the counters for the HNB-PS Network service named *hnb_ps_svc1*:

```
show ps-network counters name hnb_ps_svc1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ps-network statistics

Displays the Packet Switched session statistics for Home-NodeB Gateway (HNB-GW) services configured and running on this system.

Platform

ASR 5000

Product

HNB-GW

Privilege

Inspector

Mode

Exec

Syntax

```
show ps-network statistics [ name ps_svc_name [ sgsn sgsn_point_code]] [ gtpu-only |
ranap-only | sccp-only ] [ | { grep grep_options | more } ]
```

name *ps_svc_name*

Filters the session statistics display based on an existing HNB-PS Network service name that is associated with an HNB-GW service running on this system. *ps_svc_name* is an alphanumeric string of 1 through 63 characters.

sgsn *sgsn_point_code*

Filters the counter display filtered on the basis of SGSN address provided in the SS7 point code that is connected to a particular HNB-PS Network service. *sgsn_point_code* must be the address of an SGSN in SS7 point code notation.

ranap-only

Filters the session statistics to display only Radio Access Network Application Protocol (RANAP) traffic for an HNB-PS Network service which is configured and associated with an HNB-GW service running on this system.

sccp-only

Filters the session statistics to display only Signaling Connection Control Part (SCCP) traffic for the specified HNB-PS Network service which is configured and associated with an HNB-GW service running on this system.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to the specified command. You must specify a command to which the output of this command will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in *Command Line Interface Overview* chapter of the *Command Line Interface Reference*.

Usage

Use this command to view the session statistics for overall session or in selected part of user session for HNB-GW services configured and running on this system.

Example

The following command displays the session statistics for the HNB-PS Network service named *hnb_ps1*:

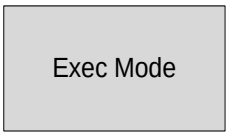
```
show ps-network statistics name hnbps1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

Chapter 115
Exec Mode show Commands (Q-S)

This chapter includes the commands **`qci-qos-mapping`** through **`show system uptime`**.

The Exec Mode is the initial entry point into the command line interface system. Exec mode **show** commands are useful in troubleshooting and basic system monitoring.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

show qci-qos-mapping

Displays QoS Class Identifier-Quality of Service (QCI-QoS) mapping tables configured on this system.

Platform

ASR 5000

Product

HSGW

P-GW

S-GW

Privilege

Inspector

Mode

Exec

Syntax

show qci-qos-mapping table { all | name *table_name* **} [| { *grep_options* | more }]**

all

Displays information for all QCI-QoS mapping tables configured on this system.

name *table_name*

Displays information for an existing QCI-QoS mapping table specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the contents of a specific QCI-QoS mapping table or all mapping tables configured on this system.

Example

The following command displays the contents of a QCI-QoS mapping table named *table1*:

```
show qci-qos-mapping table name table1
```

show qos npu inter-subscriber traffic

This command is only supported on PACs running on ST16 platforms. It has been deprecated for use on ASR 5x00 platforms.

show radius

Displays and statistic information for RADIUS accounting and/or authentication.

Platform

ASR 5000

Product

PDSN

HA

GGSN

ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show radius { accounting servers | authentication servers } [detail] [admin-status { enabled | disabled }] [| { grep *grep_options* **| more }] [radius group** *group_name* **[detail] [| { grep** *grep_options* **| more }]]**

accounting servers

Lists information for configured accounting servers and their current state.

authentication servers

Lists information for configured authentication servers and their current state.

[detail]

Displays historical state information for configured servers of the specified type.

admin-status { enabled | disabled }

Displays information for accounting and/or authentication servers with an administrative status of "enabled" or "disabled".

radius group *group_name*

Displays the authentication/authorization RADIUS server group information for an existing server group specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display the RADIUS server information as part of periodic monitoring of the health of the system.

Example

The following displays the information on configured accounting servers:

```
show radius accounting server
```

The following command displays detailed information for RADIUS accounting servers:

```
show radius accounting servers detail
```

The following command displays detailed information for RADIUS server group *star1* used for authentication:

```
show radius authentication servers radius group star1 detail
```

The following command displays detailed information for RADIUS server group *star1* used for accounting:

```
show radius accounting servers radius group star1 detail
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius charging servers

This command displays the RADIUS authentication and accounting servers or server group that are configured for use by charging services.

Platform

ASR 5000

Product

PDSN

HA

GGSN

ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show radius charging servers [radius group *group_name* **] [| { grep** *grep_options* **| more }]**

radius group *group_name* **all**

Displays all RADIUS counter information for an existing server group configured for use by charging services. *group_name* is specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information about RADIUS servers or server group configured for use by Charging Services.

Example

The following command displays RADIUS servers configured for Charging Services:

```
show radius charging servers
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius client

DIsplays information about the RADIUS client configured on the system.

Platform

ASR 5000

Product

PDSN

HA

GGSN

ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show radius client status [| { grep *grep_options* **| more }]**

status

Displays a status summary for the RADIUS client.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Configuring the RADIUS protocol on the system enables RADIUS client functionality. This command is displays information pertaining to the status of the client.

Example

The following command displays detailed information pertaining to the system's RADIUS client:

```
show radius client status
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show radius counters

Displays RADIUS server and statistic information for accounting and/or authentication.

Platform

ASR 5000

Product

PDSN

HA

GGSN

ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show radius counters { all | radius group *group_name* **all | server** *ip_address* **[port** *number* **] | summary [all-contexts [verbose]] } [| { grep** *grep_options* **| more }]**

counters { all | server *ip_address* **[port** *number* **] }**

all: Displays statistics for all servers.
server *ip_address*: Displays statistics for the server specified by its IPv4 address.
port *number*: Displays statistics for a port on the server specified as an integer from 0 through 65535.

radius group *group_name* **all**

Displays all RADIUS counter information for an existing server group specified as an alphanumeric string of 1 through 63 characters.
all: Displays statistics for all servers.

summary [all-contexts [verbose]]

Displays a summary of RADIUS statistics for all the RADIUS servers configured in a specific context.
all-contexts: Displays a summary of RADIUS statistics for all RADIUS servers configured in all context. If **verbose** is also specified, the information is displayed in more detail.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display the RADIUS server information as part of periodic monitoring of the health of the system.

Example

The following command displays detailed information pertaining to the RADIUS server group *star1* with in current context:

```
show radius counters radius group star1 all
```

The following displays the statistics for the server with IP address *10.2.3.4*, then just port *7777*, followed by **all** services.

```
show radius counters server 10.2.3.4

show radius counters server 10.2.3.4 port 7777

show radius counters all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show resources

Displays the resource information by CPU or session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show resources { cpu | npu | session } [| { grep *grep_options* **| more }]**

cpu | npu | session

cpu: Displays resource information by CPU.
npu: Displays resource information by network processing unit (NPU).
session: Displays resource information by session.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View resource utilization as part of troubleshooting systems which appear sluggish or are having excessive connection timeouts or other connection issues.

Example

The following display the resource information by CPU and session, respectively.

```
show resources cpu

show resources session
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show rohc counters

Displays RObust Header Compression (ROHC) counters for all active calls.

Platform

ASR 5000

Product

PDSN

HSGW

ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show rohc counters [all | callid *call_id* **| imsi** *imsi_num* **| ip-address** *ip_addr* **| msid** *msid_num* **| username** *user_name* **] [| { grep** *grep_options* **| more }]**

all

Displays all information.

callid *call_id*

Displays the information only for the call ID specified as a 4-byte hexadecimal number.

imsi *imsi_num*

Displays information for the specified IMSI (International Mobile Subscriber Identity). The IMSI is an up to 15-digit field which identifies the subscriber's home country and carrier: 3 digits of Mobile Country Code (MCC), 2 or 3 digits of Mobile Network Code (MNC), followed by the Mobile Subscriber Identification Number MSIN. Example: 123-45-678910234. May also be entered as 12345678910234.

ip-address *ip_addr*

Displays information only for the mobile subscriber IP address specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

msid *msid_num*

Displays information only for a mobile subscriber ID from 7 to 16 digits for an IMSI, MIN, or RMI.

username *user_name*

Displays radio-packet (R-P) interface information only for a specified username.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display ROHC counters for all active calls.

Example

The following command displays ROHC counters for all active calls:

```
show rohc counters all
```

show rohc statistics

Displays statistics and counters for RObust Header Compression (ROHC) IP header compression.

Platform

ASR 5000

Product

PDSN

HSGW

ASN-GW

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show rohc statistics [pdsn-service *pdsnsvc_name* **] [asngw-service** *asngwsvc name* **] [hsgw-service** *hsgwsvc_name* **] [| { grep** *grep_options* **| more }]**

Important: Keywords available for this command are license-driven. For example, if a PDSN license is loaded, the **pdsn-service** option is visible.

pdsn-service *pdsnsvc_name*

Displays ROHC statistics and counters for the an existing PDSN service specified as an alphanumeric string of 1 through 63 characters.

asngw-service *asngwsvc_name*

Displays ROHC statistics and counters for an existing ASN-GW service specified as an alphanumeric string of 1 through 63 characters.

hsgw-service *hsgwsvc_name*

Displays ROHC statistics and counters for an existing HSGW service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display ROHC statistics for all services or for a specific ASN-GW, PDSN, or HSGW.

Example

The following command displays ROHC statistics for the PDSN service named pdsn1:

```
show rohc statistics pdsn-service pdsn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show route-map

Displays entries for all route maps or a specific route map.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show route-map [name *route-map name* **] [| { grep** *grep_options* **| more }]**

name *route-map name*

Displays information for a route-map specified as an alphanumeric string of 1 through 79 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to see the rules configured in all route-maps for the current context.

Example

The following command displays the route-map information for prefix list *Prefix100*:

```
show route-map Prefix100
```

Refer to the **match** and **set** command descriptions in the *Route-map Configuration Mode Commands* chapter for descriptions of the various entries listed.

show rp

Displays radio-packet (R-P) interface statistics using the filtering options specified.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show rp [counters | full | summary] { all | callid *call_id* **| msid** *ms_id* **| peer-address** *peer_ip_address* **| username** *user_name* **} [| { grep** *grep_options* **| more }]**

counters | full | summary

Provides an optional modifier to the output for the desired level and type of information.
counters: Displays R-P protocol statistics.
full: Displays all available information.
summary: Displays only a summary of available information.
These options are not available in conjunction with the keywords **statistics** or **service-option statistics**.

all | callid *call_id* **| msid** *ms_id* **| peer-address** *peer_ip_address* **| username** *user_name*

all: Displays all R-P information.
callid *call_id*: Displays only the information for the call ID specified as a 4-digit hexadecimal number.
msid *ms_id*: Displays information only for a mobile subscriber ID specified by 7 to 16 digits for an IMSI, MIN, or RMI.
peer-address *peer_ip_address*: Displays R-P information for the peer IP address of the PCF specified in IPv4 dotted-decimal notation.
username *user_name*: Displays R-P information for the specified username.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the R-P interface statistics for the current context.

Example

The following displays the summary for all connections.

show rp summary all

The following outputs the R-P interface detailed information for the user *isp1user1*.

show rp full username isp1user1

The following command displays the standard information for the call with ID *FF0E11CD*.

show rp callid ff0e11cd

The following displays the statistics summary for the R-P facility.

show rp

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show rp service-option

Displays the radio-packet (R-P) service option statistics using the filtering options specified.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show rp service-option statistics [number *svc_option_num* **| pdsn-service** *pdsn_name* **] [| { grep** *grep_options* **| more }]**

number *svc_option_num* **| pdsn-service** *pdsn_name*

Default: display statistics for all service option numbers and associated packet data services.
number *svc_option_num*: Displays statistics for the specified service option number.
pdsn-service *pdsn_name*: Displays statistics for the specified packet data service.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the R-P service option statistics for the current context.

Example

The following displays the statistics for all service options.

```
show rp service-option statistics
```

The following displays the statistics for service option *5*.

```
show rp service-option statistics number 5
```

The following command displays the statistics for all service options in collected for the packet data service *sampleService*.

```
show rp service-option statistics pdsn-service sampleService
```

show rp statistics

Displays the radio-packet (R-P) protocol statistics using the filtering options specified.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show rp statistics [ hsgw-service hsgw-name | pcf-summary [ wf1 ] | pdsn-service
pdsn_name | peer-address { peer_address | all } ] [ include-bcmcs ] [ verbose ] [ | {
grep grep_options | more } ]
```

hsgw-service*hsgw_name*

Specifies an eHRPD Serving Gate Way service followed by the name of an HSGW service specified as an alphanumeric string of 1 through 63 characters.

pcf-summary [wf1]

Displays a session summary of Packet Control Function (PCF) statistics.

The **wf1** option displays PCF statistics in wide-format number 1.

pdsn-service *pdsn_name*

Displays the statistics information for the pdsn-service specified as an alphanumeric string of 1 through 63 characters.

peer-address { *peer_address*| | all }

- *peer_address*: Displays statistics only for the peer specified by its IP address in IPv4 dotted-decimal notation.
- **all**: Displays statistics for all peers.

verbose

Displays more detailed statistics.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the R-P statistics for the current context.

Example

The following displays all collected R-P statistics.

```
show rp statistics
```

The following displays the R-P statistics associated with the peer address *10.2.3.4*.

```
show rp statistics peer-address 10.2.3.4
```

The following command displays the R-P statistics for the packet data service *PCFnet*.

```
show rp statistics pdsn-service PCFnet
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show rsvp counters

Displays Resource Reservation Protocol (RSVP) counters using the filtering options specified.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show rsvp counters [all | callid *call_id* **| msid** *ms_id* **| username** *user_name* **]**

all | callid *call_id* **| msid** *ms_id* **| username** *user_name*

all: Displays all RSVP information.
callid *call_id*: Displays information only for the call ID specified as a 4-digit hexadecimal number.
msid *ms_id*: Displays information for a mobile subscriber ID specified a string of 7 to 16 digits for an IMSI, MIN, or RMI.
username *user_name*: Displays RSVP information only for the specified username.

Usage

View the RSVP counters for the current context.

Example

The following displays all collected RSVP counters.

```
show rsvp counters all
```

show rsvp statistics

Displays Resource Reservation Protocol (RSVP) statistics using the filtering options specified.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show rsvp counters [pdsn-service *service* **| sessmgr instance** *instance* **]**

pdsn-service *service* **| sessmgr instance** *instance*

pdsn-service *service*: Displays statistics for the service specified as an alphanumeric string of 1 through 63 characters.
sessmgr instance *instance*: Displays statistics for the specified session manager instance.

Usage

View the RSVP statistics for the current context.

Example

The following displays collected RSVP statistics for a *sampleService*.

```
show rsvp statistics pdsn-service sampleService
```

show sccp-network

Displays SS7 Signaling Connection Control Part (SCCP) network configuration and status information.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show sccp-network { *ntwk_index* | all } [status [all | dpc]]

ntwk_index

Displays configuration and status information for the SSCP network configuration with the network index specified as an integer from 1 through 12.

all

Displays all available configuration and status information for all SSCP networks.

status all

Displays all status information for specified SCCP networks.

status dpc

Displays status information for the device in the SCCP network identified by the destination point-code (DPC).

Usage

Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or network.

Example

The following command displays global SCCP statistics:

```
show sccp-network all
```

The following command displays information for an SCCP network configuration with the network index of *1*:

```
show sccp-network 1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sccp statistics

Displays SS7 Signaling Connection Control Part (SCCP) statistics for services that use the SCCP protocol.

Platform

ASR 5000

Product

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show sccp statistics [iups-service *iups_srvc_name* **| map-service** *map_srvc_name* **| sccp-network** *ntwk_index* **[dpc** *dpc* **[ssn** *ssn* **] | global-title-translation { address-map instance** *add_map_inst* **| association instance** *assoc_inst* **} [sessmgr instance** *sessmgr_inst* **]] [| { grep** *grep_options* **| more }]**

iups-service *iups_srvc_name*

Displays SCCP protocol statistics for an existing IuPS service in the current context specified as an alphanumeric string of 1 through 63 characters.

map-service *map_srvc_name*

Displays SCCP protocol statistics for the an existing Mobile Application Part (MAP) service in the current context specified as an alphanumeric string of 1 through 63 characters.

sccp-network *ntwk_index*

Displays SCCP protocol statistics for the SSCP network configuration with a network index specified as an integer from 1 through 12.
The following filters can be added to fine tune the display of SCCP network statistics:

- **dpc** *dpc*: Enter a standard pointcode address to limit the display of SCCP network statistics to those for the identified DPC.
- **ssn** *ssn*: Enter an integer from 1 to 255 to limit the display of SCCP network statistics to those for the identified subsystem number.
- **global-title-translation address-map instance** *add_map_inst*: Enter an integer from 1 to 4096 to limit the display of SCCP network statistics to those for the identified GTT address-map.
- **global-title-translation association instance** *assoc_inst*: Enter an integer from 1 to 16 to limit the display of SCCP network statistics to those for the identified GTT association.
- **sessmgr instance** *sessmgr_inst*: Enter an integer from 1 to 384 to limit the display of SCCP network statistics to those for the identified session manager.

Usage

Use this command to display global SCCP statistics or to display SCCP statistics for a specified service or SCCP network.

Example

The following command displays global SCCP statistics:

```
show sccp statistics
```

The following command displays SCCP statistics for the IuPS service named *iups-serv1*:

```
show sccp statistics iups-service iups-serv1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sctp-param-template

Displays configuration information for Stream Control Transmission Protocol (SCTP) parameter templates configured on this system.

Platform

ASR 5000

Product

MME

Privilege

Inspector

Mode

Exec

Syntax

show sctp-param-template { all | name *template_name* **} [| { grep** *grep_options* **| more }]**

all

Displays configuration information for all SCTP parameter templates configured on this system.

name *template_name*

Displays configuration information for an existing SCTP parameter template specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration information for SCTP parameter templates on this system.

Example

The following command displays configured parameters for an SCTP parameter template named *sctp_pt3*:

```
show sctp-param-template name sctp_pt3
```

show service all

Displays configuration information for all services currently configured on this system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show service all
```

Usage

Use this command to view configuration information for all services configured on this system.

Example

The following command displays information about all services configured on this system:

```
show service all
```

show session counters historical

Displays historical information for session-related counters based on data collected in bulk statistics.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show session counters historical { all | arrived | callops | connected | disconnected |
failed | handoff | rejected | renewal } [ all-intervals | cumulative | graph |
incremental | recent-intervals | table ]
```

all

Displays data for all counters either as a single, wide table or multiple graphs.

arrived

Displays only data for “total calls arrived” counters. This is based on the “sess-ttlarrived” statistic in the system schema.

callops

Displays data for all call operations. This is a calculated value based on the following formula:
(arrived + rejected + disconnected + failed + handoffs + renewals)

connected

Displays only data for “total calls connected” counters. This is based on the “sess-ttlconnected” statistic in the system schema.

disconnected

Displays only data for “total calls disconnected” counters. This is based on the “sess-ttldisconn” statistic in the system schema.

failed

Displays only data for “total calls failed” counters. This is based on the “sess-ttlfailed” statistic in the system schema.

handoff

Displays only data for “total handoffs” counters. This is based on the “sess-ttlhandoff” statistic in the system schema.

rejected

Displays only data for "total calls rejected" counters. This is based on the "sess-ttlrejected" statistic in the system schema.

renewal

Displays only data for "total renewal" counters. This is based on the "sess-ttlrenewal" statistic in the system schema.

Output Options

The following output options are available for this command:

- **all-intervals** Displays all available historical information from all samples. This this filter is used by default.
- **cumulative** Displays total data for all samples up to and including the last one. In this view, values increase over time.
- **graph** Displays data in graphical form.
- **incremental** Displays data changes for each specific sample. The data for each sample is the amount of change since the previous sample. This filter is used by default.
- **recent-intervals** Displays historical information for only recent samples.
- **table** Displays data in tabular form. This is the default view.

Usage

This command provides the ability to track key session-related statistic information over time. This information can be used as part of system performance monitoring and capacity planning.

Important: The information provided in the output of this command requires that bulk statistics functionary be enabled on the system. Refer to the *System Administration Guide* for more information on configuring and enabling bulk statistics support.

The output of this command displays historical data collected at various sample intervals. The interval length is 15 minutes and is not user-configurable. Up to 192 samples (two days' worth of data) are maintained.

Important: Data collection is "best-effort" over these intervals. Data is preserved on the SMC or MIO card switchovers. As with all counters, certain session failures can cause inaccuracies with counters, including counters which appear to go backwards.

Each sample is identified by a timestamp that displays the approximate time the data was gathered. the timestamp is in the format YYYY:MM:DD:hh:mm:ss.
Data acquired during the sample may be marked with an "S" appended to the end of the timestamp or to the counter value. The "S" indicates that the data is suspect (potentially bad). Occurrences of this result from events like changes to the real time clock, which can cause an interval to be an atypical length. Instances of suspect data should be rare. Additionally, there may be occasions in which a sample may be marked as "invalid". "invalid" identifies bad data, a situation that could result when the polling has not run long enough, or because of an unexpected error retrieving data.
Since baseline values must be obtained prior to collecting interval samples, the first interval of data will not be available until up to twice the interval period.

Example

The following command displays cumulative total calls arrived information for the most recent intervals and displays the output in graphical format:

```
show session counters historical arrived recent-intervals cummulative
graph
```

The following command displays historical data for all counters for all intervals and displays the output in tabular format:

```
show session counters historical all
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session counters pcf-summary

Displays the Packet Control Function (PCF) summary which include the number of calls, call types, and Tx/Rx packets/octets statistics.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show session counters pcf-summary [call-types | data | wf1 [pcf *pcf_address* **| [| { grep** *grep_options* **| more }]]]**

call-types

Displays the number of calls and the types of calls.

data

Displays the number of successful calls and Tx/Rx packets/octets statistics.

pcf *pcf_address*

Displays the given PCF summary for a particular address.

wf1

Displays the PCF summary in a single very wide line.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display a summary of all PCFs.

Example

```
show session counters pcf-summary
```

show session disconnect-reasons

Displays a list of the reasons for call disconnects and the number of calls disconnected for each reason.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show session disconnect-reasons [gprs-only | sgsn-only | mme-only | verbose] [| { grep *grep_options* **| more }]]**

gprs-only

Only supported on the SGSN.
This keyword limits the display to session disconnect reasons for the SGSN's 2G MM and PDP context disconnects.

sgsn-only

Only supported on the SGSN.
Displays session disconnect reasons for the SGSN's 3G MM and PDP context disconnects.

mme-only

Displays session disconnect reasons for MME call disconnects.

verbose

List all disconnect reasons even if the values are zero (0).

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display a list of the reasons why calls were disconnected.

Example

To view session disconnect statistics, enter the following command:

```
show session disconnect-reasons
```

To view a list of the disconnect reasons with verbose output, enter the following command:

```
show session disconnect-reasons verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session duration

Displays session duration information for the current context filtered by the options specified.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show session duration [*session_filter* **] [| { grep** *grep_options* **| more }]**

session_filter

Specifies the name of the entity whose session duration information is to be filtered and displayed. This options are:

- **asn-peer-address** *ip_address*: Displays session information for the ASN GW peer whose IP address is specified in IPv4 dotted-decimal notation.
- **asngw-service** *service_name*: Displays session information for the specified ASN-GW service.
- **asnpc-peer-address** *ip_address*: Displays session information for the Access Service Network Paging Controller (ASN PC) peer whose IP address is specified in IPv4 dotted-decimal notation.
- **asnpc-service** *service_name*: Displays session information for the specified ASN PC service.
- **apn** *apn_name*: Displays session information for an existing Access Point Name (APN) specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
- **cscf-service** *service_name*: Displays session information for an existing Call Session Control Function (CSCF) service specified as an alphanumeric string of 1 through 63 characters.

Important: Displays information for in-progress CSCF SIP calls only. Registrations are not considered calls.

- **dhcp-server** *dhcp_address*: Displays session information for the Dynamic Host Configuration Protocol (DHCP) server specified by its IP address in IPv4 dotted-decimal notation.
- **epdg-service** *service_name*: Displays session information for ePDG service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
- **fa** *fa_address*: Displays session information for the foreign agent (FA) whose IP address is specified in IPv4 dotted-decimal notation.
- **fa-service** *fa_name*: Displays session information for the named foreign agent service.
- **ggsn-service** *ggsn_name*: Displays session information for an existing GGSN service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
- **gprs-only**: Limits the display to the session information for the SGSN's 2G MM and PDP contexts.

- **ha** *ha_address*: Displays session information for the home agent specified by its IP address in IPv4 dotted-decimal notation.
- **ha-service** *ha_name*: Displays session information for the named home agent (HA) service.
- **hnbgw-only**: Displays session information for the HNB-GW service related sessions instances (such as HNB, IuPS, IuCS).
- **hsgw-service** *service_name*: Displays session information for an existing HSGW service specified as an alphanumeric string of 1 through 63 characters.
- **lma-service** *service_name*: Displays session information for an existing Local Mobility Anchor (LMA) service specified as an alphanumeric string of 1 through 63 characters.
- **mme-service** *service_name*: Displays session information for an existing Mobility Management Entity (MME) service specified as an alphanumeric string of 1 through 63 characters.
- **mag-service** *service_name*: Displays session information for an existing Mobile Access Gateway (MAG) service specified as an alphanumeric string of 1 through 63 characters.
- **pcf** *pcf_address*: Displays session information for the packet control function specified by its IP address in IPv4 dotted-decimal notation.
- **pdsn-service** *pdsn_name*: Displays session information for the named packet data service.

Important: If no PCF address or PDSN service is specified, the session information for all sessions is displayed.

- **sgsn-address** *sgsn-address*: Displays session information for the SGSN specified by its IP address in IPv4 dotted-decimal notation.
- **sgsn-only**: Limits the display to the session information for the SGSN's 3G MM and PDP contexts.
- **sgw-service** *service_name*: Displays session information for an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the session information to troubleshoot subscriber problems and for general monitoring for orphaned sessions.

Example

The following commands display the duration for the session connected to the packet control function with address *10.2.3.4*, packet data service *sampleService*, and for all sessions, respectively.

```
show session duration pcf 10.2.3.4

show session duration pdsn-service sampleService

show session duration
```

show session progress

Displays session progress information for the current context filtered by the options specified.

Platform

ASR 5000

Product

Syntax

show session progress [asn-peer-address *ip_address* **| asngw-service** *service_name* **| asnpc-service** *service_name* **| asnpc-peer-address** *ip_address* **| apn** *apn_name* **| cscf-service** *service_name* **| dhcp-server** *dhcp_address*| **epdg-service** *service_name* **| fa** *fa_address* **| fa-service** *fa_name* **| ggsn-service** *ggsn_name* **| ha** *ha_adress* **| ha-service** *ha_name* **| hsgw-servie** *service_name* **| lma-service** *service_name* **| mag-service** *service_name* **| mme-address** *mme_address* **| pcf { ** *pcf_address* **| all } | pdsn-service** *pdsn_name* **| pdsnclosedrp-service | pgw-address** *ip_address* **| sgsn-address** *sgsn_address* **| sgw-service** *service_name* **] [| { grep** *grep_options* **| more }]**

progress [asn-peer-address *ip_address* **| asngw-service** *service_name* **| asnpc-service** *service_name* **| asnpc-peer-address** *ip_address* **| apn** *apn_name* **| cscf-service** *service_name* **| dhcp-server** *dhcp_address* **| epdg-service** *service_name* **| fa** *fa_address* **| fa-service** *fa_name* **| ggsn-service** *ggsn_name* **| ha** *ha_adress* **| ha-service** *ha_name* **| hsgw-servie** *service_name* **| lma-service** *service_name* **| mag-service** *service_name* **| mme-address** *mme_address* **| pcf { ** *pcf_address* **| all } | pdsn-service** *pdsn_name* **| pdsnclosedrp-service | pgw-address** *ip_address* **| sgsn-address** *sgsn_address* **| sgw-service** *service_name* **]**

progress: indicates session progress information is to be displayed.

- **asn-peer-address** *ip_address*: Displays session information for the Access Service network-Gateway (ASN-GW) peer specified by its IP address in IPv4 dotted-decimal notation.
- **asngw-service** *service_name*: Displays session information for the named ASN-GW service.
- **asnpc-service** *service_name*: Displays session information for the named Access Service Network Paging Controller (ASN PC) service.
- **asnpc-peer-address** *ip_address*: Displays session information for the ASN PC peer specified by its IP address in iIPv4 dotted-decimal notation.
- **apn** *apn_name*: Displays session information for an existing Access Point Name (APN) specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
- **cscf-service** *service_name*: Displays session information for an existing Call Session Control Function (CSCF) service specified as an alphanumeric string of 1 through 63 characters.

Important: Displays information for in-progress CSCF SIP calls only. Registrations are not considered calls.

- **dhcp-server** *dhcp_address*: Displays session information for the Dynamic Host Configuration Protocol (DHCP) server specified by its IP address in IPv4 dotted-decimal notation.
- **epdg-service** *service_name*: Displays session information for ePDG service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
- **fa** *fa_address*: Displays session information for the foreign agent (FA) whose IP address is specified in IPv4 dotted-decimal notation.
- **fa-service** *fa_name*: Displays session information for the named foreign agent service.
- **ggsn-service** *ggsn_name*: Displays session information for an existing GGSN service specified as an alphanumeric string of 1 through 63 characters that is case sensitive.
- **gprs-only**: Limits the display to the session information for the SGSN's 2G MM and PDP contexts.
- **ha** *ha_address*: Displays session information for the home agent specified by its IP address in IPv4 dotted-decimal notation.
- **ha-service** *ha_name*: Displays session information for the named home agent (HA) service.
- **hnbgw-only**: Displays session information for the HNB-GW service related sessions instances (such as HNB, IuPS, IuCS).
- **hsgw-service** *service_name*: Displays session information for an existing HSGW service specified as an alphanumeric string of 1 through 63 characters.
- **lma-service** *service_name*: Displays session information for an existing Local Mobility Anchor (LMA) service specified as an alphanumeric string of 1 through 63 characters.
- **mme-service** *service_name*: Displays session information for an existing Mobility Management Entity (MME) service specified as an alphanumeric string of 1 through 63 characters.
- **mag-service** *service_name*: Displays session information for an existing Mobile Access Gateway (MAG) service specified as an alphanumeric string of 1 through 63 characters.
- **pcf** *pcf_address*: Displays session information for the packet control function specified by its IP address in IPv4 dotted-decimal notation.
- **pdsn-service** *pdsn_name*: Displays session information for the named packet data service.

Important: If no PCF address or PDSN service is specified, the session information for all sessions is displayed.

- **pgw-address** *ip_address*: Displays session progress information for the P-GW specified by its IP address in IPv4 dotted-decimal notation.
- **sgsn-address** *sgsn-address*: Displays session information for the SGSN specified by its IP address in IPv4 dotted-decimal notation.
- **sgw-service** *service_name*: Displays session progress information for an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

Example

The following commands display the status information for the session connected to the packet control function with address *10.2.3.4*, packet data service *sampleService*, and for all sessions, respectively.

```
show session progress pcf 10.2.3.4

show session progress pdsn-service sampleService

show session progress
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session recovery status

Displays session recovery status information for the current context filtered by the options specified.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show session recovery status [verbose] [| { grep *grep_options* **| more }]**

recovery status

Displays the current status of the system's ability to recover from a hardware or software fault that requires the recovery of home agent-based Mobile IP session(s).

verbose

Includes per-CPU Session Recovery status.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the session information for troubleshooting subscriber problems and for general monitoring for orphaned sessions.

Example

To display the session recovery status information, enter the following command:

```
show session recovery status
```

Adding the optional verbose keyword to this command provides more details.

```
show session recovery status verbose
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session setuptime

Displays session setup time information for all sessions or sessions associated with the specified Access Gateway (AGW).

Platform

ASR 5000

Product

PDSN

HNB-GW

SGSN

Privilege

Operator

Mode

Exec

Syntax

```
show session setuptime [  epdg-only [ verbose ] | hnbgw-only | pcf pcf_address  | gprs-only | sgsn-address sgsn_address| sgsn-only ] [ | { grep grep_options | more } ]
```

`[  epdg-only [ verbose ]  hnbgw-only |  mme-only | pcf pcf_address  | gprs-only | sgsn-address sgsn_address | sgsn-only ]`

Displays the call setup times aggregated into basic ranges of time.

- **`epdg-only`**: Display ePDG Session Statistics. **`verbose`**: Displays session setup times in verbose mode.
- **`hnbgw-only`**: Filters and displays the call setup information for HNB-GW calls only.
- **`pcf`** *`pcf_address`*: displays call setup data for the packet control function whose IP address is specified as *`pcf_address`*. *`pcf_address`* must be specified using IPv4 dotted-decimal notation. The call setup times for all PCFs is displayed when no specified PCF is specified.
- **`gprs-only`**: Displays 2G call setup data for the for the SGSN for the MM and PDP contexts.
- **`sgsn-address`** *`sgsn_address`***:** Displays call setup times for the specified SGSN. *`sgsn_address`* is the IP address of the SGSN and must be expressed in IPv4 dotted-decimal notation. This keyword is used by the GGSN.
- **`sgsn-only`**: Displays 3G call setup data for the for the SGSN for the MM and PDP contexts.

`| { grep grep_options | more }`

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **`grep`** and **`more`** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.

When no keywords are specified, the information shown is cumulative for all sessions that have been facilitated by the system.

Example

The following command shows setup time statistics for all sessions from the PCF at IP address *192.168.10.3*:

```
show session setuptime pcf 192.168.10.3
```

show session subsystem

Displays session information for system subsystems. If no keywords are specified, information for all subsystems is displayed.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show session subsystem [full | facility *facility* **[all | instance** *id* **]] [verbose] [| { grep** *grep_options* **| more }]**

[full | facility *facility* **[all | instance** *id* **]]**

- **full**: Indicates that a full statistics summary of all subsystems is to be displayed.
- **facility** *facility*: Specifies the facility for which subsystem statistics is to be displayed where *facility* is specified as one of:
  - **a11mgr**: A11 Manager
  - **aaamgr**: Accounting and Authentication Manager
  - **aaaproxy**: AAA Proxy Manager
  - **alcapmgr**: ALCAP Manager
  - **asngwmgr**: ASN Gateway Manager
  - **asnpcmgr**: ASN Paging/Location-Registry Manager
  - **cscfmgr**: SIP CSCF Manager
  - **cscfttmgr**: SIP CSCFTT manager
  - **dgmbmgr**: Diameter Gmb Application Manager
  - **diamproxy**: Diameter Proxy Application Manager [Release 12.0 and earlier versions only]
  - **egtpegmgr**: EGTP Egress Demux Manager
  - **egtpinmgr**: EGTP Ingress Demux Manager
  - **famgr**: Foreign Agent Manager
  - **gtpcmgr**: GTP-C Manager
  - **gtpumgr**: GTP-U Demux Manager
  - **hamgr**: Home Agent Manager
  - **henbgwdemux**: Home eNodeB Gateway demux manager
  - **henbgwmgr**: Home eNodeB Gateway Manager
  - **hnbmgr**: HNBGW HNB Manager

- **imsimgr**: SGSN IMSI Manager
- **ipsgmgr**: IP Services Gateway Manager
- **l2tpdemux**: L2TP Demux Manager
- **l2tpmgr**: L2TP Manager
- **linkmgr**: SGSN/SS7 Master Manager
- **magmgr**: Mobile Access Gateway Manager
- **megadiammgr**: MegaDiameter Manager
- **mmedemux**: MME Demux Manager
- **mmemgr**: MME Manager
- **mmgr**: SGSN/SS7 Master Manager
- **pdgmgr**: PDG Manager
- **phsgwmgr**: PHS Gateway Manager
- **phspcmgr**: PHS Paging Controller Manager
- **sessmgr**: Session Manager
- **sgtpcmgr**: SGSN GTP-C Manager

- **all | instance** *id*: the keyword **all** indicates all instances of the specified facility are to be displayed whereas the keyword **instance** specifies a specific instance for which information is to be displayed where *id* must be specified as an integer from 0 through 4294967295. If all or instance is not specified summary statistics are displayed.

verbose

Displays everything the **show session subsystem** command displays with the exception that the Setup Time statistics are reported in 100 millisecond increments from 100 ms up to 9600 ms.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

View the session information to troubleshooting subscriber problems and for general monitoring for orphaned sessions.
If this command is entered with no keywords, the information displayed is cumulative for all sessions facilitated by the system.

Example

The following commands display the statistics information summarized for all sessions, then for the *famgr* facility (all sessions), and finally only for the session ID *127589* for the *hamgr* subsystem.

```
show session subsystem full

show session subsystem facility famgr all

show session subsystem facility hamgr instance 127589
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show session trace

Displays status and statistics for the session trace application.

Platform

ASR 5000

Product

GGSN

MME

P-GW

S-GW

Privilege

Inspector

Mode

Exec

Syntax

show session trace { statistics | subscriber network-element { ggsn | mme | pgw | sgw } trace-ref *value* **| tce-address** *ip_address* **tce-index** *num* **| tce-summary | trace-summary } [| { grep** *grep_options* **| more }]**

statistics

Displays summary statistics for the session trace subsystem.

subscriber network-element { ggsn | mme | pgw | sgw } trace-ref *value*

Displays status and statistics for a specified session trace using the network element type; GGSN, MME, P-GW, and S-GW, and a valid trace reference of 12 characters.

tce-address *ip_address* **tce-index** *num*

Displays status and statistics for an existing Trace Collection Entity (TCE) connection specified by its IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
tce-index *num*: Specifies a TCE index of the trace collection entity as an integer from 0 through 7.

tce-summary

Displays a summary of all active TCE connections.

trace-summary

Displays a summary of all active session traces.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display status and statistics for the session trace application.

Example

The following command displays status and statistics for a subscriber session trace on a P-GW with a trace reference of *32223398765*:

```
show session trace subscriber network-element pgw trace-ref 32223398765
```

The following command displays status and statistics for a subscriber session trace on an MME with a trace reference of *32221234567*:

```
show session trace subscriber network-element mme trace-ref 32223398765
```

The following command displays status and statistics for a subscriber session trace on an GGSN with a trace reference of *1203398765*:

```
show session trace subscriber network-element ggsn trace-ref 1203398765
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sf

Displays switch fabric task (SFT) information associated with packet processing cards.

Platform

ASR 5000

Product

All

Privilege

Inspector

Syntax

```
show sf stats sft [ historical ]
```

historical

Displays historical information regarding SFT performance.

Usage

Use this command to display information and statistics about the switch fabric task.

Example

The following command displays statistics for the SFT:

```
show sf stats sft
```

show sgs-service

Displays information and statistics about Visitor Location Register (VLR) SGs interface services configured on this system.

Platform

ASR 5000

Product

MME

Privilege

Inspector

Syntax

show sgs-service { all | name *name* **| offload-status [service-name** *sgs_svc_name* **] | statistics { all | name** *name* **} | vlr-status [service-name** *sgs_svc_name* **] [vlr-name** *name* **] [full]**

all

Displays information about all SGs interface services configured on this system.

---

name *name*

Displays information about an existing SGs service specified as an alphanumeric string of 1 through 63 characters.

---

offload-status *sgs_svc_name*

Displays statistics for all VLRs flagged for offload for an existing SGs service specified as an alphanumeric string of 1 through 63 characters.

---

statistics { all | name *name* **}**

Displays statistics for SGs services configured on this system.
all: Displays statistics for all SGs services configured on this system.
name *name*: Displays statistics for an existing SGs service specified as an alphanumeric string of 1 through 63 characters.

---

vlr-status [service-name *name* **] [vlr-name** *name* **] [full]**

Displays status information about VLRs configured in SGs services on this system.
service-name *sgs_svc_name*: Displays names and states of VLRs configured in an existing SGs service specified as an alphanumeric string of 1 through 63 characters.
vlr-name *name*: Displays the name and state of an existing VLR configured in SGs services on this system and specified as an alphanumeric string of 1 through 63 characters.
full: Displays additional information about VLRs configured in SGs services on this system. Additional information includes ports, addresses and peer IDs.

Usage

Use this command to display information and statistics about SGs services configured on this system.

Example

The following command displays statistics for an SGs service named *sgs3*:

```
show sgs-service name sgs3
```

The following command displays VLR status information for a configured VLR named *vlr-main*:

```
show sgs-service vlr-status vlr-name vlr-main
```

show sgsn sessmgr

Displays session manager (SessMGR) statistics specific to the SGSN service.

Platform

ASR 5000

Product

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show sgsn sessmgr { all | instance *smgr_inst* **}**

all

Displays all SessMGR statistics specific to the system's SGSN services.

instance *smgr_inst*

Displays the statistics for a session manager instance of the SGSN service specified as an integer between 1 and 10000000.

Usage

Use this command to display information for SGSN services.

Example

The following command displays SGSN SessMGR statistics for all SGSN services on the system:

```
show sgsn sessmgr all
```

show sgsn-fast-path

Displays information related to SGSN fast-path.

Platform

ASR 5000

Product

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show sgsn-fast-path statistics [all | smgr-instance *smgr_inst* **] [| { grep** *grep_options* **| more }]**

all

Displays fast-path statistics for all session managers.

smgr-instance *smgr_inst*

For releases prior to 14.0, this keyword displays the fast-path statistics for a session manager instance specified as an integer between 1 and 65535.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistics for SGSN fast-path configurations.

Example

The following command displays fast-path statistics for all SGSN session managers:

```
show sgsn sessmgr all
```

show sgsn-map-app

Displays collected statistics for the SGSN Mobile Application Part (MAP).

Platform

ASR 5000

Product

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show sgsn-map-app statistics [| { grep *grep_options* **| more }]**

all

Displays collected statistics for the SGSN MAP application.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistics for the SGSN MAP application.

Example

The following command displays SGSN MAP statistics:

```
show sgsn-map-app statistics
```

show sgsn-mode

Displays the SGSN global configuration.

Platform

ASR 5000

Product

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show sgsn-mode[| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the configuration created with the commands in the SGSN Global Configuration mode.

Example

The following command displays the SGSN global configuration:

```
show sgsn-mode
```

show sgsn-operator-policy

This command has been deprecated. Refer to the **show operator-policy** command.

show sgsn-pool

Displays collected pooling statistics for either GPRS services or SGSN services.

Platform

ASR 5000

Product

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show sgsn-pool statistics { gprs-service *srvc_name* **| sgsn-service** *srvc_name***} { nri-value** *nri_value* **| peer-non-broadcast-lac** *lac* **rac** *rac* **| target-load-in-progress [smgr-instance** *smgr_instance* **| target-nri** *target_nri* **] | target-offloaded-to-peer [target-nri** *target_nri* **] } [| { grep** *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the collected statistics for pooling in either GPRS or SGSN services. The outputs can be filtered to focus the statistics displayed.

Example

The following command displays the:

```
show sgsn-pool statistics sgsn-service sgsn1 nri-value 3
```

show sgsn-service

Displays information about the configured SGSN services in the current context.

Platform

ASR 5000

Product

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show sgsn-servie { all | name *srvc_name* **}**

all

Displays information for all SGSN services in the current context.

name *srvc_name*

Displays information for an existing SGSN service specified as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to display information for SGSN services.

Example

The following command displays information for all SGSN services in the current context:

```
show sgsn-service all
```

The following command displays information for an SGSN service in the current context that is named *sgsn1*:

```
show sgsn-service name sgsn1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgtp-service

Displays information about the configured GPRS Tunnelling Protocol (SGTP) services in the current context, including GTP-C and GTP-U operational configuration.

Platform

ASR 5000

Product

SGSN

PDG/TTG

MME

Privilege

Inspector

Exec

Syntax

show sgtp-service { ggsn-table [smgr-instance*smgr_instance* **] | mbms-bearers | name** *srvc_name***sgsn-table**

ggsn-table [smgr-instance *srvc_name* **]**

Displays GGSN information configured for the SGTP service(s) in the current context.
smgr-instance *srvc_name* enter an integer from 1 through 384 to limit the GGSN output to information for a specific session manager.

mbms-bearers

This keyword is specific to the SGSN and is not yet supported.

name *srvc_name* **[gtpu-table]**

Displays information for the specified SGTP service in the current context. *srvc_name* must be an alphanumeric string of 1 through 63 characters that identifies a configured SGTP service.
gtpu-table: Limits the output to GTPU information for a specific SGTP service.

sgsn-table

Displays SGSN information configured for the SGTP service(s) in the current context.

Usage

Use this command to control the display of SGTP services information.

Example

The following command displays information for all SGTP services in the current context:

```
show sgtp-service all
```

The following command displays the GGSN information in SGTP services in the current context:

```
show sgtp-service ggsn-table
```

The following command displays the SGSN information in SGTP services in the current context:

```
show sgtp-service sgsn-table
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgtpc statistics

Displays all statistics, for SGSN GPRS Tunnelling Protocol (SGTP) interface parameters, collected since the last restart or last use of a **clear** command.

Platform

ASR 5000

Product

SGSN

PDG/TTG

MME

Privilege

Exec

Syntax

show sgtpc statistics [all | gsn-address *ipv4_address* **| sgtp-service** *sgtp_srvc_name* **] [verbose][| { grep** *grep_options* **| more }]**

all

Displays configuration information for all of the SGTP services defined for the current context.

gsn-address *ipv4_address*

Displays statistics for an SGSN specified by its IP address in IPv4 dotted-decimal notation. This must be an existing and active interface.

sgtp-service *sgtp_srvc_name*

Displays statistics for an existing SGTP service specified as an alphanumeric string from 1 through 63 characters.

verbose

Causes the system to displays more detailed level of statistics.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information for SGSN services.

Example

The following command displays statistics for the SGTP service named *sgtp1*:

```
show sgtpc statistics sgtp-service sgtp1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sgtpu statistics

Displays all transmission and reception statistics for pre-defined and active GTP-U interfaces collected since the last restart or last use of a **clear** command.

Platform

ASR 5000

Product

SGSN

PDG/TTG

Privilege

Inspector

Mode

Exec

Syntax

show sgtpu statistics [ggsn-address *ipv4_address* **| gprs-service** *gprs_srvc_name* **nsei** *nse_id* **| iups-bind-address** *ipv4_address*| **iups-service** *iups_srvc_name* **| rnc-address** *ipv4_address* **| sgtp-service** *sgtp_srvc_name* **][| { grep** *grep_options* **| more }]**

ggsn-address *ipv4_address*

Displays statistics for the GGSN specified by its IP address in IPv4 dotted-decimal notation.

gprs-service *gprs_srvc_name* **nsei** *nse_id*

Displays NSEI-based GTPU statistics associated with an existing GPRS service specified as an alphanumeric string of 1 through 63 characters.
nsei *nse_id*: Specifies a GPRS NSEI as an integer from 0 through 65535.

iups-bind-address *ipv4_address*

Displays SGSN GPRS Tunnelling Protocol (SGTP) statistics for an Iu GTPU interface specified by its IP address in IPv4 dotted-decimal notation.

iups-service *iups_srvc_name*

Displays statistics for an existing IuPS service specified as an alphanumeric string of 1 through 63 characters.

rnc-address *ipv4_address*

Displays statistics for a Radio Network Controller (RNC) identified by its IP address in IPv4 dotted-decimal notation.

sgtp-service *sgtp_srvc_name*

Displays statistics for an existing SGTP service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display statistics for the SGTPU interface.

Example

The following command displays GPTP-U statistics for the traffic between an SGSN and a connected RNC:

```
show sgtpu statistics rnc-address 123.1.2.3
```

show sgw-service

Displays configuration settings and/or service statistics for Serving Gateway (S-GW) services on this system.

Platform

ASR 5000

Product

S-GW

Privilege

Inspector

Mode

Exec

Syntax

show sgw-service { all | name *service_name* **| statistics { all | name** *service_name* **} } [| { grep** *grep_options* **| more }]**

all

Displays configuration information for all S-GW services configured on this system.

name *service_name*

Displays configuration information for an existing S-GW service c specified as an alphanumeric string of 1 through 63 characters.

statistics { all | name *service_name* **}**

all: Displays statistics for all S-GW services on this system or for a specified service.
name *service_name*: Displays statistics for an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.

| { grep *grep_options* **| more }**

Indicates the output of the command is to be piped (sent) to the command specified.
A command to send output to must be specified.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section in the *Command Line Interface Overview* chapter.

Usage

Use this command to view configuration settings and/or service statistics for S-GW services on this system.

Example

The following command displays service statistics for the S-GW service named *sgw1*:

```
show sgw-service statistics name sgw1
```

show sms statistics

Displays traffic statistics for the Short Message Service (SMS).

Platform

ASR 5000

Product

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show sms statistics [gprs-only | sgsn-only] [name *map_srvc* **] [verbose] [| { grep** *grep_options* **| more }]**

gprs-only

Displays only GPRS access type SMS statistics.

sgsn-only

Displays only UMTS access type SMS statistics.

name *map_srvc*

Displays statistics for an existing MAP service specified as an alphanumeric string of 1 through 63 characters.

verbose

Causes the system to displays more detailed level of statistics.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display traffic statistics for the SMS services.

Example

Use the following command to display SMS statistics for 3G traffic:

```
show sms statistics sgsn-only
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show sndcp statistics

Displays statistics for the packet traffic going through the Subnetwork Dependent Convergence Protocol (SNDCP) layer.

Platform

ASR 5000

Product

SGSN

Privilege

Inspector

Mode

Exec

Syntax

show sndcp statistics [gprs-service *srvc_name* **] [verbose] [| { grep** *grep_options* **| more }]**

gprs-service *srvc_name*

Displays statistics for an existing GPRS service specified as an alphanumeric string of 1 through 63 characters.

verbose

Displays a more detailed level of statistics.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display SNDCP traffic statistics. Include the **gprs-service** keyword to filter the output to statistics for only one GPRS service.

Example

Use the following command to display all SNDCP layer traffic statistics:

```
show sndcp statistics verbose
```

Use the following command to display SNDCP layer traffic statistics for the *test1* GPRS service:

```
show sndcp statistics gprs-service test1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show snmp

Displays information on the Simple Network Management Protocol (SNMP) servers and interfaces.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show snmp { accesses | communities | contexts | notifies | server | transports | trap [history | statistics { verbose } { wide }] | views } [| { grep *grep_options* **| more }]**

---

accesses

Displays SNMP server usage statistics.

---

communities

Displays SNMP community strings.

---

contexts

Displays SNMP information per context.

---

notifies

Displays SNMP event trap and notification statistics.

---

server

Displays SNMP server configuration information.

---

transports

Displays trap destination configuration information.

---

trap [history | statistics { verbose } { wide }]

history: Displays SNMP event trap history. **trap history** Displays up to 5,000 time-stamped trap records stored in a buffer. The buffer may be cleared by entering the **clear snmp history** command.
statistics: Displays SNMP event trap and notification statistics.
verbose: Displays rows for every defined trap, even if never generated.
wide: Displays trap statistics data in excess of 80 columns.

---

views

Displays SNMP views.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display SNMP information as part of system verification and troubleshooting.

Example

The following commands display the usage statistics, community string information, event trap and notification data, server information, and trap destination configuration, respectively.

```
show snmp communities

show snmp transport

show snmp server

show snmp accesses

show snmp notifies

show snmp trap history
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show srp

Displays the Service Redundancy Protocol (SRP) information.

Platform

ASR 5000

Product

All products that support Interchassis Session Recovery (ICSR)

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show srp { call-loss statistics | checkpoint statistics [active | standby] [verbose] | info | monitor [all | authentication-probe | bfd | bgp | diameter] | statistics } | [grep *grep_options* **| more]**

call-loss statistics

Displays history of lost calls during switchover.

checkpoint statistics [active | standby] [verbose]

Displays check pointing statistics on session redundancy data (session managers, current call recovery records, etc.).
active: Displays information for the active chassis.
standby: Displays information for the standby chassis.
verbose: Displays cumulative information for all session managers in tabular output.

info

Displays Service Redundancy Protocol information (context, chassis state, peer, connection state, etc.).

monitor [all | authentication-probe | bfd | bgp | diameter]

Displays SRP monitor information.
all: Displays monitor information for all types (authentication-probe, bgp, and diameter).
authentication-probe: Displays authentication probe monitor information.
bfd: Displays BFD monitor information.
bgp: Displays BGP monitor information.
diameter: Displays Diameter monitor information.

statistics

Displays SRP statistics (hello messages sent, configuration validation, resource messages, switchovers, etc.).

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

The output of this command may be considered as part of a periodic system auditing program by verifying the Service Redundancy Protocol performance. For more information, refer to the *Interchassis Session Recovery* appendix of the *System Administration Guide* and the *Service Redundancy Protocol Configuration Mode* chapter of this guide.

Example

The following commands display Service Redundancy Protocol information:

```
show srp audit-statistics

show srp call-loss statistics

show srp checkpoint statistics

show srp info

show srp monitor

show srp statistics
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ss7-routing-domain

This command displays the configuration information for the defined Signalling System #7 (SS7) routing domains. Since SS7 routing domains encompass a large number of operational parameters, this command enables you to narrow your displays to specific protocol parameters on a specific link.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show ss7-routing-domain { all | *ss7rd_id* { m3ua | mtp2 | mtp3 | qsaal | routes [adjacent] | sctp asp { all | instance *asp_id* } | sscf } }

show ss7-routing-domain *ss7rd_id* m3ua { statistics { gen | peer-server { all | id *peer-server_id* peer-server-process { all | instance *psp_instance* } } } | status { address-translation-table | destination-point-code { all | *ss7_dpc* } | gen | peer-server *peer-server_id* [peer-server-process instance *psp_id* | verbose] }

show ss7-routing-domain 1 sscf { statistics linkset { all | id *linkset_id* link { all | id *link_id* } } | status linkset { all | id *linkset_id* link { all | id *link_id* [verbose] } } }

ss7-routing-domain { all | *ss7rd_id* }

all: Displays information for all SS7 routing domains.
ss7rd_id: Displays information for the SS7 routing domain ID specified as an integer from 1 through 12.

m3ua

Displays statistics and status information for the SS7 MTP3 User Adaptation Layer (M3UA) in the specified SS7 routing domain.

mtp2

Displays statistics and status information for the SS7 Message Transfer Part-2 (MTP2) in the specified SS7 routing domain.

mtp3

Displays statistics and status information for the SS7 Message Transfer Part-3 (MTP3) in the specified SS7 routing domain.

qsaal

Displays statistics and status information for the Service Specific Connection-Oriented Protocol (SSCOP) sub-layer of the Quasi Signaling Application Adaptation Layer (QSAAL) in the specified SS7 routing domain.

routes [adjacent]

Displays the destination point code (DPC) routing table.
adjacent: If this keyword is used with the **routes** keyword, access is provided to the statistics and status information for configured adjacent point codes.

sctp asp { all | instance *asp_id* **}**

Provides access to the status or statistics for the Stream Control Transmission Protocol (SCTP) application server processes (ASP) in the specified SS7 routing domain for all or a specified SCTP ASP instance.

- **all**: Displays the information for all SCTP application server process instances for a specific SS7 routing domain.
- **instance** *asp_id*: Displays the information for an SCTP application server process instance specified as an integer from 1 through 4.

sscf

Displays statistics and status information for the Service Specific Coordination Function (SSCF [q.2140]) in the specified SS7 routing domain.

peer-server [all | id *peer-server_id* **]**

Filters the information for the specific protocol in the SS7 routing domain for all or a specific peer server ID.

- **all**: Displays the information for all peer servers for a specific protocol.
- **id** *peer-server_id*: Indicates the specific linkset identifier as an integer from 1 through 49.

peer-server-process [all | instance *instance_id* **]**

Filters the information for the specific protocol in the SS7 routing domain for all or a specific instance of peer-server process.

- **all**: Displays the information for all peer server process instances for a specific protocol.
- **instance** *instance_id*: Specifies a peer server process instance as an integer from 1 through 4.

destination-point-code [all | *dest_point_code***]**

Filters the information for the specific protocol in the SS7 routing domain for all or a specific DPC.

- **all**: Displays the information for all DPCs in the SS7 routing domain.
- *dest_point_code*: Specifies a DPC in the SS7 routing domain.

gen

Displays general information for the specific protocol in the specified SS7 routing domain.

verbose

Enables the display of maximum information for a protocol.

linkset [all | id *linkset_id* **]**

Filters the information for the specific protocol in SS7 routing domain for all or a specific link set.

- **all**: Displays the information for all linkset for a specific protocol.
- **id** *linkset_id*: Specifies a linkset identifier as an integer from 1 through 49.

link [all | id *link_id* **]**

Filters the information for a specified protocol in the SS7 routing domain for all or a specific link set.

- **all**: Displays the information for all links for a specific protocol.
- **id** *link_id*: Specifies a linkset identifier as be an integer from 1 through 16.

Usage

Use this command to display the SS7 routing domain and different layer protocol information for SGSN service.

Example

Displays the information/statistics for all SCTP application server processes of peer server ID 17 and peer server process instance 1 in SS7 routing domain 12:

```
show ss7-routing-domain 12 sctp asp all status peer-server id 17 peer-
server-process instance 1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show ssh key

Displays the secure shell (SSH) public key information.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show ssh key [type { v1-rsa | v2-rsa | v2-dsa }] [| { grep *grep_options* **| more }]**

[type { v1-rsa | v2-rsa | v2-dsa }]

Specifies the type of SSH key information to display. If type is not specified, information for all types is displayed.
v1-rsa: SSH v1 RSA host key only
v2-rsa: SSH v2 DSA host key only
v2-dsa: SSH v2 RSA host key only

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Show the secure shell key information for all types to verify installed keys.

Example

The following command shows information for all SSH V1 and SSH V2 keys:

```
show ssh key
```

The following command shows information for only SSH V2 RSA host keys:

```
show ssh key type v2-rsa
```

show ssl cipher-suite

Displays information related to Secure Sockets Layer (SSL) cipher suites since the last restart or **clear** command. A cipher suite contains the cryptographic algorithms supported by the client.

Platform

ASR 5000

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show ssl cipher-suite [name *name* **] [| { grep** *grep_options* **| more }]**

name *name*

Displays information related to the SSL cipher suite specified as an alphanumeric string of 1 through 127 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information related to SSL cipher suites.

Example

The following command displays information for the SSL cipher suite *ssl_cipher_suite_1*:

```
show ssl cipher-suite name ssl_cipher_suite_1
```

show ssl connection

Displays information pertaining to Secure Sockets Layer (SSL) connections on the Proxy Call Session Control Function (P-CSCF).

Platform

ASR 5000

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show ssl connection [list | summary [service-name *name* **]] [name** *name* **] [| { grep** *grep_options* **| more }]**

list

Lists the SSL connections on the P-CSCF.

summary

Displays state and statistical information for the SSL connections on the P-CSCF.

service-name *name*

Lists the SSL connections on the P-CSCF for the specified P-CSCF service, or displays state and statistical information for the SSL connections on the P-CSCF for the specified P-CSCF service.
name must be an alphanumeric string of 1 through 63 characters.

name *name*

Displays state and statistical information for the SSL connection specified as an alphanumeric string of 1 through 127 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command in Exec Mode to display information and statistics pertaining to SSL connections.
If the **summary** keyword is not used, detailed information is displayed.

Example

The following command displays SSL connection information for the P-CSCF service *pcscf_tls_1*:

```
show ssl connection list service-name pcscf_tls_1
```

show ssl map

Displays information related to configured Secure Sockets Layer (SSL) maps/templates since the last restart or **clear** command.

Platform

ASR 5000

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show ssl map [map-type ssl-subscriber-template] [name *name* **] [| { grep** *grep_options* **| more }]**

map-type ssl-subscriber-template

Displays information related to configured SSL maps/templates for the SSL map/template type ssl-subscriber-template.

name *name*

Displays information related to configured SSL maps/templates for the map/template name specified as n alphanumeric string of 1 through 127 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display information related to configured SSL maps/templates.

Example

The following command displays information related to configured SSL maps/templates for the SSL map/template *ssl_template_1*:

```
show ssl map name ssl_template_1
```

show ssl statistics

Displays statistics for Secure Sockets Layer (SSL) since the last restart or **clear** command.

Platform

ASR 5000

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show ssl statistics [service-name *name* **] [| { grep** *grep_options* **| more }]**

service-name *name*

Displays SSL statistics for the Proxy Call Session Control Function (P-CSCF) service. specified as an alphanumeric string of 1 through 127 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display SSL statistics.

Example

The following command displays SSL statistics for all P-CSCF services:

```
show ssl statistics
```

show subscribers

Displays information for subscriber sessions that are defined by specified keywords. Command keywords are base commands that display distinctive types of data. Filter keywords are a superset of command keywords that modify or filter the output of the base commands.

Important: Not all filter keywords are available for all command keywords. CLI Help displays available filter keywords based on: the platform type (ASR 5000 or ASR 5500), the products that are licensed to run on the platform, and the preceding command keyword and subsequent filter keywords.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Inspector, Operator

Mode

Exec

Syntax

show subscribers [*command_keyword* **] [** *filter_keywords* **] [| { grep** *grep_options* **| more }]**

command_keyword

The following keywords are base commands that each have a distinct display output. Only one command keyword can be entered on the command line.

aaa-configuration

Displays Authentication Authorization and Accounting (AAA) configuration information for subscriber sessions defined by the specified filter keywords. The following filter keywords are valid with this command:

```
active, active-charging -service, all, apn, asn-peer-address, asngw-
service, asnpc-service, bandwidth-policy, bearer-establishment, bng-
service, callid, card-num, cbb-policy, ccoa-only, configured-idle-
timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, fa,
fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-
traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-
ipsec-only, ha-service, hnbgw-only, hsgw-service, idle-time, ims-auth-
service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-
prefix, l3-tunnel-local-address, l3-tunnel-remote-address, lac, lac-
service, lma-service, lns, lns-service, long-duration-time-left, mag-
service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-
service, msid, nemo-only network-requested, network-type, pcf, pdg-
service, pdsn-service, pgw-address, plmn-type, profile-id, profile-
name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address,
sgsn-service, sgw-address, sgw-service, tpo, tx-data, username,
verbose, grep, more
```

access-flows { accounting | dynamic | pre-provisioned | static }

Shows the ip-flows for the subscribers defined by the specified filter keywords.

- **accounting**: displays the accounting type of access flows for a subscriber.
- **dynamic**: displays the dynamic type of access flows for a subscriber.
- **pre-provisioned**: displays the pre-provisioned type of access flows for a WiMAX subscriber.
- **static**: displays the static type of access flows for a subscriber.

The following filter keywords are valid with this command:

active, active-charging-service, all, apn, asn-peer-address, asngw-service, asnpc-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, fa, fa-service, flow-type, ggsn-service, gprs-service, gsm-traffic-class, ha, ha-ipsec-only, ha-service, hnbgw-only, hsgw-service, idle-time, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-address, l3-tunnel-remote-address, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mme-address, mme-service, msid, msisdn, network-requested, network-type, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, rulebase, rx-data, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, tpo, tx-data, username, verbose, grep, more

access-type { lxcdma | ehrpd | lte | undetemrined | wcdma | wifi | wired }

Displays active subscribers using a specific type of UE.

- **1xcdma**: 1XCDMA – Wireless CDMA 1x high speed internet service
- **ehrpd**: eHRPD – Enhanced High Rate Packet Data
- **evdo**: EvDO – EVolution-Data Optimized
- **lte**: LTE – Long Term Evolution
- **undetermined**
- **wcdma**: WCDMA – Wideband Code Division Multiple Access
- **wifi**: WiFi – Wireless local area network
- **wired**

The following filter keywords are valid with this command:

access-type, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, cscf-service, domain, ebi, enodeb-address, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rx-data, s1u-state, security-type, session-time-left, sgw-address, smgr-instance, tpo, tx-data, ue-type, username, grep, more

active

Displays active subscribers. When no Filter Keywords are specified, the output is a summary of all active subscribers. When Filter Keywords are specified, the percentage is displayed as graphs in which one is displayed using a high sampling rate, a 10-second interval between samples, and a low sampling rate, a 15-minute interval between samples.
The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, session-time-left, sgsn-address, sgsn-service, smgr-instance, sgw-address, sgw-service, tpo, tx-data, username, grep, more

active-charging-service *acs_service*

Displays information for subscribers being processed by the active charging service specified as an alphanumeric string of 1 through 15 characters.
The following filter keywords are valid with this command:

active-charging-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-address, l3-tunnel-remote-address, long-duration-time-left, mag-service, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

activity

Displays subscriber link activity percentage. When no Filter Keywords are specified, the output is a summary of all subscriber activity. When Filter Keywords are specified, the link activity percentage is displayed as graphs in which one is displayed using a high sampling rate, a 10-second interval between samples, and a low sampling rate, a 15-minute interval between samples.
The following filter keywords are valid with this command:

active, all, apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac,

lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

all *ip_address*

Displays all current subscribers who have either active or dormant sessions.

apn *apn_string*

Displays subscribers currently facilitated by the Access Point name (APN) configured on the SGSN or GGSN.
The following filter keywords are valid with this command:

active-charging-service, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-address, l3-tunnel-remote-address, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, nat, nemo-only network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, smgr-instance, tpo, tx-data, username, verbose, grep, more

asn-peer-address *ip_address*

Displays information for subscribers on an ASN-GW trusted peer.
ip_address is the IP address of the ASN-GW peer server expressed in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

asn-peer-address, asngw-service, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, fa-service, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-address, l3-tunnel-remote-address, long-duration-time-left, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

asngw-only *service_name*

Displays ASN-GW specific context information for the session.
The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, asn-peer-address, asngw-service, bearer-establishment, bng-service, callid, card-num,

```
configured-idle-timeout, connected-time, counters, data-rate, dormant,
ebi, enodeb-address, fa, fa-service, firewall, full, fw-and-nat, gtp-
version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-
service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-
prefix, l3-tunnel-local-address, l3-tunnel-remote-address, long-duration-
time-left, mipv6ha-service, msid, nat, network-type, policy, profile-id,
profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgw-
address, smgr-instance, subscription, summary, tft, tpo, tx-data,
username, wf1, grep, more
```

asngw-service *service_name*

Displays counters for subscribers accessing the ASN-GW service.
service_name must be an existing service and be from 1 to 63 alphanumeric characters.
The following filter keywords are valid with this command:

```
asn-peer-address, asngw-service, bearer-establishment, bng-service,
callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-
address, fa, fa-service, firewall, full, fw-and-nat, gtp-version, gtpu-
bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-
address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-
local-address, l3-tunnel-remote-address, long-duration-time-left,
mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci,
rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-
instance, tpo, tx-data, username, grep, more
```

bandwidth-policy *policy_name*

Show information for subscribers associated with the specified Active Charging bandwidth policy. Must be followed by the name of an existing bandwidth policy specified as an alphanumeric string of 1 trough 63 characters.
The following filter keywords are valid with this command:

```
access-type, active-charging-service, bandwidth-policy, bearer-
establishment, bng-service, callid, card-num, cbb-policy, configured-
idle-timeout, connected-time, cscf-service, domain, ebi, enodeb-address,
fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service,
ha, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-
address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-
local-addr, l3-tunnel-remote-addr, lma-service, long-duration-time-left,
mag-service, mipv6ha-service, msid, nat, network-type, profile-id,
profile-name, qci, rulebase, rx-data, s1u-state, security-type, session-
time-left, sgw-address, smgr-instance, tpo, tx-data, ue-type, username,
grep, more
```

bearer-establishment { direct-tunnel | normal | pending }

Selects Bearer Establishment type defined by the specified filter keywords.

- **direct-tunnel**: Select subscribers having direct tunnel established with the Radio Network Controller (RNC).
- **normal**: Select subscribers having bearer established with SGSN.
- **pending**: Select subscribers for whom bearer is not fully established.

The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, css-delivery-sequence, css-service, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

bng-service *srvc_name*

Displays current configuration the specified Broadband Network Gateway (BNG) service. The following filter keywords are valid with this command:

active, all, apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

callid *id*

Displays subscriber information for the call ID specified as an 8-byte hexadecimal number.
The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, css-delivery-sequence, css-service, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type,

pcf, pdg-service, pdsn-service, pgw-address, plmn-type, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. The slot number is an integer from 1 through 7 and 10 through 16 on the ASR 5000, or 1 through 4 and 7 through 10 on the ASR 5500.
The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, cpu-num, css-delivery-sequence, css-service, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

ccb-policy *policy_name*

Show information for subscribers associated with the specified Active Charging Content Based Billing (CBB) policy. Must be followed by the name of an existing Active Charging CBB policy specified as an alphanumeric string of 1 trough 63 characters.
The following filter keywords are valid with this command:

active, active-charging -service, all, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-only, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-address, l3-tunnel-remote-address, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, msid, nemo-only network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgsn-service, tpo, tx-data, username, verbose, grep, more

ccoa-only

Displays current configuration for all MIP-HA subscribers that registered with a collocated COA only. The following filter keywords are valid with this command:

```
access-type, active-charging-service, bandwidth-policy, bearer-
establishment, bng-service, callid, card-num, cbb-policy, configured-
idle-timeout, connected-time, domain, ebi, enodeb-address, fa, firewall,
fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-
service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method,
ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-
remote-addr, long-duration-time-left, mipv6ha-service, msid, nat,
network-type, pcc-service, profile-id, profile-name, qci, rulebase, rx-
data, s1u-state, s5-proto, security-type, session-time-left, sgsn-
address, sgsn-service, sgw-address, smgr-instance, tpo, tx-data,
username, grep, more
```

configuration { all | username *name* **}**

Displays current configuration for all subscribers or a specified subscriber.

configured-idle-timeout [< | > | greater-than | less-than] *value*

Shows the idle timeout that is configured for the specified subscriber. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

connected-time [< | > | greater-than | less-than] *value*

Shows how long the subscriber has been connected.

- **<**: Filters output so that only information less than the specified value is displayed.
- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

counters

Shows the counters associated with the subscriber. The following filter keywords are valid with this command:

```
access-type, active, active-charging-service, all, apn, asn-peer-
address, asngw-service, asnpc-service, bandwidth-policy, bearer-
establishment, bng-service, callid, card-num, cbb-policy, ccoa-only,
configured-idle-timeout, connected-time, cscf-service, dhcp-server, dns-
proxy, domain, dormant, ebi, enodeb-address, fa, fa-service, firewall,
```

fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

cscf-only

Displays information for Call Session Control Function (CSCF) subscribers only.
The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, counters, cscf-service, data-rate, dormant, fa, full, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, network-type, policy, rx-data, session-time-left, smgr-instance, subscription, summary, tft, tx-data, username, wf1

cscf-service *service_name*

Displays information for subscribers accessing the specified CSCF service.
service_name must be an existing service expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, cscf-service, fa, gtp-version, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, network-type, rx-data, session-time-left, smgr-instance, subscription, tx-data, username

css-delivery-sequence

Important: This is a restricted keyword. In StarOS 9.0 and later, this keyword is obsoleted.

css-service *csssvc_name*

Important: This is a restricted keyword. In StarOS 9.0 and later releases, this keyword is obsolete.

data-rate

Displays subscriber throughput data. **This keyword is best used for individual subscriber output.**
The following filter keywords are valid with this command:

access-type, active, active-charging-service, all, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, dormant, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, graph, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, high, hnbgw-service, hsgw-only, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, pv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, low, mag-service, mipv6ha-service, mme-address, mme-service, msid, msisdn, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, summary, tpo, tx-data, ue-type, username, verbose, grep, more

debug-info { callid *id* **| msid** *id* **| username** *name* **}**

Displays internal call troubleshooting information for subscriber sessions defined by the specified keywords.

- **callid** *id*: Displays subscriber information for the call specified by *id*. The call ID must be specified as an 8-digit hexadecimal number.
- **msid** *id*: Displays information for the mobile user identified by *id*. *id* must be from 7 to 16 digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.
- **username** *name*: Displays information for connections for the subscriber identified by *name*. The user must have been previously configured. *name* must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as wildcard enclose them in single quotes (‘). For example; ‘$’.

dhcp-server *ipv4_address*

Displays subscribers based on a specific DHCP server where their IP address was allocated. Must be followed by IP address of the server, using IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, msid, msisdn, nat, nemo-only, network-requested, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, session-time-left,

sgsn-address, sgsn-service, smgr-instance, tpo, tx-data, username, grep, more

domain *name*

Displays all subscribers with an Address-of-Record (AoR) from the specified domain. *name* is an alphanumeric string of 1 through 79 characters.
The following filter keywords are valid with this command:

access-type, active-charging-service, all, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, firewall, fw-and-nat, ggsn-service, graph, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, hsgw-only, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, network-type, pcc-service, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgw-address, smgr-instance, summary, tpo, tx-data, ue-type, username, grep, more

dormant *number*

Displays all dormant subscribers, those registered but not transmitting/receiving data.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

ebi *number*

Displays subscribers based on an EPS bearer identity. *number* specifies the EBI number and must be an integer value from 5 to 15.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, fa, fa-

service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

---

enodeb-address *ip_address*

Displays subscribers based on the eNodeB to which they are attached. *ip_address* must be a valid IP address of an existing eNodeB specified in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

---

fa *ipv4_address*

Displays subscribers for a specified Peer Foreign Agent. Must be followed by the IP address of a Remote FA, in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-

time-left, mag-service, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

fa-only

Displays FA-specific context information for the session.
The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, callid, card-num, configured-idle-timeout, connected-time, counters, cscf-service, data-rate, dhcp-server, dormant, ebi, enodeb-address, fa, fa-service, firewall, full, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, pgw-address, plmn-type, policy, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, sgw-service, smgr-instance, subscription, summary, tft, tpo, tx-data, username, wf1, grep, more

fa-service *srvc_name*

Displays subscribers for a specified Foreign Agent service. Must be followed by FA service name expressed as an alphanumerical string of 1 through 63 characters.
The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configuration, configured-idle-timeout, connected-time, counters, cscf-service, data-rate, debug-info, dhcp-server, dormant, ebi, enodeb-address, fa, fa-only, fa-service, firewall, full, fw-and-nat, ggsn-only, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-only, lac-service, lns, lns-only, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, pgw-address, plmn-type, policy, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance,

subscription, summary, tft, tpo, tx-data, username, wf1, grep, more

firewall { not-required | required }

Displays information for subscribers based on whether or not firewall processing is required.
The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv4, ipv6, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

fng-only

Displays Femto Network Gateway (FNG) context information for the session.
The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, dormant, ebi, enodeb-address, fa, fa-service, firewall, fng-service, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pdif-service, policy, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, subscription, summary, tft, tpo, tx-data, username, wf1, grep, more

fng-service *srvc_name*

Displays information for subscribers accessing the specified FNG service.
service_name must be an existing service expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, fa-service, firewall, fng-service, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pdif-service, profile-id, profile-name, qci, rx-data,

session-time-left, sgw-address, smgr-instance, subscription, summary, tft, tpo, tx-data, username, grep, more

full

Shows all available subscriber information. The following filter keywords are valid with this command:

access-type, active, active-charging-service, all, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, dormant, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s1-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

fw-and-nat policy *fw_nat_policy*

Important: This option is customer-specific and is only available in StarOS 8.1.

Displays information for subscribers using an existing Firewall-and-NAT policy specified as an alphanumeric string of 1 through 15 characters.

ggsn-only

Displays only GGSN-specific subscriber context information.
The following filter keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, counters, cscf-service, data-rate, dhcp-server, dormant, ebi, enodeb-address, fa, fa-service, firewall, full, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-only, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, policy, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-

instance, subscription, summary, tft, tpo, tx-data, username, wf1, grep, more

ggsn-service *srvc_name*

Displays only subscribers for a specified GGSN service. Must be followed by the GGSN service name expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

gsm-traffic-class { background | conversational | interactive }

Displays subscribers associate with the specified 3GPP QoS traffic class.
The following filter keywords are valid with this keyword:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

gprs-only

This keyword is specific to the SGSN and only displays 2G SGSN subscriber information.
The following filter keywords are valid with this keyword:

aaa-configuration, active, active-charging-service, activity, all, apn, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, full, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisdn, partial, plmn-type, profile-name, rx-data, session-time-left, summary, tx-data, wide-format, grep, more

gprs-service *srvc_name*

Enter the name of the configured 2G GPRS service to display subscriber information specific to the named GPRS service for the SGSN.

srvc_name must be an alphanumeric string of 1 through 63 characters that identifies a configured GPRS service.
The following filter keywords are valid with this command:

```
apn, bearer-establishment, bng-service, callid, card-num, ccoa-only,
configured-idle-timeout, connected-time, dhcp-server, dormant, ebi,
enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-
traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-
ipsec-only, ha-service, idle-time, imei, ip-address, ip-alloc-method, ip-
pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-
addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-
udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-
requested, network-type, pcf, pdsn-service, plmn-type, profile-id,
profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-
address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more
```

gsm-traffic-class { background | conversational | interactive | streaming }

Displays information for subscriber traffic that matches the specified 3GPP traffic class.

- **background**: 3GPP QoS background class.
- **conversational**: 3GPP QoS conversational class.
- **interactive**: 3GPP QoS interactive class. Must be followed by a traffic priority.
- **streaming**: 3GPP QoS streaming class.

The following filter keywords are valid with this command:

```
apn, bearer-establishment, bng-service, callid, card-num, ccoa-only,
configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-
address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-
service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-
service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-
service, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix,
l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-
service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service,
msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-
service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state,
s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address,
smgr-instance, tpo, tx-data, username, grep, more
```

gtp-version { 0 | 1 }

Displays the specific GTP version number. Must be followed by one of the supported GTP versions (0 or 1).
The following filter keywords are valid with this command:

```
apn, bearer-establishment, bng-service, callid, card-num, configured-
idle-timeout, connected-time, ebi, enodeb-address, fa, firewall, fw-and-
nat, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address,
gtpu-service, ha, hsgw-service, idle-time, imei, ims-auth-service, imsi,
ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-
tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mag-
service, mipv6ha-service, msid, msisdn, nat, network-type, nri, nsei,
pdg-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-
```

state, s5-proto, session-time-left, sgsn-service, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

gtpu-bind-address *ipv4_address*

Displays the subscribers associated with the specified GTPU service bind address. Must be followed by an IPv4 address in dotted decimal notation.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

gtpu-service *svc_name*

Displays the subscribers associated with an existing GTPU service specified as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

ha *ipv4_address*

Displays the subscribers associated with the specified Peer Home Agent. Must be followed by the IP address of a Remote HA in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-services, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

ha-ipsec-only

Displays MIPHA subscribers with subscriber IPSec tunnel only.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

ha-service *svc_name*

Displays the subscribers associated with an existing Home Agent service specified as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr,

l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

hnbgw-only

Displays HNB-GW subscriber session information.
The following filters/keywords are valid with this command:

aaa-configuration, access-flows, access-type, active, active-charging-service, activity, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, counters, cscf-service, data-rate, domain, ebi, enodeb-address, fa, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pcc-service, policy, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, smgr-instance, subscription, summary, tpo, tx-data, ue-type, username, wf1, grep, more

hsgw-only

Displays HSGW subscriber session information.
The following filters/keywords are valid with this command:

aaa-configuration, access-flows, active, active-charging-only, all, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, counters, data-rate, dormant, ebi, enodeb-address, fa, firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mag-service, mipv6ha-service, msid, nat, network-type, policy, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, subscription, summary, tft, tpo, tx-data, username, wf1, grep, more

hsgw-service *svc_name*: Displays subscriber information based on the HSGW service name. *svc_name* must be an existing HSGW service expressed as an alphanumeric string of 1 through 63 characters.

hsgw-service *svc_name*

Displays subscriber information based on the HSGW service name. *svc_name* must be an existing HSGW service expressed as an alphanumeric string of 1 through 63 characters.
The following filters/keywords are valid with this command:

active-charging-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, firewall, fw-and-nat, gtp-

version, gtpu-bind-address, gtpu-service, ha, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mag-service, mipv6ha-service, msid, nat, network-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

---

idle-time

Displays current configuration for all subscribers within the specified idle-time interval.

- **<**: Filters output so that only information less than the specified value is displayed.
- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

---

imei *imei_number*

Displays subscribers having the specified International Mobile Equipment Identity (IMEI/IMEISV) Number. Must be followed by IMEI number.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

---

ims_auth-service *svc_name*

Displays subscriber information based on the IMS authentication service name. *svc_name* must be an existing service expressed as an alphanumeric string of 1 through 63 characters.
The following filters/keywords are valid with this command:

access-type, active-charging-service, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, gprs-service, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec, ha-service, hnbgw-service,

hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

imsi *imsi*

Displays information specific to one subscriber or group of subscribers. Enter 1 to 15 digits to identify a specific subscriber's IMSI (International Mobile Subscriber Identity).
The following filters/keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-services, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

ip-address *ipv4_address*

Displays the subscribers associated with the specified IPv4 address. Must be followed by the IP address in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-

```
type, nsapi, pcc-service, pcf, pdg-service, pdsn-service, pgw-address,
plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state,
s5-proto, security-type, session-time-left, sgsn-address, sgsn-
service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-
type, username, grep, more
```

---

ip-alloc-method {aaa-assigned | dhcp [relay-agent | proxy-client] | dynamic-pool | l2tp-lns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:

- **aaa-assigned**: Selects subscribers whose IP addresses were assigned by AAA.
- **dhcp**: Selects subscribers whose IP addresses were assigned by DHCP.
  - **relay-agent**: Selects subscribers whose IP addresses were assigned by the DHCP Relay Agent
  - **proxy-client**: Selects subscribers whose IP addresses were assigned by the DHCP Proxy Client
- **dynamic-pool**: Selects subscribers whose IP addresses were assigned from a dynamic IP address pool.
- **l2tp-lns-assigned**: Selects subscribers whose IP addresses were assigned by the Layer 2 Tunneling Protocol (LT2P) Network Server.
- **mip-ha-assigned**: Selects subscribers whose IP addresses were assigned by the Mobile IP Home Agent.
- **ms-provided-static**: Selects subscribers whose IP addresses were provided by the Mobile Station.
- **not-ms-provided-static**: Selects subscribers whose IP addresses were not provided by the Mobile Station.
- **static-pool**: Selects subscribers whose IP addresses were assigned from a static IP address pool.

The following filter keywords are valid with this command:

```
access-type, active-charging-service, apn, asn-peer-address, asngw-
service, asnpc-service, bandwidth-policy, bearer-establishment, bng-
service, callid, card-num, cbb-policy, ccoa-only, configured-idle-
timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-
address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-
service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-
service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service,
idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool,
ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr,
lac, lac-service, lma-service, lns, lns-service, long-duration-time-
left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address,
mme-service, msid, msisdn, nat, nemo-only, network-requested, network-
type, nsapi, pcc-service, pcf, pdg-service, pdsn-service, pgw-address,
plmn-type, profile-id, profile-name, qci, relay-agent, rulebase, rx-data,
s1u-state, s5-proto, security-type, session-time-left, sgsn-address,
sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data,
ue-type, username, grep, more
```

ip-pool *ip_pool_name*

Displays subscriber information based on the IP pool name. *ip_pool_name* must be an existing IP pool name expressed as an alphanumeric string of 1 through 31 characters.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

ipcf-only

Displays Intelligent Policy Control Function (IPCF) subscriber session information.

ipsg-only

Displays IP Services Gateway (IPSG) subscriber session information.

ipv6-address *ipv6_address*

Displays the subscribers associated with the specified IPv6 address. Must be followed by the IP address in IPv8 colon-separated-hexadecimal notation.
The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

ipv6-prefix *ipv6_prefix*

Displays the subscribers associated with the specified IPv6 address prefix. Must be followed by an IPv6 address prefix in the format xx:xx:xx::/len
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

l3-tunnel-local-addr *ipv4_address*

Displays subscriber information based on the layer 3 tunneling interface. Must be followed by an IP address of the local interface, using IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

l3-tunnel-remote-addr *ipv4_address*

Displays subscriber information based on the layer 3 tunneling interface. Must be followed by an IP address of the remote interface, using IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

lac *ipv4_address*

Displays subscriber information based on the Peer L2TP Access Concentrator (LAC). Must be followed by the IP address of a Remote LAC in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

lac-only

Displays subscriber information based on the L2TP Access Concentrator (LAC) context information for the session.

lac-service *svc_name*

Displays subscriber information based on an existing LAC service name expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr,

```
l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, local-tunnel-
id, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid,
msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-
service, plmn-type, profile-id, profile-name, qci, remote-tunnel-id, rx-
data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address,
smgr-instance, tpo, tx-data, username, grep, more
```

lma-only

Displays Local Mobility Anchor (LMA) specific context information for the session.

lma-service *svc_name*

Displays subscriber information based on the LMA service name. *svc_name* must be an existing LMA service expressed as an alphanumeric string of 1 through 63 characters.

lns *ipv4_address*

Displays subscriber information based on the L2TP Network Server (LNS)). Must be followed by the IP address of an LNS in IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

```
apn, bearer-establishment, bng-service, callid, card-num, ccoa-only,
configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-
address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-
class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only,
ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-
alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr,
l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-
time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-
only, network-requested, network-type, pcf, pdsn-service, plmn-type,
profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-
time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data,
username, grep, more
```

lns-only

Displays LNS specific information only.

lns-service *svc_name*

Displays subscriber information based on an existing L2TP Network Server (LNS) service name expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

```
bearer-establishment, bng-service, callid, card-num, configured-idle-
timeout, connected-time, ebi, enodeb-address, fa, firewall, fw-and-nat,
gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-
service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-
prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service,
lns-service, local-tunnel-id, long-duration-time-left,mipv6ha-service,
msid, nat, network-type, profile-id, profile-name, qci, remote-tunnel-id,
rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-
instance, tpo, tx-data, username, grep, more
```

long-duration-time-left [< | > | greater-than | less-than] *value*

Shows how much time is left for the maximum duration of a specified subscriber session.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

mag-only

Displays Mobile Access Gateway (MAG) subscriber session information.
mag-service *svc_name*: Displays subscriber information based on the Mobile Access Gateway (MAG) service name. *svc_name* must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

mag-service *svc_name*

Displays subscriber information based on the Mobile Access Gateway (MAG) service name. *svc_name* must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

mip-udp-tunnel-only

Displays Mobile IP Home Agent (MIP-HA) subscriber information for subscribers that negotiated MIP-UDP tunnels.
The following filter keywords are valid with this command:

```
apn, bearer-establishment, bng-service, callid, card-num, ccoa-only,
configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-
address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-
class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only,
ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-
alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr,
l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-
time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-
only, network-requested, network-type, pcf, pdsn-service, plmn-type,
profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-
time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data,
username, grep, more
```

mipv6ha-only

Displays MIP-HA-IPv6 context information for the session.
The following filters/keywords are valid with this command:

```
aaa-configuration, access-flows, access-type, active, active-charging-
service, activity, all, apn, asn-peer-address, asngw-service, asnpc-
service, bandwidth-policy, bearer-establishment, bng-service, callid,
card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time,
counters, cscf-service, data-rate, dhcp-server, domain, dormant, ebi,
enodeb-address, fa, fa-service, firewall, full, fw-and-nat, ggsn-address,
```

gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mipv6ha-service, mme-address, mme-service, msid, nat, network-requested, network-type, pcc-service, pcf, pdg-service, pgw-address, policy, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, subscription, summary, tft, tpo, tx-data, ue-type, username, wf1, grep, more

mipv6ha-service *svc_name*

Displays subscriber information based on an existing MIP Home Agent IPv6 service name expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

mme-address

Displays subscriber information based on the Mobility Management Entity (MME) IP address. *ip_address* must be an existing MME IP address and be entered in IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.
The following filter keywords are valid with this command:

bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, network-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

mme-only

Displays MME subscriber session information.
mme-service *svc_name*: Displays subscriber information based on the MME service name. *svc_name* must be an existing MME service expressed as an alphanumeric string of 1 through 63 characters.
mme-address *ip_address*: Displays subscriber information based on the MMM IP address. *ip_address* must be an existing MME IP address entered in IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.
The following filter keywords are valid with this command:

bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, firewall, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, network-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

msid *msid*

For this SGSN-specific keyword, enter the MSID (Mobile Station IDentifier) to display information specific to one subscriber's equipment by entering the MSID.
The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

msisdn *msisdn*

For this SGSN-specific keyword, enter the MSISDN (Mobile Station ISDN number - unique SIM phone number) to display information specific to one subscriber's equipment by entering the MSISDN.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service,

lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

nat (not-required | required }

Displays information for subscribers based on whether or not Network Address Translation (NAT) processing is required.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, asn-peer-address, asngw-service, asnpc-service, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nat-ip, nat-realm, nemo-only, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

nemo-only

Displays information on MIP-HA subscribers that are mobile routers (Network Mobility).
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

network-requested

Selects the currently active subscribers whose sessions were initiated by a GGSN network requested to create a PDP context.
The following filter keywords are valid with this command:

access-type, active-charging-service, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-timeout, connected-time, cscf-service, dhcp-server, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hnbgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-up-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, nsapi, pcc-service, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgsn-service, sgw-address, smgr-instance, tpo, tx-data, ue-type, username, grep, more

---

network-type { gre | ipip | ipsec | ipv4 | ipv4-pmipv6 | ipv4v6 | ipv4v6-pmipv6 | ipv6 | ipv6-pmipv6 | l2tp | mobile-ip | proxy-mobile-ip }

Selects the currently active subscribers based on network service access type.

- **gre**: Generic Routing Encapsulation
- **ipip**: IP-in-IP
- **ipsec**: IPSec
- **ipv4**: IPv4 only
- **ipv4-pmipv6**: IPv4 and/or Proxy Mobile IPv6 (PMIP)
- **ipv4v6**: IPv4 and/or IPv6
- **ipv4v6-pmipv6**: IPv4, IPv6 and/or Proxy Mobile IPv6
- **ipv6**: IPv6 only
- **ipv6-pmipv6**: IPv6 and/or Proxy Mobile IPv6 (PMIP)
- **l2tp**: Layer 2 Tunneling Protocol
- **mobile-ip**: Mobile IP (MIP)
- **proxy-modile-ip**: Proxy Mobile IPv6 (PMIP)

The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

pcc-service *name*

Displays statistics for users associated with an existing Policy and Charging Control (PCC) service name expressed as an alphanumeric string of 1 through 63 characters.

pcf [< | > | less-than | greater-than] *ipv4_address* **[< | > | less-than | greater-than]** *ipv4_address* **]**

Displays information for subscribers connected via the packet control function (PCF) with a specific or range of IP addresses. The address must be specified using IPv4 dotted-decimal notation.

- **<**: Filters output so that only information less than the specified IPv4 address value is displayed.
- **>**: Filters output so that only information greater than the specified IPv4 address value is displayed.
- **less-than**: Filters output so that only information less than the specified IPv4 address value is displayed.
- **greater-than**: Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.
The following filter keywords are valid with this command:

```
<, apn, bearer-establishment, bng-service, callid, card-num, ccoa-only,
configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-
address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-
class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only,
ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-
alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr,
l3-tunnel-remote-addr, lac, lac-service, less than, lns, lns-service,
long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid,
msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-
service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state,
s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance,
tpo, tx-data, username, grep, more
```

pdg-only

Displays a summary of PDG subscriber statistics.
The following filters/keywords are valid with this command:

```
aaa-configuration, access-flows, active, activity, all, apn, bearer-
establishment, bng-service, callid, card-num, configured-idle-timeout,
connected-time, counters, data-rate, dormant, ebi, enodeb-address, fa,
firewall, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service,
ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-
pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-
addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type,
pdg-service, policy, profile-id, profile-name, qci, rx-data, s1u-state,
s5-proto, session-time-left, sgw-address, smgr-instance, subscription,
summary, tft, tpo, tx-data, username, wf1, grep, more
```

pdg-service *name*

Displays statistics for users associated with an existing Packet Data Gateway (PDG) service name expressed as an alphanumeric string of 1 through 63 characters.
The following filters/keywords are valid with this command:

bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, firewall, fng-service, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pdg-service, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

pdif-only

Displays a summary of Packet Data Interworking Function (PDIF) subscriber statistics.
The following filters/keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, apn, bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, counters, data-rate, dormant, ebi, enodeb-address, fa, fa-service, firewall, fng-service, full, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pdif-service, policy, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, subscription, summary, tft, tpo, tx-data, username, wf1, grep, more

pdif-service *name*

Displays connection statistics for users associated with a specific PDIF service name.
The following filters/keywords are valid with this command:

bearer-establishment, bng-service, callid, card-num, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, fa-service, firewall, fng-service, fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, mipv6ha-service, msid, nat, network-type, pdif-service, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

pdsn-only

Displays a summary of Packet Data Serving Node (PDSN) subscriber statistics.
The following filters/keywords are valid with this command:

aaa-configuration, access-flows, active, activity, all, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, counters, data-rate, dhcp-server, dormant, ebi, enodeb-address, fa, fa-service, firewall, full, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-

prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, policy, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, smgr-instance, subscription, summary, tft, tpo, tx-data, username, wf1, grep, more

---

pdsn-service *name*

Displays statistics for users associated with an existing PDSN service name expressed as an alphanumeric string of 1 through 63 characters.
The following filter keywords are valid with this command:

apn, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, smgr-instance, tpo, tx-data, username, grep, more

---

pgw-address *ip_address*

Displays information about the subscribers connected to the specified P-GW.
ip_address must be specified by its IP address using dotted-decimal notation for IPv4 or colon separated notation for IPv6.
The following filters/keywords are valid with this command:

active-charging-service, apn, bandwidth-policy, bearer-establishment, bng-service, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, ebi, enodeb-address, fa, firewall fw-and-nat, gtp-version, gtpu-bind-address, gtpu-service, ha, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac-service, lma-service, lns, long-duration-time-left, mag-service, mipv6ha-service, msid, nat, network-type, pgw-address, pgw-address, plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state, s5-proto, saegw-service, session-time-left, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username

---

pgw-only

Displays PDN-Gateway (P-GW) subscriber session information.
The following filters/keywords are valid with this command:

all, apn, callid, card-num, ebi, full, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, network-type, pgw-service, plmn-type, profile-name, sgw-address, smgr-instance, summary

- **pgw-service** *svc_name*: Displays subscriber information based on the P-GW service name. *svc_name* must be an existing P-GW service expressed as an alphanumeric string of 1 through 63 characters.
- **sgw-address** *ip_address*: Displays subscriber information based on the S-GW IP address. *ip_address* must be an existing S-GW IP address in IPv4 dotted-decimal notation.

---

plmn-type [home | roaming | visiting }

Displays subscriber information based on the type of Public Land Mobile Network (PLMN).

- **home**: For GGSN/PGW, shows all the subscribers of charging type HOME.
- **roaming**: For GGSN/PGW, shows all the subscribers of charging type ROAMING.
- **visiting**: For GGSN/PGW, shows all the subscribers of charging type VISITING.

The following filter keywords are valid with this command:

```
apn, bearer-establishment, bng-service, callid, card-num, ccoa-only,
configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-
address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-
service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-
service, ha, ha-ipsec-only, ha-service, idle-time, imei, ims-auth-
service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-
prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service,
lma-service, lns, lns-service, long-duration-time-left, mip-udp-tunnel-
only, mipv6ha-service, msid, msisdn, nat, nemo-only, network-requested,
network-type, pcf, pdsn-service, plmn-type, profile-id, profile-name,
qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-
address, smgr-instance, tpo, tx-data, username, grep, more
```

---

policy

Displays the current policies associated with the subscriber session.
The following filter keywords are valid with this command:

```
access-type, active-charging-service, all, apn, asn-peer-address,
asngw-service, asnpc-service, bandwidth-policy, bearer-establishment,
bng-service, callid, card-num, cbb-policy, ccoa-only, configured-idle-
timeout, connected-time, cscf-service, dhcp-server, domain, dormant, ebi,
enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-
service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-
service, ha, ha-ipsec-only, ha-service, hnbgw-service, hsgw-service,
idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool,
ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr,
lac, lac-service, lma-service, lns, lns-service, long-duration-time-
left, mag-service, mip-up-tunnel-only, mipv6ha-service, mme-address,
mme-service, msid, msisdn, nat, nemo-only, network-requested, network-
type, nsapi, pcc-service, pcf, pdg-service, pdsn-service, pgw-address,
plmn-type, profile-id, profile-name, qci, rulebase, rx-data, s1u-state,
s5-proto, security-type, session-time-left, sgsn-address, sgsn-
service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-
type, username, grep, more
```

profile-id *id_number*

Displays subscriber session information based on the profile-id granted for the flow. *id_number* must be an integer from 0 to 4294967295.

profile-name *name*

Displays subscriber session information based on an existing policy profile name expressed as an alphanumeric string of 1 through 63 characters.

qci *number*

Displays subscriber session information based on the QoS Class Identifier (QCI) value assigned to the subscriber. *number* must be an integer value from 0 to 9.

rulebase *name*

Displays subscriber session information based on the named Active Charging System rulebase. *name* must be an alphanumeric string of 1 through 63 characters.

rx-data [< | > | greater-than | less-than] *value*

The number of bytes received by the specified subscriber.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

s1u-state { active | idle | idle-active }

Displays session information based on the subscriber's S1-U state. The S1-U interface is the interface from the eNodeB to the S-GW.

- **active**: Displays session information for subscribers with an S1-U state set to active.
- **idle**: Displays session information for subscribers with an S1-U state set to idle.
- **idle-active**: Displays session information for subscribers with an S1-U state set to idle-active.

s5-proto { gtp | pmip }

Displays subscriber session information based on the S5 interface protocol used. This interface provides user plane tunneling and tunnel management between S-GW and P-GW. Choose either GPRS Tunneling Protocol (GTP) or Proxy Mobile IPv6 (PMIP).

security-type { ipsec | tls }

Displays subscriber information based on the specified type of security.

- **ipsec**: IPSec
- **tls**: Transport Layer Security

session-time-left [< | > | greather-than | less] *value*

How much session time is left for the specified subscriber.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

sgsn-address *ipv4_address*

This SGSN-only keyword displays only subscriber context information for the specified interface. Must be followed by the IP address of the interface, using IPv4 dotted-decimal notation.
The following filter keywords are valid with this command:

```
apn, callid, card-num, connected-time, idle-time, gprs-service, gsm-
traffic-class, gtp-version, imsi, msid, msisdn, nri, nsei, sgsn-service,
smgr-instance
```

sgsn-only

This SGSN-only keyword displays only 3G SGSN-specific subscriber context information.
The following filter keywords are valid with this command:

```
aaa-configuration, active, active-charging-service, activity, all, apn,
callid, card-num, configured-idle-timeout, connected-time, counters,
data-rate, fa, full, ggsn-address, gsm-traffic-class, idle-time, imei,
imsi, msid, partial, plmn-type, profile-name, rnc, rx-data, session-time-
left, sgsn-service, summary, tx-data, wide-format, grep, more
```

sgsn-service *service_name*

For this SGSN-only keyword, enter the name of the configured 3G SGSN service to display subscriber information specific to the named SGSN service.
The following filter keywords are valid with this command:

```
apn, bearer-establishment, bng-service, callid, card-num, configured-
idle-timeout, connected-time, ebi, enodeb-address, fa, firewall, fw-and-
nat, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address,
gtpu-service, ha, idle-time, imei, imsi, ip-address, ip-alloc-method, ip-
pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-
addr, long-duration-time-left, mipv6ha-service, msid, msisdn, nat,
network-type, nri, plmn-type, profile-id, profile-name, qci, rx-data,
s1u-state, s5-proto, session-time-left, sgsn-service, sgw-address, smgr-
instance, tpo, tx-data, username, grep, more
```

sgw-only

Displays S-GW subscriber session information.
The following filters/keywords are valid with this command:

all, full, summary

- **sgw-service** *svc_name*: Displays subscriber information based on en existing S-GW service specified as an alphanumeric string of 1 through 63 characters.
- **pgw-address** *ip_address*: Displays subscriber information based on an existing P-GW specified by its IP address in IPv4 dotted-decimal notation.

---

sgw-service *svc_name*

Displays subscriber information based on an existing S-GW service specified as an alphanumeric string of 1 through 63 characters.

---

smgr-instance *instance_id*

Displays subscription information associated with the Session Manager identifier express as an integer from 1 through 4294967295.

---

subscription { aor *address* **| callid** *id* **| full }**

Displays subscription information for defined subscribers, based on defined parameters.

- **aor** *address*: Clears session(s) by Address of Record.
- **callid** *id*: Specifies a Call Identification Number as an 8-digit hexadecimal number.
- **full**: Displays all available information.

---

summary

Displays only a summary of the subscriber information. The following filter keywords are valid with this command:

access-type, active, active-charging-service, activity, all, asn-peer-address, asngw-service, asnpc-service, apn, bandwidth-policy, bearer-establishment, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, dhcp-server, domain, dormant, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-service, hnbgw-service, hsgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-services, mme-address, mme-service, msid, msisdn, nat, network-requested, network-type, pcc-service, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, ue-type, username, grep, more

---

tft

Displays the current Traffic Flow Template (TFT) associated with the subscriber session.
The following filter keywords are valid with this command:

active, all, apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, dormant, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-

service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

tpo { not-required | required }

Displays information for subscribers based on whether or not Traffic Performance Optimization (TPO) processing is required.
The following filter keywords are valid with this command:

apn, asn-peer-address, asngw-service, asnpc-service, bearer-establishment, bng-service, callid, card-num, ccoa-only, configured-idle-timeout, connected-time, dhcp-server, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, ggsn-service, gprs-service, gsm-traffic-class, gtp-version, gtpu-bind-address, gtpu-service, ha, ha-ipsec-only, ha-service, hsgw-service, idle-time, imei, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv4, ipv6, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, lac, lac-service, lma-service, lns, lns-service, long-duration-time-left, mag-service, mip-udp-tunnel-only, mipv6ha-service, mme-address, mme-service, msid, msisdn, nat, nemo-only, network-requested, network-type, pcf, pdg-service, pdsn-service, pgw-address, plmn-type, profile-id, profile-name, qci, rx-data, s1u-state, s5-proto, session-time-left, sgsn-address, sgsn-service, sgw-address, sgw-service, smgr-instance, tpo, tx-data, username, grep, more

tx-data [< | > | greater-than | less-than] *value*

The number of bytes transmitted by the specified subscriber.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

ue-type { ims | non-ims }

Displays information for the subscribers based on User Equipment type.

- **ims**: IP Multimedia Subsystem
- **non-ims**: UE other than IMS

The following filter keywords are valid with this command:

access-type, active-charging-service, bandwidth-policy, bearer-establishment, callid, card-num, cbb-policy, configured-idle-timeout, connected-time, cscf-service, domain, ebi, enodeb-address, fa, fa-service, firewall, fw-and-nat, gprs-service, gtp-version, gtpu-bind-address, gtpu-service, ha, hnbgw-service, idle-time, ims-auth-service, imsi, ip-address, ip-alloc-method, ip-pool, ipv6-address, ipv6-prefix, l3-tunnel-local-addr, l3-tunnel-remote-addr, long-duration-time-left, msid, nat, network-type, pcc-service, profile-id, qci, rulebase, rx-data, s1u-state, s5-proto, security-type, session-time-left, sgw-address, smgr-instance, tpo, tx-data, ue-type, username, grep, more

---

username *name*

Displays information for connections for the subscriber identified by *name*. The user must have been previously configured. *name* must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

---

wf1

Displays subscriber information in wide format number 1. Wide format number 1 includes the following information for each listed subscriber session:

- Access Type
- Access Technology
- Call State
- Link Status
- Network Type
- Call ID
- MSID
- Username
- IP Address
- Time-Idle
- Access Peer Address
- Service Address
- Network Peer Address
- Connect Time

---

filter_keywords

The following keywords are filters that modify or filter the output of the Command Keywords. Not all filters are available for all Command Keywords. Multiple Filter Keywords can be entered on a command line. When multiple Filter Keywords are specified, the output conforms to all of the Filter Keywords specifications.
For example; if you enter the following command:

show subscribers counters ip-pool pool1 card-num 1

Counters for all subscriber sessions that were assigned an IP address from the IP pool named pool1 and also are being processed by the processing card in slot 1 is displayed. Information for all other subscribers is not displayed.

active

Only display information for those subscribers who currently have active sessions.

active-charging-service *acs_service*

Displays information for subscribers being processed by the active charging service specified as an alphanumeric string of 1 through 15 characters.

activity

Displays subscriber link activity percentage.

all

If no keywords are specified before **all**, information for all subscribers is displayed. If keywords are specified before **all**, all information is displayed with no further options being allowed.

apn *name*

Displays subscribers currently facilitated by the access point name (APN) configured on the SGSN or GGSN.

asngw-only

Displays counters for subscribers accessing the ASN-GW service only.

asnpc-only

Displays counters for subscribers accessing the ASN Paging Controller and Location Registry service only.

bandwidth-policy *policy_name*

Displays information for subscribers associated with the specified Active Charging bandwidth policy.

bearer-establishment { direct-tunnel | normal | pending } *id*

Displays subscriber information for selected bearer establishment type.

bng-service *srvc_name*

Displays the current configuration for the specified Broadband Network Gateway (BNG) service.

callid *id*

Displays subscriber information for the call ID specified as an 8-byte hexadecimal number.

card-num *card_num*

The slot number of the processing card by which the subscriber session is processed. The slot number is an integer from 1 through 7 and 10 through 16 on the ASR 5000, or 1 through 4 and 7 through 10 on the ASR 5500.

cbb-policy *policy_name*

Displays information for subscribers associated with the specified Active Charging Content Based Billing (CBB) policy.

ccoa-only

Displays the subscribers that registered a MIP with CoA directly with the HA.
This option is only valid when a MIPHA session license is enabled.

configuration { all | username *name* **}**

Displays current configuration for all subscribers or a specified subscriber.

configured-idle-timeout [< | > | greater-than | less-than] *value*

Shows the idle timeout that is configured for the specified subscriber. A value of 0 (zero) indicates that the subscribers idle timeout is disabled.
<: Filters output so that only information less than the specified value is displayed.
>: Filters output so that only information greater than the specified value is displayed.
greater-than: Filters output so that only information greater than the specified value is displayed.
less-than: Filters output so that only information less than the specified value is displayed.
value: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

connected-time [< | > | greater-than | less-than] *value*

Shows how long the subscriber has been connected. **<**: Filters output so that only information less than the specified value is displayed.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

counters *keyword*

Displays the specified counter for the subscribers.

cpu-num *number*

Displays information for calls processed through the specified CPU number.

cscf-only

Displays information for Call Session Control Function (CSCF) subscribers only.

cscf-service *service_name*

Displays information for subscribers accessing an existing CSCF service specified as an alphanumeric string of 1 through 63 characters.

dhcp-server *address*

Displays subscribers currently accessing the system that have been provided an IP address by the DHCP server specified by its address. GGSN only.

dns-proxy

Displays all subscribers associated with a DNS proxy.

domain *name*

Displays all subscribers with an Address-of-Record (AoR) from the specified domain. *name* is an alphanumeric string of 1 through 79 characters.

dormant

Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

dormant

Shows information for subscriber sessions that are dormant (not transmitting or receiving data).

ebi *number*

Displays subscribers based on an EPS bearer identity number.

enodeb-address *ip_address*

Displays subscribers based on the eNodeB to which they are attached.

fa *address*

Displays information for subscribers connected to the foreign agent specified by its IP address in IPv4 dotted-decimal notation.

fa-only

Only display FA-specific context information.

fa-service *name*

Displays information for subscribers connected to the named foreign agent (FA) service.

firewall { not-required | required }

Displays information for the specified subscribers:

- **not-required**: Subscribers for whom firewall processing is not required.
- **required**: Subscribers for whom firewall processing is required.

firewall-policy *fw_policy_name*

This keyword is obsolete.

full

Displays all available information for subscribers.

fw-and-nat policy *fw_nat_policy*

Important: This option is customer-specific and is only available in StarOS 8.1.

Displays information for subscribers using an existing Firewall-and-NAT policy specified as an alphanumeric string of 1 through 15 characters.

ggsn-address *ip_address*

Displays information for subscribers connected to an existing GGSN specified by its IP address in IPv4 doted-decimal notation. SGSN only

ggsn-preservation-mode

Displays information for subscribers connected to the GGSN service with preservation mode enabled. GGSN only.

ggsn-service *name*

Displays information for subscribers connected to the named GGSN service. This keyword is for GGSN only.

gprs-only

Displays only 2G SGSN subscribers content. SGSN only.

gprs-service *srvc_name*

Displays subscriber information for the named 2G GPRS service. SGSN only.

gsm-traffic-class { background | conversational | interactive | streaming }

Displays information for subscriber traffic that matches the specified 3GPP traffic class.

- **background**: 3GPP QoS background class.
- **conversational**: 3GPP QoS conversational class.
- **interactive**: 3GPP QoS interactive class. Must be followed by a traffic priority.
- **streaming**: 3GPP QoS streaming class.

ha *address*

Displays information for subscribers connected to the home agent specified by its IP address in IPv4 dotted-decimal notation.

ha-ipsec-only

Only displays information for subscriber sessions that are using IP-Security (IPSec).

ha-only

Only displays HA-specific context information.

ha-service *name*

Displays information for subscribers connected to the named home agent service.

hnbgw-only

Displays counters for subscribers accessing the Home evolved NodeB Gateway (HNB-GW) service only.

idle-time [< | > | greater-than | less-than] *value*

Displays how long the subscriber session has been idle or display subscriber sessions that meet the idle time criteria specified.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

imei *imei_number*

Displays information for subscribers having the specified International Mobile Equipment Identity (IMEI/IMEISV) number.

ims-auth-service *service_name*

Displays information for subscribers for an existing IMS Authorization Service name.

imsi *id*

Displays the subscriber with the specified ID. The IMSI (International Mobile Subscriber Identity) ID is a 15-character string which identifies the subscriber's home country and carrier. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

ip-address [< | > | greater-than | less-than] *address*

Displays information for subscribers connected to the specified *address*.

- **<**: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
- **>**: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
- **greater-than**: Filters output so that only information for subscribers with an IP address higher than the specified address is displayed.
- **less-than**: Filters output so that only information for subscribers with an IP address lower than the specified address is displayed.
- *address*: The address must be specified using IPv4 dotted-decimal notation. Used in conjunction with <, >, greater-than, less-than. If the IP address is specified without a qualifier, only subscribers with the specified IP address have their information displayed.

ip-alloc-method {aaa-assigned | dhcp [relay-agent | proxy-client] | dynamic-pool | l2tp-lns-assigned | mip-ha-assigned | ms-provided-static | not-ms-provided-static | static pool }

Displays the specific IP Allocation Method. Must be followed by one of the IP Allocation Methods:

- **aaa-assigned**: Selects subscribers whose IP addresses were assigned by AAA.
- **dhcp**: Selects subscribers whose IP addresses were assigned by DHCP.
  - **relay-agent**: Selects subscribers whose IP addresses were assigned by the DHCP Relay Agent
  - **proxy-client**: Selects subscribers whose IP addresses were assigned by the DHCP Proxy Client
- **dynamic-pool**: Selects subscribers whose IP addresses were assigned from a dynamic IP address pool.
- **l2tp-lns-assigned**: Selects subscribers whose IP addresses were assigned by the Layer 2 Tunneling Protocol (LT2P) Network Server.
- **mip-ha-assigned**: Selects subscribers whose IP addresses were assigned by the Mobile IP Home Agent.
- **ms-provided-static**: Selects subscribers whose IP addresses were provided by the Mobile Station.
- **not-ms-provided-static**: Selects subscribers whose IP addresses were not provided by the Mobile Station.
- **static-pool**: Selects subscribers whose IP addresses were assigned from a static IP address pool.

ip-pool *name*

Displays information for subscribers assigned addresses from an existing IP address pool or IP pool group. *name* will be an IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation based on the call line setup for the specified pool.

ipv4

Displays information for subscribers with an IPv4 Firewall enabled/disabled.

ipv6

Displays information for subscribers with an IPv6 Firewall enabled/disabled.

ipv6-address *address*

Displays information for subscribers connected to the specified IPv6 address.

ipv6-prefix *prefix*

Displays information for subscribers connected to the specified IPv6 address prefix.

l3-tunnel-local-addr *ip_address*

A layer 3 tunneling interface specified by its IP address in IPv4 dotted-decimal notation.

l3-tunnel-remote-addr *ip_address*

A layer 3 tunneling peer specified by its IP address in IPv4 dotted-decimal notation.

lac *address*

Displays information for calls to the peer L2TP Access Concentrator (LAC) specified by its IP address.

lac-only

Displays LAC specific information only.

lac-service *name* **[local-tunnel-id id | remote-tunnel-id** *id* **]**

Displays information for calls associated with the LAC service specified as an alphanumeric string of 1 through 63 characters.

- **local-tunnel-id** *id*: Specifies a local tunnel from which to clear calls as an integer from 1 through 65535.
- **remote-tunnel-id** *id*: Specifies a remote tunnel from which to clear calls as an integer from 1 through 65535.

lns *address*

Displays information for calls to the peer L2TP Network Server (LNS) specified by its IP address.

lns-only

Displays LNS specific information only.

lns-service *name* **[local-tunnel-id** *id* **| remote-tunnel-id** *id* **]**

Displays information for calls associated with the LNS service specified as an alphanumeric string of 1 through 63 characters.

- **local-tunnel-id** *id*: Indicates a specific local tunnel from which to clear calls. *id* must be an integer from 1 through 65535.
- **remote-tunnel-id** *id*: Indicates a specific remote tunnel from which to clear calls. *id* must be an integer from 1 through 65535.

local-tunnel-id *identifier*

Displays information for a local tunnel identifier specified as an integer from 1 to 65535.

long-duration-time-left [< | > | greater-than | less-than] *value*

Shows how much time is left for the maximum duration of a specified subscriber session.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

mag-only

Displays Mobile Access Gateway (MAG) subscriber session information.

mag-service *svc_name*

Displays subscriber information based on the Mobile Access Gateway (MAG) service name. *svc_name* must be an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

mip-udp-tunnel-only

Displays the subscribers that negotiated MIP-UDP tunneling with the HA.
This option is only valid when MIP NAT Traversal license is enabled.

mipv6ha-only

Displays MIPV6HA-specific context information for the session.

mipv6ha-service *service_name*

Displays specific configured MIPV6 Home Agent service. *service_name* must have been previously defined.

msid *id*

Displays information for the mobile user identified by *id*. *id* must be from 7 to 16 hexadecimal digits specified as an IMSI, MIN, or RMI. Wildcard characters $ and * are allowed. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example: ‘$’.
In case of **enforce imsi-min equivalence** is enabled on the chassis and MIN or IMSI numbers supplied, this filter will show subscribers with a corresponding MSID (MIN or IMSI) whose lower 10 digits matches to lower 10 digits of the supplied MSID.
show subscribers msid *ABCD0123456789* or
show subscribers msid *0123456789*
will show any subscriber with a MSID that match the lower 10 digits of MSID supplied, for example, 0123456789.

msisdn *msisdn*

Displays information for the mobile user identified by the Mobile Subscriber ISDN Number (MSISDN). *msisdn* must be 7 to 16 digits; specified as an IMSI, MIN, or RMI.

nat { not-required | required }

Displays information for the specified subscribers.

- **not-required**: Subscribers for whom Network Address Translation (NAT) processing is not required.
- **required**: Subscribers for whom NAT processing is required.

nat-ip *nat_ip_address* **] }**

Displays information for the subscribers for whom NAT processing is enabled and are using the specified NAT IP address. *nat_ip_address* specifies the NAT IP address and must be in IPv4 dotted-decimal notation. **The nat-ip keyword is only available in StarOS 8.3 and later releases.**

nat-realm *nat_realm*

Displays information for the subscribers for whom NAT processing is enabled and are using the specified NAT realm. *nat_realm* specifies the NAT realm name and must be a string from 1 through 63 characters.

network-requested

Display information for currently active subscribers whose sessions were initiated by the GGSN network requested create PDP context procedure.

network-type { gre | ipip | ipsec | ipv4 | ipv4-pmipv6 | ipv4v6 | ipv4v6-pmipv6 | ipv6 | ipv6-pmipv6 | l2tp | mobile-ip | proxy-mobile-ip }

Selects the currently active subscribers based on network service access type.

- **gre: Generic Routing Encapsulation**
- **ipip**: IP-in-IP
- **ipsec**: IPSec
- **ipv4**: IPv4 only
- **ipv4-pmipv6**: IPv4 and/or Proxy Mobile IPv6 (PMIP)
- **ipv4v6**: IPv4 and/or IPv6
- **ipv4v6-pmipv6**: IPv4, IPv6 and/or Proxy Mobile IPv6
- **ipv6**: IPv6 only
- **ipv6-pmipv6**: IPv6 and/or Proxy Mobile IPv6 (PMIP)
- **l2tp**: Layer 2 Tunneling Protocol
- **mobile-ip**: Mobile IP (MIP)
- **proxy-modile-ip**: Proxy Mobile IPv6 (PMIP)

nri *nri_value*

This SGSN-specific filter uses the configured network resource identifier (NRI) to identify a specific SGSN in a pool to fine-tuned the subscriber information to be displayed.
nri_value: enter an integer from 0 through 63
This filter can be used in combination with further refining filters.

nsapi *nsap_id*

Displays session information for the mobile user identified by Network Service Access Point Identifier (NSAPI) between MS and SGSN. NSAPI is also used as part of the tunnel identifier between GPRS Support Nodes (GSNs). The user identity IMSI and the application identifier (NSAPI) are integrated into the Tunnel IDentifier (GTPv0) (TID) or Tunnel Endpoint Identifier (GTPv1) (TEID) that uniquely identifies the subscriber's sublink between the GSNs (SGSN and GGSN). The NSAPI is an integer value within the PDP context header.
nsap_id must be an integer from 5 through 15.

partial qos { negotiated | requested }

This filter is specific to the SGSN.
Is limits the display of information to requested or negotiated QoS information for the subscriber.
This filter can be used in combination with further defining filters: active, active-charging-service, all, apn, callid, card-num, configured-idle-timeout, connected-time, ggsn-address, gprs-service, gsm-traffic-class, idle-time, imsi, msid, msisdn, negotiated, plmn-type, requested, rx-data, session-time-left, tx-data

pcc-service *name*

Displays statistics for users associated with an existing Policy and Charging Control (PCC) service name expressed as an alphanumeric string of 1 through 63 characters.

pcf [< | > | less-than | greater-than] *ipv4_address* **[< | > | less-than | greater-than]** *ipv4_address* **]**

Displays information for subscribers connected via the packet control function with a specific or range of IP addresses. The address must be specified using IPv4 dotted-decimal notation.

- **<**: Filters output so that only information less than the specified IPv4 address value is displayed.
- **>**: Filters output so that only information greater than the specified IPv4 address value is displayed.
- **less-than**: Filters output so that only information less than the specified IPv4 address value is displayed.
- **greater-than**: Filters output so that only information greater than the specified IPv4 address value is displayed.

Note: It is possible to define a limited range of IP addresses by using the less-than and greater-than options to define minimum and maximum values.

pdsn-only

Show PDSN specific information only.

pdsn-service *name*

Displays information for subscribers connected to the packet data service *name*. The packet data service must have been previously configured.

plmn-type

Displays subscriber type (HOME, VISITING, or ROAMING).
This keyword is for the GGSN or the SGSN only.

policy

Displays the current policies associated with the subscriber session.

profile-id *id_number*

Displays subscriber session information based on the profile-id granted for the flow. *id_number* must be an integer from 0 to 4294967295.

qci *number*

Displays subscriber session information based on the QoS Class Identifier (QCI) value assigned to the subscriber. *number* must be an integer value from 0 to 9.

relay-agent

Selects subscribers whose IP Addresses were assigned by the DHCP Relay Agent.

remote-tunnel-id *identifier*

Displays information for a remote tunnel identifier specified as an integer from 1 to 65535.

rnc id *rnc_id* **mcc** *mcc_num* **mnc** *mnc_num*

Displays information for subscribers connected to the SGSN via a specific RNC (radio network controller) identified by the RNC ID, the MCC (mobile country code), and the MNC (mobile network code). SGSN only

rulebase *name*

Selects subscribers associated with the specified Active Charging rulebase.

rx-data [< | > | greater-than | less-than] *value*

The number of bytes received by the specified subscriber.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

security-type { ipsec | tls }

Displays subscriber information based on the specified type of security.

- **ipsec**: IPSec
- **tls**: Transport Layer Security

session-time-left [< | > | greather-than | less] *value*

How much session time is left for the specified subscriber.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 4294967295.

smgr-instance *number*

Specific sessmgr instance. *number* must be in the range of 1 to 4294967295.

sgsn-address *address*

Shows information for subscribers whose PDP contexts are currently being facilitated by the SGSN specified by address. This command is for GGSN only.

sgsn-service *srvc_name*

Shows subscriber information for a specified 3G SGSN service. *srvc_name* must be an alphanumeric string of 1 through 63 characters that identifies a configured SGSN service.
This command is for SGSN only.

subscription { aor *address* **| callid** *id* **| full }**

Displays subscription information for defined subscribers, based on defined parameters.

- **aor** *address*: Clears session(s) by Address of Record.
- **callid** *id*: Specifies a Call Identification Number as an 8-digit hexadecimal number.
- **full**: Displays all available information.

tft

Displays the current Traffic Flow Template (TFT) associated with the subscriber session.

tpo { not-required | required }

Displays information for specified subscribers.

- **not-required**: Subscribers for whom Traffic Performance Optimizer (TPO) processing is not enabled.
- **required**: Subscribers for whom TPO processing is enabled.

tx-data [< | > | greater-than | less-than] *value*

The number of bytes transmitted by the specified subscriber.

- **<**: Filters output so that only information less than the specified value is displayed.
- **>**: Filters output so that only information greater than the specified value is displayed.
- **greater-than**: Filters output so that only information greater than the specified value is displayed.
- **less-than**: Filters output so that only information less than the specified value is displayed.
- *value*: Used in conjunction with <, >, greater-than, less-than, If no other filtering options are specified only output matching *value* is displayed. If *value* is not specified all data is displayed. *value* must be an integer from 0 through 18446744073709551615.

ue-type { ims | non-ims }

Displays information for the subscribers based on User Equipment type.

- **ims**: IP Multimedia Subsystem
- **non-ims**: UE other than IMS

username *name*

Displays information for connections for the subscriber identified by *name*. The user must have been previously configured. *name* must be a sequence of characters and/or wildcard characters ('$' and '*') from 1 to 127 characters. The * wildcard matches multiple characters and the $ wildcard matches a single character. If you do not want the wildcard characters interpreted as a wildcard enclose them in single quotes (‘). For example; ‘$’.

verbose

Display detailed information.

wide-format

Display detailed information in a wider screen format.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view information about subscriber sessions.
The output of this command may be considered for part of a periodic system auditing program by verifying active and dormant subscribers.
The Command Keywords may be used standalone to display detailed information or you may use one or more of the various Filter Keywords to reduce the amount of information displayed.

Caution: Executing this command may negatively impact performance if multiple instances are executed while the system is under heavy load and simultaneously facilitating multiple CLI sessions.

Example

The following command displays information for all subscriber sessions:

```
show subscribers all
```

The following command displays information for all ggsn-only subscriber sessions:

```
show subscribers ggsn-only all
```

The following command displays information for all subscriber sessions in wide format 1:

```
show subscribers wf1 all
```

```
show subscribers aaa-configuration
```

```
show subscribers counters username isp1user1
```

The following command displays information for subscriber in GGSN service:

```
show subscribers ggsn-only allshow subscribers ggsn-only full
```

The following command displays information for all subscriber with SGSN session having partial QoS requests:

```
show subscribers sgsn-only partial qos requested
```

The following command displays information for all subscriber with MME session connected to MME service having IP address as *10.1.1.1*:

```
show subscribers mme-only mme-address 10.1.1.1
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show super-charger

Lists subscribers with valid super-charger configuration. When super-charger is enabled for a subscriber, the SGSN handles 2G or 3G connections controlled by an operator policy and changes hand-off and location update procedures to reduce signaling traffic management (3GPP, TS.23.116).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show super-charger { imsi imsi | all }
```

imsi

Defines a specific subscriber's international mobile subscriber identity (IMSI) number.
imsi is a string of up to 15 digits that includes the MCC (mobile country code), the MNC (mobile network code) and the MSIN (mobile station identification number),

all

Instructs the SGSN to display super charger subscription information for all subscribers.

Usage

Use this command to determine if a single subscriber, identified by the IMSI, has a super charger configuration. Also, this command can display the list of all subscribers with a super charger configuration. If a subscriber has super charger as part of the configuration, subscriber data is backed up (using the IMSI Manager) after the subscriber detaches and the purge timer expires.

Example

The following command displays the super charger configuration information for the subscriber identified by the IMSI 90121882144672.

```
show super-charger imsi 90121882144672
```

show support details

Displays a comprehensive list of system information that is useful for troubleshooting purposes. In most cases, the output of this command is requested by the Technical Assistance Center (TAC).

Platform

ASR 5000

Product

All

Privilege

All

Mode

Exec

Syntax

show support details [to file *url*] **[compress] [| { grep** *grep_options* **| more }]**

to file *url*

Specifies the location where a .tar file with the support detail information should be created. *url* may refer to a local or a remote file and must be entered using the following format:
For the ASR 5000:

[file:] { /flash | /pcmcia1 | /hd } [/*directory* **] /***file_name* **[compress]**

tftp:// { *host* **[** *:port#* **] } [/***directory* **] /***file_name*

[ftp: | sftp:] // [*username***[** *:password* **] @] {** *host* **} [** *:port#* **] [/***directory* **] /***file_name*

Important: Do not use the following characters when entering a string for the field names below: "/" (forward slash), ":" (colon) or "@" (at sign).

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.
If the filename is not specified with a .tar extension, it is automatically appended to the filename when the file is created and a message is generated.
The content of the tar file is:

- **support_summary** - An ASCII text file that contains the support detail information.
- **information.minicores.tar** - A tar file that contains any minicore files found on the system. Minicore files contain memory core dumps that are captured during some events. These core dumps provide specific memory locations and other information about the event. This information is useful to the technical support team in identifying where and when an event occurred along with its probably cause.

compress

Generates a compressed .tar.gz file for the output of the command.

| { grep *grep_options* **| more }**

Pipes (sends) the output of this command to a specified command. You must specify a command to which the output of this command will be sent.
For details on using the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to obtain extensive system information for use in troubleshooting. This command does the work of over 30 separate commands, which saves time and ensures that all of the information needed is collected and displayed in the same order every time.
In addition to the information provided, the show support details command includes information that is not otherwise accessible to users but that is helpful in the swift resolution of issues.

Example

The following command displays the system information on your console.

```
show support details
```

The following command displays the information on your console and also writes it to the local device (pcmcia1 in this case) and includes the mini core dumps, using the filename *r-p_problem.tar*:

```
show support details to file /pcmcia1/r-p_problem.tar
```

The following command displays the information on your console and also writes it to an FTP server (named host), placing the file in the **dir** directory and includes the mini core dumps, using the filename *re_problem.tar*:

```
show support details to file ftp://host/dir/re_problem.tar
```

show system uptime

Displays the amount of time the system has been operational since its last down time (maintenance or otherwise).

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show system uptime [| { grep *grep_options* **| more }]**

uptime

Displays system up time in days (D), hours (H) and minutes (M).

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display the system up time to check for the possibility of anomalous behavior related to shorter or longer up times.

Example

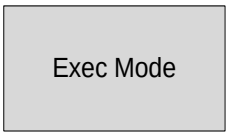
The following command displays basic system basic information and up time.

```
show system uptime
```

Chapter 116
Exec Mode show Commands (T-Z)

This chapter includes the commands **`show tacacs`** through **`show version`**.

The Exec Mode is the initial entry point into the command line interface system. Exec mode **show** commands are useful in troubleshooting and basic system monitoring.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

show tacacs

Displays information about all active Terminal Access Controller Access-Control System Plus (TACACS+) sessions.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax `show tacacs`

This command provides the following TACACS+ session information:

- individual active session number with the following additional session-specific information:
  - login username
  - login tty
  - time of login
  - login server priority
  - current session state
  - current privilege level
  - remote client application (if applicable)
  - remote client ip address (if applicable)
  - last server reply status
- total number of TACACS+ sessions

Usage

Use this command to view detailed session information for all active TACACS+ sessions.

Important: This command is available on version 11.0 and later systems.

Example

```
show tacacs
```

show task

Displays information about system tasks.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show task { info | resources | table } [card *card_num* **] [facility** *facility* **{ all | instance** *id* **}] [process** *process_name* **all] [max] [| { grep** *grep_options* **| more }]**

{ info | resources | table }

Specifies the type of information to be displayed and scope of tasks to include in output.
info: Displays detailed task information.
resources: Displays resource allocation and usage information for all tasks.
table: Displays identification information in tabular format for all tasks.

---

card *card_num*

Default: all powered on cards.
Specifies a single card for which task information is to be displayed where *card_num* must be an integer from 1 to 48 for the ASR 5000 and 1 through 20 for the ASR 5500.

---

facility *facility* **{ all | instance** *id* **max }**

Default: all facilities.
Specifies the list of facilities for which task information may be displayed. A specific instance of the facility may be displayed as specified by ID or all instances may be displayed. The value of *id* must be an integer from 0 through 10000000. *facility* must be one of:

- **a11mgr**: A11 Interface Manager facility
- **aaamgr**: AAA Manager Facility
- **aaaproxy**: AAA Proxy manager Facility
- **acsctrl**: Active Charging Service (ACS) Controller Facility [Release 11.0 and earlier versions only]
- **acsmgr**: Active Charging Service (ACS) Manager Facility
- **alcapmgr**: ALCAP Manager
- **asngwmgr**: ASN Gateway Manager
- **asnpcrmgr**: ASN Paging/Location-Registry (ASN-PC) Manager
- **bfd**: Bidirectional Forwarding Detection
- **bgp**: Border Gateway Protocol (BGP) Facility
- **bngmgr**: BNG Manager

- **bulkstat**: Bulk Statistics Manager Facility
- **callhome**: Call Home Controller
- **cdrmod**: Charging Detail Record Module
- **cli**: Command Line Interface Facility
- **cscfmgr**: SIP CSCF Manager
- **cscfttmgr**: SIP CSCFTT Manager
- **cspctrl**: Card Slot Port controller Facility
- **cssctrl**: Content Service Steering Controller
- **dcardctrl**: IPSec Daughter-card Controller Logging Facility
- **dcardmgr**: IPSec Daughter-card Manager Logging Facility
- **dgmbmgr**: Diameter Gmb Application Manager
- **dhmgr**: Distributed Host Manager
- **diamproxy**: Diameter Proxy
- **drvctrl**: Driver Controller Facility
- **egtpegmgr**: EGTP Egress Demux Manager
- **egtpinmgr**: EGTP Ingress Demux Manager
- **evlogd**: Event Log Daemon Facility
- **famgr**: Foreign Agent Manager Facility
- **gtpcmgr**: GTP-C Protocol Logging facility (GGSN product only)
- **gtpumgr**: GTP-U Demux Manager
- **h248prt**: H.248 Protocol Task [Release 11.0 and earlier versions only]
- **hamgr**: Home Agent Manager Facility
- **hatcpu**: High Availability Task CPU Facility
- **hatsystem**: High Availability Task Facility
- **hdctrl**: HD Controller
- **hnbmgr**: HNBGW HNB Manager
- **hwmgr**: Hardware Monitor Manager
- **ipsecctrl**: IP Security Controller Facility
- **ipsecmgr**: IP Security Manager Facility
- **ipsgmgr**: IP Services Gateway Facility
- **kvctrl**: KV Controller
- **kvmgr**: KV Manager
- **l2tpdemux**: L2TP Demultiplexor (LNS) Facility
- **l2tpmgr**: L2TP Manager Facility
- **lagmgr**: Link Aggregation Group (LAG) Manager
- **linkmgr**: SGSN/SS7 Link Manager
- **magmgr**: Mobile Access Gateway Manager

- **megadiammgr**: MegaDiameter Manager
- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager logging facility
- **mmgr**: SGSN/SS7 Master Manager
- **mpls_sig**: Multiprotocol Label Switching
- **mptest**: Migration Performance Test on Packet Accelerator Card
- **netwstrg**: Network Storage Manager [Release 11.0 and earlier versions only]
- **npuctrl**: Network Processor Unit Control Facility
- **npumgr**: Network Processor Unit Manager Facility
- **nputst**: Network Processor Unit Tester
- **nsctrl**: Charging Service Controller [Release 11.0 and earlier versions only]
- **nsmgr**: Charging Service Process Manager [Release 11.0 and earlier versions only]
- **orbns**: Object Request Broker Notification Server Facility
- **orbs**: Object Request Broker System Facility
- **ospf**: Open Shortest Path First Facility
- **ospfv3**: Open Shortest Path First (OSPFv3)
- **pdgmgr**: PDG Manager
- **phsgwmgr**: PHS Gateway manager
- **phspcmgr**: PHS Paging Controller manager
- **rct**: Recovery Control Task Facility
- **rdt**: Redirect Task Facility
- **rip**: Routing Information Protocol Facility
- **rmctrl**: Resource Manager Controller Facility
- **rmmgr**: Resource Manager Facility
- **sct**: Shared Configuration Task Facility
- **sessctrl**: Session Controller Facility
- **sessmgr**: Session Manager Facility
- **sesstrc**: Session Trace Collection task
- **sft**: Switch Fabric Monitoring Task
- **sgtpcmgr**: SGSN GTPC Manager
- **sipcdprt**: SIP Call Distributor Task [Release 11.0 and earlier versions only]
- **sitmain**: System Initialization Task Main Facility
- **sitparent**: Card based system initialization facility that applies to packet processing cards and system management cards (SMC - ASR 5000, MIO - ASR 5500) [Replaces the **sitpac**, **sitspc** and **sittac** facilities]
- **snmp**: SNMP Protocol Facility
- **srdb**: Static Rating Database

- **testctrl**: Test Controller
- **testmgr**: Test Manager
- **threshold**: Threshold Server Facility
- **vpnctrl**: Virtual Private Network Controller Facility
- **vpnmgr**: VPN Manager Facility
- **zebos**: ZEBOS™ OSPF Message Facility

all: Displays information for all instances of the specified facility.
instance *id*: Displays information for the facility instance specified as an integer from 0 through 10000000.

---

process *process_name* **all**

Display information for all instances of the specified process. must be one of the following process names:

- **ftpd**: File Transfer Protocol Daemon
- **inetd**: Internet Super-server Daemon
- **nsproc**: NetSpira Packet Processor
- **ntpd**: Network Time Protocol Daemon
- **orbnsd**: Object Request Broker Notification Server
- **ping**: Ping
- **pvmd-wrapper**: NetSpira Messenger Daemon
- **pvmgs**: NetSpira Messenger Daemon
- **rlogin**: Remote Login
- **sftp-server**: Secure File Transfer Protocol Server
- **sitreap**: System Initialization Task Cleanup Process
- **sn_resolve**: DNS Resolver Process
- **ssh**: Secure Shell
- **sshd**: Secure Shell Daemon
- **telnet**: Telnet
- **telnetd**: Telnet daemon
- **tftpd**: Trivial File Transfer Protocol Daemon
- **traceroute**: Traceroute

---

max

Default: current usage levels are displayed.
Displays the maximum usage levels for tasks as opposed to the current usage levels.
max is valid only in conjunction with the **resources** keyword.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display task information as part of system troubleshooting unexpected behavior.

Important: This command is not supported on all platforms.

Example

The following commands provide some examples of the combinations of options that may be used to display task information.

```
show task info facility hatspc all

show task info facility hatspc instance 456

show task resources facility zebos all

show task table facility ospf

show task table card 8 facility cli all

show task resources facility rip all max
```

show tcap statistics

This command displays the collected traffic statistics that have passed through the SS7 Transaction Capabilities Application Part (TCAP) layer.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator, Operator

Mode

Exec

Syntax

show tcap statistics [camel-service [all | name *camel_srvc* **] | map-service [all | name** *map_srvc* **]] [| { grep** *grep_options* **| more }]**

camel-service [all | name *camel_srvc* **]**

Displays TCAP statistics for either all Customized Applications for Mobile networks Enhanced Logic (CAMEL) services or only for the named CAMEL service.

map-service [all | name *mapl_srvc* **]**

Displays TCAP statistics for either all Mobile Application Part (MAP) services or only for the named MAP service.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to display the collected TCAP statistics for MAP or CAMEL services.

Example

The following command displays the collected statistics for a MAP service named *MAP-Tewk*.

```
show tcap statistics map-service name MAP-Tewk
```

show temperature

Displays the current temperature on all installed cards. Also displays the temperature of upper and lower fan trays. Temperature readings are acquired from sensors located on theses components.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show temperature [verbose] [| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

verbose

Indicates that the output is to contain detailed information.

Usage

Verify current temperature of components in chassis.

Example

```
show temperature

show tempterature verbose
```

show terminal

Displays the current terminal settings for number of lines in length and number of characters in width.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show terminal [| { grep *grep_options* **| more }]**

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to verify current terminal settings in case the output displayed appears to have line breaks/wraps in unexpected places.

Example

```
show terminal
```

show threshold

Displays thresholding information for the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show threshold [ default ]
```

[default]

Used to display the system's thresholding default values.

Usage

Use this command to display information on threshold value configuration and activity.

Example

The following command displays configuration information pertaining to threshold values configured on the system:

```
show threshold
```

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show timing

Displays the information configured to define a transmit timing source other than the system clock. The display includes related information (such as port status, timing source priority, timing alarms, etc.) for all of the ports configured for either Building Integrated Timing Supply (BITS) or line timing.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show timing
```

Usage

Use this command to determine which line cards are recovering receive timing clocks.

Important: This command is not supported on all platforms.

Example

The following command displays timing configuration and status information for the timing-configured ports.

```
show timing
```

show upgrade

Displays the status of an on-going on-line software upgrade.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

```
show upgrade
```

Usage

Use this command to show the status of an on-going on-line software upgrade.

Important: This command is not supported on all platforms.

show url-blacklisting database

Displays URL Blacklisting static database configurations.

Platform

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show url-blacklisting database [all | url *url* **| facility acsmgr { all | instance** *instance* **}] [| { grep** *grep_options* **| more }]**

all

Displays configurations of all URL Blacklisting databases present in the default or override directory.

facility acsmgr { all | instance *instance* **}**

Displays configurations of URL Blacklisting database configuration per facility/ACSMgr instance.
all: Displays URL Blacklisting database configuration of all ACSMgrs.
instance *instance*: Displays URL Blacklisting database configuration for the instance number of the database specified as an integer from 1 through 10000000.

url *url*

Displays configurations of the URL Blacklisting database specified in the database's URL expressed as an alphanumeric string of 1 through 512 characters.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.
For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Use this command to view configurations associated with in-memory and on-flash Blacklisting database. The **show url-blacklisting database** command displays the active database that is loaded, and is the one set by either the default or override CLI commands.

Example

The following command displays configurations of all the databases present in default or override directory, indicating one as Active and rest as Not Loaded:

```
show url-blacklisting database all
```

The following command displays configurations of the */flash/bl/optblk.bin* database:

show url-blacklisting database url /flash/bl/optblk.bin

The following command displays database configuration for the ACSMgr instance *1*:

show url-blacklisting database facility acsmgr instance 1

Important: Output descriptions for commands are available in the *Statistics and Counters Reference*.

show version

Displays the version information for the current system image or for a remote image.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator, Inspector

Mode

Exec

Syntax

show version [*url* **] [all | verbose] [| { grep** *grep_options* **| more }]**

url

Specifies the location of a configuration file for which to display version information. The *url* may refer to a local or a remote file and must be entered in the following format:
For the ASR 5000:

[file:] { /flash | /pcmcia1 | /hd } [/*directory* **] /***file_name*

tftp:// { *host* **[** *:port#* **] } [/***directory* **] /***file_name*

[http: | ftp: | sftp:] // [*username* **[** *:password* **] @] {** *host* **} [** *:port#* **] [/***directory* **] /***file_name*

Important: Do not use the following characters when entering a string for the field names below: "/" (forward slash), ":" (colon) or "@" (at sign).

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

all | verbose

all: displays all image information.
verbose: displays detailed information.
The **verbose** keyword may not be used in conjunction with a URL specification.

| { grep *grep_options* **| more }**

Pipes (sends) the output of the command to the command specified. You must specify a command to which the output will be sent.

For details on the usage of the **grep** and **more** commands, refer to the *Regulating a Command's Output* section of the *Command Line Interface Overview* chapter.

Usage

Display the version information to verify the image versions loaded in preparation for maintenance, upgrades, etc.

Important: This command is not supported on all platforms.

Example

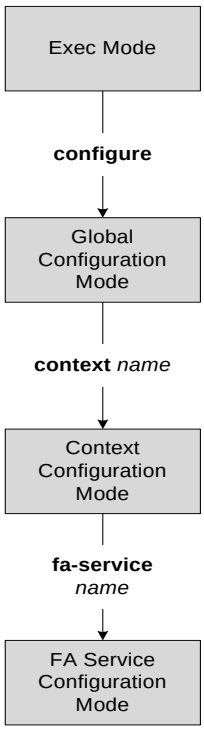
The following commands display the version information with the basic level of output and the detailed level, respectively.

```
show version

show version verbose
```

Chapter 117
FA Service Configuration Mode Commands

The Foreign Agent Service Configuration Mode is used to create and manage the Foreign Agent (FA) services associated with the current context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

advertise

Configures agent advertisement parameters within the FA service.

Platform

ASR 5000

Product

PDSN

GGSN

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

advertise {adv-delay *seconds* **| adv-lifetime** *time* **| adv-interval {** *seconds* **| msec** *num* **} | num-adv-sent** *number* **| prefix-length-extn | reg-lifetime** *reg_time* **}**

no advertise { prefix-length-extn | reg-lifetime }

default advertise adv-delay

no

Disables prefix-length-extn

no advertise reg-lifetime

Specifies that there is no limit to the registration lifetime that the FA service will allow in any Registration Request message from the mobile node.

default advertise adv-delay

Sets the initial delay for the unsolicited advertisement to the default value of 1000 ms.

advertise adv-delay *seconds*

Default: 1000
Sets the initial delay for the unsolicited advertisement.
seconds is the advertisement delay in milliseconds and must be an integer from 10 through 5000.

Important: This command is available for WiMAX CMIP calls only.

adv-lifetime *time*

Default: 9000
Specifies the FA agent advertisement lifetime.

The agent advertisement lifetime is the amount of time that an FA agent advertisement remains valid in the absence of further advertisements.
time is measured in seconds and can be configured to an integer from 1 through 65535.

adv-interval { *seconds* | msec *num* }

Default: 5 seconds
Specifies the amount of time between agent advertisements.
seconds is the time in seconds and can be an integer from 1 through1800.
msec *num*: Configures agent advertisement Interval in milliseconds. *num* can be an integer from 100 through 1800000.

num-adv-sent *number*

Default: 5
Specifies the number of unanswered agent advertisements that the FA service sends upon PPP establishment before rejecting the session.
number can be an integer from 1 through 65535.

prefix-length-extn

Default: Disabled
When enabled, the FA includes the FA-service address in the Router Address field of the Agent Advertisement and appends a Prefix Length Extension in Agent Advertisements with a prefix length of 32.

reg-lifetime *reg_time*

Default: 600
Specifies the longest registration lifetime that the FA service will allow in any Registration Request message from the mobile node.
reg_time is measured in seconds and can be configured to an integer from 1 through 65534.

Usage

Use to tailor FA advertisements to meet your network needs and/or conditions.

Example

The following command configures the FA advertisement interval at 10 seconds, the advertise lifetime to *20000* seconds, and the maximum number of unanswered advertisements that will be set to *3*.

```
advertise adv-interval 10 adv-lifetime 20000 num-adv-sent 3
```

authentication aaa

This configuration enables or disables the authentication parameters for the FA service to override dynamic keys from AAA with static keys to support MIP registration with an HA that does not support dynamic keys.

Platform

ASR 5000

Product

FA

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[no | default] authentication aaa-distributed-mip-keys override

no

Disable the override of dynamic keys from AAA.

default

By default the override behavior is disabled and the system uses dynamic keys from AAA after successful EAP authentication. If EAP authentication fails, the system uses static keys by default.

Usage

Specify how the system will perform authentication of registration request messages. By default dynamic MN-HA and FA-HA keys from AAA after successful EAP authentication used by a PMIP client in WiMAX calls for MIP registration with HA. This configuration in FA service overrides the dynamic keys from AAA with static keys to support MIP registration with an HA that does not support dynamic keys.

Example

The following command configures the FA service to override use of AAA MIP keys and force the use of statically configured FA-HA SPI/key for WiMAX calls.

```
authentication aaa-distributed-mip-keys override
```

authentication mn-aaa

Specifies how the system handles authentication for mobile node re-registrations.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

authentication mn-aaa { always | ignore-after-handoff | init-reg | init-reg-except-handoff | renew-and-dereg-noauth | renew-reg-noauth } [optimize-retries]

always

Specifies that the FA service performs authentication each time a mobile node registers. This is the default setting.

ignore-after-handoff

MN-AAA authentication is not done at the FA for a handoff Access Gateway (AGW).

init-reg

MN-AAA and MN-FAC extensions are required only in initialization RRQ.

init-reg-except-handoff

MN-AAA and MN-FAC extensions are not required in initialization RRQ after inter-Access Gateway (AGW) handoff.

renew-and-dereg-noauth

Specifies that the FA service does not perform authentication for mobile node re-registration or deregistration authorization requests. Initial registration is handled normally.

renew-reg-noauth

Specifies that the FA service does not perform authentication for mobile node re-registrations. Initial registration and de-registration are handled normally.

optimize-retries

Optimizes the number of Authentication retries sent to the AAA server.

When an authentication request is pending for a MIP call at the AGW, if a retry RRQ is received from the mobile node, the AGW discards the old RRQ and keeps the most recent RRQ. Subsequently when the authentication succeeds, the AGW forwards the most recent RRQ to the HA. If the authentication fails, the AGW replies to the MN using the most recent RRQ.

Usage

Use this command to determine how the FA service handles mobile node re-registrations.
The system is shipped from the factory with the mobile AAA authentication set to always.

Example

The following command configures the configures the FA service to perform mobile node authentication for every re-registration:

```
authentication mn-aaa always
```

The following command specifies that the FA service does not perform authentication for mobile node re-registrations:

```
authentication mn-aaa renew-reg-noauth
```

authentication mn-ha

Configures whether the FA service looks for a Mobile Network-Home Agent (MN-HA) authentication extension in the RRP (registration reply).

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

authentication mn-ha { allow-noauth | always }

allow-noauth

Allows a reply that does not contain the auth extension.

always

A reply should always contain the auth extension to be accepted.
This is the default setting.

Usage

Use this command to determine whether or not the FA service requires the MN-HA auth extension in the RRP.
The system is shipped from the factory with this set to always.

Example

The following command configures the FA service to require a reply to contain the authentication extension to be accepted.:

```
authentication mn-ha always
```

bind

Binds the FA service to a logical IP interface serving as the Pi interface and specifies the maximum number of subscribers that can access this service over the interface.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

bind address *address* **[max-subscribers** *count* **]**

no bind address

address

Specifies the IP address (address) of the interface configured as the Pi interface. *address* is specified in IPv4 dotted-decimal notation.

max-subscribers *max#*

Default: 500000
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to an integer from 0 through 500000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active packet processing cards installed in the system. Refer to the license key command for additional information.

Usage

Associate or tie the FA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces you will configure for use as Pi interfaces

- The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.
Use the **no bind address** command to delete a previously configured binding.

Example

The following command would bind the logical IP interface with the address of *192.168.3.1* to the FA service and specifies that a maximum of *600* simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

challenge-window

Defines the number of recently sent challenge values that are considered valid by the FA.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

challenge-window *number*

number

Default: 2
The number of recently sent challenge values that are considered valid. *number* must be an integer from 1 through 5.

Usage

Use this command to set the number of recently sent challenge values that are considered valid by the FA.

Example

Set the challenge window to *3*:

```
challenge-window 3
```

default subscriber

Specifies the name of a subscriber profile configured within the same context as the FA service from which to base the handling of all other subscriber sessions handled by the FA service.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[no] default subscriber *profile_name*

profile_name

Specifies the name of the configured subscriber profile. *profile_name* is an alphanumeric string of 1 through 63 characters that is case sensitive.

Usage

Each subscriber profile specifies "rules" such as permissions, PPP settings, and timeout values.
By default, the FA service will use the information configured for the subscriber named default within the same context. This command allows for multiple FA services within the same context to apply different "rules" to sessions they process. Each set of rules can be configured under a different subscriber name which is pointed to by this command.
Use the **no default subscriber** *profile_name* command to delete the configured default subscriber.

Example

To configure the FA service to apply the rules configured for a subscriber named *user1* to every other subscriber session it processes, enter the following command:

```
default subscriber user1
```

dynamic-ha-assignment

This command configures various dynamic HA assignment parameters.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[default | no] dynamic-ha-assignment [aaa-override mn-supplied-ha-addr | allow-failover]

default

Feature is disabled by default.

no

Removes the feature and returns it to the default setting of disabled.

aaa-override mn-supplied-ha-addr

Enables the system to override the mobile node supplied HA IP address with the AAA provided HA address.

allow-failover

Enables/disables a failover retry for dynamic HA assignment from the AAA server.

Usage

Use this command to override the mobile node supplied HA IP address with the AAA supplied HA address. Use this command to enable or disable the failover feature that allows the system to receive and use a newer HA address from the AAA server in cases where the original HA address is not responding.
A AAA server may assign different HA addresses each time a retransmitted MIP RRQ is authenticated during the MIP session setup. When this configuration is enabled, if the FA gets a new HA address from AAA during setup, it discards the previous HA address and start using the new address. This allows the FA session to connect to an available HA during setup.

Example

The following command enables the failover feature that allows the system to receive and use a newer HA address from the AAA server:

```
dynamic-ha-assignment allow-failover
```

dynamic-mip-key-update

When enabled, the FA service processes MIP_Key_Update_Request from the AAA server and allows dynamic MIP key updates (DMUs).

Default: Disabled

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[no] dynamic-mip-key-update

no

The FA service rejects MIP_Key_Update_Request from the AAA server, not allowing dynamic MIP key updating to occur and terminates the call.

Usage

Use this command to enable or disable the DMU feature in the FA service.

Example

To enable DMU and allow dynamic updates of MIP keys, enter the following command:

```
dynamic-mip-key-update
```

encapsulation allow gre

Enables or disables the use of generic routing encapsulation (GRE) when establishing a Mobile IP (MIP) session. When enabled, if requested by a Mobile Node (MN), the FA requests the HA to use GRE encapsulation when establishing the MIP session. When disabled, the FA does not set the GRE bit in Agent Advertisements to the MN.

Default: GRE is enabled.

```

Usage

Use this command to return to the parent configuration mode.

fa-ha-spi

Configures the security parameter index (SPI) between the FA service and the HA.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

fa-ha-spi remote-address { *ha_ip_address* **|** *ip_addr_mask_combo* **} spi-number** *number* **{ encrypted secret** *enc_secret* **|** *secret* **} [description string | hash-algorithm { hmac-md5 | md5 | rfc2002-md5 } | monitor-ha | replay-protection { timestamp | nonce } | timestamp-tolerance** *tolerance* **]**

no fa-ha-spi remote-address { *ha_ip_address* **|** *ip_addr_mask_combo* **} spi-number** *number*

remote-address { *ha_ip_address* **|** *ip_addr_mask_combo* **}**

ha_ip_address: Specifies the IP address of the HA in IPv4 dotted-decimal notation.
ip_addr_mask_combo: Specifies the IP address of the HA including network mask bits.
ip_addr_mask_combo must be specified IPv4 dotted-decimal notation with CIDR subnet mask bits (x.x.x.x/xx).

spi-number *number*

Specifies the Security Parameter Index (SPI) which indicates a security context between the FA and the HA in accordance with RFC 2002.
number can be configured to an integer from 256 through 4294967295.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the FA service and the HA. The secret can be either encrypted or non-encrypted.

- **encrypted secret** *enc_secret* : Specifies the encrypted shared key (enc_secret) between the FA service and the HA. *enc_secret* must be an alphanumeric string of 1 through 254 characters that is case sensitive.

Important: The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

- **secret** *secret*: Specifies the shared key (secret) between the FA service and the HA. *secret* must be an alphanumeric string of 1 through 127 characters that is case sensitive.

description *string*

This is a description for the SPI. *string* must be an alphanumeric string of 1 through 31 characters.

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5
Specifies the hash-algorithm used between the FA service and the HA.

- **hmac-md5**: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
- **md5**: Configures the hash-algorithm to implement MD5 per RFC 1321.
- **rfc2002-md5**: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

monitor-ha

Default: disabled
Enables the HA monitor feature for this HA address.
To set the behavior of the HA monitor feature, refer to the **ha-monitor** command in this chapter. To disable this command (if enabled) for this HA address, re-enter the entire **fa-ha-spi** command without the **monitor-ha** keyword.

replay-protection { timestamp | nonce }

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the FA service for this SPI.

- **nonce**: Configures replay protection to be implemented using NONCE per RFC 2002. Nonce is an arbitrary number used only once to sign a cryptographic communication.
- **timestamp**: Configures replay protection to be implemented using timestamps per RFC 2002.

Important: This keyword should only be used in conjunction with Proxy Mobile IP support.

timestamp-tolerance *tolerance*

Default: 60
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to 0, then timestamp tolerance checking is disabled at the receiving end.
tolerance is measured in seconds and can be configured to an integer value from 0 through 65535.

Important: This keyword should only be used in conjunction with Proxy Mobile IP support.

+

More than one of the above keywords can be entered within a single command.

Usage

An SPI is a security mechanism configured and shared by the FA service and the HA. Please refer to RFC 2002 for additional information.
Though it is possible for FAs and HAs to communicate without SPIs being configured, the use of them is recommended for security purposes. It is also recommended that a "default" SPI with a remote address of 0.0.0.0/0 be configured on both the HA and FA to prevent hackers from spoofing addresses.

Important: The SPI configuration on the HA must match the SPI configuration for the FA service on the system in order for the two devices to communicate properly.

A maximum of 2,048 SPIs can be configured per FA service.
Use the **no** version of this command to delete a previously configured SPI.

Example

The following command configures the FA service to use an SPI of *512* when communicating with an HA with the IP address *192.168.0.2*. The key that would be shared between the HA and the FA service is *q397F65*. When communicating with this HA, the FA service will also be configured to use the *rfc2002-md5* hash-algorithm.

```
fa-ha-spi remote-address 192.168.0.2 spi-number 512 secret q397F65 hash-
algorithm rfc2002-md5
```

The following command deletes the configured SPI of *400* for an HA with an IP address of *172.100.3.200*:

```
no fa-ha-spi remote-address 172.100.3.200 spi-number 400
```

gre

Configures Generic Routing Encapsulation (GRE) parameters.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

gre { checksum | checksum-verify | reorder-timeout *timeout* **| sequence-mode { none | reorder } | sequence-numbers }**

no gre { checksum | checksum-verify | sequence-numbers }

no

Disables the specified functionality.

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

reorder-timeout *timeout*

Default: 100
Configures maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *timeout* must be an integer from 0 through 5000.

sequence-mode { none | reorder }

Default: none
Configures how incoming out-of-sequence GRE packets should be handled.
none: Disables reordering of incoming out-of-sequence GRE packets.
reorder: Enables reordering of incoming out-of-sequence GRE packets.

sequence-numbers

Default: Disabled.
Enables insertion or removal of GRE sequence numbers in GRE packets.

Usage

Use this command to configure how the FA service handles GRE packets.

Example

To set maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to *500* milliseconds, enter the following command:

```
gre reorder-timeout 500
```

To enable the reordering of incoming out of sequence GRE packets, enter the following command:

```
gre sequence-mode reorder
```

ha-monitor

Configures the behavior of the HA monitor feature.

Platform

ASR 5000

Product

PDSN

ASN-GW

FA

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[default] ha-monitor [interval *sec***| max-inactivity-time** *sec* **| num-retry** *num* **]**

no ha-monitor

default

Restores the system default setting(s) for the command/keyword(s). This command is disabled by default.

no

Disables the HA monitoring feature for this FA service.

interval *sec*

Default: 30
Configures the time interval before the next monitoring request message is sent to the HA.
sec must be an integer from 1 through 36000.

max-inactivity-time *sec*

Default: 60
Specifies the maximum amount of time the system will wait without receiving MIP control traffic from a HA before the HA monitoring mechanism is triggered.
sec must be an integer from 30 through 600.

num-retry *num*

Default: 5
Configures the number of time the system will attempt to send HA monitor requests before determining the HA is down and a trap is initiated.
num must be an integer from 0 through 10.

Usage

Use this command to set parameters for the HA monitor feature. This feature allows the AGW/FA to monitor HAs with which it has MIP sessions. The monitoring feature is triggered when the AGW/FA does not receive any MIP traffic from a HA for a configured amount of time (**max-inactivity-time**). The AGW/FA starts sending special MIP RRQ monitor messages and waits for RRP monitor message responses from the HA. The RRQ monitor messages are addressed to the HA service address. The source address of the monitor-request messages is the FA service's IP address.

The actions taken during monitoring are comprised of the following:

- If no monitor response is received during the interval time (**interval**), the AGW retransmits the monitor message a configured number of times (**num-retry**).
- If no response is received after retransmitting for the number configured in **num-retry**, the HA is considered down. The AGW/FA sends a trap (HAUnreachable) to the management station. Monitoring of this HA is stopped until a MIP control message is received from the particular HA and when the AGW/FA sends a trap (HAreachable) to the management station and starts monitoring the HA again.
- When an HA receives the RRQ from an FA, it verifies the message and identifies it as a monitor message based on a special reserved NAI (in the message) and a Monitor HA CVSE in the RRQ. The HA responds with an RRP with Reply code 0x00 (accepted) and includes the Monitor HA CVSE. When the FA receives the RRP from the HA, it updates the activity for the peer HA to maintain the “up” state.

Important: This command only sets the behavior of the HA monitor feature. To enable the HA monitor feature for each HA address, refer to the **fa-ha-spi** command in this chapter. Up to 256 HAs can be monitored per system.

Example

The following commands set the HA monitor message interval to *45* seconds, the HA inactivity time to *60* seconds, and the number of HA monitor retries to *6*:

```
ha-monitor interval 45ha-monitor max-inactivity-time 60ha-monitor num-
retry 6
```

idle-timeout-mode

Controls whether Mobile IP data and control packets or only Mobile IP data resets the session idle timer.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

idle-timeout-mode { aggressive | normal }

aggressive

Only Mobile IP data resets the session idle timer.

normal

Both Mobile IP data and control packets reset the session idle timer.

Usage

Use this command to control how the session idle timer is reset.

Example

The following command specifies that only Mobile IP data can reset the session idle timer:

```
idle-timeout-mode aggressive
```

ignore-mip-key-data

When this command is enabled, if the Dynamic Mobile IP Key Update (DMU) is not enabled and the mobile node (MN) sends a MIP_Key_Data CVSE, the FA ignores the MIP_Key_Data extension and the call is continued like a regular Mobile IP (MIP) call.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[no] ignore-mip-key-data

no

Disable ignoring of MIP key data.

Usage

When DMU is not enabled, use this command to ignore MIP key data sent by the MN and allow the call to continue normally.

Example

To enable the FA to ignore MIP key data sent by the MN, enter the following command:

```
ignore-mip-key-data
```

ignore-stale-challenge

Enables the system to accept RRQs with previously used challenges. This feature is disabled by default.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[no] ignore-stale-challenge

no

Disables this feature. If an RRQ is received with a previously used challenge and there are RRQs pending on the same session, accept the RRQ if it has a new Identification in the retransmitted RRQ. All other RRQs received with previously used challenge are rejected with the Stale Challenge (106) error code.

Usage

Use this command to allow the FA to accept stale challenges regardless of the ID field or if other RRQs are pending.

Example

To enable this functionality in the FA service, enter the following command;

```
ignore-stale-challenge
```

To disable this functionality, enter the following command;

```
no ignore-stale-challenge
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Pi interfaces' IP socket on which to listen for Mobile IP Registration messages.

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

ip local-port *port#*

port#

Specifies the UDP port number.
port# can be an integer from 1 through 65535.

Usage

Specify the UDP port that should be used for communications between the FA service and the HA. The system defaults to using local port 434.

Example

The following command specifies a UDP port of *3950* for FA-to-HA communication on the Pi interface:

```
ip local-port 3950
```

isakmp

Configures support for IPSec within the FA-service.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

isakmp {peer-ha *ha_address* **{ crypto map** *map_name* **[[encrypted] secret** *secret* **] } | default { crypto map** *map_name* **[[encrypted] secret***secret* **] } }**

no isakmp { peer-ha *peer_ip_address* **| default }**

---

no

Deletes the reference to the crypto map for the specified HA, or deletes the reference for the default crypto map.

---

peer-ha *ha_address* **{ crypto map** *map_name* **[[encrypted] secret** *preshared_secret* **] }**

Configures a crypto map for a peer HA.

- *ha_address*: The IP address of the HA with which the FA service will establish an IPSec SA. The address must be expressed in IPv4 dotted-decimal format.
- **crypto map** *map_name*: The name of a crypto map configured in the same context that defines the IPSec tunnel properties. *map_name* is the name of the crypto map expressed as an alphanumeric string of 1 through 127 characters.
- **encrypted**: This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret** *secret*: The pre-shared secret that will be used during the IKE negotiation. *preshared_secret* is the secret expressed as an alphanumeric string of 1 through 127 characters.

---

default { crypto map *map_name* **[[encrypted] secret** *secret* **] }**

Specifies the default crypto map to use when there is no matching crypto map configured for an HA address.

- **crypto map** *map_name*: The name of a crypto map configured in the same context that defines the IPSec tunnel properties. *map_name* is the name of the crypto map expressed as an alphanumeric string of 1 through 127 characters.

- **encrypted**: This keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.
- **secret** *secret*: The pre-shared secret that will be used during the IKE negotiation. *preshared_secret* is the secret expressed as an alphanumeric string of 1 through 127 characters.

Usage

Use this command to configure the FA-service's per-HA IPSec parameters. These dictate how the FA service is to establish an IPSec SA with the specified HA.

Important: For maximum security, the above command should be executed for every possible HA with which the FA service communicates.

A default crypto map can also be configured using the default keyword. The default crypto map is used in the event that the AAA server returns an HA address that is not configured as an isakmp peer-ha.

Important: For maximum security, the default crypto map should be configured in addition to peer-ha crypto maps instead of being used to provide IPSec SAs to all HAs.

Note that once an IPSec tunnel is established between the FA and HA for a particular subscriber, all new Mobile IP sessions using the same FA and HA are passed over the tunnel regardless of whether or not IPSec is supported for the new subscriber sessions. Data for existing Mobile IP sessions is unaffected.

Example

The following command creates a reference for an HA with the IP address *10.2.3.4* to a crypto map named *map1*:

```
isakmp peer-ha 10.2.3.4 crypto map map1
```

The following command deletes the crypto map reference for the HA with the IP address *10.2.3.4*.

```
no isakmp peer-ha 10.2.3.4
```

limit-reg-lifetime

Enable the current default behavior of limiting the Mobile IP (MIP) lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts. When disabled, this command allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

Platform

ASR 5000

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[no | default] limit-reg-lifetime

no

Allows a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.

default

Enables the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Usage

Use the no keyword with this command to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts.
Use the base command or the keyword to reset the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts.

Example

Configure the FA service to allow a MIP lifetime that is longer than the Idle, Absolute or Long Duration timeouts by entering the following command:
no limit-reg-lifetime
Configure the FA service to the default behavior of limiting the MIP lifetime to be smaller than the Idle, Absolute, or Long Duration timeouts by entering either of the following commands:

default limit-reg-lifetimelimit-reg-lifetime

max-challenge-len

For mobile subscribers, the FA generates a random number and sends it to the mobile node as part of the mobile authentication extension (Mobile-Foreign Authentication extension) as described in RFC 3012. This command sets the maximum length of the FA challenge in bytes.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

max-challenge-len *length*

length

Default: 16
The maximum length, in bytes, of the FA challenge. This value must be an integer from 4 through 32.

Usage

Change the maximum allowed length of the randomly generated FA challenge its default of 16.

Example

Use the following command to change the maximum length of the FA challenge to 18 bytes:

```
max-challenge-len 18
```

mn-aaa-removal-indication

Enables the FA to remove the Mobile Network-Final Assembly Code (MN-FAC) and MN-AAA extensions from RRQs. This is disabled by default.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[no] mn-aaa-removal-indication

no

Disable the removal of the MN-FAC and MN-AAA extensions from RRQs.

Usage

Enable this feature if there is no need to authenticate the subscriber at HA using MN-AAA extension.

Example

The following command enables the FA service to remove MN-FAC and MN-AAA extensions from RRQs:

mn-aaa-removal-indication

multiple-reg

Specifies the number of simultaneous Mobile IP sessions that will be supported for over a single PPP session.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

multiple-reg *number*

number

number can be configured to an integer from 1 through 3.

Usage

Use to support multiple registrations per subscriber.
The system defaults to a setting of "1" for multiple simultaneous MIP sessions.

Important: The system will only support multiple Mobile IP sessions per subscriber if the subscriber's mobile node has a static IP address. The system will only allow a single Mobile IP session for mobile nodes that receive a dynamically assigned IP address. In addition, because only a single Mobile IP or proxy-Mobile IP session is supported for IP PDP contexts, this parameter must remain at its default configuration.

Example

The following command configures the number of supported simultaneous registrations for subscribers using this FA service to *3*.

```
multiple-reg 3
```

optimize tunnel-reassembly

Configures FA to HA optimization for tunnel reassembly.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

```
[ no ] optimize tunnel-reassembly
```

Usage

Enabling this functionality fragments large packets prior to encapsulation for easier processing. Tunnel reassembly optimization is disabled by default.

Important: You should not use this command without first consulting Cisco Systems Technical Support. This command applies to very specific scenarios where packet reassembly is not supported at the far end of the tunnel. There are cases where the destination network may either discard the data, or be unable to reassemble the packets.

Important: This functionality works best when the FA service is communicating with an HA service running in a system. However, an FA service running in the system communicating with an HA from a different manufacturer will operate correctly even if this parameter is enabled.

Use the **no** version of this command to disable tunnel optimization if it was previously enabled.

Example

The following command enables tunnel reassembly optimization:

```
optimize tunnel-reassembly
```

private-address allow-no-reverse-tunnel

This command enables the FA to allow calls with private addresses and no reverse tunneling.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[no] private-address allow-no-reverse-tunnel

no

Disables the functionality. This is the default setting.

Usage

Use this command to let the FA allow sessions with private addresses that do not have the reverse tunnel bit set.

Example

To enable sessions with private addresses and no reverse tunneling, enter the following command:

```
private-address allow-no-reverse-tunnel
```

proxy-mip

Configures parameters pertaining to Proxy Mobile IP support.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

proxy-mip { allow | ha-failover [max-attempts *max_attempts* **| num-attempts-before-switching** *num_attempts* **| timeout seconds]| max-retransmissions number | renew-percent-time** *renew-time* **| retransmission-timeout** *time* **}**

no proxy-mip {allow | ha-failover }

default proxy-mip { allow | ha-failover | max-retransmissions | renew-percent-time | retransmission-timeout }

no

Disables FA service support for Proxy Mobile IP or HA failover for Proxy Mobile IP.

default

Restores the specified option to the default setting as described below.

allow

Default: Disabled
Enables FA service support for Proxy Mobile IP.

ha-failover [max-attempts *max_attempts* **| num-attempts-before-switching** *num_attempts* **| timeout** *seconds* **]**

Default: Disabled
Enables HA failover for the Proxy Mobile IP feature.

- **max-attempts** *max_attempts* - Configures the maximum number of retransmissions of Proxy MIP control messages. *max_attempts* must be an integer from 1 through 10. Default is 4
- **num-attempts-before-switching** *num_attempts* - Configures the total number of RRQ attempts (including retransmissions) before failing over to the alternate HA. *num_attempts* must be an integer from 1 through 5. Default is 2.

- **timeout** *seconds* - Configures the retransmission timeout (in seconds) of Proxy MIP control messages when failover happens. *seconds* must be an integer from 1 through 50. Default is 2

max-retransmissions *number*

Default: 5
Configures the maximum number re-try attempts that the FA service is allowed to make when sending Proxy Mobile IP Registration Requests to the HA.
number is the maximum number of retries and can be configured to an integer from 1 through 4294967295.

renew-percent-time *renew-time*

Default: 75
Configures the amount of time that must pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request.
renew-time is entered as a percentage of the advertisement registration lifetime configured for the FA service. (Refer to the **advertise** command in this chapter). *renew-time* can be configured to an integer from 1 through 100.
The following equation can be used to calculate *renew-time*:
renew-time = (duration / lifetime) * 100
duration = The desired amount of time that can pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request
lifetime = The advertisement registration lifetime configured for the FA service.
duration / lifetime

retransmission-timeout *time*

Default: 3
Configures the maximum amount of time allowed by the FA for a response from the HA before re-sending a Proxy Mobile IP Registration Request message.
time is measured in seconds and can be configured to an integer from 1 through 100.

Usage

The **proxy-mip** command and its keywords configure the FA services support for Proxy Mobile IP.
When enabled though the session license and feature use key, the system supports Proxy Mobile IP to provide a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP.
In addition to the parameters configured via this command, the HA-FA SPI(s) must also be modified to support Proxy Mobile IP. Refer to the **fa-ha-spi** command for more information.

Example

The following command configures the FA service to wait up to *5* seconds for an HA to respond prior to re-sending an a Mobile IP Registration Request message:

```
proxy-mip retransmission-timeout 5
```

If the advertisement registration lifetime configured for the FA service is 900 seconds and you want the system to send a Proxy Mobile IP Registration Renewal Request message after 500 seconds, then the following command must be executed:

```
proxy-mip renew-percent-time 50
```

Note that 50 = (450 / 900) 100.

reg-timeout

Configures the FA registration reply timeout.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

reg-timeout *time*

time

Default: 45
time is measured in seconds and can be configured to an integer from 1 through 65535.

Usage

Configure the amount of time that the FA service will wait for a Registration Reply from an HA before the call is rejected with a reply code of 78H (registration Timeout).

Example

The following command configures a registration timeout of 10.

```
reg-timeout 10
```

reverse-tunnel

Enables the use of reverse tunneling for a Mobile IP (MIP) sessions when requested by the mobile node (MN).

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

[no] reverse-tunnel

no

Indicates the reverse tunnel option is to be disabled. When omitted, the reverse tunnel option is enabled.

Usage

Reverse tunneling involves tunneling datagrams originated by the MN to the HA via the FA service.
When an MN arrives at a foreign network, it listens for agent advertisements and selects an FA that supports reverse tunnels. The MN requests this service when it registers through the selected FA. At this time, the MN may also specify a delivery technique such as Direct or the Encapsulating Delivery Style.
The advantages of using reverse-tunneling:

- All datagrams from the mobile node seem to originate from its home network
- The FA can keep track of the HA that the mobile node is registered to and tunnel all datagrams from the mobile node to its HA

Use the **no** option of this command to disable reverse tunneling. If reverse tunneling is disabled, and the mobile node does not request it, then triangular routing is used.
The system defaults to reverse tunnel enabled.

Important: If reverse tunneling is disabled on the system and an MN requests it, the call will be rejected with a reply code of 74H (reverse-tunneling unavailable).

Example

The following command disables reverse-tunneling support for the FA service:

```
no reverse-tunnel
```

revocation

Enables the MIP revocation feature and configures revocation parameters.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

revocation { enable | max-retransmission *number* **| negotiate-i-bit | retransmission-timeout** *secs* **| trigger internal-failure }**

no revocation enable | trigger internal-failure | negotiate-i-bit

no

Completely disables registration revocation on the FA.
Disables sending revocation messages to the HA when a session is affected by an internal task failure.

enable

Enables the MIP registration revocation feature on the FA. When enabled, if revocation is negotiated with an HA, and a MIP binding is terminated, the FA can send a Revocation message to the HA. This feature is disabled by default.

max-retransmission *number*

Default: 3
Specifies the maximum number of retransmissions of a Revocation message before the revocation fails. *number* must be an integer from 0 through 10.

negotiate-i-bit

Default: disabled
Enables the FA to negotiate the i-bit via PRQ/RRP messages and processes the i-bit revocation messages.

retransmission-timeout *secs*

Default: 3
Specifies the number of seconds to wait for a Revocation Acknowledgement from the HA before retransmitting the Revocation message. *secs* must be an integer from 1 through 10.

trigger internal-failure

Default: disabled
Enable sending a revocation message to the HA for all sessions that are affected by an internal task failure.

Usage

Use this command to enable or disable the MIP revocation feature on the FA or to change settings for this feature. Both the HA and the FA must have Registration Revocation enabled and FA/HA authorization must be in use for Registration Revocation to be negotiated successfully.

Example

The following command enables Registration Revocation on the FA:

```
revocation enable
```

The following command sets the maximum number of retries for a Revocation message to 6:

```
revocation max-retransmission 6
```

The following command sets the timeout between retransmissions to 10:

```
revocation retransmission-timeout 10
```

threshold reg-reply-error

Set an alarm or alert based on the number of registration reply errors per FA service.

Platform

ASR 5000

Product

PDSN

ASN-GW

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FA Service Configuration

configure > context *context_name* **> fa-service** *service_name*

Syntax

threshold reg-reply-error *high_thresh* **[clear** *low_thresh* **]**

no threshold reg-reply-error

no

Deletes the alert or alarm.

high_thresh

Default: 0
The high threshold number of registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* can be an integer from 0 through 100000.

Important: You must enter a value between 1 and 100000 to trigger an alert/alarm.

clear *low_thresh*

Default:0
The low threshold number of registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* can be an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Important: You must enter a value between 1 and 100000 to trigger an alert/alarm.

Usage

Use this command to set an alert or an alarm when the number of registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- **Enter condition**: Actual number of registration reply errors > High Threshold
- **Clear condition**: Actual number of registration reply errors £ Low Threshold

Example

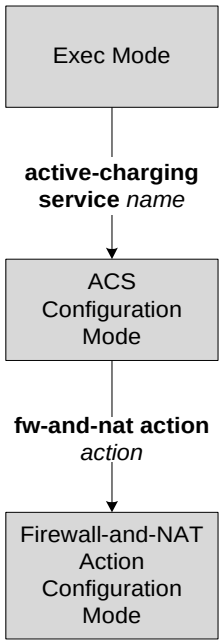
The following command configures a registration reply error threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold reg-reply-error 1000 clear 500
```

Chapter 118
Firewall-and-NAT Action Configuration Mode Commands

The Firewall-and-NAT Action Configuration Mode enables configuring Stateful Firewall (FW) and Network Address Translation (NAT) actions.

Important: This configuration mode is only available in release 11.0 and later releases. This configuration mode must be used to configure Action-based Stateful Firewall and NAT features.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

flow check-point

This command checkpoints all the flows matching the Firewall-and NAT action.

Platform

ASR 5000

Product

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Action Configuration

active-charging service *service_name* **> fw-and-nat action** *action_name*

Syntax

flow check-point [data-usage *data_usage* **[and | or] | time-duration** *duration* **[and | or]]**

{ default | no } flow check-point

default

Configures the default Firewall action.

no

Deletes the Firewall action configuration.

data-usage *data_usage*

Specifies the data usage in bytes.
data_usage must be an integer from 1 through 4294967295.
The maximum limit for data-usage is 4 GB.

time-duration *duration*

Specifies the time duration in seconds.
duration must be an integer from 1 through 86400.
The maximum limit for time-duration is 24 hours.

and | or

This option allows to configure only **data-usage** or **time-duration**, or a combination of **data-usage** and **time-duration**.

Usage

Use this command to enable/disable the check-pointing of NATed flows and control the type of flows need to be check pointed based on specified criteria. Check pointing is done only for TCP and UDP flows.

Example

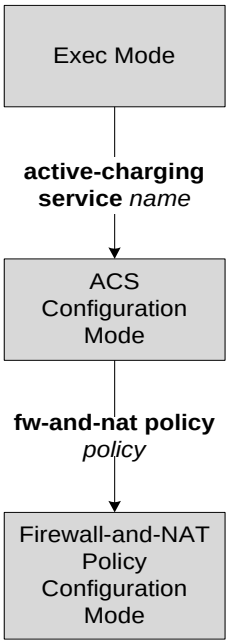
The following command configures Stateful Firewall to drop packets with data-usage *5000*:

```
flow check-point data-usage 5000
```

Chapter 119
Firewall-and-NAT Policy Configuration Mode Commands

The Firewall-and-NAT Policy Configuration Mode enables configuring Stateful Firewall (FW) and Network Address Translation (NAT) policies.

Important: This configuration mode is only available in 8.1, 9.0, and later releases. This configuration mode must be used to configure Policy-based Stateful Firewall and NAT features.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-rule

This command creates and configures an access rule.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

access-rule { no-ruledef-matches { downlink | uplink } action { deny [charging-action *charging_action* **] | permit [bypass-nat | nat-realm** *nat_realm* **[fw-and-nat-action** *name* **]] } | priority** *priority* **{ [dynamic-only | static-and-dynamic] access-ruledef** *ruledef_name* **{ deny [charging-action** *charging_action* **] | permit [[bypass-nat | nat-realm** *nat_realm* **[fw-and-nat-action** *name* **]] | trigger open-port { port_number | range** *start_port* **to** *end_port* **} direction { both | reverse | same }] } } }**

default access-rule no-ruledef-matches { downlink | uplink } action

no access-rule priority *priority*

default

Configures the default setting.
Default: Uplink direction: **permit**; Downlink direction: **deny**

no

Removes the access rule specified by the priority.

no-ruledef-matches

Configures action on packets with no ruledef match.

downlink

Specifies to act on downlink packets with no ruledef match.

uplink

Specifies to act on uplink packets with no ruledef match.

action

Specifies action to take on downlink/uplink packets with no ruledef match.

deny

Specifies to deny packets.

permit

Specifies to permit packets and allow the creation of data flows.

charging-action *charging_action*

Specifies the charging action. Optionally, a charging action can be configured for deny action. If a packet matches the deny rule, action is taken as configured in the charging action. If a charging action is specified, the content-ID and billing-action configured in the charging action are used. Also, the flow may be terminated (instead of just discarding the packet), if so configured in the specified charging action.
charging_action must be an alphanumeric string of 1 through 63 characters.

bypass-nat

Important: In 9.0 and later releases, this keyword is NAT license dependent.

Specifies to bypass NAT.

nat-realm *nat_realm*

Important: In 9.0 and later releases, this keyword is NAT license dependent.

Specifies the NAT realm to be used to perform NAT on subscriber packets matching the access ruledef. If the NAT realm is not specified, NAT will be bypassed. That is, NAT will not be performed on subscriber packets that are matching a ruledef with no NAT realm name configured in it.
nat_realm must be an alphanumeric string of 1 through 31 characters.

priority *priority*

Specifies priority of an access ruledef in the Firewall-and-NAT policy.
priority must be an integer from 1 through 65535 that is unique for each access ruledef in the Firewall-and-NAT policy.

[dynamic-only | static-and-dynamic] access-ruledef *ruledef_name*

Specifies the access ruledef name. Optionally, the ruledef type can also be specified.

- **dynamic-only**: Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is disabled by default.
- **static-and-dynamic**: Static and Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is enabled by default.
- **access-ruledef** *ruledef_name*: Specifies the access ruledef name. *ruledef_name* must be an alphanumeric string of 1 through 63 characters.

trigger open-port { *port_number* | range *start_port* to *end_port* } direction { both | reverse | same }

Important: In 9.0 and later releases, this keyword is Stateful Firewall license dependent.

Optionally a port trigger can be specified to be used for this rule to limit the range of auxiliary data connections (a single or range of port numbers) for protocols having control and data connections (like FTP). The trigger port will be the destination port of an association which matches a rule.

- *port_number*: Specifies the auxiliary port number to open for traffic, and must be an integer from 1 through 65535.
- **range** *start_port* **to** *end_port*: Specifies the range of port numbers to open for subscriber traffic.
  - *start_port* must be an integer from 1 through 65535.
  - *end_port* must be an integer from 1 through 65535, and must be greater than *start_port*.
- **direction { both | reverse | same }**: Specifies the direction from which the auxiliary connection is initiated. This direction can be same as the direction of control connection, or the reverse of the control connection direction, or in both directions.
  - *both*: Provides the trigger to open port for traffic in either direction of the control connection.
  - *reverse*: Provides the trigger to open port for traffic in the reverse direction of the control connection (from where the connection is initiated).
  - *same*: Provides the trigger to open port for traffic in the same direction of the control connection (from where the connection is initiated).

Usage

Use this command to add access ruledefs to the Firewall-and-NAT policy and configure the priority and actions for rule matching.

The policy specifies the rules to be applied on calls. The ruledefs in the policy have priorities, based on which priority matching is done.

For Stateful Firewall, the port trigger configuration is optional, and can be configured only if a rule action is permit. When a rule is matched and the rule action is permit, if the trigger is configured, the appropriate check is made. The trigger port will be the destination port of an association that matches the rule. Multiple triggers can be defined for the same port number to permit multiple auxiliary ports for subscriber traffic.

When a rule is matched and if the rule action is deny, the action taken depends on what is configured in the specified charging action. If the flow exists, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as Event Data Record (EDR) enabled, an EDR is generated.
- If the content ID is configured, UDR information is updated.
- If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Important: For Stateful Firewall, only the terminate-flow action is applicable if configured in the specified charging action.

Allowing/dropping of packets is determined in the following sequence:

- Check is done to see if the packet matches any pinholes. If yes, no rule matching is done and the packet is allowed.
- Access ruledef matching is done. If a rule matches, the packet is allowed or dropped as per the **access-rule priority** configuration.
- If no access ruledef matches, the packet is allowed or dropped as per the **access-rule no-ruledef-matches** configuration.

For a packet dropped due to access ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command in the ACS Rulebase Configuration Mode.
The GGSN can dynamically activate or deactivate dynamic ruledefs for a subscriber based on the rule name received from a policy server. At rule match, if a rule in the policy is a dynamic rule, and if the rule is enabled for the particular subscriber, rule matching is done for the rule. If the rule is disabled for the particular subscriber, rule matching is not done for the rule.

Example

For Stateful Firewall, the following command assigns a priority of *10* to the access ruledef *test_rule*, adds it to the policy, and permits port trigger to be used for the rule to open ports in the range of *1000* to *2000* in either direction of the control connection:

```
access-rule priority 1 access-ruledef test_rule permit trigger open-port
range 1000 to 2000 direction both
```

end

Exits the current configuration mode and returns to the Exec mode.

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

firewall dos-protection

This command configures Stateful Firewall protection for subscribers from Denial-of-Service (DoS) attacks.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

[no] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce | ip-unaligned-timestamp | ipv6-dst-options [invalid-options | unknown-options] | ipv6-extension-hdrs [limit *extension_limit* **] | ipv6-frag-hdr nested-fragmentation | ipv6-hop-by-hop [invalid-options | jumbo-payload | router-alert | unknown-options] | mime-flood | port-scan | source-router | tcp-window-containment | teardrop | winnuke }**

default firewall dos-protection

no

Disables Stateful Firewall protection for subscribers against the specified Denial of Service (DoS) attack(s).

default

Disables Stateful Firewall protection for subscribers against all DoS attacks.

all

Enables Stateful Firewall protection for subscribers against all DoS attacks supported by the Stateful Firewall service.
The IPv6 extension headers will be enabled only if the **firewall validate-ip-options** command is enabled in the Firewall-and-NAT policy configuration.

flooding { icmp | tcp-syn | udp }

Enables protection against the specified flooding attack:

- **icmp**: Enables protection against ICMP Flood attack.
- **tcp-syn**: Enables protection against TCP Syn Flood attack.
- **udp**: Enables protection against UDP Flood attack.

ftp-bounce

Enables protection against FTP Bounce attacks.

ip-unaligned-timestamp

Enables protection against IP Unaligned Timestamp attacks.

ipv6-dst-options [invalid-options | unknown-options]

Drops IPv6 packets containing the IPv6 destination options header.
The following options are specified in the Destination Options extension header:

- The Tunnel Encapsulation Limit (option type: 0x04) is a destination option defined in RFC 2473.
- The Home Address option (option type: 0xC9) is part of Mobile IP processing defined in RFC 3775. This option is only valid as a Destination Option.
- The NSAP Address option (option type: 0xC3) is assigned as a Destination Option by RFC 1888 and deprecated (reclassified as historic) by RFC 4048.
- **invalid-options**: Drops IPv6 packets containing invalid IPv6 destination options.

  The following values are invalid in a Destination Options extension header option type field. Packets with these options in a Destination Options header will be dropped.

  - Value 0xC2, Jumbo Payload
  - Value 0x05, Router Alert
  - Value 0x06, Quick start
  - Value 0x07, CALIPSO
- **unknown-options**: Drops IPv6 packets containing unknown IPv6 destination options.

ipv6-extension-hdrs [limit *extension_limit* **]**

Default: 8
Limits the number of IPv6 extension headers in an IPv6 packet. An IPv6 packet can contain zero or more extension headers.
Firewall will not fully parse packets with unknown extension headers as the extension header format is unspecified. Under such cases, the transport protocol will be considered as **unknown**. Packets with invalid length field in the extension headers and packets with next header 0x01 (ICMPv4) will be dropped. IPv6 uses ICMPv6 of type 0x3A.
extension_limit must be an integer from 0 through 4294967295.

ipv6-frag-hdr nested-fragmentation

Drops IPv6 packets containing nested fragmentation (reassembled packets containing a fragment header). IPv6 fragmentation is done only by the source node. An IPv6 fragment packet must have only one fragment header. Firewall will drop packets with more than one fragment header. The Reassembled packet containing a fragment header will be dropped by Firewall. As per RFC 2460, the fragment length (except for last fragment) must be a multiple of 8 octets. If not, such fragments are dropped.

ipv6-hop-by-hop [invalid-options | jumbo-payload | router-alert | unknown-options]

Drops IPv6 packets containing the hop-by-hop extension header.

The Hop-by-Hop Options extension header, if present, must be the first header to follow the IPv6 main header. This is indicated by a value of 0x00 in the next header field in the main header. The length must be expressed as a multiple of 8 octets (excluding the first 8 octets). If not, such packets will be dropped.

- **invalid-options**: Drops IPv6 packets containing invalid IPv6 hop-by-hop options.

  The following values are invalid in a Hop-by-Hop extension header option type field. Packets with these options in a hop-by-hop header will be dropped.

  - Value 0x04, Tunnel Encapsulation limit
  - Value 0xC9, Home Address Destination option
  - Value 0xC3, NSAP Address option

  The options are present in TLV (Type Length Value) format. If the length specified is invalid, then such packets will be dropped.

- **jumbo-payload**: Drops IPv6 packets with jumbo payload hop-by-hop options.

  The Jumbo Payload option (RFC 2675) has the option type value 0xC2 and is only valid as a Hop-by-Hop option. This option allows the creation of very large IP packets (packets larger than 65K bytes). If this option is allowed, the following validity checks will be done.

  - The IP payload length must be 0x00 when the Jumbo Payload option is present.
  - The Jumbo Payload option must be used only when the length is greater than 65,535; the two most significant bytes of the Jumbo length cannot be 0x00.
  - The Jumbo Payload option cannot be used in conjunction with a Fragmentation extension header.

  If any of the above checks fail, then the IPv6 packet will be dropped. The Option Type field must have 4n+2 alignment.

- **router-alert**: Drops IPv6 packets with router alert hop-by-hop options.

  The Router Alert (RFC 2711) option is used to signal the routers that a closer inspection of the packet is warranted. Denial of service (DoS) attacks can occur if an attacker sends large number of packets with this option. Only one option of this type must be present, regardless of value, per Hop-by-Hop header with 2n + 0 alignment.

- **unknown-options**: Drops IPv6 packets containing unknown IPv6 hop-by-hop options.

---

mime-flood

Enables protection against HTTP Multiple Internet Mail Extension (MIME) header flooding attacks.

---

port-scan

Enables protection against Port Scan attacks.

---

tcp-window-containment

Enables protection against TCP sequence number out-of-range attacks.

---

source-router

Enables protection against IPv4/IPv6 Source Route IP Option attacks.
This command can be used to filter IPv4/IPv6 packets containing Routing header of Type 0 (source routing). In this release, only type 0 filtering is supported.

teardrop

Enables protection against IPv4/IPv6 Teardrop attacks.

winnuke

Enables protection against WIN-NUKE attacks.

Usage

Use this command to enable Stateful Firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

Important: DoS attacks are detected only in the downlink direction.

Example

The following command enables protection from all supported DoS attacks:

```
firewall dos-protection all
```

firewall flooding

This command configures Stateful Firewall protection from Packet Flooding attacks.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

`active-charging service` *`service_name`* **`> fw-and-nat policy`** *`policy_name`*

Syntax

`firewall flooding { protocol { icmp | tcp-syn | udp } packet limit` *`packets`* **`| sampling-interval`** *`interval`* **`}`**

`default firewall flooding { protocol { icmp | tcp-syn | udp } packet limit | sampling-interval }`

`default`

Configures the default setting for the specified configuration.

`protocol { icmp | tcp-syn | udp }`

Specifies the transport protocol:

- **`icmp`**: Configuration for ICMP protocol.
- **`tcp-syn`**: Configuration for TCP-SYN packet limit.
- **`udp`**: Configuration for UDP protocol.

`packet limit` *`packets`*

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval.
`packets` must be an integer from 1 through 4294967295.
Default: 1000 packets per sampling interval for all protocols.

`sampling-interval` *`interval`*

Specifies the flooding sampling interval, in seconds.
`interval` must be an integer from 1 through 60.
Default: 1 second
The maximum sampling-interval configurable is 60 seconds.

Usage

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.

Example

The following command ensures a subscriber will not receive more than *1000* ICMP packets per sampling interval:

```
firewall flooding protocol icmp packet limit 1000
```

The following command ensures a subscriber will not receive more than *1000* UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IP addresses, those packets will be limited to 1000 packets per sampling interval. This way only “suspected” malicious packets are limited and not “legitimate” packets.

```
firewall flooding protocol udp packet limit 1000
```

The following command ensures a subscriber will not receive more than *1000* TCP-Syn packets per sampling interval:

```
firewall flooding protocol tcp-syn packet limit 1000
```

The following command specifies a flooding sampling interval of *1* second:

```
firewall flooding sampling-interval 1
```

firewall icmp-checksum-error

This command configures Stateful Firewall action on packets with ICMP/ICMPv6 Checksum errors.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall icmp-checksum-error { drop | permit }

default firewall icmp-checksum-error

default

Configures the default setting.
Default: **drop**

drop

Drops packets with ICMP/ICMPv6 Checksum errors.

permit

Permits packets with ICMP/ICMPv6 Checksum errors.

Usage

Use this command to configure Stateful Firewall action on packets with ICMP/ICMPv6 Checksum errors. This command also applies to ICMP/ICMPv6 packets with Inner IP Checksum error.
For NAT-only calls, packets with ICMP/ICMPv6 errors are dropped, and other packets are allowed.

Example

The following command configures Stateful Firewall to drop packets with ICMP/ICMPv6 Checksum errors:

```
firewall icmp-checksum-error drop
```

firewall icmp-destination-unreachable-message-threshold

This command configures a threshold on the number of ICMP/ICMPv6 error messages sent by the subscriber for a particular data flow.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall icmp-destination-unreachable-message-threshold *messages* **then-block-server**

{ default | no } firewall icmp-destination-unreachable-message-threshold

default

Configures the default setting.
Default: No limit

no

Removes the previous configuration.

messages

Specifies the threshold on the number of ICMP/ICMPv6 error messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of ICMP/ICMPv6 error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked.
Some servers that run QChat ignore the ICMP/ICMPv6 error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

Example

The following command configures a threshold of *10* ICMP/ICMPv6 error messages:

```
firewall icmp-destination-unreachable-message-threshold 10 then-block-
server
```

firewall icmp-echo-id-zero

This command configures Stateful Firewall action on echo packets with ICMP/ICMPv6 ID zero.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall icmp-echo-id-zero { drop | permit }

default firewall icmp-echo-id-zero

default

Configures the default setting.
Default: **permit**

drop

Drops packets with ICMP/ICMPv6 ID zero.

permit

Permits packets with ICMP/ICMPv6 ID zero.

Usage

Use this command to configure Stateful Firewall action on echo packets with ICMP/ICMPv6 ID zero.

Example

The following command configures Stateful Firewall to drop packets with ICMP/ICMPv6 ID zero:

```
firewall icmp-echo-id-zero drop
```

firewall icmp-fsm

This command enables/disables Stateful Firewall's ICMP/ICMPv6 Finite State Machine (FSM).

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

[default | no] firewall icmp-fsm

default

Configures the default setting.
Default: Enabled. Same as **firewall icmp-fsm**.

no

Disables Stateful Firewall ICMP/ICMPv6 FSM checks.

Usage

Use this command to enable/disable Stateful Firewall ICMP/ICMPv6 FSM checks. When Stateful Firewall and ICMP/ICMPv6 FSM are enabled, ICMP/ICMPv6 reply messages for which there is no saved ICMP/ICMPv6 request message are discarded. ICMP/ICMPv6 error messages (i.e., messages containing an embedded message) for which there is no saved flow for the embedded message are discarded.

Example

The following command disables Stateful Firewall's ICMP/ICMPv6 FSM checks:

```
no firewall icmp-fsm
```

firewall ip-reassembly-failure

This command configures Stateful Firewall action on IPv4/IPv6 packets involved in IP Reassembly Failure scenarios.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall ip-reassembly-failure { drop | permit }

default firewall ip-reassembly-failure

default

Configures the default setting.
Default: **permit**

drop

Drops IPv4/IPv6 packets involved in IP reassembly failure scenarios.

permit

Permits IPv4/IPv6 packets involved in IP reassembly failure scenarios.

Usage

Use this command to configure Stateful Firewall action on IPv4/IPv6 packets involved in IP reassembly failure scenarios such as missing fragments, overlapping offset, etc.
For NAT-only calls, packets involved in IP reassembly failure scenarios are dropped.

Example

The following command specifies to drop IPv4/IPv6 packets involved in IP reassembly failure scenarios:

```
firewall ip-reassembly-failure drop
```

firewall malformed-packets

This command configures Stateful Firewall action on malformed packets. In release 12.0, this command supports ICMPv6 and IPv6 packets.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall malformed-packets { drop | permit }

default firewall malformed-packets

default

Configures the default setting.
Default: **permit**

drop

Drops malformed packets.

permit

Permits malformed packets.

Usage

Use this command to configure Stateful Firewall action on malformed packets.
For NAT-only calls, malformed packets are always permitted.

Example

The following command specifies Stateful Firewall to drop malformed packets:

```
firewall malformed-packets drop
```

firewall max-ip-packet-size

This command configures the maximum IPv4/IPv6 packet size (after IP reassembly) allowed over Stateful Firewall.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

`active-charging service` *`service_name`* **`> fw-and-nat policy`** *`policy_name`*

Syntax

`firewall max-ip-packet-size` *`packet_size`* **`protocol { icmp | non-icmp }`**

`default firewall max-ip-packet-size protocol { icmp | non-icmp }`

`default`

Configures the default setting.
Default: 65535 bytes (for both ICMP/ICMPv6 and non-ICMP/ICMPv6)

`packet_size`

Specifies the maximum packet size allowed by firewall. Any IPv6 packet with payload size greater than the configured value will be dropped.
`packet_size` must be an integer from 30000 through 65535.

`protocol { icmp | non-icmp }`

Specifies the transport protocol:

- **`icmp`**: Configuration for ICMP/ICMPv6 protocol.
- **`non-icmp`**: Configuration for protocols other than ICMP/ICMPv6.

Usage

Use this command to configure the maximum IPv4/IPv6 packet size allowed for ICMP/ICMPv6 and non-ICMP/ICMPv6 packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt” and “Ping-Of-Death” attacks.

Example

The following command allows a maximum packet size of *`60000`* for ICMP/ICMPv6 protocol:

```
firewall max-ip-packet-size 60000 protocol icmp
```

firewall mime-flood

This command configures Stateful Firewall protection from MIME Flood attacks.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall mime-flood { http-headers-limit *max_limit* **| max-http-header-field-size** *max_size* **}**

default firewall mime-flood { http-headers-limit | max-http-header-field-size }

default

Configures the default setting for the specified parameter.

http-headers-limit *max_limit*

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.
max_limit must be an integer from 1 through 256.
Default: 16

max-http-header-field-size *max_size*

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.
max_size must be an integer from 1 through 8192.
Default: 4096 bytes

Usage

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent MIME flooding attacks.
This command is only effective if Stateful Firewall DoS protection for MIME flood attacks has been enabled using the **firewall dos-protection mime-flood** command, and the **route** command has been configured to send HTTP packets to the HTTP analyzer.

Example

The following command sets the maximum number of headers allowed in an HTTP packet to *100*:

```
firewall mime-flood http-headers-limit 100
```

The following command sets the maximum header field size allowed in the HTTP header to *1000* bytes:

```
firewall mime-flood max-http-header-field-size 1000
```

firewall policy

This command enables/disables Stateful Firewall support in a Firewall-and-NAT policy.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

In 11.0 and earlier releases:

firewall policy firewall-required

no firewall policy

In 12.0 and later releases:

firewall policy { ipv4-and-ipv6 | ipv4-only | ipv6-only }

{ default | no } firewall policy

default

Disables IPv4 and IPv6 Stateful Firewall support in the Firewall-and-NAT policy.

no

Disables IPv4 and IPv6 Stateful Firewall support in the Firewall-and-NAT policy.

firewall-required

Enables Stateful Firewall support in the Firewall-and-NAT policy.

Important: This keyword is available only in 11.0 and earlier releases.

ipv4-and-ipv6

Enables both IPv4 and IPv6 Stateful Firewall support in the Firewall-and-NAT policy.

ipv4-only

Enables IPv4 Stateful Firewall and disables IPv6 Stateful Firewall in the Firewall-and-NAT policy.

ipv6-only

Enables IPv6 Stateful Firewall and disables IPv4 Stateful Firewall support in the Firewall-and-NAT policy.

Usage

Use this command to enable/disable IPv4 and/or IPv6 Stateful Firewall support for all subscribers using a Firewall-and-NAT policy.

Example

The following command enables IPv4 and IPv6 Stateful Firewall support in a Firewall-and-NAT policy:

```
firewall policy ipv4-and-ipv6
```

The following command disables Stateful Firewall support in a Firewall-and-NAT policy:

```
no firewall policy
```

firewall tcp-checksum-error

This command configures Stateful Firewall action on packets with TCP Checksum error.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall tcp-checksum-error { drop | permit }

default firewall tcp-checksum-error

default

Configures the default setting.
Default: **drop**

drop

Drops packets with TCP Checksum errors.

permit

Permits packets with TCP Checksum errors.

Usage

Use this command to configure Stateful Firewall action on packets with TCP Checksum error.
For NAT-only calls, packets with TCP Checksum errors are permitted.

Example

The following command specifies Stateful Firewall to drop packets with TCP Checksum errors:

```
firewall tcp-checksum-error drop
```

firewall tcp-first-packet-non-syn

This command configures Stateful Firewall action on TCP flows starting with a non-SYN packet.

Important: In release 9.0, this command is deprecated. This configuration is available as the **`firewall tcp-fsm [ first-packet-non-syn { drop | permit | send-reset } ]`** command.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

`active-charging service` *`service_name`* **`> fw-and-nat policy`** *`policy_name`*

Syntax

`firewall tcp-first-packet-non-syn { drop | reset }`

`default firewall tcp-first-packet-non-syn`

`default`

Configures the default setting.
Default: **`drop`**

`drop`

Drops the non-SYN packet.

`reset`

Sends reset.

Usage

Use this command to configure Stateful Firewall action on TCP flows starting with a non-SYN packet.

Example

For flows starting with a non-SYN packet, the following command specifies Stateful Firewall to drop the non-SYN packet:

```
firewall tcp-first-packet-non-syn drop
```

firewall tcp-fsm

This command enables/disables Stateful Firewall's TCP Finite State Machine (FSM).

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall tcp-fsm [first-packet-non-syn { drop | permit | send-reset }]

{ default | no } firewall tcp-fsm

default

Configures the default setting.
Default: **drop**

no

Disables Stateful Firewall's TCP FSM.

first-packet-non-syn { drop | permit | send-reset }

Specifies Stateful Firewall action on TCP flows starting with a non-SYN packet:

- **drop**: Specifies to drop the packet.
- **permit**: Specifies to permit the packet.
- **send-reset**: Specifies to drop the packet and send TCP RST.

Default: **drop**

Usage

Use this command to enable/disable Stateful Firewall's TCP FSM checks. When Stateful Firewall and TCP FSM are enabled, state of the TCP session is checked to decide whether to forward TCP packets.

Example

The following command enables TCP FSM, and configures action to take on TCP flows starting with a non-SYN packet to drop the packet:

```
firewall tcp-fsm first-packet-non-syn drop
```

firewall tcp-idle-timeout-action

This command configures action on TCP idle timeout expiry.

Important: In release 9.0 and later this command is also available to NAT.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

`active-charging service` *`service_name`* **`> fw-and-nat policy`** *`policy_name`*

Syntax

`firewall tcp-idle-timeout-action { drop | reset }`

`{ default | no } firewall tcp-idle-timeout-action`

`default`

Configures the default setting.
Default: **`reset`**

`no`

Configures the TCP idle timeout expiry action to reset.

`drop`

Drops the session on TCP idle timeout expiry.

`reset`

Resends TCP RST on TCP idle timeout expiry. When configured to reset, the session is dropped, and the system can avoid packets arriving for the idle flow from getting dropped.

Usage

Use this command to configure action to take on TCP idle timeout expiry.

Example

The following command configures action to take on TCP idle timeout expiry to drop:

```
firewall tcp-idle-timeout-action drop
```

firewall tcp-options-error

This command configures Stateful Firewall action on packets with TCP Option errors.

Platform

ASR 5000

Product

PSF

Privileges

Security Administrator, Administrator

Mode

Syntax

firewall tcp-options-error { drop | permit }

default firewall tcp-options-error

default

Configures the default setting.
Default: **permit**

drop

Drops packets with TCP Option errors.

permit

Permits packets with TCP Option errors.

Usage

Use this command to configure Stateful Firewall action on packets with TCP Option errors.

Example

The following command configures Stateful Firewall to drop packets with TCP Option errors:

```
firewall tcp-options-error drop
```

firewall tcp-partial-connection-timeout

This command configures action on idle timeout for partially open TCP connections.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall tcp-partial-connection-timeout *timeout*

{ default | no } firewall tcp-partial-connection-timeout

default

Configures the default setting.

no

Disables the idle timeout for partially open TCP connections.

timeout

Specifies the timeout in seconds.
timeout must be an integer from 0 through 86400.
Default: 30 seconds

Usage

Use this command to configure idle timeout for TCP connections that are yet to be established (partially open) in the case of Firewall enabled calls.

Example

The following command sets the idle timeout setting to *30* seconds:

```
firewall tcp-partial-connection-timeout 30
```

firewall tcp-reset-message-threshold

This command configures a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After this threshold is reached, further downlink traffic to the subscriber on the unwanted flow is blocked.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall tcp-reset-message-threshold *messages* **then-block-server**

{ default | no } firewall tcp-reset-message-threshold

default

Configures the default setting.
Default: Disabled

no

Disables the configuration.

messages

Specifies the threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of TCP reset messages (TCP RST+ACK) sent by the subscriber for a particular data flow. After the threshold is reached, assuming the server is not reacting properly to the reset messages further downlink traffic to the subscriber on the unwanted flow is blocked. This configuration enables QCHAT noise suppression for TCP.

Example

The following command sets the threshold on the number of TCP reset messages to *10*:

```
firewall tcp-reset-message-threshold 10 then-block-server
```

firewall tcp-syn-flood-intercept

This command configures TCP SYN intercept parameters for protection against TCP SYN flooding attacks.

Important: In release 8.0, this configuration is available in the ACS Configuration Mode. In release 8.1, for Rulebase-based Stateful Firewall configuration, this configuration is available in the ACS Rulebase Configuration Mode. In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall tcp-syn-flood-intercept { mode { none | watch [aggressive] } | watch-timeout *intercept_watch_timeout* **}**

default firewall tcp-syn-flood-intercept { mode | watch-timeout }

default

Configures the default settings for SYN Flood DoS protection.

mode { none | watch [aggressive] }

Specifies the TCP SYN flood intercept mode:

- **none**: Disables the TCP SYN Flood Intercept feature.
- **watch**: Configures TCP SYN flood intercept feature in watch mode. The Stateful Firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, the Stateful Firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive**: Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**

watch-timeout *intercept_watch_timeout*

Specifies the TCP intercept watch timeout, in seconds.
intercept_watch_timeout must be an integer from 5 through 30.
Default: 30

Usage

This TCP intercept functionality provides protection against TCP SYN Flooding attacks. This command enables and configures TCP intercept parameters to prevent TCP SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the **dos-protection** command.
The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example

The following command sets the intercept watch timeout setting to *15* seconds:

```
firewall tcp-syn-flood-intercept watch-timeout 15
```

firewall tcp-syn-with-ecn-cwr

This command configures Stateful Firewall action on TCP SYN packets with either ECN or CWR flag set.

Platform

ASR 5000

Product

PSF

Privileges

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall tcp-syn-with-ecn-cwr { drop | permit }

default firewall tcp-syn-with-ecn-cwr

default

Configures the default setting.
Default: **permit**

drop

Drops TCP SYN packets with either ECN or CWR flag set.

permit

Permits TCP SYN packets with either ECN or CWR flag set.

Usage

Use this command to configure Stateful Firewall action on receiving a TCP SYN packet with either ECN or CWR flag set.

Example

The following command configures Stateful Firewall to drop TCP SYN packets with ECN / CWR flag set:

```
firewall tcp-syn-with-ecn-cwr drop
```

firewall udp-checksum-error

This command configures Stateful Firewall action on packets with UDP Checksum error.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

firewall udp-checksum-error { drop | permit }

default firewall udp-checksum-error

default

Configures the default setting.
Default: **drop**

drop

Drops packets with UDP Checksum error.

permit

Permits packets with UDP Checksum error.

Usage

Use this command to configure Stateful Firewall action on packets with UDP Checksum error.
For NAT-only calls, packets with UDP Checksum error are permitted.

Example

The following command specifies to drop packets with UDP Checksum error:

```
firewall udp-checksum-error drop
```

firewall validate-ip-options

This command enables / disables the Stateful Firewall validation of IP options for errors.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

[default | no] firewall validate-ip-options

default

Configures the default setting.
Default: Disabled. Same as **no firewall validate-ip-options**

no

Disables validation of IP options.

Usage

Use this command to enable / disable Stateful Firewall validation of IP options. When enabled, Stateful Firewall will drop packets with IP option errors.
For NAT calls, validation of IP Options is disabled.

Example

The following command enables validation of IP options:

```
firewall validate-ip-options
```

nat binding-record

This command configures the generation of NAT Binding Records.

Platform

ASR 5000

Product

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

nat binding-record edr-format *edr_format* **[port-chunk-allocation] [port-chunk-release]**

{ default | no } nat binding-record

default

Configures the default setting.
Default: **port-chunk-release**

no

Disables generating NAT Binding Records.

edr-format *edr_format*

Specifies the Event Data Record (EDR) format name.
edr_format must be an alphanumeric string of 1 through 63 characters.

port-chunk-allocation

Specifies generating NAT Binding Records when a port-chunk is allocated.

port-chunk-release

Specifies generating NAT Binding Record when a port-chunk is released.

Usage

Use this command to configure the generation of NAT Binding Records.

Example

The following command configures an EDR format named *test123* and specifies generating NAT Binding Records when a port chunk is allocated:

```
nat binding-record edr-format test123 port-chunk-allocation
```

nat policy

This command enables/disables Network Address Translation (NAT) support in a Firewall-and-NAT policy.

Important: In release 8.3, this configuration is available in the ACS Rulebase Configuration Mode.

Platform

ASR 5000

Product

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

nat policy nat-required [default-nat-realm *nat_realm_name* **[fw-and-nat-action** *action_name* **]]**

no nat policy

no

Disables both NAT support in the Firewall-and-NAT policy.

nat-required

Enables NAT support in the Firewall-and-NAT policy.

default-nat-realm *nat_realm_name*

Specifies the default NAT realm for the Firewall-and-NAT policy.
nat_realm_name must be the name of an existing NAT realm, and must be an alphanumeric string of 1 through 31 characters.

fw-and-nat-action *action_name*

Specifies the Firewall-and-NAT action name.
action_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to enable/disable NAT support for all subscribers using a Firewall-and-NAT policy.
In release 8.1, to enable NAT support for a subscriber, Stateful Firewall must also be enabled for that subscriber. See the **firewall policy** CLI command.
Once NAT is enabled for a subscriber, the NAT IP address to be used is chosen from the NAT realms specified in the rules. See the **access-rule** CLI command.

You can enable/disable NAT at any time, however the changed NAT status will not be applied to active calls. The new NAT status will only be applied to new calls.

Example

The following command enables NAT support in a Firewall-and-NAT policy:

```
nat policy nat-required
```

The following command disables NAT support in a Firewall-and-NAT policy:

```
no nat policy
```

nat private-ip-flow-timeout

This command configures the Private IP NPU flow timeout setting.

Platform

ASR 5000

Product

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

nat private-ip-flow-timeout *timeout*

{ default | no } nat private-ip-flow-timeout

default

Configures the default setting.
Default: 180 seconds

no

Disables the Private IP NPU flow timeout configuration.
When disabled, the flow is installed at call setup and will be removed only when the subscriber disconnects.

timeout

Specifies the Private IP NPU flow timeout period in seconds.
timeout must be an integer from 180 through 86400.

Usage

Use this command to configure the Private IP NPU flow timeout setting.
For NAT-enabled calls, by default, the downlink private IP NPU flow will not be installed at call setup for a subscriber session. The flow will only be installed on demand. When there is no traffic on the private flow, the private IP flow will be removed after the configurable timeout period.

Example

The following command configures the Private IP NPU flow timeout setting to *36000* seconds:

```
nat private-ip-flow-timeout 36000
```

nat suppress-aaa-update

This command suppresses sending NAT Bind Update (NBU) to the AAA server when PPP disconnect happens.

Important: This command is customer-specific. For more information please contact your local service representative.

Platform

ASR 5000

Product

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Policy Configuration

active-charging service *service_name* **> fw-and-nat policy** *policy_name*

Syntax

nat suppress-aaa-update call-termination

default nat suppress-aaa-update

default

Configures the default setting.
Default: No suppression of AAA updates.

Usage

Use this command to suppress sending of NBU to the AAA server when PPP disconnect happens, as these NBUs would be cleared at the AAA after receiving the accounting-stop. This enables to minimize the number of messages between the chassis and AAA server. When not configured, NBU are sent to the AAA server whenever a port chunk is allocated, de-allocated, or the call is cleared (PPP disconnect).

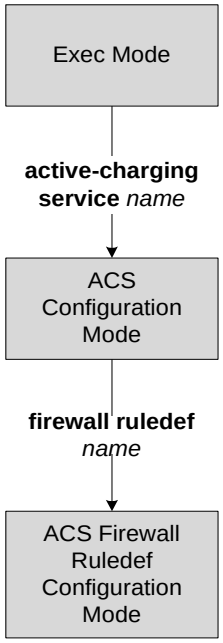
Example

The following command suppresses the sending of NBU to the AAA server:

```
nat suppress-aaa-update call-termination
```

Chapter 120
Firewall-and-NAT Access Ruledef Configuration Mode Commands

The Firewall-and-NAT Access Ruledef Configuration Mode is used to configure and manage Access rule definitions used by the Stateful Firewall (FW) and Network Address Translation (NAT) in-line services.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bearer 3gpp apn

This command configures an access ruledef to analyze user traffic based on APN bearer.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] bearer 3gpp apn [case-sensitive] *operator value*

no

Removes previously configured bearer ruledef.

case-sensitive

This keyword makes the rule case sensitive.
By default, ruledefs are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the APN name.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

value

The APN name to match in bearer flow.
value must be an alphanumeric string of 1 through 63 characters that can include punctuation characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on APN name.

Example

The following command creates an access ruledef for analyzing user traffic for an APN named *apn12*:

```
bearer 3gpp apn = apn12
```

bearer 3gpp imsi

This command configures an access ruledef to analyze user traffic based on International Mobile Station Identification (IMSI) number in bearer flow.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] bearer 3gpp imsi { *operator msid* **| { !range | range } imsi-pool** *imsi_pool* **}**

no

Removes previously configured bearer ruledef.

operator

Specifies how to logically match the MSID.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

msid

Specifies the Mobile Station Identifier.

{ !range | range } imsi-pool *imsi_pool*

{ !range | range }: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

imsi-pool *imsi_pool*: Specifies the IMSI pool name. *imsi_pool* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on IMSI number of mobile station.

Example

The following command creates an access ruledef to analyze user traffic for the IMSI number *9198838330912*:

```
bearer 3gpp imsi = 9198838330912
```

bearer username

This command configures an access ruledef to analyze user traffic based on user name of the bearer flow.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] bearer username [case-sensitive] *operator value*

no

Removes previously configured bearer ruledef.

case-sensitive

This keyword makes the rule case sensitive.
By default, ruledefs are not case sensitive.
Default: Disabled

operator

Specifies how to logically match the MSID.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

value

Specifies the user name.
value must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to specify a access ruledef to analyze user traffic based on user name of the bearer flow.

Example

The following command creates an access ruledef for analyzing user traffic for the user name *user12*:

```
bearer username = user12
```

create-log-record

This command enables/disables access ruledef logging.

Usage

Use this command to return to the parent configuration mode.

icmp any-match

This command configures an access ruledef to match any ICMPv4 traffic for the user.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] icmp any-match *operator condition*

no

Removes previously configured ICMPv4 any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access ruledef to match any ICMPv4 traffic of the user.

Example

The following command creates an access ruledef to match any non-ICMPv4 traffic of the user:

```
icmp any-match = FALSE
```

icmp code

This command configures an access ruledef to analyze user traffic based on ICMPv4 code.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

[no] ip any-match *operator condition*

no

Removes previously configured IP any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access ruledef to match any IP traffic of the user.

Example

The following command creates an access ruledef to match any non-IP traffic of the user:

```
ip any-match = FALSE
```

ip downlink

This command configures an access ruledef to analyze user traffic based on IP packet flow in downlink direction (to subscriber).

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] ip downlink *operator condition*

no

Removes previously configured IP ruledef.

operator

Specifies how to logically match the packet flow direction.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **TRUE**: Analyzed
- **FALSE**: Not analyzed

Usage

Use this command to define an access ruledef to analyze user traffic based on the IP packet flow direction as downlink.

Example

The following command creates access ruledef for analyzing user traffic using an IP packet direction to downlink (to subscriber):

```
ip downlink = TRUE
```

ip dst-address

This command configures an access ruledef to analyze user traffic based on IP destination address.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] ip dst-address { *operator* **{** *ipv4/ipv6_address* **|** *ipv4/ipv6_address/mask* **} | { !range | range } host-pool** *host_pool* **}**

---

no

Removes previously configured IP destination address ruledef.

---

operator **{** *ipv4/ipv6_address* **|** *ipv4/ipv6_address/mask* **}**

operator specifies how to logically match the IP destination address.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

ipv4/ipv6_address: Specifies the IP address of destination node for outgoing traffic.
ipv4/ipv6_address must be the IP address entered using IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.
ipv4/ipv6_address/mask: Specifies the IP address of destination node for outgoing traffic.
ipv4/ipv6_address/mask must be the IP address entered using IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool* **}**

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on the IP destination address.

Example

The following command creates IP ruledef for analyzing user traffic using an IP destination address of *10.1.1.1*:

```
ip dst-address = 10.1.1.1
```

ip protocol

This command configures an access ruledef to analyze user traffic based on the protocol being transported by IP packets.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] ip protocol { { *operator* **{** *protocol* **|** *protocol_assignment* **} } | {** *operator protocol_assignment* **} }**

---

no

Removes previously configured IP protocol address ruledef.

---

operator **{** *protocol* **|** *protocol_assignment* **}**

operator: Specifies how to logically match the IP protocol.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

protocol: Specifies the protocol by name.
protocol must be one of the following:

- ah
- esp
- gre
- icmp
- tcp
- udp

protocol_assignment: Specifies the protocol by assignment number. *protocol_assignment* must be an integer from 0 through 255 (for example, 1 for ICMP, 6 for TCP, and 17 for UDP).

---

operator protocol_assignment

operator: Specifies how to logically match the IP protocol.
operator must be one of the following:

- **<=**: Less than or equals

- **>=**: Greater than or equals

protocol_assignment: Specifies the protocol by assignment number.
protocol_assignment must be an integer from 0 through 255 (for example, 1 for ICMP, 6 for TCP, and 17 for UDP).

Usage

Use this command to specify an access ruledef to analyze user traffic based on the IP protocol.

Example

The following command creates IP ruledef for analyzing user traffic using a protocol assignment of *1*:

```
ip protocol = 1
```

ip src-address

This command configures an access ruledef to analyze user traffic based on IP source address.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] ip src-address { *operator* **{** *ipv4/ipv6_address* **|** *ipv4/ipv6_address/mask* **} | { !range | range } host-pool** *host_pool* **}**

---

no

Removes previously configured IP destination address ruledef.

---

operator **{** *ipv4/ipv6_address* **|** *ipv4/ipv6_address/mask* **}**

operator: Specifies how to logically match the IP source address.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

ipv4/ipv6_address: Specifies the IP address using IPv4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation.
ipv4/ipv6_address/mask: Specifies the IP address using IPV4 dotted-decimal notation or IPv6 colon-separated-hexadecimal notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool*: Specifies the host pool name. *host_pool* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on the IP source address.

Example

The following command creates IP ruledef for analyzing user traffic using an IP source address of *10.1.1.1*:

```
ip src-address = 10.1.1.1
```

ip uplink

This command configures an access ruledef to analyze user traffic based on IP packet flow in the uplink direction (from subscriber).

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] ip uplink *operator condition*

no

Removes previously configured IP uplink match ruledef.

operator

Specifies how to logically match the IP packet flow direction.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **TRUE**: Not analyzed
- **FALSE**: Analyzed

Usage

Use this command to define an access ruledef to analyze user traffic based on the IP packet flow direction as uplink.

Example

The following command creates access ruledef for analyzing user traffic using an IP packet direction to uplink (from subscriber):

```
ip uplink = TRUE
```

ip version

This command defines rule expressions to match version number in IP header.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] ip version = { ipv4 | ipv6 }

no

Deletes the specified rule expression.

ipv4

Specifies the rule expression for IP version 4.

ipv6

Specifies the rule expression for IP version 6.

Usage

Use this command to define rule expressions to match IPv4/IPv6 version number in IP header.

Example

The following command defines a rule expression to match user traffic for the IP version **ipv6**:

```
ip version = ipv6
```

tcp any-match

This command configures an access ruledef to match any TCP traffic for the user.

Platform

ASR 5000

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

active-charging service *service_name* **> firewall ruledef** *psf_ruledef_name*

Syntax

[no] tcp any-match *operator condition*

no

Removes previously configured TCP any-match ruledef.

operator

Specifies how to logically match the analyzed state.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to be matched for the user traffic.
condition must be one of the following:

- **FALSE**: Specified condition is FALSE.
- **TRUE**: Specified condition is TRUE.

Usage

Use this command to specify an access ruledef to match any TCP traffic of the user.

Example

The following command creates an access ruledef to match any non-TCP traffic of the user:

```
tcp any-match = FALSE
```

tcp dst-port

This command configures an access ruledef to analyze user traffic based on destination TCP port.

Platform

ASR 5000

Product

PSF

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > ACS Configuration > Firewall-and-NAT Access Ruledef Configuration

Syntax

[no] tcp dst-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

---

no

Removes the previously configured destination TCP port ruledef.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the range of destination TCP ports.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535 that is greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on destination TCP port.

Example

The following command creates an access ruledef for analyzing user traffic matching destination port for TCP as *10*:

```
tcp dst-port = 10
```

tcp either-port

This command configures an access ruledef to analyze user traffic based on either (destination or source) TCP ports.

Platform

ASR 5000

Product

PSF

---

no

Removes previously configured TCP either-port (destination or source) ruledef.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535 that is greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on either TCP port.

Example

The following command creates an access ruledef for analyzing user traffic matching destination or source port for TCP as *10*:

```
tcp either-port = 10
```

tcp src-port

This command configures an access ruledef to analyze user traffic based on source TCP port.

[no] tcp src-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map* **} }**

---

no

Removes previously configured source TCP port ruledef.

---

operator

Specifies how to logically match the port number.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Less than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 to 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535 that is greater than *start_range*.

port-map *port_map*

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on source TCP port.

Example

The following command creates an access ruledef for analyzing user traffic matching source port for TCP as *10*:

```
tcp src-port = 10
```

Specifies name of the port-map for the port range.
port_map must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify an access ruledef to analyze user traffic based on source UDP port.

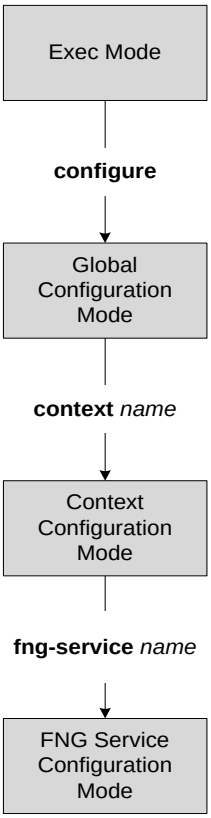
Example

The following command creates an access ruledef for analyzing user traffic matching source port for UDP as *10*:

```
udp src-port = 10
```

Chapter 121
FNG Service Configuration Mode Commands

The FNG Service Configuration Mode is used to configure the properties required for the Femto Network Gateway (FNG) to interface with the Femto Access Points (FAPs) in the network.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa aggregation

Sets the system attributes for A12 aggregation for the FNG service.

Platform

ASR 5000

Product

FNG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FNG Service Configuration

configure > context *context_name* **> fng-service** *service_name*

Syntax

aaa aggregation { interface type *a12*| **destination address** *ipv4_address* **| a12-group { context** *name* **[aaa-group** *name* **] | aaa-group** *name* **[context** *name* **] } }**

no aaa aggregation interface type *a12*

no a12 destination address *ipv4_address*

no aaa aggregation a12-group { context *name* **[aaa-group** *name* **] | aaa-group** *name* **[context** *name* **] }**

aaa aggregation interface type *a12*

Enables A12 aggregation functionality for the FNG service.

aaa aggregation interface a12 destination address *ipv4_address*

Adds a destination address for an AN-AAA server for A12 aggregation. A maximum of ten destination addresses can be configured.

aaa aggregation a12-group { context *name* **[aaa-group** *name* **] | aaa-group [context** *name* **] }**

Defines the AAA context and AAA group to be used for A12 aggregation.
If the context name and AAA group are not specified, the FNG defaults to the FNG service context and the default AAA group in that context. If the AAA group is specified but the context is not specified, the FNG uses the FNG service context and the AAA group in that context. If the AAA group is not specified and the context is specified, the FNG uses the default AAA group in that context.

no aaa aggregation interface type *a12*

Disables A12 aggregation functionality for the FNG service.

no aaa aggregation a12-destination address *ipv4_address*

Deletes the specified destination address for an AN-AAA server.

no aaa aggregation a12-group { context *name* **[aaa-group** *name* **] | aaa-group [context** *name* **] }**

Deletes the specified AAA context and AAA group to be used for A12 aggregation.

Usage

Sets the system attributes for AAA aggregation in the FNG service.

Example

The following command enables the A12 functionality for the FNG service:

```
aggregation interface type a12
```

aaa authentication

Specifies the AAA group to use for FAP authentication.

Platform

ASR 5000

Product

FNG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FNG Service Configuration

configure > context *context_name* **> fng-service** *service_name*

Syntax

aaa authentication { context-name *name* **aaa-group** *name* **| context-name** *name* **aaa-group** *name* **}**

no aaa authentication

no aaa authentication

Removes any existing authentication configuration.

context-name *name* **aaa-group** *name*

Specifies the context name and the AAA group name configured in the context for FAP authentication.
context-name *name*: Specifies the context where the AAA server group is defined as an alphanumeric string of 1 through 79 characters.
aaa-group *name*: Specifies the name of the AAA group to be used for authentication as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify that during IPSec session establishment using IKEv2 setup, the FNG will use Radius AAA for FAP authentication.

Example

Use the following to configure device authentication for an AAA group named *aaa-10* in the FNG context named *fng1*:

```
aaa authentication context-name fng1 aaa-group aaa-10
```

bind

Binds the FNG service IP address to a crypto template and specifies the maximum number of sessions the FNG service supports.

Platform

ASR 5000

Product

FNG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FNG Service Configuration

configure > context *context_name* **> fng-service** *service_name*

Syntax

bind address *ipv4_address* **{ crypto-template** *string* **}[max-sessions** *number* **]**

no bind

no bind

Removes a previously configured binding.

address *ipv4_address*

Specifies the IPv4 address of the FNG service.

crypto-template *string*

Specifies the name of the crypto template to be bound to the FNG service.
string is any value from 0 - 127 alpha and/or numeric characters.

max-sessions *number*

Specifies the maximum number of sessions to be supported by the FNG service as an integer from 0 through 1000000. Default: 1000000
If the max-sessions value is changed on an existing system, the new value takes effect immediately if it is higher than the current value. If the new value is lower than the current value, existing sessions remain established, but no new sessions are permitted until usage falls below the newly-configured value.

Usage

Binds the IP address used as the connection point for establishing the IKEv2 sessions to a crypto template. It can also define the maximum number of sessions the FNG can support.

Example

The following command binds an FNG service with an IP address of *10.2.3.4* to the crypto template named *T1* and sets the maximum number of sessions to *500000*:

```
bind address 10.2.3.4 crypto-template T1 max-sessions 500000
```

default

Sets or restores the default condition for the selected parameter.

Platform

ASR 5000

Product

FNG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FNG Service Configuration

configure > context *context_name* **> fng-service** *service_name*

Syntax

default { { aaa attribute 3gpp2-service-option } | duplicate-session-detection | ip source-violation { drop-limit | period } | setup-timeout | subscriber *name* **}**

aaa attribute 3gpp2-service-option

Sets or restores the default value of 4095.

duplicate-session-detection

Sets or restores the default option for duplicate session detection to be fapid-based.

ip source-violation (drop-limit | period }

Sets or restores the IP source violation detection defaults, as follows:
drop-limit: Sets or restores the maximum number of IP source violations within the detection period before dropping the call to the default value of 10.
period: Sets or restores the detection period for IP source violations to the default value of 120 seconds.

setup-timeout

Sets or restores the maximum time allowed for session setup to the default value of 60 seconds.

subscriber *name*

Sets or restores the name of the default subscriber.
name is a string of 1-127 characters.

username mac-address-stripping

The default behavior is to disable stripping the MAC address from the username.

Usage

Configures the default settings for a given parameter.

Example

Use the following command to set the maximum time allowed for session setup to the default value of 60 seconds:

default setup-timeout

duplicate-session-detection

Configures the FNG to detect duplicate call sessions based on Femtocell Access Point (FAP) ID and to clear old call information.

This feature is disabled by default.

Platform

ASR 5000

Product

FNG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FNG Service Configuration

configure > context *context_name* **> fng-service** *service_name*

Syntax

duplicate-session-detection { fapid-based }

no duplicate-session-detection

default duplicate-session-detection

fapid-based

Sets the FNG to detect duplicate call sessions based on the FAP ID.

no duplicate-session-detection

Disables duplicate session detection.

default duplicate-session-detection

Sets or restores the default option for duplicate session detection to be fapid-based.

Usage

By default, duplicate session detection is disabled.Use this command to enable this feature. It applies only to calls established after the feature has been enabled.
The following command enables duplicate session detection based on FAP ID:

```
duplicate-session-detection fapid-based
```

ip source-violation

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.

Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Platform

ASR 5000

Product

FNG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FNG Service Configuration

configure > context *context_name* **> fng-service** *service_name*

Syntax

ip source-violation { clear-on-valid-packet | drop-limit *num* **| period** *secs* **}**

no ip source-violation clear-on-valid-packet

clear-on-valid-packet

Configures the service to reset the drop-limit counters upon receipt of a properly addressed packet. Default: disabled

drop-limit *num*

Sets the maximum number of allowed IP source violations within the detection period before dropping a call as an integer from 1 through 1000000. Default: 10

period *secs*

Sets the detection period (in seconds) for IP source violations as an integer from 1 through 1000000. Default: 120

Usage

This function allows the operator to configure the network to prevent problems such as when a user gets handed back and forth between two gateways a number of times during a handoff scenario.
When a subscriber packet is received with a source IP address violation, the system increments the IP source violation drop-limit counter and starts the timer for the IP source violation period. Every subsequent packet received with a bad source address during the IP source violation period causes the drop-limit counter to increment.
For example, if the drop-limit is set to 10, after 10 source violations, the call is dropped. The detection period timer continues to count throughout this process.

Example

The following command sets the drop limit to *15* and leaves the other values at their default values:

```
ip source-violation drop-limit 15
```

setup-timeout

Specifies the maximum time allowed to set up a session in seconds.

Platform

ASR 5000

Product

FNG

Privilege

Security-Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FNG Service Configuration

configure > context *context_name* **> fng-service** *service_name*

Syntax

setup-timeout *integer*

default setup-timeout

setup-timeout *integer*

Sets the session setup timer (in seconds) as an integer from 2 through 300. Default: 60

default

Sets or restores the default session setup timer value to 60 seconds.

Usage

The FNG clears both the user session and tunnels if a call does not initiate successfully before the session setup timer expires.

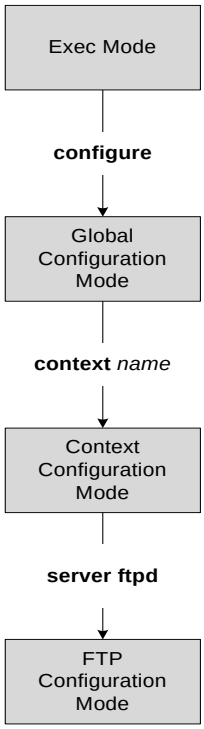
Example

The following command sets the session setup timeout value to the default value of 60 seconds:

```
default setup-timeout
```

Chapter 122
FTP Configuration Mode Commands

The FTP Configuration Mode is used to manage the FTP server options for the current context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

max servers

Configures the maximum number of FTP servers that can be started within any 60 second interval. If this limit is reached, the system waits two minutes before trying to start any more servers.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FTP Configuration

configure > context *context_name* **> server ftpd**

Syntax

max servers *count*

count

Default: 40
Specifies the maximum number of servers that can be spawned in any 60-second interval. *count* must be an integer from 1 through 100.

Usage

Set the number of servers to tune the system response as a heavily loaded system may need more servers to support the incoming requests.
The converse would be true as well in that a system can benefit by reducing the number of servers such that FTP services do not cause excessive system impact to other services.

Example

```
max servers 50
```

timeout

Configures the client idle timeout before an FTP session is automatically closed.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > FTP Configuration

configure > context *context_name* **> server ftpd**

Syntax

timeout *seconds*

seconds

Default: 900
Specifies the number of seconds of inactivity before an FTP session is automatically closed. *seconds* must be an integer from 10 through 86400.

Usage

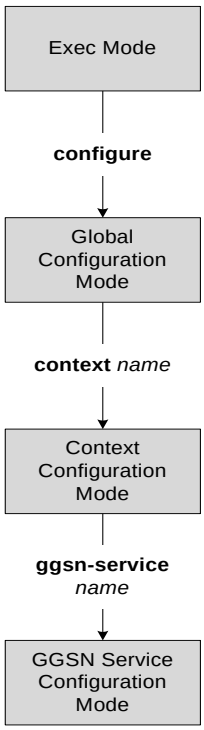
Adjust the session timeout to fine tune the system. FTP session resources can be released sooner to support additional requests by adjusting the timeout to a smaller value.

Example

```
timeout 300
```

Chapter 123
GGSN Service Configuration Mode Commands

The Gateway GPRS Support Node (GGSN) Configuration Mode is used to create and manage GGSN services within the current context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

Configures the name of the context configured on the system that processes accounting for PDP contexts handled by this GGSN service.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

accounting context *context_name*

no accounting context

no

Removes a previously configured accounting context.

context_name

Specifies the name of the context to be used for accounting. *context_name* must be an alphanumeric string of 1 through 79 characters that is case sensitive.

Usage

By default, the system attempts to use the same context as the one in which the GGSN service is configured for accounting purposes. This command can be used to either change the system's default behavior, or allow GPRS Tunneling Protocol Prime (GTPP) accounting to a charging gateway (CG).
By default when GTPP accounting is used, accounting records will be sent to the accounting servers configured in whichever context the GGSN service is configured. This command may be used to override that default.

Example

The following command configures the GGSN service's accounting context to be plmn1:

```
accounting context plmn1
```

associate gtpu-service

This command associates a previously configured GTP-U service to bind the GGSN service with a peer. A GTP-U service must be configured in Context Configuration mode before using this configuration.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

associate gtpu-service *svc_name*

noassociate gtpu-service

no

Removes the associated GTP-U service from this GGSN service configuration.

svc_name

Identifies the name of the GTP-U service preconfigured in Context Configuration mode to associate with a GGSN service. *svc_name* is an alphanumeric string from 1 through 63 characters.

Usage

Use this command to configure GTP-U data plan between GGSN service and peer node. The service defined for GTP-U can be configured in Context configuration mode.

Example

Following command associates GTP-U service named *gtpu-hnb1* with specific GGSN service.

```
associate gtpu-service gtpu-hnb1
```

associate pgw-service

This command enables a previously configured P-GW service to which handover will be done by the GGSN service. The P-GW service must be configured in Context Configuration mode before using this configuration.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

associate pgw-service *svc_name*

no associate pgw-service

no

Removes the associated P-GW service from this GGSN service configuration.

svc_name

Identifies the name of the P-GW service preconfigured in Context Configuration mode to which handover will be done.
The *svc_name* must be an alphanumeric string from 1 through 63 characters.

Usage

Use this command to allow enabling/disabling bearer handover from GGSN to a P-GW service. The service defined for P-GW can be configured in Context configuration mode.
The P-GW's eGTP service should have the same bind address as GGSN service and P-GW and GGSN should share same GTP-U, otherwise handover will fail.

Example

Following command enables P-GW service named *pgw-test* handover with specific GGSN service.

```
associate pgw-service pgw-test
```

authorize-with-hss

This command enables or disables subscriber session authorization via a Home Subscriber Server (HSS) over an S6b Diameter interface. This feature is required to support the interworking of GGSN with P-GW and HA.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

[default | no] authorize-with-hss

no

Disables the default authorization of subscriber over S6b interface. Resets the command to the default setting of "authorize locally" from an internal APN authorization configuration.

Usage

Use this command to enable/disable the authorization support for subscriber over S6b interface, which is used between GGSN and the 3GPP AAA to exchange the information related to charging, P-CSCF discovery, etc. By use of this feature allows the GGSN service to interact with HSS over S6b interface through Diameter configuration which is already configured on the system.

Important: Diameter configuration must be available before enabling this command. For more information of Diameter interface configuration, refer *Diameter Endpoint Configuration Mode Commands* chapter.

Important: This command is a license-enabled feature.

Example

The following command enables the subscriber authorization via an HSS over an S6b Diameter interface to provide session interoperability between GGSN and PGW and HA in this GGSN service:

```
authorize-with-hss
```

bind

Binds the GGSN service to a logical IP interface serving as the Gn interface. Specifies the maximum number of subscribers that can access this service over the interface.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

bind address *ip_address* **max [total-pdp-contexts** *max_total* **| ppp-pdp-contexts** *max_ppp* **]**

no bind address *address*

no

Removes a previously configured binding for the GGSN service.

ip_address

Specifies the IP address (address) of the interface configured as the Gn interface. *ip_address* is specified in IPv4 dotted-decimal notation.

max

Configures the maximum limits for total/PPP PDP contexts.

total-pdp-contexts *max_total*

Default: 1500000
Specifies the maximum number of PDP contexts (both IP and PPP) that can access this service on this interface.
count is an integer from 0 through 4000000.

Important: The maximum number of supported subscriber contexts varies based on the installed session capacity license and the number of active packet processing cards installed in the system. Note that each PPP PDP context is treated as two IP PDP contexts. Refer to the **license key** command for additional information.

ppp-pdp-contexts *max_ppp*

Default: 750000
Specifies the maximum number of PPP PDP contexts that can access this service on this interface.
count can be configured to an integer from 0 and 2500000.

Important: The maximum number of supported subscriber contexts varies based on the installed session capacity license and the number of active packet processing cards installed in the system. Refer to the **license key** command for additional information.

Usage

Used to associate or tie the GGSN service to a specific logical IP address. The logical IP address or interface takes on the characteristics of a Gn interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.

This command also sets a "soft" limit as to the number of simultaneous subscriber contexts that can be facilitated by the service/interface at any given time. Soft limits are based on measurements gathered at regular short intervals (several times per minute) as opposed to measurements taken in real-time. Therefore, the sampled measurement may not match the actual number of PDP contexts currently being processed. Every PDP context request received is compared against the result of the last sample. If the sample is less than the soft limit configured, the request will be processed. If it is more, the request will be rejected.

When configuring the **`total-pdp-contexts`** or **`ppp-pdp-contexts`** options, be sure to consider the following:

- Each PPP PDP context is treated as two IP PDP contexts due to the additional CPU and memory resources required
- The total number of configured Gn interfaces
- The maximum number of subscriber PDP contexts that all of the interfaces may handle during peak busy hours
- The average bandwidth for each of the PDP contexts
- The type of physical port (10/100Base-T or 1000Base-Tx) to which these interfaces are bound

Taking these factors into account and distributing your subscriber contexts across all available interfaces allows you to configure your interfaces to optimally handle PDP contexts without degrading performance.

Example

The following command would bind the logical IP interface with the address of *`192.168.3.1`* to the GGSN service and specifies that a maximum of *`600`* simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

cc behavior

Configures the 3GPP behavior bits associated with the GGSN's charging characteristics (CC).

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

cc behavior | no-records *nr_value*

{ default | no } cc behavior

no-records *nr_value*

Default: 0 (disabled)
Specifies the behavior bit upon which the GGSN ceases sending accounting records to a server.
nr_value can be configured to an integer from 1 through 12 corresponding to the 12 behavior bits – B1 through B12.

Usage

3GPP standards after 3GPP R98 included 12 behavior bits as part of GGSN charging characteristics. Like the charging characteristics profile index, the behavior bits are sent by the SGSN to the GGSN in the Create PDP Context request message.
This command configures the behavior bits for each of the conditions described.

Example

The following command configures a behavior bit of 10 for no-records:

```
cc behavior no-records 10
```

cc profile

Configures the charging characteristic (CC) profile index properties.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

cc profile *index* [**buckets** *number* | **interval** *time* [**downlink** *down_octets* **uplink** *up_octets* | **total** *total_octets*] | **prepaid** { **prohibited** | **use-rulebase-configuration** } | **sgsns** *num_changes* | **tariff time1** *mins hours* [**time2** *mins hours* [**time3** *mins hours* [**time4** *mins hours* [**time5** *mins hours* [**time6** *mins hours*]]]]] | **volume** { **downlink** *vol_down_octets* **uplink** *vol_up_octets* | **total** *total_octets* }]

no cc profile *index* { **buckets** | **interval** | **prepaid** | **sgsns** | **tariff** | **volume** }

default cc profile *index*

no

Removes a previously configured profile index.

default

Returns the specified cc profile to the original default system settings.

index

Configures a profile index for the parameter to be specified. index can be configured to an integer from 0 through 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

buckets *number*

Default: 4
Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before an accounting record should be closed.
number can be configured to an integer from 1 through 4.

interval *time* **[downlink** *down_octets* **uplink** *up_octets* **| total** *total_octets* **]**

Specifies the normal time duration that must elapse before closing an accounting record provided that any or all of the following conditions occur:

- Downlink traffic volume is reached within the time interval
- Uplink traffic volume is reached within the time interval
- Total traffic volume (up and downlink) is reached within the time interval

time is measured in seconds and can be configured to an integer from 60 through 40000000.
down_octets is the downlink traffic volume measured in octets and can be configured to an integer from 0 through 1000000.
up_octets is the uplink traffic volume measured in octets and can be configured to an integer from 0 through 1000000.
total_octets is the total traffic volume measured in octets and can be configured to an integer from 0 through 1000000.

prepaid { prohibited | use-rulebase-configuration }

This command enables or disables prepaid for the specified profile index.
Default: N/A
prohibited: Disable prepaid for the specified profile index.
use-rulebase-configuration: Use the prepaid configuration in the rulebase.

sgsns *num_changes*

Default: 4
Specifies the number of SGSN changes (such as, inter-SGSN switchovers) resulting in a new RAI (Routing Area Identity) that can occur before closing an accounting record.
num_changes can be configured to an integer from 1 through 15.

tariff time1 *mins hours* **time2** *mins hours* **time3** *mins hours* **time4** *mins hours* **time5** *mins hours* **time6** *mins hours*

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Six different tariff times may be specified. If less than six times are required, the same time can be specified multiple times.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: The minutes of the hour, an integer value from 0 to 59.
- *hours*: The hour of the day, an integer value from 0 to 23.

volume {downlink *vol_down_octets* **uplink** *vol_up_octets* **| total** *total_octets* **}**

Specifies the downlink, uplink, and total volumes that must be met before closing an accounting record.
vol_down_octets is measured in octets and can be configured to an integer from 100000 to 4000000000.
vol_up_octets is measured in octets and can be configured to an integer from 100000 to 4000000000.
total_octets is the total traffic volume (up and downlink) measured in octets and can be configured to an integer from 100000 to 4000000000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures profile indexes for the GGSN's charging characteristics. The GGSN supports up to 16 profile indexes.
This command works in conjunction with the **cc-sgsn** command located in the APN Configuration Mode that dictates which CCs should be used for subscriber PDP contexts.

Example

The following command configures a profile index of *10* for tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10 tariff time1 0 7 time2 30 19 time3 0 7 time4 30 19
```

default

Sets/restores the default value assigned for the specified parameter.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

[default] { cc { behavior | profile *index* **} | echo-interval | gtpu echo-interval | gtpu reorder { context | sequence-numbers | timeout } | guard-interval | ip { local-port gtpc-v1 | qos-dscp } | max-retransmissions | plmn { unlisted-sgsn } | setup-timeout | timeout }**

---

cc { behavior | profile *index* **}**

Restores the GGSN's charging characteristics parameters to the following default settings:

- **behavior**: Restores all behavior parameters to their default values of 0 (disabled).
- **profile:** For the specified index, the following defaults are applied:
  - buckets: 4
  - interval: Disabled
  - volume: Disabled
  - sgsns: 4
  - tariff-time: Disabled

---

echo-interval

Restores the GTP echo-interval parameter to its default setting of 60.

---

gtpu echo-interval

Restores the GTPU echo-interval parameter to its default setting of 60.

---

gtpu reorder { context | sequence-numbers | timeout }

Restores the gtpu reordering parameters to the following default settings:

- gtpu reorder context: Disabled
- gtpu reorder sequence-numbers: Disabled
- gtpu reorder timeout: 100 milliseconds

gtpu udp-checksum insert

Restores the GGSN gtpu udp-checksum parameter to its default setting of enabled.

guard-interval

Restores the GGSN guard-interval parameter to its default setting of 100.

ip {local-port gtpc-v1 | qos-dscp }

Restores the GGSN ip parameters to the following default setting:

- **local-port gtpc-v1**: 2123
- **qos-dscp**: conversational ef streaming af11 interactive af21 background be

max-retransmissions

Restores the GGSN max-retransmissions parameter to its default setting of 4.

plmn { unlisted-sgsn }

Restores the GGSN plmn unlisted-ggsn parameter to its default setting of reject.

setup-timeout

Restores the GGSN setup-timeout parameter to its default setting of 60.

timeout

Restores the GGSN timeout parameter to its default setting of 5.

Usage

After the system has been modified from its default values, this command is used to set/restore specific parameters to their default values.

Example

The following command restores the GGSN service's guard interval parameter to its default setting:

```
default guard-interval
```

dns-client

This command defines the context name where a DNS client is configured. It associates an existing DNS client configuration with the GGSN to perform a DNS query for P-CSCF, if a P-CSCF query request in an AAA message is received from the Diameter node.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

dns-client context *dns_ctxt_name*

{ no | default } dns-client context

no

Removes the association of DNS context which was configured to perform DSN query in this GGSN service.

default

Sets the default context for the DNS client.

dns_ctxt_name

Specifies the name of the context in which a DNS client configuration is present. Typically this should be the same context in which this GGSN service is configured.
dns_ctxt_name is a context name and must be alphanumeric string of 1 through 79 characters.

Usage

Use this command to associate a DNS client configuration to perform DNS query used for the resolution of P-CSCF query received in AAA message from Diameter peer, on the basis of DNS client parameters configured in a context.
A DNS client configuration must be present in the same context as GGSN service before enabling this command to perform DNS query for P-CSCF.

Important: This command is a license-enabled feature.

Example

The following command associates a DNS client configuration to perform DNS query for P-CSCF with this GGSN service which is configured in same context as GGSN service:

```
default dns-client context
```

echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-C Echo packets are sent from the GGSN service to the SGSN.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

echo-interval *seconds*

{ default | no } echo-interval

default

Configures the default value (60 seconds) for echo interval.

no

Disables the sending of GTPv1-C Echo packets.

seconds

Default: 60
Specifies the frequency at which the GGSN service sends GTPv1-C Echo packets to the SGSN(s) it is configured to communicate with.
seconds is measured in seconds and can be configured to an integer from 60 through 3600.

Usage

Use this command to adjust the rate at which the GGSN sends these packets. GTPv1-C Echo packets are used to detect whether SGSNs that the GGSN service is communicating with, has become unresponsive or has rebooted.
The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new SGSN on the system using the **sgsn address** command as described in this chapter
- Upon the execution of the path failure detection policy as described in **path-failure** command of this chapter

The echo-interval command is used in conjunction with the **max-retransmissions** and **retransmission-timeout** commands as described in this chapter.

In addition to receiving an echo response for this echo protocol, if GGSN receives a Node Alive Request message or a Echo Request message from a presumed dead SGSN, it will immediately assume the SGSN is active again.
If the GGSN discovers that an SGSN has become unresponsive, it will terminate all PDP contexts that had been established with the SGSN.

Example

The following command configures the GGSN service to send GTP Echo packets every 120 seconds:

```
echo-interval 120
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fqdn

This command defines Fully Qualified Domain Name (FQDN) which would be used for authorization over S6b interface between GGSN and 3GPP AAA/HSS.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

fqdn host *host_name* **realm** *realm_id*

{ no | default } fqdn

no

Removes the configured FQDN host name and realm ID from the GGSN service.

default

Sets the system to default mode for this command and configures the host and realm ID value to NULL.

host *host_name*

Specifies the name of the host to be used for authorization over an S6b interface to a 3GPP AAA server/HSS from the GGSN service.
host_name is a unique node name for authorization over the S6b interface from this GGSN service.
host_name must be an alphanumeric string of 1 through 127 characters. Punctuation marks are allowed.

realm *realm_id*

Specifies the realm as an FQDN to be used for authorization over S6b interface with 3GPP AAA server/HSS from GGSN service. The realm may typically be a company or service name.
realm_id is a unique identifier configured for the authorization over S6b interface from this GGSN service, expressed as an alphanumeric string of 1 through 127 characters. Punctuation marks are allowed.
host_name

Usage

Use this command to define host and realm as the FQDN for a 3GPP AAA server/HSS that would be used for authorization over an S6b interface with the GGSN. The realm specified as an FQDN may typically be a company or service name.
By default the FQDN host and realm will be NULL

Important: This command is a license-enabled feature.

Example

The following configures the *hss1* as host name and *xyz.com* as realm to support authorization over an S6b from this GGSN service:

```
fqdn host hss1 realm xyz.com
```

gtpc nsapi-in-create-pdp-response

This command excludes or includes the optional information element (IE) Network Service Access Point Identifier (NSAPI) within “Create PDP Context Response” messages in GTP-C.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

[default | no] gtpc nsapi-in-create-pdp-response

default

Sets the default mode for GTP-C messages not to include the NSAPI IE in “Create PDP Context Response” messages.

no

Removes the preconfigured mode for GTP-C messages; the GTP-C message will not include the NSAPI IE in “Create PDP Context Response” messages. By default it is disabled.

Usage

Use this command to exclude or include the NSAPI IE in “Create PDP Context Response” GTP-C messages received from the SGSN.

Example

The following command configures the GGSN service to include the optional NSAPI IE in “Create PDP Context Response” messages:

```
gtpc nsapi-in-create-pdp-response
```

gtpc private-extension

This command includes customer-specific private extensions in GTP-C messages.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

gtpc private-extension { { { focs | odb } access-list *acl_name* **in disconnect-on-violation } | ggsn-preservation-mode | loss-of-radio-coverage | none }**

default gtpc private-extension

no gtpc private-extension [focs | ggsn-preservation-mode | loss-of-radio-coverage]

default

Sets the default mode for GTP-C messages. By default it is disabled.

no

Disables the configured private extensions for GTP-C messages.

{focs | odb} access-list *acl_name* **in disconnect-on-violation**

Configures the Free-Of-Charge-Service (FOCS) and Operator Determined Barring (ODB) extensions for all packet-oriented services as defined by operators.
focs: Enables or disables Free of Charge Services for the subscriber who has no credit, and also takes the access-list *acl_name* to be applied for FOCS.
odb: Enables or disables "all packet oriented service barred" for the subscriber, and also takes the access-list *acl_name* to be applied for ODB.
acl_name is the name of a configured access control list (ACL) for this service.

Important: These are the customer-specific keywords and need customer-specific license to use them.

ggsn-preservation-mode

Enables the processing of customer-specific private extension in Update PDP Context requests. This extension indicates whether the subscriber is active or idle, and whether RAN resources have been released. It also indicates the desired "type" of preservation mode behavior.
When **ggsn-preservation-mode** is configured, different types of accounting records are generated based on the "type" of mode. To enable the generation of different accounting records, the trigger for preservation

mode must be configured for RADIUS or GTPP for that accounting protocol. If that trigger is not configured, there will be no change in the generation of accounting records.

Important: This is a customer-specific keyword and needs customer-specific license to use this feature.

loss-of-radio-coverage

Enables the protection against overcharging a subscriber due to loss of radio coverage (LORC) in a GGSN service. It also enables the system to understand the private extension for LORC) in GTP-C Update PDP Context messages from the SGSN.

Important: This is a license enabled keyword and need feature-specific license to use it.

none

Removes the private extensions from record which are from GTP-C messages received from the SGSN.

Usage

Use this command to configure the processing of private extensions within GTP-C messages received from the SGSN. It also configures the customer specific features, such as preservation mode for GGSN service. Overcharging protection (LORC) is a solution which provides the ability to accurately bill customers. This implementation is based on Cisco-specific private extension to GTP messages and/or any co-relation of G-CDRs and S-CDRs. It also does not modify any RANAP messages.

Important: This is a license enabled command that requires installation of feature-specific licenses to use this command.

Example

The following command configures the GGSN service to record the private extension for protecting the subscribers from overcharging during loss of radio coverage:

```
gtpc private-extension loss-of-radio-coverage
```

gtpc ran-procedure-ready-delay

This command configures the GGSN to enable the RAN Procedure Ready feature for the particular GGSN service and specify the timeout period for the RAN procedure timer in the GGSN. This timer starts on arrival of every secondary Create PDP Context request.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

gtpc ran-procedure-ready-delay [timeout *dur* **]**

{ default | no } gtpc ran-procedure-ready-delay

default

Sets the default mode of RAN Procedure Ready feature for this GGSN service. By default it is disabled.

no

Disables the RAN Procedure Ready feature for this GGSN service. By default it is disabled.

timeout *dur*

Default: 10
Specifies the timeout duration (in seconds) for the RAN procedure timer. This timer starts on the arrival of every secondary “Create PDP Context Request” message.
This is an optional keyword. If no timeout period is specified, the default value is 10 seconds.
dur must be an integer from 1 through 40.

Usage

Use this command to enable the RAN Procedure Ready feature for this GGSN service and specify the timeout period for the RAN procedure timer. This timer starts on the arrival of every secondary “Create PDP Context Request” message.
The GGSN waits until the Radio Access Bearer setup is completed and “Update PDP Context Request” is sent by the SGSN. If any downlink data is received before arrival of the “Update PDP Context Request” or before timer expiry, the downlink packets will be queued or buffered.
If the buffer becomes full (total buffer limit is of 1024 packets), all newly arriving packets are dropped.
The RAN Procedure Ready feature supports the following scenarios when RAB setup timer starts at the GGSN:

- If the GGSN receives the “Update PDP Context Request” before timer expiry, the GGSN stops the timer, sends all the queued/buffered packets in ‘first-in first-out’ manner and disables buffering of subsequent downlink data.
- If the GGSN receives the “Update PDP Context Request” before the timer expires, it processes the “Update PDP Context Request” as usual, but does not disable the buffering of downlink data. It then waits for another “Update PDP Context Request” to come with the RAN Procedure Ready set, or waits for timer to expire.
- If the GGSN does not receive the “Update PDP Context Request” with RAN Procedure Ready set before timer expiry, the timer is fired and the GGSN starts sending all queued packets and disables buffering of subsequent downlink data (assuming that the corresponding SGSN does not support this feature).
- If the timer has expired and the GGSN receives an “Update PDP Context Request” for a secondary PDP context with or without RAN Procedure Ready bit set, the UPC will be processed normally without buffering the packets.

Important: This feature does not affect the Enhanced Charging Service or deep packet inspection (DPI) since the buffering of downlink data is done before sending it to an ACSMgr.

Important: During an SGSN handoff scenario all packets are processed normally and the downlink packets are buffered until the timer expires.

Example

The following command configures the GGSN service to enable the RAN Procedure Ready feature and specify the timeout period as *20* seconds for the RAN Procedure timer in GGSN:

```
gtpc ran-procedure-ready-delay timeout 20
```

gtpu echo-interval

This command is obsolete and now available for configuration in GTP-U service configuration mode.

guard-interval

Configures the time period after which a redundant PDP context request received from an SGSN is treated as a new request rather than a re-send of a previous request.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

guard-interval *guard_time*

{ default | no } guard-interval

default

Configures the default value for guard-interval function for the GGSN service.

no

Disables the guard-interval function for the GGSN service.

guard_time

Default: 100
Specifies the amount of time that must pass before a GGSN service treats a redundant PDP context request as a new request instead of a re-send of a previous request.
guard_time is measured in seconds and can be configured to an integer from 10 through 3600.

Usage

The guard interval is used to protect against replay attacks. Without a guard interval configured, information from a valid PDP context request could be used to gain un-authorized network access.
If the GGSN service receives a PDP context request in which the International Mobile Subscriber Identity (IMSI), the Network Service Access Point Identifier (NSAPI), the end user IP address, and the GTP sequence number are identical to those received in a previous request, the GGSN treats the new request as a re-send of the original. Therefore, information from a valid PDP context request could be collected and re-sent at a later time by an un-authorized user to gain network access.
Configuring a guard interval limits the amount of time that the information contained within a PDP context request remains valid.

Example

The following command configures the GGSN service with a guard interval of *60* seconds:

```
guard-interval 60
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Gn interfaces' GTP-C socket for GTPv1.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

ip local-port gtpc-v1 *port#*

default ip local-port gtpc-v1

default

Configures the default value for the local UDP port for GTP Version 1 control messaging for this GGSN service.

gtpc-v1 *port#*

Default: 2123
Specifies the UDP port number for GTPv1 GTPC sockets.
port# can be configured to an integer from 1 through 65535.

Usage

By default, the GGSN service attempts to use GTPv1 when communicating with SGSNs. This parameter configures the UDP port over which the GTP control (GTP-C) sockets are sent.
If an SGSN only supports GTPv0, the GGSN service automatically switches to GTPv0 when communicating with this SGSN. In the scenario, the GGSN service communicates with the SGSN on UDP port 3386 and does not have a GTP-C socket.

Important: The UDP port setting on the SGSN must match the local-port setting for the GGSN service on the system in order for the two devices to communicate.

Example

The following command configures the GGSN service to use UDP port *2500* for exchanging GTPC sockets with SGSNs when using GTPv1:

```
ip local port 2500
```

ip qos-dscp

Configures the quality of service (QOS) differentiated service code point (DSCP) used when sending data packets over the Gn interface.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

ip qos-dscp { qci { 1 { *dscp* **} | 2 {** *dscp* **} | 3 {** *dscp* **} | 4 {** *dscp* **} | 5 {** *dscp* **|** *allocation-retention-priority* **} | 6 {** *dscp* **|** *allocation-retention-priority* **} | 7 {** *dscp* **|** *allocation-retention-priority* **} | 8 {** *dscp* **|** *allocation-retention-priority* **} | 9 {** *dscp* **}} | gtpc } +**

no ip qos-dscp { qci { 1 | 2 | 3 | 4 | 5 { *allocation-retention-priority* **|** *dscp* **} | 6 {** *allocation-retention-priority* **|** *dscp* **} | 7 {** *allocation-retention-priority* **|** *dscp* **} | 8 {** *allocation-retention-priority* **|** *dscp* **} | 9 } | gtpc } +**

allocation-retention-priority

Specifies the DSCP for interactive class if the allocation priority is present in the QOS profile.
allocation-retention-priority can be the integer 1, 2, or 3.
DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QOS profile.
The following table shows the DSCP value matrix for *allocation-retention-priority*.

Table 19. Default DSCP Value Matrix

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	ef	ef	ef
3	af21	af21	af21
	af21	af21	af21

qci

Configures the QoS Class Identifier (QCI) attribute of QOS. Here the *qci_val* is the QCI for which the negotiate limit is being set; it ranges from 1 to 9.

dscp

Default QCI:

- 1: ef
- 2: ef
- 3: af11
- 4: af11
- 5: ef
- 6: ef
- 7: af21
- 8: af21
- 9: be

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• **af11:** Assured Forwarding 11 per-hop-behavior (PHB)	• **af32:** Assured Forwarding 32 PHB
• **af12:** Assured Forwarding 12 PHB	• **af33:** Assured Forwarding 33 PHB
• **af13:** Assured Forwarding 13 PHB	• **af41:** Assured Forwarding 41 PHB
• **af21:** Assured Forwarding 21 PHB	• **af42:** Assured Forwarding 42 PHB
• **af22:** Assured Forwarding 22 PHB	• **af43:** Assured Forwarding 43 PHB
• **af23:** Assured Forwarding 23 PHB	• **be:** Best effort forwarding PHB
• **af31:** Assured Forwarding 31 PHB	• **ef:** Expedited forwarding PHB

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they are tagged. The diffserv markings are applied to the outer IP header of every GTP data packet. The diffserv marking of the inner IP header is not modified.
The traffic patterns are defined by QCI (1 to 9). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in the following tables:

Table 20. Class structure for assured forwarding (af) levels

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Table 21. DSCP Precedence

Precedence (low to high)	DSCP
0	Best Effort (be)
1	Class 1
2	Class 2
3	Class 3
4	Class 4
5	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command. The **no ip qos** command can be issued to remove a QOS setting and return it to it's default setting.

Example

The following command configures the DSCP level for QCI to be Expedited Forwarding,**ef**:

```
ip qos-dscp qci 1 ef
```

max-retransmissions

Configures the maximum number of times that GTP control packets are retransmitted to an SGSN before it marks it unreachable.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

max-retransmissions *max_number*

default max-retransmissions

default

Configures the default value for maximum retries for GTP control packets for the GGSN service.

max_number

Default: 4
Indicates the maximum number of times that GTP control packets are retransmitted.
max_number can be configured to an integer from 0 through 15.

Usage

This command is used in conjunction with the **timeout** command to control the retransmission of GTP control packets when no response is received from an SGSN. It is equivalent to the N3-REQUESTS parameter discussed in 3GPP TS 29.060.
If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of this command.
If the max-retransmissions value is exceeded, the GGSN records a “Path Failure” for that SGSN and releases all PDP contexts associated with it.

Example

The following command configures the maximum number of retransmissions to *8*:

```
max-retransmissions 8
```

mbms policy

This command enables/disables the Multimedia Broadcast Multicast Services (MBMS) user service support for multicast and/or broadcast mode. It also specifies the policy for MBMS user service mode.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

mbms policy { multicst broadcast | none }

{ no | default } mbms policy

no

Removes or disables the configured MBMS support for multicast and/or broadcast mode in this GGSN service.

default

Restores the default mode of MBMS support in this GGSN service.

multicst broadcast

Enables the MBMS support and configures the policy for multicast and broadcast of user service.

Usage

Use this command to enable/disable the MBMS user service support for Multicast and/or Broadcast mode. It also specifies the policy for MBMS user service mode.

Example

The following command enables MBMS support in this GGSN service:

```
mbms policy multicast broadcast
```

newcall

This command enables or disables the new call related behavior of this GGSN service when duplicate sessions with the same IP address request are received. This feature is required to support interworking with P-GW and HA.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

newcall duplicate-subscriber-requested-address { accept | reject }

default newcall duplicate-subscriber-requested-address

default

Restores the default mode for new call session with the same address request received in this GGSN service. It rejects calls with duplicate address requests.

accept

Sets the system to "accept" another session using the same IP address for a new call. The new session will be created and the old session will be torn down.
Default: Disabled

reject

Rejects new calls with duplicate address requests. This is the default behavior.
Default: Enabled

Usage

Use this command to enable or disable new call connections when the UE is not able to gracefully disconnect from the Enterprise PDN before attempting to reconnect via another access method. When enabled this command tears down the old session in order to accept the new connection with the same IP address assignment.
This feature also allows the GGSN to accept a request for a static subscriber address, even if the address is already used by another session. If this feature is not enabled, a new request with the same IP address for another session will be rejected.

Important: This command is a license-enabled feature.

Example

The following command allows the GGSN to accept the duplicate call session request with the same IP address:

```
newcall duplicate-subscriber-requested-address accept
```

path-failure

Determines the GTP path-failure behavior on echo/non-echo messages.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

path-failure detection-policy gtp { echo [non-echo] | non-echo [echo] }

{ no | default } path-failure detection-policy

no

No defined detection policy means path-failures are not detected.

default

Sets the path-failure detection-policy to GTP in echo mode.

detection-policy gtp {echo [non-echo] | non-echo [echo] }

Detection-policy is the policy to be used when path-failure is in active state. GTP messages are either gtp(u) (user) or gtp(c) (control) type, and the gtp keyword takes either echo or non-echo as message type.
echo: gtp(u) or gtp(c) message.
non-echo: a message type other than gtp(u) or gtp(c).

Usage

Under current circumstances, a GGSN shuts down the GTP tunnel if the associated SGSN does not respond to multiple retries of an echo or non-echo message from the GGSN. In this way, a single call failure could be responsible for the loss of all active calls in the tunnel.
This is also an issue when echo is disabled, or when there is very little traffic on the SGSN and the GGSN is configured with large echo intervals.
This behavior adversely impacts the user experience because the customer has to reconnect every time this happens with their SGSN.

Example

The following example detects path failures when the SGSN fails to respond to multiple echo message retries:

```
path-failure detection-policy gtp echo
```

The following example turns off path-failure detection. On timeout of gtp(c) message retries, the particular context will be purged:

```
no path-failure detection-policy
```

plmn id

Configures the GGSN's public land mobile network (PLMN) identifiers. Up to five PLMN IDs can be configured for each GGSN service.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

plmn id mcc *mcc_value***mnc** *mnc_value* **[primary]**

no plmn id mcc *mcc_value* **mnc** *mnc_value*

no

Removes a previously configured PLMN identifier for the GGSN service.

mcc *mcc_value*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_number is the PLMN MCC identifier and can be configured to an integer between 100 and 999.

mnc *mnc_value*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_number is the PLMN MNC identifier and can be configured to any 2- or 3-digit integer from 00 through 999.

primary

When multiple PLMN IDs are configured, the **primary** keyword can be used to designate one of the PLMN IDs to be used for the AAA attribute (3GPP-GGSN-MCC-MNC).

Usage

The PLMN identifier is used by the GGSN service to determine whether or not a mobile station is visiting, roaming, or home. Multiple GGSN services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each GGSN Service.

Example

The following command configures the PLMN identifier with an MCC of *462* and MNC of *2*:

```
plmn id mcc 462 mnc 02
```

plmn unlisted-sgsn

Configures the GGSN's policy for handling communications from SGSNs with which it is not configured to communicate.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

default plmn unlisted-sgsn

plmn unlisted-sgsn [[foregn [disable-gtpc-echo | | reject-foreign-subscriber] | home [disable-gtpc-echo |]] | reject]]

default

Resets configured parameters to their default settings.

foreign

Default: Disabled
Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the **sgsn address** command.
This keyword also dictates that unlisted SGSNs are treated as if they belong to a foreign PLMN. Therefore, PDP contexts originating from them are treated as visiting or roaming.

mcc *mcc_value*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_value is the PLMN MCC identifier and can be configured to an integer from 100 through 999.

mnc *mnc_value*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_value is the PLMN MNC identifier and can be configured to a 2- or 3-digit integer from 00 through 999.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

reject-foreign-subscriber

Default: Disabled

Specifies that incoming calls from foreign subscribers are rejected.

home

Default: Disabled
Specifies that the GGSN service accepts messages from SGSNs that are not configured within the service using the **sgsn address** command.
This keyword also dictates that unlisted SGSNs are treated as if they belong to the GGSN service's home PLMN.

rat-type { GAN | GERAN | HSPA | UTRAN | WLAN }

This keyword configures the type of radio access technology.
GAN: Specifies the Generic Access Network type of Radio Access Technology (RAT).
GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.
HSPA: Specifies the High Speed Packet Access type of RAT.
UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.
WLAN: Specifies the Wireless Local Access Network type of RAT.

reject

Default: Enabled
Specifies that the GGSN service rejects messages from SGSNs that are not configured within the service using the **sgsn address** command.
When the GGSN service rejects the message(s), it returns a cause code of No Resources 199 (C7H, No resources available).

Usage

This command works in conjunction with the **sgsn** command that configures the GGSN service to communicate with specific SGSNs. Any messages received from SGSNs not configured in that list are subject to the rules dictated by the **unlisted-sgsn** policy.

Example

The following command configures the GGSN service to accept messages from unlisted SGSNs and treat the SGSN as if it is on the GGSN's home network:

```
plmn unlisted-sgsn accept home
```

policy

Specifies the reject code to be used in the "Create PDP Context" response message when a RADIUS server timeouts.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

policy { accounting-server-timeout use-reject-code { system-failure | no-resources } | authentication-server-timeout use-reject-code { system-failure | user-authentication-failure } }

default policy { authentication-server-timeout | accounting-server-timeout }

default

Restores the specified parameter to its default setting.

accounting-server-timeout use-reject-code { system-failure | no-resources }

Default: **no-resources**
Specifies the reject code used by the GGSN if communication with an accounting server times out. The possible reject codes are:

- system-failure (204 (CCH))
- no-resources (199 (C7H))

authentication-server-timeout use-reject-code {system-failure | user-authentication-failure }

Default: user-authentication-failure
Specifies the reject code used by the GGSN if communication with an authentication server times out. The possible reject codes are:

- system-failure (204 (CCH))
- user-authentication-failure (209 (D1H))

Usage

This command is used to configure the cause code used by the GGSN if communication with either a RADIUS authentication or accounting server times out.
When this parameter is used in conjunction with Radius accounting servers, the response is only set if a flag is configured in the APN Delay GTP Response, only after getting a response to the Accounting Start.

Example

The following command configures the GGSN response to a RADIUS authentication server timeout to be *system-failure*:

```
policy authentication-server-timeout use-reject-code system-failure
```

retransmission-timeout

Configures the timeout period in between retransmissions of GTP control packets. This timeout configuration is not applicable on Echo Request retransmission.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

retransmission-timeout *retransmit_time*

default retransmission-timeout

default

Configures the default time interval that must pass without an SGSN response before the GGSN service retransmits GTP control packets.

retransmit_time

Default: 5
Specifies the amount of time that must pass without an SGSN response before the GGSN service retransmits GTP control packets.
retransmit_time is measured in seconds and can be configured to an integer from 1 through 20.

Usage

This command is used in conjunction with the **max-retransmissions** command to control the retransmission of GTP control packets when no response is received from an SGSN.
If no response is received from the SGSN prior to the expiration of the timeout value, the GTP control packets are re-sent by the GGSN. This process occurs as many times as allowed by the configuration of the max-retransmissions command.
If the max-retransmissions value is exceeded within the retransmission-timeout period, the GGSN records a "Path Failure" for that SGSN and releases all PDP contexts associated with it.

Important: This retransmission timeout configuration in not applicable for Echo Requests message retransmission. Echo are sent/retransmitted every echo interval, which can be configured separately.

Example

The following command configures a timeout value of *20* seconds:

```
retransmission-timeout 20
```

setup-timeout

Configures the maximum amount of time the GGSN service allows for the setting up of PDP contexts.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

setup-timeout *setup_time*

default setup-timeout

default

Configures the default maximum amount of time the GGSN service allows for the setting up of PDP contexts.

setup-time

Default: 60
Specifies the maximum amount of time the GGSN service allows for the setting up of PDP contexts.
setup_time is measured in seconds and can be configured to an integer from 1 through 6000.

Usage

Use this command to limit the amount of time allowed for setting up PDP contexts. If the PDP context is not setup within the configured time frame, the GGSN service rejects the PDP context with a cause code of 199 (C7H, No resources available).

Example

The following command allows a maximum of *120* seconds for the setting up of PDP contexts:

```
setup-timeout 120
```

sgsn address

Configures the SGSNs that this GGSN service is allowed to communicate with.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

sgsn address { { *ip_address* [subnetmask *netmask*] } | *ip_address/netmask* } [plmn-foreign [reject-foreign-subscriber] | mcc *mcc_code* mnc *mnc_code* [reject-foreign-subscriber]] [rat-type { GAN | GERAN | HSPA | UTRAN | WLAN }] [description *description*] [disable-gtpc-echo]

no sgsn { address *ip_address* [subnetmask *netmask*] }

no

Removes a specific SGSN from the list or all configured SGSNs.

address

Configures the IP address of the SGSN.
ip_address must be expressed in IPv4 dotted-decimal notation.

subnetmask

Configures the subnet mask of the SGSN.
netmask must be expressed in IPv4 dotted-decimal notation.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

plmn-foreign

Indicates whether or not the SGSN belongs to a foreign public land mobile network (PLMN).

reject-foreign-subscriber

Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

mcc *mcc_code*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_code is the PLMN MCC identifier and configured as an integer from 100 through 999.

mnc *mnc_code*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_code is the PLMN MNC identifier and configured as a 2- or 3-digit integer from 00 through 999.

rat-type {GAN | GERAN | HSPA | UTRAN | WLAN }

This keyword configures the type of radio access technology.
GAN: Specifies the Generic Access Network type of Radio Access Technology (RAT).
GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.
HSPA: Specifies the High Speed Packet Access type of RAT.
UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.
WLAN: Specifies the Wireless Local Access Network type of RAT.

description *description*

Add description field to the SGSN entry in GGSN service.
description is an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure a list of SGSNs that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSNs.

Important: The GGSN only communicates with the SGSNs configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the **plmn unlisted-sgsn** command.

Example

The following command configures the GGSN to communicate with an SGSN on a foreign PLMN with an IP address of *192.168.1.100* and subnet mask of *255.255.255.0*:

```
sgsn address 192.168.1.100 subnetmask 255.255.255.0 plmn-foreign
```

sgsn define-multiple-address-group

This command defines an SGSN Multiple Address Group and enters SGSN Multiple Address Group Configuration mode. Whenever there is a change in the control address in a GTPC UPC message, it is treated as an inter-SGSN handoff because an SGSN is usually identified uniquely by a single IP-address. This command supports a multiple address group feature which allows you to specify a set of addresses that specify a single SGSN. When a UPC handoff is received from any address in the group, it is treated as an intra-SGSN handoff.

Syntax

sgsn define-multiple-address-group *grp_name* **[-noconfirm]**

no sgsn define-multiple-address-group *grp_name*

no

Removes a specific SGSN Multiple Address Group from the list GGSN service configuration.

grp_name

Specifies the name of an SGSN multiple address group to create or configure.
*grp_name*is an alphanumeric string from 1 through 63 characters.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create or configure an SGSN Multiple Address Group that the GGSN service is to communicate with. This command can be entered multiple times to configure multiple SGSN Multiple Address Groups.

Example

The following command creates an SGSN Multiple Address Group named *sgsngrp1* and enters SGSN Multiple Address Group Configuration mode:

```
sgsn define-multiple-address-group sgsngrp1
```

sgsn multiple-address-group

Configures the SGSN multiple address groups that this GGSN service is allowed to communicate with.

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

sgsn multiple-address-group *grp_name* **[disable-gtpc-echo] [mcc** *mcc_code* **mnc** *mnc_code* **[reject-foreign-subscriber]] [plmn-foreign [reject-foreign-subscriber] [rat-type { GAN | GERAN | HSPA | UTRAN | WLAN }] [description** *description* **]**

no sgsn multiple-address-group *grp_name*

no

Removes a specific SGSN multiple address group from the list of configured SGSN multiple address groups.

grp_name

Specifies the name of a configured SGSN multiple address group to use.

disable-gtpc-echo

Default: Send GTPC Echo messages to unlisted SGSNs.
When this keyword is specified, GTPC echo messages are not sent to unlisted SGSNs.

plmn-foreign

Indicates whether or not the SGSN multiple address group belongs to a foreign public land mobile network (PLMN).

reject-foreign-subscriber

Default: Disabled
Specifies that incoming calls from foreign subscribers are rejected.

mcc *mcc_code*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_code is the PLMN MCC identifier and can be configured to an integer from 100 through 999.

mnc *mnc_code*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.

mnc_code is the PLMN MNC identifier configured as a 2- or 3-digit integer from 00 through 999.

rat-type { GAN | GERAN | HSPA | UTRAN | WLAN }

This keyword configures the type of radio access technology.
GAN: Specifies the Generic Access Network type of Radio Access Technology (RAT).
GERAN: Specifies the GSM EDGE Radio Access Network type of RAT.
HSPA: Specifies the High Speed Packet Access type of RAT.
UTRAN: Specifies the UMTS Terrestrial Radio Access Network type of RAT.
WLAN: Specifies the Wireless Local Access Network type of RAT.

description *description*

Add a description field to the SGSN multiple address group entry in the GGSN service configuration. *description* must be an alphameric string of 1 through 63 characters.

Usage

Use this command to configure a list of SGSN multiple address groups with which the GGSN service is to communicate. This command can be entered multiple times to configure multiple SGSN multiple address groups.

Important: The GGSN only communicates with the SGSN multiple address groups configured using this command unless a plmn-policy is enabled to allow communication with unconfigured SGSNs. PLMN policies are configured using the **plmn unlisted-sgsn** command.

Example

The following command configures the GGSN to communicate with an SGSN with multiple address that is defined by an SGSN multiple address group named *sgsngrp1* that is on a foreign PLMN:

```
sgsn multiple-address-group sgsngrp1 plmn-foreign
```

sgsn mcc-mnc

This command configures sgsn mcc-mnc for this GGSN service.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

sgsn mcc-mnc { prefer-rai | prefer-uli }

default sgsn mcc-mnc

default

Configures the default option for sgsn mcc-mnc. Default is ‘prefer-uli’.

prefer-rai

Configures sgsn mcc-mnc using rai.

prefer-uli

Configures sgsn mcc-mnc using uli.

Usage

Use this command to configure the sgsn mcc-mnc.

Example

The following command configures the sgsn mcc-mnc to ‘prefer-rai’:

```
sgsn mcc-mnc prefer-rai
```

trace-collection-entity

This command configures the trace collection entity IP address. Trace collection entity is the destination node to which trace files are transferred and stored.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GGSN Service Configuration

configure > context *context_name* **> ggsn-service** *service_name*

Syntax

trace-collection-entity *IPv4_addr*

no trace-collection-entity

no

Removes the configured IPv4 address for trace collection in this GGSN service.

IPv4_addr

Specifies the IP address in IPv4 dotted-decimal notation.

Usage

Use this command to configure the trace collection entity IP address. This configuration is required because during signaling session trace activation, CPC REQ and UPC REQ do not provide the IP address for the trace collection entity.

Example

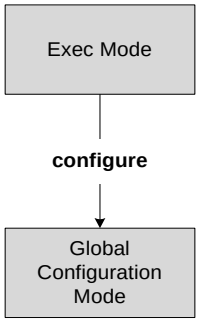
The following command configures the trace collection entity IP address with this GGSN service:

```
trace-collection-entity 192.36.56.56
```

Chapter 124
Global Configuration Mode Commands (A-K)

This section includes the commands **`aaa accounting-overload-protection`** through **`imei-profile`**.

The Global Configuration Mode is used to configure basic system-wide parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa accounting-overload-protection

This command configures Overload Protection Policy for accounting requests.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

aaa accounting-overload-protection prioritize-gtpp

{ default | no } aaa accounting-overload-protection

default

Configures the default setting.
Default: no priority assigned

no

Disables the Overload Protection configuration.

prioritize-gtpp

Gives higher priority to GTPP requests among the other outstanding requests. So while purging the lower priority requests will be selected first.

Usage

Use this command to configure Overload Protection Policy for accounting requests.

Example

The following command prioritizes GTPP requests among the other outstanding requests:

```
aaa accounting-overload-protection prioritize-gtpp
```

aaa default-domain

Configure global accounting and authentication default domain for subscriber and context-level administrative user sessions.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

aaa default-domain { administrator | subscriber } *domain_name*

no aaa default-domain { administrator | subscriber }

no

Removes all or only the specified configured domain.

administrator | subscriber

administrator: Configures the default domain for context-level administrative users.
subscriber: Configures the default domain for subscribers.

domain_name

Sets the default context.
domain_name must be an alphanumeric string of 1 through 79 characters.

Usage

This command configures the default domain which is used when accounting and authentication services are required for context-level administrative user and subscriber sessions whose user name does not include a domain.

Example

The following commands configure the default domains for context-level administrative users and subscribers, respectively:

```
aaa default-domain administrator sampleAdministratorDomain

aaa default-domain subscriber sampleSubscriberDomain
```

aaa domain-matching ignore-case

This command disables case sensitivity when performing domain matching. When this command is enabled, the system disregard case when matching domains.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] aaa domain-matching ignore-case

default aaa domain-matching

default

Configures ignore-case as the domain matching method.

no

Specifies that the system consider case when domain matching.

Usage

Use this command to configure the system to ignore case when matching domains.

Example

The following command configures the system to ignore case when matching domains:

```
aaa domain-matching ignore-case
```

aaa domain-matching imsi-prefix

Enables domain lookup for session based on the International Mobile Subscriber Identity (IMSI) prefix length. Default: Disabled

Important: This command is only available in 8.3 and later releases.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

aaa domain-matching imsi-prefix prefix-length *prefix_length*

no aaa domain-matching imsi-prefix

default aaa domain-matching

no

Specifies the system must not consider imsi-prefix domain matching method.

prefix-length

Specifies the IMSI length to be matched with the domain.
prefix_length must be an integer from 1 through 15.

Usage

Use this command to configure the IMSI-prefix method of domain matching. This command enables domain lookup for the session based on the IMSI prefix length. If there is a domain configured with the matching IMSI prefix, the associated configuration is used.
This feature does not support partial matches.

Example

The following command configures the IMSI prefix method for domain matching setting the prefix length to *10*.

```
aaa domain-matching imsi-prefix prefix-length 10
```

aaa large-configuration

This command enables or disables the system to accept a large number of RADIUS configurations to be defined and stored.

Important: For this command to take affect, after entering the command the configuration must be saved and reloaded.

When aaa large-configuration is disabled, the following restrictions are in place:

- Only one (1) NAS IP address can be defined per context with the **`radius attribute`** command.
- The RADIUS attribute **nas-ip-address** can only be configured if the RADIUS group is **default**.
- Only 320 RADIUS servers can be configured system-wide.
- Only 64 RADIUS groups can be configured system-wide.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`[ no ] aaa large-configuration`

`no`

Disables AAA large configuration support.

Usage

When aaa large-configuration is enabled, the system provides the ability to configure multiple NAS IP addresses in a single context to used with different radius groups. As well, the command allows support for up to 1,600 RADIUS server configurations and for a PDSN a maximum of 400 or for a GGSN a maximum of 800 RADIUS server group configurations system-wide.

Example

To enable the definition of a large number of RADIUS configurations, enter the following commands in the following order:
In APN Configuration mode, enter:

```
default aaa group
```

In Global Configuration mode, enter:

```
aaa large-configuration
```

In Exec mode, use the **save configuration** command and then the **reload** command.

aaa last-resort

Configure global accounting and authentication last resort domain for subscriber and context-level administrative user sessions.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

aaa last-resort context { administrator | subscriber *context_name* **}**

no aaa last-resort context { administrator | subscriber }

no

Removes all or only the specified previously configured authentication last resort domain name.

administrator | subscriber

administrator: Configures the last resort domain for context-level administrative.
subscriber: Configures the last resort domain for the subscribers.

context_name

Specifies the context which is to be set as the last resort. *context_name* must be an alphanumeric string of 1 to 79 characters.

Usage

Set the last resort context which is used when there is no applicable default domain (context) and there is no domain provided with the subscriber's or context-level administrative user's name for use in the AAA functions.

Example

The following commands configure the last resort domains for context-level administrative user and subscribers, respectively:

```
aaa last-resort administrator sampleAdministratorDomain

aaa last-resort subscriber sampleSubscriberDomain
```

The following command removes the previously configured domain called *sampleAdministratorDomain*:

```
no aaa last-resort administrator sampleAdministratorDomain
```

aaa tacacs+

This command enables or disables system-wide TACACS+ AAA (authentication, authorization and accounting) services for administrative users. This command is valid only if TACACS+ servers and related services have been configured in TACACS Configuration Mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
[ no ] aaa tacacs+
```

Usage

Enables or disables the use of TACACS+ AAA services for administrative users.

Example

```
aaa tacacs+

no aaa tacacs+
```

aaa username-format

Configure global accounting and authentication user name formats for AAA (authentication, authorization and accounting) functions. Up to six formats may be configured.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] aaa username-format { domain | username } *separator*

default aaa username-format

no

Removes the specified user name format from the configuration.

domain | username

Default: username @
domain: indicates the left side of the string from the separator character is a domain name and the right side is the user name.
username: indicates the left side of the string from the separator character is a user name and the right side is the domain name.

Important: The user name string is always searched from right to left for the first occurrence of the separator character.

separator

Specifies the character to use to delimit the domain from the user name for global AAA functions.Permitted characters include: @, %, -, \, #, or /. To specify a back slash ('\') as the separator, you must enter a double back slash ('\\') on the command line.

Usage

Define the formats for user name delimiting if certain domains or groups of users are to be authenticated based upon their user name versus domain name.

Example

```
aaa username-format domain @

aaa username-format username %
```

```
no aaa username-format username %
```

active-charging service

This command allows you to create/configure/delete the Active Charging Service (ACS)/Enhanced Charging Service (ECS).

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

active-charging service *acs_service_name* **[-noconfirm]**

no active-charging service *acs_service_name*

no

Deletes the specified Active Charging Service.

acs_service_name

Specifies name of the Active Charging Service.
acs_service_name must be the name of an Active Charging Service, and must be an alphanumeric string of 1 through 15 characters.
If the named Active Charging Service does not exist, it is created, and the CLI mode changes to the ACS Configuration Mode wherein the service can be configured. If the named Active Charging Service already exists, the CLI mode changes to the ACS Configuration Mode.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/configure/delete an Active Charging Service in the system. Note that, in this release, only one Active Charging Service can be created in the system.
Use this command after enabling ACS using the **require active-charging** command. This command allows administrative users to configure the ACS functionality.
On entering this command, the CLI prompt changes to:
`[context_name]hostname(config-acs)#`

Example

The following command creates an ACS service named *test*:

```
active-charging service test
```

alarm

Enables or disables alarming options for the SPIO card or the SSC internal alarms and the central-office external alarms. To verify the state of the alarms, refer to the **show alarm** command.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

alarm { audible | central-office }

no alarm { audible | central-office }

no

Disables the option specified.

audible | central-office

audible: indicates the internal audible alarm on the SPIO cards or SSCs are to be enabled.
central-office: indicates the central office alarms are to be enabled.

Usage

Disable CO and audible alarms when an existing device provides such capability.

Example

The following commands enable the SPIO card or SSC internal alarms and disable the central office alarms, respectively.

```
alarm audible

no alarm central-office
```

apn-profile

Creates an instance of an Access Point Name (APN) profile.

Platform

ASR 5000

Product

MME

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`[ no ] apn-profile` *`apn_profile_name`*

`no`

Deletes the APN profile instance from the configuration.

`apn_profile_name`

Specifies the name of the APN profile. Enter an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create an instance of an APN profile and to enter the APN profile configuration mode. An APN profile is a template which groups a set of APN-specific commands that may be applicable to one or more APNs. See the *APN Profile Configuration Mode Commands* chapter for information regarding the definition of the rules contained within the profile and the use of the profile.

Important: An APN profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what APN profiles have already been created, return to the Exec mode and enter the **`show apn-profile all`** command.

Example

The following command creates a configuration instance of an APN profile:

```
apn-profile apnprof27
```

apn-remap-table

Creates an instance of an Access Point Name (APN) remap table.

Platform

ASR 5000

Product

MME

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] apn-remap-table *apn_remap_table_name*

no

Deletes the APN remap table instance from the configuration.

apn_remap_table_name

Specifies the name of the APN remap table. Enter an alphanumeric string of 1 through 65 characters.

Usage

Use this command to create an instance of an APN remap table and to enter the APN remap table configuration mode. An APN remap table includes entries that define how an incoming APN, or the lack on one, will be handled. See the *APN Remap Table Configuration Mode Commands* chapter for information regarding the definition of the entries contained within the table and the use of the table.

Important: An APN remap table is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what APN remap tables have already been created, return to the Exec mode and enter the **show apn-remap-table all** command.

Example

The following command creates a configuration instance of an APN remap table:

```
apn-remap-table pnremap-USorigins-table1
```

arp

Configures a system-wide time interval for performing Address Resolution Protocol (ARP) refresh.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

arp base-reachable-time *time*

default arp base-reachable-time

default

Restores the parameter to its default setting.

time

Default: 30
Specifies the ARP refresh interval (in seconds) as an integer from 30 through 86400.

Usage

Use this command to configure a system-wide ARP refresh interval. Once a neighbor is found, the entry is considered valid for at least a random value between the *time*/2 and the *time**1.5.

Example

The following command configures an ARP refresh interval of 1 hour:

```
arp base-reachable-time 3600
```

autoconfirm

This command disables or enables confirmation for certain commands. This command affects all future CLI sessions.

Important: To change the behavior for the current CLI session only, use the **autoconfirm** command in the Exec Mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator, Operator

Mode

Exec > Global Configuration

configure

Syntax

autoconfirm

no autoconfirm

Usage

When autoconfirm is enabled, certain commands ask you to answer yes or no to confirm that you want to execute the command. When autoconfirm is disabled the confirmation questions never appear. Disabling autoconfirm disables command confirmation for all future CLI sessions.
By default **autoconfirm** is enabled.

Example

The following command enables command confirmation for all future CLI sessions;

```
autoconfirm
```

The following command disables command confirmation for all future CLI sessions;

```
no autoconfirm
```

autoless

This command is obsolete. It is included in the CLI for backward compatibility with older configuration files. When executed, this command issues a warning and performs no function.

banner

Configures the CLI banner which is displayed upon the start of a CLI session.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

banner { charging-service | lawful-intercept | motd | pre-login } *string*

no banner { charging-service | lawful-intercept | motd | pre-login }

no

Removes the banner message by setting it to be a string of zero length.

charging-service

Specifies the Active Charging Service banner message. The banner is displayed upon initialization of an SSH CLI session with ACS-admin privileges (whenever anyone with the CLI privilege bit for ACS logs on).

lawful-intercept

Refer to the *Lawful Intercept Configuration Guide* for a description of this parameter.

motd

Configures the CLI banner message of the day which is displayed upon the initialization of any CLI session.

pre-login

Configures the CLI banner displayed before a CLI user logs in.

Important: This banner is displayed only for serial port and telnet log ins. It is not supported in ssh and, therefore, will not be displayed before ssh log ins.

string

Specifies the banner or message to be displayed at session initialization. *string* may be an alphanumeric string of 0 through 2048 characters. The string must be enclosed in double quotation marks if the banner or message is to include spaces.

Usage

Set the message of the day banner when an important system wide message is needed. For example, in preparation for removing a chassis from service, set the banner 1 or more days in advance to notify administrative users of the pending maintenance.

Example

```
banner motd "Have a nice day."

banner motd No_News_Today

no banner motd
```

boot delay

Configures the delay period, in seconds, before attempting to boot the system from a software image file residing on an external network server.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

boot delay *time*

no boot delay

no

Deletes the setting for the boot delay. The boot process executes immediately.

time

Specifies the amount of time (in seconds) to delay prior to requesting the software image from the external network server as an integer from 1 through 300.

Usage

Useful when booting from the network when connection delays may cause timeouts. Such as when the Spanning Tree Protocol is used on network equipment.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following sets the boot delay to *10* seconds:

```
boot delay 10
```

boot interface

Configures Ethernet network interfaces for obtaining a system software image during the system boot process.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

Releases prior to 12.2:

boot interface { spio-eth1 | spio-eth2 } [medium { auto | speed *medium_speed* **duplex** *medium_duplex* **} [media** *medium_media* **]]no boot interface**

Releases after 12.2:

boot interface { local-eth1 | local-eth2 } [medium { auto | speed *medium_speed* **duplex** *medium_duplex* **} [media** *medium_media* **]]no boot interface**

no

Removes the boot interface configuration from the boot.sys file. Only files from the local file system can be loaded.

spio-eth1 | spio-eth2

Specifies the network interface to be configured where **spio-eth1** is the primary interface on the SPIO (slot 24 interface 1 or slot 25 interface 1) and **spio-eth2** is the secondary interface on the SPIO (slot 24 interface 2 or slot 25 interface 2). The interfaces are either RJ-45 ifor speeds of 10, 100, or 1000 megabits per second (Mbps), or SFP for the optical Gigabit (1000 Mbps).

local-eth1 | local-eth2

Specifies the network interface to be configured where **local-eth1** is the primary ethernet interface and **local-eth2** is the secondary ethernet interface.
For the ASR 5000, the primary is interface 1 on the SPIO and the secondary is interface 2 on the SPIO. The interfaces are either RJ-45 ifor speeds of 10, 100, or 1000 megabits per second (Mbps), or SFP for optical Gigabit (1000 Mbps).
For the ASR 5500, the primary is port 1 (1000Base-T) on the MIO and the secondary interface is port 2 (1000Base-T) on the MIO.

medium { auto | speed *medium_speed* **duplex** *medium_duplex* **}**

Default: auto

auto: configures the interface to auto-negotiate the interface speed. and duplex.
speed *medium_speed* **duplex** *medium_duplex*: specifies the speed to use at all times where *medium_speed* must be one of:

- 10
- 100
- 1000

The keyword **duplex** is used to set the communication mode of the interface where *medium_duplex* must be one of:

- full
- half

---

media *medium_media*

Default: rj45
Optionally sets the physical interface where *medium_media* must be either rj45 or sfp.

Usage

Modify the boot interface settings to ensure the system is able to obtain a software image from an external network server.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following configures the primary interface to auto-negotiate the speed.

```
boot interface spio-eth1 medium auto

boot interface local-eth1 medium auto
```

The following command configures the secondary interface to a fixed gigabit speed at full duplex using RJ45 connectors for the physical interface.

```
boot interface spio-eth2 medium speed 1000 duplex full media rj45

boot interface local-eth2 medium speed 1000 duplex full media rj45
```

The following restores the defaults for the boot interface.

```
no boot interface
```

boot nameserver

Configures the IP address of the DNS (Domain Name Service) server to use when looking up hostnames in URLs for network booting.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

boot nameserver *ip_address*

no boot nameserver

no

Removes the network boot nameserver information from the boot.sys file.

ip_address

IPv4 dotted-decimal address of the DNS server the system uses to lookup hostnames in URLs for a software image from the network during the system boot process.

Usage

Use this command to identify the DNS server to use to lookup hostnames in a software image URL.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following configures the system to communicate with a DNS nameserver with the IP address of 10.2.3.4:

```
boot nameserver 10.2.3.4
```

boot networkconfig

Configures the networking parameters for the Switch Processor I/O card network interfaces to use when obtaining a software image from an external network server during the system boot process.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

boot networkconfig { dhcp | { { dhcp-static-fallback | static } ip address spio24 *ip_address* **[spio25** *ip_address* **] netmask** *ip_mask* **[gateway** *gw_address* **] } }**

no boot networkconfig

no

Removes the network configuration information from the boot.sys file.

dhcp

Indicates that a Dynamic Host Control Protocol (DHCP) server is used for communicating with the external network server.

dhcp-static-fallback | static

dhcp-static-fallback: provides static IP address fallback network option when a DHCP server is unavailable.
static: specifies a fixed network IP address for the external network server that hosts the software image.

spio24 *ip_address* **[spio25** *ip_address* **] netmask** *ip_mask* **[gateway** *gw_address* **]**

spio24 *ip_address* [**spio25** *ip_address*]: the IP address to use for the SPIO in slot 24 and optionally the SPIO in slot 25 for network booting. *ip_address* must be specified using IPv4 dotted-decimal notation.
netmask *ip_mask*: the network mask to use in conjunction with the IP address(es) specified for network booting. *ip_mask* must be specified using IPv4 dotted-decimal notation.
gateway *gw_address*: the IP address of a network gateway to use in conjunction with the IP address(es) specified for network booting. *gw_address* must be entered using IPv4 dotted-decimal notation.

Important: If *gw_address* is not specified, the network server must be on the same LAN as the system. Since both SPIOs must be in the same network, the netmask and gateway settings are shared.

Usage

Configure the network parameters for the ports on the SPIO cards to use to communicate with an external network server that hosts software images.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Important: When configuring static addresses both SPIOs must have different IP addresses. Neither address can be the same as the local context IP address.

Example

The following configures the system to communicate with the external network server via DHCP with a fallback to IP address *192.168.100.10*, respectively.

```
boot networkconfig dhcp-static-fallback ip address spio24 192.168.100.10
netmask 255.255.255.0
```

The following command configures the system to communicate with an external network server using the fixed (static) IP address *192.168.100.10* with a network mask of *255.255.255.0*.

```
boot networkconfig static ip address spio24 192.168.100.10 netmask
255.255.255.0
```

The following restores the system default for the network boot configuration options.

```
no boot networkconfig
```

boot system priority

Specifies the priority of a boot stack entry to use when the system first initializes or restarts. Up to 10 boot system priorities (entries in the boot.sys file located in the /flash device in the SPC, SMC or MIO) can be configured.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

boot system priority *number* **image** *image_url* **config** *config_path*

no boot system priority *number*

no

Remove a boot stack entry at the priority specified from the boot stack when it is no longer used.

priority *number*

Specifies the priority for the file group (consisting of an image (.bin) and its corresponding configuration (.cfg) file) specified in the boot stack. The value must be in the range from 1 through 100 where a priority of 1 is the highest. Up to 10 boot system priorities (boot stack entries) can be configured.

Important: When performing a software upgrade it is important that the new file group have the highest priority (lowest value) configured.

Important: To ensure that higher priority numbers remain open, use an "N-1" priority numbering methodology, where "N" is the first priority in the current boot stack.

image *image_url*

Specifies the location of a image file to use for system startup. The URL may refer to a local or a remote file. The URL must be formatted according to the following format:
For the ASR 5000:

- **[file:]{ /flash | /pcmcia1 | /hd }[/***directory* **]/***filename*
- **[http: | tftp:]//***host***[:***port* **][/***directory* **]/***filename*

Important: Use of the SMC hard drive is not supported in this release.

Important: Do not use the following characters when entering a string for the field names below: "/" (forward slash), ":" (colon) or "@" (at sign).

directory is the directory name.
filename is the actual file of interest.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

Important: A file intended for use on an ASR 5000 uses the convention xxxxx.asr5000.bin, where xxxxx is the software build number.

Important: When using the TFTP, it is advisable to use a server that supports large blocks, per RFC 2348. This can be implemented by using the "block size option" to ensure that the TFTP service does not restrict the file size of the transfer to 32MB.

config *config_path*

Specifies the location of a configuration file to use for system startup. This must be formatted according to the following format:
For the ASR 5000:

- **[file:]{ /flash | /pcmcia1 | /hd }[/***path* **]/***filename*

Important: Use of the SMC hard drive is not supported in this release.

Where *path* is the directory structure to the file of interest, and *filename* is the name of the configuration file. This file typically has a **.cfg** extension.

Usage

This command is useful in prioritizing boot stack entries in the boot.sys file, typically located on the /flash device of the Active SPC, SMC, or MIO, for automatic recovery in case of a failure of a primary boot file group.

Important: The configuration file must reside on the SPC's, SMC's, or MIO's local filesystem, stored on one of its local devices (/flash, or /pcmcia1, or /hd-raid/pcmcia1, or /pcmcia2, or /usb1, or /hd-raid). Attempts to load the configuration file from an external network server will result in a failure to load that image and configuration file group, causing the system to load the image and configuration file group with the next highest priority in the boot stack.

Important: Configuration changes do not take effect until the system is reloaded.

Important: The settings for this command are stored immediately in the boot.sys file. No changes are made to the system configuration file.

Example

The following commands set up two locations to obtain a boot file group from.

```
boot system priority 1 image tftp: //remoteABC/pub/2012jan.bin config
/flash/pub/data/2012feb.cfg

boot system priority 2 image /flash /pub/data/2002jun.bin config
/pcmcia1/pub/data/2012feb.cfg
```

The following removes the current priority **1** boot entry from the boot.sys file.

```
no boot system priority 1
```

bulkstats

Enables the collection of bulk statistics by the system and/or enters the bulk statistic configuration mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

bulkstats { collection | historical | mode }

no bulkstats collection

collection

Enables the statistics collection process. Collects a period snapshot of data, such as “here is what the value is right now”.

historical collection

Enables the system to collect historical bulk statistics.
If enabled, the system keeps track of some things which require the storing of more data, such as “the highest value that’s been seen over the last 24 hours”.

mode

Enters the bulk statistics configuration mode. The resulting command-line prompt will look similar to:

```
[<context-name>]asr5000(config-bulkstats)#
```

no

Disables the collection of bulk statistics.

Usage

The Bulk Statistics Configuration Code consists of commands for configuring bulk statistic properties, such as the period of collection. Bulk Statistics configuration mode commands are defined in the *Bulk Statistics Configuration Mode Commands* chapter.
The system can be configured to collect bulk statistics and send them to a collection server (called a receiver). Bulk statistics are statistics that are collected in a group or schema, for example, system statistics, port statistics, radius statistics.
Once bulk statistics receiver, schema, and collection properties are configured, this **bulkstats** command is used to enable or disable the collection of the data.

To collect a sample that will provide an average, for example, an average of CPU counters, the "historical" features must be enabled with the **bulkstats historical collection** command.
Since bulk statistics are collected at regular, user-defined intervals, the **bulkstats force** command in the Exec Mode can be used to manually initiate the collection of statistics at any time.

Example

```
bulkstats collection

bulkstats mode

no bulkstats collection
```

ca-certificate

Configures and selects an X.509 CA root certificate to enable a security gateway or SCM to perform certificate-based peer (client) authentication. The system supports a maximum of 16 certificates and 16 CA root certificates. A maximum of four CA root certificates can be bound to a crypto or ssl template.

Platform

ASR 5000

Product

FNG

SCM (P-CSCF, A-BG)

Privilege

Administrator, Security Administrator, Operator

Mode

Exec > Global Configuration

configure

Syntax

ca-certificate name *name* **pem { data** *pemdata* **| url** *url* **}**

no ca-certificate name *name*

no

Disables ca-certificate.

---

name *name*

Names the CA certificate. *name* must be an alphanumeric string of 1 through 128 characters.

---

pem

Specifies that the Privacy-enhanced Electronic Mail (PEM) format is to be used.

---

data *pemdata*

CA certificate data in PEM format. *pemdata* must be an alphanumeric string of 1 through 4095 characters.

---

url *url*

URL of the file containing CA certificate in PEM. *url* must be an existing URL expressed in one of the following formats:

- `[file:]{/flash | /pcmcia1 | /hd-raid}[/directory]/<filename`
- `tftp://<host>[:<port>][/<directory>]/<filename`
- `ftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `sftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `http://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`

When read via a file, note that **show configuration** will not contain the URL reference, but will instead output the data via **data pemdata**, such that the configuration file is self-contained.

no

Removes the named CA certificate.

Usage

In addition to the X.509 certificate-based gateway authentication method and the PSK (Pre-Shared Key) and EAP-AKA (Extensible Authentication Protocol - Authentication and Key Agreement) peer (client) authentication methods, the FNG and SCM support X.509 certificate-based peer authentication.
The FNG checks the network policy on whether a FAP is authorized to provide service. If the network policy states that all FAPs that pass device authentication are authorized to provide service, no further authorization check may be required. If the network policy requires that each FAP be individually authorized for service (in the case where the FEID is associated with a valid subscription), the FNG sends a RADIUS Access-Request message to the AAA server. If the AAA server sends a RADIUS Access-Accept message, the FNG proceeds with device authentication. Otherwise, the FNG terminates the IPSec tunnel setup by sending an IKEv2 Notification message indicating authentication failure.
The operator/administrator is responsible for configuring the certificates through the CLI. The system will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named *fap1*:

```
no ca-certificate data fap1
```

ca-crl

Configures the name and URL path of a Certificate Authority-Certificate Revocation List (CA-CRL).

Platform

ASR 5000

Product

FNG

HNB-GW

PDG/TTG

PDIF

SCM (P-CSCF A-BG)

S-GW

Privilege

Operator

Mode

Exec > Global Configuration

configure

Syntax

ca-crl name *name* **{ der | pem } { url** *url* **}**

no ca-crl name *name*

---

no

Removes the named CA-CRL.

---

name

Provides a name of the CA-CRL. *name* must be an alphanumeric string of 1 through 128 characters.

---

der

Specifies that the Distinguished Encoding Rules (DER) format is to be used for the source format.

---

pem

Specifies that the Privacy-enhanced Electronic Mail (PEM) format is to be used for the source format.

---

url *url*

Specifies the URL where the CA-CRL is to be fetched. *url* must be an existing URL expressed in one of the following formats:

- `[file:]{/flash | /pcmcia1 | /hd-raid}[/directory]/<filename`
- `tftp://<host>[:<port>][/<directory>]/<filename`
- `ftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `sftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`

- `http://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`

Usage

Use this command to name and fetch a CA-CRL from a specified location.
Without additional information from the CA, an issued certificate remains valid to any verifier until it expires. To revoke certificates, the CA publishes a CRL periodically to provide an updated list of certificates revoked, but not yet expired. Like a certificate, a CRL is a digital document signed by the CA. In addition to a list of serial numbers of revoked certificates, the CRL includes attributes such as issuer name (same as the issuer name in the certificate), signature (signed by the issuer using the same key that signs certificates), last update (the time this CRL was issued), and next update (the time next CRL will be available).

Example

The following command fetches a CA-CRL named *list1.pem* from a *host.com/CRLs* location and names the list *CRL5*:

```
ca-crl name CRL5 pem url http://host.com/CRLs/list1.pem
```

call-control-profile

Creates an instance of a call-control profile.

Platform

ASR 5000

Product

MME

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] call-control-profile *cc_profile_name*

no

Deletes the Call-Control Profile instance from the configuration.

cc_profile_name

Specifies the name of the call-control profile. Enter an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create an instance of a call-control profile and to enter the call-control profile configuration mode. A call-control profile is a template which groups a set of call-handling instructions that may be applicable to one or more incoming calls. See the *Call-Control Profile Configuration Mode Commands* chapter for information regarding the definition of the rules contained within the profile and the use of the profile.

Important: A call-control profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what call-control profiles have already been created, return to the Exec mode and enter the **show call-control-profile all** command.

Example

The following command creates a configuration instance of an call-control profile:

```
call-control-profile ccprof1
```

card

Enters the card configuration mode for the card specified.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`card` *`number`*

`number`

Specifies the number of the card for which the card configuration mode is to be entered. *`number`* must be an integer from 1 through 48 (on the ASR 5000) or 1 through 20 (on the ASR 5500).

Usage

Enter the configuration mode for a specific card when changes a required.

Important: This command is not supported on all platforms.

Example

```
card 8
```

card-standby-priority

Configures the redundancy priorities for packet processing cards by specifying the slot number search order for a standby card when needed.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`card-standby-priority` *`slot_num`* **`[`** *`slot_num`* **`]`** **`[`** *`slot_num`* **`]`** **`...`**

`slot_num`

Specifies the slot of the card for the order of the standby cards. *`slot_num`* must be in the range from 1 through 16 excluding slots 8 and 9 (on the ASR 5000) or 1 through 10 excluding slots 5 and 6 (on the ASR 5500). *`slot_num`* may be repeated as many times as necessary to indicate the complete search order.

Usage

Set the standby order of the redundant cards when multiple standby cards are available. Questionable hardware should be placed lower in the priority list.

Important: This command replaces the **`pac-standby-priority`** command.

Important: This command is not supported on all platforms.

Example

The following command configures the redundancy priority to use the standby cards in slots 16, 14, and 12 in that order:

```
card-standby-priority 16 14 12
```

cdr-multi-mode

This command enables multiple instances of CDRMOD, one per packet processing card.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
[ default ] cdr-multi-mode
```

default

Configures this command with its default setting.
Default: Single-CDRMOD mode

Usage

Use this command to enable the multi-CDRMOD mode, wherein there will be one instance of CDRMOD per packet processing card. All the SessMgr instances that are running on a packet processing card will send the records to the CDRMOD instance running on that card.
By default, CDRMOD runs in single mode, wherein there will be only one instance of CDRMOD running for the entire chassis. All the SessMgr instances that are running on a packet processing card will send the records to the CDRMOD instance.

Important: For changes to this command to take effect, save the configuration and reboot the system.

Important: In multi-CDRMOD mode, you should enable hard-disk usage.

certificate

Configures and selects an X.509 Trusted Author certificate.

Platform

ASR 5000

Product

ACS

ePDG

FNG

PDG/TTG

PDIF

SCM (P-CSCF A-BG)

Privilege

configure

Syntax

certificate name *name* **pem { data** *pemdata* **| url** *url* **} private-key pem { [encrypted] data** *pemdata* **| url** *url* **}**

no certificate name *name*

no

Disables certificate.

name *name*

Names the certificate. *name* must be from 1 to 128 alphanumeric characters.

pem

Specifies that the Privacy-enhanced Electronic Mail (PEM) format is to be used.

data *pemdata*

Certificate/private key data in PEM format. *pemdata* must be an alphanumeric string of 1 through 4095 (certificate) or 1 through 8191 (private key) characters.

url *url*

URL of the file containing certificate/private key in PEM. *url* must be an existing URL expressed in one of the following formats:

- `[file:]{/flash | /pcmcia1 | /hd-raid}[/directory]/<filename`
- `tftp://<host>[:<port>][/<directory>]/<filename`
- `ftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`

- `sftp://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`
- `http://[<username>[:<password>]@]<host>[:<port>][/<directory>]/<filename`

When read via a file, **show configuration** will not contain the URL reference, but instead outputs the data via **data** *pemdata*, such that the configuration file is self-contained.

private-key

Private key data.

encrypted

Encrypted private key data.

no

Removes the named certificate.

Usage

A certificate authority or certification authority (CA) is an entity which issues digital certificates for use by other parties. It is an example of a trusted third party. CAs are characteristic of many public key infrastructure (PKI) schemes.
If CERT information is configured, the system will include the CERT payload in the first IKE_AUTH Response during the first authentication. The system stores its own certificate for use in the first AUTH calculation. MS will not have its own certificate from CA. Still, it will be capable of accepting a certificate from the system and verify AUTH.
The operator/administrator is responsible for configuring the certificates through the CLI. The system will generate an SNMP notification when the certificate is within 30 days of expiration, and then once a day.

Example

Use the following command to remove a certificate named *box1*:

```
no certificate data box1
```

cli

Configures global Command Line Interface (CLI) parameters.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

cli { access { monitor-protocol | monitor-subscriber | show-configuration } { administrator | operator } } | configuration-monitor | login-failure-delay number | max-sessions number | operator clear-subscriber-one-only | trap config-mode }

no cli { configuration-monitor | hidden | login-failure-delay number | max-sessions | operator clear-subscriber-one-only | trap config-mode }

default cli { access { monitor-protocol | monitor-subscriber | show-configuration } | configuration-monitor | login-failure-delay | max-sessions | operator clear-subscriber-one-only | trap config-mode }

no

Removes the specified option.

default

Resets the keywords to their default values.

access { monitor-protocol | monitor-subscriber | show-configuration } { operator | administrator }

Sets access privileges on the **monitor protocol** and **monitor subscriber** commands:
monitor-protocol: Selects privileges for the **monitor protocol** command.
monitor-subscriber: Selects privileges for the **monitor subscriber** command.
show-configuration: Selects privileges for the **show-configuration**command. However the default access level for this command is the user with operator privileges.
operator: Sets the privileges for the selected command to allow use by users with operator privileges.
administrator: Restricts use of the selected command to administrators only.

login-failure-delay *number*

Specifies the time to wait before a login failure is returned and another login may be attempted. Default is five seconds.

max-sessions *number*

Sets the number of allowed simultaneous CLI sessions on the system. If this value is set to a number below the current number of open CLI sessions, the open sessions will continue until closed. *number* must be an integer from 2 through 100.

Caution: Use caution when setting this command. Limiting simultaneous CLI sessions prevents authorized users from accessing the system if the maximum number allowed has been reached. The system already limits CLI sessions based on available resources. Additional limitation could have adverse effects.

operator clear-subscriber-one-only

Restricts Operator to clearing only one subscriber session at a time.

trap config-mode

Enables sending an SNMP notification (trap) when a CLI user enters the configuration mode.

Usage

This command sets access parameters and enables several operational parameters for the system's command line interface.

Example

The following command sets the number of allowed simultaneous CLI sessions to *5*.

```
cli max-sessions 5
```

The following command sets the command **monitor protocol** to administrator-only

```
cli access monitor-protocol administrator
```

clock

Configures system clock timezone and what local time zone to use.

- us-indiana (GMT-6:00; Indiana)

- us-mountain (GMT-7:00; Cheyenne, Denver, Las Vegas)
- us-pacific (GMT-8:00) San Francisco, LA, Seattle
- utc (GMT; Universal Time Coordinated: London, Dublin, Edinburgh, Lisbon, Reykjavik, Casablanca)

local

Indicates the timezone specified by *tz* is to be considered the local time zone for local time display and conversion.

Usage

Clock and timezone management is necessary for proper accounting records. The chassis may be set to display a different local time than that of the system clock which allows accounting records to use the system time but to display the proper local time for users.

Example

```
clock timezone utc

clock timezone us-indiana local

no clock timezone
```

congestion-control overload-disconnect

This command enables and disables the policy for disconnecting passive calls (chassis-wide) during an overload situation. It also configures and fine-tunes the overload-disconnect congestion control policy for an entire chassis.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

congestion-control overload-disconnect [iterations-per-stage *integer* **| percent** *percentage_value* **| threshold { license-utilization** *percentage_value* **| max-sessions-per-service-utilization** *percentage_value* **| tolerance** *number* **}]**

default congestion-control overload-disconnect [iterations-per-stage | percent | threshold { license-utilization | max-sessions-per-service-utilization | tolerance }]

no congestion-control overload-disconnect

default

When "default" and one of the keywords is added to the command, the policy remains in its current state and the value for the specified keyword is reset to its default value.
When "default" and the command are entered without keywords, the overload-disconnect policy for congestion control is disabled.

no

Disables the overload-disconnect policy for congestion control.

iterations-per-stage *integer*

Specifies the number of calls to be disconnected during the defined number of seconds. *integer* is a value from 2 through 8. The default value is 8.

percent *percentage_value*

Specifies the percentage of calls to be disconnected, in stages, during an overload situation. *percentage_value* is an integer from 1 through 100. The default value is 5.

threshold

license-utilization: Specifies the license-utilization percentage threshold for overload situations. If candidates are available, passive calls are disconnected when this threshold is exceeded. *percentage_value* is an integer from 1 through 100. The default value is 80.

max-sessions-per-service-utilization: Specifies a percentage of the maximum sessions per service. If candidates are available, passive calls are disconnected when this threshold is exceeded. *percentage_value* is an integer from 1 through 100. The default value is 80.
tolerance: Specifies the percentage of calls the system disconnects below the values set for the other two thresholds. In either case, a Clear Traps message is sent after the number of calls goes below the corresponding threshold value. *number* is an integer from 1 through 25. The default value is 10.

Usage

Use this command to set the policy for call disconnects when the chassis experiences call overload.
To verify the congestion-control configuration use **show congestion-control configuration** from the Exec mode.
To set overload-disconnect policies for individual subscribers., see **overload-disconnect** in Subscriber Configuration Mode Commands.

Example

The following command sets an overload-disconnect policy for the chassis in which 5 calls would be disconnected very 5 seconds during an overload situation.

```
congestion-control overload-disconnect interations-per-stage 5
```

Both of the following commands disable the overload-disconnect policy without changing the policy configuration.

```
default congestion-control overload-disconnect
```

or

```
no congestion-control overload-disconnect
```

To instruct the system to stop call disconnects when the number of calls goes down 85% of the total allowed calls for that service, enter both of the following commands to set the max-sessions-per-service-utilization value to 90% and the tolerance value to 5%:

```
congestion-control overload-disconnect threshold max-sessions-per-
service-utilization 90

congestion-control overload-disconnect threshold tolerance 5
```

congestion-control policy

Configures congestion control policies.

default

Specifies the Congestion Control policy action for the selected service to its default value.

asngw-service

Specifies the Congestion Control policy action for the ASN-GW service.

asnpc-service

Specifies the Congestion Control policy action for the ASN PC-LR service.

cscf-service

Specifies the Congestion Control policy action for the CSCF service.

fng-service

Specifies the Congestion Control policy action for the FNG service.

ggsn-service

Specifies the Congestion Control policy action for the GGSN service.

ha-service

Specifies the Congestion Control policy action for the HA service.

hnbgw-service

Specifies the Congestion Control policy action for the HNB-GW service.
Supported policy actions are:

- **drop**: Specifies that the system should drop incoming packets containing new session requests.
- **none**: Specifies that the system should take no action.
- **reject**: Specifies that the system processes new session request messages and responds with a reject message.

lma-service

Specifies the Congestion Control policy action for the LMA service

lns-service

Specifies the Congestion Control policy action for the LNS service.

mipv6ha-service

Specifies the Congestion Control policy action for the MIPv6-HA service.

mme-service

Sets the congestion control policy for action to take when subscriber sessions exceeds the defined threshold limit.
For MME type of session/calls, **redirect** action is not supported.

pdg-service

Specifies the Congestion Control policy action for the PDG service.

pdif-service

Specifies the Congestion Control policy action for the PDIF service.

pdsn-service

Specifies the Congestion Control policy action for the PDSN service.

sgsn-service

Specifies the Congestion Control policy action for the SGSN service.

action { drop | none | redirect | reject }

Specifies the policy action:

- **drop**: Specifies that the system should drop incoming packets containing new session requests. (PDSN, GGSN, ASN GW, LMA, MME, and ASN PC and HA only)

- **none**: Specifies that the system should take no action. This is the default for PDIF-service.
- **redirect**: Specifies that the system should redirect new session requests to an alternate device. (PDSN and HA only)

  Important: If this option is used, the IP address of the alternate device must be configured using the **policy overload redirect** command that is part of the service configuration. Note that this option can not be used in conjunction with GGSN and MME services.

- **reject**: Specifies that the system processes new session request messages and responds with a reject message. (For PDSN and HA, the reply code is 130, "insufficient resources". For the GGSN, the reply code is 199, "no resources available".)

report-overload { permit-emergency-sessions | reject-new-sessions | reject-non-emergency-sessions } enodeb-percentage *percentage*

Important: This set of keywords is supported only by the MME.

Enables the MME to report overload conditions to eNodeBs and take additional action to alleviate congestion situations.
permit-emergency-sessions: Specifies that only emergency sessions are allowed to access the MME during the overload period.
reject-new-sessions: Specifies that all new sessions destined for the MME will be rejected during the overload period.
reject-non-emergency-sessions: Specifies that all non-emergency sessions will be rejected during the overload period.
enodeb-percentage *percentage*: Configures the percentage of known eNodeBs that will receive the overload report. *percentage* must be an integer from 1 to 100.

Usage

Congestion policies can be configured for each service. When congestion control functionality is enabled, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures a congestion control policy of reject for PDSN services:

```
congestion-control policy pdsn-service action reject
```

The following command configures a congestion control policy of reject for MME services:

```
congestion-control policy mme-service action reject
```

congestion-control threshold

Configures the congestion control threshold values that are to be monitored.

Platform

ASR 5000

Mode

Exec > Global Configuration

configure

Syntax

congestion-control threshold { license-utilization *percent* **| max-sessions-per-service-utilization** *percent* **| message-queue-utilization** *percent* **| message-queue-wait-time** *time* **| port-rx-utilization** *percent* **| port-specific {** *slot/port* **| all } [tx-utilization** *percent* **] [rx-utilization** *percent* **] port-specific-rx-utilization critical | port-specific-tx-utilization critical | port-tx-utilization** *percent* **| service-control-cpu-utilization** *percent* **| system-cpu-utilization** *percent* **| system-memory-utilization** *percent* **| tolerance** *percent* **}**

default congestion-control threshold { license-utilization | max-sessions-per-service-utilization | message-queue-utilization | message-queue-wait-time | port-rx-utilization | port-specific | tx-utilization | rx-utilization | port-tx-utilization | service-control-cpu-utilization | system-cpu-utilization | system-memory-utilization | tolerance }

no congestion-control threshold port-specific { *slot/port* **| all }**

no congestion-control threshold port-specific { *slot/port* **| all } [rx-utilization** *percent* **] [tx-utilization** *percent* **]**

no congestion-control threshold port-specific-rx-utilization critical

no congestion-control threshold port-specific-tx-utilization critical

no congestion-control threshold { message-queue-utilization | message-queue-wait-time | port-rx-utilization *percent* **| port-tx-utilization percent | service-control-cpu-utilization | system-cpu-utilization | system-memory-utilization }**

---

default congestion-control threshold *keyword*

Sets the threshold keyword to its default value.

---

no congestion-control threshold port-specific { slot/port | all }

This command disables port specific threshold monitoring on the specified port or on all ports.
slot/port: Specifies the port for which port specific threshold monitoring is being configured. The slot and port must refer to an installed card and port.
all: Set port specific threshold monitoring for all ports on all cards.

no congestion-control threshold port-specific-rx-utilization critical

This command disables specific receive port utilization.

no congestion-control threshold port-specific-tx-utilization critical

This command disables specific transmit port utilization.

license-utilization *percent*

Default: 100
The percent utilization of licensed session capacity as measured in 10 second intervals.
percent can be configured to any integer value from 0 to 100.

max-sessions-per-service-utilization *percent*

Default: 80
The percent utilization of the maximum sessions allowed per service as measured in real-time. This threshold is based on the maximum number of sessions or PDP contexts configured for the a particular service. (Refer to the **bind** command for the PDSN, GGSN, SGSN, or HA services.)
percent can be an integer from 0 through 100.

message-queue-utilization *percent*

Default: 80
The percent utilization of the Demux Manager software task's message queue as measured in 10 second intervals. The queue is capable of storing a maximum of 10000 messages.
percent can be an integer from 0 through 100.

message-queue-wait-time *time*

Default: 5
The maximum time (in seconds) messages can be held in queue as measured by packet time stamps.
time is measured in seconds and can be an integer from 1 through 30.

Important: In the event that this threshold is crossed, an SNMP trap is not triggered. The service congestion policy invocation resulting from the crossing of this threshold is enforced only for the packet that triggered the action.

[no] port-rx-utilization *percent*

Default: 80
The average percent utilization of port resources for all ports by received data as measured in 5-minute intervals.
percent can be an integer from 0 through 100.

[no] port-specific { *slot/port* **| all } [rx-utilization** *percent* **] [tx-utilization** *percent***]**

Default: Disabled
Sets port-specific thresholds. If you set port-specific thresholds, when any individual port-specific threshold is reached, congestion control is applied system-wide.
slot/port: Specifies the port for which port-specific threshold monitoring is being configured. The slot and port must refer to an installed card and port.
all: Set port specific threshold monitoring for all ports on all cards.

rx-utilization *percent*: Default 80%. The average percent utilization of port resources for the specified port by received data as measured in 5-minute intervals. *percent* must an integer from 0 through 100.
tx-utilization *percent*: Default 80%. The average percent utilization of port resources for the specified port by transmitted data as measured in 5-minute intervals. *percent* must be an integer from 0 through 100.

[no] port-tx-utilization *percent*

Default: 80
The average percent utilization of port resources for all ports by transmitted data as measured in 5-minute intervals.
percent can be an integer from 0 through 100.

service-control-cpu-utilization *percent*

Default: 80
The average percent utilization of CPUs on which a Demux Manager software task instance is running as measured in 10-second intervals.
percent can be an integer from 0 through 100.

system-cpu-utilization *percent*

Default: 80
The average percent utilization for all PSC/PSC2 CPUs available to the system as measured in 10-second intervals.
percent can be an integer from 0 through 100.
This threshold setting can be disabled with **no congestion-control threshold system-cpu-utilization** command. In case later you want to enable the same threshold setting **congestion-control threshold system-cpu-utilization** command will enable the CPU utilization threshold to preconfigured level.

system-memory-utilization *percent*

Default: 80
The average percent utilization of all CPU memory available to the system as measured in 10-second intervals.
percent can be an integer from 0 through 100.

tolerance *percent*

Default: 10
The percentage under a configured threshold that dictates the point at which the condition is cleared.
percent can be an integer from 0 through 100.

Usage

Thresholds dictate the conditions for which congestion control is to be enabled and establish limits for defining the state of the system (congested or clear). These thresholds function in a similar fashion to the operation thresholds that can be configured for the system (as described in later in this chapter). The primary difference is that when these thresholds are reached, not only is an SNMP trap generated (starCongestion), but a service congestion policy is invoked as well.
The tolerance parameter establishes the threshold at which the condition is cleared. An SNMP trap (starCongestionClear) is generated for the clear condition, as well.

Important: The MME (version 14.0 and higher) supports three levels of thresholds – critical, major and minor – for each condition. Refer to the **congestion-control threshold** commands immediately following this command for information specific to the MME.

Example

The following command configures a system CPU utilization threshold of 75%.

```
congestion-control threshold system-cpu-utilization 75
```

This setting will remain in configuration unless you specify another threshold value in place of 75. This threshold setting can be disabled with **no congestion-control threshold system-cpu-utilization** command but cannot be removed from configuration. Later if you want to enable the previously configured threshold value of *75* percent, you only need to enter the **congestion-control threshold system-cpu-utilization** command without specifying any threshold value. It will enable the CPU utilization threshold to preconfigured level of *75* percent.
For example, **no congestion-control threshold system-cpu-utilization** disables the configured threshold setting and **congestion-control threshold system-cpu-utilization** again enables the threshold setting of 75%.
The following command configures a threshold tolerance of 5%:

```
congestion-control threshold license-utilization tolerance 5
```

In the above examples, the starCongestion trap gets triggered if the license utilization goes above 75% and the starCongestionClear trap gets triggered if it reaches or goes below 70%.

content-filtering category database directory

This command configures the base directory to be used for storing all content-rating databases that are required for Category-based Content Filtering application.

Platform

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

content-filtering category database directory path *directory_path*

default content-filtering category database directory path

default

Specifies the default base directory and directory path for Category-based Content Filtering application.

directory_path

Default: /pcmcia1/cf
Specifies the base directory and its path to store all of the full or incremental content rating databases for the Category-based Content Filtering application.
directory_path must be an alphanumeric string of 1 through 255 characters.

Usage

Use this command to specify the directory and its path to download all full or incremental category-rating databases to be used for the Category-based Content Filtering application.
Merging of incremental database can be done as part of the database upgrade process preformed with **upgrade content-filtering category database** command in the Executive Mode.

Example

The following command configures the */flash/cf_temp/DB* as the base directory to download all full and incremental content-rating databases for content filtering application.

```
content-filtering category database directory path /flash/cf_temp/DB
```

content-filtering category database max-versions

This command configures the number of full content-rating databases to maintain/archive in the base directory for category-based content filtering application.

Platform

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

content-filtering category database max-versions *num_archive*

default content-filtering category database max-versions

default

Sets the default number of full databases for specified directory path/location.

num_archive

Default: 2
Specifies the maximum number of database to be archived or maintained in the specific location.
num_archive must be an integer from 1 through 3.

Usage

Use this command to set the number of full content-rating database to be maintained in the specified directory path with the base file name specified using the **content-filtering database override file** command. The specified directory path is the location specified using the **content-filtering category database directory path** command.

Example

The following command configures the system to maintain *3* full content-rating databases for category-based content filtering application.

```
content-filtering category database max-versions 3
```

content-filtering category database override

This command specifies the name of a file to be used by the category-rating database load process for category-based content filtering application.

Platform

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

content-filtering category database override file *file_name.extension*

default content-filtering category database override file

default

Sets the default content rating database file name; for example, optcmd.bin.

file *file_name.extension*

Specifies the header of the file in the database directory path location to determine the newest full database. *file_name* must be an alphanumeric string of up to 10 characters with an extension of 3 characters after a period (.) as *extension*.

Usage

Use this command to configure the category-rating database file name to determine the newest version of full database. A process called "**LOAD_DATABASE**" invokes during the system startup or the database upgrade process by **upgrade content-filtering category database** command in Executive Mode. This process examines the header of each of the files in the database folder specified by **content-filtering category directory path** command in this mode.
Note that by default system examines the header of those files only which begins with the string "OPTCMDB" and having extension ".bin".

Example

The following command configures the system to examine the header of files that begins with *CF_sta.DB* only for content filtering application.

```
content-filtering category database override file CF_sta.DB
```

context

Enters the Context Configuration mode or is used to add or remove a specified context.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

context *name* **[-noconfirm]**

no context *name*

no

Removes the specified context from the configuration.

name

Specifies the name of a context to enter, add, or remove. When creating a new context, the context name must be unique.

Important: When creating a new context, the *context name* specified must not conflict with the name of any existing context or domain names.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Configure contexts or remove obsolete contexts.

Important: A maximum of 64 contexts may be created.

Example

```
context sampleContext

no context sampleContext
```

crash enable

Enables or disables the copying of crash data to a specified location.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

crash enable [encrypted] url *crash_url* **[filename-pattern** *pattern* **] [restrict** *mbyte* **]**

no crash enable

no

Removes the specified context from the configuration.

Important: System crash information is generated and stored in the crash list even when the **no** keyword is specified. The information maintained in the crash lists is minimal crash information when the **no** keyword has been specified.

encrypted

Indicates that the URL encrypted for security reasons.

filename-pattern *pattern*

The **filename-pattern** is a an alphanumeric string containing any or all of the following variables:

- *%hostname%* - The system hostname.
- *%ip%* - A SPIO IP address
- *%cpu%* - CPU number
- *%card%* - Card number
- *%time%* - POSIX timestamp in hexadecimal notation
- *%filename%* - Alias for *crash-%card%-%cpu%-%time-core%*
- *%%* - A single *%* sign

If no pattern is specified, the result is the same as the pattern *filename*.
Use '/' characters in the filename pattern part to store crashes in per-system subdirectories.

url *crash_url*

Specifies the location to store crash files. *crash_url* may refer to a local or a remote file. *crash_url* must be entered using the following format:
For the ASR 5000:

- **[file:]{/flash|/pcmcia1|/hd}[/***directory***]/**
- **tftp://{***host***[:***port#***]}[/***directory***]/**
- **[ftp: | sftp:]//[***username***[:***password***]@] {***host***}[:***port#***][/***directory***]/**

Important: Use of the SMC hard drive is not supported in this release.

Important: Do not use the following characters when entering a string for the field names below: "/" (forward slash), ":" (colon) or "@" (at sign).

directory is the directory name.
filename is the actual file of interest.
username is the user to be authenticated.
password is the password to use for authentication.
host is the IP address or host name of the server.
port# is the logical port number that the communication protocol is to use.

restrict *mbyte*

Specifies a maximum amount of memory (in megabytes) to use for storing crash files as an integer from 1 through 128. Default: 128
The **restrict** keyword is only applicable to local URLs.

Usage

Enable crashes if there are systems that are not stable and the crash information will be useful for trouble shooting. The remote storage of the crash file reduces the memory utilized on the chassis.

Example

```
crash enable ftp://remoteABC/pub/crash.dmp

crash enable /flash/pub/data/crash.dmp restrict 64

no crash enable
```

cs-network

This command creates/removes an HNB-CS network configuration instance for Femto UMTS access over Iu-CS/Iu-Flex interface between Home NodeB Gateway (HNB-GW) service and CS networks elements; i.e. MSC/VLR. This command also configures an existing HNB-CS network instance and enters the HNB-CS Network Configuration mode on a system.

Platform

ASR 5000

Product

HNB-GW

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

cs-network *cs_instance* **[-noconfirm]**

no cs-network *cs_instance*

no

Removes the specified HNB-CS network instance from the system.

Caution: Removing the HNB-CS network instance is a disruptive operation and it will affect all UEs accessing MSC(s) configured in specific CS core network through the HNB-GW service.

Caution: If any HNB-CS Network instance is removed from system all parameters configured in that mode will be deleted and Iu-CS/Iu-Flex interface will be disabled.

cs_instance

Specifies the name of the Circuit Switched Core Networks instance which needs to be associated with the HNB Radio Network PLMN via the HNB RN-PLMN Configuration mode. If *cs_instance* does not refer to an existing HNB-PS network instance, the new HNB-CS network instance is created.
cs_instance must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to enter the HNB-CS Network Configuration mode for an existing CS network instance or for a newly defined HNB-CS network instance. This command is also used to remove an existing HNB-CS network instance.

This configuration enables/disables the Iu-CS/Iu-Flex interface on HNB-GW service with CS core network elements; i.e. MSC/VLR.
A maximum of one HNB-CS network instance per HNB-GW service instance which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

Caution: This is a critical configuration. The HNBs cannot access MSC(s) in CS core network without this configuration. Any change to this configuration would lead to disruption in HNB access to CS core network.

Entering this command results in the following prompt:

```
[context_name]hostname(config-cs-network)#
```

The various parameters available for configuration of an HNB-CS network instance are defined in the *HNB-CS Network Configuration Mode Commands* chapter.

Example

The following command enters the existing HNB-CS Network configuration mode (or creates it if it does not already exist) for the instance named *hnb-cs1*:

```
cs-network hnb-cs1
```

The following command will remove HNB-CS network instance *hnb-cs1* from the system without any warning to operator:

```
no cs-network hnb-cs1
```

css acsmgr-selection-attempts

This is a restricted command. In 9.0 and later releases this command is obsolete.

css delivery-sequence

This is a restricted command. In 9.0 and later releases this command is obsolete.

css service

This is a restricted command. In 9.0 and later releases this command is obsolete.

default

Restores the system default values for the specified parameters.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

default { aaa { accounting-overload-protection domain-matching | usrname-format } | arp base-reachable-time |autoconfirm | banner [lawful-intercept | motd | pre-login] | boot [delay | interface | nameserver | networkconfig] | bulkstats historical collection | card-standby-priority | cdr-multi-mode | clock timezone | cli max-sessions | congestion-control [overload-disconnect | policy | threshold } | diameter-proxy ram-disk | enforce { imsi-min equivalence | ip optimize-ipid-assignment } | gtpp { compression-processes | ram-disk-limit } | high-availability fault-detection speed | local-user { allow-aaa-authentication | lockout-time | max-failed-logins } | logging { display | filter runtime } | network-overload-protection | operational-mode | pac-standby-priority | qos npu inter-subscriber traffic { bandwidth | priority [assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }] } | require { cipher ssl resource-percentage | demux card | session recovery } | reveal disabled commands | snmp { engine-id | heartbeat | history heartbeat | notif-threshold } | system { contact | description | hostname | location | serial-number } | system-mac | system-priority | task { facility sessmgr start | resource cpu-memory-low } | terminal { all | databits | flowcontrol | parity | speed | stopbits }| threshold { *value* } | timestamps | upgrade limit [time] [usage] }

---

aaa { accounting-overload-protection domain-matching | usrname-format }

Restores the aaa behavior to its default of disabled for the following options:

- **accounting-overload-protection**: Disables OverLoad Protection Policy for Accounting Requests.
- **domain-matching**: Restores the default domain matching method.
- **username-format**: Restores the use of the default username format for global AAA services

---

arp base-reachable-time

Restores ARP base-reachable-time to 30 seconds.

---

autoconfirm

Restores the autoconfirm behavior to its default of disabled.

banner

lawful-intercept - Restores the system default message of the day for SSH CLI sessions.
motd – Restores the system default message of the day banner.
pre-login – Restores the CLI log in banner to the system default.

boot [delay | interface | nameserver | networkconfig]

interface | networkconfig - Restores the default boot interface and network configuration options. The keywords **interface** and **networkconfig** are used to restore the default option settings for the interface and network configuration options, respectively.
Defaulting the network configuration boot option removes the network boot option from the boot.sys file. It does not remove the network config options from the configuration file which is managed separately from the boot.sys file.
delay - Removes the boot delay setting (if any). The default for boot delay is "no boot delay".
nameserver - Removes the nameserver IP address.

card-standby-priority

Resets the standby priority of the Packet Services Cards.

cdr-multi-mode

Restores the default value of this command to Single-CDRMOD mode.

cli max-sessions

Restores the default value of this command to **no cli max-sessions** which removes the limit on the number of allowed simultaneous CLI sessions on the system.

clock-timezone

Restores the system's clock timezone to UTC.

congestion-control [overload-disconnect | policy | threshold]

Restores the system's congestion-control functionality to its default setting of disabled. You can selectively restore other components to their default values.

diameter-proxy ram-disk

Restores the ram-disk size to 32MB.

enforce { imsi-min equivalence | ip optimize-ipid-assignment }

Disables the enforcement of either option.

gtpp { compression-process | ram-disk-limit }

Restores number of compression processes allowed to 1.
Restores the RAM disk size to 32MB.

high-availability fault-detection speed

Restores speed to Norma1.

local-user { allow-aaa-authentication | lockout-time | max-failed-logins }

Enables aaa-authentication.
Restores lock-time to 60 minutes.
Restores max-failed-logins to 5.

logging {display | filter runtime}

display: sets the default level of detail to display for trace log information to the system default.
filter runtime: resets the filtering of logged information to log in real time.

network-overload-protection

For SGSN, disables this attach rate throttle feature that provides network overload protection.

operational-mode

Sets the operational mode of the chassis to the system default.

pac-standby-priority

This parameter has been replaced by the **card-standby-priority** keyword.

qos npu inter-subscriber traffic {bandwidth | priority [assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }] }

Restores the following NPU QoS parameters to their default values:

- **bandwidth**:
- gold: 10%
- silver: 20%
- bronze: 30%
- best-effort: 40%
- **priority**: All DSCP values are mapped to the best-effort priority queue but are not configured.

require { cipher ssl resource-percentage | demux card | session recovery }

Resets the cipher ssl resource-percentage to 0.
Disables the demux capabilities on the demux card.
Disables the session recovery featured.

snmp { engine-id | heartbeat | history heartbeat |notif-threshold }

engine-id: Restores the SNMP engine ID to the system default.
heartbeat: Restores the SNMP heartbeat interval to 60 minutes.
history heartbeat: Reenables the recording of heartbeat notifications in SNMP history.
notif-threshold: Restores the SNMP notification thresholds to the system defaults.

system { contact | description | hostname | location | serial-number }

Sets the following system parameters to their default values:

- **contact**: Resets to none specified.
- **description**: Resets to none specified.

- **hostname**: Resets to “asr5000” or asr5500”.
- **location**: Resets tro none specified.
- **serial-number**: Reses to factory default.

---

system-mac hostname

Resets the system MAC address to the factory default value.

---

system-priority hostname

Resets the system priority to its default value.

---

task { facility sessmgr start | resource cpu-memory-low }

facility sessmgr start: Restores the default session manager start policy to Normal.
resource cpu-memory-low: Resets the system so that when a CPU runs very low on memory (below 12MB) the most over-limit task is killed.

---

terminal { all | databits | flowcontrol | parity | speed | stopbits }

all: Restores all terminal parameters to their default values.
databits: Resets to 8 data bits.
flowcontrol: Resets to none.
parity: Resets to none.
speed: Resets 9600 bits/second.
stopbits: Resets to one stop bit.

---

threshold { *value* **}**

Restores thresholding values to their default setting. The possible values are:

- **10sec-cpu-utilization**: CPU utilization using a 10 sec average.
- **aaa-acct-archive-queue-size<1..3>**: AAA accounting archive queue threshold settings.
- **aaa-acct-archive-size**: AAA accounting archive size.
- **aaa-acct-failure**: AAA accounting failure threshold settings
- **aaa-acct-failure-rate**: AAA accounting failure rate threshold settings
- **aaa-auth-failure**: AAA authentication failure threshold settings
- **aaa-auth-failure-rate**: AAA authentication failure rate threshold settings
- **aaa-retry-rate**: AAA retry rate threshold settings
- **aaamgr-request-queue**: AAA manager internal request queue threshold settings
- **asngw-auth-failure**: ASN-GW Auth Failure related threshold
- **asngw-handoff-denial:** ASN-GW handoff denial threshold
- **asngw-max-eap-retry**: ASN-GW maximum EAP retry threshold
- **asngw-network-entry-denial**: ASN-GW Network entry denial threshold
- **asngw-session-setup-timeout**: ASN-GW session setup timeout threshold
- **asngw-session-timeout**: ASN-GW session timeout threshold
- **asnpc-idle-mode-timeout**: ASN-PC idle mode timeout threshold
- **asnpc-im-entry-denial**: ASN-PC IM entry denial threshold

- **asnpc-lu-denial**: ASN-PC lu denial threshold
- **asnpc-session-setup-timeout**: ASN-PC session setup timeout threshold
- **bgp-routes**: bgp routes threshold
- **call-reject-no-resource**: Calls rejected due to no resources threshold settings
- **call-setup**: Calls setup threshold settings
- **call-setup-failure**: Call setup failure threshold settings
- **card-temperature-near-power-off-limit**: Threshold for the gap between the current card temperature and the power off limit
- **cdr-file-space**: CDR file space threshold
- **contfilt-block**: Content Filtering Blocks threshold settings
- **contfilt-rating**: Content Filtering Ratings threshold settings
- **cpu-available-memory**: CPU available memory threshold settings
- **cpu-load**: PSC/PSC2 CPU load (5-minute average)
- **cpu-memory-usage**: Percentage of total CPU memory usage
- **cpu-orbs-critical**: ORBs process CPU usage critical level
- **cpu-orbs-warn**: PORBs process CPU usage warning level
- **cpu-session-throughput**: CPU session throughput threshold settings
- **cpu-utilization**: CPU utilization threshold settings
- **dcca-bad-answers**: Diameter Bad Answers threshold settings
- **dcca-protocol-error**: Diameter Protocol Error threshold settings
- **dcca-rating-failed**: Diameter Rating Failed threshold settings
- **dcca-unknown-rating-group**: Diameter Unknown Rating Group threshold settings
- **diameter**: Diameter threshold settings
- **dns-learnt-ip-max-entries**: DNS IP maximum entries threshold
- **dns-lookup-failure**: DNS Lookup Failure threshold
- **edr-file-space**: EDR file space threshold
- **edr-udr-dropped-flow-control**: EDR-UDRs Dropped due to flow control
- **fng-current-active-sessions**: Femto Network Gateway (FNG) current active sessions threshold
- **fng-current-sessions**: FNG current sessions threshold
- **fw-deny-rule**: Stateful Firewall Deny Rule threshold
- **fw-dos-attack**: Stateful Firewall Dos-Attacks threshold
- **fw-drop-packet**: Stateful Firewall Drop Packets threshold
- **fw-no-rule**: Stateful Firewall No-Rule threshold
- **license**: Session license threshold settings
- **mgmt-cpu-memory-usage**: Management (SMC) CPU memory usage threshold
- **mgmt-cpu-utilization**: Management (SMC) CPU utilization threshold (most recent 5-minute average)

- **mme-attach-failure**: MME Attach Failure related threshold
- **mme-auth-failure**: MME Auth Failure related threshold
- **model**: Thresholding model settings
- **monitoring**: Threshold monitoring configuration settings
- **nat-port-chunks-usage**: Port chunk utilization threshold
- **npu-utilization**: NPU utilization threshold (most recent 5-minute average)
- **packets-filtered-dropped**: Filtered/dropped packet threshold settings
- **packets-forwarded-to-cpu**: Forwarded packet threshold settings
- **pdg-current-active-sessions**:PDG current active sessions threshold
- **pdg-current-sessions**: PDG current sessions threshold
- **pdif-current-active-sessions**: Threshold monitoring for only the currently-active PDIF sessions.
- **pdif-current-sessions**: Threshold monitoring for all current PDIF sessions.
- **per-service-asngw-sessions**: The number of sessions per ASN-GW service
- **per-service-ggsn-sessions**: The number of GGSN sessions per GGSN service
- **per-service-gprs-pdp-sessions**: The number of PDP contexts per GPRS service
- **per-service-gprs-sessions**: The number of GPRS sessions per GPRS service
- **per-service-ha-sessions**: The number of HA sessions per HA service
- **per-service-lns-sessions**: The number of LNS sessions per LNS service

- **per-service-sgsn-pdp-sessions**: The number of PDP contexts per SGSN service
- **per-service-sgsn-sessions**: The number of SGSN sessions per SGSN service
- **phsgw-eapol-auth-failure**: Personal Handy Phone Gateway (PHSGW) EAPOL authentication failure threshold
- **phsgw-handoff-denial**: PHSGW handoff denial threshold
- **phsgw-max-eap-retry**: PHSGW maximum EAP retry threshold
- **phsgw-max-eapol-retry**: PHSGW max EAPOL retry threshold
- **phsgw-network-entry-denial**: PHSGW Network entry denial threshold
- **phsgw-session-setup-timeout**: PHSGW session setup timeout threshold
- **phsgw-session-timeout**: PHSGW session timeout threshold
- **phspc-session-setup-timeout**: PHSPC session setup timeout threshold
- **phspc-sleep-mode-timeout**: PHSPC sleep mode timeout threshold
- **phspc-sm-entry-denial**: PHSPC sm entry denial threshold
- **poll**: Threshold polling interval configuration settings
- **ppp-setup-fail-rate**: PPP setup failure rate threshold
- **rp-setup-fail-rate**: RP setup failure rate threshold
- **storage-utilization**: Mass storage (flash memory) utilization

- **subscriber**: subscriber related thresholds
- **system-capacity**: Percentage usage of system resources
- **total-asngw-sessions**: Total ASN-GW sessions threshold
- **total-ggsn-sessions**: Total GGSN sessions for all GGSN services in the system
- **total-gprs-pdp-sessions**: Total PDP contexts for all GPRS services in the system
- **total-gprs-sessions**: Total GPRS sessions per for all GPRS services in the system
- **total-ha-sessions**: Total HA sessions for all HA services in the system
- **total-hnbgw-hnb-sessions**: Total 3G Home NodeBGateway (HNBGW) HNB sessions for all HNB services in the system
- **total-hnbgw-iu-sessions**: Total HNBGW Iu sessions in the system
- **total-hnbgw-ue-sessions**: Total HNBGW UE sessions in the system
- **total-hsgw-sessions**: Total HRPD Serving Gateway (HSGW) sessions for all HSGW services in the system
- **total-lma-sessions**: Total Local Mobility Anchor (LMA) sessions for all LMA services in the system
- **total-lns-sessions**: Total L2TP Network Server (LNS) sessions for all LNS services in the system
- **total-mme-sessions**: Total Mobility Management Entity (MME) sessions for all MME services in the system
- **total-pdsn-sessions**: Total PDSN sessions for all PDSN services in the system
- **total-pgw-sessions**: Total Packet Data Network Gateway (PGW) sessions for all PGW services in the system
- **total-saegw-sessions**: Total PDP contexts for all SAEGW services in the system
- **total-sgsn-pdp-sessions**: Total PDP contexts for all SGSN services in the system
- **total-sgsn-sessions**: Total SGSN sessions for all SGSN services in the system
- **total-sgw-sessions**: Total Serving gateway (SGW) sessions for all SGW services in the system
- **tpo-dns-failure**: Traffic Performance Optimization (TPO) DNS FAILURE threshold
- **tpo-low-compression-gain**: TPO LOW compression gain threshold
- **tpo-rto-timeout**: TPO retransmission timeout (RTO) threshold

timestamps

Resets the inclusion of timestamps in command.

upgrade limit [time] [usage]

Sets upgrade limit values to the defaults. If the optional keywords are not specified all values are reset to their defaults.
time: Resets the maximum time a session may exist during a software upgrade to the default of 120.
usage: Resets the minimum number of sessions before closing the sessions during a software upgrade to the system default of 100.

Usage

Restore system defaults to aid in trouble shooting or just prior to modifying additional configuration options.

Example

```
default banner motd

default boot

default logging display

default system hostname

default upgrade limit time
```

diameter-proxy ram-disk

This command configures the amount of extra RAM disk space in MB to be allocated to Diamproxy task when local storage (hard disk) is enabled.

Platform

ASR 5000

Product

HSGW

P-GW

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

diameter-proxy ram-disk mb *space_mb*

default diameter-proxy ram-disk mb

default

Configures the default setting.
Default: 32 MB

mb space_mb

Specifies the storage space in MB.
space_mb must be an integer from 10 through 256.

Usage

Specifies the additional storage space to be allocated to Diamproxy for file write, in MB. The specified memory in MB is added to the existing memory allocated to Diamproxy only if HDD storage is enabled. By default, 32 MB is additionally allocated.

Example

The following command specifies that *100* MB of additional storage space be allocated to the Diamproxy task:

```
diameter-proxy ram-disk mb 100
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

enforce imsi-min equivalence

Enables the PDSN/HA to treat IMSI and MIN as the same for identifying the PDSN/HA session.

Platform

ASR 5000

Product

PDSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no | default] enforce imsi-min equivalence

default

Returns the command to its default setting of disabled.

no

Disables the PDSN/HA from treating IMSI and MIN as the same for identifying the PDSN/HA session.

Usage

Generally on an HA, the IMSI and MIN are treated as different and hence the RRQs with 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session if the NAI and HoA also match. If the NAI and/or HoA do not match, then the duplicate IMSI session detect and terminate feature is applicable.
Generally on a PDSN, the IMSI and MIN are treated as different and hence RP messages from 1x and DO PDSNs are processed as different sessions. You can use this feature to treat the IMSI and MIN with the matching lower 10-digit as the same for identifying a session. The 10-digit MIN and the 15-digit IMSI are treated as equivalent for the purpose of matching PDSN sessions if the lower 10 digits are the same. Any handoff from 1x to DO or vice-versa is treated as the same session.

Example

To monitor or clear subscriber session information filtered by on IMSI/MIN refer to the **show subscribers msid** command.

Important: This command must be executed at startup only and will not take effect when reconfigured without rebooting.

Example

The following command enables the treatment of the IMSI and MIN as the same for identifying the session:

```
enforce imsi-min equivalence
```

Either of the following commands disables the treatment of the IMSI and MIN as the same for identifying sessions:

```
no enforce imsi-min equivalence
```

```
default enforce imsi-min equivalence
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fa-spi-list

Replaces a duplicate Foreign Agent- Security Parameter Index (FA-SPI) remote address list applied to multiple FA services with a list name.

Platform

ASR 5000

Product

PDSN

FA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

fa-spi-list *fa_spi_list*

fa_spi_list

Remote address list name expressed as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to Replace duplicate FA-SPI remote address list applied to multiple FA or HA services with a list name.

Example

The following command configures the list FA SPI list to *fa-list2*:

```
fa-spi-list fa-list2
```

global-title-translation address-map

Creates an instance of a Global Title Translation (GTT) address-map, a database, for global titles (ISDN-type address) used for SCCP routing. Upon creating the instance, the system enters global title translation address-map configuration mode. For the commands to configure the database, go to the *Global Title Translation Address-Map Configuration Mode Commands* chapter.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

global-title-translation address-map instance *instance*

no global-title-translation address-map instance *instance*

no

Removes the specified GTT address-map database from the SCCP portion of the configuration.

instance

This value uniquely identifies a specific instance of a GTT address-map.
instance must be an integer from 1 through 4096.

Usage

Create a GTT address-map with a unique identifier and enter the GTT address-map configuration mode.

Example

```
global-title-translation address-map instance 324
```

global-title-translation association

Creates an instance of a Global Title Translation (GTT) association which defines the rules for handling global title translation. Upon creating the instance, the system enters global title translation association configuration mode. For the commands to configure the rules, go to the *Global Title Translation Association Configuration Mode Commands* chapter.

Platform

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

global-title-translation association instance *instance*

no global-title-translation association instance *instance*

no

Removes the specified instance of a GTT association from the SCCP portion of the configuration.

instance

This value uniquely identifies a specific instance of a GTT association.
instance must be an integer from 1 through 16.

Usage

Create a GTT association with a unique identifier and enter the GTT association configuration mode.

Example

```
global-title-translation association instance 2
```

gtpp compression-process

This command configures the maximum number of child compression processes that AAA proxy can have.

Platform

ASR 5000

Product

GGSN

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

gtpp compression-process *max_number*

default gtpp compression-process

default

Restores the system to the default settings for the number of child compression processes allowed.

max_number

Specifies the maximum number of child processes. The default is 1
max_number: must be an integer from 1 through 4.

Usage

This command configures the maximum number of child compression processes that AAA proxy can have only if hard disk storage is enabled.

Example

```
gtpp compression-process 3
```

gtpp ram-disk-limit

This command configures additional storage space to be allocated for writing files.

Platform

ASR 5000

Product

GGSN

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

gtpp ram-disk-limit mb *mega_bytes*

default gtpp ram-disk-limit

default

Restores the system to the default settings of 32 MB of storage.

mb *mega_bytes*

Specifies the number of megabytes of storage allocated for files.
mega_bytes: must be an integer from 10 through 256. The default is 32 MB.

Usage

The memory specified with this command would be added to the existing memory allocated to the AAA proxy only if hard disk storage is enabled.

Example

```
gtpp ram-disk-limit mb 256
```

gtpp single-source

Configures the system to reserve a CPU for performing a proxy function for accounting.

Platform

ASR 5000

Product

GGSN

SGSN

P-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

gtpp single-source [centralized-lrsn-creation | private-extensions]

no gtpp single-source

centralized-lrsn-creation

Defines Log Record Sequence Number (LRSN) generation at proxy. The AAA proxy will generate the LRSN for all CDR types generated by either the GGSN or the SGSN.
Default: disabled

private-extensions

This optional keyword enables the proprietary use of customer-specific GTPP extensions.
If **private-extensions** is not configured, all customer specific private extensions related to GTPP message transfer with CGF and recovery through GSS are disabled.

Important: In order for the customer-specific extensions to work properly, the **gtpp max-pdu-size** command in the Context Configuration Mode should be set to 65400 and the **gtpp server** command's **max** value should be set to "1".

no

Disables GTPP single-sourcing. This is the default setting.

Caution: Entering this command while PDP contexts are in process could cause the loss of pending CDRs. The configuration must be saved and the chassis reloaded for this option to take effect.

Usage

When GTPP single-sourcing is enabled, the system's AAA proxy function generates requests to the accounting server using a single UDP source port number, instead of having each AAA Manager generate

independent requests with unique UDP source port numbers. This is accomplished by the AAA Managers forwarding their GTPP PDUs to the AAA Proxy function that runs on a reserved packet processing card CPU. Since a packet processing card CPU is being reserved, fewer Session Managers and AAA Managers will be started on that card.

Caution: This command must be entered prior to the configuration of other services. Specifying it later may return an error due to a lack of CPU availability.

Example

The following command enables GTPP single-sourcing with the use of private GTPP extensions:

```
gtpp single-source private-extensions
```

The following command disables GTPP single-sourcing:

```
no gtpp single-source
```

ha-spi-list

Replaces a duplicate Home Agent-Security Parameters Index (HA-SPI) remote address list applied to multiple HA services with a list name.

Platform

ASR 5000

Product

PDSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

ha-spi-list *ha_spi_list*

ha_spi_list

Remote address list name expressed as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to Replace duplicate HA-SPI remote address list applied to multiple HA services with a list name.

Example

The following command configures the list HA SPI list to *ha-list2*:

```
ha-spi-list ha-list2
```

hd raid

Provides access to a the HD RAID Configuration mode in order to manage parameters supporting local storage of data records.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
hd raid
```

Usage

Enters the HD RAID configuration mode.
Entering this command results in the following prompt:

```
[context_name]hostname(config-hd-raid)#
```

HD RAID Configuration Mode commands are defined in the *HD RAID Configuration Mode Commands* chapter.

Example

The following command opens the HD RAID Configuration mode:

```
hd raid
```

hd storage-policy

Provides access to the local hard drive configuration mode in order to manage parameters supporting local storage of records.

Platform

ASR 5000

Product

GGSN

SGSN

HSGW

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] hd storage-policy *name*

no

Removes a configured HD storage policy from the system.

storage-policy *name*

Specifies a name for an HD storage policy and then enters the HD Storage Policy Configuration Mode. *name* must be an alphanumeric string of 1 through 63 characters.

Usage

Creates a new policy or specifies an existing policy and enters the HD Storage Policy Configuration Mode. Entering this command results in the following prompt:
[*context_name*]*hostname*(config-hd-storage-policy)#
HD Storage Policy Configuration Mode commands are defined in the HD Storage Policy Configuration Mode Commands chapter.

Example

The following command creates an HD storage policy named *policy3* and enters the HD Storage Policy Configuration Mode:

```
hd storage-policy policy3
```

high-availability

Configures the speed for detection of packet processing card task failures.

Platform

ASR 5000

Product

PDSN

GGSN

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`high-availability fault-detection speed { aggressive | normal }`

`default high-availability fault-detection speed`

`{ aggressive | normal }`

Default: **`normal`**

- **`aggressive`**: Initiates packet processing card failover without performing additional checks.
- **`normal`**: Initiates packet processing card failover after additional checks are performed.

Usage

Use this command to increase the fault detection speed for faster switchovers after a packet processing card task failure.

Setting fault detection speed to aggressive will trigger packet processing card failover as soon as possible if a potential failure is detected. Aggressive mode will reduce the duration of subscriber outages caused by a failed packet processing card if session recovery is enabled.

Aggressive mode also bypasses most information gathering steps and logs that can be used to determine the root cause of the failure.

In normal mode, additional checks are performed before triggering a packet processing card failover to ensure that the card has actually failed. In aggressive mode these checks are bypassed so that session recovery can start as soon as possible. These additional checks reduce the likelihood of a false positive failure.

Example

The following command sets the fault detection speed for packet processing card tasks to **`aggressive`**:

```
high-availability fault-detection speed aggressive
```

hybrid-mode

Enables an ASR 5000 chassis to run a mix of Packet Services Cards (PSCs) and PSC Type A (PSCAs). When enabled, PSCAs will boot and be compatible with the PSCs as long as encryption services are disabled. The default is to run the chassis in non-hybrid mode; PSCAs will not boot when inserted in the chassis.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] hybrid-mode [force]

no

Returns the chassis to non-hybrid mode. PSCAs will not boot.

force

Always updates the configuration, even if the encryption services could not be disabled. However, the PSC and PSCA cards will continue to be incompatible until encryption services are manually disabled.

Usage

To allow a chassis to run in PSC/PSCA hybrid-mode with encryption services disabled you must configure **hybrid-mode force** once.
To go from hybrid mode to non-hybrid mode, you must enter the **no hybrid-mode force** command. Non-hybrid chassis mode allows encryption services to be started through the appropriate CLI commands. However, all PSCAs in the chassis will be disabled.
For additional information, see the *ASR 5000 Installation Guide*.

Example

The following command enables the chassis to run a mix of PSCs and PSCAs without encryption services:

```
hydrid-mode force
```

imei-profile

Creates an instance of an International Mobile Equipment Identity (IMEI) profile.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] imei-profile *imei_profile_name*

no

Deletes the IMEI profile instance from the configuration.

imei_profile_name

Specifies the name of the IMEI profile as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create an instance of an IMEI profile and to enter the IMEI Profile Configuration mode. An IMEI profile is a template which groups a set of device instructions, such as blacklisting, that may be applicable to one or more calling devices. See the *IMEI Profile Configuration Mode Commands* chapter for information regarding the definition of the rules contained within the profile and the use of the profile.

Important: An IMEI profile is a key element of the Operator Policy feature and is only valid when associated with at least one operator policy.

To see what IMEI profiles have already been created, return to the Exec mode and enter the **show imei-profile all** command.

Example

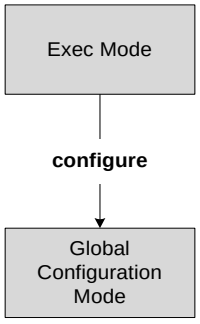
The following command creates a configuration instance of an IMEI profile:

```
imei-profile imeiprof1
```

Chapter 125
Global Configuration Mode Commands (L-S)

This section includes the commands **`license`** through **`system`**.

The Global Configuration Mode is used to configure basic system-wide parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

license

Configures the session license key.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

license key *key_value* **[-force] session-limit**

no license key *key_value* **[-force] session-limit**

no

Removes the license key(s) installed.

key *key_value*

Installs the license key specified by *key_value*. *key_value* is provided by Cisco operations staff.

session-limit

Use this keyword to suppress fail-over calls from being rejected if the licensed threshold is crossed.

Important: This is a customer-specific command that is available for HA, PDSN, EHA, and PDIF. Please contact your local Cisco sales representative for more information.

-force

Sets the license key even if resources are not available. The system supports the dynamic resizing of demultiplexor software tasks based on the licensed session capacity and feature type. When installing a license, the system automatically attempts to resize currently functioning tasks. Warning messages are displayed if there is an issue. Though its use is not recommended, the **-force** keyword can be used to suppress these warning messages.

Caution: Use of this option is not recommended.

Usage

Install or update system session keys when necessary due to expiration and/or capacity needs.

Example

```
license key sampleKeyValue

no license key
```

line

Enters the terminal display line configuration mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

line

Usage

Change the terminal display configuration based upon the users own terminal characteristics.

link-aggregation

Configures system MAC address and priority for Link Aggregation. These parameters are usually changed to match the feature requirements of the remote Ethernet switch.

Platform

ASR 5000

Product

WiMAX

PDSN

HA

FA

GGSN

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

link-aggregation { system-mac { *MAC_address* | auto } | system-priority *priority* } [-noconfirm]

{ default | no } link-aggregation { system-mac | system-priority } [-noconfirm]

default

Resets the configuration to the default.

system-mac { *MAC_address* | auto }

Sets the system MAC address used along with the system priority to form the system ID.
MAC_address is manually entered as six groups of two hexadecimal digits separated by hyphens (for example, 01-23-45-67-89-ab).
Auto is the default and is the MAC address of the LAG master port.

system-priority *priority*

This command sets the system priority used by Link Aggregation Control Protocol (LACP) to form the system ID.
priority is a hexadecimal value from 0x0000 through 0xFFFF. Default is 0x8000 (32768).

-noconfirm

Executes the command without additional prompting for command confirmation.

Usage

The system MAC address (6 bytes) and system priority (2 bytes) combine to form the system ID. A system consists of a packet processing card and its associated QGLC or XGLC traffic ports. The highest system ID priority (the lowest number) handles dynamic changes.
For additional usage and configuration information for the link aggregation feature, refer to the *System Administration Guide*.

Important: Not supported on all platforms

Example

The following command configures the link aggregation system-priority to 10640 (*0x2990*):

```
link-aggregation system-priority 0x2990
```

local-policy-service

This command enables creating, configuring, or deleting a local QoS policy.

Platform

ASR 5000

Product

P-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

local-policy-service *name* **[-noconfirm]**

no local-policy-service *name*

no

Deletes the specified local QoS policy service from the system.

name

Specifies name of the local QoS policy service as an alphanumeric string of 1 through 63 characters.

Important: The *name* must be unique across all contexts.

If the named local QoS policy service does not exist, it is created, and the CLI mode changes to the Local Policy Service Configuration Mode wherein the local QoS policy service can be configured.
If the named local QoS policy service already exists, the CLI mode changes to the Local Policy Service Configuration Mode for that local QoS policy service.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to specify a local QoS policy service name to allow configuration of a local QoS policy service.

Important: This feature is license dependent. Please contact your local sales representative for more information.

A local QoS policy service can be used to control different aspects of a session, such as QoS, data usage, subscription profiles, or server usage, by means of locally defined policies.

Local QoS policies are triggered when certain events occur and the associated conditions are satisfied. For example, when a new call is initiated, the QoS to be applied for the call could be decided based on the IMSI, MSISDN, and APN.

Important: A maximum of 16 local QoS policy services are supported.

Entering this command results in the following prompt:

```
[context_name]hostname(config-local-policy-service)#
```

Local Policy Service Configuration Mode commands are defined in the *Local Policy Service Configuration Mode Commands* chapter.

Example

The following command creates a local QoS policy service named `lctest` and enters the Local Policy Service Configuration Mode:

```
local-policy-service lctest
```

local-user allow-aaa-authentication

Enables or disables the use of administrative accounts other than local-user administrative accounts.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
[ default | no ] local-user allow-aaa-authentication
```

default

Returns this parameter to its default setting of enabled.

no

Disables administrative user accounts other than local-user accounts.

Usage

Local-user administrative accounts are separate from other administrative user accounts configured at the context level (Security Administrator, Administrator, Operator, and Inspector).
Context-level administrative users rely on the system's AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server.
Since the T1.276-2003 password security mechanisms are supported only for local-user administrative accounts and not for the AAA-based administrative accounts, this command provides a mechanism for disabling AAA-based administrative accounts.
By default, AAA-based administrative accounts are allowed.

Example

The following command forces the system to authenticate local-user accounts based only on the information in the security account file on its CompactFlash:

```
no local-user allow-aaa-authentication
```

local-user lockout-time

Configures the lockout period for local-user administrative accounts.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

local-user lockout-time *time*

default local-user lockout-time

default

Restores the parameter to its default setting.

time

Default: 60
Specifies the amount of time (in minutes) that must elapse before a previously locked-out local-user account can attempt to login again. *time* is an integer from 1 through 10080.

Usage

Local-user administrative accounts can become locked for reasons such as exceeding the configured maximum number of login failures.
Once an account is locked, this parameter specifies the lockout duration. Once the amount of time configured by this parameter has elapsed, the local-user can once again attempt to login.

Example

The following command configures a lockout time of *120* minutes (2 hours):

```
local-user lockout-time 120
```

local-user max-failed-logins

Configures the maximum number of failed login attempts a local-user can have before their account is locked out.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

local-user max-failed-logins *number*

[default | no] local-user max-failed-logins

no

Disables this functionality.

default

Restores this parameter to its default setting.

number

Default: 5
Specifies the maximum number of times a local-user could experience a login failure before their account is locked out. *number* is an integer from 2 through 100.

Usage

This command configures the maximum number of failed login attempts a local-user can have before their account is locked out. For example if, this parameter is configured to "3" then after the third failed login attempt, the account would be locked.

Important: Local-user accounts can be configured to either enforce or reject a lockout due to the maximum number of failed login being reached. Refer to the **local-user username** command for more information.

Refer to the **local-user lockout-time** command for more information.

Example

The following command configures a maximum of three login attempts:

```
local-user max-failed-logins 3
```

local-user password

Configures local-user administrative account password properties.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

local-user password { [complexity { ansi-t1.276-2003 | none }] [history length *number* **[duration** *days* **]] [max-age** *days* **] [min-change-char** *number* **] [min-change-interval** *days* **] [min-length** *number* **] }**

no local-user password { [history] [max-age] [min-change-interval] }

default local-user password { [complexity] [history] [max-age] [min-change-char] [min-change-interval] [min-length] }

no

Disables the specified parameter.

default

Restores the specified parameter to its default setting.

[complexity { ansi-t1.276-2003 | none }]

Default: ansi-t1.276-2003
Specifies the password strength as one of the following:

- **ansi-t1.276-2003:** If this option is selected, the following rules are enforced:
- Passwords may not contain the username or the reverse of the username
- Passwords may contain no more than three of the same characters used consecutively
- Passwords must contain at least three of the following:
  - uppercase alpha character
  - lowercase alpha character
  - numeric character
  - special character
- **none:** No additional password checks are performed.

[history length *number* **[duration** *days* **]]**

Default: length is 5
Specifies the number of previous password entries kept in the history list maintained by the system. A password cannot be reused if it is one of the entries kept in the history list unless the time it was last used was more than the number of days specified by the **duration** keyword.
If the duration keyword is not used, the only check performed by the system is that it is not in the history list.
number is the number of entries for each account stored in the history list entered as an integer from 1 through 100. *days* is the number of days during which a password can not be reused entered an integer from 1 through 365.

[max-age *days* **]**

Default: 90
Specifies the maximum age for a password. Users logging in with a password older than the specified limit are locked out. Once the lockout period expires, at their next login attempt, they are prompted to change their password before accessing the CLI.

Important: Local-user accounts can be configured to either enforce or reject a lockout due to a password's maximum age being reached. Refer to the **local-user username** command for more information.

days is the number of days that passwords remain valid entered as an integer from 1 through 365.

[min-change-char *number* **]**

Default: 2
Specifies the minimum number of characters that must be changed (in comparison to the current password) when a user changes their password.

Important: Changes in password length are counted as "character" changes. For example: changing a password from "password" to "passwo" is a 2-character change, changing a password from "password" to "password2" is a 1-character change, and changing a password from "password" to "apassword" is a 9-character change.

number is the number of characters entered as an integer from 0 through 16.

[min-change-interval *days* **]**

Default: 1
Specifies the frequency that passwords can be changed (other than first login).
days is the minimum number of days that must pass before a user can change their password. It is an integer from 1 through 365.

Important: If the **no local-user password min-change-interval** command is used, users may change their password as often as desired which could allow them to circumvent the password history function.

[min-length *number* **]**

Default: 8
Specifies the minimum length allowed for user-defined password.
number is the minimum number of alphanumeric characters that the password must contain, entered as an integer from 3 through 32.

Usage

This command is used to set the property requirements for user-defined passwords and system behavior in relation to those passwords.
Information pertaining to user passwords, login failures, and password history are stored on the packet processing cards and in the software's Shared Configuration Task (SCT).
The system uses the information in the SCT for runtime operations such as determining password ages and determining if new passwords meet the criteria specified by this command.

Example

The following command configures a minimum password length requirement of *6* characters:

```
local-user password min-length 6
```

The following command configures the system to store the *4* most recently used passwords per user-account in the history list:

```
local-user password history length 4
```

local-user username

Adds or removes local-user administrative accounts.

Syntax

local-user username *name* **[authorization-level { administrator | inspector | operator | security-admin }] [ecs | noecs] [ftp | noftp] [timeout-min-absolute** *time* **] [timeoute-min-idle** *time* **] [no-lockout-login-failure] [no-lockout-password-aging] password** *password*

no local-user username *name*

---

no

Removes a previously configured user.

---

name

Specifies the name of the user as an alphanumeric string of 3 through 16 characters that is case sensitive.

[authorization-level { administrator | inspector | operator | security-admin }]

Default: Operator

Configures the authorization level for the user as one of the following:

- **administrator**: Administrator users have read-write privileges and can execute any command throughout the CLI except for a few security functions allowed only in the administrator mode. Administrators can configure or modify the system and are able to execute all system commands, including those available to the operator and inspector user. This level corresponds to the both the System Administrator and Application Administrator levels in the T1.276-2003.
- **inspector**: Inspector users are limited to a small number of read-only Exec Modecommands.The bulk of these are “show” commands giving the inspector the ability to view a variety of statistics and conditions. The Inspector cannot execute show configuration commands and do not have the privilege to enter the Config Mode.
- **operator**: Operator users have read-only privileges to a larger subset of the Exec Mode commands as depicted in the following figure. Operator users can execute all commands that are part of the inspector mode, plus some system monitoring, statistical, and fault management functions. Operators do not have the ability to enter the Config Mode.
- **security-admin**: Security Administrator users have read-write privileges and can execute any command throughout the CLI. Security Administrators can execute all system commands, including

those available to the administrator, operator, and inspector users. This level corresponds to both the System Security Administrator and Application Security Administrator levels in T1.276-2003.

[ecs | noecs]

Specifies whether or not the user has access to Active Charging Service configuration parameters.

- **ecs**: The user has access.
- **noecs**: The user does not have access.

Default: **ecs**

[ftp | noftp]

Default: ftp
Specifies whether or not the user is allowed to access the system via the File Transfer Protocol (FTP) and/or the Secure File Transfer Protocol (SFTP).

- **ftp**: The user has access.
- **noftp**: The user does not have access.

[timeout-min-absolute *time* **]**

Default: 0
Specifics the maximum session time (in minutes) for this user. *time* is an integer from 0 through 525600. A value of "0" indicates no limit.

Important: This limit applies only to the user's CLI sessions.

[timeout-min-idle *time* **]**

Default: 0
Specifics the maximum idle time (in minutes) for this user. *time* is an integer from 0 through 525600. A value of "0" indicates no limit.

Important: This limit applies only to the user's CLI sessions.

[no-lockout-login-failure]

Default: Disabled
Specifies that this user will never be locked out due to login attempt failures.

[no-lockout-password-aging]

Default: Disabled
Specifies that this user will never be locked out due to the age of their password.

password *password*

Specifies the initial password for this user. *password* must an alphanumeric string of 6 through 32 characters that is case sensitive.

Important: The user is requested to change their password upon their first login.

Usage

The ability to configure administrative local-users is provided in support of the login security mechanisms specified in ANSI T1.276-2003.

Like administrative users configured at the context level, local-users can be assigned one of 4 security levels:

Local-User Level User	Context Level User
Security Administrator	Administrator
Administrator	Config-Administrator
Operator	Operator
Inspector	Inspector

Local-user configuration support is handled differently from that provided for administrative users configured at the context level.

Context-level administrative users rely on the system's AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server. Passwords for these user types are assigned once and are accessible in the configuration file.

Local-user account information (passwords, password history, lockout states, etc.) is maintained in non-volatile memory and in the software's Shared Configuration Task (SCT). This information is maintained in a separate file – not in configuration files used by the system. As such, the configured local-user accounts are not visible with the rest of the system configuration.

Local-user and context-level administrative accounts can be used in parallel.

Example

The following command configures a security-administrator level local-user administrative account for a user named *User672* that has FTP privileges, a temporary password of *abc123*, and that does not lockout due to either login attempt failures or password aging:

```
local-user username User672 authorization-level security-admin ftp no-
lockout-login-failure no-lockout-password-aging password abc123
```

The following command deletes a previously configured local-user administrative account called admin32:

```
no local-user username admin32
```

logging console

Enables the output of logged events to be displayed on the console terminal.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] logging console

no

Disables the output of events to the console port.

Usage

Log console output to allow for offline review during system monitoring and/or trouble shooting.

logging disable

Enables/disables the logging of the specified event ID or range of IDs.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

logging disable eventid *id* **[to** *to_id* **]**

no logging disable eventid *id* **[to** *to_id* **]**

no

Indicates the event IDs specified are to be enabled for logging.

eventid *id*

Specifies the event for which no logging is to occur. *id* must be a integer from 1 through 100000.

to *to_id*

Specifies the end ID of the events when a range of event ID is to be disabled from being logged. *to_id* must be an integer from 1 through 100000. The *to_id* must be equal to or larger than the *id* specified.

Usage

Disable common events which may occur with a normal frequency are not of interest in monitoring the system for troubles.

Example

The following commands disables the logging of event ID 4580 and the range of events from 4500 through 4599, respectively.

```
logging disable eventid 4580 4580

logging disable eventid 4500 to 4599
```

The following enables the subset of disabled event IDs:

```
no logging disable eventid 4500 to 4549
```

logging display

Configures the level of detail for information to be logged.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

logging display event-verbosity *evt_level* **] [pdu-data** *format* **] [pdu-verbosity** *pdu_level* **]**

event-verbosity *evt_level*

Specifies the level of verboseness to use in logging of events as one of:

- min
- concise
- full

pdu-data *format*

Specifies output *format* for packet data units when logged as one of:

- **none**: outputs in raw format
- **hex**; displays out in hexadecimal format
- **hex-ascii**; displays output in hexadecimal and ASCII similar to a main-frame dump

pdu-verbosity *pdu_level*

Specifies the level of verboseness to use in logging of packet data units as an integer from 1 through 5, where 5 is the most detailed.

Usage

Tune the level of information to be logged so as to avoid flooding a log file with information which is not useful or critical.

Example

The following sets the logging display for events to the maximum.

```
logging display event-verbosity full
```

The following command sets the logging display level of detail for packet data units to level *3* and sets the output format to the main-frame style *hex-ascii*:

```
logging display pdu-data hex-ascii pdu-verbosity 3
```

logging filter

Configures the logging of events to be performed in real time for the specified facility.

Syntax

logging filter runtime facility *facility* **level** *report_level* **[critical-info | no-critical-info]**

facility *facility*

Specifies the facility to modify the filtering of logged information. The following list displays the valid facilities for this command:

- **a10**: A10 interface facility
- **a11**: A11 interface facility
- **a11mgr**: A11 Manager facility
- **aaa-client**: Authentication, Authorization and Accounting (AAA) client facility
- **aaamgr**: AAA manager logging facility
- **aaaproxy**: AAA Proxy facility
- **aal2**: ATM Adaptation Layer 2 (AAL2) protocol logging facility
- **acl-log**: Access Control List (ACL) logging facility
- **acsctrl**: Active Charging Service (ACS) Controller facility
- **acsmgr**: ACS Manager facility
- **alarmctrl**: Alarm Controller facility
- **alcap**: Access Link Control Application Part (ALCAP) protocol logging facility
- **alcapmgr**: ALCAP manager logging facility
- **all**: All facilities
- **asngwmgr**: Access Service Network (ASN) Gateway Manager facility
- **asnpcmgr**: ASN Paging Controller Manager facility
- **bfd**: Bidirectional Forwarding Detection (BFD) protocol logging facility
- **bgp**: Border Gateway Protocol (BGP) facility
- **bssap+**: Base Station Sub-system Application Part+ protocol facility for the login interface between the SGSN and the MSC/VLR (2.5G and 3G)

- **bssgp**: Base Station Sub-system GPRS Protocol logging facility handles exchange information between the SGSN and the BSS (2.5G only)
- **callhome**: Call Home application logging facility
- **cap**: CAMEL Application Part (CAP) logging facility for protocol used in prepaid applications (2.5G and 3G)
- **cli**: Command Line Interface (CLI) logging facility
- **credit-control**: Credit Control (CC) facility
- **cscf**: IMS/MMD Call Session Control Function (CSCF)
- **cscfmgr**: SIP CSCF Manager facility
- **cscfnpdb**: CSCF Number Portability Database (NPDB) logging facility
- **cscfttmgr**: SIP CSCF Tunnel and Transport Manager facility
- **csp**: Card/Slot/Port controller facility
- **css**: Content Service Selection (CSS) facility
- **css-sig**: CSS RADIUS Signaling facility
- **cx-diameter**: Cx Diameter Messages facility
- **dcardctrl**: IPSec Daughter Card Controller logging facility
- **dcardmgr**: IPSec Daughter Card Manager logging facility
- **demuxmgr**: Demux Manager API facility
- **dgmbmgr**: Diameter Gmb Application Manager logging facility
- **dhcp**: Dynamic Host Configuration Protocol (DHCP) logging facility
- **dhcpv6**: DHCPv6
- **dhost**: Distributed Host logging facility
- **diabase**: Diabase messages facility
- **diameter**: Diameter endpoint logging facility
- **diameter-acct**: Diameter Accounting
- **diameter-auth**: Diameter Authentication
- **diameter-dns**: Diameter DNS subsystem
- **diameter-ecs**: ACS Diameter signaling facility
- **diameter-hdd**: Diameter Horizontal Directional Drilling (HDD) Interface facility
- **diameter-svc**: Diameter Service
- **diamproxy**: DiamProxy logging facility
- **dpath**: IPSec Data Path facility
- **drvctrl**: Driver Controller facility
- **eap-ipsec**: Extensible Authentication Protocol (EAP) IPSec facility
- **eap-sta-s6a-s13-s6b-diameter**: EAP/STA/S6A/S13/S6B Diameter messages facility
- **ecs-css**: ACSMGR <-> Session Manager Signalling Interface facility
- **egtpc**: eGTP-C logging facility

- **egtpmgr**: enhanced GPRS Tunneling Protocol (eGTP) manager logging facility
- **egtpu**: eGTP-U logging facility
- **epdg**: evolved Packet Data (ePDG) gateway logging facility
- **evlog**: Event log facility
- **famgr**: Foreign Agent manager logging facility
- **firewall**: Firewall logging facility
- **fng**: Femto Network Gateway (FNG) logging facility
- **gmm**:
  - For 2.5G: Logs the GPRS Mobility Management (GMM) layer (above LLC layer)
  - For 3G: Logs the access application layer (above the RANAP layer)
- **gprs-app**: GPRS Application logging facility
- **gprs-ns**: GPRS Network Service Protocol (layer between SGSN and the BSS) logging facility
- **gq-rx-tx-diameter**: Gq/Rx/Tx Diameter messages facility
- **gss-gcdr**: GTPP Storage Server GCDR facility
- **gtpc**: GTP-C protocol logging facility
- **gtpcmgr**: GTP-C protocol manager logging facility
- **gtpp**: GTP-prime protocol logging facility
- **gtpu**: GTP-U protocol logging facility
- **gtpumgr**: GTP-U Demux manager
- **gx-ty-diameter**: Gx/Ty Diameter messages facility
- **gy-diameter**: Gy Diameter messages facility
- **hamgr**: Home Agent manager logging facility
- **hat**: High Availability Task (HAT) process facility
- **hdctrl**: HD Controller logging facility
- **hnb-gw**: HNB-GW (3G Femto GW) logging facility
- **hnbmgr**: HNB-GW Demux Manager logging facility
- **hss-peer-service**: Home Subscriber Server (HSS) Peer Service facility
- **igmp**: Internet Group Management Protocol (IGMP)
- **ikev2**: Internet Key Exchange version 2 (IKEv2)
- **ims-authorizatn**: IP Multimedia Subsystem (IMS) Authorization Service facility
- **ims-sh**: HSS Diameter Sh Interface Service facility
- **imsimgr**: SGSN IMSI Manager facility
- **imsue**: IMS User Equipment (IMSUE) facility
- **ip-arp**: IP Address Resolution Protocol facility
- **ip-interface**: IP interface facility
- **ip-route**: IP route facility
- **ipms**: Intelligent Packet Monitoring System (IPMS) logging facility

- **ipsec**: IP Security logging facility
- **ipsg**: IP Service Gateway interface logging facility
- **ipsgmgr**: IP Services Gateway facility
- **ipsp**: IP Pool Sharing Protocol logging facility
- **kvstore**: Key/Value Store (KVSTORE) Store facility
- **l2tp-control**: Layer 2 Tunneling Precool (L2TP) control logging facility
- **l2tp-data**: L2TP data logging facility
- **l2tpdemux**: L2TP Demux Manager logging facility
- **l2tpmgr**: L2TP Manager logging facility
- **lagmgr**: Link Aggregation Group (LAG) manager logging facility
- **li**: Refer to the *Lawful Intercept Interface Reference* for a description of this command.
- **linkmgr**: SGSN/BSS SS7 Link Manager logging facility (2.5G only)
- **llc**: Logical Link Control (LLC) Protocol logging facility; for SGSN: logs the LLC layer between the GMM and the BSSGP layers for logical links between the MS and the SGSN
- **local-policy**: Local Policy Service facility
- **location-service**: Location Services facility
- **m3ua**: M3UA Protocol logging facility
- **magmgr**: Mobile Access Gateway manager logging facility
- **map**: Mobile Application Part (MAP) protocol logging facility
- **megadiammgr**: MegaDiameter Manager (SLF Service) logging facility
- **mme-app**: Mobility Management Entity (MME) Application logging facility
- **mme-misc**: MME miscellaneous logging facility
- **mmedemux**: MME Demux Manager logging facility
- **mmemgr**: MME Manager facility
- **mmgr**: Master Manager logging facility
- **mobile-ip**: Mobile IP processes
- **mobile-ip-data**: Mobile IP data facility
- **mobile-ipv6**: Mobile IPv6 logging facility
- **mpls**: Multiprotocol Label Switching (MPLS) protocol logging facility
- **mtp2**: Message Transfer Part 2 (MTP2) Service logging facility
- **mtp3**: Message Transfer Part 3 (MTP3) Protocol logging facility
- **multicast-proxy**: Multicast Proxy logging facility
- **npuctrl**: Network Processor Unit Control facility
- **npumgr**: Network Processor Unit Manager facility
- **npumgr-acl**: NPUMGR ACL logging facility
- **npumgr-flow**: NPUMGR FLOW logging facility
- **npumgr-fwd**: NPUMGR FWD logging facility

- **npumgr-init**: NPUMGR INIT logging facility
- **npumgr-port**: NPUMGR PORT logging facility
- **npumgr-recovery**: NPUMGR RECOVERY logging facility
- **ntfy-intf**: Notification Interface logging facility [Release 12.0 and earlier versions only]
- **ogw-app**: Offload Gateway (OGW) application logging facility [Release 12.0 and earlier versions only]
- **ogw-gtpc**: OGW GTP-C application logging facility [Release 12.0 and earlier versions only]
- **ogw-gtpu**: OGW GTP-U application logging facility [Release 12.0 and earlier versions only]
- **ogwmgr**: OGW Demux Manager logging facility [Release 12.0 and earlier versions only]
- **orbs**: Object Request Broker System logging facility
- **ospf**: OSPF protocol logging facility
- **ospfv3**: OSPFv3 protocol logging facility
- **p2p**: Peer-to-Peer Detection logging facility
- **pdg**: Packet Data Gateway (PDG) logging facility
- **pdgdmgr**: PDG Demux Manager logging facility
- **pdif**: Packet Data Interworking Function (PDIF) logging facility
- **pgw**: Packet Data Network Gateway (PGW) logging facility
- **phs**: Payload Header Suppression (PHS)
- **phs-control**: PHS X1/X5 and X2/X6 Interface logging facility
- **phs-data**: PHS Data logging facility
- **phs-eapol**: PHS EAP over LAN (EAPOL) logging facility
- **phsgwmgr**: PHS Gateway Manager facility
- **phspcmgr**: PHS Paging Controller Manager facility
- **pmm-app**: Packet Mobility Management (PMM) application logging facility
- **ppp**: Point-To-Point Protocol (PPP) link and packet facilities
- **pppoe**: PPP over Ethernet logging facility
- **push**: VPNMGR CDR push logging facility
- **radius-acct**: RADIUS accounting logging facility
- **radius-auth**: RADIUS authentication logging facility
- **radius-coa**: RADIUS change of authorization and radius disconnect
- **ranap**: Radio Access Network Application Part (RANAP) Protocol facility logging info flow between SGSN and RNS (3G)
- **rct**: Recovery Control Task logging facility
- **rdt**: Redirect Task logging facility
- **resmgr**: Resource Manager logging facility
- **rf-diameter**: Diameter Rf interface messages facility
- **rip**: Routing Information Protocol (RIP) logging facility [RIP is not supported at this time.]
- **rohc**: Robust Header Compression (RoHC) facility

- **rsvp**: Reservation Protocol logging facility
- **rua**: RANAP User Adaptation (RUA) [3G Femto GW - RUA messages] logging facility
- **s1ap**: S1 Application Protocol (S1AP) Protocol logging facility
- **sccp:** Signalling Connection Control Part (SCCP) Protocol logging (connection-oriented messages between RANAP and TCAP layers).
- **sct**: Shared Configuration Task logging facility
- **sctp**: Stream Control Transmission Protocol (SCTP) Protocol logging facility
- **sessctrl**: Session Controller logging facility
- **sessmgr**: Session Manager logging facility
- **sesstrc**: session trace logging facility
- **sft**: Switch Fabric Task logging facility
- **sgs**: SGs interface protocol logging facility
- **sgsn-app**: SGSN-APP logging various SGSN “glue” interfaces (for example, between PMM, MAP, GPRS-FSM, SMS).
- **sgsn-failures**: SGSN call failures (attach/activate rejects) logging facility (2.5G)
- **sgsn-gtpc**: SGSN GTP-C Protocol logging control messages between the SGSN and the GGSN
- **sgsn-gtpu**: SGSN GTP-U Protocol logging user data messages between the SGSN and GGSN
- **sgsn-mbms-bearer**: SGSN Multimedia Broadcast/Multicast Service (MBMS) Bearer app (SMGR) logging facility
- **sgsn-misc**: Used by stack manager to log binding and removing between layers
- **sgsn-system**: SGSN System Components logging facility (used infrequently)
- **sgsn-test**: SGSN Tests logging facility; used infrequently
- **sgtpcmgr**: SGSN GTP-C Manager logging information exchange through SGTPC and the GGSN
- **sgw**: Serving Gateway facility
- **sh-diameter**: Sh Diameter messages facility
- **sitmain**: System Initialization Task main logging facility
- **sm-app**: SM Protocol logging facility
- **sms**: Short Message Service (SMS) logging messages between the MS and the SMSC
- **sndcp**: Sub Network Dependent Convergence Protocol (SNDCP) logging facility
- **snmp**: SNMP logging facility
- **srdb**: Static Rating Database
- **srp**: Service Redundancy Protocol (SRP) logging facility
- **sscfnni**: SSCFNNI Protocol logging facility
- **sscop**: SSCOP Protocol logging facility
- **ssh-ipsec**: SSH IP Security logging facility
- **ssl**: Secure Socket Layer (SSL) message logging facility
- **stat**: Statistics logging facility
- **system**: System logging facility

- **tacacsplus**: TACACS+ Protocol logging facility
- **tcap**: TCAP Protocol logging facility
- **testctrl**: Test Controller logging facility
- **testmgr**: Test Manager logging facility
- **threshold**: threshold logging facility
- **ttg**: Tunnel Termination Gateway (TTG) logging facility
- **tucl**: TCP/UDP Convergence Layer (TUCL) logging facility
- **udr**: User Data Record (UDR) facility (used with the Charging Service)
- **user-data**: User data logging facility
- **user-l3tunnel**: User Layer 3 tunnel logging facility
- **usertcp-stack**: User TCP Stack
- **vpn**: Virtual Private Network logging facility
- **wimax-data**: WiMAX DATA
- **wimax-r6**: WiMAX R6

`level` *`report_level`* **`[ critical-info | no-critical-info ]`**

`level` *`report_level`*: specifies the level of information to be logged, *`report_level`*, as one of:

- critical
- debug
- error
- info
- trace
- unusual
- warning

`critical-info` | **`no-critical-info`**: indicates if critical information is to be displayed or not. The keyword **`critical-info`** specifies that events with a category attribute of critical information are to be displayed. Examples of these types of events can be seen at bootup when system processes and tasks are being initiated. The **`no-critical-info`** keyword specifies that events with a category attribute of critical information are not to be displayed.

Usage

This command is useful when it is necessary to get real time output of events. Event output may be cached otherwise which may make it difficult to trouble shoot problems which do not allow the last cache of events to be output prior to system problems.

Caution: Issuing this command could negatively impact system performance depending on system loading, the log level, and/or the type of facility(ies) being logged.

Example

Set real time output for the point-to-point protocol facility and all facilities, respectively, to avoid logging of excessive information.

```
logging filter runtime facility ppp

logging filter runtime facility all level warning
```

logging monitor

Enables or disables the monitoring of a specified user.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] logging monitor {ipaddr *ip_address* **| msid** *ms_id* **| username user_name}**

no

Disables the monitoring of the user specified by the options given.

ipaddr *ip_address*

Specifies the IP address of the user for which the monitoring filter is to be set. *ip_address* must entered using IPv4 dotted-decimal notation.

msid *ms_id*

msid *ms_id*: specifies the mobile subscriber ID for which the monitoring filter is to be set. *ms_id* must be from 7 to 16 digits.
This keyword/option can be used to specify the Mobile Subscriber ISDN (MSISDN) for GGSN calls which enables logging based on MSISDN.

username *user_name*

username *user_name*: specifies a user for which the monitoring filter is to be set. *user_name* must refer to a previously configured user.

Usage

Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

Caution: Issuing this command could negatively impact system performance depending on the number of subscribers for which monitoring is performed and/or the amount of data they're passing.

Example

The following command enables the monitoring of user *user1* and mobile subscriber ID 4441235555, respectively.

```
logging monitor username user1
```

```
logging monitor msid 44441235555
```

The following disables the monitoring of user *user1*.

```
no logging monitor username user1
```

logging runtime

Enables events to be filtered and logged in real time.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`logging runtime buffer store { all-events | filtered-events-only }`

`buffer store { all-events | filtered-events-only }`

Determines which logs are stored in internal logging daemon runtime buffer.

- **`all-events`**: Logging daemon runtime buffer stores all logs that come to it.
- **`filtered-events-only`**: Logging daemon runtime buffer stores only logs that pass the runtime filter.

Usage

Sets the filtering of logged information to log in real time.

Example

The following command enables storage of logs that pass the runtime filter:

```
logging runtime buffer store filtered-events-only
```

lte-policy

This command enters the LTE Policy Configuration Mode where LTE policy parameters can be configured.

lte-policy

Usage

Enters the LTE Policy Configuration Mode.
Entering this command results in the following prompt:
`[context_name]hostname(lte-policy)#`
LTE Policy Configuration Mode commands are defined in the *LTE Policy Configuration Mode Commands* chapter.

mediation-device

This command is obsolete. Even though the CLI accepts the command no function is performed.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
[ no ] mediation-device mode { tcs }
```

network-overload-protection

This command configures an attach rate throttle mechanism to control the number of new connections (attaches or inter-SGSN RAUs), through the SGSN, on a per second basis.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

network-overload-protection sgsn-new-connections-per-second *#_new_connections* **action { drop | reject with cause { congestion | network failure } } [queue-size** *queue_size* **] [wait-time** *wait_time* **]**

default network-overload-protection sgsn-new-connections-per-second

default

Using **default** in the command, disables this attach rate throttle feature that provides network overload protection.

sgsn-new-connections-per-second *#_new_connections*

Define the number of new connections to be accepted per second.
#_new_connections: Must be an integer from 50 to 5000.

action

Specifies the action to be taken by the SGSN when the attach rate exceeds the configured limit on the number of attaches. Select one of the following actions:

- **drop:** Drop the new connection request.
- **reject-with-cause:** Reject the new connection request. Include one of the following as the cause in the reject message:
- **congestion**
- **network failure**

queue-size *queue_size*

Defines the maximum size of the pacing queue used for buffering the packets. If configured, the queue-size should be greater than or equal to the *#_new_connections* value and less than or equal to the optimal value (the *wait_time* * *#_new_connections*). This validation is done in the CLI.
queue_size Must be an integer from 250 to 25000.
Default: unconfigured. The default value is the *#_new_connections* * *wait-time*. This will be the optimal value.

wait-time *wait_time*

Defines the maximum life-time (number of seconds) of the packets in the queue beyond which the packets are considered to be “stale”.
wait_time Must be an integer from 1 to 15
Default: 5

Usage

Use this command to configure the rate at which the SGSN must process new connection requests. The rate is the number of new connections to be accepted per second.
With basic network overload protection, the incoming new connection rate is higher than this configured rate. When this occurs, all of the new connection requests cannot be processed. This command can also be used to configure the action to be taken when the rate limit is exceeded. The new connection requests, which cannot be processed, can be either dropped or rejected with a specific reject cause.
The SGSN’s *optimized* network overload protection performs attach-rate throttling to avoid overloading Gr, Gn and Gf interfaces. This is enabled with **queue-size** and **wait-time** keywords so that the IMSIMgr throttles the attach rate to values configured with these keywords.
If the SGSN receives more than the configured number of attaches in a second, then the attaches are buffered in the pacing queue and requests are only dropped when the buffer overflows due to high incoming attach rate. Messages in the queue are processed (FIFO) until they age-out when the queued message's lifetime crosses the configured wait-time. The wait-time and the attach rate decide the optimal size of the queue.
Counters for this feature are available in the **show gmm-sm statistics** command display in the Network Overload Protection portion of the table.

Example

Configure the throttle rate or limit to 2500 attaches per second and to drop all requests if the limit is exceeded.

```
network-overload-protection sgsn-new-connections-per-second 2500 action
drop
```

Disables the network-overload protection feature and set the default queue size to 1000 and the wait time to 5 seconds:

```
default network-overload-protection sgsn-new-connections-per-second
```

Set the attach rate to 500 per second, the action to drop, the wait time to 5 seconds, and the queue size to be calculated (as follows: *wait_time* * *#_new_connections* - i.e., 2500)

```
network-overload-protection sgsn-new-connections-per-second 500 action
drop wait-time 5
```

network-service-entity

This command creates a new instance of an SGSN network service entity (NSE) for either the IP environment or the Frame Relay environment.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] network-service-entity (ip-local | peer-nsei *peer_nsei_number* **frame-relay)**

no

Deletes the network service entity definition from the system configuration.

ip-local

Configures the local endpoint for NS/IP and enters the NSE-IP configuration mode. The prompt will change to:

```
[local]<hostname>(nse-ip-local)#
```

peer-nsei *peer_nsei_number* **frame-relay**

Configures a peer NSE with frame relay connectivity. This set of keywords also provides access to the NSE-FR Configuration mode. The prompt will change to:

```
[local]<hostname>(nse-fr-peer-nsei-<peer_nsei_number>)#
```

Usage

Use this command to access the configuration modes for either the IP or Frame Relay network service entities.

Example

Enter the NSE for a Frame Relay configuration instance identified as 4554:

```
network-service-entity peer-nsei 4554 frame-relay
```

network-service-entity ip

This command has been deprecated. See the replacement command network-service-entity .

ntp

Enters the Network Time Protocol (NTP) configuration mode or disables the use of NTP on the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] ntp

no

Disables the use of NTP for clock synchronization. When omitted, NTP client support is enabled on the chassis. By default NTP synchronization to external servers is disabled.

Important: If the use of NTP is disabled the system clock may drift over a period of time. This may require manual updates to the system clock to synchronize the clock with other network elements.

Usage

Used when it is necessary to enable or configure NTP settings. For additional information refer to the *NTP Configuration Mode Commands* chapter and the *System Administration Guide*.

Example

The following command enters the NTP configuration mode:

```
ntp
```

The following disables the use of the network timing protocol for system clock synchronization.

```
no ntp
```

operator-policy

This command creates an operator policy and enters the operator policy configuration mode. Commands for configuration of the policies are available in the *Operator Policy Configuration Mode Commands* chapter.

Platform

ASR 5000

Product

MME

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

operator-policy (default | name *policy_name* **} [-noconfirm]**

no operator-policy (default | name *policy_name* **}**

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

no

Removes the specified operator policy from the system configuration.

default

default, in this case, is the *name* of a specific operator policy. This default policy is used when no other defined operator policy matches the incoming IMSI.

Important: You should configure this default operator policy to be it available to handle IMSIs that are not matched with other defined policies.

name *policy_name*

Specifies the unique name of an operator policy. *policy_name* is entered as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create an operator policy and to enter the operator policy configuration mode to define or modify policies.
An operator policy associates APNs, APN profiles, IMEI ranges, IMEI profiles, an APN remap table and a call-control profile to ranges of IMSIs. These profiles and tables are created and defined within their own

configuration modes to generate sets of rules and instructions that can be reused and assigned to multiple policies. In this manner, an operator policy manages the application of rules governing the services, facilities and privileges available to subscribers. These policies can override standard behaviors and provide mechanisms for an operator to get around the limitations of other infrastructure elements such as DNS servers and HLRs.
The system supports up to 1,000 operator policies, including the *default* operator policy.

Important: An operator policy is **the** key element of the Operator Policy feature. After defining an instance of an operator policy, you must go to the SGSN Global Configuration Mode (from the Global Configuration mode) to define the IMSI range(s). This requirement does not hold if you are using a *default* operator policy.

To see what operator policies have already been created, return to the Exec mode and enter the **`show operator-policy all`** command.

Example

The following command accesses the default operator policy and enters the operator policy configuration mode to view or modify the specified policy:

```
operator-policy default
```

orbem

Enters the Object Request Broker Element Manager (ORBEM) Configuration mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
orbem
```

Usage

Set the configuration mode to allow modification of the ORBEM configuration data.

pac-standby-priority

This command has been renamed to **`card-standby-priority`**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

port atm

Identifies a physical port on a line card that supports ATM signaling and then enters the configuration mode for the specific interface-type. For the commands to configure the port interface, see the CLI chapter ATM Port Configuration Mode.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`port atm` *`slot/port`*

`atm`

Indicates the port identified is an ATM interface port.

`slot/port`

To determine valid ATM slot and port numbers, use the Exec mode's command **`show port table`**
`slot:` Identifies the chassis slot holding the line card that supplies ATM ports. The slot ID number can be an integer from 17 through 48.
`port:` Identifies the physical port that is to be configured to support ATM signaling. The ID number can be an integer from 1 through 4.

Usage

Change the current configuration mode to Ethernet Port Configuration mode.

Important: This command is not supported on all platforms.

Example

The following enters the ATM port configuration mode for ATM port 1 on the card in slot 19:

```
port atm 19/1
```

port bits

Enters the Building Integrated Timing Supply (BITS) port configuration mode by identifying the BITS port on the active or standby SPIO.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

port bits *slot/port*

bits

Identifies the BITS port.

slot/port

slot: Identifies the chassis slot holding the SPIO. The slot ID can be either 24 (active SPIO) or 25 (standby SPIO).
port: Identifies the BITS port on the SPIO. The port ID number must be 4.

Usage

Change the current configuration mode to BITS port configuration mode.

Important: This command is not supported on all platforms.

Example

The following enters the BITS port configuration mode for the active SPIO:

```
port bits 24/4
```

port channelized

Identifies a physical port on a Channelized Line Card (CLC) that supports Frame Relay signaling and creates a Frame Relay interface. This command enters the configuration mode for the commands that configure the Frame Relay interface and the channelized port interface. For additional information, see the *Channelized Port Configuration Mode Commands* chapter.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

port channelized *slot/port*

channelized

Selects the channelized frame relay interface for the selected line card and port.

slot/port

To determine valid slots and port numbers, use the Exec mode's command **show port table** to find the channelized line card.
slot: Identifies the chassis slot holding the Channelized Line Card that sources Frame Relay ports. The slot ID number can be an integer from 17 through 48.
port: Identifies the physical port that is to be configured to support Frame Relay signaling. The ID number can only be 1.

Usage

Change the current configuration mode to Channelized Port configuration mode.

Example

The following enters the Channelized port configuration mode for port 1 on the card in slot 20:

```
port channelized 20/1
```

port ethernet

Enters the Ethernet Port Configuration mode for the identified port.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

port ethernet *slot/port*

ethernet

Indicates the port identified is an Ethernet interface port.

slot/port

Specifies the port for which Ethernet Port Configuration mode is being entered. The slot and port must refer to an installed card and port.

Usage

Change the current configuration mode to Ethernet Port Configuration mode.

Example

The following command enters the Ethernet Port Configuration mode for ethernet port 1 in slot 17:

```
port ethernet 17/1
```

port mac-address virtual-base-address

This command defines a block of 256 consecutive media access control (MAC) addresses and enables virtual MAC addressing for Ethernet line card ports. Not available for the XT2 platform.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

port mac-address virtual-base-address *MAC_Address*

no port mac-address virtual-base-address

no

Disables virtual MAC addressing for Ethernet line card ports. The block of virtual MAC addresses is not saved.

MAC_Address

Specifies the beginning address of a block of 256 MAC addresses that are used for virtual MAC addressing.

Usage

Use this command to disregard the MAC addresses assigned and stored in card firmware and assign MAC addresses for all Ethernet ports from the specified block of virtual MAC addresses. This command does not affect the MAC addresses on SPIO cards.
There are 65536 MAC addresses (00:05:47:FF:00:00 - 00:05:47:FF:FF:FF) reserved for use by customers. This range allows for the creation of 256 address blocks each containing 256 MAC addresses (for example, 00:05:47:FF:00:00, 00:05:47:FF:01:00, 00:05:47:FF:02:00, 00:05:47:FF:03:00, 00:05:47:FF:04:00, etc.).

Caution: This configuration requires the configuration of a valid block of unique MAC addresses that are not used anywhere else. Use of non-unique MAC addresses can degrade and impair the operation of your network.

Important: This command is not supported on all platforms.

Example

To enable virtual MAC addressing for Ethernet ports on all Ethernet line cards in the system using a block of MAC addresses starting at *00:05:47:FF:00:00*, enter the following command:

```
port mac-address virtual-base-address 00:05:47:FF:00:00
```

port rs232

Enters the RS-232 Port Configuration mode for the RS-232 console port on the specified SPIO card. Not available on the XT2 platform.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

port rs232 *slot* **3**

rs232

Indicates the port identified is an RS-232 port on a SPIO card.

slot **3**

Specifies the slot of the SPIO for which RS-232 Port Configuration mode is being entered. The slot must refer to an installed SPIO card. The specified port must always be 3 for an RS-232 port.
The value for *slot* must be either 24 or 25.

Usage

Change the current configuration mode to RS-232 Port Configuration mode.

Example

The following command enters the RS-232 Port Configuration mode for the SPIO in slot 24;

```
port rs232 24 3
```

profile-id-qci-mapping

Creates a Qos Class-Identifier-Radio Access Network (QCI-RAN) ID mapping table or specifies an existing table and enters the QCI Mapping Configuration mode for the system.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] profile-id-qci-mapping *name* **[-noconfrm]**

no

Removes the specified mapping table from the system

name

Creates a new or enters an existing mapping table configuration. *name* must be an alphanumeric string of 1 through 63 alphanumeric.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enters the QCI-RAN ID mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.
Entering this command results in the following prompt:

```
[context_name]hostname(config-hsgw-association-table)#
```

QCI Mapping Configuration Mode commands are defined in the *QCI Mapping Configuration Mode Commands* chapter.
Use this command when configuring the HSGW eHRPD component.

Important: This command creates a mapping table available to any HSGW context configured on the system.

Example

The following command enters the existing QCI mapping configuration mode (or creates it if it doesn't already exist) for a mapping table named *qci_table1*:

```
profile-id-qci-mapping qci_table1
```

The following command will remove *qci_table1* from the system:

```
no profile-id-qci-mapping qci_table1
```

ps-network

This command creates/removes an HNB-PS network configuration instance for Femto UMTS access over Iu-PS/Iu-Flex interface between Home NodeB Gateway (HNB-GW) service and PS networks elements; i.e. SGSN. This command also configures an existing HNB-CS network instance and enters the HNB-CS Network Configuration mode on a system.

Platform

ASR 5000

Product

HNB-GW

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] ps-network *ps_instance* **[-noconfirm]**

no ps-network *ps_instance*

no

Removes the specified HNB-PS network instance from the system.

Caution: Removing the HNB-PS network instance is a disruptive operation and it will affect all UEs accessing SGSN(s) in specific PS core network through the HNB-GW service.

WARNING: If any HNB-PS Network instance is removed from system all parameters configured in that mode will be deleted and Iu-PS/Iu-Flex interface will be disabled.

ps_instance

Specifies the name of the Packet Switched Core Networks instance which needs to be associated with HNB Radio Network PLMN in HNB RN-PLMN configuration mode. If *ps_instance* does not refer to an existing HNB-PS instance, the new HNB-PS network instance is created.
ps_instance must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to enter the HNB-PS Network Configuration mode for an existing PS network instance or for a newly defined HNB-PS network instance. This command is also used to remove an existing HNB-PS network instance.

This configuration enables the Iu-PS/Iu-Flex interface on HNB-GW service with CS core network elements; i.e. MSC/VLR.
A maximum of 1 HNB-PS networks instance which is further limited to a maximum of 256 services (regardless of type) can be configured per system.

Caution: This is a critical configuration. The HNBs can not access SGSNs in PS core network without this configuration. Any change to this configuration would lead to disruption in HNB access to PS core network.

Entering this command results in the following prompt:

```
[context_name]hostname(config-ps-network)#
```

The various parameters available for configuration of an HNB-PS network instance are defined in the *HNB-PS Network Configuration Mode Commands* chapter.

Example

The following command enters the existing HNB-PS Network configuration mode (or creates it if it doesn't already exist) for the instance named *hnb-ps1*:

```
ps-network hnb-ps1
```

The following command will remove HNB-PS network instance *hnb-ps1* from the system without any prompt to user:

```
no ps-network hnb-ps1
```

qci-qos-mapping

Global QCI-QoS mapping tables are used to map QoS Class Identifier (QCI) values to appropriate Quality of Service (QoS) parameters.

Platform

ASR 5000

Product

HSGW

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

qci-qos-mapping *name* **[-noconfirm]**

no

Removes the specified mapping configuration from the system

name

Creates a new or enters an existing mapping configuration. *name* must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Enter the QCI-QoS mapping configuration mode for an existing table or for a newly defined table. This command is also used to remove an existing table.
Entering this command results in the following prompt:

```
[context_name]hostname(config-qci-qos-mapping)#
```

QCI - QoS Mapping Configuration Mode commands are defined in the *QCI - QoS Mapping Configuration Mode Commands* chapter.
Use this command when configuring the following eHRPD component: HSGW, P-GW, S-GW.

Important: This command creates a mapping configuration available to any HSGW, P-GW, S-GW context configured on the system.

Example

The following command enters the existing QCI - QoS mapping configuration mode (or creates it if it doesn't already exist) for a mapping configuration named *qci-qos3*:

```
qci-qos-mapping qci-qos3
```

qos npu inter-subscriber traffic bandwidth

Configures NPU QoS bandwidth allocations for the system.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

qos npu inter-subscriber traffic bandwidth gold *percent* **silver** *percent* **bronze** *percent* **best-effort** *percent*

no qos npu inter-subscriber traffic bandwidth

no

Removes a previous bandwidth allocation.

gold *percent*

Default: 10%
Specifies the maximum percentage of bandwidth to be allocated to the gold queue priority.
percent can be configured to an integer from 0 through 100.

silver *percent*

Default: 20%
Specifies the maximum percentage of bandwidth to be allocated to the silver queue priority.
percent can be configured to an integer from 0 through 100.

bronze *percent*

Default: 30%
Specifies the maximum percentage of bandwidth to be allocated to the bronze queue priority.
percent can be configured to an integer from 0 through 100.

best-effort *percent*

Default: 40%
Specifies the maximum percentage of bandwidth to be allocated to the best-effort queue priority.
percent can be configured to an integer from 0 through 100.

Usage

The bandwidth of a subscriber queue is maintained by rate limiting functions which implement packet-rate limiting at the first level and bit-rate limiting at the next level.
The packet-rate limit of a queue is defined by the number of packets-per-second (PPS) permitted for queuing. Before queuing a packet on a subscriber queue, the NPU ensures that the packet falls within the limit. If the packet to be queued exceeds the packet rate limit, it is dropped.
Each subscriber queue is configured with a bit rate limit, measured in megabits-per-second (Mbps), referred to as CP-BPS (bit-per-second to CP). The CP-BPS is available as the total bandwidth for the subscriber traffic that a CP can sustain. Each subscriber queue receives an allocation of a certain percentage of the CP-BPS.
The following maximum CP-BPS values are supported:

- Lead CP (CP0) = 128 Mbps
- Remaining CPs (CP1, CP2, CP3) = 256 Mbps

For additional information on the NPU QoS functionality, refer to the System Administration and Configuration Guide.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command configures bandwidth allocations of 20, 30, 40, and 50% for the gold, silver, bronze, and best-effort queues respectively:

```
qos npu inter-subscriber traffic bandwidth gold 20 silver 30 bronze 40
best-effort 50
```

Upon executing this command, the priority queues will have the following packet processing card CP bandwidth allocations based on the maximum CP bandwidth specifications:

Priority	Lead CP (CP 0) Bandwidth (Mbps)	CP 1 through CP 3 Bandwidth (Mbps)
Gold	25.6	51.2
Silver	38.4	76.8
Bronze	51.2	102.4
Best-effort	64	128

qos npu inter-subscriber traffic bandwidth-sharing

Configures NPU QoS bandwidth sharing properties for the system.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

qos npu inter-subscriber traffic bandwidth-sharing { { enable | disable } { all | slot *slot_num* **cpu** *cpu_num* **} }**

enable

Enables bandwidth sharing for the specified criteria.

disable

Disables bandwidth sharing for the specified criteria.

all

Specifies that the bandwidth action is to be applied to all packet processing cards and every CPU on each packet processing card.

slot *slot_num*

Specifies that the bandwidth action is to be applied to a packet processing card in a specific chassis slot number.
slot_num is the slot in which a packet processing card is installed. These cards can be installed in slots 1 through 8 and 10 through 16 on the ASR 5000, or 1 through 4 and 7 through 10 on the ASR 5500.

cpu *cpu_num*

Specifies a specific control processor (CP) on a packet processing card for which to perform the bandwidth action.
cpu_num is an integer value from 0 to 3. 0 represents the lead CP.

Usage

The available bandwidth of a subscriber queue can be shared equally among the other subscriber queues. Any unutilized bandwidth of a queue can be shared with the other queues equally. For example, if only one DSCP

is configured and it is mapped to best-effort, that DSCP would get the bandwidth allocated to the best-effort in addition to the rest of the bandwidth allocated to the gold, silver, and bronze.
By default, the system enables sharing for all packet processing cards and their CPs.
For additional information on the NPU QoS functionality, refer to the *System Administration Guide*.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command disables bandwidth sharing for the fourth CP (CP 3) on a packet processing card installed in chassis slot 3:

```
qos npu inter-subscriber traffic bandwidth-sharing disable slot 4 cpu 3
```

qos npu inter-subscriber traffic priority

Configures the DSCP-to-Priority assignments for the system.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

qos npu inter-subscriber traffic priority { best-effort | bronze | gold | silver } assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef | *dscp_num* } }

no qos npu inter-subscriber traffic priority [assigned-to dscp { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef }]

best-effort

Specifies the best-effort queue priority.

bronze

Specifies the bronze queue priority.

gold

Specifies the gold queue priority.

silver

Specifies the silver queue priority.

af*XX*

Assigns the Assured Forwarding *XX* PHB (per-hop behavior) DSCP.
Each Assured Forwarding PHB has a corresponding DSCP value as follows:

- af11 through af13: DSCP values 5 through 7 respectively
- af21 through af23: DSCP values 9 through 11 respectively
- af31 through af33: DSCP values 13 through 15 respectively
- af41 through af43: DSCP values 17 through 19 respectively

be

Assigns the Best Effort forwarding PHB which has a corresponding DSCP value of 0.

ef

Assigns the Expedited Forwarding PHB which has a corresponding DSCP value of 23.

dscp_num

Specifies a specific DSCP value as an integer from 0 through 31.

Usage

The differentiated services (DS) field of a packet contains six bits (0-5) that represent the differentiated service code point (DSCP) value.
Five of the bits (1-5) represent the DSCP. Therefore, up to 32 (25) DSCPs can be assigned to the various priorities. By default, they're all assigned to the lowest priority (best-effort).
For additional information on the NPU QoS functionality, refer to the *System Administration Guide*.

Important: This functionality is not supported for use with the PDSN at this time.

Example

The following command maps the ef DSCP to the gold priority queue:

```
qos npu inter-subscriber traffic priority gold assigned-to dscp ef
```

ran-peer-map

Creates a Radio Access Network (RAN) Peer Map and enters the RAN Peer Map Configuration Mode.

Platform

ASR 5000

Product

ASN-GW

PHSGW

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] ran-peer-map *name* **[-noconfirm]**

no

Removes the RAN Peer Map from the system.

name

Specifies the name of the RAN Peer Map. *name* must be an alphanumeric string of 1 through 31 characters.

Usage

Use this command to create a new RAN Peer Map or edit an existing one. RAN peer maps reconcile base station MAC addresses received in R6 protocol messages to the base station's IP address.
Entering this command results in the following prompt:

```
[context_name]hostname(config-ran-peer-map)#
```

RAN Peer Map Configuration Mode commands are defined in the ASN RAN Peer Map Configuration Mode Commands chapter in this guide.

Example

The following command creates a RAN peer map named *ran12*:

```
ran-peer-map ran12
```

require active-charging

This command enables/disables Active Charging Service (ACS) with or without the Category-based Content Filtering application.

Platform

ASR 5000

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
require active-charging [ isolated-mode ] [ content-filtering category [ static-and-dynamic ] ] [ optimized-mode ]

no require active-charging
```

no

Disables ACS on the system.

isolated-mode

Enables ACS and separates ACS-related resources from other sub-system resource sharing.

Important: In 8.1 and later releases, this keyword is not supported.

optimized-mode

Enables ACS in Optimized mode, wherein ACS functionality is managed by SessMgrs.

Important: In 8.0 and earlier releases and in 9.0 and later releases, this keyword is not supported.

Important: In Release 8.1, ACS must be configured in the Optimized mode.

Important: In Release 8.1, if the active-charging mode is changed from the default (non-optimized) mode to the Optimized mode, or vice-versa, the system must be rebooted for the change to take effect.

Important: In Release 8.3, this keyword is obsolete. With or without this keyword ACS is always enabled in the Optimized mode.

Use the **require active-charging** command to enable ACS in the non-optimized mode. Wherein, ACS Managers will spawn to support ACS.
Use the **require active-charging optimized-mode** command to enable ACS in the Optimized mode. Wherein, ACS is enabled as part of Session Managers.

content-filtering category [static-and-dynamic]

Enables the Category-based Content Filtering application with ACS support and creates the necessary Static Rating Database (SRDB) tasks to utilize the internal database of static/dynamic URLs.
For Dynamic Content Filtering support, the **static-and-dynamic** keyword must be configured to specify that the Dynamic Rater Package (model and feature files) must be distributed to rating modules on startup, recovery, etc. If not configured, by default, the static-only mode is enabled.

Usage

Use this command to enable/disable ACS with or without Category-based Content Filtering application on the chassis.

Important: This command triggers the resource subsystem to switch to ACS-enabled mode and start ACS-related tasks. This CLI command must be configured before any services are configured, so that the resource subsystem can appropriately reserve adequate memory for the ACS-related tasks. After configuring this command, the configuration must be saved and the system rebooted in order to allocate the resources for ACS upon system startup.

In 8.0 and 8.1 releases, this command must be configured before configuring any services. This is to ensure that the resource subsystem can appropriately reserve adequate memory for ACS Manager tasks. If this command is configured after all the Session Manager tasks are already active, the ACS Manager tasks will not be started even if additional cards are added to the chassis—instead, the chassis must be rebooted.

Example

In Release 8.0, the following command enables resource subsystem to configure ACS in isolated mode:

```
require active-charging isoated-mode
```

In Release 8.1, the following command enables ACS in Optimized mode:

```
require active-charging optimized-mode
```

In Release 8.3, the following command enables ACS in Optimized mode:

```
require active-charging
```

require cipher ssl resource-percentage

Assigns the 8 processing cores on the PSC2 card and splits the hardware acceleration resources between SSL protocol and IPSec protocol processing.

Platform

ASR 5000

Product

SCM (P-CSCF, A-BG)

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

require cipher ssl resource-percentage *percentage_value*

default require cipher ssl resource-percentage

percentage_value

The system converts the specified resource percentage value to the nearest number of processing cores assigned to SSL processing. The system assigns the remaining processing cores to IPSec processing. This value can be within the range of 0 to 100.
For example, if 20% of the hardware acceleration resources are assigned to SSL processing, the system translates this value to INT((20*8+50)/100) = 2 processing cores assigned to SSL processing, and (8-2) = 6 processing cores assigned to IPSec processing.

default

Sets the default percentage value to 0%, assigning all 8 processing cores to IPSec processing.

Usage

Use this command to split the 8 processing cores on the PSC2 card between SSL protocol and IPSec protocol processing.

Example

The following command assigns 20% of the hardware acceleration resources on the PSC2 card (2 processing cores) to SSL processing, and 80% of the hardware acceleration resources (6 processing cores) to IPSec processing:

```
require cipher ssl resource-percentage 20
```

require demux card

This command enables or disables the demux capabilities.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
[ default | no ] require demux card
```

default

Disables the demux capabilities on the card.

no

Disables the demux capabilities on the card.

Usage

Use this command configure the system to allow session recovery task placement scheme when session recovery is off.

Important: This command is not supported on all platforms.

Example

The following command enables demux capabilities:

```
require demux card
```

require detailed-rohc-stats

Enables or disables context-specific Robust Header Compression (RoHC) statistics.

Platform

ASR 5000

Product

HSGW

PDSN

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] require detailed-rohc-stats

no

Disables statistics for RoHC calls. This is the default condition.

Usage

Enables context-specific statistics for RoHC calls.

Example

Enter the following command to enable context specific statistics for RoHC calls:

```
require detailed-rohc-stats
```

require diameter-proxy

This command enables or disables Diameter Proxy mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

require diameter-proxy { master-slave | multiple | single }

no require diameter-proxy

no

Disables Diameter Proxy mode.
Default: no require diameter-proxy

master-slave

Sets the Diameter-Proxy to Master-Slave mode.
In Master-slave mode, multiple Diameter proxies run on system, one on each packet processing card where one of them acts as Master and other Diameter proxies act as Slave.
In such mode, the Master proxy relays the traffic across multiple Slave Diameter proxies.

multiple

To configure one Diameter proxy for each active packet processing card.

single

To configure one Diameter proxy for the entire chassis.

Usage

When the Diameter Proxy mode is enabled, each proxy process is a Diameter host, instead of requiring every Diameter application user (such as, every ACSMgr and/or every SessMgr, depending on the application) to be a host.
In Master-slave mode, multiple Diameter proxies runs on system, one on each packet processing card where one of them acts as Master and other Diameter proxies act as Slave.
In such mode Master relays the traffic from an incoming connection to a specific Slave Diameter proxy.

Example

To configure a Diameter proxy for each active packet processing card, enter the following command:

```
require diameter-proxy multiple
```

To configure a single Diameter proxy for the entire chassis, enter the following command:

```
require diameter-proxy single
```

require ecs credit-control subscriber-mode

This command configures the Diameter Credit-Control Application (DCCA) to work in per subscriber-PDN level Gy mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
[ no ] require ecs credit-control subscriber-mode
```

no

Creates DCCA/Gy sessions per bearer/PDP-context.

Usage

This command is applicable to all products using the Gy interface. Use this command to configure DCCA/Gy to work in per subscriber-PDN level Gy mode, wherein one Diameter session is created per subscriber PDN rather than per bearer, and only one DCCA/Gy session is created for multi-bearer PDNs.
If this command is not configured, or the **no require ecs credit-control subscriber-mode** command is configured, DCCA/Gy sessions are created per bearer/PDP-context, and as a result when there are multiple PDP contexts or multiple bearers in a PDN as many DCCA/Gy sessions are created.

Important: This command will take effect only when the system is booted/rebooted. When configured after the system comes up, the command will be accepted but will not be applied until after the system is rebooted with the saved configuration.

Important: This command is independent of the **require active-charging** command. The **ecs** keyword in this command is license dependent.

require session recovery

Enables session recovery when hardware or software fault occurs within system.

Platform

ASR 5000

Product

GGSN

ASN-GW

HA

HSGW

LNS

MME

PDG/TTG

PDIF

PDSN

P-GW

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
[ no ] require session recovery
```

no

Disables session recovery feature after configuration file is saved and system is restarted.

Usage

When this feature is enabled, the system attempts to recover any home agent-based Mobile IP sessions that would normally be lost due to a hardware or software fault within the system.
This functionality is available for the following call types:

- ASN-GW services supporting simple IP, Mobile IP, and Proxy Mobile IP
- PDSN services supporting simple IP, Mobile IP, and Proxy Mobile IP
- HA services supporting Mobile IP and/or Proxy Mobile IP session types with or without per-user Layer 3 tunnels
- GGSN services for IPv4 and PPP PDP contexts
- SGSN services for all attached and/or activated subscribers
- LNS session types

- PDIF services supporting Simple-IP, Mobile-IP and Proxy Mobile-P
- MME services

The default setting for this command is disabled.
The **no** option of this command disables this feature.
This command only works when the Session Recovery feature is enabled through a valid Session and Feature Use License Key.

Important: After entering this command, you must restart the system for the command takes effect. Remember to save the configuration file before issuing the **reload** command.

reveal disabled commands

Enables the input of commands for features that do not have license keys installed. The output of the command **show cli** indicates when this is enabled. This command effects all future CLI sessions. This is disabled by default.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] reveal disabled commands

no

Do not show disabled commands.

Usage

When this is enabled and a disabled command is entered, a message is displayed that informs you that the required feature is not enabled and also lists the name of the feature that you need to support the command. When this is disabled and a disabled command is entered, the CLI does not acknowledge the existence of the command and displays a message that the keyword is unrecognized.

Example

Set the CLI to accept disabled commands and display the required feature for all future CLI sessions with the following command:

```
reveal disabled commands
```

Set the CLI to reject disabled commands and return an error message for all future CLI sessions:

```
no reveal disabled commands
```

rohc-profile

This command allows you to create an RoHC (Robust Header Compression) profile and enter the RoHC Profile Configuration Mode. This mode is used to configure RoHC Compressor and Decompressor parameters. RoHC profiles can then be assigned to specific subscriber sessions when RoHC header compression is configured.

Platform

ASR 5000

Product

HSGW

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

rohc-profile profile-name *name* **[-noconfirm] [common-options | compression-options | decompression-options]**

no rohc-profile profile-name *name*

common-options

Configures common parameters for compressor and decompressor.

compression-options

Configures ROHC compression options.

decompression-options

Configures ROHC decompression options.

no

Remove the specified RoHC profile.

name

The name of the RoHC profile to create or remove. *name* must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Do not prompt for additional verification when executing this command.

Usage

Use this command to enter the RoHC Profile Configuration mode.

Entering this command results in the following prompt:

```
[context_name]host(config-rohcprofile-<profile_name>)#
```

RoHC Profile Configuration Mode commands are defined in the *RoHC Profile Configuration Mode Commands* chapter.

Example

Enter the following command to create an RoHC profile named *HomeUsers* and enter the RoHC Configuration mode without prompting for verification:

```
rohc-profile profile-name HomeUsers
```

The following command removes the RoHC profile named *HomeUsers*:

```
no rohc-profile profile-name HomeUsers
```

sccp-network

This command creates or removes a Signaling Connection Control Part (SCCP) network instance which is used to define the SS7 end-to-end routing in a UMTS network. As well, this command enters the SCCP network configuration mode. The SGSN supports up to 12 SCCP network instances at one time.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

sccp-network *sccp_net_id* **[-noconfirm]**

no sccp-network *sccp_net_id*

no

Remove the SCCP network configuration with the specified index number from the system configuration.

sccp_net_id

This number identifies a specific SCCP network configuration.
sccp_net_id: must be an integer from 1 through 12.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create or modify an SCCP network and enter the SCCP network configuration mode. The SCCP network is not a standard SS7 or UMTS concept - this concept is specific to this platform.
For details about the commands and parameters needed to create and edit the SCCP Network configuration, check the *SCCP Network Configuration Mode* chapter.

Example

The following command creates an SCCP network with the index number of *1*:

```
sccp-network 1
```

The following command creates an SCCP network with the index number of *2* to associate with HNB-GW service for HNB access network users without any prompt.:

```
sccp-network 2 -noconfirm
```

sctp-parameter-template

This command allows you to create an SCTP parameter template and enter the SCTP Parameter Template Configuration Mode. This mode is used to configure parameters for SCTP associations.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] sctp-param-template *name*

no

Removes the specified SCTP parameter template from the system.

name

Specifies the name of the SCTP parameter template being created or accessed. *name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to enter the SCTP Parameter Template Configuration mode.
Entering this command results in the following prompt:

```
[context_name]host(sctp-param-template)#
```

SCTP Parameter Template Configuration Mode commands are defined in the *SCTP Parameter Template Configuration Mode Commands* chapter.

Example

The following command creates a new SCTP parameter template or enters an existing template named *sctp-tmpl2*:

```
sctp-param-template sctp-tmpl2
```

session trace

This command configures the type of network elements, file transfer protocol, and Trace collection entity mode to be used for the transportation of trace files collected for the subscriber session tracing on the UMTS/EPC network element(s) along with network connection parameters and timers.

Platform

ASR 5000

Product

GGSN

MME

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

session trace network-element { all | mme | pgw | sgw | ggsn } [collection-timer *sec* **] [tce-mode { none | push transport sftp path** *string* **username** *name* **{ encrypted password** *enc_pw* **| password** *password* **} }]**

no session trace network-element { all | mme | pgw | sgw | ggsn }

---

no

Removes the entire session trace configuration from the system or a specific network element trace configuration.

---

network-element { all | mme | pgw | sgw | ggsn }

Identifies the type of service to the session trace application in order to determine the applicable interfaces.
all: Specifies that all network elements and their associated interfaces are to be made available to the session trace application.
ggsn: Specifies that the GGSN as network element and its associated interfaces is to be made available to the session trace application.
mme: Specifies that the MME as network element and its associated interfaces is to be made available to the session trace application.
pgw: Specifies that the P-GW as network element and its associated interfaces is to be made available to the session trace application.
sgw: Specifies that the S-GW as network element and its associated interfaces is to be made available to the session trace application.

---

collection-timer *sec*

Specifies the amount of time (in seconds) to wait from initial activation/data collection before data is reported to the Trace Collection Entity (TCE). *sec* must be an integer from 0 through 255.

tce-mode none

Specifies that session trace files are to be stored locally and must be pulled by the TCE.

tce-mode push transport sftp path *string* **username** *name* **{ encrypted password** *enc_pw* **| password** *password* **}**

Specifies that session trace files are to be pushed to the Trace Collection Entity (TCE).
sftp: Specifies that Secure FTP is used to push session trace files to the TCE.
path *string*: Specifies the directory path on the TCE where files will be placed.
username *name*: Specifies the username to be used when pushing files to the TCE.
encrypted password *enc_pw*: Specifies the encrypted password to be used when pushing files to the TCE.
password *password*: Specifies the password to be used when pushing files to the TCE.

Usage

Use this command to configure the file transfer methods and modes for subscriber session trace functionality and to how and where session trace files are sent after collection.
This configuration contains collection timer, UMTS/EPC network element, type of file transfer, and user credentials setting to send the collected trace files to the TCE.

Example

The following command configures the collection time for session traces to *30* seconds, identifies the network element as all elements (GGSN, MME, S-GW, and P-GW), and pushes session trace files to a TCE via SFTP into a directory named */trace/agw* using a username *admin* and a password of *pw123*:

```
session trace network-element all collection-timer 30 tce-mode push
transport sftp path /trace/agw username admin password pw123
```

The following command configures the collection time for session traces to *30* seconds, identifies the network element as an MME, and pushes session trace files to a TCE via SFTP into a directory named */trace/sgw* using a username *admin* and a password of *pw123*:

```
session trace network-element mme collection-timer 30 tce-mode push
transport sftp path /trace/mme username admin password pw123
```

The following command configures the collection time for session traces to *30* seconds, identifies the network element as GGSN, and pushes session trace files to a TCE via SFTP into a directory named */trace/ggsn* using a username *admin* and a password of *pw123*:

```
session trace network-element ggsn collection-timer 30 tce-mode push
transport sftp path /trace/ggsn username admin password pw123
```

sgsn-global

This command gives access to the SGSN Global configuration mode to set parameters relevant to the SGSN and HNB-GW as a whole.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
sgsn-global
```

Usage

Using this command moves into SGSN Global Configuration mode. In this mode, you can set system-wide parameters on SGSN and HNB-GW to perform the following tasks:
On SGSN:

- monitoring and managing TLLIs in the BSSGP layer.
- defining IMSI ranges used as filters in the operator policy selection process.

Example

Enter the SGSN Global configuration mode with the following:

```
sgsn-global
```

snmp authentication-failure-trap

Enables or disables the SNMP traps for authentication failures.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`[ no ] snmp authentication-failure-trap`

`no`

Disables SNMP traps for authentication failures. When omitted, SNMP traps for authentication failures will be generated.

Usage

Disables authentication failure traps if they are not of interest. At this time the option may be changed to support trouble shooting.
By default SNMP authentication failure traps are disabled.

snmp community

Configures the SNMP v1 and v2 community strings.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

In StarOS 12.1 and earlier releases:

snmp community *string* **] [read-only | read-write]**

no snmp community *string*

---

no

The specified community string is removed from the configuration.

---

name *string*

Specifies a community string whose options are to be modified. An unencrytpted string must be an alphanumeric string of 1 through 31 characters. An encrypted string is an alphanumeric string of 1 through 80 characters.

---

context *context_name*

Default: community string applies to all contexts.
Specifies a the context to which the community string shall be applied. *context_name* must be an alphanumeric string of 1 through 31 characters.

---

read-only | read-write

Default: read-only
Specifies if access rights for the community string.
read-only: the configuration may only be viewed.
read-write: the configuration may be viewed and edited.

---

view *view_name*

Default: community string applies to all views.
Specifies the view to which the community string shall be applied. *view_name* must be an alphanumeric string of 1 through 31 characters.

Usage

The community strings define the privileges of SNMP users. It may be desirable to give read-only access to front line operators.

Example

```
snmp community name plain_text_string

snmp community encrypted name encrypted_string

snmp community name plain_text_string context sampleContext

snmp community name plain_text_string context sampleContext view
sampleView

snmp community name plain_text_string read-write view sampleView

no snmp community plain_text_string
```

snmp engine-id

Configures the SNMP engine to use for SNMP requests when SNMPv3 agents are utilized.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

snmp engine-id local *id*

id

Specifies the SNMPv3 engine to employ. *id* must be an alphanumeric string of 1 through 31 characters.

Usage

When SNMPv3 is used for SNMP access to the chassis the engine ID can be used to quickly change which schema is used for SNMP access.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

Example

```
snmp engine-id local id
```

snmp heartbeat

Enables the sending of periodic “heartbeat” notifications (traps).

Platform

ASR 5000

Product

All

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

snmp heartbeat { interval [*minutes* **] | second-interval [** *seconds* **] }**

[deafult | no] snmp heartbeat

default

Returns the command to its default setting of disabled.

no

Disables the feature.

interval [*minutes* **]**

Default: 60
Specifies the interval time (in minutes) between notifications. *minutes* must be an integer from 1 through 1440.

second-interval [*seconds* **]**

Default: 30
Specifies the secondary interval time, in seconds, between notifications. *seconds* must be an integer from 10 through 50.

Usage

Use this command to enable the sending of a heartbeat notification periodically to confirm a system is up and communicating.

Example

The following command sets the SNMP heartbeat notification interval to 2 hours, 15 minutes and 30 seconds:

```
snmp heartbeat interval 135 second-interval 30
```

snmp history heartbeat

Enables the recording of heartbeat notifications in SNMP history.

Platform

ASR 5000

Product

All

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

[default | no] snmp history heartbeat

default

Returns the command to the default setting of enabled.

no

Disables the history recording feature.

Usage

Use this command to enable the recording of SNMP heartbeat notifications in SNMP history files.

snmp notif-threshold

Configures the number of SNMP notification that need to be generated for a given event before it is propagated to the SNMP users.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

snmp notif-threshold *count* **[low** *low_count* **] [period** *seconds* **]**

no snmp notif-threshold

no

Removes all SNMP notification thresholds. All notifications will be broadcast to SNMP users.

count

Default: 100
Specifies the number of notifications that must be generated before the next notification is broadcast to SNMP users. *count* must be an integer from 1 through 10000.

low *low_count*

Default: 20
Specifies the number of notifications within the monitoring period before which any subsequent notification for each specific event. *low_count* must be an integer from 1 through 10000.

period *seconds*

Default: 300
Specifies the number of seconds of the monitoring window size before any subsequent notification may be broadcast to users. *seconds* must be an integer from 10 through 3600.

Usage

Set the notification threshold to avoid a flood of events which may be the result of a single failure or maintenance activity.

Example

```
snmp notif-threshold 100
```

```
snmp notif-threshold 100 period 30
```

snmp server

Enables the SNMP server as well the configuration of the SNMP server port.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

snmp server [port *number* **]**

no snmp server

no

Restores the default SNMP port assignment.

port *number*

Default: 161
Specifies the port number to use for SNMP communications. *number* must be an integer from 1 to 65535.

Usage

Set the SNMP port for communications when SNMP is enabled.

Important: This will result in restarting the SNMP agent when the **no** keyword is omitted. SNMP queries as well as notifications/traps will be blocked until the agent has restarted.

Example

```
snmp server port 100

no snmp server
```

snmp target

Configures remote receivers for SNMP notifications.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

snmp target *name ip_address* **[port** *number* **] [non-default] [security-name** *string* **] [version { 1 | 2c | 3 | view] [security-level { noauth | { auth | priv-auth privacy [encrypted] des** *privpassword* **} authentication [encrypted] { md5 | sha }** *authpassword* **} } [informs | traps]**

no snmp target *name*

---

no

Removes the specified target as a receiver of unsolicited SNMP messages (traps).

---

authentication { md5 | sha } *authpassword*

Reads the authentication type and password if the security level of the SNMP messages is set to **auth** or **priv-auth**. Authentication types are:

- **md5**: Configures the hash-algorithm to implement MD5 per RFC 1321.
- **sha**: Specifies that the hash protocol is Secure Hash Algorithm.

---

security-level **{ noauth | { auth | priv-auth privacy [encrypted] des** *privpassword* **}**

Sets the security level of the SNMPv3 messages, as follows:

- **noauth**: No authentication and encryption is used.
- **auth**: Only authentication will be used.
- **priv-auth**: Both authentication and encryption will be used.
- **privacy des** *privpassword*: Reads the privacy type and password.

---

name

Specifies a logical name to use to refer to the remote receiver. *name* must be an alphanumeric string of 1 through 31 characters.

---

ip_address

Specifies the IP address of the receiver. *ip_address* must be specified using IPv4 dotted-decimal notation.

non-default

Specifies that this destination is only used for SNMP traps which have been specifically identified.

port *number*

Default: 162
Specifies the port which is to be used in communicating with the remote receivers. *number* must be an integer from 0 through 65535.

security-name *string*

Default: no community string included
Specifies the community string to use in the unsolicited messages. *string* must be an alphanumeric string of 1 through 31 characters.

version { 1 | 2c | 3 } | view

Default: 1
Specifies the SNMP version the target supports and consequently the version of the SNMP protocol to use for communications.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices.However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must configure this command to use version 1 or version 2c.

informs | traps

Default: traps
Specifies the type of SNMP event to use to send notifications to SNPM targets. **traps** are unacknowledged (fire and forget) whereas **informs** require a response from the SNMP target.
If the notification type is set to **informs**, the notification is resent if no response is received within 5 seconds. The notification is resent at most two times.

Usage

The target manages the list of remote receivers to which unsolicited messages are sent. Use this command to add /remove a monitoring system to/from a network.

Example

```
snmp target sampleReceiver 1.2.3.4 security-name sampleComm

snmp target sampleReceiver 1.2.5.6 port 100

snmp target sampleReceiver 1.2.7.8 version 2c traps

no snmp target sampleReceiver
```

snmp trap

This command enables or disables generation of specific or all SNMP traps.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

snmp trap { enable | suppress } [*trap_name1 trap_name2 ... trap_nameN* **| all]**

enable

Enables or allows the generation of one or more SNMP traps by the system.

suppress

Disables the generation of one or more SNMP traps by the system.

trap_name1 trap_name2 ... trap_nameN

The name of the specific SNMP trap to enable or disable. Multiple traps can be listed for a single instance of this command.

Important: The system disregards character case (case insensitive) when entering trap names.

all

Default: Enable All
Specifies that all SNMP traps will be affected by the specified operation (enable or suppress).

Usage

SNMP traps are used by the system to indicate that certain events have occurred. A complete listing of the traps supported by the system and their descriptions can be found in the *SNMP MIB Reference*. Additionally, a trap listing can be viewed using the following command:

snmp trap { enable | suppress } ?

By default, the system enables the generation of all traps. However, individual traps can be disabled allowing only traps of a certain type or alarm level to be generated. This command can be used to disable un-desired traps and/or re-enable previously suppressed traps.

Example

The following command suppresses the LogMessage trap:

```
snmp trap suppress logmessage
```

The following command suppresses the *CLISessEnd* and *CLISessStart*:

```
snmp trap suppress clisessend clisessstart
```

snmp trap-timestamps

Adds an additional system-time varbind to generated traps.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] snmp trap-timestamps

no

Disables the adding of timestamps to generated traps.

Usage

The timestamp added to the generated trap reflects the current system time. The timestamp is proprietary. This functionality is disabled by default.

Important: If the Web Element Manager application is used as your alarm server, the application relies on the timestamp provided by enabling this command to identify duplicate traps. As a result, it is recommended that this parameter be enabled for this case.

Example

The following command enables the inclusion of a timestamp with each generated trap:

```
snmp trap-timestamps
```

snmp user

Configures an SNMPv3 user for SNMP access.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

snmp user *user_name* **[[encrypted] password** *password* **| engine** *id* **| group** *grp_name* **| security-model** *model* **auth [[encrypted] password** *password* **]]**

no snmp user *user_name*

---

no

Removes the specified user from the list of valid SNMPv3 users.

---

user_name

Specifies the user which is to use SNMPv3 interfaces to the system. *user_name* must be an alphanumeric string of 1 through 31 characters.

---

engine *id*

The SNMP engine ID. **id** must be an alphanumeric string of 1 through 31characters.

---

group *grp_name*

Default: undefined (not a member of any group)
Specifies the user SNMPv3 group the into which user will be added. *grp_name* must be an alphanumeric string of 1 to 1023 characters.

---

security-model *model* **auth**

Default: USM
Specifies the security model used to authenticate the user. *model* must be configured to the following:

- **usm**: User Security Model

[encrypted] password *password*

Default: undefined
Specifies the password for authenticating the user when the security model is set to User-based Security Model (USM).
The **encrypted** keyword indicates the password will be received in an encrypted form. *password* must be an alphanumeric string of 8 through 31 characters.

The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Add and remove SNMPv3 users as operations staff or automated systems are updated. The security model will be user dependant based upon the support the users system provides.

Important: The system can send either SNMPv1, SNMPv2c, or SNMPv3 traps to numerous target devices. However, the Web Element Manager can only process SNMP version 1 (SNMPv1) and SNMP version 2c (SNMPv2c) traps. If the SNMP target being configured is Web Element Manager application, then you must not configure this command to use.

Example

```
snmp user user1

snmp user user1 security-model 2c auth

snmp user user1 group user1 group sampleGroup security-model usm auth

no snmp user user1
```

ss7-routing-domain

This command creates an SS7 routing domain instance and enters the SS7 Routing Domain Configuration mode.

Platform

ASR 5000

Product

SGSN

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

ss7-routing-domain *rd_id* **variant** *v_type* **[-noconfirm]**

no ss7-routing-domain *rd_id*

no

Removes the specified SS7 routing domain from the system configuration.

rd_id

Identifies a specific SS7 routing domain. Once it has been created, it can be accessed for further configuration and modification by entering the *rd_id* without entering the variant.
rd_id must be an integer from 1 through 12.

variant *v_type*

Identifies the national standard to be used for call setup, routing and control, signaling. Select one of the following:

- **ansi:** American National Standards Institute (U.S.A.)
- **bici:** Broadband Intercarrier Interface standard
- **china:** Chinese standard
- **itu:** International Telecommunication Union (ITU-T) Telecommunication Standardization Sector
- **ntt:** Japanese standard
- **ttc:** Japanese standard

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create an SS7 routing domain configuration instance or to enter the SS7 routing domain configuration mode to edit the configuration.
A routing domain groups configuration items to facilitate the management of the SS7 connection resources for an SGSN service. An Access Gateway supports up to 12 configured SS7 routing domains at one time.
After entering this command, the prompt appears as:
`[context_name]<hostname>(config-ss7-routing-domain-routing_domain_id)#`
For details about the commands and parameters used to define or edit an SS7 routing domain, refer *SS7 Routing Domain Configuration Mode* chapter.

Example

The following creates an SS7 routing domain with an index of *1* and the variant selection of Broadcast Intercarrier Interface (*bici*):

```
ss7-routing-domain 1 variant bici
```

The following command creates an SS7 routing domain instance with an index of *2* and the variant selection of Broadcast Intercarrier Interface (*bici*) to be associated with HNB RN-PLMN in an HNB access network:

```
ss7-routing-domain 1 variant bici
```

suspend local-user

Suspends a local-user administrative account.

Platform

ASR 5000

Product

All

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] suspend local-user *name*

no

Removes the suspended status for the specified local-user account.

name

The name of the local-user account expressed as an alphanumeric string of 3 through 16 characters that is case sensitive.

Usage

This command allows a security administrator to suspend local-user administrative accounts.
A "suspended" user cannot login to the system. The user's account information (passwords, password history, etc.), however, is preserved.

Example

The following command suspends a local-user account called *Inspector1*:

```
suspend local-user Inspector1
```

The following command removes the suspension from a local-user account called *Admin300*:

```
no suspend local-user Admin300
```

system

Configures system information which is accessible via SNMP.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

system { carrier-id mcc *mcc_id* **mnc** *mnc_id* **| contact** *who* **| description** *string* **| hostname** *host_name* **| location** *text* **| serial-number** *ser_number* **| sysdesc-sysoid-style [default | new] }**

default system { contact | location }

default

Removes the configured **system contact** and **system location** form the system.

carrier-id mcc *mcc_id* **mnc** *mnc_id*

Important: This carrier ID is not used by the GGSN.

Specifies a carrier-id that is a unique identifier for the carrier that has installed the system. When the carrier ID values are set, the carrier-id and gmt_offset attributes are included in access-request and accounting packets when using the following RADIUS dictionaries:

- 3gpp2
- 3gpp2-835
- starent
- starent-835
- starent-vsa1
- starent-vsa1-835
- custom9

mcc *mcc_id*: The mobile country code. This must be specified as a 3-digit string from 001 through 999.
mnc *mnc_id*: The mobile network code. This must be specified as a 2- or 3-digit string from 01 through 999.

contact *who*

Default: No contact specified.

contact *who*: specifies the contact information for the chassis. *who* must be an alphanumeric string of 0 through 255 characters. The string must be embedded in double quotes (“) if spaces and special punctuation is to be used.

description *string*

Allows a user to describe the system for identification purposes. The system description can be comprised of a mix of alphanumeric characters, as follows:

- **%version%** - software version.
- **%build%** - software build number
- **%chassis%** - chassis type (ST16, ASR 5000, or ASR 5500)
- **%staros%** - OS type
- **%hostname%** - system name
- **%release%** - release number
- **%kerver%** - kernel version
- **%machine%** - machine hardware name
- *string* - an alphanumeric string of 1 through 255 characters.

hostname *host_name*

hostname *host_name*: configures the chassis host name where *host_name* must be an alphanumeric string of 1 through 63 characters.

Important: Please note that changing the chassis host name results in the command prompt changing as well to reflect the new name. This may affect any previously scripted interfaces from an OSS or maintenance facility.

location *text*

Default: No location specified.
location *text*: specifies the system location expressed as an alphanumeric string of 0 through 255 characters. The text specified must be embedded in double quotes (“) if spaces are to be used.

Default: None.
Specifies a system identifier as an alphanumeric string of 1 through 11 characters.

sysdesc-sysoid-style [default | new]

Allows the user to select the SNMP return for the objects sysDescr and sysOId.

- **default** - SNMP returns old style system description and old style system OID string.
- **new** - SNMP returns Cisco style system description and Cisco style OID string.

Usage

Specify system basic information which is useful back at a network operations center which uses the SNMP interfaces for management.

Example

The following commands configure the contact information, system host name, and location text, or remove configured location and system respectively.

```
system contact user1@company.com

system hostname system16

system location "Clark Street Closet\nBasement Rack 4"
```

The following commands remove the configured contact and location from system respectively

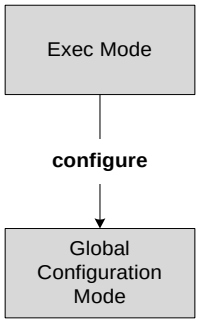
```
default system contact

default system location
```

Chapter 126
Global Configuration Mode Commands (T-threshold phspc)

This section includes the commands **`tacacs mode`** through **`threshold phspc-sm-entry-denial`**.

The Global Configuration Mode is used to configure basic system-wide parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

tacacs mode

Enters the TACACS+ (Terminal Access Controller Access Control System+) configuration mode. Use this mode to configure up to three TACACS+ servers for use in authenticating administrative users via the TACACS+ protocol.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

```
configure
```

Syntax

```
tacacs mode
```

Usage

Enter TACACS Configuration Mode to configure up to three TACACS+ servers for use in authenticating administrative users via the TACACS+ protocol. For additional information, see the *TACACS+ Configuration Mode Commands* chapter.

Example

Use the following command to enter TACACS mode:

```
tacacs mode
```

task facility acsmgr

This command configures ACSMgr task settings.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

task facility acsmgr start [aggressive | normal]

no task facility acsmgr start

no

Disables the configured ACSMgr setting.

aggressive

Specifies to start the maximum possible ACSMgr tasks.

normal

Configures the resource subsystem to start/stop ACSMgr tasks on an as-needed basis.

Usage

This command provides option for the resource subsystem to start maximum possible ACSMgr tasks based on the license configured and the available system configuration.

Example

The following command starts the maximum possible ACSMgr tasks:

```
task facility acsmgr start aggressive
```

task facility ipsecmgr

Configures IPSec manager settings.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

task facility ipsecmgr { ikev1 { task-count { increased | normal } } | task-count { increased | normal } }

ikev1 { task-count { increased | normal } }

Default: **normal**
Adjusts the IPSec manager task count to support EHA for IKEv1. See **task-count** below.

task-count { increased | normal }

Default: **normal**
Adjusts the IPSec manager task count to support EHA.
increased: Starts additional IPSec manager tasks operating on the packet processing cards. In increased mode, they run on all but demux packet processing cards. Also, all the IPSec managers start at the same time when an active non-demux card is detected and IPSec is configured.
normal: Uses the standard algorithm for allocating memory for IPSec manager tasks. In normal mode, IPSec managers do not run on session packet processing cards.

Caution: If **task-count** is set to **normal** and session recovery is enabled, IPSec manager tasks are not allowed to start on most packet processing cards. Because the resources are not reserved, IPSec managers in normal mode only run on demux packet processing cards.

Usage

Sets IPSec manager parameters for all IPSec managers in the system.

Example

Use the following command to set the IPSec manager task count to **increased** mode:

```
task facility ipsecmgr task-count increased
```

task facility sessmgr

Configures system information which is accessible via SNMP.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`task { facility sessmgr start { aggressive | normal }`

`facility sessmgr start { aggressive | normal }`

Default: Normal
Specifies the facility options for the session manager.
`aggressive`: specifies the maximum number of session manager processes are started immediately.

Caution: The **`task facility sessmgr start aggressive`** command should only be used if the system will reach capacity (for the existing configuration) during the first few minutes of service.

Caution: This command must only be executed last during configuration (or appended to the end of the configuration file) to ensure the availability of memory resources to contexts and services.

`normal`: indicates the session manager processes are started as needed.

Usage

Set the session manager start policy to aggressive on heavily utilized systems to avoid undue delays in processing subscriber sessions.

Example

```
task facility sessmgr start aggressive

task facility sessmgr start normal
```

task resource cpu-memory-low

Configures the system action for SNMP trap generation and logging whenever CPU memory.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

task resource cpu-memory-low { kill | warn } }

{ kill | warn }

Default: kill
Sets the action for the Resource Manager to take when the amount of free memory on a CPU falls below 12MB. An SNMP TRAP and CORBA notification are generated and the event is logged.
Once the free memory threshold is crossed, The Resource Manager examines all tasks on that cpu and finds the most over limit task and kills it. If there are no over limit tasks nothing happens. Resource Manager takes preference on killing a non-sessmgr task over a sessmgr task.
kill: The task most over memory limit (if any) is killed and recovered.
warn: The event is logged and no tasks are killed.

Usage

Set the CPU memory low action to only log CPU low memory events.

Example

```
task resource cpu-memory-low warn
```

terminal

Configures the console port on the SPIO.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

terminal [carrierdetect { off | on } | databits { 7 | 8 } | flowcontrol { hardware { off | on } | none } | parity { even | none | odd } | speed { 115200 | 19200 | 38400 | 57600 | 9600 } | stopbits { 1 | 2 }]

carrierdetect { off | on }

Specifies whether or not the console port is to use Data Carrier Detect (DCD) when connecting to a terminal.
Default: off
off: Do not use DCD.
on: Use DCD.

databits { 7 | 8 }

Specifies the number of data bits used to transmit and receive characters.
Default: **8**
7: Use 7 databits to transmit and receive characters.
8: Use 8 databits to transmit and receive characters.

flowcontrol { hardware { off | on } | none }

Specifies how the flow of data is controlled between the SPIO and a terminal.
Default: **none**
hardware: Enables or disables the use of hardware-based flow control
off: Disables the use of Ready to Send (RTS) and Clear to Send (CTS).
on: Enables the use of Ready to Send (RTS) and Clear to Send (CTS).
none: Disables the use of DCD, RTS and CTS.

parity { even | none | odd }

Specifies the type of error checking used on the port.
Default: none
even - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits even.
none - Disables error checking.
odd - Enables error checking by setting the parity bit to 1 (if needed) making the number of 1s in the data bits odd.

speed { 115200 | 19200 | 38400 | 57600 | 9600 }

Specifies the flow of data in bits per second between the console port and terminal.
Default: **9600**

stopbits { 1 | 2 }

Specifies the number of stop bits between each transmitted character.
Default: **1**
1: Use one stop bit between each transmitted character.
2: Use two stop bits between each transmitted character.

Usage

Sets the SPIO's console port parameters for communication with the terminal device.

Example

The following command sets the SPIO's console port. The terminal must support these values.

```
terminal carrierdetect off databits 7 flowcontrol hardware on parity even
speed 115200 stopbits 1
```

threshold 10sec-cpu-utilization

Configures alarm or alert thresholds that measure a 10-second average of CPU utilization. Its polling interval can be set down to 30 seconds.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold 10sec-cpu-utilization *percent* **[clear** *percent* **]**

percent

Default: 0
Configures Specifies the high threshold for 10-second average cpu-utilization. If the monitored CPU utilization is greater than or equal to the specified percentage an alert is sent. Regardless of the length of the polling interval, only one sample at the end of the polling interval is tested.

clear *percent*

Default: 0:
This is a low watermark value that sets the alarm clearing threshold value. If not specified it is taken from the first value.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set a threshold that sends an alert when CPU utilization over a 10-second average exceeds the limit set.
Alerts or alarms are triggered for 10-second sample of CPU utilization based on the following rules:

- **Enter condition:** 10-second average percentage of CPU utilization is greater than or equal to the high threshold.
- **Clear condition:** 10-second average percentage of CPU utilization is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command generates an alert when the 10-second average CPU utilization reaches *45* percent:

```
threshold 10sec-cpu-utilization 45
```

threshold aaa-acct-archive-size

Configures accounting message archive size, alarm or alert thresholds.

Platform

ASR 5000

Product

PDSN

GGSN

HA

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold aaa-acct-archive-size *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-acct-archive-size

high_thresh

Default: 1
Specifies the high threshold number of archived accounting messages that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 1044000.

clear *low_thresh*

Default: 1
Specifies the low threshold number of archived accounting messages that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 1044000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system cannot communicate with configured AAA accounting servers (RADIUS or CGFs), either due to the server being busy or loss of network connectivity, the system buffers, or archives, the accounting messages.
Accounting message archive size thresholds generate alerts or alarms based on the number of AAA accounting messages buffered in the archive during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failures based on the following rules:

- **Enter condition:** Actual number of archived messages that is greater than or equal to the high threshold.
- **Clear condition:** Actual number of archived messages that is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *250* AAA accounting archived messages and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold aaa-acct-archive-size 250 clear 100
```

threshold aaa-acct-failure

Configures accounting failure, alarm or alert thresholds for the system.

Platform

ASR 5000

Product

PDSN

GGSN

HA

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold aaa-acct-failure *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-acct-failure

high_thresh

Default: 0
Specifies the high threshold number of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of accounting failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Accounting failure thresholds generate alerts or alarms based on the number of failed AAA accounting message requests that occur during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failures based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* AAA accounting failures and low threshold of *25* for a system using the Alarm thresholding model:

```
threshold aaa-acct-failure 100 clear 25
```

threshold aaa-acct-failure-rate

Configures accounting failure rate, alarm or alert thresholds for the system.

Platform

ASR 5000

Product

PDSN

GGSN

HA

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold aaa-acct-failure-rate *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-acct-failure-rate

high_thresh

Default: 1
Specifies the high threshold percent of accounting failures that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 and 100.

clear *low_thresh*

Default: 1
Specifies the low threshold percent of accounting failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Accounting failure rate thresholds generate alerts or alarms based on the percentage of AAA accounting message requests that failed during the specified polling interval. Accounting requests are counted for all AAA accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for accounting failure rates based on the following rules:

- **Enter condition:** Actual failure percentage is greater than or equal to the high threshold.
- **Clear condition:** Actual failure percentage is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA accounting failure rate high threshold percentage of *30* and a low threshold percentage of *10* for a system using the Alarm thresholding model:

```
threshold aaa-acct-failure-rate 30 clear 10
```

threshold aaa-auth-failure

Configures authentication failure, alarm or alert thresholds for the system.

Platform

ASR 5000

Product

PDSN

GGSN

HA

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold aaa-auth-failure *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-auth-failure

high_thresh

Default: 0
Specifies the high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.*high_thresh* is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of authentication failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Authentication failure thresholds generate alerts or alarms based on the number of failed AAA authentication message requests that occur during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with.
Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.

- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* AAA authentication failures for a system using the Alert thresholding model:

```
threshold aaa-auth-failure 100
```

threshold aaa-auth-failure-rate

Configures authentication failure rate, alarm or alert thresholds for the system.

Syntax

threshold aaa-auth-failure-rate *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-auth-failure-rate

high_thresh

Default: 5
Specifies the high threshold percent of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100.

clear

Allows the configuration of Specifies the low threshold.

low_thresh

Default: 5
Specifies the low threshold percent of authentication failures that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Authentication failure rate thresholds generate alerts or alarms based on the percentage of AAA authentication message requests that failed during the specified polling interval. Authentication requests are counted for all AAA authentication servers that the system is configured to communicate with.

Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual failure percentage is greater than or equal to the high threshold.
- **Clear condition:** Actual failure percentage is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA authentication failure rate high threshold percentage of *30* for a system using the Alert thresholding model:

```
threshold aaa-auth-failure-rate 30
```

threshold aaa-retry-rate

Configures AAA retry rate, alarm or alert thresholds for the system.

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold aaa-retry-rate *high_thresh* **[clear** *low_thresh* **]**

default threshold aaa-retry-rate

high_thresh

Default: 5
Specifies the high threshold percent of AAA request message retries that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100.

clear *low_thresh*

Default: 5
Specifies the low threshold percent of AAA request message retries that maintains a previously generated alarm condition. If the percentage of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated. *low_thresh* is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

AAA request message retry rate thresholds generate alerts or alarms based on the percentage of request messages (both authentication and accounting) that were retried during the specified polling interval. The percentage is based on a message count taken for all AAA authentication and accounting servers that the system is configured to communicate with.
Alerts or alarms are triggered for request message retries based on the following rules:

- **Enter condition:** Actual retry percentage is greater than or equal to the high threshold.
- **Clear condition:** Actual retry percentage is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA message retry rate high threshold percentage of *25* and a low threshold percentage of *10* for a system using the Alarm thresholding model:

```
threshold aaa-retry-rate 25 clear 10
```

threshold aaamgr-request-queue

Configures the AAA Manager internal request queue, alarm or alert thresholds.

Platform

ASR 5000

Product

PDSN

GGSN

HA

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold aaamgr-request-queue *high_thresh* **[clear** *low_thresh* **]**

default threshold aaamgr-request-queue

high_thresh

Default: 0
Specifies the high threshold number of AAA Manager Requests that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 1 through 100.

clear

Allows the configuration of Specifies the low threshold.

low_thresh

Default: 5
Specifies the low threshold number of AAA Manager Requests that maintains a previously generated alarm condition. If the percentage of failures falls beneath the low threshold within the polling interval, a clear alarm is generated. *low_thresh* is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

AAA Manager Request thresholds generate alerts or alarms based on the number of AAA Manager Requests for an AAA manager process during the specified polling interval.
Alerts or alarms are triggered for AAA Manager Requests based on the following rules:

- **Enter condition:** Actual number of AAA Manager Requests per AAA manager is greater than or equal to the high threshold.
- **Clear condition:** Actual number of AAA Manager Requests per AAA manager process is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm is not generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a AAA authentication failure rate high threshold percentage of *30* for a system using the Alert thresholding model:

```
threshold aaamgr-request-queue 30
```

threshold asngw-auth-failure

Configures authentication failure, alarm or alert thresholds for the ASN-GW system.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asngw-auth-failure *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-auth-failure

high_thresh

Default: 0
Specifies the high threshold number of authentication failures that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of authentication failures that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to configure threshold limits to generate alerts or alarms based on the number of failed ASN-GW authentication message requests that occur during the specified polling interval. Authentication requests are counted for all ASN Gateway authentication servers with which that the system is configured to communicate.
Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* authentication failures for an ASN-GW using the Alert thresholding model:

```
threshold asngw-auth-failure 100
```

threshold asngw-handoff-denial

Configures alarm or alert thresholds for hand-off denials within the ASN-GW service.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asngw-handoff-denial *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-handoff-denial

high_thresh

Default: 0
Specifies the high threshold number of hand-off denials that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of hand-off denials that maintains a previously generated alarm condition. If the number of hand-off denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of denied hand-off that occurred during the specified polling interval. Hand-off denial messages are counted for all ASN Gateways that the system is configured to communicate with.
Alerts or alarms are triggered for hand-off denials based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* hand-off denials using the Alert thresholding model:

```
threshold asngw-handoff-denial 100
```

threshold asngw-max-eap-retry

Configures alarm or alert thresholds for maximum retries for Extensible Authentication Protocol (EAP) authentication within an ASN-GW service.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asngw-max-eap-retry *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-max-eap-retry

high_thresh

Default: 0
Specifies the high threshold number of retries for EAP authentication that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of retries for EAP authentication that maintains a previously generated alarm condition. If the number of retries falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of retries for EAP authentication that occur during the specified polling interval.
Alerts or alarms are triggered for maximum number of retries for EAP authentication based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* alerts or alarms generated on maximum number of retries for EAP authentication for an ASN Gateway using the Alert thresholding model:

```
threshold asngw-max-eap-retry 100
```

threshold asngw-network-entry-denial

Configures alarm or alert thresholds for denials of network entry to an MS within the ASN-GW service.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asngw-network-entry-denial *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-network-entry-denial

high_thresh

Default: 0
Specifies the high threshold number of denial of network entry to an MS that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of denial of network entry to an MS that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of network entry denials that occurred during the specified polling interval. Network denial messages are counted for an MS with which the system is configured to communicate.
Alerts or alarms are triggered for network entry denials based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* network entry denials for an MS using the Alert thresholding model:

```
threshold asngw-network-entry-denial 100
```

threshold asngw-session-setup-timeout

Configures alarm or alert thresholds for session setup timeouts in an ASN-GW service.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asngw-session-setup-timeout *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-session-setup-timeout

high_thresh

Default: 0
Specifies the high threshold number of timeouts during session setup that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of timeouts during session setup that maintains a previously generated alarm condition. If the number of denials falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during session setup that occurred during the specified polling interval.
Alerts or alarms are triggered for session setup timeouts based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* timeouts during session setup using the Alert thresholding model:

```
threshold asngw-session-setup-timeout 100
```

threshold asngw-session-timeout

Configures alarm or alert thresholds for session timeouts in an ASN-GW service.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asngw-session-timeout *high_thresh* **[clear** *low_thresh* **]**

default threshold asngw-session-timeout

high_thresh

Default: 0
Specifies the high threshold number of timeouts during session that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of timeouts during session that maintains a previously generated alarm condition. If the number of session timeouts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during a session that occurred during the specified polling interval.
Alerts or alarms are triggered for session timeouts based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* timeouts during a session using the Alert thresholding model:

```
threshold asngw-session-timeout 100
```

threshold asnpc-idle-mode-timeout

Configures alarm or alert thresholds for ASNPC Instant Messenger idle mode timeouts.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asnpc-idle-mode-timeout *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of ASNPC idle mode timeouts that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of ASNPC idle mode timeouts during session that maintains a previously generated alarm condition. If the number of session timeouts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the maximum number of idle mode timeouts allowed in the ASNPC service.
Alerts or alarms are triggered for session timeouts based on the following rules:

- **Enter condition:** Actual number of timeouts is greater than or equal to the high threshold.
- **Clear condition:** Actual number of timeouts is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures the high threshold for ASNPC idle mode timeouts at *10000*:

```
threshold asnpc-idle-mode-timeout 10000
```

threshold asnpc-im-entry-denial

Configures the ASNPC Instant Messenger (IM) entry denial, alarm or alert thresholds.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asnpc-im-entry-denial *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of IM entry denials during session that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of IM entry denials during session that maintains a previously generated alarm condition. If the number of session timeouts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the maximum number of IM session denials allowed in the ASNPC service.
Alerts or alarms are triggered for session timeouts based on the following rules:

- **Enter condition:** Actual number of failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures the high threshold for IM session counts at *10000*:

```
threshold asnpc-im-entry-denial 10000
```

threshold asnpc-lu-denial

Configures the alarm or alert thresholds for Location Update (LU) denials.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asnpc-lu-denial *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of LU denials during session that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of LU denials during session that maintains a previously generated alarm condition. If the number of session timeouts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 10000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the maximum number of Location Update denials allowed in the ASNPC service.

Example

The following command configures high threshold of *10000* LU denials:

```
threshold asnpc-lu-denial 10000
```

threshold asnpc-session-setup-timeout

Configures alarm or alert thresholds for ASNPC session setup timeouts in an ASN-GW service.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold asnpc-session-setup-timeout *value*

default threshold asnpc-session-setup-timeout

value

value is an integer from 1 through 1000000.

Usage

Use this command to set threshold limits to generate alerts or alarms based on the number of timeouts during session setup that occurred during the specified polling interval.
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* timeouts during session setup using the Alert thresholding model:

```
threshold asnpc-session-setup-timeout 100
```

threshold call-reject-no-resource

Configures alarm or alert thresholds on the system for calls rejected due to insufficient resources.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold call-reject-no-resource *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of no-resource call rejects issued by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
The number is an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of no-resource call rejects issued by the system that maintains a previously generated alarm condition. If the number of rejections falls beneath the low threshold within the polling interval, a clear alarm will be generated.
The number is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

No resource call reject thresholds generate alerts or alarms based on the total number of calls that were rejected by the system due to insufficient or no resources (memory and/or session licenses) during the specified polling interval.
Alerts or alarms are triggered for no-resource-rejected calls based on the following rules:

- **Enter condition:** Actual number of calls rejected due to no resources is greater than or equal to the high threshold.
- **Clear condition:** Actual number of calls rejected due to no resources is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count for the number of calls rejected by the system due to insufficient or no resources to *100* and allow threshold of *40* for a system using the Alarm thresholding model:

```
threshold call-reject-no-resource 100 clear 40
```

threshold call-setup

Configures call setup, alarm or alert thresholds for the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold call-setup *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of calls setup by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of calls setup by the system that maintains a previously generated alarm condition. If the number of setups falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Call setup thresholds generate alerts or alarms based on the total number of calls setup by the system during the specified polling interval.
Alerts or alarms are triggered for call setups based on the following rules:

- **Enter condition:** Actual number of call setups is greater than or equal to the high threshold.
- **Clear condition:** Actual number of call setups is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* calls setup for a system using the Alert thresholding model:

```
threshold call-setup 100
```

threshold call-setup-failure

Configures call setup failure, alarm or alert thresholds for the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold call-setup-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of call setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of call setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Call setup failure thresholds generate alerts or alarms based on the total number of call setup failures experienced by the system during the specified polling interval.
Alerts or alarms are triggered for call setup failures based on the following rules:

- **Enter condition:** Actual number of call setup failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of call setup failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *100* call setup failures and a low threshold of *80* for a system using the Alarm thresholding model:

```
threshold call-setup-failure 100 clear 80
```

threshold card-temperature-near-power-off-limit

Configures alarm or alert thresholds for triggering and clearing high card temperature alarms.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold card-temperature-near-power-off-limit*high_temp* **[clear** *low_temp* **]**

high_thresh

Default: 0
Specifies the high card temperature (in degrees Celsius) that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low card temperature (in degrees Celsius) before a high temperature alarm is cleared.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the high and low temperatures in degrees Celsius that generate and clear alarms.

Example

The following command configures sets the high and low temperatures to *40* and *35* degrees:

```
threshold card-temperature-near-power-off-limit 40 clear 35
```

threshold cdr-file-space

Configures, alarm or alert thresholds for monitoring the percentage of total file space allocated for Charging Data Records (CDRs) used during the polling interval.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold cdr-file-space *high_thresh* **[clear** *low_thresh* **]**

default threshold cdr-file-space

default

Configures this command with the default threshold settings.

high_thresh

Specifies the high threshold for percentage of total allocated CDR file space used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in percentage of total allocated CDR file space used and is an integer from 0 through 100. A value of 0 disables the threshold.
Default: 90

clear *low_thresh*

Specifies the low threshold for percentage of total allocated CDR file space used that maintains a previously generated alarm condition. If the space usage falls below Specifies the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in percentage of total allocated CDR file space used and is an integer from 0 through 100. A value of 0 disables the threshold.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

CDR file space usage generate alerts or alarms based on the percentage of total allocated CDR file space used during the polling interval.
Alerts or alarms are triggered for CDR file space usage session based on the following rules:

- **Enter condition:** Actual percentage of allocated CDR file space usage is greater than or equal to the specified percentage of total CDR file space.
- **Clear condition:** Actual CDR file space used is less than the specified clear percentage of total allocated CDR file space usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65* percent of total allocated CDR file space usage and a clear threshold of *35* percent:

```
threshold cdr-file-space 65 clear 35
```

threshold contfilt-block

Configures, alarm or alert thresholds for Content Filtering rating operations blocked during a polling interval at which the threshold are raised or cleared.

Platform

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold contfilt-block *high_thresh_value* **[clear** *low_thresh_value* **]**

default threshold contfilt-block

default

Configures this command with the default threshold settings.

high_thresh

Specifies the high threshold for number of rating operations blocked for content filtering service that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in numbers of total rating operations blocked and is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Specifies the low threshold for the total number of rating operations blocked for a content filtering service that maintains a previously generated alarm condition. If the threshold falls below Specifies the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in numbers of total rating operations blocked and is an integer from 0 through 1000000. A value of 0 disables the threshold.
Default: 0

Usage

Use this command to configure the threshold for a content filtering service to generates alerts or alarms based on the number of rating operations blocked for a content filtering service during the polling interval.
If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll contfilt-block** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65000* rating operations blocked and a clear threshold of *35000* operations:

```
threshold contfilt-block 65000 clear 35000
```

threshold contfilt-rating

Configures, alarm or alert thresholds for Content Filtering rating operations performed during a polling interval at which the threshold are raised or cleared.

Platform

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold contfilt-rating *high_thresh_value* **[clear** *low_thresh_value* **]**

default threshold contfilt-rating

default

Configures this command with the default threshold settings.

high_thresh

Specifies the high threshold for number of rating operations performed for content filtering service that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured in numbers of total rating operations performed and is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Specifies the low threshold for the total number of rating operations performed for a content filtering service that maintains a previously generated alarm condition. If the threshold falls below Specifies the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured in umber of total rating operations performed and is an integer from 0 through 1000000. A value of 0 disables the threshold.
Default: 0

Usage

Use this command to configure the threshold for a content filtering service to generates alerts or alarms based on the number of rating operations performed for a content filtering service during the polling interval.
If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll contfilt-rating** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65000* percent of total rating operations performed and a clear threshold of *35000* percent:

```
threshold contfilt-rating 65000 clear 35000
```

threshold cpu-available-memory

Configures alarm or alert thresholds for available CPU memory in the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold cpu-available-memory *low_thresh* **[clear** *high_thresh* **]**

low_thresh

Default: 32
Specifies the low threshold amount of CPU memory that must be met or exceeded at the polling time to generate an alert or alarm.
low_thresh is measured in megabytes (MB) and is an integer from 0 through 2048.

clear *high_thresh*

Default: 32
Specifies the high threshold amount of CPU memory that maintains a previously generated alarm condition. If the memory amount rises above the high threshold within the polling interval, a clear alarm will be generated.
high_thresh is measured in megabytes (MB) and is an integer from 0 through 2048.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

CPU available memory thresholds generate alerts or alarms based on the amount of available memory for each packet processing card CPU at the polling time. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for available CPU memory based on the following rules:

- **Enter condition:** Average measured amount of memory/CPU for the last 5 minutes is less than or equal to the low threshold.
- **Clear condition:** Average measured amount of memory/CPU for the last 5 minutes is greater than the high threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a low threshold count of *50* MB CPU memory available and a high threshold of *112* MB for a system using the Alarm thresholding model:

```
threshold cpu-available-memory 50 clear 112
```

threshold cpu-load

Configures alarm or alert thresholds for monitoring packet processing card CPU loads using a 5-minute average measurement. The threshold is enabled by enabling CPU resource monitoring.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold cpu-load *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
If the monitored CPU load is greater than or equal to the specified number an alert is sent. *high_thresh* must be an integer from 0 through 15.

clear *low_thresh*

Default: 0
This is a low watermark value that sets the alarm clearing threshold value. If not present it is taken from the first value. *low_thresh* must be an integer from 0 through 15.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

Use this command to set an alert when the card's CPU load is equal to or greater than the number specified. Alerts or alarms are triggered for CPU load based on the following rules:

- **Enter condition:** Actual CPU load is greater than or equal to the high threshold.
- **Clear condition:** Actual CPU load is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

To set an alert when the packet processing card CPU load is over *10* and set an alert clear when the CPU load drops down equal or less than *7*, enter the following command;

```
threshold cpu-load 10 clear 7
```

threshold cpu-memory-usage

Configures, alarm or alert thresholds for monitoring the percentage of total CPU memory used during the polling interval.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold cpu-memory-usage *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold for percentage of total memory used that must be met or exceeded at the end of the polling interval to generate an alert or alarm.
high_thresh is measured as a percentage of total CPU memory used and is an integer from 0 and 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold for percentage of total CPU memory used that maintains a previously generated alarm condition. If the memory usage falls below the low threshold within the polling interval, a clear alarm is generated.
low_thresh is measured as a percentage of total CPU memory used and is an integer from 0 and 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

CPU memory usage generate alerts or alarms based on the percentage of total CPU memory used during the polling interval.
Alerts or alarms are triggered for CPU memory usage session based on the following rules:

- **Enter condition:** Actual percentage of CPU memory usage is greater than or equal to the specified percentage of total CPU memory.
- **Clear condition:** Actual CPU memory usage is less than the specified clear percentage of total CPU memory usage.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a threshold of *65* percent of total packet processing card CPU memory usage and a clear threshold of *35* percent:

```
threshold cpu-memory-usage 65 clear 35
```

threshold cpu-orbs-crit

Configures thresholds for generating critical-level alerts or alarms based on the percentage of CPU utilization by the Object Request Broker System (ORBS) software task.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold cpu-orbs-crit *high_thresh* **[clear** *low_thresh* **]**

[default] threshold cpu-orbs-crit

default

Restores this parameter to its default setting.

high_thresh

Default: 60
Specifies the high threshold percent of CPU utilization by the ORB software task that must be exceeded as measured at the time of polling to generate a critical-level alert or alarm.
high_thresh is measured in percentage of total CPU utilization and is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 60
Specifies the low threshold percent of CPU utilization by the ORB software task that maintains a previously generated alarm condition. If the percentage is measured as less than or equal to Specifies the low threshold at the time of polling, a clear alarm will be generated.
low_thresh is measured in percentage of total CPU utilization and is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

Object Request Broker (ORB) software task CPU utilization thresholds generate critical-level alerts or alarms based on the percentage of packet processing card CPU resources it is consuming at the time of polling.

Critical-level alerts or alarms are triggered for CPU usage by the ORBs software task based on the following rules:

- **Enter condition:** Actual CPU usage percentage is greater than the high threshold.
- **Clear condition:** Actual CPU usage percentage is less than or equal to the low threshold.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a critical-level alarm threshold of *35* percent of CPU utilization by the ORBS task and a clear threshold of *30* percent:

```
threshold cpu-orbs-crit 35 clear 30
```

threshold cpu-orbs-warn

Configures thresholds for generating warning-level alerts or alarms based on the percentage of CPU utilization by the Object Request Broker System (ORBS) software task.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold cpu-orbs-warn *high_thresh* **[clear** *low_thresh* **]**

[default] threshold cpu-orbs-warn

default

Restores this parameter to its default setting.

high_thresh

Default: 50
Specifies the high threshold percent of CPU utilization by the ORBS software task that must be exceeded as measured at the time of polling to generate a warning-level alert or alarm.
high_thresh is measured in percentage of total CPU utilization and is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 50
Specifies the low threshold percent of CPU utilization by the ORBS software task that maintains a previously generated alarm condition. If the percentage is measured as less than or equal to Specifies the low threshold at the time of polling, a clear alarm will be generated.
low_thresh is measured in percentage of total CPU utilization and is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

Object Request Broker (ORB) software task CPU utilization thresholds generate warning-level alerts or alarms based on the percentage of packet processing card CPU resources it is consuming at the time of polling.

Warning-level alerts or alarms are triggered for CPU usage by the ORBS software task based on the following rules:

- **Enter condition:** Actual CPU usage percentage is greater than the high threshold.
- **Clear condition:** Actual CPU usage percentage is less than or equal to the low threshold.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a warning-level alarm threshold of *25* percent of CPU utilization by the ORBS task and a clear threshold of *20* percent:

```
threshold cpu-orbs-warn 25 clear 20
```

threshold cpu-session-throughput

Configures alarm or alert thresholds for CPU session throughput within the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold cpu-session-throughput *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold session throughput that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is measured in kilobytes per second (Kbps) and is an integer from 0 through 1000000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold session thereabout that maintains a previously generated alarm condition. If the throughput falls below Specifies the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is measured in kilobytes per second (Kbps) and is an integer from 0 through 1000000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU session throughput thresholds generate alerts or alarms based on total throughput for all Session Manager tasks running on each packet processing card CPU during the polling interval. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for CPU session throughput based on the following rules:

- **Enter condition:** Actual CPU session throughput is greater than or equal to the high threshold.
- **Clear condition:** Actual CPU session throughput is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a high threshold count of *900* Kbps session throughput and a low threshold of *500* KBps for a system using the Alarm thresholding model:

```
threshold cpu-session-throughput 900 clear 500
```

threshold cpu-utilization

Configures alarm or alert thresholds for CPU utilization within the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold cpu-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 85
Specifies the high threshold CPU utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100.

clear *low_thresh*

Default: 85
Specifies the low threshold CPU utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU utilization thresholds generate alerts or alarms based on the utilization percentage of each packet processing card CPU during the specified polling interval. Although, a single threshold is configured for all CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for CPU utilization based on the following rules:

- **Enter condition:** Average measured CPU utilization for the last 5 minutes
- **Clear condition:** Average measured CPU utilization for the last 5 minutes is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a high threshold CPU utilization percentage of *90* for a system using the Alert thresholding model:

```
threshold cpu-utilization 90
```

threshold dcca-bad-answers

Configures alarm or alert thresholds for invalid or bad responses to the system from Diameter servers.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold dcca-bad-answers *high_thresh* **[clear** *low_thresh* **]**

default threshold dcca-bad-answers

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of invalid messages or responses that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of invalid messages/responses that maintains a previously generated alarm condition. If the number of failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system receives invalid message or response from Diameter server **dcca-bad-answers** is generated.
DCCA bad answer messages size threshold generates alerts or alarms based on the number of invalid response or messages received during the specified polling interval.
Alerts or alarms are triggered for DCCA bad answers based on the following rules:

- **Enter condition:** Actual number of DCCA bad answer messages is greater than or equal to the high threshold.
- **Clear condition:** Actual number of DCCA bad answer messages is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* DCCA bad answer messages and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold dcca-bad-answers 250 clear 100
```

threshold dcca-protocol-error

Configures alarm or alert thresholds for Diameter Credit Control Application (DCCA) protocol errors from the Diameter server.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold dcca-protocol-error *high_thresh* **[clear** *low_thresh* **]**

default threshold dcca-protocol-error

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of protocol error received from Diameter server that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of protocol error received from Diameter server that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the system receives the protocol errors from Diameter server, **dcca-protocol-error** is generated.
DCCA protocol error threshold generates alerts or alarms based on the number of protocol error messages received from Diameter server during the specified polling interval.
Alerts or alarms are triggered for DCCA protocol error based on the following rules:

- **Enter condition:** Actual number of DCCA protocol error is greater than or equal to the high threshold.
- **Clear condition:** Actual number of DCCA protocol errors is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* protocol errors and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold dcca-protocol-error 250 clear 100
```

threshold dcca-rating-failed

Configures Diameter Credit Control Application (DCCA) Rating Group (content-id) request reject, alarm or alert thresholds.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold dcca-rating-failed *high_thresh* **[clear** *low_thresh* **]**

default threshold dcca-rating-failed

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of requests for a block of credits due to invalid Rating Group (content-id), rejected from the Diameter server that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of requests for a block of credits due to invalid Rating Group (content-id), rejected from the Diameter server that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the Diameter server rejects the system request for a block of credits due to invalid Rating Group, defined as content-id, **dcca-rating-failed** message is generated.
Rating Group failed threshold generates alerts or alarms based on the number of requests rejected from Diameter server during the specified polling interval.

Alerts or alarms are triggered for Rating Group failed based on the following rules:

- **Enter condition:** Actual number of DCCA Rating Group failed is greater than or equal to the high threshold.
- **Clear condition:** Actual number of DCCA Rating Group failed is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* requests rejected and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold dcca-rating-failed 250 clear 100
```

threshold dcca-unknown-rating-group

Configures alarm or alert thresholds for the unknown Diameter Credit Control Application (DCCA) Rating Group (content-id) messages returned by Diameter servers.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold dcca-unknown-rating-group *high_thresh* **[clear** *low_thresh* **]**

default threshold dcca-unknown-rating-group

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of unknown Rating Group (content-id) messages sent by the Diameter server that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of unknown Rating Group (content-id) sent by Diameter server and received by system that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

In the event that the Diameter server sends invalid Rating Groups, **content-ids** to the system, **dcca-unk-rating-group** message is generated.
Unknown Rating Group threshold generates alerts or alarms based on the number of unknown Rating Groups received by the system from Diameter server during the specified polling interval.
Alerts or alarms are triggered for unknown rating groups based on the following rules:

- **Enter condition:** Actual number of unknown rating groups is greater than or equal to the high threshold.
- **Clear condition:** Actual number of unknown rating groups is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold count of *250* unknown rating groups and low threshold of *100* for a system using the Alarm thresholding model:

```
threshold dcca-unknown-rating-group 250 clear 100
```

threshold diameter diameter-retry-rate

Configures Diameter Retry Rate, alarm or alert thresholds based on the percentage of Diameter requests that were retried during the polling interval.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold diameter diameter-retry-rate *high_thresh* **[clear** *low_thresh* **]**

default threshold diameter diameter-retry-rate

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the high threshold. If, within the polling interval, the percentage of Diameter requests retried equals or exceeds *high_thresh* an alert or alarm is generated.
high_thresh is an integer from 0 through 100.
Default: 0

clear *low_thresh*

Specifies the low threshold. If, within the polling interval, the percentage of Diameter requests retried falls below *low_thresh*, a clear alarm is generated.
low_thresh is an integer from 0 through 100.
Default: 0

Important: This value is applicable for the Alarm mode, and ignored for the Alert mode. In addition, if this value is not configured for the Alarm mode, the system assumes it is identical to the high threshold.

Usage

Diameter Retry Rate threshold generates alerts or alarms based on the percentage of Diameter requests that were retried during the specified polling interval.
Alerts or alarms are triggered based on the following rules:

- **Enter condition:** Percentage of Diameter requests retried is greater than or equal to the high threshold.
- **Clear condition:** Percentage of Diameter requests retried is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures a high threshold of *75* percent, and a low threshold of *50* percent for a system using the Alarm thresholding model:

```
threshold diameter diameter-retry-rate 75 clear 50
```

threshold edr-udr-dropped flow control

Configures alarm or alert thresholds to monitor the total number of Event Data Records (EDRs) and Usage Data Records (UDRs) discarded due to flow control.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold edr-udr-dropped-flow-control *high_thresh* **[clear** *low_thresh* **]**

default threshold edr-udr-dropped-flow-control

default

Configures this command with the default threshold settings.
Default: High threshold: 90; Low threshold: 10

high_thresh

Specifies the high threshold for total number of EDRs + UDRs dropped due to flow control, which must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh must be an integer from 0 through 100000.
A value of 0 disables the threshold.
Default: 90

clear *low_thresh*

Specifies the low threshold for total number of EDRs + UDRs dropped that maintains a previously generated alarm condition. If the total number of EDRs + UDRs dropped falls below Specifies the low threshold within the polling interval, a clear alarm is generated.
low_thresh must be an integer from 0 through 100000 that must be lower than *high_thresh*.
A value of 0 disables the threshold.
Default: 10

Usage

Use this command to configure thresholds to monitor the total number of EDRs + UDRs discarded due to flow control. Alerts or alarms are generated based on the total number of EDRs + UDRs dropped during polling interval.
Alerts or alarms are triggered for EDR file space usage session based on the following rules:

- **Enter condition:** Actual number of EDRs + UDRs dropped greater than or equal to the specified number of EDRs + UDRs dropped.

- **Clear condition:** Actual number of EDR + UDRs dropped is less than the specified clear number of EDRs + UDRs dropped.

If a trigger condition exists at the end of the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold of *90* and a clear threshold of *45* to monitor EDRs + UDRs dropped due to flow control:

```
threshold edr-udr-dropped-flow-control 90 clear 45
```

threshold epdg-current-sessions

Configures alarm or alert thresholds for the number of subscribers currently in Evolved Packet Date Gateway (ePDG) sessions.

Platform

ASR 5000

Product

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold epdg-current-sessions

default threshold epdg-current-sessions

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of the total number of ePDG subscriber sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of the total number of ePDG subscriber sessions that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Sets the upper and power thresholds for the total number of ePDG subscriber sessions that will generate and clear alerts or alarms.
Alerts or alarms are triggered based on the following rules:

- **Enter condition:** Actual number of ePDG subscriber sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual number of ePDG subscriber sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures sets the upper threshold of ePDG subscriber sessions at *100000* and the lower threshold at *90000*:

```
threshold epdg-current-sessions 100000 clear 90000
```

threshold fng-current-active-sessions

Configures alarm or alert thresholds for the number of subscribers currently active Femto Network Gateway (FNG) sessions.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold fng-current-active-sessions

default threshold fng-current-actice-sessions

default

Disables the threshold for configured alarm and sets the *high_thresh* and *low_thresh* values to 0.

high_thresh

Default: 0
Specifies the high threshold number of the total number of active FNG subscriber sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of the total number of active FNG subscriber sessions that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Sets the upper and power thresholds for the total number of active FNG subscriber sessions that will generate and clear alerts or alarms.
Alerts or alarms are triggered based on the following rules:

- **Enter condition:** Actual number of active FNG subscriber sessions is greater than or equal to the high threshold.

- **Clear condition:** Actual number of active FNG subscriber sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example

The following command configures sets the upper threshold of active FNG subscriber sessions at *100000* and the lower threshold at *90000*:

```
threshold fng-current-active-sessions 100000 clear 90000
```

threshold fng-current-sessions

Configures alarm or alert thresholds for the number of subscribers currently in Femto Network Gateway (FNG) sessions, including inactive sessions.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold fng-current-sessions

default threshold fng-current-sessions

default

Configures this command with the default threshold settings.
Default: High threshold: 90; Low threshold: 10

high_thresh

Default: 0
Specifies the high threshold number of the total number of FNG subscriber sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: 0
Specifies the low threshold number of the total number of FNG subscriber sessions that maintains a previously generated alarm condition. If the number of errors falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Sets the upper and power thresholds for the total number of FNG subscriber sessions that will generate and clear alerts or alarms.
Alerts or alarms are triggered based on the following rules:

- **Enter condition:** Actual number of FNG subscriber sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual number of FNG subscriber sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Example The following command configures sets the upper threshold of FNG subscriber sessions at *200000* and the lower threshold at *190000*:

```
threshold fng-current-sessions 200000 clear 190000
```

threshold fw-deny-rule

Configures alarm or alert thresholds for the Stateful Firewall Deny Rule.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold fw-deny-rule *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-deny-rule

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the Stateful Firewall Deny-Rule threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall Deny-Rule alarm clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of Deny-Rule instances exceeds a given value, a n alarm or alert is raised; it is cleared when the number of Deny-Rule instances falls below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval, and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall Deny Rule high threshold of *1000* and a low threshold of *900* for a system using the Alarm Thresholding model:

```
threshold fw-deny-rule 1000 clear 900
```

threshold fw-dos-attack

Configures alarm or alert thresholds for Stateful Firewall Denial-of-Service (DoS) attacks.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold fw-dos-attack *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-dos-attack

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the Stateful Firewall DoS attacks threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall DoS attacks clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of DoS attacks exceed a given value, a threshold is raised and it is cleared when the number of DoS attacks fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall DoS attacks high threshold of *1000* and a low threshold of *100* for a system using the Alarm Thresholding model:

```
threshold fw-dos-attack 1000 clear 100
```

threshold fw-drop-packet

Configures alarm or alert thresholds for Stateful Firewall dropped packets.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold fw-drop-packet *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-drop-packet

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the Stateful Firewall dropped packets threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall dropped packets clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of dropped packets exceed a given value, a threshold is raised and it is cleared when the number of dropped packets fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall dropped packets high threshold of *1000* and a low threshold of *900* for a system using the Alarm thresholding model:

```
threshold fw-drop-packet 1000 clear 900
```

threshold fw-no-rule

Configures alarm or alert thresholds for Stateful Firewall no rule occurrences.

Platform

ASR 5000

Product

PSF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold fw-no-rule *high_thresh* **[clear** *low_thresh* **]**

default threshold fw-no-rule

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the Stateful Firewall no rules threshold value, which if met or exceeded generates an alert or alarm.
high_thresh must be an integer from 0 through 1000000.
Default: 0

clear *low_thresh*

Specifies the Stateful Firewall no rules clear threshold value. If, in the same polling interval, the threshold falls below *low_thresh* a clear alarm is generated.
low_thresh must be an integer from 0 through 1000000.
Default: 0

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the low threshold.

Usage

When the number of no rule occurrences exceeds a given value, a threshold is raised and it is cleared when the number of no rules fall below a value within the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a Stateful Firewall no rule high threshold of *1000* and a low threshold of *900* for a system using the Alarm Thresholding model:

```
threshold fw-no-rule 1000 clear 900
```

threshold license remaining-sessions

Configures alarm or alert thresholds for the percentage of session license utilization by the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no] threshold license remaining-sessions *low_thresh* **clear** *high_thresh*

no *low_thresh*

Disables threshold session license utilization alerts or alarms.

remaining-sessions *low_thresh*

Default: 10
Specifies the low threshold session license utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
low_thresh is an integer from 0 through 100.

clear *high_thresh*

Default: 10
Specifies the high threshold session license utilization percentage that maintains a previously generated alarm condition. If the utilization percentage rises above the high threshold within the polling interval, a clear alarm will be generated.
high_thresh is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to Specifies the low threshold.

Usage

Session license utilization thresholds generate alerts or alarms based on the utilization percentage of all session capacity licenses during the specified polling interval.
The system uses session capacity license to dictate the maximum number of simultaneous sessions that can be supported. There are multiple session types that require licenses. Although, a single threshold is configured for all session types, alerts or alarms can be generated for each type.
Alerts or alarms are triggered for session license utilization based on the following rules:

- **Enter condition:** Actual session license utilization percentage per session type is greater than or equal to the low threshold.

- **Clear condition:** Actual session license utilization percentage per session type is greater than the high threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a session license low threshold percentage of *10* and a high threshold of *35* for a system using the Alarm thresholding model:

```
threshold license remaining-sessions 10 clear 35
```

threshold mgmt-cpu-memory-usage

Configures alarm or alert thresholds for the percentage of CPU memory usage on management cards.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold mgmt-cpu-memory-usage *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold percent of CPU memory usage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is measured in percentage of total memory used and can be configured to an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Specifies the low threshold percent of CPU memory usage that maintains a previously generated alarm condition. If the percentage falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is measured in percentage of total memory used and can be configured to an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU memory usage thresholds generate alerts or alarms based on memory usage for the SPC, SMC, or MIO CPU during the polling interval. A single threshold enables CPU monitoring for both the active and standby SPCs, SMCs, or MIOs allowing for alerts or alarms to be generated for each CPU.
Alerts or alarms are triggered for SPC, SMC, or MIO CPU memory usage based on the following rules:

- **Enter condition:** Actual CPU memory usage is greater than or equal to the high threshold
- **Clear condition:** Actual CPU memory usage is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a threshold of *65* percent of total SPC, SMC, or MIO CPU memory usage and a clear threshold of *35* percent:

```
threshold mgmt-cpu-memory-usage 65 clear 35
```

threshold mgmt-cpu-utilization

Configures alarm or alert thresholds for the percentage of CPU utilization on management cards.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold mgmt-cpu-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold CPU utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100.

clear *low_thresh*

Specifies the low threshold CPU utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

CPU utilization thresholds generate alerts or alarms based on the utilization percentage of each SPC, SMC, or MIOCPU during the specified polling interval. Although, a single threshold is configured for both SPC, SMC, or MIO CPUs, separate alerts or alarms can be generated for each CPU.
Alerts or alarms are triggered for SPC, SMC, or MIO CPU utilization based on the following rules:

- **Enter condition:** Average measured CPU utilization for the last 5 minutes is greater than or equal to the high threshold.
- **Clear condition:** Average measured CPU utilization for the last 5 minutes is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Important: This command is not supported on all platforms.

Example

The following command configures a high threshold SPC, SMC, or MIO CPU utilization percentage of *90* for a system using the Alert thresholding model:

```
threshold mgmt-cpu-utilization 90
```

threshold mme-attach-failure

Configures alarm or alert thresholds for the total number of MME Attach Failure messages across all the MME services in the system.

Platform

ASR 5000

Product

MME

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-mme-attach-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold number of total MME Attach Failure messages across all services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold number of total MME Attach Failure messages across all services on a system that maintains a previously generated alarm condition. If the number of MME Attach Failure messages across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of MME Attach Failure message across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME Attach Failure message based on the following rules:

- **Enter condition:** Actual total number of MME Attach Failure messages is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of MME Attach Failure messages is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll mme-attach-failure** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.

Example

The following command configures the limit of MME Attach Failure high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold mme-attach-failure 10000
```

threshold mme-auth-failure

Configures alarm or alert thresholds for the total number of MME Auth Failure messages across all the MME services.

Platform

ASR 5000

Product

MME

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-mme-auth-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold number of total MME Auth Failure messages across all MMM services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh can be configured to an integer from 0 through 100000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold number of total MME Auth Failure messages across all services on a system that maintains a previously generated alarm condition. If the number of MME Attach Failure messages across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of MME Auth Failure message across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME Auth Failure message based on the following rules:

- **Enter condition:** Actual total number of MME Auth Failure messages is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of MME Auth Failure messages is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll mme-auth-failure** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.

Example

The following command configures a total MME Auth Failure high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold mme-auth-failure 10000
```

threshold model

Configures the thresholding model, alarm or alert, for the system to use.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold model { alarm | alert }

alarm

Selects the alarm thresholding model as described in the *Usage* section for this command.

alert

Selects the alert thresholding model as described in the *Usage* section for this command.

Usage

The system supports the following thresholding models:

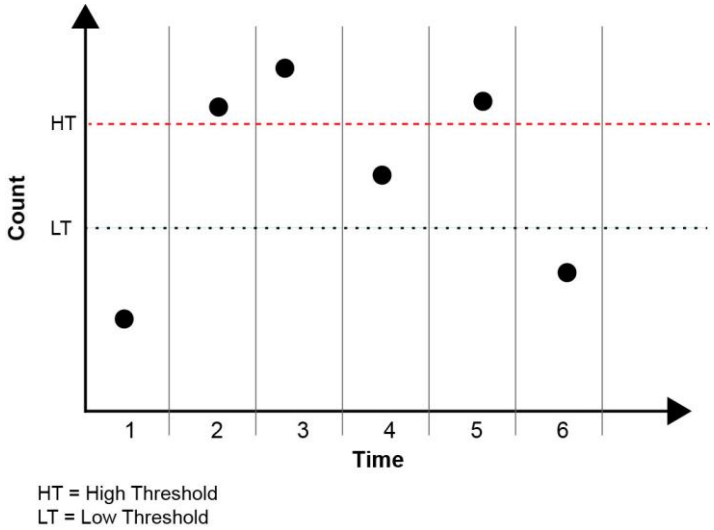
- **Alert:** A value is monitored and an alert condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

In the example shown in the figure below, this model generates alerts during period 2, 3, and 5 at the point where the count exceeded the high threshold.

- **Alarm:** Both high and low threshold are defined for a value. An alarm condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

The alarm is cleared at the end of the first interval where the measured value is below the low threshold. In the example shown in the figure below, this model generates an alarm during period 2 when the count exceeds the high threshold. A second alarm is generated in period 6 when the count falls beneath low threshold. The second alarm indicates a “clear” condition.

Figure 4. Thresholding Model Example



Important: For certain values the alert or alarm serves to warn of low quantities (such as, memory, session licenses, etc.). In these cases, the low threshold is the condition that must be met or exceeded within the polling interval to generate the alert or alarm. When the high threshold is exceeded during an interval, the low quantity condition is cleared.

Refer to the **`threshold monitoring`** command for additional information on thresholding.

Example

The following command configures the system to support the Alarm thresholding model:

```
threshold model alarm
```

threshold monitoring

Enables threshold monitoring for the selected value.

Platform

ASR 5000

Product

All

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

[no | default] threshold monitoring { aaa-acct-archive-size | aaa-acct-failure | aaa-auth-failure | aaa-retry-rate | aaamgr-request-queue | asngw | call-setup | content-filtering | cpu-resource | cpu-session-throughput | diameter | ecs | epdg-service | fa-service | firewall | ha-service | hnbgw-service | hsgw-service | ipsec | license | lma-service | mme-service | npu-resource | packets-filtered-dropped | packets-forwarded-to-cpu | pdg-service | pdif-service | pdsn-service **| pgw-service | phsgw | phspc | route-service | sgw-service | subscriber | system | tpo }**

no

Disables threshold monitoring for the specified value.

default

Sets or restores the default value assigned to the specified parameter.

aaa-acct-archive-size

Enables threshold monitoring for the size of the AAA accounting record archive.

aaa-acct-failure

Enables threshold monitoring for AAA accounting failures and AAA accounting failure rate values.
Refer to the **threshold aaa-acct-failure** and **threshold aaa-acct-failure-rate** commands for additional information on these values.

aaa-auth-failure

Enables threshold monitoring for AAA authentication failures and AAA authentication failure rate values.
Refer to the **threshold aaa-auth-failure** and **threshold aaa-auth-failure-rate** commands for additional information on these values.

aaa-retry-rate

Enables threshold monitoring for the AAA retry rate value.
Refer to the **threshold aaa-retry-rate** command for additional information on this value.

aaamgr-request-queue

Enables threshold monitoring for AAA Manager Requests for each AAA manager process. Refer to the **threshold aaamgr-request-queue** command for additional information on these values.

asngw

Enables the threshold monitoring for ASN-GW services.

call-setup

Enables threshold monitoring for the call setup, call setup failures, and no-resource rejected call values.
Refer to the **threshold call-setup, threshold call-setup-failure, threshold ppp-setup-fail-rate, threshold rp-setup-fail-rate**, and **threshold call-reject-no-resource** commands for additional information on these values.

cpu-resource

Enables threshold monitoring for CPU thresholds.
Refer to the **threshold 10sec-cpu-utilization, threshold cpu-available-memory, threshold cpu-load, threshold cpu-memory-usage, threshold cpu-orbs-crit, threshold cpu-orbs-warn, threshold cpu-session-throughput, threshold cpu-utilization, threshold mgmt-cpu-memory-usage,** and **threshold mgmt-cpu-utilization** commands for additional information on these values.

cpu-session-throughput

Enables threshold monitoring for the CPU session throughput value.
Refer to the **threshold cpu-session-throughput** command for additional information on this value.

content-filtering

Enables threshold monitoring for the Content Filtering in-line service.

diameter

Enables threshold monitoring for Diameter.

ecs

Enables threshold monitoring for the Active Charging Service (ACS)/Enhanced Charging Service (ECS).

epdg-service

Enables threshold monitoring for Evolved Packet Data Gateway (ePDG) servcice.
Refer to the **threshold epdg-current-sessions** command for additional information on this value.

fa-service

Enables threshold monitoring for Registration Reply errors for each FA service.
Refer to the **threshold reg-reply-error** FA Service Configuration Mode command for additional information on this value.

firewall

Enables threshold monitoring for the Stateful Firewall in-line service.
Default: Disabled

Refer to the **threshold fw-deny-rule, threshold fw-dos-attack, threshold fw-drop-packet**, and **threshold fw-no-rule** commands for additional information on this value.

Important: Stateful Firewall thresholds can only be enabled if the Stateful Firewall license is present.

ha-service

Enables threshold monitoring for Registration Reply errors, re-registration reply errors, deregistration reply errors, and average calls setup per second for each HA service and average calls setup per second at the context level.
Refer to the **threshold init-rrq-rcvd-rate, threshold reg-reply-error, threshold rereg-reply-error,** and **threshold dereg-reply-error** HA Service Configuration Mode commands and the **threshold ha-service init-rrq-rcvd-rate** Context Configuration mode command for additional information on this value.

hnbgw-service

Enables threshold monitoring for HNB-GW sessions including Iu-CS and Iu-PS sessions for HNB-GW services on a system at the system level.

Important: This keyword is required to activate the threshold alarm/alert for HNB-GW service to use **threshold total-hnbgw-hnb-sessions**, **thresshold total-hnbgw-iu-sessions**, and **thresshold total-hnbgw-ue-sessions** command for threshold values.

hsgw-service

Enables threshold monitoring for HSGW services.
Refer to the threshold total-hsgw-sessions for more information on HSGW thresholds.

ipsec

Enables monitoring of IPSec thresholds.
Refer to the *HA-Service Configuration Mode* chapter of the *Command Line Interface Reference* for information on the IPSec thresholds.

license

Enables threshold monitoring for the session license value.
Refer to the **threshold license** command for additional information on this value.

lma-service

Enables threshold monitoring for LMA services.
Refer to the **threshold total-lma-sessions** command for more information on LMA thresholds.

mme-service

Default: Disabled.
Enables threshold monitoring for the MME services.
Refer to the **threshold total-mme-sessions** command for additional information on this value.

npu-resouce

Enables threshold monitoring for the Network Processor Unit (NPU) resources, including NPU utilization.

Refer to the **threshold npu-utilization** command for additional information on this value.

packets-filtered-dropped

Enables threshold monitoring for the filtered/dropped packet value.
Refer to the **threshold packets-filtered-dropped** command for additional information on this value.

packets-forwarded-to-cpu

Enables threshold monitoring for the forwarded packet value.
Refer to the **threshold packets-forwarded-to-cpu** command for additional information on this value.

pdg-service

Enables threshold monitoring for PDG service.
Threshold monitoring for PDG service is disabled by default.

pdif-service

Enables threshold monitoring for PDIF service.

pdsn-service

Enables threshold monitoring for average calls setup per second for contexts and for PDSN services, A11 Request.
Refer to the **threshold packets-forwarded-to-cpu** command for additional information on this value.

pgw-service

Enables threshold monitoring for P-GW services.
Refer to the threshold total-pgw-sessions for more information on P-GW thresholds.

route-service

Enables threshold monitoring for BGP/VRF route services.
Refer to the **ip maximum-routes** command in Context configuration mode and **threshold route-service bgp-routes** in this mode for more information on route thresholds.

sgw-service

Enables threshold monitoring for S-GW services.
Refer to the threshold total-sgw-sessions for more information on S-GW thresholds.

subscriber

Enables threshold monitoring for the subscriber and session values.
Refer to the **threshold subscriber active**, **threshold subscriber total**, **threshold total-ggsn-sessions**, **threshold total-gprs-sessions**, **threshold total-gprs-pdp-sessions**, **threshold total-ha-sessions**, **threshold total-lns-sessions**, **threshold total-pdsn-sessions**, **threshold total-pgw-sessions**, **threshold total-sgw-sessions**, **threshold total-sgsn-sessions**, **threshold total-sgsn-pdp-sessions**, **threshold per-service-ggsn-sessions**, **threshold per-service-ha-sessions**, t**hreshold per-service-lns-sessions**, and **threshold per-service-pdsn-sessions** commands for additional information on these values.

system

Enables system (chassis) thresholds monitoring.

tpo

Enables thresholds monitoring for Traffic Performance Optimization (TPO) in-line service.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high CPU utilization, or packet collisions on a network) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 22. ASR 5000 Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

In addition to the values that can be enabled by this command, the system supports the enabling of threshold monitoring for IP pool address availability (refer to the **ip pool** and threshold commands in this reference) and port utilization (refer to the threshold commands in this chapter).

Example

The following command enables thresholding for subscriber totals:

```
threshold monitoring subscriber
```

threshold nat-port-chunks-usage

Configures alarm or alert thresholds for the percentage of Network Address Translation (NAT) port chunk utilization.

Important: This command is only available in 8.3 and later releases.

Platform

ASR 5000

Product

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold nat-port-chunks-usage *high_thresh* **[clear** *low_thresh* **]**

default threshold nat-port-chunks-usage

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the high NAT-port-chunks-usage percentage threshold that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh must be an integer from 0 through 100. A value of 0 disables the threshold.
Default: 0

clear *low_thresh*

Specifies the low nat-port-chunks-usage percentage threshold that must be met within the polling interval for a clear alarm to be generated.
low_thresh must be an integer from 0 through 100. A value of 0 disables the threshold. If not set, the *high_thresh* will be the high and low threshold setting.
Default: 0

Usage

Use this command to configure the NAT port chunk utilization threshold settings.

Example

The following command sets the NAT port chunk utilization threshold settings to a high of *75*% and a low of *15*%:

```
threshold nat-port-chunks-usage 75 clear 15
```

threshold npu-utilization

Configures alarm or alert thresholds for the percentage of network processing unit (NPU) utilization.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold npu-utilization *high_thresh* **clear** *low_thresh*

default

Configures this command with the default threshold settings.
Default: 0—disabled

high_thresh

Specifies the high percentage threshold for NPU utilization that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh must be an integer from 0 through 100. A value of 0 disables the threshold.
Default: 0

clear *low_thresh*

Specifies the low percentage threshold for NPU utilization that must be met within the polling interval for a clear alarm to be generated.
low_thresh must be an integer from 0 through 100. A value of 0 disables the threshold. If not set, the *high_thresh* will be the high and low threshold setting.
Default: 0

Usage

Use this command to configure the NPU utilization threshold settings.

Example

The following command sets the NPU utilization threshold settings to a high of *90*% and a low of *75*%:

```
threshold npu-utilization 90 clear 75
```

threshold packets-filtered-dropped

Configures alarm or alert thresholds for filtered or dropped packets within the system.

Platform

ASR 5000

Product

PDSN

GGSN

HA

P-GW

SGSN

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold packets-filtered-dropped *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of filtered/dropped packets experienced by the system resulting from access control list (ACL) rules that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of filtered/dropped packets experienced by the system resulting from ACL rules that maintains a previously generated alarm condition. If the number of packets falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Filtered/dropped packet thresholds generate alerts or alarms based on the total number of packets that were filtered or dropped by the system as a result of ACL rules during the specified polling interval.
Alerts or alarms are triggered for filtered/dropped packets based on the following rules:

- **Enter condition:** Actual number of filtered/dropped packets is greater than or equal to the high threshold.
- **Clear condition:** Actual number of filtered/dropped packets is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value. In addition, refer to information on ACLs in this reference.

Example

The following command configures a filtered/dropped packet high threshold count of *150000* for a system using the Alert thresholding model:

```
threshold packets-filtered-dropped 150000
```

threshold packets-forwarded-to-cpu

Configures alarm or alert thresholds for packets forwarded to active system CPUs in the system.

Platform

ASR 5000

Product

PDSN

GGSN

HA

P-GW

SGSN

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold packets-forwarded-to-cpu *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of packets forwarded to CPUs that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of packets forwarded to CPUs that maintains a previously generated alarm condition. If the number of packets falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Forwarded packet thresholds generate alerts or alarms based on the total number of packets that were forwarded to active system CPU(s) during the specified polling interval. Packets are forwarded to active system CPUs when the NPUs do not have adequate information to properly route them.

Important: Ping and/or traceroute packets are intentionally forwarded to system CPUs for processing. These packet types are included in the packet count for this threshold.

Alerts or alarms are triggered for forwarded packets based on the following rules:

- **Enter condition:** Actual number of forwarded packets is greater than or equal to the high threshold
- **Clear condition:** Actual number of forwarded packets is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **`threshold poll`** command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a forwarded packet high threshold count of *`100000`* for a system using the Alert thresholding model:

```
threshold packets-forwarded-to-cpu 100000
```

threshold pdg-current-active-sessions

Configures alarm or alert thresholds for monitoring the total number of currently active Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG) sessions.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold pdg-current-active-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of active PDG sessions to be monitored on a chassis. *high_thresh* is an integer from 0 through 1000000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears the number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is an integer from 0 through 1000000.

Usage

Thresholds are provided for monitoring the overall PDG usage on a chassis. This command is used to monitor the total number of active PDG sessions for an entire chassis.

Example

The following command configures a monitoring threshold of *300000* and a clearing threshold of 100000 active PDG sessions on a chassis:

```
threshold pdg-current-active-sessions 300000 clear 100000
```

threshold pdg-current-sessions

Configures alarm or alert thresholds for monitoring the total number of current Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG) sessions, including inactive sessions.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold pdg-current-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of PDG sessions on a chassis, both active and inactive. *high_thresh* is any integer from 0 through 1000000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears any number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is any integer from 0 through 1000000.

Usage

Thresholds are provided for monitoring the overall PDG usage on a chassis. This command is used to monitor the total number of PDG sessions, both active and inactive, for an entire chassis.

Example

The following command configures a monitoring threshold of *300000* and a clearing threshold of *100000* active and inactive PDG sessions on a chassis:

```
threshold pdg-current-sessions 300000 clear 100000
```

threshold pdif-current-active-sessions

Configures alarm or alert thresholds for monitoring the total number of currently active Packet Data Interworking Function (PDIF) sessions.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold pdif-current-active sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of active PDIF sessions to be monitored on a chassis. *high_thresh* is any integer from 0 through 1000000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears the specified number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is any integer from 0 through 1000000.

Usage

Thresholds are provided for monitoring the overall PDIF usage on a chassis. This command is used to monitor the total number of active PDIF sessions for an entire chassis.

Example

The following command configures a monitoring threshold of *300000* and a clearing threshold of *100000* active PDIF sessions on a chassis:

```
threshold pdif-current-active-sessions 300000 clear 100000
```

threshold pdif-current-sessions

Configures alarm or alert thresholds for monitoring the total number of current Packet Data Interworking Function (PDIF) sessions, including inactive sessions.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold pdif-current-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Configures the total number of PDIF sessions on a chassis, both active and inactive. *high_thresh* is an integer from 0 through 1000000.
There is no default, but 0 means that there is no threshold monitoring.

clear *low_thresh*

Clears the specified number of sessions being monitored using the *high_thresh* variable defined above. *low_thresh* is an integer from 0 through 1000000.

Usage

Thresholds are provided for monitoring the overall PDIF usage on a chassis. This command is used to monitor the total number of PDIF sessions, both active and inactive, for an entire chassis.

Example

The following command configures a monitoring threshold of *300000* and a clearing threshold of *100000* active and inactive PDIF sessions on a chassis:

```
threshold pdif-current-sessions 300000 clear 100000
```

threshold per-service-asngw-sessions

Configures alarm or alert thresholds for the number of sessions per ASN-GW service in the system.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-asngw-sessions *high_thresh* **[** *clear low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of PDP contexts for any one ASN-GW service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 2500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of PDP contexts for any one ASN-GW service that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of PDP contexts for any ASN-GW service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of PDP contexts for any ASN-GW service is greater than or equal to the high threshold
- **Clear condition:** Actual number of PDP contexts is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* subscriber attaches per GGSN service for the Alert thresholding model:

```
threshold per-service-asngw-sessions 10000
```

threshold per-service-ggsn-sessions

Configures alarm or alert thresholds for the number of PDP contexts per GGSN service in the system.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-ggsn-sessions *high_thresh* **[** *clear low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of PDP contexts for any one GGSN service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of PDP contexts for any one GGSN service that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of PDP contexts for any GGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of PDP contexts for any GGSN service is greater than or equal to the high threshold
- **Clear condition:** Actual number of PDP contexts is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* subscriber attaches per GGSN service for the Alert thresholding model:

```
threshold per-service-ggsn-sessions 10000
```

threshold per-service-gprs-pdp-sessions

Configures alarm or alert thresholds for the number of 2G-activated PDP contexts per GPRS service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-gprs-pdp-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of 2G-activated PDP contexts for any one GPRS service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of 2G-activated PDP contexts for any one GPRS service. This number or higher maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, then a clear alarm will be generated.
low_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 2G-activated PDP contexts for any GPRS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of PDP contexts for any GPRS service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PDP contexts is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 2G-activated PDP contexts per GPRS service for the Alert thresholding model:

```
threshold per-service-gprs-sessions 10000
```

threshold per-service-gprs-sessions

Configures alarm or alert thresholds for the number of 2G-attached subscribers per GPRS service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-gprs-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of 2G-attached subscribers for any one GPRS service. This threshold number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of 2G-attached subscribers for any one GPRS service. The number of subscribers must remain above this threshold in order to maintain a previously generated alarm condition. If the number of 2G subscribers falls beneath the low threshold within the polling interval, then a clear alarm will be generated.
low_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 2G-attached subscribers for any GPRS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 2G-attached subscribers for any GPRS service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of 2G-attached subscribers is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 2G-attaches per GPRS service for the Alert thresholding model:

```
threshold per-service-gprs-sessions 10000
```

threshold per-service-ha-sessions

Configures alarm or alert thresholds for the number of HA sessions per Home Agent (HA) service in the system.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-ha-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of HA sessions for any one HA service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of HA sessions for any one HA service that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of HA sessions for any HA service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HA sessions based on the following rules:

- **Enter condition:** Actual number of HA sessions for any HA service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of HA sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a HA session per service high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold per-service-ha-sessions 10000
```

threshold per-service-lns-sessions

Configures alarm or alert thresholds for the number of L2TP Network Server (LNS) sessions per LNS service in the system.

Platform

ASR 5000

Product

PDSN

GGSN

HA

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-lns-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of LNS sessions for any one LNS service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 2500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of LNS sessions for any one LNS service that maintains a previously generated alarm condition. If the number of LNS sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of LNS sessions for any LNS service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for LNS sessions based on the following rules:

- **Enter condition:** Actual number of LNS sessions for any LNS service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of LNS sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a LNS session per service high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold per-service-lns-sessions 10000
```

threshold per-service-pdg-sessions

Configures alarm or alert thresholds for the number of Packet Data Gateway (PDG) sessions per PDG service in the system.

Platform

ASR 5000

Product

PDG/TTG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-pdg-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of PDG sessions for any one PDG service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of PDG sessions for any one PDG service that maintains a previously generated alarm condition. If the number of PDG sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of PDG sessions for any PDG service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDSN sessions based on the following rules:

- **Enter condition:** Actual number of PDG sessions for any PDG service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PDSN sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a PDG session per service high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold per-service-pdg-sessions 10000
```

threshold per-service-pdsn-sessions

Configures alarm or alert thresholds for the number of Packet Data Serving Node (PDSN) sessions per PDSN service in the system.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-pdsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of PDSN sessions for any one PDSN service that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 2500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of PDSN sessions for any one PDSN service that maintains a previously generated alarm condition. If the number of PDSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of PDSN sessions for any PDSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDSN sessions based on the following rules:

- **Enter condition:** Actual number of PDSN sessions for any PDSN service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PDSN sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a PDSN session per service high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold per-service-pdsn-sessions 10000
```

threshold per-service-sgsn-pdp-sessions

Configures alarm or alert thresholds for the number of 3G-activated PDP contexts per SGSN service on the system.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-sgsn-pdp-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of 3G-activated PDP contexts for any one SGSN service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of 3G-activated PDP contexts for any one SGSN service. This number or higher maintains a previously generated alarm condition. If the number of 3G-activated PDP contexts falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2400000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 3G-activated PDP contexts for any SGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 3G-activated PDP contexts for any SGSN service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of 3G-activated PDP contexts is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 3G-activated PDP contexts per SGSN service for the system's Alert thresholding model:

```
threshold per-service-sgsn-sessions 10000
```

threshold per-service-sgsn-sessions

Configures alarm or alert thresholds for the number of 3G-attached subscribers per SGSN service in the system.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold per-service-sgsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of 3G-attached subscribers for any one SGSN service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of 3G-attached subscribers for any one SGSN service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the number of 3G-attached subscribers for any one SGSN service in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for PDP contexts based on the following rules:

- **Enter condition:** Actual number of 3G-attached subscribers for any single SGSN service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of 3G-attached subscribers for any single SGSN service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold count of *10000* 3G-attached subscribers per SGSN service for a system using the Alert thresholding model:

```
threshold per-service-sgsn-sessions 10000
```

threshold phsgw-auth-failure

Configures alarm or alert thresholds for the number of authentication failures in Personal Handyphone Service Gateway (PHSGW) service.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phsgw-auth-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number for PHSGW authentication failures in any one PHSGW service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of PHSGW authentication failures in any one PHSGW service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSGW authentication failures.
Alerts or alarms are triggered for authentication failures based on the following rules:

- **Enter condition:** Actual number of PHSGW authentication failures in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSGW authentication failures in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSGW au the tic a it on failures:

```
threshold phsgw-auth-failure 100000 clear 50000
```

threshold phsgw-eapol-auth-failure

Configures alarm or alert thresholds for authentication failures for a PHSGW service using Extensible Authentication Protocol Over LAN (EAPOL).

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phsgw-eapol-auth-failure *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number for PHSGW EAPOL failures in any one PHSGW service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of PHSGW EAPOL failures in any one PHSGW service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSGW EAPOL failures.
Alerts or alarms are triggered for EAPOL failures based on the following rules:

- **Enter condition:** Actual number of PHSGW EAPOL failures in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSGW EAPOL failures in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSGW EAPOL failures:

```
threshold phsgw-eapol-auth-failure 100000 clear 50000
```

threshold phsgw-handoff-denial

Configures alarm or alert thresholds for handoff denials in PHSGW.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phsgw-handoff-denial *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of handoff denials for any one PHSGW service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of handoff denials for any one PHSGW service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSGW handoff denials.
Alerts or alarms are triggered for handoff denials based on the following rules:

- **Enter condition:** Actual number of PHSGW handoff denials in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSGW handoff denials in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSGW handoff denials:

```
threshold phsgw-handoff-denial 100000 clear 50000
```

threshold phsgw-max-eap-retry

Configures alarm or alert thresholds for the maximum number of Extensible Authentication Protocol (EAP) retries in PHSGW.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phsgww-max-eap-retry *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of EAP retries for any one PHSGW service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of EAP retries for any one PHSGW service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSGW EAP retries.
Alerts or alarms are triggered for handoff denials based on the following rules:

- **Enter condition:** Actual number of PHSGW EAP retries in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSGW EAP retries in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSGW EAP retries:

```
threshold phsgw-max-eap-retry 100000 clear 50000
```

threshold phsgw-max-eapol-retry

Configures alarm or alert thresholds for the maximum number of Extensible Authentication Protocol over LAN (EAPOL) retries in PHSGW.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phsgww-max-eapol-retry *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of EAPOL retries for any one PHSGW service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of EAPOL retries for any one PHSGW service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSGW EAPOL retries.
Alerts or alarms are triggered for handoff denials based on the following rules:

- **Enter condition:** Actual number of PHSGW EAPOL retries in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSGW EAPOL retries in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSGW EAPOL retries:

```
threshold phsgw-max-eapol-retry 100000 clear 50000
```

threshold phsgw-network-entry-denial

Configures, alarm or alert thresholds for the number of network entry denials in PHSGW.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phsgww-max-network-entry-denial *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of network entry denials for any one PHSGW service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of network entry denials for any one PHSGW service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSGW network entry denials.
Alerts or alarms are triggered for handoff denials based on the following rules:

- **Enter condition:** Actual number of PHSGW network entry denials in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSGW network entry denials in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSGW network entry denials:

```
threshold phsgw-network-entry-denial 100000 clear 50000
```

threshold phsgw-session-setup-timeout

Configures alarm or alert thresholds for the number of PHSGW sessions that timed out during setup.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phsgww-session-setup-timeout *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of session setup timeouts for any one PHSGW service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of session setup timeouts for any one PHSGW service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSGW session setup timeouts.
Alerts or alarms are triggered for handoff denials based on the following rules:

- **Enter condition:** Actual number of PHSGW session setup timeouts in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSGW session setup timeouts in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSGW session setup timeouts:

```
threshold phsgw-session-setup-timeout 100000 clear 50000
```

threshold phsgw-session-timeout

Configures alarm or alert thresholds for the number of PHSGW sessions that timed out.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phsgww-session-timeout*high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of session timeouts for any one PHSGW service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of session timeouts for any one PHSGW service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSGW session timeouts.
Alerts or alarms are triggered for handoff denials based on the following rules:

- **Enter condition:** Actual number of PHSGW session timeouts in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSGW session timeouts in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSGW session timeouts:

```
threshold phsgw-session-timeout 100000 clear 50000
```

threshold phspc-session-setup-timeout

Configures alarm or alert thresholds for the number of Personal Handyphone System - Personal Computer (PHSPC) sessions that timed out during setup.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phspc-session-setup-timeout*high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of session setup timeouts for any one PHSPC service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of session setup timeouts for any one PHSPC service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSPC session setup timeouts.
Alerts or alarms are triggered for handoff denials based on the following rules:

- **Enter condition:** Actual number of PHSPC session setup timeouts in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSPC session setup timeouts in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSPC session setup timeouts:

```
threshold phspc-session-setup-timeout 100000 clear 50000
```

threshold phspc-sleep-mode-timeout

Configures alarm or alert thresholds for the number of PHSPC sessions that timed out when the personal computer went into sleep mode.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold phspc-sleep-mode-timeout`*`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`high_thresh`

Default: 0
Specifies the high threshold number of sleep mode timeouts for any one PHSPC service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` is an integer from 0 through 1000000. A value of 0 disables the threshold.

`clear` *`low_thresh`*

Default: 0
Specifies the low threshold number of sleep mode timeouts for any one PHSPC service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSPC sleep mode timeouts.
Alerts or alarms are triggered for handoff denials based on the following rules:

- **Enter condition:** Actual number of PHSPC sleep mode timeouts in any one PHSGW service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSPC sleep mode timeouts in any one PHSGW service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **`threshold poll`** command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSPC sleep mode timeouts:

```
threshold phspc-sleep-mode-timeout 100000 clear 50000
```

threshold phspc-sm-entry-denial

Configures alarm or alert thresholds for the number of denied PHSPC short message (SM) sessions.

Platform

ASR 5000

Product

PHSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold phspc-sm-entry-denial*high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of SM entry denials for any one PHSPC service. This number must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of SM entry denials for any one PHSPC service. This number must be met or exceeded to maintain a previously generated alarm condition. If the number of subscribers falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Set the monitoring and clearing thresholds for PHSPC SM entry denials.
Alerts or alarms are triggered for handoff denials based on the following rules:

- **Enter condition:** Actual number of PHSPC SM entry denials in any one PHSPC service is greater than or equal to the high threshold.
- **Clear condition:** Actual number of PHSPC SM entry denials in any one PHSPC service is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

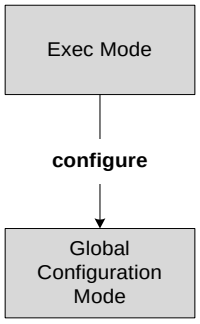
The following command configures a monitoring threshold of *100000* and a clearing threshold of *50000* for PHSPC SM entry denials:

```
threshold phsgw-sm-entry-denial 100000 clear 50000
```

Chapter 127
Global Configuration Mode Commands (threshold poll commands A - N)

This section includes the commands **`threshold poll 10sec-cpu-utilization interval`** through **`threshold poll npu-utilization interval`**.

The Global Configuration Mode is used to configure basic system-wide parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

threshold poll 10sec-cpu-utilization interval

Configures the polling interval over which to measure a 10-second average of CPU utilization.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll 10sec-cpu-utilization interval *duration*

default threshold poll 10sec-cpu-utilization interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCPUUtilization10Sec** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the 10-second CPU utilization threshold:

```
threshold poll 10sec-cpu-utilization 600
```

threshold poll a11-ppp-send-discard interval

Configures the polling interval for PDSN service over which to count the number of packets that the PPP protocol processing layer internally discarded on transmit for any reason.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll a11-ppp-send-discard interval*duration*

default threshold poll a11-ppp-send-discard interval

default

Restores the specified parameter to its default value 0 seconds.

interval *duration*

Default: 0 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 900 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshPDSNSvcA11PPPSendDiscard** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the A11 PPP send discard threshold:

```
threshold poll a11-ppp-send-discard interval 600
```

threshold poll a11-rac-msg-discard interval

Configures the polling interval for PDSN service over which to count the number of Discarded A11 Registration Acknowledgements.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll a11-rac-msg-discard interval*duration*

default threshold poll a11-rac-msg-discard interval

default

Restores the specified parameter to its default value 0 seconds.

interval *duration*

Default: 0 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 900 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshPDSNSvcA11RACMsgDiscard** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the A11 RAC message discard threshold:

```
threshold poll a11-rac-msg-discard interval 600
```

threshold poll aa11-rrp-failure interval

Configures the polling interval for PDSN service over which to count A11 Registration Response failures.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll a11-rrp-failure interval *duration*

default threshold poll a11-rrp-failure interval

default

Restores the specified parameter to its default value 0 seconds.

interval *duration*

Default: 0 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 900 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshPDSNSvcA11RRPFailure** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the A11 RRP failure threshold:

```
threshold poll a11-rrp-failure interval 600
```

threshold poll a11-rrq-msg-discard interval

Configures the polling interval for PDSN service over which to count how many A11 Registration Request messages are discarded.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll a11-rrq-msg-discard interval*duration*

default threshold poll a11-rrq-msg-discard interval

default

Restores the specified parameter to its default value 0 seconds.

interval *duration*

Default: 0 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 900 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshPDSNSvcA11RRQMsgDiscard** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the A11 RRQ message discard threshold:

```
threshold poll a11-rrq-msg-discard interval 600
```

threshold poll aaa-acct-archive-size interval

Configures the polling interval over which to count archived AAA accounting messages.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll aaa-acct-archive-size interval *duration*

default threshold poll aaa-acct-archive-size interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for the AAA accounting archive size threshold:

```
threshold poll aaa-acct-archive-size interval 600
```

threshold poll aaa-acct-failure interval

Configures the polling interval over which to count failed AAA accounting requests.

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll aaa-retry-rate interval` *`duration`*

`default threshold poll aaa-retry-rate interval`

`default`

Restores the specified parameter to its default value 300 seconds.

`interval` *`duration`*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
`duration` is an integer from 60 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshAAARetryRate`** command in this mode.

Example

The following command configures the polling interval to *`600`* seconds for the AAA retry rate threshold:

```
threshold poll aaa-retry-rate interval 600
```

threshold poll aaamgr-request-queue interval

Configures the polling interval over which to count the number of AAA Manager Requests for each AAA manager process.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll aaamgr-request-queue interval *duration*

default threshold poll aaamgr-request-queue interval

default

Restores the specified parameter to its default value 0 seconds.

interval *duration*

Default: 0 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshAAAMgrQueue** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the AAA manager request queue threshold:

```
threshold poll aaamgr-request-queue interval 600
```

threshold poll active-subscriber interval

Configures the polling interval over which to count the total number of active subscriber sessions.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll active-subscriber interval*duration*

default threshold poll active-subscriber interval

default

Restores the specified parameter to its default value 300 seconds.

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration is an integer from 60 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshSubscriberActive** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the active subscriber threshold:

```
threshold poll active-subscriber interval 600
```

threshold poll asngw-auth-failure interval

Configures the polling interval over which to count or measure the thresholding value for ASN Gateway authentication failure.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll asngw-auth-failure interval *dur*

default threshold poll asngw-auth-failure interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshASNGWAuthFail** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the ASN Gateway authentication failure threshold:

```
threshold poll asngw-auth-failure interval 600
```

threshold poll asngw-handoff-denial interval

Configures the polling interval over which to count or measure the thresholding value for ASN Gateway hand-off denial.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll asngw-handoff-denial interval *dur*

default threshold poll asngw-handoff-denial interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the polling interval time in seconds.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshASNGWHandoffDenial** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the hand-off denial threshold:

```
threshold poll asngw-handoff-denial interval 600
```

threshold poll asngw-max-eap-retry interval

Configures the polling interval over which to count or measure the thresholding value for maximum Extensible Authentication Protocol (EAP) authentication retries.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll asngw-max-eap-retry interval *dur*

default threshold poll asngw-max-eap-retry interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshASNGWMaxEAPRetry** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the maximum EAP authentication retry threshold:

```
threshold poll asngw-max-eap-retry interval 600
```

threshold poll asngw-network-entry-denial interval

Configures the polling interval over which to count or measure the thresholding value for network entry denial to an MS.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll asngw-network-entry-denial interval *dur*

default threshold poll asngw-network-entry-denial interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshASNGWNWEntryDenial** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the network entry denial threshold:

```
threshold poll asngw-network-entry-denial interval 600
```

threshold poll asngw-session-setup-timeout interval

Configures the polling interval over which to count or measure the thresholding value for session setup timeout.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll asngw-session-setup-timeout interval *dur*

default threshold poll asngw-session-setup-timeout interval

default

Restores the specified parameter to its default value 300 seconds.

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshASNGWSessSetupTimeout** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the session setup timeout threshold:

```
threshold poll asngw-session-setup-timeout interval 600
```

threshold poll asngw-session-timeout interval

Configures the polling interval over which to count or measure the thresholding value for session timeout.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

configure

Syntax

threshold poll asngw-session-timeout interval *dur*

default threshold poll asngw-session-timeout interval

default

Restores the specified parameter to its default value (300 seconds).

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshASNGWSessTimeout** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the session timeout threshold:

```
threshold poll asngw-session-timeout interval 600
```

threshold poll asnpc-idle-mode-timeout interval

Configures the polling interval over which to count the number of ASNPC Instant Messenger idle mode timeouts.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll asnpc-idle-mode-timeout interval *dur*

default threshold poll asnpc-idle-mode-timeout interval

default

Restores the specified parameter to its default value (300 seconds).

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshASNPCIdleModeTimeout** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the idle mode timeout threshold:

```
threshold poll asnpc-idle-mode-timeout interval 600
```

threshold poll asnpc-im-entry-denial interval

Configures the polling interval over which to count the number of ASNPC Instant Messenger entry denials.

Platform

interval *dur*

Default: 900 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCallRejectNoResource** command in this mode.

Example

The following command configures the polling interval to *600* seconds for call reject no-resource threshold:

```
threshold poll call-reject-no-resource interval 600
```

threshold poll call-setup interval

Configures the polling interval over which to count the number of calls that were setup.

Platform

ASR 5000

Product

All

Privilege

Mode

Exec > Global Configuration

configure

Syntax

threshold poll call-setup interval*dur*

default threshold poll call-setup interval

default

Restores the specified parameter to its default value (900 seconds).

interval *dur*

Default: 900 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCallSetup** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the call setup threshold:

```
threshold poll call-setup interval 600
```

threshold poll call-setup-failure interval

Configures the polling interval over which to count the number of calls that failed to setup.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll call-setup-failure interval*dur*

default threshold poll call-setup-failure interval

default

Restores the specified parameter to its default value (900 seconds).

interval *dur*

Default: 900 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 30 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCallSetupFailure** command in this mode.

Example

The following command configures the polling interval to *600* seconds for call setup failure threshold:

```
threshold poll call-setup-failure interval 600
```

threshold poll call-setup-failures interval

Configures the polling interval over which to count the number of CSCF call setup failures.

Platform

ASR 5000

Product

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll call-setup-failures interval*dur*

default threshold poll call-setup-failures interval

default

Restores the specified parameter to its default value (300 seconds).

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 60 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCSCFSvcTotalCallFailure** command in this mode.

Example

The following command configures the polling interval to *600* seconds for CSCF session timeout threshold:

```
threshold poll call-setup-failures interval 600
```

threshold poll call-total-active interval

Configures the polling interval over which to count the total number of CSCF active calls.

Platform

ASR 5000

Product

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll call-total-active interval*dur*

default threshold poll call-total-active interval

default

Restores the specified parameter to its default value (300 seconds).

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 60 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCSCFSvcTotalActiveCalls** command in this mode.

Example

The following command configures the polling interval to *600* seconds for session timeout threshold:

```
threshold poll call-total-active interval 600
```

threshold poll card-temperature-near-power-off-limit interval

Configures the polling interval over which to count the number of times card temperatures reached the power-off limit.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll card-temperature-near-power-off-limit interval*dur*

default threshold poll card-temperature-near-power-off-limit interval

default

Restores the specified parameter to its default value (300 seconds).

interval *dur*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is an integer from 60 through 60000 in multiples of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCardTemperatureNearPowerOffLimit** command in this mode.

Example

The following command configures the polling interval to *600* seconds for session timeout threshold:

```
threshold poll card-temperature-near-power-off-limit interval 600
```

threshold poll cdr-file-space interval

Configures the polling interval for Charging Data Record (CDR) File Space Usage threshold.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cdr-file-space interval *duration*

default threshold poll cdr-file-space interval

default

Uses the default polling interval.
Default: 300 seconds

interval *duration*

Specifies the polling interval (in seconds) for the CDR File Space Usage threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval for CDR File Space Usage threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCDRFileSpace** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CDR file space usage threshold:

```
threshold poll cdr-file-space interval 600
```

threshold poll contfilt-block interval

Configures the polling interval Content Filtering Block threshold.

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll contfilt-block interval *duration*

default threshold poll contfilt-block interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *duration*

Specifies the polling interval (in seconds) for the Content Filtering Block threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval Content Filtering Block threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshContFiltBlock** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the content filtering blocking threshold:

```
threshold poll contfilt-block interval 600
```

threshold poll contfilt-rating interval

Configures the polling interval for the Content Filtering Rating threshold.

Platform

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll contfilt-rating interval *duration*

default threshold poll contfilt-rating interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the polling interval (in seconds) for the Content Filtering Rating threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval for the Content Filtering Rating threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshContFiltRating** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the content filtering rating processing threshold:

```
threshold poll contfilt-rating interval 600
```

threshold poll cpu-available-memory interval

Configures the polling interval over which to measure the percentage of total packet processing card CPU memory used.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cpu-available-memory interval*duration*

default threshold poll cpu-available-memory interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCPUMemory** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CPU available memory threshold:

```
threshold poll cpu-available-memory interval 600
```

threshold poll cpu-load interval

Configures the polling interval over which to monitor packet processing card CPU loads using a 5-minute average measurement.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cpu-load interval*duration*

default threshold poll cpu-load interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCPULoad** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CPU load threshold:

```
threshold poll cpu-load interval 600
```

threshold poll cpu-memory-usage interval

Configures the polling interval over which to measure the percentage of total packet processing card CPU memory used.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cpu-memory-usage interval *duration*

default threshold poll cpu-memory-usage interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCPUMemUsage** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CPU memory usage threshold:

```
threshold poll cpu-memory-usage interval 600
```

threshold poll cpu-orbs-crit interval

Configures the polling interval over which to measure the percentage of CPU utilization by the ORBS software task for critical-level alerts.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll cpu-orbs-crit interval` *`duration`*

`default threshold poll cpu-orbs-crit interval`

`default`

Uses the default threshold polling interval.
Default: 300 seconds

`interval` *`dur`*

Specifies the amount of time (in seconds) that comprises the polling interval.
`duration` must be an integer from 60 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshCPUOrbsCritical`** command in this mode.

Example

The following command configures the polling interval to *`600`* seconds for the CPU ORBS critical threshold:

```
threshold poll cpu-orbs-crit interval 600
```

threshold poll cpu-orbs-warn interval

Configures the polling interval over which to measure the percentage of CPU utilization by the ORBS software task for warning-level alerts.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cpu-orbs-warn interval *duration*

default threshold poll cpu-orbs-warn interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 60 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCPUOrbsWarn** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CPU ORBS warning threshold:

```
threshold poll cpu-orbs-warn interval 600
```

threshold poll cpu-session-throughput interval

Configures the polling interval over which to measure total throughput for all Session Manager tasks running on each packet processing card CPU.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cpu-session-throughput interval *duration*

default threshold poll cpu-session-throughput interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 60 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshSessCPUThroughput** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CPU session throughput threshold:

```
threshold poll cpu-session-throughput interval 600
```

threshold poll cpu-utilization interval

Configures the polling interval over which to measure the percentage of CPU utilization.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cpu-utilization interval *duration*

default threshold poll cpu-utilization interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 60 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCPUUtilization** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CPU utilization threshold:

```
threshold poll cpu-utilization interval 600
```

threshold poll cscf-invite-rcvd interval

Configures the polling interval in seconds over which to count the invitations received for Call State Control Function (CSCF) calls.

Platform

ASR 5000

Product

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cscf-invite-rcvd interval *duration*

default threshold poll cscf-invite-rcvd interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 60 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCSCFSvcCallsPerInterval** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CSCF call invite threshold:

```
threshold poll cscf-invite-rcvd interval 600
```

threshold poll cscf-reg-rcvd interval

Configures the polling interval in seconds over which to count the registrations received for Call State Control Function (CSCF) calls.

Platform

ASR 5000

Product

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cscf-reg-rcvd interval *duration*

default threshold poll cscf-reg-rcvd interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 60 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCSCFSvcRegPerInterval** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CSCF call registrations threshold:

```
threshold poll cscf-reg-rcvd interval 600
```

threshold poll cscf-service-route-failures interval

Configures the polling interval in seconds over which to count the CSCF service route failures.

Platform

ASR 5000

Product

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll cscf-service-route-failures interval *duration*

default threshold poll cscf-service-route-failures interval

default

Uses the default threshold polling interval.
Default: 300 seconds

interval *dur*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 60 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshCSCFSvcRouteFailures** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the CSCF service route failures threshold:

```
threshold poll cscf-service-route-failures interval 600
```

threshold poll dcca-bad-answers interval

Configures the polling interval for DCCA Bad Answers threshold—invalid or bad response to the system from the Diameter server.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll dcca-bad-answers interval *duration*

default threshold poll dcca-bad-answers interval

default

Uses the default threshold polling interval.
Default: 900 seconds

interval *duration*

Specifies the polling interval (in seconds) for the DCCA Bad Answers threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the poling interval for DCCA Bad Answers threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshDCCABadAnswers** command in this mode.

Example

The following command configures the polling interval to *600* seconds for invalid or bad response threshold to the system from Diameter server:

```
threshold poll dcca-rating-failed interval 600
```

threshold poll dcca-protocol-error interval

Configures the polling interval for Diameter Credit-Control Application (DCCA) Protocol Error threshold.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll dcca-protocol-error interval *duration*

default threshold poll dcca-protocol-error interval

default

Uses the default threshold polling interval.
Default: 900 seconds

interval *duration*

Specifies the polling interval (in seconds) for the DCCA Protocol Error threshold.
duration must be an integer from 60 through 60000.

Usage

Use this the polling interval for DCCA Protocol Error threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshDCCAProtocolError** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the DCCA protocol error threshold:

```
threshold poll dcca-protocol-error interval 600
```

threshold poll dcca-rating-failed interval

Configures the polling interval for Diameter Credit-Control Application (DCCA) Rating Failed threshold.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll dcca-rating-failed interval` *`duration`*

`default threshold poll dcca-rating-failed interval`

`default`

Uses the default polling interval.
Default: 900 seconds

`interval` *`duration`*

Specifies the polling interval (in seconds) for the DCCA Rating Failed threshold.
`duration` must be an integer from 60 through 60000.

Usage

This command configures the polling interval for DCCA Rating Failed threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshDCCARatingFailed`** command in this mode.

Example

The following command configures the polling interval to *`600`* seconds for the Diameter Credit Control Application (DCCA) Rating Group (content-id) request reject thresholds:

```
threshold poll dcca-rating-failed interval 600
```

threshold poll dcca-unknown-rating-group interval

Configures the polling interval for Diameter Credit-Control Application (DCCA) Unknown Rating Group threshold.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll dcca-unknown-rating-group interval *duration*

default threshold poll dcca-unknown-rating-group interval

default

Uses the default polling interval.
Default: 900 seconds

interval *duration*

Specifies the polling interval (in seconds) for the DCCA Unknown Rating Group threshold.
duration must be an integer from 60 through 60000.

Usage

This command configures the polling interval for DCCA Unknown Rating Group threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholding in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshDCCAUnknownRatingGroup** command in this mode.

Example

The following command configures the polling interval to *600* seconds to threshold for the unknown DCCA Rating Group (content-id) returned by Diameter to system:

```
threshold poll dcca-unknown-rating-group interval 600
```

threshold poll dereg-reply-error interval

Configures the polling interval to count the number of de-registration reply errors per HA service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll dereg-reply-error interval *duration*

default threshold poll dereg-reply-error interval

default

Uses the default polling interval.
Default: 300 seconds

interval *duration*

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 60 through 60000. The input will be rounded up to the closest multiple of 30.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands in this chapter for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshHASvcDeregReplyError** command in this mode.

Example

The following command configures the HA de-registration reply error threshold polling interval to *600* seconds:

```
threshold poll dereg-reply-error interval 600
```

threshold poll diameter-retry-rate interval

Configures the polling interval for the Diameter Credit-Control Application (DCCA) Diameter Retry Rate threshold.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll diameter-retry-rate interval *duration*

default threshold poll diameter-retry-rate interval

default

Uses the default polling interval.
Default: 300 seconds

interval *duration*

Specifies the polling interval (in seconds) for the Diameter Retry Rate threshold.
duration must be an integer from 60 through 60000. The input will be rounded up to the closest multiple of 30.

Usage

This command specifies the polling interval for Diameter Retry Rate threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands in this chapter for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshDiameterRetryRate** command in this mode.

Example

The following command configures the Diameter Retry Rate threshold polling interval to *600* seconds:

```
threshold poll diameter-retry-rate interval 600
```

threshold poll edr-file-space interval

Command configures the polling interval for Event Data Record (EDR) File Space Usage threshold.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll edr-file-space interval` *`duration`*

`interval` *`duration`*

Default: 300 seconds.
Specifies the polling interval (in seconds) for the EDR File Space Usage threshold.
`duration` must be an integer from 60 through 60000.

Usage

This command configures the polling interval for EDR File Space Usage threshold.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshEDRFileSpace`** command in this mode.

Example

The following command configures the polling interval to *`600`* seconds for the EDR file space usage threshold:

```
threshold poll edr-file-space interval 600
```

threshold poll edr-udr-dropped-flow-control interval

Configures the polling interval to count the total number of Event Data Records (EDRs) and Usage Data Records (UDRs) discarded due to ACSMGR flow control.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll edr-udr-dropped-flow-control interval` *`duration`*

`interval` *`duration`*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
`duration` must be an integer from 60 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *`600`* seconds for the EDR/UDR drops due to flow control threshold:

```
threshold poll edr-udr-dropped-flow-control interval 600
```

threshold poll epdg-current-sessions interval

Configures the polling interval to count the total number of subscribers currently in Evolved Packet Date Gateway (ePDG) sessions.

Platform

ASR 5000

Product

ACS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll epdg-current-sessions interval *duration*

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 60 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshEPDGCurrSess** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the ePDG sessions threshold:

```
threshold poll epdg-current-sessions interval 600
```

threshold poll error-no-resource interval

Configures the polling interval in seconds over which to count CSCF No Resource Errors.

Platform

ASR 5000

Product

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshIPSECIKERequests** command in this mode.

Example

The following command configures the polling interval to *600* seconds for the average number of IPSec call requests:

```
threshold poll ipsec-ike-requests interval 600
```

threshold poll ipsec-tunnels-established interval

Configures the polling interval over which to count the number of IPSec tunnels that have been established.

Platform

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll ipsec-tunnels-established interval` *`duration`*

`interval` *`duration`*

Default: 900 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
`duration` must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshIPSECTunEstabl`** command in this mode.

Example

The following command configures the polling interval to *`600`* seconds for the number of established IPSec tunnels:

```
threshold poll ipsec-tunnels-established interval 600
```

threshold poll ipsec-tunnels-setup interval

Configures the polling interval over which to count the number of IPSec tunnels that have been setup.

Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Example

The following command configures the polling interval to *600* seconds for management card CPU memory usage:

```
threshold poll mgmt-cpu-utilization interval 600
```

threshold poll mme-attach-failure interval

Configures the polling interval to count the MME Attach Failure messages across all MME services in the system.

Platform

ASR 5000

Product

MME

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll mme-attach-failure interval *dur*

default threshold poll mme-attach-failure interval

default

Restores the polling interval value to its default value of 900 seconds.

interval *dur*

Default: 900 seconds.
Specifies the polling interval (in seconds) for counting MME Attach Failure messages across all MME services in the system.
dur must be an integer from 30 through 60000 in multiples of 30.

Usage

Use this command to configure the polling interval to count the MME Attach Failure messages across all MME services in the system to generate threshold value.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring mme-service** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshMMEAttachFail** command in this mode.

Example

The following command configures the polling interval of *600* seconds to count the MME Attach Failure messages for threshold limit:

```
threshold poll mme-attach-failure interval 600
```

threshold poll mme-auth-failure interval

Configures the polling interval to count the MME Authentication Failure messages across all MME services in the system.

Platform

Restores the specified poll interval value to its default value of 900 seconds.

interval *dur*

Default: 900 seconds.
Specifies the polling interval (in seconds) for counting MME Authentication Failure messages across all MME services in the system.
dur must be an integer from 30 through 60000 in multiples of 30.

Usage

Use this command to configure the polling interval to count the MME Auth Failure messages across all MME services in the system to generate threshold value.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring mme-service** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshMMEAuthFail** command in this mode.

Example

The following command configures the polling interval of *600* seconds to count the MME Auth Failure messages for threshold limit:

```
threshold poll mme-auth-failure interval 600
```

threshold poll nat-port-chunks-usage interval

Configures the polling interval over which to measure the percentage of Network Address Translation (NAT) port chunk utilization.

Platform

ASR 5000

Product

NAT

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll nat-port-chunks-usage interval *duration*

interval *duration*

Default: 900 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshNATPortChunksUsage** command in this mode.

Example

The following command configures the polling interval to *600* seconds for (NAT) port chunk utilization:

```
threshold poll nat-port-chunks-usage interval 600
```

threshold poll npu-utilization interval

Configures the polling interval over which to measure the percentage of network processing unit (NPU) utilization.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll npu-utilization interval *duration*

interval *duration*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
duration must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold monitoring** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshNPUUtilization** command in this mode.

Example

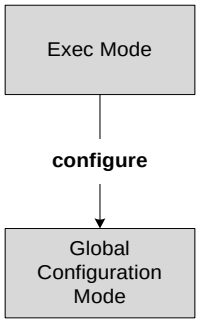
The following command configures the polling interval to *600* seconds for NPU utilization:

```
threshold poll npu-utilization interval 600
```

Chapter 128
Global Configuration Mode Commands (threshold poll commands O - Z)

This section includes the commands **`threshold poll packets-filtered-dropped interval`** through **`threshold poll tpo-rto-timeout`**.

The Global Configuration Mode is used to configure basic system-wide parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

threshold poll packets-filtered-dropped interval

Configures the polling interval over which to count the filtered/dropped packets.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll packets-filtered-dropped interval` *`duration`*

`interval` *`duration`*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
`duration` must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshPacketsFilteredDropped`** command in this mode.

Example

The following command configures the polling interval to *`600`* seconds for filtered/dropped packets:

```
threshold poll packets-filtered-dropped interval 600
```

threshold poll packets-forwarded-to-cpu interval

Configures the polling interval over which to count packets forwarded to active system CPUs in the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll packets-forwarded-to-cpu interval` *`duration`*

`interval` *`duration`*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
`duration` must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshPacketsForwarded`** command in this mode.

Example

The following command configures the polling interval to *`600`* seconds for packets forwarded to active system CPUs in the system:

```
threshold poll packets-forwarded-to-cpu interval 600
```

threshold poll pdg-current-active-sessions interval

Configures the polling interval over which to count the total number of currently active Packet Data Gateway/Tunnel Termination Gateway (PDG/TTG) sessions.

Platform

ASR 5000

Product

PDG

TTG

Privilege

Security Administrator, Administrator

Mode

`interval` *`duration`*

Default: 300 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
`duration` must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshPerServicePDGSessions`** command in this mode.

Example

The following command configures the polling interval to *`600`* seconds for PDG/TTG sessions:

```
threshold poll per-service-pdg-sessions interval 600
```

threshold poll per-service-pdsn-sessions interval

Configures the polling interval in seconds over which to count the number of Packet Data Serving Node (PDSN) sessions per PDSN service in the system.

Platform

`threshold poll phspc-sm-entry-denial interval` *`duration`*

`interval` *`duration`*

Default: 0 seconds.
Specifies the amount of time (in seconds) that comprises the polling interval.
`duration` must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **`threshold monitoring`** and other threshold commands for additional information on the system's support for thresholds in this chapter.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshPHSPCSmEntryDenial`** command in this mode.

Example

The following command configures the polling interval to *`600`* seconds for PHSPC SM session denials:

```
threshold poll phspc-sm-entry-denial interval 600
```

threshold poll port-high-activity interval

Configures the polling interval in seconds over which to measure the overall percentage of port utilization.

Platform

ASR 5000

Product

All

Privilege

Administrator Security Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll port-high-activity interval *seconds*

interval *seconds*

Configures the threshold polling interval in multiples of 30 seconds. *seconds* is an integer from 30 through 60000. Default is 300 seconds.

Usage

High port activity thresholds generate alerts or alarms based on the peak utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis. Alerts or alarms are triggered for high port activity based on the following rules:
Enter condition: Actual percent peak utilization of a port is greater than or equal to the high threshold.
Clear condition: Actual percent peak utilization of a port is less than the low threshold.
If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.This threshold is configured on a per-port basis configured using the port *port-type slot#/port#* command syntax.

Important: This command is not available on all platforms

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshPortHighActivity** command in this mode.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshPortHighActivity** command in this mode.

Example

Use the following example to configure the polling interval over which to measure for high port activity to *300* seconds:

```
threshold poll port-high-activity interval 300
```

threshold poll port-rx-utilization interval

Configures the polling interval in seconds over which to measure the overall percentage of incoming traffic received over system ports.

Platform

ASR 5000

Product

All

Privilege

Administrator Security Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll port-rx-utilization interval` *`seconds`*

`interval` *`seconds`*

Configures the threshold polling interval in multiples of 30 seconds. *`seconds`* is an integer from 30 to 60000. Default is 300 seconds.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis configured using the port *`port-type slot#/port#`* command syntax.

Important: This command is not available on all platforms

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. (The transmitted and received percentages are combined.) Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshPortRxUtil`** command in this mode.

Example

Use the following example to configure a threshold poll interval of *`300`* seconds (5 minutes)

```
threshold poll port-rx-utilization interval 300
```

threshold poll port-tx-utilization

Configures the polling interval in seconds over which to measure the overall percentage of outgoing traffic sent over system ports.

Platform

ASR 5000

Product

All

Privilege

Administrator Security Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll port-tx-utilization interval *seconds*

interval *seconds*

Configures the threshold polling interval in multiples of 30 seconds. *seconds* is an integer from 30 through 60000. Default is 300 seconds.

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis configured using the port *port-type slot#/port#* command syntax.

Important: This command is not available on all platforms

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. (The transmitted and received percentages are combined.) Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshPortTxUtil** command in this mode.

Example

Use the following example to configure a threshold poll interval of *300* seconds (5 minutes)

```
threshold poll port-tx-utilization interval 300
```

threshold poll ppp-setup-fail-rate interval

Configures the polling interval in seconds over which to measure for the percentage of point-to-point protocol (PPP) setup failures.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Restores the threshold poll interval value to its default value of 900 seconds.

interval *time*

Default: 900 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is any integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshRPSetupFailRate** command in this mode.

Example

The following command configures the polling interval for the RP setup fail rate polling duration value to *600* seconds (10 minutes):

```
hreshold poll rp-setup-fail-rate interval 600
```

threshold poll storage-utilization interval

Configures the polling interval over which to measure the percentage of management card flash memory utilization.

Platform

ASR 5000

Product

All

Privilege

Administrator Security Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll storage-utilization interval *dur*

default threshold poll route-service interval

default

Restores the threshold poll interval value to its default value of 900 seconds.

interval *time*

Default: 900 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is any integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshStorageUtilization** command in this mode.

Example

The following command configures the polling interval for flash memory utilization polling duration value to *600* seconds (10 minutes):

```
threshold poll storage-utilization interval 600
```

threshold poll system-capacity interval

Configures the polling interval over which to measure the percentage of current system capacity.

Platform

Mode

Exec > Global Configuration

configure

Syntax

threshold poll system-capacity interval *dur*

default threshold poll route-service interval

default

Restores the threshold poll interval value to its default value of 900 seconds.

interval *time*

Default: 900 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
dur is any integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshSystemCapacity** command in this mode.

Example

The following command configures the polling interval for flash memory utilization polling duration value to *600* seconds (10 minutes):

```
hreshold poll system-capacity interval 600
```

threshold poll total-asngw-sessions interval

Configures the polling interval over which to count or measure the thresholding value for the total number of sessions across all the ASN-GW services on a system to trigger an alert or alarm.

Platform

ASR 5000

Product

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll total-asngw-sessions interval *time*

default threshold poll total-asngw-sessions interval

default

Restores the threshold polling interval value to its default value of 300 seconds.

interval *time*

Default: 300 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
time must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshASNGWSessions** command in this mode.

Example

The following command configures the polling interval for counting the total number of ASN-GW sessions across all the ASN-GW services on a system, to *600* seconds (10 minutes):

```
threshold poll total-asngw-sessions interval 600
```

threshold poll total-ggsn-sessions interval

Configures the polling interval over which to count or measure the thresholding value for the total number of sessions across all the GGSN services on a system to trigger an alert or alarm.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

interval *time*

Default: 300 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
time must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshGPRSSessions** command in this mode.

Example

The following command configures the polling interval for counting the total number of 2G-attached subscribers, to *600* seconds (10 minutes):

```
threshold poll total-gprs-sessions interval 600
```

threshold poll total-ha-sessions interval

Configures the polling interval over which to count the total number of Home Agent (HA) sessions on the system.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll total-ha-sessions interval *time*

default threshold poll total-ha-sessions interval

default

Restores the threshold polling interval value to its default value of 300 seconds.

interval *time*

Default: 300 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
time must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshHASessions** command in this mode.

Example

The following command configures the polling interval for counting the total number of HA sessions on the system, to *600* seconds (10 minutes):

```
threshold poll total-ha-sessions interval 600
```

threshold poll total-hnbgw-hnb-sessions

Configures the polling interval over which to count or measure the thresholding value for the total number of IuH sessions between the HNB and HNB-GW to count across all the HNB-GW services on a system to trigger an alert or alarm.

Platform

ASR 5000

Product

HNB-GW

Privilege

Exec > Global Configuration

configure

Syntax

threshold poll total-hnbgw-ue-sessions interval *time*

default threshold poll total-hnbgw-ue-sessions interval

default

Restores the threshold poll interval value to its default value of 300 seconds.

interval *time*

Default: 300 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
time must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshTotalHNBGWUeSess** command in this mode.

Example

The following command configures the polling interval for the total number of UEs connected to an HNB-GW service across all the HNB-GW services on a system, to *600* seconds (10 minutes):

```
threshold poll total-hnbgw-ue-sessions interval 600
```

threshold poll total-hsgw-sessions interval

Configures the polling interval over which to count the total number of HRPD Serving Gateway (HSGW) sessions across all services in the system.

Platform

ASR 5000

Product

HSGW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll total-hsgw-sessions interval *time*

default threshold poll total-hsgw-sessions interval

interval *time*

Default: 300 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
time must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshSGSNSessions** command in this mode.

Example

The following command configures the polling interval for the total number of SGSN sessions on a system, to *600* seconds (10 minutes):

```
threshold poll total-sgsn-sessions interval 600
```

threshold poll total-sgw-sessions interval

Configures the polling interval over which to count the total number of Serving Gateway (S-GW) sessions across all services in the system.

Platform

ASR 5000

Product

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll total-sgw-sessions interval *time*

default threshold poll total-sgw-sessions interval

default

Restores the threshold poll interval value to its default value of 300 seconds.

interval *time*

Default: 300 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
time must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshSGWSessions** command in this mode.

Example

The following command configures the polling interval for the total number of S-GW sessions on a system, to *600* seconds (10 minutes):

```
threshold poll total-sgw-sessions interval 600
```

threshold poll total-subscriber interval

Configures the polling interval over which to count the total number of subscriber sessions across all services in the system.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll total-subscriber interval *time*

default threshold poll total-subscriber interval

default

Restores the threshold poll interval value to its default value of 300 seconds.

interval *time*

Default: 300 seconds
Specifies the amount of time (in seconds) that comprises the polling interval.
time must be an integer from 30 through 60000.

Usage

This command sets the time period over which to monitor the specified value for threshold crossing.

Important: All configured polling intervals are rounded up to the closest multiple of 30. For example, if a polling interval is configured for 130 seconds, the system uses a polling interval of 150 seconds.

Refer to the **threshold model** and **threshold monitoring** commands for additional information on the system's support for thresholding.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshSubscriberTotal**command in this mode.

Example

The following command configures the polling interval for the total number of subscribers on a system, to *600* seconds (10 minutes):

```
threshold poll total-subscriber interval 600
```

threshold poll tpo-dns-failure

Configures the threshold polling interval for monitoring Traffic Performance Optimization (TPO) DNS resolution failures.

Platform

ASR 5000

Product

TPO

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold poll tpo-dns-failure interval` *`interval`*

`default threshold poll tpo-dns-failure interval`

`default`

Configures this command with the default polling interval.
Default: 900 seconds

`interval`

Specifies the polling interval (in seconds) for monitoring TPO DNS resolution failures.
`interval` must be an integer from 30 through 60000. The system rounds up the value to the closest multiple of 30.

Usage

Use this command to configure the threshold polling interval for monitoring TPO DNS resolution failures.

Important: To enable an SNMP trap for monitoring this threshold use the **`snmp trap enable ThreshTpoDnsFailure`** command in this mode.

Example

The following command configures the polling interval for TPO DNS resolution failures threshold to *`600`* seconds:

```
threshold poll tpo-dns-failure interval 600
```

threshold poll tpo-low-compression-gain

Configures the threshold polling interval for monitoring TPO low-compression-gain results.

Platform

ASR 5000

Product

TPO

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll tpo-low-compression-gain interval *interval*

default threshold poll tpo-low-compression-gain interval

default

Configures this command with the default polling interval.
Default: 900 seconds

interval

Specifies the polling interval (in seconds) for monitoring TPO low-compression-gain results.
interval must be an integer from 30 through 60000. The system rounds up the value to the closest multiple of 30.

Usage

Use this command to configure the threshold polling interval for monitoring TPO low-compression-gain results.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshTpoLowCompressionGain** command in this mode.

Example

The following command configures the polling interval for TPO low-compression-gain results threshold to *600* seconds:

```
threshold poll tpo-low-compression-gain interval 600
```

threshold poll tpo-rto-timeout

Configures the threshold polling interval for monitoring TPO retransmission timeouts (RTOs).

Platform

ASR 5000

Product

TPO

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold poll tpo-rto-timeout interval *interval*

default threshold poll tpo-rto-timeout interval

default

Configures this command with the default polling interval.
Default: 900 seconds

interval

Specifies the polling interval (in seconds) for monitoring TPO retransmission timeouts.
interval must be an integer from 30 through 60000. The system rounds up the value to the closest multiple of 30.

Usage

Use this command to configure the threshold polling interval for monitoring TPO retransmission timeouts.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshTpoRtoTimeout** command in this mode.

Example

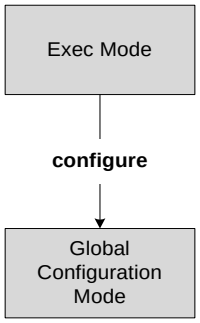
The following command configures the polling interval for TPO retransmission timeouts threshold to *600* seconds:

```
threshold poll tpo-rto-timeout interval 600
```

Chapter 129
Global Configuration Mode Commands (threshold ppp - url-blacklisting)

This section includes the commands **`threshold ppp-setup-fail-rate`** through **`url-blacklisting database`**.

The Global Configuration Mode is used to configure basic system-wide parameters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

threshold ppp-setup-fail-rate

Configures alarm or alert thresholds for the percentage of point-to-point protocol (PPP) setup failures.

Platform

ASR 5000

Product

PDSN

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold ppp-setup-fail-rate *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold rate percentage for PPP setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold rate percentage for PPP setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

PPP setup failure rate thresholds generate alerts or alarms based on the rate of call setup failures experienced by the system during the specified polling interval. The failure rate is the percentage of failures as determined by number of PPP setup failures divided by the total number of PPP sessions initiated.
Alerts or alarms are triggered for PPP setup failure rates based on the following rules:

- **Enter condition:** Actual number of call setup failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of call setup failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a PPP setup failure rate high percentage threshold of *50* percent and a clear threshold of *45* percent:

```
threshold ppp-setup-fail-rate 50 clear 45
```

threshold route-service bgp-routes

Configures alarm or alert thresholds for the percentage of route services to BGP routes.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold route-service bgp-routes *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold rate percentage for BGP routes on the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold rate percentage for BGP routes on the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to configure a threshold in percentage of maximum BGP routes allowed. If the percentage of the number of BGP routes in a context (including all VRFs) reaches *high_thresh*, a notification is generated. Optionally, if the threshold subsystem is configured in 'alarm' mode, a **Threshold_Clear** notification is generated when the percentage of the number of BGP routes in a context (including all VRFs) goes below *low_thresh*. The maximum number of BGP routes is also sent by BGP task when getting the statistics
Alerts or alarms are triggered for BGP routes based on the following rules:

- **Enter condition:** Actual number of call setup failures is greater than the high threshold.
- **Clear condition:** Actual number of call setup failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures system for high threshold of *50* percent and a clear threshold of *45* percent:

```
threshold route-service bgp-routes 50 clear 45
```

threshold rp-setup-fail-rate

Configures alarm or alert thresholds for the percentage of RAN PDSN (RP) setup failures.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold rp-setup-fail-rate *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold rate percentage for RP setup failures experienced by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold rate percentage for RP setup failures experienced by the system that maintains a previously generated alarm condition. If the number of setup failures falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

RP setup failure rate thresholds generate alerts or alarms based on the rate of call setup failures experienced by the system during the specified polling interval. The failure rate is the percentage of failures as determined by number of Registration Request Messages rejected divided by the total number of Registration Request Messages received.
Alerts or alarms are triggered for RP setup failure rates based on the following rules:

- **Enter condition:** Actual number of call setup failures is greater than or equal to the high threshold.
- **Clear condition:** Actual number of call setup failures is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a RP setup failure rate high threshold of *50* percent and a clear threshold of *45* percent:

```
threshold rp-setup-fail-rate 50 clear 45
```

threshold spc-cpu-memory-usage

This command has been renamed to **`threshold mgmt-cpu-memory-usage`**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

Important: This command is not supported on all platforms.

threshold spc-cpu-utilization

This command has been renamed to **`threshold mgmt-cpu-utilization`**. Please refer to that command for details. Note that for backwards compatibility, the system accepts this command as valid.

threshold storage-utilization

Configures alarm or alert thresholds for the percentage of management card flash memory utilization.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold storage-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 90
Specifies the high threshold storage utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 90
Specifies the low threshold storage utilization percentage that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Flash memory utilization thresholds generate alerts or alarms based on the utilization percentage of storage available to the system.
Alerts or alarms are triggered for storage utilization based on the following rules:

- **Enter condition:** Actual percentage storage utilization is greater than or equal to the high threshold.
- **Clear condition:** Actual percentage storage utilization is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold for storage utilization percentage of *85* for a system using the Alert thresholding model:

```
threshold storage-utilization 85
```

threshold subscriber active

Configures alarm or alert thresholds for the number of active subscribers in the system.

Platform

ASR 5000

Product

PDSN

GGSN

SGSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold subscriber active *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of active subscriber sessions facilitated by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of active subscriber sessions facilitated by the system that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Active subscriber thresholds generate alerts or alarms based on the total number of active subscriber sessions facilitated by the system during the specified polling interval.
Alerts or alarms are triggered for active subscriber totals based on the following rules:

- **Enter condition:** Actual total number of active subscriber sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of active subscriber sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures an active subscriber high threshold count of *150000* and a low threshold of *100000* for a system using the Alarm thresholding model:

```
threshold subscriber active 150000 clear 100000
```

threshold subscriber total

Configures alarm or alert thresholds for the total number of active and inactive subscribers in the system.

Platform

ASR 5000

Product

PDSN

GGSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold subscriber total *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of subscriber sessions (active and dormant) facilitated by the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of subscriber sessions (active and dormant) facilitated by the system that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Total subscriber thresholds generate alerts or alarms based on the total number of subscriber sessions (active and dormant) facilitated by the system during the specified polling interval.
Alerts or alarms are triggered for subscriber totals based on the following rules:

- **Enter condition:** Actual total number of subscriber sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of subscriber sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures an active subscriber high threshold count of *450000* and a low threshold of *250000* for a system using the Alarm thresholding model:

```
threshold subscriber total 450000 clear 250000
```

threshold system-capacity

Configures alarm or alert thresholds based on the percentage of current system capacity.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold system *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 90
Specifies the high threshold system capacity percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

clear *low_thresh*

Default: 90
Specifies the low threshold system capacity percentage that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 100. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Flash memory utilization thresholds generate alerts or alarms based on the system utilization.
Alerts or alarms are triggered for system capacity based on the following rules:

- **Enter condition:** Actual percentage of system capacity is greater than or equal to the high threshold.
- **Clear condition:** Actual percentage of system capacity is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a high threshold for system capacity percentage of *95* for a system using the Alert thresholding model:

```
threshold system-capacity 95
```

threshold total-asngw-sessions

Configures alarm or alert thresholds for the total number of ASN-GW sessions across all the services in the system.

Platform

ASR 5000

Product

ANS-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-asngw-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold number of total ASN-GW sessions across all the sessions in the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold number of total ASN-GW sessions that maintains a previously generated alarm condition. If the number of ASN-GW sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of ASN-GW sessions across all the services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of ASN-GW sessions based on the following rules:

- **Enter condition:** Actual total number of ASN-GW sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of ASN-GW sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total ASN-GW session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-asngw-sessions 10000
```

threshold total-ggsn-sessions

Configures alarm or alert thresholds for the total number of GGSN sessions across all the services in the system.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-ggsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold number of total GGSN sessions across all the sessions in the system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold number of total GGSN sessions that maintains a previously generated alarm condition. If the number of GGSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of GGSN sessions across all the services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of GGSN sessions based on the following rules:

- **Enter condition:** Actual total number of GGSN sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of GGSN sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total GGSN session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-ggsn-sessions 10000
```

threshold total-gprs-pdp-sessions

Configures alarm or alert thresholds for the total number of PDP contexts per GPRS sessions in the system.

Platform

ASR 5000

Product

SGSN

Privilege

Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold total-gprs-pdp-sessions` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`high_thresh`

Default: 0
Specifies the high threshold number of total PDP contexts per GPRS session for all GPRS services that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` is an integer from 1 through 2000000. A value of 0 disables the threshold.

`clear` *`low_thresh`*

Default: 0
Specifies the low threshold number of total PDP contexts per GPRS session for all GPRS services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` is an integer from 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of GPRS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for GPRS sessions based on the following rules:

- **Enter condition:** Actual total number of PDP Contexts is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of PDP contexts is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **`threshold poll`** command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a total number of PDP contexts per GPRS session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-gprs-pdp-sessions 10000
```

threshold total-gprs-sessions

Configures alarm or alert thresholds for the total number of GPRS sessions in the system.

Platform

ASR 5000

Product

SGSN

Privilege

Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold total-gprs-sessions` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`high_thresh`

Default: 0
Specifies the high threshold number of total GPRS sessions for all GPRS services that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` is an integer from 1 through 2000000. A value of 0 disables the threshold.

`clear` *`low_thresh`*

Default: 0
Specifies the low threshold number of total GPRS sessions for all GPRS services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` is an integer from 0 and 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of GPRS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for GPRS sessions based on the following rules:

- **Enter condition:** Actual total number of GPRS sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of GPRS sessions is less than the low threshol.d

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a total number of GPRS sessions high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-gprs-sessions 10000
```

threshold total-ha-sessions

Configures alarm or alert thresholds for the total number of Home Agent (HA) sessions across all services in the system.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-ha-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of HA sessions for all HA services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of HA sessions for all HA services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of HA sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HA sessions based on the following rules:

- **Enter condition:** Actual total number of HA sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of HA sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of HA sessions high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-ha-sessions 10000
```

threshold total-hnbgw-hnb-sessions

Configures alarm or alert thresholds for the total number of Home NodeB (HNB) sessions across all the HNB Gateway (HNB-GW) services in the system.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-hnbgw-hnb-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold for the total number of HNB-HNB-GW sessions on IuH interfaces across all HNB-GW services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold for the total number of HNB-HNB-GW sessions on IuH interfaces across all services on a system that maintains a previously generated alarm condition. If the number of HNB-HNB-GW sessions in a system falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 1000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of HNB-HNB-GW sessions on IuH interface across all HNB-GW services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of HNB-HNB-GW sessions on IuH interface based on the following rules:

- **Enter condition:** Actual total number of HNB-HNB-GW sessions on IuH interface is greater than the high threshold.
- **Clear condition:** Actual total number of HNB-HNB-GW sessions on IuH interfaces is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll total-hnbgw-hnb-sessions** command to configure the polling interval and the **threshold monitoring hnbgw-service** command to enable thresholding for this value.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshTotalHNBGWHnbSess** command in this mode.

Example

The following command configures the total number of HNB-GW-HNB sessions on IuH interfaces to a high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-hnbgw-hnb-sessions 10000
```

threshold total-hnbgw-iu-sessions

Configures alarm or alert thresholds for the total number of subscriber sessions towards the Core Networks (CN) across all HNB-GW services over Iu interfaces (Iu-CS/Iu-PS interface) on a system.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-hnbgw-iu-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold for the total number of subscriber sessions towards CN across all HNB-GW services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 3000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold for the total number of subscriber sessions towards CN across all services on a system that maintains a previously generated alarm condition. If the number of subscriber sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 3000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of subscriber sessions towards CN across all HNB-GW services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of subscriber sessions towards CN across all HNB-GW service on a system based on the following rules:

- **Enter condition:** Actual total number of subscriber sessions across all HNB-GW service on a system is greater than the high threshold.
- **Clear condition:** Actual total number of subscriber sessions across all HNB-GW service on a system is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll total-hnbgw-iu-sessions** command to configure the polling interval and the **threshold monitoring hnbgw-service** command to enable thresholding for this value.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshTotalHNBGWIuSess** command in this mode.

Example

The following command configures the total number of subscriber sessions towards CN across all HNB-GW services to a high threshold count of *30000* for a system using the Alert thresholding model:

```
threshold total-hnbgw-iu-sessions 30000
```

threshold total-hnbgw-ue-sessions

Configures alarm or alert thresholds for the total number of UEs connected to an HNB-GW service across all the HNB-GW services in the system.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-hnbgw-ue-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold for the total number of UEs connected across all HNB-GW services on a system that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold for the total number of UEs connected to HNB-GW service across all HNB-GW services that maintains a previously generated alarm condition. If the number of UE sessions across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of UEs connected to HNB-GW service across all HNB-GW services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of UEs connected across all HNB-GW service on a system based on the following rules:

- **Enter condition:** Actual total number of UEs connected to HNB-GW service across all HNB-GW services on a system is greater than the high threshold.
- **Clear condition:** Actual total number of UEs connected to HNB-GW service across all HNB-GW services on a system is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll total-hnbgw-ue-sessions** command to configure the polling interval and the **threshold monitoring hnbgw-service** command to enable thresholding for this value.

Important: To enable an SNMP trap for monitoring this threshold use the **snmp trap enable ThreshTotalHNBGWUeSess** command in this mode.

Example

The following command configures the total number of UEs connected to HNB-GW service across all HNB-GW services to a high threshold count of *40000* for a system using the Alert thresholding model:

```
threshold total-hnbgw-ue-sessions 40000
```

threshold total-hsgw-sessions

Configures alarm or alert thresholds for the total number of HRPD Serving Gateway (HSGW) sessions across all services in the system.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold total-hsgw-sessions` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`high_thresh`

Default: 0
Specifies the high threshold for the number of HSGW sessions for all HSGW services that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` is an integer from 1 through 2500000. A value of 0 disables the threshold.

`clear` *`low_thresh`*

Default: 0
Specifies the low threshold for the number of HSGW sessions for all HSGW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` is an integer from 0 and 2500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of HSGW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for HSGW sessions based on the following rules:

- **Enter condition:** Actual total number of HSGW sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of HSGW sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **`threshold poll`** command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a total number of HSGW sessions high threshold count of *500000* for a system using the Alert thresholding model:

```
threshold total-hsgw-sessions 500000
```

threshold total-lma-sessions

Configures alarm or alert thresholds for the total number of Local Mobility Anchor (LMA) sessions across all services in the system.

Platform

ASR 5000

Product

P-GW

Privilege

Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold total-lma-sessions` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`high_thresh`

Default: 0
Specifies the high threshold number of LMA sessions for all LMA services that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` is an integer from 1 through 1500000. A value of 0 disables the threshold.

`clear` *`low_thresh`*

Default: 0
Specifies the low threshold number of LMA sessions for all LMA services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` is an integer from 0 through 1500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of LMA sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for LMA sessions based on the following rules:

- **Enter condition:** Actual total number of LMA sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of LMA sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **`threshold poll`** command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a total number of LMA sessions high threshold count of *500000* for a system using the Alert thresholding model:

```
threshold total-lma-sessions 500000
```

threshold total-lns-sessions

Configures alarm or alert thresholds for the total number of L2TP Network Server (LNS) sessions in the system.

Platform

ASR 5000

Product

PDSN

GGSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-lns-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of total LNS sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer value from 0 through 4000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of total LNS sessions that maintains a previously generated alarm condition. If the number of LNS sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of LNS sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of LNS sessions based on the following rules:

- **Enter condition:** Actual total number of LNS sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of LNS sessions is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total LNS session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-lns-sessions 10000
```

threshold total-mme-sessions

Configures alarm or alert thresholds for the total number of Mobility Management Entity (MME) sessions across all the MME services in the system.

Platform

ASR 5000

Product

MME

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-mme-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0 (Disabled)
Specifies the high threshold number of total MME sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer value from 0 through 2500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0 (Disabled)
Specifies the low threshold number of total MME sessions that maintains a previously generated alarm condition. If the number of MME sessions, across all the services in a system, falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 2500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to monitor and set alarms or alerts when the total number of MME sessions across all the MME services in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of MME sessions based on the following rules:

- **Enter condition:** Actual total number of MME sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of MME sessions is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll total-mme-sessions** command to configure the polling interval and the **threshold monitoring mme-service** command to enable thresholding for this value.

Example

The following command configures a total MME session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-mme-sessions 10000
```

threshold total-pdsn-sessions

Configures alarm or alert thresholds for the total number of Packet Data Serving Node (PDSN) sessions in the system.

Platform

ASR 5000

Product

PDSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-pdsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of total PDSN sessions that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 2500000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of total PDSN sessions that maintains a previously generated alarm condition. If the number of PDSN sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 and 2500000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of PDSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for the total number of PDSN sessions based on the following rules:

- **Enter condition:** Actual total number of PDSN sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of PDSN sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total PDSN session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-pdsn-sessions 10000
```

threshold total-pgw-sessions

Configures alarm or alert thresholds for the total number of Packet Data Network Gateway (P-GW) sessions across all services in the system.

Platform

ASR 5000

Product

P-GW

Privilege

Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold total-pgw-sessions` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`high_thresh`

Default: 0
Specifies the high threshold number of P-GW sessions for all P-GW services that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` is an integer from 1 through 3000000. A value of 0 disables the threshold.

`clear` *`low_thresh`*

Default: 0
Specifies the low threshold number of P-GW sessions for all P-GW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` is an integer from 0 through 3000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of P-GW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for P-GW sessions based on the following rules:

- **Enter condition:** Actual total number of P-GW sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of P-GW sessions is less than the low threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **`threshold poll`** command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a total number of P-GW sessions high threshold count of *500000* for a system using the Alert thresholding model:

```
threshold total-pgw-sessions 500000
```

threshold total-sgsn-pdp-sessions

Configures alarm or alert thresholds for the total number of PDP contexts for all Serving GPRS Support Node (SGSN) sessions in the system.

Platform

ASR 5000

Product

SGSN

Privilege

Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold total-sgsn-pdp-sessions` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`high_thresh`

Default: 0
Specifies the high threshold number of total PDP contexts per SGSN session for all SGSN services that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` is an integer from 1 through 4000000. A value of 0 disables the threshold.

`clear` *`low_thresh`*

Default: 0
Specifies the low threshold number of total PDP contexts per SGSN session for all SGSN services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` is an integer from 0 through 4000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of SGSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for SGSN sessions based on the following rules:

- **Enter condition:** Actual total number of PDP contexts is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of PDP contexts is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **`threshold poll`** command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a total number of PDP contexts per SGSN session high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-sgsn-pdp-sessions 10000
```

threshold total-sgsn-sessions

Configures alarm or alert thresholds for the total number of SGSN sessions in the system.

Platform

ASR 5000

Product

SGSN

Privilege

Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold total-sgsn-sessions *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 0
Specifies the high threshold number of total SGSN sessions for all SGSN services that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 1 through 2000000. A value of 0 disables the threshold.

clear *low_thresh*

Default: 0
Specifies the low threshold number of total SGSN sessions for all SGSN services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
low_thresh is an integer from 0 through 2000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of SGSN sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for SGSN sessions based on the following rules:

- **Enter condition:** Actual total number of SGSN sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of SGSN sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command to configure the polling interval and the **threshold monitoring** command to enable thresholding for this value.

Example

The following command configures a total number of SGSN sessions high threshold count of *10000* for a system using the Alert thresholding model:

```
threshold total-sgsn-sessions 10000
```

threshold total-sgw-sessions

Configures alarm or alert thresholds for the total number of Serving Gateway (S-GW) sessions across all services in the system.

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration

`configure`

Syntax

`threshold total-sgw-sessions` *`high_thresh`* **`[ clear`** *`low_thresh`* **`]`**

`high_thresh`

Default: 0
Specifies the high threshold number of S-GW sessions for all S-GW services that must be met or exceeded within the polling interval to generate an alert or alarm.
`high_thresh` is an integer from 1 through 3000000. A value of 0 disables the threshold.

`clear` *`low_thresh`*

Default: 0
Specifies the low threshold number of S-GW sessions for all S-GW services that maintains a previously generated alarm condition. If the number of sessions falls beneath the low threshold within the polling interval, a clear alarm will be generated.
`low_thresh` is an integer from 0 through 3000000. A value of 0 disables the threshold.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Monitor and set alarms or alerts when the total number of S-GW sessions in the system is equal to or greater than the set limit.
Alerts or alarms are triggered for S-GW sessions based on the following rules:

- **Enter condition:** Actual total number of S-GW sessions is greater than or equal to the high threshold.
- **Clear condition:** Actual total number of S-GW sessions is less than the low threshold.

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **`threshold poll`** command to configure the polling interval and the **`threshold monitoring`** command to enable thresholding for this value.

Example

The following command configures a total number of S-GW sessions high threshold count of *500000* for a system using the Alert thresholding model:

```
threshold total-sgw-sessions 500000
```

threshold tpo-dns-failure

Configures alarm or alert thresholds for monitoring Traffic Performance Optimization (TPO) DNS resolution failures.

Platform

ASR 5000

Product

TPO

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold tpo-dns-failure *high_thresh* **[clear** *low_thresh* **]**

default threshold tpo-dns-failure

default

Configures this command with the default threshold setting.
Default: 0—disabled

high_thresh

Specifies that if in a polling interval the number of TPO DNS failures experienced by the system meets or exceeds *high_thresh* an alert or alarm should be generated.
high_thresh is an integer from 0 through 10000.
Default: 0

clear *low_thresh*

Specifies that if, within the polling interval, the number of TPO DNS failures experienced by the system falls below *low_thresh* a clear alarm should be generated.
low_thresh is an integer from 0 through 10000.
Default: 0

Usage

Use this command to configure thresholds for monitoring TPO DNS resolution failures.

threshold tpo-low-compression-gain

Configures alarm or alert thresholds for monitoring TPO low compression gain comparison results.

Platform

ASR 5000

Product

TPO

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold tpo-low-compression-gain *high_thresh* **[clear** *low_thresh* **]**

default threshold tpo-low-compression-gain

default

Configures this command with the default threshold setting.
Default: 0—disabled

high_thresh

Specifies that if in a polling interval the number of TPO low-compression-gain comparison results experienced by the system meets or exceeds *high_thresh* an alert or alarm is generated.
high_thresh is an integer from 0 through 100000.
Default: 0

clear *low_thresh*

Specifies that if, within the polling interval, the number of TPO low-compression-gain comparison results experienced by the system falls below *low_thresh* a clear alarm is generated.
low_thresh is an integer from 0 through 100000.
Default: 0

Usage

Use this command to configure thresholds for monitoring TPO low compression gain results.

threshold tpo-rto-timeout

Configures alarm or alert thresholds for monitoring TPO retransmission timeouts (RTOs).

Platform

ASR 5000

Product

TPO

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

threshold tpo-rto-timeout *high_thresh* **[clear** *low_thresh* **]**

default threshold tpo-rto-timeout

default

Configures this command with the default threshold setting.
Default: 0—disabled

high_thresh

Specifies that if in a polling interval the number of TPO RTOs experienced by the system meets or exceeds *high_thresh* an alert or alarm should be generated.
high_thresh is an integer from 0 through 5000000.
Default: 0

clear *low_thresh*

Specifies that if, within the polling interval, the number of TPO RTOs experienced by the system falls below *low_thresh* a clear alarm should be generated.
low_thresh is an integer from 0 through 5000000.
Default: 0

Usage

Use this command to configure thresholds for monitoring TPO DNS resolution failures.

timestamps

Enables or disables the generation of a timestamp in response to each commands entered. The timestamp does not appear in any logs as it is a CLI output only. This command affects all future CLI sessions. Use the **timestamps** command in the Exec Mode to change the behavior for the current CLI session only.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

timestamps

no timestamps

no

Disables generation of timestamps for each command entered. When omitted, the output of a timestamp for each entered command is enabled.

Usage

Enable the timestamps when logging a CLI session on a remote terminal such that each command will have a line of text indicating the time when the command was entered.

Example

timestamps

no timestamps

upgrade limit

Configures upgrade session limits that trigger when the system may execute the software upgrade.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

upgrade limit [time *session_life* **] [usage** *session_num* **]**

upgrade limit

This command issued with no keywords sets all parameters to their defaults.

time *session_life*

Default: 120
Defines the maximum number of minutes that a session may exist on the system undergoing a software upgrade, before it is terminated by the system. As individual user sessions reach this lifetime limit, the system terminates the individual session(s). *session_life* must be an integer ranging from 1 through 1440.

usage *session_num*

Default: 100
This keyword defines a low threshold limit of sessions running either on a packet processing card or system-wide. When a software upgrade is invoked, this parameter applies to the entire system.
When the threshold is crossed (when the number of sessions on the packet processing card or system is less than this value), the remaining sessions on the card or system are terminated allowing the upgrade to begin. The remaining sessions on the packet processing card or system are terminated regardless of their session life.
session_num must be an integer from 0 through 6000.

Usage

Use this command to configure upgrade session limits that trigger the system to begin executing the software upgrade.

Important: This command is not supported on all platforms.

Important: Software Patch Upgrades are not supported in this release.

Example

The following command sets the number of minutes a session can exist to *200*, and the minimum number of sessions that may exist before terminating them to *50*:

```
upgrade limit time 200 usage 50
```

url-blacklisting database

This command configures URL Blacklisting database directory parameters.

Platform

ASR 5000

Product

CF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration

configure

Syntax

url-blacklisting database { directory path *path* **| max-versions** *max_versions* **| override file** *file_name* **}**

default url-blacklisting database { directory path | max-versions | override file }

default

Configures this command with the default settings.

directory path *path*

Specifies the path to the directory to be used for storing URL Blacklisting databases.
path must be an alphanumeric string of 1 through 255 characters.
Default: /flash/bl

max-versions *max_versions*

Specifies the maximum number of URL Blacklisting database versions to be maintained in the URL Blacklisting database directory path with the base file name specified by the URL Blacklisting database override file.
max_versions must be an integer from 0 through 3.
Default: 0

override file *file_name*

Specifies the URL Blacklisting database override file name.
file_name must be in *name.extension* format. For example, *abc.bin*. And, must be an alphanumeric string of 1 through 10 characters.
Default: optblk.bin

Usage

Use this command to configure URL Blacklisting database directory parameters.

Example

The following command configures the maximum number of URL Blacklisting database versions to be maintained to *3*:

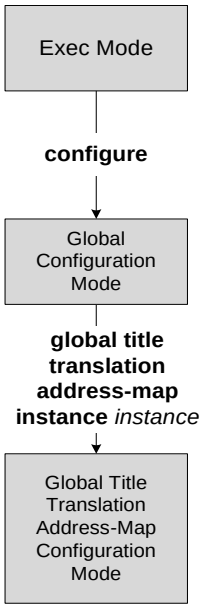
```
url-blacklisting database max-versions 3
```

Chapter 130
Global Title Translation Address-Map Configuration Mode Commands

The Global Title Translation (GTT) Address-Map configuration mode provides the commands to create, configure, and manage a specific GTT address map database.

Upon accessing this mode, your prompt should look similar to the following:

```
[local] <hostname> (config-gtt-assoc-<instance#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

This command associates (links) the global title translation (GTT) address-map with a specific GTT association, which includes the translation action rules.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Global Title Translation Address-Map Configuration

configure > global title translation address-map instance *instance_number*

Syntax

associate gtt-association *assoc_num* **action id** *id*

no association

no

Removes the association definition from the GTT address-map configuration.

gtt-association *assoc_num*

Identifies a specific GTT association to link (associate) with the GTT address-map.
assoc_num: Must be an integer from 1 to 16.

action id *id*

Identifies a specific action defined in the GTT association database configuration.
id: Must be an integer from 1 to 8.

Usage

Create an association between a specific translation action rule in a specific GTT association and this GTT address-map.

Example

associate gtt-association *1* **action id** *1*

description

This command defines a descriptive string to facilitate identification of this particular global title translation (GTT) address-map. This is used for operator reference only.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Global Title Translation Address-Map Configuration

`configure > global title translation address-map instance` *`instance_number`*

Syntax

`description` *`string`*

`no description`

`no`

Removes the description string from the current global title translation address-map configuration.

`string`

Specifies the alphanumeric string that is stored. must be from 1 through 127 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

Usage

Use this command to set a description for reference by operators.

Example

`description` *`"GTT for Finnish national carrier."`*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

gt-address

Configures the SCCP global title address.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Global Title Translation Address-Map Configuration

configure > global title translation address-map instance *instance_number*

Syntax

gt-address *gt_address*

no gt-address

no

Removes the GT address from the GTT address-map configuration.

gt_address

Up to 15 digits.

Usage

Define the SCCP short address.

Example

gt-address *01040552873424*

mode

Configures the mode of operation of the SCCP entities.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Global Title Translation Address-Map Configuration

configure > global title translation address-map instance *instance_number*

Syntax

mode [dominant | loadshare]

dominant

This instructs the system to maintain the associated entity as the primary traffic pipe.

loadshare

This instructs the system to distribute the traffic load.

Usage

This command configure load balance for the system.

Example

mode loadshare

out-address

Identifies the out-going address of the SCCP entity. After this command is completed, the system enters the Out-Address configuration mode. Refer to the Out-Address Configuration Mode chapter for information about commands to define the out-address.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Global Title Translation Address-Map Configuration

`configure > global title translation address-map instance` *`instance_number`*

Syntax

`out-address` *`name`*

`no out-address`

`no`

Removes the **`out-address`** definition from the GSS address-map configuration.

`name`

Defines a unique string to identify the out-going address using 1 to 63 alphanumeric characters.

Usage

Use this command to identify the address of the SCCP in the GTT configuration. This command also provides access to the Out-Address configuration mode so that the parameters for the out-going SCCP can be configured and maintained.

Example

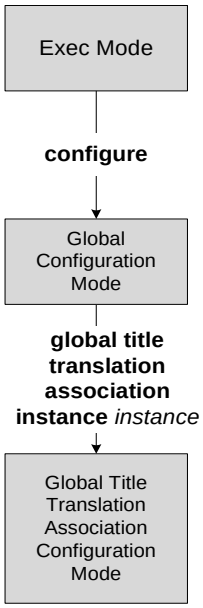
`out-address` *`SCCP_London`*

Chapter 131
Global Title Translation Association Configuration Mode Commands

The Global Title Translation (GTT) Association configuration mode provides the commands to create the rules for translating the global titles (destination point codes and subsystem address in the messages) used for routing at the SCCP layer.

Upon accessing this mode, your prompt should look similar to the following:

```
[local] <hostname> (config-gtt-addrmap-<instance#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action

This command configures the actions that determine the operation of rules of the global title translation (GTT).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Global Title Translation Association Configuration

configure > global title translation association instance *instance_number*

Syntax

action id *id* **type** *action_type* **start-digit** *value* **end-digit** *value*

no action id *id*

---

id

id uniquely identifies an action. The id must be an integer from 1 to 15.

---

type *action_type*

The following defines the action rules that will determine how global titles (GT) are translated to locally understood addresses - in most cases point codes (PC). The command can be re-issued multiple times to define multiple action rules.

- **constant:** Defines the starting digit in the range of digits in the incoming global titles that are translated to fixed addresses.
- **fixed:** Defines the starting digit in a fixed range of digits used for performing GTT.
- **gt-to-pc:** Use these digits as first of range of global title digits in incoming message to convert to point code for routing.
- insert-pc: Defines the rule for inserting destination point code before the incoming GTAI and change TT, ES and NAI. Use digits of incoming message global title digits as pc for routing.
- **selins**: Selective insertion type to perform GTT.
- **strip-pc:** Strip first 6 digits from GTAI if first 6 dgts in stripped point code are in INT format.
- **var-asc**: Use a varaible number of digits, in ascending order, to perform GTT.
- **var-des:** Use a variable number of digits. in descending order. to perform GTT.

---

start-digit *value*

value must be an integer from 0 to 255.

---

end-digit *value*

value must be an integer from 0 to 255.

Usage

Use this command to create GTT association rules. Rules can be based on ranges of digits or modified ranges depending upon the action types included in the commands.

Example

Use the following command to create a global title translation rule that bases the translation on a fixed range of digits starting at 23 and ending at 122:

```
action id 1 type fixed start-digit 23 end-digit 122
```

description

This command defines a descriptive string to facilitate identification of this particular global title translation (GTT) association. This is used for operator reference only.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Global Title Translation Association Configuration

configure > global title translation association instance *instance_number*

Syntax

description *string*

no description

string

Specifies the alphanumeric string that is stored. must be from 1 through 127 alphanumeric characters. Strings with spaces must be enclosed in double-quotes. See the example below.

no

Removes the description string from the current global title translation association configuration.

Usage

Use this command to set a description for reference by operators.

Example

The following command sets the description to identify a routing domain for messages transmitted within a national boundary.

```
description "GTT database 2"
```

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

gt-format

This command creates an instance of a global title formatting that is applied to the database in the process of address translation. Once the command is completed, the system enters global title (GT) format database configuration mode. The commands for configuration can be found in the GT Format Configuration Mode chapter in this reference guide.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Global Title Translation Association Configuration

`configure > global title translation association instance` *`instance_number`*

Syntax

`gt-format` *`format_num`*

`format_num`

- 1: Selects GT-format 1 options which include **`nature-of-address`** and **`odd/even.`** Once selected, the system enters GT-Format1 configuration mode.
- 2: Selects GT-format2 options which include **`translation-type`**. Once selected, the system enters GT-Format2 configuration mode.
- 3: Selects GT-format3 options which include **`encoding-scheme`**, **`numbering-plan,`** and **`translation-type`**. Once selected, the system enters GT-Format3 configuration mode.
- 4: Selects GT-format4 options which include **`encoding-scheme`**, **`nature-of-address,`** **`numbering-plan,`** and **`translation-type`**. Once selected, the system enters GT-Format4 configuration mode.

Usage

Selects GT format #2 for the database GTT process.

Example

Use this command to associate the GT format for GTT:

```
gt-format 2
```

variant

This command configures the choice of national standard protocols to associate with the GTT process databases.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Global Title Translation Association Configuration

configure > global title translation association instance *instance_number*

Syntax

variant *type*

default

Sets the **variant** configuration to **itu**.

type

The following network variant national standards-based protocols are possible:

- **ansi**
- **china**
- **itu**
- **japan**

Usage

Use this command to select the national standard protocols to associate with the GTT process database.

Example

The following command sets the variant to *ansi*:

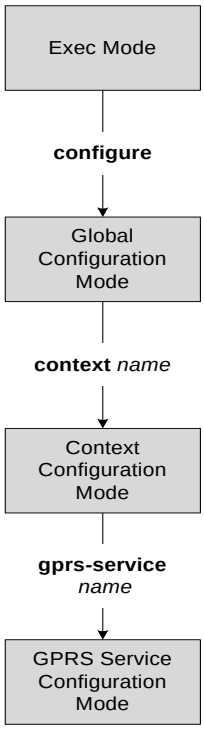
variant *ansi*

Chapter 132
GPRS Service Configuration Mode Commands

The GPRS Service Configuration Mode is used within the context configuration mode to define the criteria the SGSN needs to operate within a GPRS network. The GPRS Service works with other services, such as SGSN GPRS Tunneling Protocol (see SGTP Service Configuration Mode Commands) and Mobile Application Part (see MAP Service Configuration Mode Commands), to handle communication parameters required to work with other network entities such as the base station subsystem (BSS).

The prompt for this mode appears as:

```
[context_name]hostname(config-gprs-service)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

accounting

Defines the accounting context name and enables/disables specific types of CDR generation for the accounting in the GPRS service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

accounting { cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } }+ | context *cntx_name* **}**

default accounting cdr-types

no accounting (cdr-types | context }

---

default

Returns the system to default CDR generation which includes:

- M-CDR
- S-CDR
- SMS CDRs

---

no

Disables all CDR types.

---

cdr-types { mcdr | scdr | sms { mo-cdr | mt-cdr } }

Default: all types enabled.
Defines the types of CDRs to be generated within the specified GPRS service for accounting:

- **mcdr:** Enables generation of M-CDRs.
- **scdr:** Enables generation of S-CDRs.
- **sms:** Enables generation of SMS-type CDRs based on one of the following:
  - **mo-cdr:** SMS CDRs originates from the mobile.
  - **mt-cdr:** SMS CDRs terminates at the mobile.

+

This symbol indicates that more than one keyword can be used and repeated. This enables you to include more than one type of CDR selection in a single command.

context *cntx_name*

Specifies an accounting context to be associated with the GPRS service.
cntx_name: Define a string of 1 to 79 alphanumeric characters.

Usage

Use this command to define the type of CDRs to generate for GPRS service. By default all types of CDRs are generated. Note that change of this configuration will be applied to new calls and/or to new PDP contexts only.
By default, the generation of all CDR types is enabled.

Example

The following command configures the system to generate only M-CDRs for accounting in the current GPRS service:

```
accounting cdr-types mcdr
```

admin-disconnect-behavior

This command defines some of the actions the SGSN will take during an Admin-Disconnect procedure.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

admin-disconnect-behavior { clear-subscription | detach-type { reattach-not-required | reattach-required } }

default admin-disconnect-behavior { clear-subscription | detach-type }

clear-subscription

Including this keyword in the configuration instructs the SGSN to clear subscriber contexts and the subscription data database whenever the **clear subscribers all** command is issued (from the Exec mode) for attached subscribers. As well, the SGSN will issue an appropriate Map-Purge-MS-Req to the HLR if needed.
Default: disabled

detach-type

Including this keyword defines which type of detach instruction to include in the Detach-Request message during an Admin-Disconnect procedure. One of the following options must be included when this command is entered:

- **reattach-not-required**
- **reattach-required**

Default: reattach-required

default

Including the **default** keyword in the command, instructs the SGSN to use the default value for the specified parameter.

no

Returns the SGSN to the default where this clear function is disabled

Usage

Using he **clear subscribers all** command (in the Exec Mode) will clear subscriber contexts and the subscription data database, and if needed, issue an appropriate Map-Purge-MS-Req to the HLR.

Include the **clear-subscription** keyword with this command configuration to ensure that more than attached MM-context and active PDP-contexts are cleared when the clear **subscribers all** command is issued for attached subscribers.
To clear subscription data for detached subscribers, refer to the **sgsn clear-detached-subscriptions** command described in the *Exec* mode chapter.
Including the **detach-type** keyword with this command instructs the SGSN to include either a 'reattach-required' or a 'reattach-no-required' instruction in the Detach-Request message.

Example

Enable the clearing function so that subscription data is cleared from the HLR database:

```
admin-disconnect-behavior clear-subscription
```

associate-dscp-template

Identifies a DSCP template to be associated with the GPRS service.

Important: This command can be used before the associated DSCP template instance is created and configured but care should be used to match the template names.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

associate-dscp-template downlink *template_name*

no associate-dscp-template downlink

no

Removes the template association definition from the configuration.

template_name

Specifies a unique DSCP template to associate with this GPRS service.
template_name must be a string of 1 to 64 alphanumeric characters with dots (.), dashes (-), and forward slashes (/) but with no spaces.

Usage

Use this command to associate DSCP templates with this GPRS service. A single template can be associated with multiple GPRS services.

Related commands:

- The dscp-template command in the SGSN Global configuration mode creates / deletes an instance of a template. This command also provides access to the mode containing all the configuration commands used to define DSCP settings for the control packets for the Iu interface and the control and data packets for the Gb interface (see the *DSCP Template Configuration Mode Commands* section).
- To check the list of DSCP templates configured, use the **show sgsn-mode** command documented in the *Exec Mode Commands* section.

Example

The following command associates the template with DSCP settings for traffic going through one of the SGSNs located in Paris mobile network:

associate-dscp-template *dscp-template-paris3*

associate-service

Identifies services to be associated with the GPRS Service.

Important: This command can be used before the associated service instance is created and configured but care should be used to match the service names.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

[no] associate-service { gs *name* **| map** *name* **| sgtp** *name* **} [context** *ctxt_name* **]**

no

Removes the service association definition from the configuration.

gs *name*

Specifies the Gs service configuration to associate with this GPRS service.
name must be a string of 1 to 63 alphanumeric characters with no spaces.

map *name*

Specifies the MAP service configuration to associate with this GPRS service.
name must be a string of 1 to 63 alphanumeric characters with no spaces.

sgtp *name*

Specifies the SGTP service configuration to associate with this GPRS service.
name must be a string of 1 to 63 alpha numeric characters with no spaces.

context *ctxt_name*

Defines the context in which the service was created.
ctxt_name must be a string of 1 to 63 alphanumeric characters with no spaces.

Usage

Use this command to associate other services, that have been or will be configured, to this GPRS service.

Example

The following command associates Gs service *gs1* with this GPRS service.

associate-service gs *gs1* **context** *sgsn2*

cc profile

Configures the charging characteristic (CC) profile index properties.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

[no] cc profile *index* **{ buckets** *number* **| interval** *time* **| tariff time1** *mins hours* **[time2** *mins hours* **[time3** *mins hours* **[time4** *mins hours* **]]] | volume { downlink** *octets* **uplink** *octets* **| total** *octets* **} }**

default cc profile *index*

no

Removes the a specific charging characteristics configuration definition.

default

Resets the charging characteristics to system defaults.

index

Configures a profile index for the parameter to be specified. index can be configured to any integer value from 0 to 15.

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

buckets *number*

Default: 4
Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before an accounting record should be closed.
number can be configured to any integer value from 1 through 4.

interval *time*

time is measured in seconds and can be configured to any integer value from 60 to 40,000,000.

tariff time1 *mins hours* **time2** *mins hours* **time3** *mins hours* **time4** *mins hours*

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Six different tariff times may be specified. If less than six times are required, the same time can be specified multiple times.

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: The minutes of the hour, an integer value from 0 to 59.
- *hours*: The hour of the day, an integer value from 0 to 23.

volume { downlink *vol_down_octets* **uplink** *vol_up_octets* **| total** *total_octets* **}**

Specifies the downlink, uplink, and total volumes that must be met before closing a CDR.
vol_down_octets : Measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.
vol_up_octets : Measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.
total_octets : The total traffic volume (up and downlink) measured in octets; can be configured to any integer value from 100,000 to 4,000,000,000.

Usage

Charging characteristics consist of a profile index and behavior settings. This command configures profile indexes for the SGSN's charging characteristics. The SGSN supports up to 16 profile indexes.
This command works in conjunction with the cc-sgsn command located in the APN configuration mode that dictates which CCs should be used for subscriber PDP contexts.

Example

The following command configures a profile index of 10 for tariff times of 7:00 AM and 7:30 PM:

```
cc profile 10 tariff time1 0 7 time2 30 19
```

check-imei

This command configures the action the SGSN will take if the route towards the EIR is down.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

check-imei { gf-failure-action | gf-timeout-action } { continue | reject }

default check-imei { gf-failure-action | gf-timeout-action }

default

Resets the default function to reject the Attach.

gf-failure-action

Coupled with either **continue** or **reject**, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and if the EIR is temporarily unreachable due to associated DPC/SSN inaccessible/out-of-service.

gf-timeout-action

Coupled with either **continue** or **reject**, this keyword instructs the SGSN to take action if a valid EIR configuration exists under the MAP service and the route to the EIR is available, but no response is received from the EIR.

continue

Instructs the SGSN to continue the Attach process.

reject

Instructs the SGSN to reject the Attach process.

Usage

Typically, the Attach process will be continued when there is an IMEI check timeout based on the configuration under the SGSN service configuration and/or the GPRS service configuration. But this works only if the route towards the EIR is UP and the IMEI request timer expires. This command configures the SGSN to allow the Attach process to continue in the case the route towards the EIR is down, that is the DPC / SSN is out-of-service.

Example

Use the following command to reset the default and reject Attach:

```
default check-imei gf-failure-action
```

check-imei-timeout-action

This command has been deprecated.

ciphering-algorithm

This command configures the priority, ordering, for the use of the GPRS encryption ciphering algorithms.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

ciphering-algorithm { negotiation-failure-action { reject [failure-code *cause_code* **] | use-geo0 } priority** *priority [algorithm]* **}**

default ciphering-algorithm priority *priority*

default

Returns the system ciphering-algorithm priority to the default of GEA0 - which means that no ciphering will be done.

negotiation-failure-action { reject [failure-code *cause_code* **] | use-geo0 }**

This set of keywords configure the SGSN's action if there is not a match between the MS and SGSN ciphering algorithm configurations.

- **reject**: Instructs the SGSN to reject a call when the ciphering algorithms do not match.
- **failure-code** *cause_code*: Instructs the SGSN to include a GMM cause code in the Reject message. Enter an integer from 2 to 111; default code is 14 (GPRS services not allowed in this PLMN). Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):
  - 2 - IMSI unknown in HLR
  - 3 - Illegal MS
  - 6 - Illegal ME
  - 7 - GPRS services not allowed
  - 8 - GPRS services and non-GPRS services not allowed
  - 9 - MSID cannot be derived by the network
  - 10 - Implicitly detached
  - 11 - PLMN not allowed
  - 12 - Location Area not allowed
  - 13 - Roaming not allowed in this location area
  - 14 - GPRS services not allowed in this PLMN

- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

- **use-geo0**: Instructs the SGSN to honor the Attach/RAU Request without ciphering (geo0). This is the default action for negotiation failure.

---

priority *priority algorithm*

Defines the priority, order of use, for the ciphering algorithm.
priority: Must be an integer from 1 to 4.

---

algorithm

Identifies the algorithm to be matched to the priority. Options include:

- gea0 - No ciphering
- gea1 - GPRS Encryption Algorithm - GEA1
- gea2 - GPRS Encryption Algorithm - GEA2
- gea3 - GPRS Encryption Algorithm - GEA3

Usage

Use this command to specify the order (priority) of usage for the GPRS encryption algorithms. All of the GPRS encapsulation algorithms use a 64-bit key derived from a common mechanism: the mobile receives a random challenge, then the SIM calculates an authentication signature and an encryption key.
Also use this command to define the action to be taken if there is not a match between the MS and the SGSN ciphering algorithm configurations.

Example

The following command sets no ciphering to be used after two encryption algorithms have been used:

```
ciphering-algorithm priority 3 gea0
```

The following command configures the SGSN to reject calls if the ciphering algorithm configurations don't match:

```
ciphering-algorithm negotiation-failure-action reject
```

dns israu-mcc-mnc-encoding

Configures either decimal or hexadecimal format for the MCC and MNC values in the DNS query.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

dns israu-mcc-mnc-encoding { decimal | hexidecimal }

default dns israu-mcc-mnc-encoding

default

Resets the SGSN to send the MCC and MNC values in decimal format for DNS queries.

decimal

Default.
Instructs the SGSN to send the MCC and MNC in decimal format in the DNS query.

hexadecimal

Instructs the SGSN to send the MCC and MNC in hexadecimal format in the DNS query.

Usage

Use this command to determine the type of encoding for the MCC and MNC to be included in the DNS query. For example:
In decimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc310.mcc722.gprs
```

In hexadecimal, the MNC/MCC in a DNS query would appear like:

```
rac0017.lac42e3.mnc0136.mcc02d2.gprs
```

Example

Use hexadecimal values for the MCC/MNC in the DNS query.

```
dns israu-mcc-mnc-encoding hexadecimal
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the context configuration mode.

gmm

gmm actually provides a set of commands used to define the GPRS mobility management parameters for the SGSN service.

Important: The **gmm** commands can be repeated as needed to set each timer.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

gmm { accept-procedure [new-tlli | old-tlli] | attach ptmsi-signature-mismatch send-reject failure-code *cause_code* **| ciph-gmm-msg-from-unknown-ms { detach | ignore } | mobile-reachable-timeout** *mins* **| negotiate-t3314-timeout** *secs* **| purge-timeout** *mins* **| T3302-timeout** *mins* **| T3312-timeout** *mins* **| T3313-timeout** *secs* **| T3350-timeout** *secs* **| T3360-timeout** *secs* **| T3370-timeout** *secs* **| trau-timeout***secs* **}**

default gmm { attach ptmsi-signature-mismatch | ciph-gmm-msg-from-unknown-ms | mobile-reachable-timeout | negotiate-t3314-timeout | purge-timeout | T3302-timeout | T3312-timeout | T3313-timeout | T3350-timeout | T3360-timeout | T3370-timeout | trau-timeout }

no gmm negotiate-t3314-timeout

default

Disables the specified function or resets the specified timer to system defaults.

no

Removes the specified GMM definition from the configuration.

accept-procedure [new-tlli | old-tlli]

Default: new-tlli
This keyword enables the use of either a new TLLI (temporary logical link identifier) or an old TLLI for attach-accept or RAU-accept messages sent by the SGSN to the MS during related procedures.

attach ptmsi-signature-mismatch send-reject failure-code *cause_code*

Default: disabled

This keyword enables the SGSN to validate the P-TMSI signature, present in the Attach Request, against the PTMSI-SIGNATURE stored at the SGSN. The SGSN then sends an Attach Reject to the MS if the PTMSI-SIGNATURE does not match.
The P-TMSI signature validation functionality only works if the feature is enabled. But even if it is enabled, the feature does not validate in the following situations:

- when the PTMSI-SIGNATURE is absent from the 2G Attach Request.
- if the first subscriber being in DETACHED state or is purged with FREEZE-PTMSI. In both the scenarios PTMSI-SIGNATURE cannot be validated.
- when the 2G subscriber(MS2) attaches with the same P-TMSI and a different P-TMSI_Signature as previously attached 2G subscriber (MS1), both the subscriber profiles are cleared from the system. This is relevant where the old RAI for MS-2 is the same as the current RAI for MS-1.

Optionally, a GMM failure *cause_code* can be configured to include in the Attach Reject if one is sent. Refer to the GMM failure cause codes listed below (information has been taken from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error

- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

ciph-gmm-msg-from-unknown-ms { detach | ignore }

Configures how the SGSN will behave when it receives a ciphered GMM message from an unknown MS.
detach - Instructs the SGSN to send a Detach message to the MS.
ignore - Instructs the SGSN to send an Ignore (drop) message to the MS.
Default: **ignore**

mobile-reachable-timeout *mins*

Default: 58 minutes
Timer value for the mobile reachability timer.
mins must be an integer from 4 to 1440.

negotiate-T3314-timeout *secs*

Set the number of seconds for the T3314-timeout ready timer value. Value sent out from SGSN so MS can negotiate ready timer.
secs must be an integer from 0 to 11160. Default is 44 seconds.

- If the MS does not send the ready timer in the Attach/RAU request, then the SGSN sends this T3314-timeout (ready timer) value.
- If the MS sends the requested value of the ready timer in the Attach/RAU Request, and if the requested value is less than or equal to the value of the negotiate-T3314-timeout timer, then the SGSN sends Att/RAU Accept with the requested T3314 value.
- If the MS sends the requested value of the ready timer in the Attach/RAU Request, and if the requested value is greater than the value of the negotiate-T3314-timeout timer, then the SGSN sends Att/RAU Accept with the negotiate-T3314-timeout value.

Important: This is the only GMM timer that can be disabled by entering **no** at the beginning of the command syntax. **no gmm negotiate-t3314-timeout** By disabling negotiation of the T3314-timeout value, if the MS sends the requested value of the ready timer in the Att/RAU Request, then the SGSN sends the T3314-timeout value in the Att/RAU Accept.

purge-timeout *mins*

Default: 10080 minutes
Value defines the mm-context lifetime in minutes.
mins must be an integer from 1 to 20160.

T3302-timeout *mins*

Default: 12 minutes
Defines the number of minutes for timer to send to MS.
mins is an integer from 1 to 186.

T3312-timeout *min*

Default: 54 minutes
Periodic RAU update timer to send to MS.
mins is an integer from 0 to 186.

T3313-timeout *secs*

Default: 5 seconds
Initial page timeout timer for retransmission for Paging Requests.
secs is an integer from 1 to 60.

T3314-timeout *secs*

Default: 44 seconds
Ready Timer for controlling Cell Update Procedure.
secs must be an integer from 0 to 11519.

T3350-timeout *secs*

Default: 6 seconds
Retransmission timer for Attach Accept/RAU Accept/P-TMSI Realloc Command.
secs must be an integer from 1 to 20.

T3360-timeout*secs*

Default:6 seconds
Retransmission timer for Authentication Request.
secs must be an integer from 1 to 20.

T3370-timeout *secs*

Default:6 seconds
Retransmission timer for Identity Request.
secs must be an integer from 1 to 20.

trau-timeout *secs*

This timer is available in releases 9.0 and higher.
Default: 30
Specifies the number of seconds the “old” 3G SGSN waits to purge the MS’s data. This timer is started by the “old” SGSN after completion of the inter-SGSN RAU.
secs : Must be an integer from 5 to 60.

Usage

Use this command to set GMM timers.

Example

Set the t3370 timer expiration for 15 seconds:

```
gmm t3370-timeout 15
```

llc

Configures the timers that control the data flow for the logical link control (LLC) sub-layer.

Important: This command may be repeated as often as necessary to define the needed timers.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

llc { iov-ui-in-xid-reset | n201u-max { sapi11 *pkt-size* **| sapi3** *pkt-size* **| sapi5** *pkt-size* **| sapi9** *pkt-size* **} | nu-overflow-detection high-watermark** *high_num* **low-watermark** *low_num* **increment-oc| pdu-lifetime** *secs* **| random-value-in-iov-ui | reset-vur | t200 sapi1** *time* **| t200 [sapi11** *time* **| sapi3** *time* **| sapi5** *time* **| sapi7** *time* **| sapi9** *time* **] | uplink-pdu-len-validation }**

default llc { iov-ui-in-xid-reset | n201u-max { sapi11 | sapi3 | sapi5 | sapi9 } | nu-overflow-detection | pdu-lifetime | reset-vur | T200 [sapi1 | sapi11 | sapi3 | sapi5 | sapi7 | sapi9] | uplink-pdu-len-validation }

no llc { iov-ui-in-xid-reset | nu-overflow-detection | reset-vur | uplink-pdu-len-validation }

default

Resets the configuration to the default values.

no

Disables the **uplink-pdu-len-validation** .

iov-ui-in-xid-reset

This keyword makes it possible for the operator to configure whether or not to send IOV-UI in an XID-RESET. This is useful when the MS is not setup to accept IOV-UI (for example, MS sends Attach/RAU Requests with cksn=7) and including IOV-UI in the XID-Reset would result in Attach/RAU failure. Default: Enabled

n201u-max sapi *n pkt_size*

This keyword sets the maximum number of octets, per service access point identifier (SAPI), for the downlink data packets. This is the upper limit that the SGSN will negotiate with the subscriber for packets sent from the SGSN to the BSC.

sapi *n* : Command must identify one of the following SAPI: sapi11, sapi3, sapi5, or sapi9.
pkt_size : Must be an integer from 140 to 1520. Default size is 1520 octets.

---

nu-overflow-detection high-watermark *high_num* **low-watermark** *low_num* **increment-oc**

Enables/disables overflow detection for the N(u) counter and setting overflow high/low thresholds facilitates ciphering synchronization between the MS and SGSN.
high_num: Enter an integer between 1 and 511.
low_num: Enter an integer between 0 and 510.
If the expected value of nu(Vur) is greater than or equal to the configured high-watermark, and the received nu(LFN) is less than or equal to the configured low-watermark, the SGSN increments the overflow counter (VurOC).
The recommended overflow settings are as follows:**llc nu-overflow-detection high-watermark 496 low-watermark 15 increment-oc** While expecting a packet with 496 < nu < 511 and a packet with 0 < nu < 15 is received, overflow is detected and VurOC is incremented.

---

pdu-lifetime *secs*

Defines LLC layer PDU lifetime at the BSC. .
secs must be an integer from 0 to 90.
Default: 6

---

random-value-in-iov-ui

Including this keyword enables the SGSN to negotiate the sending of a random value for the IOV-UI in the XID Request sent to the MS.
If this keyword is not included, then by default the SGSN will send a zero (0) as the value of the IOV-UI in the XID message.

---

reset-vur

Enables/disables the mechanism to reset the Vur value maintained at LLC if the intra RAU request is received with N(U) = 0
Default: Disabled

T200 sapi1 *time*

Sets the retransmission timer (in seconds) for sapi1.
time must be an integer of 1 to 10.
Default: 5

T200 sapi11 *time*

Sets the retransmission timer (in seconds) for sapi11.
time must be an integer of 1 to 50.
Default: 40

T200 sapi3 *time*

Sets the retransmission timer (in seconds) for sapi3.
time must be an integer of 1 to 10.
Default: 5

T200 sapi5 *time*

Sets the retransmission timer (in seconds) for sapi5.

time must be an integer of 1 to 20.
Default: 10

T200 sapi7 *time*

Sets the retransmission timer (in seconds) for sapi7.
time must be an integer of 1 to 40.
Default: 20

T200 sapi9 *time*

Sets the retransmission timer (in seconds) for sapi9.
time must be an integer of 1 to 40.
Default: 20

uplink-pdu-len-validation

Available in releases 8.1 and higher.
This feature enables validation of the size of the uplink LLC packets. With validation enabled, the SGSN will drop any uplinked packets that are larger than the negotiated limit.
If the **no** form of the command is used, then this feature is disabled. The SGSN will be more flexible with uplink packet sizes. So if the SGSN and MS have a mismatch and the MS sends packets that are larger than expected, then the SGSN will not drop the packets.
Default: Enabled.

Usage

Use the command repeatedly to configure additional timers and features for the LLC sub-layer.

Example

Set the T200 retransmission timer to timeout at 12 seconds for SAPI5:

```
llc t200 sapi5 12
```

Use the following command to instruct the SGSN to ignore the N201_U packet size limits for uplink packets from an MS:

```
no uplink-pdu-len-validation
```

nri

This command configures the network resource identifier (NRI) to identify a specific SGSN. The NRI information is stored in the P-TMSI. The SGSN uses a portion of this NRI to set the parameters for Gb flex (SGSN pooling) functionality.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

nri length *nri_length* **{ nri-value** *nri_value* **| null-nri-value** *null_nri_value* **non-broadcast-lac** *lac_id* **rac** *rac_id* **[nri-value** *value* **}**

no nri

length *nri_length*

Specifies the number of bits to be used in the P-TMSI, bits 23 to 18 are used to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length will be of zero length.
nri_length : Must be an integer from 1 to 6 to identify the number of bits.

null-nri-value *null_nri_value*

Configures the null NRI value which must be unique across the pool areas. This keyword is used for the offloading procedure for SGSN pooling (enabled with the **sgsn offloading** command, see the *Exec Mode* chapter).
null_nri_value is an integer from 0 (zero) to 63 used to identify the SGSN to be used for the offloading procedure for SGSN pooling. There is no default value for this parameter.

non-broadcast lac *lac_id* **rac** *rac_id*

Defines the non-broadcast LAC/RAC to be used in combination with the null-NRI for the offloading procedure.
lac_id defines a location area code associated with a BSS. Must be an integer between 1 and 65535.
rac_id defines the remote area code to be associated with a BSS. Must be an integer between 1 and 255.

nri-value *nri_value*

Specifies the MS-assigned value of the NRI to retrieve from the P-TMSI. This value must not exceed the maximum possible value specified by the NRI length. The NRI value must be unique across the pool or across all overlapping pools.
nri_value must be an integer from 1 to 63 to identify a specific SGSN in a pool. Use of 0 (zero) value is not recommended.

Multiple NRI values can be identified by providing multiple nri-values separated by a blank space for example: **nri length** *6* **nri-value** *29 43 61*

Usage

Use this command to add or remove the Gb flex pool configuration for this GPRS service. The command can be repeated to specify different values for any of the keyword parameters. If more than one NRI is configured, the GPRS service will round-robin between the available NRIs when new subscribers (re)connect.

Use this command to retrieve the NRI (identity of an SGSN) stored in in bits 23 to 18 of the packet-temporary mobile subscriber identity (P-TMSI). If more than one NRI value is configured, the GPRS service will round-robin between the available NRIs when new subscribers (re)connect.

Example

The following command specifies the the NRI length as *5* bits, identifies SGSN *23* with LAC *222* and RAC *12* for offloading procedure with NRIs *6* and *41*:

```
nri length 5 null-nri-value 34 non-broadcast lac 222 rac 12 nri-value 6
41
```

paging-policy

Configures the paging parameters for the GPRS service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

paging-policy { last-known-area { all | bsc | cell | location-area | routing-area } + | max-retransmissions *retran_num* **}**

no paging-policy last-known-area { bsc | cell | location-area | routing-area }

default paging-policy { last-known-area | max-retransmissions }

---

no

Disables the paging-policy definition for this GPRS service configuration.

---

default

Resets the defaults for parameters managed by this paging policy.

---

last-known-area

Select one or more paging areas and enter them in preferred paging order:

- **all** : Pages in the last known BSC.
- **bsc** : Pages in last known BSC.
- **cell** : Pages in last known cell.
- **location-area** : Pages in last known location area.
- **routing-area** : Pages in last known routing area.

By default, paging occurs in the following order:
cell, BSC, routing area, location area.

---

max-retransmission *retran_num*

Configures the maximum number of retries for a page request per paging area.
retran_num: Enter an integer from 0 to 5.

- 2 : default.
- 0 : disables retransmission for paging request so that the SGSN only sends a single 2G PS-paging request to the BSC with no retransmissions.

+

Keywords can be repeated or combined as needed to complete the paging policy configuration.

Usage

Use this command to configure the order of preference for retransmitting into specified paging-areas.

Example

Use the following command to instruct the SGSN to page the cell and BSC as the last-known areas :

```
paging-policy last-known-area cell bsc
```

peer-nsei

This command associates a peer (remote) network service entity (NSEI) for a BSS with this GPRS service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

peer-nsei *nse_id* **{lac** *lac_id* **rac** *rac_idpeer_nsei_name* **| pooled }**

no peer-nsei *nse_id* **[associate dscp-template downlink | lac** *lac_id* **rac** *rac_id* **| name | pooled]**

no

Removes the specified configuration from this peer-nsei configuration.

Important: Deleting the LAC/RAC portion of the configuration will probably result in the loss of subscriber connections.

nse_id

Defines a specific peer NSEI configuration for this GPRS service.
nse_id - enter an integer from 0 to 65535.

lac *lac_id*

Defines a location area code associated with the NSE BSS.
lac_id must be an integer between 1 and 65535.

rac *rac_id*

Defines the remote area code to be associated with the NSE BSS
rac_id must be an integer between 1 and 255.

pooled

Enables pooling with non-pooled BSCs within the pool area.

Usage

Use this command repeatedly to associate one or more LAC/RAC combinations and/or pooling with this peer-GPRS service configuration. Also repeat the command as needed to create an association with a DSCP marking template, to define a name for a BSC, and to enable pooling with non-pooled BSCs.
The Network Service Entity (NSE) at the BSS and the SGSN provides the network management functionality required for the operation of the Gb interface. Each NSE is identified by means of NSE identifier (NSEI).

Example

The following command configures the NSE with identifier as *4114* having location area code *234* and routing area code as *22*:

```
peer-nsei 4114 lac 234 rac 22
```

The following command enables Gb flex (pooling) functionality for NSEI *4414* for this GPRS service:

```
peer-nsei 4114 pooled
```

plmn

This command identifies the Public Land Mobile Network (PLMN) for the GPRS service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

plmn id mcc *mcc_num* **mnc** *mnc_num*

no plmn id

no

Removes the PLMN information from the configuration for the current SGSN service.

mcc *mcc_num*

Define the mobile country code (MCC) portion of the PLMN Id.
mnc_num must be a 3 digit integer from 100 to 999.

mnc *mnc_num*

Define the mobile network code (MNC) portion of the PLMN Id.
mnc_num must be a 2 or 3 digit integer from 00 to 999.

Usage

Use this command to set PLMN parameters for the current SGSN service.

Example

The following command identifies the PLMN MCC as *200* and the MNC as *10*:

```
plmn id mcc 200 mnc 10
```

reporting-action event-record

This command enables the SGSN to log GMM/SM events in EDR files for 2G services.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

reporting-action event-record

[default | no] reporting-action event-record

default

Disables the logging function.

no

Removes the logging function from the configuration file.

Usage

This command is one of the steps needed to enable the SGSN to create a log for events such as Attach, RAU, and Activations. The log is an EDR (event data record) in CSV format. For details about how this feature works, refer to the *GMM-SM Event Logging* chapter in the *SGSN Administration Guide*.

Related Commands:

- To enable GMM/SM event logging for 2G services, the **reporting-action event-record** command must be configured in the SGSN service configuration.
- To enable a log to be generated in an EDR file, the **edr-module active-charging-service** command must be enabled in the Context configuration mode.
- To configure parameters for the logging file characteristics and for file transfer, use the commands in the EDR Module Configuration Mode.

Example

Enable GMM/SM event logging for 3G services:

```
reporting-action event-record
```

setup-timout

This command configures the maximum number of seconds allowed for session setup.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

setup-timout *seconds*

default setup-timout

default

Returns the configuration to the default, 60 seconds.

seconds

An integer from 1 to 1000000.

Usage

Use this command to set the time allowed for session setup.

Example

The following command sets the maximum session setup time to *300* seconds:

```
setup-timout 300
```

sgsn-context-request

This command specifies whether or not the PTMSI signature check should be skipped if the PTMSI signature is not included in the SGSN context request.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

sgsn-context-request ptmsi-signature-absence allowed

default sgsn-context-request ptmsi-signature-absence

no sgsn-context-request ptmsi-signature-absence allowed

default

Returns the configuration to the default action to perform the PTMSI signature check.

no

Removes this definition from the system configuration.

Usage

Use this command to skip the PTMSI signature check.

Example

The following command instructs the system to perform the PTMSI signature check.

```
default sgsn-context-request ptmsi-signature-absence
```

sgsn-number

Define the SGSN E.164 number to be used when interacting via MAP protocol for this GPRS service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

sgsn-number *sgsn_number*

no sgsn-number

no

Disables the use of this definition in the system configuration.

sgsn-number

Enter a string of 1 to 16 digits to identify the SGSN's E.164 identification.

Usage

Use this command to identify the ISDN number for the SGSN associated with this GPRS service.
The SGSN supports multiple SGSN numbers – different numbers in the 2G GPRS service configuration and the the 3G SGSN service configuration. If an HLR-initiated dialog is received, the SGSN will perform a lookup based on the IMSI and find the correct SGSN number with which the MS is associated. Subsequent messaging will use this address.

Example

Disable the E.164 number for this GPRS service.

```
no sgsn-number
```

sm

This command configures the session management (SM) parameters associated with this particular GPRS service context.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

sm { activate-max-retransmissions *num_retries* **| deactivate- max-retransmissions** *num_retries* **| guard-timer** *guard_seconds* **| ignore-pco-decode-error | modify-max-retransmissions** *num_retries* **| partial-apn-match | requested-apn-from-first-subrec | t3385-timeout** *secs* **| t3386-timeout** *secs* **| t3395-timeout** *secs* **| trim-trailing-spaces-in-apn }**

default sm { activate-max-retransmissions | deactivate-max-retransmissions | ignore-pco-decode-error | modify-max-retransmissions | t3385-timeout | t3386-timeout | t3395-timeout | trim-trailing-spaces-in-apn }

default

Resets the SM parameters to the defaults.

activate-max-retransmissions *num_retries*

Defines the maximum number of retries to transmit ‘activate PDP context request’.
num_retries : Must be an integer from 1 to 10.
Default: 4

deactivate-max-retransmissions *num_retries*

Defines the maximum number of retries to transmit ‘deactivate PDP context request’.
num_retries : Must be an integer from 1 to 10.
Default: 4

ignore-pco-decode-error

Enables the SGSN to ignore received decode errors that are due to incorrectly encoded PCO IE length in SM Requests.
Default: disabled

modify-max-retransmissions *num_retries*

Defines the maximum number of retries to transmit ‘modify PDP context request’.
num_retries: integer from 1 to 10.

Default: 4

partial-apn-match

Enables partial matching of requested APN during APN selection.
Partial APN or APN with trailing spaces may be present in an Activate Request because incorrect information was keyed in by the user. Though it is valid to reject such Activation Requests, it increases the signaling between the MS and the SGSN. This has an impact on the radio resources.

requested-apn-from-first-subrec

Enables use of a 'requested APN' from the first subscription record. When this feature is enabled, the PDP Activation is not rejected during APN Selection; instead, the APN from the first subscription record is used as the requested APN and the SGSN continues with the rest of the APN Selection process.
A requested APN is an optional IE in an Activate PDP Request. To get the requested PDP type, if multiple PDP subscription records exist for the subscriber, then the MS has to include the APN information to choose the PDP subscription record during APN selection. Otherwise, such activations will be rejected during APN selection (per TS 23.060 Appendix A). Though it is valid to reject such activation requests, it increases the signaling between the MS and the SGSN, which impacts the radio resources.

t3385-timeout*secs*

Defines the maximum amount of time for retransmission of 'activate request' messages.
secs : Must be an integer from 1 to 60.
Default: 8

t3386-timeout *secs*

Defines the maximum amount of time for retransmission of 'modify request' messages.
secs : Must be an integer from 1 to 60.
Default: 8 seconds.

t3395-timeout *secs*

Defines the maximum amount of time for retransmission of 'deactivate request' messages.
secs : Must be an integer from 1 to 60.
Default: 8

trim-trailing-spaces-in-apn

Enables SGSN to strip off any trailing space(s) in requested APN.
If a requested APN in an Activate PDP Context Request has any trailing spaces, then those trailing spaces will be removed and the length field will be updated.

Usage

Repeat this command with different keywords (parameters) to configure the SM (session management) as needed for this GPRS service. Keywords can be used to optimize signaling between the MS and the SGSN to reduce the impact on the radio resources.

Example

Reset the number of retransmission messages for deactivate PDP context request to *5*.

```
sm deactivate-max-retransmissions 5
```

sndcp

Define the sub-network dependent convergence protocol (SNDCP) network packet data unit (N-PDU) reassembly timeout interval associated with this GPRS service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GPRS Service Configuration

configure > context *context_name* **> gprs-service** *service_name*

Syntax

sndcp reassembly-timeout *seconds*

default sndcp reassembly-timeout

default

Resets the timer configuration to the default value of 30 seconds.

seconds

Defines the the number of seconds the SGSN waits for all the SNDCP segments to arrive before dropping all the disassembled segments.
seconds: Must be an integer from 1 to 300.

Usage

Use this command to modify the SNDCP reassembly timer. This timer starts as soon as the first N-PDU segment is received (either in-order or out-of-order). If all the segments belong to the N-PDU arrive before the timer expires then the segments are reassembled. If all the segments do not arrive before the timer expires, then the stored segments are discarded.

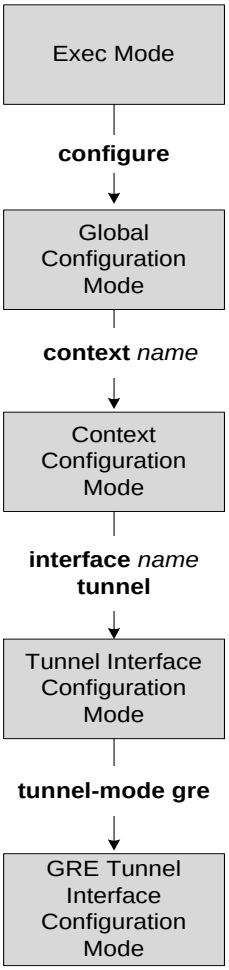
Example

Reset the default for the timer.

```
default sndcp reassembly-timeout
```

Chapter 133
GRE Tunnel Interface Configuration Mode Commands

The Generic Routing Encapsulation (GRE) Tunnel Interface Configuration Mode is used to create and manage the GRE tunneling interfaces for addresses, address resolution options, etc.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

destination

This command configures the destination IP address of the tunnel by specifying the destination end address. This is a mandatory configuration for a GRE tunnel interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > GRE Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode gre**

Syntax

[no] destination address *ip_address*

no

Removes or disassociates the configured destination IP address from a specific GRE tunnel interface configuration.

address *ip_address*

Configures the IP address for the interface.
ip_address must be specified using the IPv4 dotted-decimal notation.

Usage

Use this command to configure the destination IP address of the tunnel by specifying the IP address of destination tunnel end for GRE tunnel interface.

Important: State of source address will affect the operational state of the tunnel.

Example

The following command sets the 10.2.3.4 as destination IP address of the GRE tunnel interface:

```
destination address 10.2.3.4
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

keepalive

This command configures various parameters for sending Keepalive messages to the remote end-point in GRE tunnel interface configuration. By default sending keepalives is disabled.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > GRE Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode gre**

Syntax

keepalive [interval *time_interval* **num-retry** *retry* **]**

[default | no] keepalive

default

Sets the sending of Keepalives with default parameters.
interval: 10 seconds
num-retry: 3 retries

no

Disables the keepalive and turns off the sending of Keepalives messages.

interval *time_interval*

Default: 10
Specifies the time interval (in seconds) between two Keepalives sent to remote ends of GRE tunnel interface configuration.
time_interval must be an integer from 5 through 3600.

num-retry *retry*

Default: 3
Specifies number of retransmission of keepalives to remote node without getting any response before the remote node is marked as dead/down.
retry must be an integer between 0 through 10.

Usage

Use this command to configure the parameters for sending Keepalives to the remote end-point of GRE tunnel. It also configures the interval at which GRE Keepalives are sent on the interface and number of retries

without getting a response from the remote end-point before the tunnel is shutdown. By default, Keepalives will not be sent.

Example

The following command enables the keepalive and sets the other parameters to defaults:

```
default keepalive
```

source

This command configures the source IP address of the tunnel either by specifying the IP address (host address) or by specifying another configured non-tunnel IP interface. This is a mandatory configuration for GRE tunnel interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > GRE Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode gre**

Syntax

[no] source { address *ip_address* **| interface** *interface_name* **}**

no

Removes/disassociates the configured source IP address or host interface from a specific GRE tunnel interface configuration.

address *ip_address*

Configures the IP address for the interface specifying the IP address.
ip_address must be specified using IPv4 dotted-decimal notation.

interface *interface_name*

Specifies the name of the preconfigured non-tunnel IP interface, whose address is used as the source address of the GRE tunnel.

Usage

Use this command to configure the source IP address of the tunnel either by specifying the IP address (host address) or by specifying another configured non-tunnel IP interface for GRE tunnel interface.

Important: State of source address will affect the operational state of the tunnel.

Example

The following command sets the 10.2.3.4 as source IP address of the GRE tunnel interface:

```
source address 10.2.3.4
```

tos

This command configures the parameters/action for the type of Service (ToS) parameter in the IP tunnel transport protocol header.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > GRE Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode gre**

Syntax

tos { value [af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 | be | ef | lower-bits *tos_value*] **| copy }**

[default | no] tos

default

Sets the IP TOS to lower bits value of 0.

value [*tos_value* **]**

Default: **af11**
Specifies the IP QoS DSCP per-hop behavior to be marked on the outer header of signalling packets originating from the Access Gateway. This is a standards-based feature (RFC 2597). The following forwarding types are supported:

- **af11**: Assured Forwarding 11 per-hop behavior
- **af12**: Assured Forwarding 12 per-hop behavior
- **af13**: Assured Forwarding 13 per-hop behavior
- **af21**: Assured Forwarding 21 per-hop behavior
- **af22**: Assured Forwarding 22 per-hop behavior
- **af23**: Assured Forwarding 23 per-hop behavior
- **af31**: Assured Forwarding 31 per-hop behavior
- **af32**: Assured Forwarding 32 per-hop behavior
- **af33**: Assured Forwarding 33 per-hop behavior
- **af41**: Assured Forwarding 41 per-hop behavior
- **af42**: Assured Forwarding 42 per-hop behavior
- **af43**: Assured Forwarding 43 per-hop behavior
- **be**: Best Effort forwarding per-hop behavior

- **ef**: Expedited Forwarding per-hop behavior typically dedicated to low-loss, low-latency traffic.

The assured forwarding behavior groups are listed in the table below.

	Class 1	Class 2	Class 3	Class 4
Low Drop	AF11	AF21	AF31	AF41
Medium Drop	AF12	AF22	AF32	AF42
High Drop	AF13	AF23	AF33	AF43

Traffic marked with a higher class is given priority during congestion periods. If congestion occurs to traffic with the same class, the packets with the higher AF value are dropped first.

lower-bits *tos_value*

Default: 0
Sets the least-significant 6 bits in the ToS byte with the specified numeric value.
tos_value must be an integer from 0 through 255.

copy

This keyword instructs the system to copy the ToS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the ToS value of the IPv4 tunnel transport protocol header

Usage

Use this command either to set the ToS parameter in the IPv4 tunnel transport protocol header to the specified value or instructs to copy the ToS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the ToS value of the IPv4 tunnel transport protocol header. If one of the enumerated values is set, the DSCP bits which are the six most-significant bits in the ToS byte are marked. If the integer value is set, it will be written into the six least-significant bits of the ToS byte.

Example

The following command instructs the system to copy the ToS value from the passenger IPv4 packet or Traffic class value from the passenger IPv6 packet to the ToS value of the IPv4 tunnel transport protocol header:

```
tos copy
```

ttl

This command configures the Time to live (TTL) parameter to be used in the tunnel transport protocol header for the current GRE tunnel interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > GRE Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode gre**

Syntax

ttl *ttl_value*

default ttl

default

Sets the TTL value to system default value.

ttl_value

Default: 15
Specifies the maximum time to live to be used in the tunnel transport protocol header
The time to live (TTL) is not a measure of time but the number of hops through the network.
ttl_value must be an integer between 1 through 255.

Usage

Use this command to set the TTL parameter to be used in the tunnel transport protocol header for the GRE tunnel configuration.

Example

The following configures the TTL to a value of *10*:

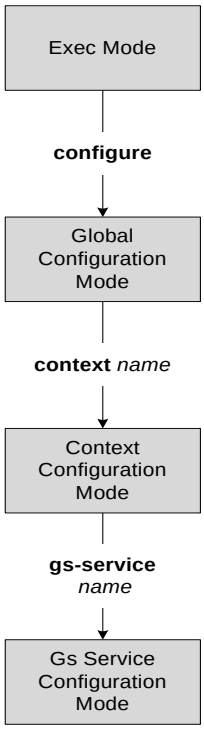
```
ttl 10
```

Chapter 134
Gs Service Configuration Mode Commands

The Gs Service configuration mode configures the parameters used to setup and maintain a Gs interface for a connection between the SGSN and an MSC/VLR.

Upon accessing this mode, your prompt should look similar to the following:

```
[<context_name>]<hostname>(config-gs-service)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate-sccp-network

This command associates a previously defined Signaling Connection Control Part (SCCP) network instance with the Gs service. This association is required to access Visitor Location Register(s) (VLRs).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Gs Service Configuration

configure > context *context_name* **> gs-service** *service_name*

Syntax

associate-sccp-network *sccp_net_id*

no associate-sccp-network

no

Removes the associated SCCP network configuration instance from this Gs service configuration.

sccp_net_id

Identifies the SCCP network configuration instance to associate with this Gs interface to enable connection with VLR(s).
sccp_network_num: Must be an integer from 1 through 12.

Usage

Use this command to associate the SCCP network configuration instance with the Gs interface in this service.

Important: A single SCCP network configuration instance can not be shared with multiple Gs services.

Important: To enable a Gs service, the user needs to configure **ssn** with the **bssap+** command.

Example

Following command associates SCCP network 2 with this Gs service.

```
associate-sccp-network 2
```

bssap+

This command defines the Base Station System Application Part Plus configuration parameters for the Gs service to enable the SGSN to access a Visitor Location Register(s) (VLRs).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Gs Service Configuration

configure > context *context_name* **> gs-service** *service_name*

Syntax

bssap+ ssn *ss_num*

no bssap+ ssn *ss_num*

no

Removes the configured BSSAP+ subsystem number from this Gs service.

ssn *ss_num*

Specifies the subsystem number to configure in this Gs interface to use BSSAP+.
ss_num must be an integer from 1 through 255.

Usage

Use this command to configure the BSSAP+ subsystem with Gs interface in this service to communicate with VLR(s).

Important: A single SCCP network configuration instance can not be shared with multiple Gs services.

Important: To start a Gs service, the user needs to configure the command parameter.

Example

Following command configures subsystem 101 with BSSAP+ in this Gs service.

```
bssap+ ssn 101
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the previous configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous configuration mode.

max-retransmission

This command configures the retransmission values for different procedure counters in Gs service as described in TS 29.018.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Gs Service Configuration

configure > context *context_name* **> gs-service** *service_name*

Syntax

max-retransmissions { n8 | n9 | n10 | n12 } *retrans_num*

default max-retransmissions { n8 | n9 | n10 | n12 }

no

Removes the configured Gs procedures from this Gs service.

{ n8 | n9 | n10 | n12 }

Specifies the various Gs service procedures that are available to be used to communicate with VLR(s).

- n8: Defines the maximum number of retries for explicit IMSI detach from a non-GPRS service. Default is 2.
- **n9**: Defines the maximum number of retries for explicit IMSI detach from a non-GPRS service. Default is 2.
- **n10**: Defines the maximum number of retries for implicit IMSI detach from the GPRS service. Default is 2.
- **n12**: Defines the maximum number of retries for BSSAP+ to send Reset Indication messages. Default is 2.

retrans_num

Default: 2
Specifies the number of re-transmission of message for specified procedures.
retrans_num: Must be an integer from 0 through 10.

Usage

Use this command to configure the retransmission values for specific procedure counters in Gs service. counters are based on TS 29.018.
This command can be entered for each procedure counter separately.

Example

Following command configure retransmission value as *3* for counter for procedure to send BSSAP+ Reset Indication messages in this Gs service.

```
max-retransmissions n12 3
```

non-pool-area

This command creates a non-pool area for a set of subscriber location area code (LAC) values that can be used with a specific VLR for the Gs service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Gs Service Configuration

configure > context *context_name* **> gs-service** *service_name*

Syntax

non-pool-area *non_pool_name* **{ use-vlr** *vlr_name* **lac** *lac_num* **} +**

no non-pool-area *non_pool_name* **[lac** *lac_num*

no

Removes the configured non-pool area from this Gs service.

non_pool_name

Specifies the name of the non-pool area to configure with this command.
non_pool_name must be an alpha and/or numeric string of 1 to 63 characters.

use-vlr *vlr_name*

Specifies the name of the VLR to be associated with this non-pool area.
vlr_name is the name of VLR and must be an alpha and/or numeric string of 1 to 63 characters.

lac *lac_num*

Specifies the subscribers' location area code to be attached with this non-pool area and specific VLR. This LAC of subscriber is obtained from the radio area indicator (RAI).
Including this keyword with the **no** form of the command enables the operator to remove a specific LAC from the non-pool area configuration.
lac_num is the LAC value and must be an integer value from 1 through 65535.

+

More than one *lac_num*, separated by a space, can be entered within a single command.

Usage

This command can be repeated as necessary to define a total of 32 configured LACs for the combined **non-pool-area** and **pool-area** configurations per Gs service.

Example

Following command configure a non-pool area *starpool1* to use VLR named *starvlr1* for LAC *101* in a Gs service.

```
non-pool-area starpool1 use-vlr starvlr1 lac 101
```

pool-area

This command creates a pool area configuration instance. This command also enters the Pool Area configuration mode to define the set of VLRs to use for a pool area for a set of subscriber location area code (LAC) values in the Gs service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Gs Service Configuration

configure > context *context_name* **> gs-service** *service_name*

Syntax

pool-area *pool_name* **[-noconfirm]**

no pool-area *non_pool_name*

no

Removes the configured pool area from this Gs service.

pool_name

Specifies the name of the pool area to configure with this command for VLR pooling and association of a LAC.
pool_name: Must be an alpha and/or numeric string of 1 to 63 characters.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Use this command to create/enter the pool area configuration mode. This mode is used configure the set of VLRs to be used for a set of subscriber LAC.
This command can be used multiple times, subject to a limit of 128 LAC values (the total number of **non-pool-area** and **pool-area** configurations) per Gs service.

Example

The following command configures a pool area named *starpool1* in a Gs service without any confirmation prompt.

```
pool-area starpool1 -noconfirm
```

sgsn-number

Define the SGSN's E164 number to associate an SGSN with this Gs Service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Gs Service Configuration

configure > context *context_name* **> gs-service** *service_name*

Syntax

sgsn-number *E.164_number*

E.164_number

Defines the SGSN's 'telephone' number, the ISDN number for per ITU-T E.164 numbering plan. The number must be a numerical string of 1 to 15 digits.

Usage

For releases 8.1 or higher, use this command to define the SGSN's E.164 ISDN number. This value should match the **sgsn-number** defined for SGSN Service or GPRS Service.

Important: Note: the Gs Service will not start unless the SGSN's E.164 number is configured.

Example

sgsn-number *12345678901234*

timeout

This command configures various timers defining the wait before retransmitting a specific message for Gs service procedures.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Gs Service Configuration

configure > context *context_name* **> gs-service** *service_name*

Syntax

timeout { t6-1-timer *t6_1_dur* **| t8-timer** *t8_dur* **| t9-timer** *t9_dur* **| t10-timer** *t10_dur* **| t12-1-timer minute** *t12_1_dur* **| t12-2-timer** *t12_2_dur***}**

[default] timeout { t6-1-timer | t8-timer | t9-timer | t10-timer | t12-1-timer | t12-2-timer }

default

Sets the timer value to wait in seconds/minutes to default values. Default values for timers are:

- **t6-1-timer**: 10 seconds
- **t8-timer**: 4 seconds
- **t9-timer**: 4 seconds
- **t10-timer**: 4
- **t12-1-timer**: 54 mins (+ 8 seconds)
- **t12-2-timer**: 4 seconds

t6-1-timer *t6_1_dur*

Default: 10
Specifies the retransmission timer value to guard the location update.
t6_1_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 10 through 90.

t8-timer *t8_dur*

Default: 4
Specifies the retransmission timer value to guard the explicit IMSI detach from the GPRS service procedure.
t8_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

t9-timer *t9_dur*

Default: 4

Specifies the retransmission timer value to guard the explicit IMSI detach from the non-GPRS service procedure.
t9_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

t10-timer *t10_dur*

Default: 4
Specifies the retransmission timer value to guard the implicit IMSI detach from the GPRS service procedure.
t10_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 30.

t12-1-timer minute *t12_1_dur*

Default: 54 minutes (plus 8 seconds for transmission delay)
Specifies the retransmission timer value to control the resetting of SGSN-Reset variable procedure.
t12_1_dur is the waiting duration in minutes before retransmitting reset message for the SGSN Reset variable and must be an integer from 0 through 384.

t12-2-timer *t12_2_dur*

Default: 4
Specifies the retransmission timer value to guard the SGSN reset procedure.
t12_2_dur is the waiting duration in seconds before retransmitting the specific message and must be an integer from 1 through 120.

Usage

Use this command to configure the time, for different procedure timers, to wait before retransmitting a procedure message.
This command can be repeated for each timer to configure multiple timers.

Example

Following command sets the timeout duration of 4 seconds for t8 timer to wait before retransmitting the procedure message to explicitly do the IMSI detach from GPRS service:

```
default timeout t8-timer
```

vlr

This command defines a VLR configuration for use with this Gs service.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Gs Service Configuration

configure > context *context_name* **> gs-service** *service_name*

Syntax

vlr *vlr_name* **isdn-number** *E164_num* **[bssap+ ssn** *ssn* **] [point-code** *pt_code* **]**

no vlr *vlr_name*

no

Removes the configured VLR from the Gs service.

vlr_name

Specifies the name of the VLR to configure in this Gs mode with ISDN number.
vlr_name must be an alpha and/or numeric string of 1 to 63 characters.

isdn-number *E164_num*

Specifies the VLR number to configure with this command.
E164_num: The ISDN number for the target VLR. Value must be defined according to the E.164 numbering plan and must be a numeric string of 1 to 15 digits.

bssap+ ssn *ssn*

Specifies the subsystem number to configure with this VLR to use BSSAP+.
ssn: Must be an integer from 1 through 255. Default value is 252.

point-code *pt_code*

Specifies SS7 address of VLR in point code value to this configured VLR name.
pt_code: Must be in SS7 point code dotted-decimal ###.###.### format or decimal ######## format.

Usage

Use this command to define VLR configuration instances to be associated with the Gs service.
A maximum of 32 VLRs can be configured per Gs service.

Example

Following command configures the VLR named *starvlr1* with an ISDN number *12344567*, a subsystem number of *252*, and a point code value of *123.345.567*:

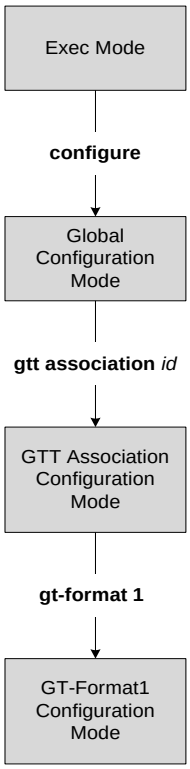
vlr *starvlr1* **isdn-number** *12344567* **point-code** *123.345.567*

Chapter 135
GT-Format1 Configuration Mode Commands

The GT-Format1 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-1-format1)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

nature-of-address

Configures the indicator to identify the nature of the address.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format1 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

nature-of-address { international | national | subscriber)

international

Identifies the numbers as international.

national

Identifies the numbers as matching the national configuration.

subscriber

Identifies the numbers as subscriber numbers.

Usage

Configure the identify of the GT format as national.

Example

nature-or-address *national*

odd-even-indicator

Configures the bits for matching the global title translation.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format1 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

odd-even-indicator *type*

type

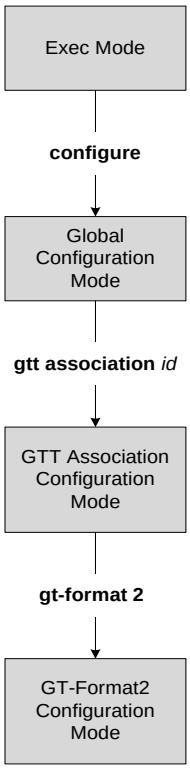
- **odd:** Sets the odd bit for matching the GTT.
- **even:** Sets the even bit for matching the GTT.

Chapter 136
GT-Format2 Configuration Mode Commands

The GT-Format2 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-format<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the Global configuration mode.

translation-type

Configures the translation type to be applied during the translation process.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format2 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

translation-type *number*

number

Must be an integer between 0 and 255.
Default is 0

Usage

Use this command to configure the GTT translation type to be applied during global title translation process.

Example

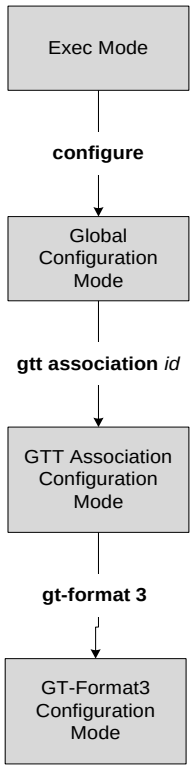
translation-type *232*

Chapter 137
GT-Format3 Configuration Mode Commands

The GT-Format3 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-1-format<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

encoding-scheme

Configures the encoding-scheme to use during global title translation (GTT).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format3 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

encoding scheme *scheme_type*

scheme_type

Select one of the following encoding scheme types to determine the encoding type to be used during GTT:

- **bcd-even:** BCD even encoding scheme
- **bcd-odd:** BCD odd encoding scheme
- **nw-specfic:** Network specific encoding scheme
- **unknown:** Unknown encoding scheme

Usage

Select BCD even encoding for GTT

Example

encoding scheme *bcd-even*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

numbering-plan

Configures the GTT process to apply one of the numbering-plans during the GT translation process.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format3 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

numbering-plan *plan_type*

plan_type

Select one of the following numbering plans be employed during GTT:

- **data:** Data numbering plan
- **generic**: Generic number plan
- **isdn** : ISDN tel numbering plan
- **isdn-mobile:** ISDN mobile numbering plan
- **land-mobile:** Land mobile numbering plan
- **maritime-mobile:** Maritime mobile numbering plan
- **nw-specific** : Private network / network-specific numbering plan
- **telex:** Telex numbering plan
- **unknown**: Unknown numbering plan

Usage

Select ISN telephone number plan for GTT process.

Example

The following command sets the numbering plan to use during GTT processing to isdn

```
numbering-plan isdn
```

translation-type

Configures the global title translation (GTT) process to apply a specific number for translation during the GTT process.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format3 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

translation-type *number*

number

Must be an integer between 0 and 255.
Default is 0

Usage

Use this command to define the translation-type to be used during the global title translation process.

Example

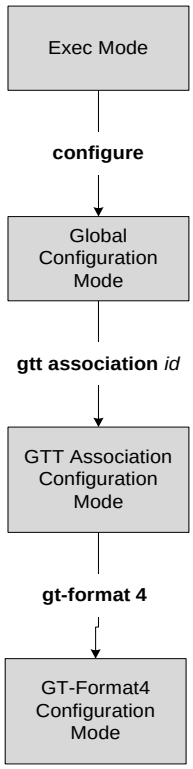
translation-type *233*

Chapter 138
GT-Format4 Configuration Mode Commands

The GT-Format4 configuration mode is a sub-mode for either the Global Title Translation Association configuration mode or the Global Title Translation Address-Map configuration mode. This sub-mode configures a set of rules used in the global title translation (GTT) process.

Upon accessing this mode, your prompt should look similar to the following:

```
[local]<hostname>(config-gtt-1-format<#>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

encoding-scheme

Configures the encoding-scheme to use during GTT.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format4 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

encoding scheme *scheme_type*

scheme_type

Select one of the following encoding scheme types to determine the encoding type to be used during GTT:

- **bcd-even:** BCD even encoding scheme
- **bcd-odd:** BCD odd encoding scheme
- **nw-specfic:** Network-specific encoding scheme
- **unknown:** Unknown encoding scheme

Usage

Select BCD even encoding for GTT

Example

encoding scheme *bcd-even*

end

Exits the configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

nature-of-address

Configures the indicator to identify the nature of the address.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format4 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

nature-of-address { international | national | subscriber)

international

Identifies the numbers as international.

national

Identifies the numbers as matching the national configuration.

subscriber

Identifies the numbers as subscriber numbers.

Usage

Configure the identify of the GT format as national.

Example

```
nature-or-address national
```

numbering-plan

Configures the GTT process to apply one of the numbering-plans during the GT translation process.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format4 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

numbering-plan *plan_type*

plan_type

Select one of the following numbering plans be employed during GTT:

- **data:** Data numbering plan
- **generic**: Generic number plan
- **isdn** : ISDN tel numbering plan
- **isdn-mobile:** ISDN mobile numbering plan
- **land-mobile:** Land mobile numbering plan
- **maritime-mobile:** Maritime mobile numbering plan
- **nw-specific** : Private network/ network-specific numbering plan
- **telex:** Telex numbering plan
- **unknown**: Unknown numbering plan

Usage

Select ISN telephone number plan for GTT process.

Example

numbering-plan *isdn*

translation-type

Configures the GTT process to apply a specific number for translation during the GTT process.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > GTT Association Configuration > GT-Format4 Configuration

configure > global title translation association instance *instance_number* **> gt-format** *format_number*

Syntax

translation-type *number*

number

Must be an integer between 0 and 255.
Default is 0.

Usage

Use this command to configure the translation-type to be implemented during the global title translation process.

Example

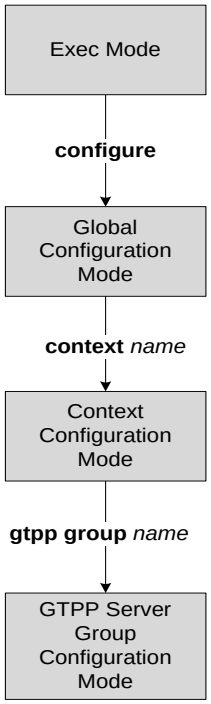
translation-type *231*

Chapter 139
GTPP Server Group Configuration Mode Commands

The GTPP Server Group Configuration Mode is used to create and manage the GTPP server groups within the context or system.

GTPP server group commands facilitate the setup of the hard disk for CDR storage. They also support accounting and charging functionality within a context, and configuration of a group (list) of charging gateway function (CGF) servers on a per subscriber or per GGSN/P-GW APN level.

In this mode, your prompt will be similar to `[context_name]hostname(config-gtpp-group)#`



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

gtpp attribute

Enables the specification of some of the optional fields in the CDRs that the GSN (GGSN or SGSN) generates and/or how the information is to be presented. Many keywords are also applicable to S-GW and P-GW CDRs.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp attribute { apn-ni | apn-selection-mode | charging-characteristic-selection-mode | camel-info | cell-plmn-id | diagnostics | duration-ms | dynamic-flag | imei | local-record-sequence-number | losdv | ms-timezone | msisdn | node-id | node-id-suffix *STRING* **| pdn-connection-id | pdp-address | pdp-type | pgw-plmn-id | plmn-id | rat | recordextension | record-extensions rat | served-mnai | sms { destination-number | recording-entity | service-centre } | start-time | stop-time | uli } +**

default gtpp attribute { apn-ni | apn-selection-mode | charging-characteristic-selection-mode | cell-plmn-id | diagnostics | duration-ms | dynamic-flag | imei | local-record-sequence-number | losdv | ms-timezone | msisdn | node-id | pdn-connection-id | pdp-address | pdp-type | pgw-plmn-id | plmn-id | rat | recordextension | record-extensions rat | served-mnai | sms { destination-number | recording-entity | service-centre } | start-time | stop-time | uli }

no gtpp attribute { apn-ni | apn-selection-mode | charging-characteristic-selection-mode | cell-plmn-id | diagnostics | duration-ms | dynamic-flag | imei | local-record-sequence-number | losdv | ms-timezone | msisdn | node-id | node-id-suffix | pdn-connection-id | pdp-address | pdp-type | pgw-plmn-id | plmn-id | rat | recordextension | record-extensions rat | served-mnai | sms { destination-number | recording-entity | service-centre } | start-time | stop-time | uli }

default

Resets the default attribute values for this GTPP group configuration.

no

Disables the specified optional field so that the information will not be present in generated CDRs.

apn-ni

Default: Enabled
This keyword controls the inclusion of the optional field “APN” in the x-CDRs.

apn-selection-mode

Default: Enabled
This keyword controls the inclusion of the optional field “APN Selection Mode” in the x-CDRs.

camel-info

SGSN only
Enter this keyword to include CAMEL-specific fields in SGSN CDRs. Default: Disabled

cell-plmn-id

SGSN only
Enter this keyword to enable the system to include the Cell PLMN ID field in the M-CDR. Default: Disabled

charging-characteristic-selection-mode

Default: Enabled
This keyword controls the inclusion of the optional field “Charging Characteristic Selection Mode” in the x-CDRs.

diagnostics

Default: Disabled
Enables the system to include the Diagnostic field in the CDR that is created when PDP contexts are released. The field will include one of the following values:

- **26** - For GGSN: if the GGSN sends “delete PDP context request” for any other reason (e.g., the operator types “clear subscribers” on the GGSN). For SGSN: The SGSN includes this cause code in the S-CDR to indicate that a secondary PDP context activation request or a PDP context modification request has been rejected due to insufficient resources.
- **36** - For GGSN: this cause code is sent in the G-CDR to indicate the PDP context has been deactivated in the GGSN due to the SGSN having sent a “delete PDP context request” to the GGSN. For SGSN, this cause code is used to indicate a regular MS or network-initiated PDP context deactivation.
- **37** - when the network initiates a QoS modification, the SGSN sends in the S-CDR to indicate that the MS initiation deactivate request message has been rejected with QoS not accepted as the cause.
- **38** - if the GGSN sends “delete PDP context request” due to GTP-C/GTP-U echo timeout with SGSN. If the SGSN sends this cause code, it indicates PDP context has been deactivated due to path failure, specifically GTP-C/GTP-U echo timeout.
- **39** - SGSN only - this code indicates the network (GGSN) has requested a PDP context reactivation after a GGSN restart.
- **40** - if the GGSN sends “delete PDP context request” due to receiving a RADIUS Disconnect-Request message.

duration-ms

Specifies that the information contained in the mandatory Duration field be reported in milliseconds instead of seconds (as the standards require). Default: Disabled

dynamic-flag

Default: Enabled
This keyword controls the inclusion of the optional field “Dynamic Flag” in the x-CDRs.

imei

Default: Disabled
For SGSN: includes the IMEI value in the S-CDR.
For GGSN: includes the IMEISV value in the G-CDR.

local-record-sequence-number

Default: Disabled
This keyword provides both the local record sequence number and the Node ID. In the x-CDRs, this field indicates the number of CDRs generated by the node and is unique within the session manager.
The Node ID field is included in the x-CDR for any of several reasons, such as when PDP contexts are released or if partial-CDR is generated based on configuration. The field will consist of a AAA Manager identifier automatically appended to the name of the SGSN or GGSN service.
The name of the SGSN or GGSN service may be truncated, because the maximum length of the Node ID field is 20 bytes. Since each AAA Manager generates CDRs independently, this allows the Local Record Sequence Number and Node ID fields to uniquely identify a CDR.

Important: If this keyword is enabled and the **gtpp centralized-lrsn-creation** option is enabled with the **gtpp single-source centralized-lrsn** command, then the Node ID format changes as follows: <1-byte-AAAproxy-restart-counter> <3-byte AAAproxy instance number> <node-id-suffix>. If **gtpp centralized-lrsn-creation** is not enabled, the node-id format for CDRs generated by Sessmgr is as follows: <1-byte Sessmgr restart-value> <3-byte Sessmgr instance number> <node-id-suffix>. If **gtpp centralized-lrsn-creation** is not enabled, the node-id format for CDRs generated by ACSMGR is as follows: <1-byte ACSmgr restart-value> <3-byte ACSmgr instance number> <Active charging service-name>.

losdv

Default: Enabled
This keyword controls the inclusion of the optional field “List of Service Data” in the x-CDRs.

ms-timezone

Default: Enabled
This keyword controls the inclusion of the optional field “MS-Timezone” in the x-CDRs.

msisdn

Default: Enabled
This keyword controls the inclusion of the optional field “MSISDN” in the x-CDRs.

node-id

Default: Enabled
This keyword controls the inclusion of the optional field “Node ID” in the x-CDRs.

node-id-suffix *STRING*

Default: Disabled

Specifies the configured Node-ID-Suffix to use in the NodeID field of GTPP CDRs as an alphanumeric string of 1 through 16 characters. Each Session Manager task generates a unique NodeID string per GTPP context.

Important: The NodeID field is a printable string of the *ndddSTRING* format: *n*: The first digit is the Sessmgr restart counter having a value between 0 and 7. *ddd*: The number of sessmgr instances. Uses the specified NodeID-suffix in all CDRs. The "Node-ID" field consists of sessMgr Recovery counter (1 digit) *n* + AAA Manager identifier (3 digits) *ddd* + the configured Node-Id-suffix (1 to 16 characters) *STRING*. If the centralized LRSN feature is enabled, the "Node-ID" field will consist of only the specified NodeID-suffix (NodeID-prefix is not included). If this option is not configured, then GTPP group name will be used instead (For default GTPP groups, context-name will be used).

Important: If this **node-id-suffix** is not configured, the GGSN uses the GTPP context name as the Node-id-suffix (truncated to 16 characters) and the SGSN uses the GTPP group named as the node-id-suffix.

pdn-connection-id

Default: Enabled
This keyword controls the inclusion of the optional field "PDN Connection ID" in the x-CDRs.

pdp-address

Default: Enabled
This keyword controls the inclusion of the optional field "PDP Address" in the x-CDRs.

pdp-type

Default: Enabled
This keyword controls the inclusion of the optional field "PDP Type" in the x-CDRs.

pgw-plmn-id

Default: Enabled
This keyword controls the inclusion of the optional field "PGW PLMN-ID" in the x-CDRs.

plmn-id [unknown-use]

Default: Enabled
For SGSN, reports the SGSN PLMN Identifier value (the RAI) in the S-CDR provided if the dictionary supports it.
For GGSN, reports the SGSN PLMN Identifier value (the RAI) in the G-CDR if it was originally provided by the SGSN in the GTP create PDP context request. It is omitted if the SGSN does not supply one.
Normally when SGSN PLMN-id information is not available, the attribute sgsnPLMNIdentifier is not included in the CDR. This keyword enables the inclusion of the sgsnPLMNIdentifier with a specific value when the SGSN PLMN-id is not available.
unknown-use *hex_num*: is aa hexadecimal number from 0x0 through 0xFFFFFF that identifies a foreign SGSN that has not provided a PLMN-id. For GGSN only.

rat

Default: Enabled
For SGSN: includes the RAT (identifies the radio access technology type) value in the S-CDR.
For GGSN: includes the RAT (identifies the radio access technology type) value in the G-CDR.

record-extensions rat

Default: Disabled
Enables network operators and/or manufacturers to add their own recommended extensions to the CDRs according to the standard record definitions from 3GPP TS 32.298 Release 7 or higher.

sms { destination-number | recording-entity | service-centre }

This keyword is specific to the SGSN.
Entering this keyword causes the inclusion of an SMS-related field in the SMS-MO-CDR or SMS-MT-CDR.
destination-number: Includes the "destinationNumber" field in the SMS-MO-CDR or SMS-MT-CDR.
recording-entity: Includes the "recordingEntity" field in the SMS-MO-CDR or SMS-MT-CDR.
service-centre: Includes the "serviceCentre" field in the SMS-MO-CDR or SMS-MT-CDR.

start-time

Default: Enabled
This keyword controls the inclusion of the optional field "Start-Time" in the x-CDRs.

stop-time

Default: Enabled
This keyword controls the inclusion of the optional field "Stop-Time" in the x-CDRs.

uli

Default: Enabled
This keyword controls the inclusion of the optional field "User Location Information" in the x-CDRs.

+

Indicates that this command can be entered multiple times to configure multiple attributes.

Usage

This command dictates some of the optional information fields that should be reported in CDRs generated by the GGSN. In addition, it controls how the information for some of the mandatory fields are reported.
Fields described as optional by the standards but not listed above will always be present in the CDRs, except for Record Extensions (which will never be present).

Example

The following command dictates that the time provided in the Duration field of the CDR is reported in milliseconds:

```
gtpp attribute duration-ms
```

gtpp charging-agent

Configures the IP address and port of the system interface within the current context used to communicate with the CGF or the GSS.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp charging-agent address *ip_address* **[port** *port* **]**

no gtpp charging-agent

no

Removes a previously configured charging agent address.

address *ip_address*

Specifies the IP address of the interface configured within the current context that is used to transmit G-CDR records to the CGF or the GSS.
ip_address is expressed in IPv4 dotted-decimal notation.

port *port*

Specifies the Charging Agent UDP port as an integer from 1 through 65535. If the port is not defined, the default port number 49999 will be used.

Important: Configuring GTPP charging-agent on port 3386 may interfere with ggsn-service configured with the same ip address.

Usage

This command can be used to establish a UDP interface to connect to the GSS or this command can establish a Ga interface to connect to the CFG. These interfaces must exist in the same context in which GTPP functionality is configured (refer to the **gtpp** commands in this chapter).

This command instructs the system as to what interface to use. The IP address supplied is also the address by which the GGSN/SGSN is known to the CGF or the GSS. Therefore, the IP address used for the Ga or UDP interface could be identical to one bound to a GGSN/SGSN service (a Gn interface).
If no GGSN/SGSN services are configured in the same context as the Ga/UDP interface, the address configured by this command is used to receive unsolicited GTPP packets.

Example

The following command configures the system to use the interface with an IP address of 192.168.13.10 as the accounting interface with port *20000* to the CGF:

```
gtpp charging-agent address 192.168.13.10

gtpp charging-agent address 192.168.13.10 port 20000
```

gtpp data-request sequence-numbers

Configures the range of sequence numbers to be used in the GTPP data record transfer record (DRT). Use this command to set the start value for the sequence number.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp data-request sequence-numbers start { 0 | 1 }

default gtpp data-request sequence-numbers start

default

Default is 0 (zero).

start { 0 | 1 }

Specifies the value of the start sequence number for the GTPP Data Record Transfer Request. Default: 0

- **0**: Designates the start sequence number as 0.
- **1**: Designates the start sequence number as 1.

Usage

When the GGSN/P-GW/SGSN is configured to send GTPP echo request packets, the SGSN always uses 0 as the sequence number in those packets. Re-using 0 as a sequence number in the DRT packets is allowed by the 3GPP standards; however, this CLI command ensures the possibility of inter-operating with CGFs that can not properly handle the re-use of sequence number 0 in the echo request packets.

Example

The following command sets the sequence to start at 1.

```
gtpp data-request sequence-numbers start 1
```

gtpp deadtime

Configures the amount of time the GGSN/SGSN waits before attempting to communicate with a CGF that was previously marked as unreachable (non-responsive).

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp deadtime *time*

default gtpp deadtime

default

Resets the deadtime to the default of 120 seconds.

time

Specifies the amount of time (in seconds) that must elapse before the system attempts to communicate with a CGF that was previously unreachable.
time is an integer from 1 to 65535. Default: 120

Usage

If the system is unable to communicate with a configured CGF, after a pre-configured number of failures the system marks the CGF as being down.
This command specifies the amount of time that the system waits prior to attempting to communicate with the downed CGF.
Refer to the **gtpp detect-dead-server** and **gtpp max-retries** commands for additional information on the process the system uses to mark a CGF as down.

Example

The following command configures the system to wait 60 seconds before attempting to re-communicate with a CGF that was marked as down:

```
gtpp deadtime 60
```

gtpp dead-server suppress-cdrs

Configures the action the GGSN or the SGSN will take on CDRs generated during a communication failure between the GGSN or the SGSN and the GTPP servers.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

[no | default] gtpp dead-server suppress-cdrs

no

Removes the suppression instruction from the configuration and sets the CDR suppression mode as disabled.

default

Resets to the default mode: disable suppression of CDRs when GTPP server detected as “dead” or unreachable.

Usage

For the GGSN/P-GW: This command works in conjunction with the **gtpp detect-dead-server** to set an action when a communication failure is detected between the GGSN and a configured GTPP server. It disables the archiving of CDRs on the system when the GTPP server is unreachable or dead.
For the GGSN, P-GW, and SGSN: During a communication or server failure, the GGSN, P-GW, or SGSN typically retains the GTPP requests until the system buffer runs out of resources. This command enables suppression of the CDRs, so with this command the GGSN, P-GW, or the SGSN will start purging all CDRs associated with this GTPP group as soon as the GGSN/P-GW/SGSN detects that the GTPP server is down or that a communication failure has occurred. The CDRs generated, for the period while the server is down/unreachable, will also be purged.

Example

The following command configures the system to start purging CDRs when a communication failure with a server is detected:

```
gtpp dead-server suppress-cdrs
```

gtpp detect-dead-server

Configures the number of consecutive communication failures that could occur before the system marks a CGF as "dead" (unreachable).

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp detect-dead-server consecutive-failures *max_number*

default gtpp detect-dead-server consecutive-failures

default

Resets the system to the default number of consecutive failures.

consecutive-failures *max_number*

Default: 5
Specifies the number of failures that could occur before marking a CGF as down as an integer from 0 through 1000. If 0 (zero) is the value entered, the system will mark the CGF as dead after a single instance of **max-retries** has been attempted with no success, regardless of configured **deadtime**.

Usage

This command works in conjunction with the **gtpp max-retries** parameter to set a limit to the number of communication failures that can occur with a configured CGF.
The **gtpp max-retries** parameter limits the number of attempts to communicate with a CGF. Once that limit is reached, the system treats it as a single failure. The **gtpp detect-dead-server** parameter limits the number of consecutive failures that can occur before the system marks the CGF as down and communicate with the CGF of next highest priority.
If all of the configured CGFs are down, the system ignores the detect-dead-server configuration and attempt to communicate with highest priority CGF again.
If the system receives a GTPP Node Alive Request, Echo Request, or Echo Response message from a CGF that was previously marked as down, the system immediately treats it as being active.
Refer to the **gtpp max-retries** command for additional information.

Example

The following command configures the system to allow 8 consecutive communication failures with a CGF before it marks it as down:

```
gtpp detect-dead-server consecutive-failures 8
```

gtpp dictionary

Designates specific dictionary used by GTPP for specific context.

Platform

custom37 | custom38 | custom39 | custom4 | custom40 | custom5 | custom6 | custom7 |
custom8 | custom9 | standard }

default gtpp dictionary
```

default

Configures the default dictionary.

custom1

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99. It supports the encoding of IP addresses in text format for G-CDRs.

custom2

Custom-defined dictionary.

custom3

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 but it does support the encoding of IP addresses in binary format for CDRs.

custom4

Custom-defined dictionary. It conforms to TS 32.015 v 3.6.0 for R99 except that:

- the Data Record Format Version information element contains 0x1307 instead of 0x1308
- "QoSRequested" is not present in the LoTV containers

- "QoSnegotiated" is added only for the first container and the container after a QoS change

custom5 ... custom20

Custom-defined dictionaries.

custom21 ... custom25

Custom-defined dictionaries for GGSN only.

custom26

Custom-defined dictionary for customization of G-CDR records for GGSN only. This is compliant to 3GPP TS 32.298 (R6 v 6.5.0) for proprietary fields and encoding.

custom27

Custom-defined dictionary for customization of S-CDR records for SGSN only. This is compliant to 3GPP TS 32.298 (R6 v 6.6.0) for proprietary fields and encoding.

custom28 ... custom30

Custom-defined dictionaries for GGSN only.

custom31 ... custom40

Custom-defined dictionaries based on 3GPP 32.298 v6.4.1 for SGSN only.

- **custom31:** Custom-defined dictionary for S-CDR encoding. Includes a field appended for PLMN-ID.
- **custom33:** Custom-defined dictionary for S-CDR encoding. Includes a field appended for PLMN-ID and does not support diagnostic or SGSN-change fields.

standard

Default: Enabled
A dictionary conforming to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

Usage

Use this command to designate specific dictionary used by GTPP for specific context.

Example

The following command configures the system to use custom3 dictionary to encode IP address in Binary format in G-CDRs:

```
gtpp dictionary custom3
```

gtpp duplicate-hold-time

Configures the number of minutes to hold onto CDRs that are possibly duplicates while waiting for the primary CGF to come back up.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp duplicate-hold-time minutes *minutes*

default gtpp duplicate-hold-time

default

Resets the configuration to the default value of 60 minutes for the duplicate hold time.

minutes

When the primary CGF is down, the number of minutes to hold onto CDRs that may be duplicates. *minutes* must be an integer from 1 to 10080. Default is 60.

Usage

Use this command to configure how long to hold onto CDRs, that are possibly duplicates, while waiting for the primary CGF to come back up. If the GGSN determines that the primary CGF is down, CDRs that were sent to the primary CGF, but not acknowledged, are sent by the GGSN to the secondary CGF as "possibly duplicates". When the primary CGF comes back up, the GGSN uses GTPP to determine whether the possibly duplicate CDRs were received by the primary CGF. Then the secondary CGF is told whether to release or cancel those CDRs. This command configures how long the system should wait for the primary CGF to come back up. As soon as the configured time expires, the secondary CGF is told to release all of the possibly duplicate CDRs.

Example

Use the following command to set the amount of time to hold onto CDRs to 2 hours (120 minutes):

```
gtpp duplicate-hold-time minutes 120
```

gtpp echo-interval

Configures the frequency at which the system sends GTPP echo packets to configured CGFs.

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp echo-interval *time*

{ default | no } gtpp echo-interval

default

Resets the configuration to the default echo-interval of 60 seconds.

no

Disables the use of the echo protocol except for the scenarios described in the Usage section for this command.

time

Specifies the number of seconds for sending GTPP echo packets as an integer from 60 to 3600. Default: 60.

Usage

The GTPP echo protocol is used by the system to ensure that it can communicate with configured CGFs. The system initiates this protocol for each of the following scenarios:

- Upon system boot
- Upon the configuration of a new CGF server on the system using the **gtpp server** command as described in this chapter
- Upon the execution of the **gtpp test accounting** command as described in the Exec Mode Commands chapter of this reference
- Upon the execution of the **gtpp sequence-numbers private-extensions** command as described in this chapter

The echo-interval command is used in conjunction with the **gtpp max-retries** and **gtpp timeout** commands as described in this chapter.
In addition to receiving an echo response for this echo protocol, if we receive a GTPP Node Alive Request message or a GTPP Echo Request message from a presumed dead CGF server, we will immediately assume the server is active again.
The alive/dead status of the CGFs is used by the AAA Managers to affect the sending of CDRs to the CGFs. If all CGFs are dead, the AAA Managers will still send CDRs, (refer to the **gtpp deadtime** command), albeit at a slower rate than if a CGF were alive. Also, AAA Managers independently determine if CGFs are alive/dead.

Example

The following command configures an echo interval of 120 seconds:

```
gtpp echo-interval 120
```

gtpp egcdr

Configures the eG-CDR and P-CDR (P-GW CDR) parameters and triggers.

Platform

ASR 5000

Product

GGSN

P-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp egcdr { final-record [[include-content-ids { all | only-with-traffic }] [closing-cause { same-in-all-partials | unique }]] | losdv-max-containers *max_losdv_containers* **| lotdv-max-containers** *max_lotdv_containers* **| rulebase-max-length** *rulebase_name_max_length* **| service-data-flow threshold { interval** *interval* **| volume { downlink** *bytes* **[uplink** *bytes* **] | total** *bytes* **| uplink** *bytes* **[downlink** *bytes* **] } } | service-idle-timeout { 0 |** *service_idle_timeout* **} }**

default gtpp egcdr { final-record include-content-ids only-with-traffic closing-cause same-in-all-partials | losdv-max-containers | lotdv-max-containers | service-idle-timeout 0 }

no gtpp egcdr { rulebase-max-length | service-data-flow threshold { interval | volume { downlink [uplink] | total | uplink [downlink] } } }

---

final-record [[include-content-ids { all | only-with-traffic }] [closing-cause { same-in-all-partials | unique }]]

Enables configuration of the final eG-CDR/P-CDR.

- **include-content-ids**: Controls which content-ids are being included in the final eG-CDR/P-CDR.
  - **all**: Specifies that all content-ids be included in the final eG-CDR/P-CDR.
  - **only-with-traffic**: Specifies that only content-ids with traffic be included in the final eG-CDR/P-CDRs.
- **closing-cause**: Configures closing cause for the final eG-CDR/P-CDR.
  - **same-in-all-partials**: Specifies that the same closing cause is to be included for multiple final eG-CDR/P-CDRs.
  - **unique**: Specifies that the closing cause for final eG-CDR/P-CDRs is to be unique.

---

losdv-max-containers *max_losdv_containers*

Specifies the maximum number of List of Service Data Volume (LoSDV) containers in one eG-CDR/P-CDR. *max_losdv_containers* must be an integer from 1 through 255.
Default: 10

lotdv-max-containers *max_lotdv_containers*

Specifies the maximum number of List of Traffic Data Volume (LoTDV) containers in one eG-CDR/P-CDR. *max_lotdv_containers* must be an integer from 1 through 8.
Default: 8

rulebase-max-length *rulebase_name_max_length*

Specifies the maximum character length of charging rulebase name in LOSDVs of eG- CDR/P-GW-CDR. *rulebase_name_max_length* must be an integer from 0 through 63. Zero (0) means the rulebase name is added as-is.
Default: None. That is, full (un-truncated) charging rulebase name will go in LOSDVs of eG-CDR/P-GW-CDR.

service-data-flow threshold { interval *interval* **| volume { downlink** *bytes* **[uplink** *bytes* **] | total** *bytes* **| uplink** *bytes* **[downlink** *bytes* **] } }**

Configures the thresholds for closing a service data flow container within an eG-CDR/P-CDR.

- **interval** *interval*: Specifies the time interval (in seconds) to close the eG-CDR/P-CDR if the minimum time duration thresholds for service data flow containers satisfied in flow-based charging. The interval is an integer from 60 through 40000000. Default: Disabled
- **volume { downlink** *bytes* **[uplink** *bytes* **] | total** *bytes* **| uplink** *bytes* **[downlink** *bytes* **] }**: Specifies the volume octet counts for the generation of the interim eG-CDR/P-CDRs to the service data flow container in FBC.
  - **downlink** *bytes*: Specifies the limit for the number of downlink octets after which the eG-CDR/P-CDR is closed.
  - **total** *bytes*: Specifies the limit for the total number of octets (uplink+downlink) after which the eG-CDR/P-CDR is closed.
  - **uplink** *bytes*: Specifies the limit for the number of uplink octets after which the eG-CDR/P-CDR is closed.
  - *bytes* must be an integer from 10000 through 400000000.

A service data flow container has statistics for an individual content ID. When the threshold is reached, the service data flow container is closed.
In 12.3 and earlier releases, when the CLI command **gtpp egcdr service-data-flow threshold interval** was configured to 'n' seconds, the difference between "timeOfFirstUsage" and "timeOfReport" of LOSDV was always 'n' seconds for the LOSDVs closed due to "service-data-flow" threshold. Here, changeTime of LOSDV was reported incorrectly. It was always timeOfFirstUsage + 'n'. This does not hold true when the traffic for a particular content ID was not continuous.

service-idle-timeout { 0 | *service_idle_timeout***}**

Specifies a time period during which if no data is reported for a service flow, the service container is closed and added to eG-CDR/P-CDR (as part of LOSDV container list) with service condition change as ServiceIdleOut.
0: Specifies there is no service-idle-timeout trigger.
service_idle_timeout is an integer from 10 through 86,400. Default: 0

Usage

Use this command to configure individual triggers for eG-CDR/P-CDR generation.

Example

Use the following command to set the maximum number of LoSDV containers to 7:

```
gtpp egcdr losdv-max-containers 7
```

gtpp error-response

Configures the response when the system receives an error response after transmitting a DRT (data record transfer) request.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp error-response { discard-cdr | retry-request }

default gtpp error-response

default

Resets the system's configuration to the default value for error-response. Default is retry-request.

discard-cdr

Purges the request upon receipt of an error response and not to retry.

retry-request

Retries sending a DRT after receiving an error response. This is the default behavior.

Usage

This command configures the system's response to receiving an error message after sending a DRT request.

Example

```
gtpp error-response discard-cdr
```

gtpp max-cdrs

Configures the maximum number of charging data records (CDRs) to be included in a packet.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp max-cdrs *max_cdrs* **[wait-time** *wait_time* **]**

default gtpp max-cdrs

default

Sets the default configuration.

max_cdrs

Specifies the maximum number of CDRs to insert in a single packet as an integer from 1 through 255. Default: 1

wait-time*wait_time*

Specifies the number of seconds the GSN waits to send the packet while accumulating CDRs as defined by **max-cdrs**. If the **wait-time** interval expires before **max-cdrs** is reached, this keyword over-rides and the packet is sent. Default: Disabled
wait_time is an integer from 1 through 300.

Important: The **wait-time** interval can only be enabled if the value for **max-cdrs** is greater than 1.

Usage

The system places CDRs into a packet until either **max-cdrs** is met, **wait-time** times out, or the maximum PDU size, configured by the **gtpp max-pdu-size** command, is met.
The **gtpp max-pdu-size** and the **wait-time** parameters take priority over **max-cdrs**.

Important: This command's configuration is ignored if CDRs are stored on an SMC hard disk.

Example

The following command configures the system to place a maximum of 10 CDRs in a single GTPP packet with a wait-time of *30* seconds:

```
gtpp max-cdrs 10 wait-time 30
```

gtpp max-pdu-size

Configures the maximum payload size of a single GTPP packet that could be sent by the system.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp max-pdu-size *pdu_size*

default gtpp max-pdu-size

default

Resets the default **max-pdu-size** of 4096.

pdu_size

Specifies the maximum payload size (in bytes) of the GTPP packet as an integer from 1024 to 65400. The payload includes the CDR and the GTPP header. Default: 4096

Usage

The GTPP packet contains headers (layer 2, IP, UDP, and GTPP) followed by the CDR. Each CDR contains one or more volume containers. If a packet containing one CDR exceeds the configured maximum payload size, the system creates and send the packet containing the one CDR regardless.
The larger the packet data unit (PDU) size allowed, the more volume containers that can be fit into the CDR.
The system performs standard IP fragmentation for packets that exceed the system's maximum transmission unit (MTU).

Important: The maximum size of an IPv4 PDU (including the IPv4 and subsequent headers) is 65,535. However, a slightly smaller limit is imposed by this command because the system's max-pdu-size doesn't include the IPv4 and UDP headers, and because the system may need to encapsulate GTPP packets in a different/larger IP packet (for sending to a backup device).

Example

The following command configures a maximum PDU size of 2048 octets:

```
gtpp max-pdu-size 2048
```

gtpp max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive CGF.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp max-retries *max_attempts*

default gtpp max-retries

default

Resets the maximum number of to the default of 4.

max_attempts

Specifies the number of times the system attempts to communicate with a CGF that is not responding as an integer from 1 to 15. Default: 4

Usage

This command works in conjunction with the **gtpp detect-dead-server** and **gtpp timeout** parameters to set a limit to the number of communication failures that can occur with a configured CGF.
When the value specified by this parameter is met, a failure is logged. The **gtpp detect-dead-server** parameter specifies the number of consecutive failures that could occur before the server is marked as down. In addition, the **gtpp timeout** command controls the amount of time between re-tries.
If the value for the max-retries is met, the system begins storing CDRs in Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context). Archived CDRs are re-transmitted to the CGF until they are acknowledged or the system's memory buffer is exceeded.
Refer to the **gtpp detect-dead-server** and **gtpp timeout** commands for additional information.

Example

The following command configures the maximum number of re-tries to be 8.

```
gtpp max-retries 8
```

gtpp mbms bucket

Configures the traffic data volume (bucket) limit of charging buckets due to QoS changes of tariff time that can occur before a G-MBMS-CDR should be closed.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp mbms buckets *number*

[no] gtpp mbms buckets

no

Disables the configured traffic data volume bucket limits trigger for G-MBMS-CDR generation for MBMs user service data.

number

Specifies the number of statistics container changes due to QoS changes or tariff time that can occur before a G-MBMS-CDR should be closed as an integer from 1 through 4. Default: 4

Usage

Use this command to configure the traffic data volume (bucket) based G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the bucket-based trigger to generate G-MBMS-CDRs after changes in *2* container:

```
gtpp mbms buckets 2
```

gtpp mbms interval

Configures the interval duration for interval-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp mbms interval *duration_sec*

no gtpp mbms interval

no

Disables the interval-based trigger for G-MBMS-CDR generation for MBMs user service data.

duration_sec

Specifies the normal time duration (in seconds) that must elapse before closing an accounting record provided that any or all of the following conditions occur:

- Downlink traffic volume is reached within the time interval
- Tariff time based trigger occurred within the time interval
- Data volume (up and downlink) bucket trigger occurred within the time interval

duration_sec is an integer from 60 through 40,000,000. Default: Disabled

Usage

Use this command to configure the G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the interval-based trigger to generate G-MBMS-CDRs in every *60* seconds:

```
gtpp mbms interval 60
```

gtpp mbms tariff

Configures the tariff slots for tariff-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp mbms tariff time1 *mins hours* **[time2** *mins hours* **[time3***mins hours* **[time4***mins hours* **]]]**

no gtpp mbms tariff

no

Disables the tariff-based triggers for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

tariff time1 *mins hours* **[time2***mins hours* **[time3***mins hours* **[time4***mins hours* **]]]**

Specifies time-of-day time values to close the current statistics container (but not necessarily the accounting record). Default: Disabled

Important: The system assumes that the billing system uses the day/date to determine if the statistics container represents an actual tariff period.

For each of the different tariff times, the following parameters must be configured:

- *mins*: Minute of the hour, an integer from 0 through 59.
- *hours*: Hour of the day, an integer from 0 through 23.

Usage

Use this command to configure the tariff-time-based triggers for G-MBMS-CDR generation in MBMS user data service.

Example

The following command configures the tariff-time-based trigger to generate G-MBMS-CDRs every day at 11 hours and 30 min:

```
gtpp mbms tariff time1 30 11
```

gtpp mbms volume

Configures the download traffic data volume based trigger for GTPP MBMS Charging Data Record (G-MBMS-CDR) generation.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp mbms volume *download_bytes*

no gtpp mbms volume

no

Disables the configured download traffic data volume based trigger for G-MBMS-CDR generation for MBMs user service data.

volume *download_bytes*

Specifies the threshold of downlink data volumes that (in bytes) must be met before a G-MBMS-CDR should be closed as an integer from 100000 through 4000000000. Default: Disabled

Usage

Use this command to configure the traffic data volume (download) based G-MBMS-CDR generation triggers for MBMS user data service.

Example

The following command configures the traffic data volume (download) limit to trigger to generate G-MBMS-CDRs after reaching 150,000 octets:

```
gtpp mbms volume download_bytes
```

gtpp redirection-allowed

Configures the system to allow/disallow the redirection of CDRs when the primary CGF is unavailable.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

[default | no] gtpp redirection-allowed

default

Resets the system to allow redirection of CDRs.

no

Removes the redirection definition from the configuration.

Usage

This command allows operators to better handle erratic network links, without having to remove the configuration of the backup server(s) via the **no gtpp server** command.
This functionality is enabled by default.
If the **no gtpp redirection-allowed** command is executed, the system only sends CDRs to the primary CGF. If that CGF goes down, the system will buffer the CDRs in memory until the CGF comes back or until the system runs out of buffer memory. In addition, if the primary CGF announces its intent to go down (with a GTPP Redirection Request message), the system responds to that request with an error response.

Example

The following command configures the system to allow the redirection of CDRs when the primary CGF is unavailable:

```
default gtpp redirection-allowed
```

gtpp redirection-disallowed

This command has been obsoleted and is replaced by the **gtpp redirection-allowed** command.

gtpp server

Configures the charging gateway function (CGF) accounting server(s) with in GTPP server group that the system is to communicate with.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp server *ip_address* **[max** *msgs* **] [priority** *priority* **] [udp-port** *port* **] [node-alive { enable | disable }] [-noconfirm]**

no gtpp server *ip_address* **[udp-port** *port* **]**

no

Deletes a previously configured CGF.

ip_address

Specifies the IP address of the CGF in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

max *msgs*

Specifies the maximum number of outstanding or unacknowledged GTPP packets (from any one AAA Manager task) allowed for this CGF before the system begins buffering the packets.
msgs can be configured to an integer from 1 to 256. Default: 256

priority*priority*

Default:1000
Specifies the relative priority of this CGF as an integer from 1 through 1000. When multiple CGFs are configured, the priority is used to determine which CGF server to send accounting data to. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this.
If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.

udp-port*port*

Specifies the UDP port over which the GGSN communicates with the CGF. as an integer from 1 through 65535. Default: 3386

node-alive { enable | disable }

Enable or disables GGSN sending Node Alive Request to a GTPP Server (such as CGF). This configuration can be done per GTPP Server. Default: Disable.

-noconfirm

Executes this command without any additional prompt and confirmation from the user.

Usage

Use this command to configure the CGF(s) that the system sends CDR accounting data to.
Multiple CGFs can be configured using multiple instances of this command subject to the following limits:

- Up to 4 CGFs can be configured in one GTPP server group
- Total of 32 CGFs can be configured per context.

Each configured CGF can be assigned a priority. The priority is used to determine which server to use for any given subscriber based on the routing algorithm that has been implemented. A CGF with a priority of "1" has the highest priority.

Important: The configuration of multiple CGFs with the same IP address but different port numbers is not supported.

Each CGF can also be configured with the maximum allowable number of unacknowledged GTPP packets. Since multiple AAA Manager tasks could be communicating with the same CGF, the maximum is based on any one AAA Manager instance. If the maximum is reached, the system buffers the packets Random Access Memory (RAM). The system allocates memory as a buffer, enough to store one million CDRs for a fully loaded chassis (a maximum of one outstanding CDR per PDP context).

Example

The following command configures a CGF with an IP address of 192.168.2.2 and a priority of 5.

```
gtpp server 192.168.2.2 priority 5
```

The following command deletes a previously configured CGF with an IP address of 100.10.35.7:

```
no gtpp server 100.10.35.7
```

gtpp source-port-validation

Configures whether the system validates the UDP source port in received GTPP messages.

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

[no] gtpp storage-server *ip_address* **port** *port_num*

no

Removes a previously configured back-up storage server.

ip_address

The IP address of the back-up storage server expressed in IPv4 dotted-decimal notation.

port *port_num*

Specifies the UDP port number over which the GGSN communicates with the back-up storage server.
Default: 3386

Usage

This command identifies the connection to the GSS. One backup storage server can be configured per GTPP group.

Example

The following command configures a GSS with an IP address of 192.168.1.2:

```
gtpp storage-server 192.168.1.2
```

gtpp storage-server local file

Configures the parameters for GTPP files stored locally on the GTPP storage server.

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp storage-server local file { compression { gzip | none } | format { custom1 | custom2 | custom3 | custom4 | custom5 | custom6 | custom7 | custom8 } | name { format *string* **[max-file-seq-num** *seq_number* **] | prefix** *prefix* **} | purge-processed-files [file-name-pattern** *name_pattern* **| purge-interval** *purge_interval* **] | rotation { cdr-count** *count* **| time-interval** *time* **[force-file-rotation] | volume mb** *size* **} |]**

default gtpp storage-server local file { compression | format | name { format | prefix } | purge-processed-files | rotation { cdr-count | time-interval | volume } }

no gtpp storage-server local file { purge-processed-files | rotation { cdr-count | time-interval } }

no

Removes a previously configured parameters for local storage of CDR files on HDD on SMC card.

compression { gzip | none }

Configures the type of compression to be used on the files stored locally.
gzip – Enables Gzip file compression.
none – Disables Gzip file compression -this is the default value.

format custom1 .. 8

Configures the file format to be used to format files to be stored locally.
custom1 – File format custom1 - this is the default file format.
custom2 to custom5 Customer specific CDR file formats.
custom6 – File format custom6 with a block size of 8K for CDR files.
custom7 – File format custom7 is a customer specific CDR file format.

custom8 — File format custom8 is a customer specific CDR file format. It uses *node-id-suffix_date_time_fixed-length-seq-num*.u format for file naming where:

- *date* is date in MMDDYYYYY (01312010) for mat
- *time* is time in HHMMSS (023508) format
- *fixed-length-seq-num* is the fixed length of the sequence number for s specific file having a 6-digit counter starting from 000001 and ending at 999999. When file sequence reaches 999999, the sequence is reset to 000001.

---

name format *string*

Allows the format of the CDR filenames to be configured independently so that the name format contains the file name with conversion specifications.
string **—**is an alphanumeric string of 1 through 127 characters. It **must begin** with the % (percent sign).

- **%y** = year as a decimal number without century (range 00 to 99).
- **%Y** = year as a decimal number with century.
- **%m** = month as a decimal number (range 01 to 12).
- **%d** = day of the month as a decimal number (range 01 to 31).
- **%H** = hour as a decimal number 24-hour format (range 00 to 23).
- **%h** = hour as a decimal number 12-hour format (range 01 to 12).
- **%M** = minute as a decimal number (range 00 to 59).
- **%S** = second as a decimal number (range 00 to 60). (The range is up to 60 to allow occasional leap seconds.)
- **%Q** = file sequence number. Field width may be specified between the % and the Q. If the natural size of the field is smaller than this width, then the result string is padded (on the left) to the specified width with 0s
- **%N** = No of CDRs in the file. Field width may be specified between the % and the N. If the natural size of the field is smaller than this width, then the result string is padded (on the left) to the specified width with 0s
- **%%** = This field is used to add % to the CDR file name.
- **max-file-seq-no**: This can be configured optionally. It indicates the maximum value of sequence number in file name (starts from 1). Once the configured max-file-seq-no limit is reached, the sequence number will restart from 1. If no max-file-seq-no is specified then file sequence number ranges from 1- 4294967295.

By default the above keyword is not configured (default gtpp storage-server local file name format). In which case the CDR filenames are generated based on the file format as before (maintains backward compatibility).

---

name prefix *prefix*

Defines the prefix to be used for the file name. By default the file name prefix would be “GTPP-group-name + VPN-ID”. It is possible to have a NULL value prefix where the system would enter a default, which would be *group+vpn*,
prefix **—** is an alphanumeric string of 1 through 64 characters, Do not enter a value (NULL).

---

purge-processed-files [file-name-pattern *name_pattern* **| purge-interval** *purge_interval* **]**

Default: Disabled

Enables the GSN to periodically delete locally processed (*.p) CDR files from the HDD on the SMC card.

Important: This option is available only when GTPP server storage mode is configured for local storage of CDRs with the **gtpp storage-server mode local** command and the **purge-processed-files parameters** is enabled.

file-name-pattern *name_pattern*: Defines a pattern for the file name that will be used to match against the files to be purged. This means that the only files to be selected and deleted will be those with names matching this pattern and whose age (when to purge) has been specified with the existing **purge-interval** parameter.
name_pattern is an alphanumeric string of up to127 characters that can contain '*' (wild card to match 0+ chars) and one or more ':' (to specify alternate, synonymous with '|'); for example: file-name-pattern "*.P:*.dat" matches "anything.P" AND "anything.dat"
purge-interval *purge_interval*: Specifies the purge interval duration in minutes as an integer from 1 through 259200. Default: 60

rotation { cdr-count *count* **| time-interval** *time* **[force-rotation] | volume** *size* **}**

Specifies rotation related configuration for GTPP files stored locally.
cdr-count *count*: Configures the CDR count for the file rotation as an integer from 1000 through 65000. Default value 10000.
time-interval *time*: Configures the time interval for file rotation (in seconds) as an integer from 30 through 86400. Default: 3600 (1 hour).
force-file-rotation : Forces CDR file-rotation at a specified interval configured via the **time-interval** keyword, even if no CDRs were generated. By default this keyword is Disabled.
volume *size*—: Configures the file volume (in megabytes) for file rotation as an integer from 2 through 40. This trigger can not be disabled. Default: 10

Usage

This command configures the parameters for storage of GTPP packets as files on the local server - meaning the hard disk drive (HDD).

Example

The following command configures rotation for every 1.5 hours for locally stored files.

```
gtpp storage-server local file rotation time-interval 5400
```

Configuring file name format along with max-file-seq-no:

```
gtpp storage-server local file name format processed_2g_%Y%m%d_%5Q_%N.cdr
max-file-seq-no 2345
```

Configuring file name prefix with a NULL value:

```
gtpp storage-server local file name prefix NULL
```

Configure the file name pattern and purge interval to setup file purging from the HDD:

```
gtpp storage-server local file purge-processed-files file-name-pattern
*.z purge-interval 4
```

gtpp storage-server max-retries

Configures the maximum number of times the system attempts to communicate with an unresponsive GTPP back-up storage server.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

[default] gtpp storage-server max-retries *max_attempts*

default

Restores the system to the default value of 2 retry attempts.

max_attempts

Specifies the number of times the system attempts to communicate with a GTPP back-up storage server that is not responding as an integer from 1 to 15. Default: 2

Usage

This command works in conjunction with the **gtpp storage-server timeout** parameters to set a limit to the number of communication failures that can occur with a configured GTPP back-up storage server.
The **gtpp storage-server timeout** command controls the amount of time between retries. Refer to the description of this command for additional information.

Example

The following command configures the maximum number of re-tries to be 8.

```
gtpp storage-server max-retries 8
```

gtpp storage-server mode

Configures storage mode, local or remote, for CDRs. Local storage mode is available with ASR 5000 platforms only.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp storage-server mode { local | remote | streaming }

default gtpp storage-server mode

default

Returns the GTPP group configuration to the default "remote" value for the GTPP storage server mode.

local

Specifies the use of the hard disk for storing CDRs. Default: Disabled

Important: This option is available with ASR 5000 platforms only.

remote

Specifies the use of an external server for storing CDRs. This is the default value.

Important: When the external server is down, the Session Managers will start buffering up to a maximum of 26400 CDRs or a total of 120 MB worth of CDRs, whichever limit reaches first. The maximum CDR limit specified is per the session manager. The chassis level limit varies depending on the number of session manager instances and number of active cards.

streaming

Default: Disabled
This keyword allows the operator to configure "streaming" mode of operation for GTPP group. When this keyword is supplied the CDRs will be stored in following fashion:

- When GTPP link is active with CGF, CDRs are sent to a CGF via GTPP and local hard disk is NOT used as long as every record is acknowledged in time.

- If the GTPP connection is considered to be down, all streaming CDRs will be saved temporarily on the local hard disk and once the connection is restored, unacknowledged records will be retrieved from the hard disk and sent to the CGF.

Important: This option is available with ASR 5000 platforms only.

Usage

This command configures whether the CDRs should be stored on the hard disk of the SMC or remotely, on an external server.

Example

The following command configures use of a hard disk for storing CDRs.

```
gtpp storage-server mode local
```

gtpp storage-server timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the GTPP back-up storage server.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

[default] gtpp storage-server timeout *duration*

default

Restores the timeout duration to the default of 30 seconds.

duration

Specifies the maximum amount of time (in seconds) that the system waits for a response from the GTPP back-up storage server before assuming the packet is lost.
duration is an integer from 30 through 120. Default: 30

Usage

This command works in conjunction with the **gtpp storage-server max-retries** command to establish a limit on the number of times that communication with a GTPP back-up storage server is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of *60* seconds:

```
gtpp storage-server timeout 60
```

gtpp suppress-cdrs zero-volume-and-duration

Suppresses the CDRs created by session having zero duration and/or zero volume. By default this mode is “disabled”.

Platform

ASR 5000

Product

GGSN

P-GW

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp suppress-cdrs zero-volume-and-duration { gcdrs [egcdrs] | egcdrs [gcdrs] }

default gtpp suppress-cdrs zero-volume-and-duration

default

Disables the CDR suppression mode.

gcdrs [egcdrs]

Specifies that this command will handle G-CDRs before eG-CDR/P-CDRs.

gcdrs [egcdrs]

Specifies that this command will handle eG-CDR/P-CDRs before G-CDRs.

Usage

Use this command to suppress the CDRs (G-CDRs and eG-CDR/P-CDRs) which were created due with zero-duration session and zero-volume session due to any reason. By default this command is disabled and system will not suppress any CDR.

Example

The following command configures the system to suppression the eG-CDR/P-CDRs created for a zero duration session or zero volume session:

```
gtpp suppress-cdrs zero-volume-and-duration egcdrs gcdrs
```

gtpp timeout

Configures the amount of time that must pass with no response before the system re-attempts to communicate with the CGF.

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

[default] gtpp timeout *time*

default

Resets the systems GTPP timeout value to 20 seconds.

time

Specifies the maximum amount of time (in seconds) the system waits for a response from the CGF before assuming the packet is lost.
time is an integer from 1 through 60. Default: 20

Usage

This command works in conjunction with the **gtpp max-retries** command to establish a limit on the number of times that communication with a CGF is attempted before a failure is logged.
This parameter specifies the time between retries.

Example

The following command configures a retry timeout of 30 seconds:

```
gtpp timeout 30
```

gtpp trigger

Disables GTPP trigger conditions that cause either partial CDR record closure or opening of a new CDR record container. GTPP Triggers are specified in 3GPP TS 32.251 v6.6.0. All GTPP trigger changes take effect immediately, except **volume-limit**.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp trigger { cell-update | direct-tunnel | egcdr max-losdv | ggsn-preservation-mode-change | inter-plmn-sgsn-change | ms-timezone-change | plmn-id-change | qos-change | rat-change [generate { cdr | container }] | routing-area-update | sgsn-change-limit | serving-node-change-limit | tariff-time-change | time-limit| volume-limit }

default gtpp trigger

no gtpp trigger { cell-update | direct-tunnel | egcdr max-losdv | ggsn-preservation-mode-change | inter-plmn-sgsn-change | ms-timezone-change | plmn-id-change | qos-change | rat-change | routing-area-update | sgsn-change-limit | serving-node-change-limit | tariff-time-change | time-limit | volume-limit }

default

Sets the specified trigger condition back to the default setting. All trigger conditions are enabled by default.

no

Re-enables the specified trigger condition.

cell-update

Enables the cell update trigger for S-CDRs, if the dictionary specified in the **gtpp dictionary** configuration includes support for cell update. This trigger is available only for 2G. Currently, custom18 dictionary supports the cell update trigger.

direct-tunnel

Enables the direct tunnel trigger for CDRs.

egcdr max-losdv

Enables the trigger for an eG-CDR/P-CDR if the List of Service Data Volume (LoSDV) containers crosses the configured limit for LOSDV containers. Default: Disabled

ggsn-preservation-mode-change

This keyword is for GGSN only.
This trigger enables the preservation-mode-change trigger for G-CDR

inter-plmn-sgsn-change

This keyword is for GGSN only.
Disabling this trigger ignores an Inter-PLMN SGSN change and doesn't release a G-CDR. Default: Enabled

ms-timezone-change

This keyword is specific to GGSN.
No partial record closure for a time zone change occurs when this trigger is disabled. MS time zone change should be applicable only for 3GPP R6 based GTPP dictionaries. Default: Enabled

plmn-id-change

This trigger keyword is specific to the 2G SGSN and is proprietary (non-standard).
Enables the PLMNID change trigger for S-CDRs if the dictionary specified in the **gtpp dictionary** configuration supports the PLMNID change. If enabled, the SGSN generates a partial S-CDR when the MS changes the PLMN while under the same SGSN (intra-system intra-SGSN PLMN-ID handover). Currently, custom18 dictionary supports this trigger. Default: Disabled

qos-change

Enables the QoS-change trigger for CDRs. Disabling this trigger ignores a QoS-change and does not open a new CDR for it. Default: Enabled

rat-change [generate { cdr | container }]

Enables or disables the partial record closure for a RAT change. If disabled, no partial record closure for a RAT change occurs. RAT change should be applicable only for 3GPP R6 based GTPP dictionaries. Default: Enabled
In SGSN, RAT change trigger (2G<->3G) means inter-service handoff (SGSN service <-> GPRS service). If this trigger is enabled, after the RAT change interim CDR is generated. After this RAT change CDR, CDR thresholds such as volume/time etc. and GTPP Group are applicable from new service. If RAT change trigger is disabled, the CDR thresholds and GTPP group etc. will not change and will continue to use from old service.
After the RAT change, the System Type field in CDR changes to indicate the new system type. If this trigger is disabled, then the next CDR generated will indicate System Type, but the data count in the CDR does not necessarily belong to the system type indicated in CDR; instead, it may belong to both 2G and 3G as CDR is not closing when handover takes place.

Important: The System Type field in CDR-related change is not applicable to customized CDR formats, which does not use the System Type field

generate { cdr | container }: Sets generation of CDR or just a Container on a RAT change.
cdr: Generates a CDR on a RAT-change.

container: Generates a container only on a RAT-change.

routing-area-update

Enables the routing-area-update trigger for CDRs.

sgsn-change-limit [also-intra-sgsn-multiple-address-group-change]

This keyword is obsolete and is available to maintain the backward compatibility for existing customers. The new keyword for **sgsn-change-limit** is **serving-node-change-limit**. Default: Enabled
Disabling this trigger ignores an SGSN change and does not add the SGSN IP address into the SGSN address list of the CDR. This helps to reduce the release of CDRs due to SGSN changes crossing the configured limit.
also-intra-sgsn-multiple-address-group-change: This keyword includes Intra-SGSN group changes as an SGSN change.

serving-node-change-limit [also-intra-sgsn-multiple-address-group-change]

This keyword is enabled for PGW, SGW, and GGSN. However, the **also-intra-sgsn-multiple-address-group-change** is enabled only for GGSN. Default: Enabled
Disabling this trigger ignores an SGSN change and does not add the SGSN IP address into the SGSN address list of the CDR. This helps to reduce the release of CDRs due to SGSN changes crossing the configured limit.
also-intra-sgsn-multiple-address-group-change: This keyword includes Intra-SGSN group changes as an SGSN change.

tariff-time-change

When this trigger is disabled, container closure does not happen for a tariff-time change. Default: Enabled
This trigger is applicable for G-MB-CDRs for MBMS session too.

time-limit

When this trigger is disabled, no partial record closure occurs when the configured time limit is reached. Default: Enabled
This trigger is applicable for G-MB-CDRs for MBMS session too.

volume-limit

When this trigger is disabled no partial record closure occurs when volume limit is reached. Default: Enabled
This trigger is applicable for G-MB-CDRs for MBMS session too.

Usage

Use this command to disable or enable GTTP triggers that can cause partial CDR record closure or cause a new CDR to be created.

Example

The following command disables partial record closure when a configured time limit is reached:

```
gtpp trigger time-limit
```

The following command re-enables partial record closure when a configured time limit is reached:

```
no gtpp trigger time-limit
```

gtpp transport-layer

Selects the transport layer protocol for Ga interface for communication between AGW (GSNs) and GTPP servers.

Platform

ASR 5000

Product

GGSN

P-GW

SGSN

S-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > GTPP Server Group Configuration

configure > context *context_name* **> gtpp group** *group_name*

Syntax

gtpp transport-layer { tcp | udp }

default gtpp transport-layer

default

Resets the transport layer protocol to GTPP servers to the default of UDP.

tcp

Enables the system to implement TCP as transport layer protocol for communication with GTPP server.
Default: Disabled

udp

Enables the system to implement UDP as transport layer protocol for communication with GTPP server.
Default: Enabled

Usage

Use this command to select the TCP or UDP as the transport layer protocol for Ga interface communication between GTPP servers and AGWs (GSNs).

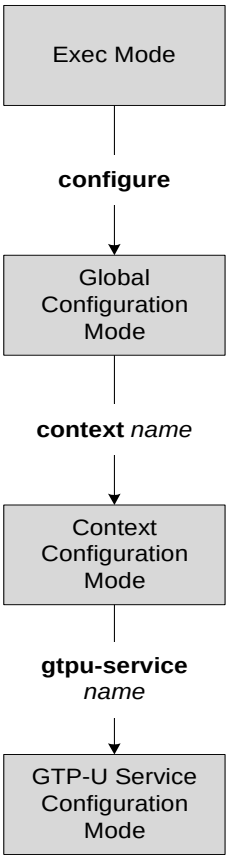
Example

The following command enables TCP as the transport layer protocol for the GSN's Ga interface.

```
gtpp transport-layer tcp
```

Chapter 140
GTP-U Service Configuration Mode Commands

The GTP-U Service Configuration Mode is used to manage parameters applied to incoming GTP-U packets.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind

Configures the IP address to use for GTP-U data packets.

Platform

ASR 5000

Product

GGSN

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > GTP-U Service Configuration

configure > context *context_name* **> gtpu-service** *service_name*

Syntax

[no] bind { ipv4-address *ipv4_address* **[crypto-template** *crypto_template* **] [ike-bind-address { ipv4_address }] [ipv6-address** *ipv6_address* **] | ipv6-address** *ipv6_address* **[crypto-template** *crypto_template* **] [ike-bind-address { ipv6_address }] [ipv4-address** *ipv4_address* **] }**

no

removes a configured IP address from this service.

ipv4-address *ipv4_address*

Binds this service to the IPv4 address of a configured interface.
ipv4_address must be entered using IPv4 dotted-decimal notation.

ipv6-address *ipv6_address*

Binds this service to the IPv6 address of a configured interface.
ipv6_address must be entered using IPv6 colon-separated-hexadecimal notation.

crypto-template *crypto_template*

Configures crypto template for IPSec, which enables IPSec tunneling for this GTP-U address. Must be followed by the name of an existing crypto template.
crypto_template must be an alphanumeric string of 1 through 127 characters.

ike-bind-address *ip_address*

Configures an IKE bind address. Must be followed by IPv4 or IPv6 address; IP address type must be the same as the GTP-U address type.
ipv4_address must be entered using IPv4 dotted-decimal notation.
ipv6_address must be entered using IPv6 colon-separated-hexadecimal notation.

Important: This keyword is only applicable if a crypto template is bound to the GTP-U address.

Usage

Use this command to bind the service to an interface for sending/receiving GTP-U packets.

Important: A GTP-U service can support a maximum of 12 GTP-U endpoints/interfaces.

Example

The following command configures the IPv4 address for this GTP-U service as *10.2.3.4*:

```
bind ipv4-address 10.2.3.4
```

echo-interval

Configures the rate at which GPRS Tunneling Protocol (GTP) v1-U echo packets are sent.

Platform

ASR 5000

Product

GGSN

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > GTP-U Service Configuration

configure > context *context_name* **> gtpu-service** *service_name*

Syntax

echo-interval *seconds*

{ default | no } echo-interval

default

Returns the command to its default settings.

no

Removes the configured echo-interval setting.

seconds

Specifies the number of seconds between the sending of a GTP-Uv1 echo packet. *seconds* must be an integer from 60 through 3600. Default: 60

Usage

Use this command to configure the rate at which GTP-Uv1 echo packets are sent.

Example

The following command sets the rate between the sending of echo packets at *120* seconds:

```
echo-interval 120
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

extension-header

Configures the addition of an extension header in the GTP-U packet header, allowing for error indication messages.

Platform

ASR 5000

Product

GGSN

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > GTP-U Service Configuration

configure > context *context_name* **> gtpu-service** *service_name*

Syntax

[default | no] extension-header source-udp-port

default

Returns the command to its default setting of disabled.

no

Disables the feature.

source-udp-port

Configures extension header type UDP Port support in GTP-U header for GTP-U Error Indication messages.

Usage

Use this command to configure the addition of an extension header in the GTP-U packet to allow for error indication messages

Example

The following command enables the inclusion of an extension header to allow for error indication messages:

```
extension-header source-udp-port
```

ipsec-allow-error-ind-in-clear

Configures whether error-indication is dropped or sent without IPSec tunnel.

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > GTP-U Service Configuration

configure > context *context_name* **> gtpu-service** *service_name*

Syntax

[default | no] ipsec-allow-error-ind-in-clear

default

Error-indication is dropped if no IPSec tunnel is present for that peer.

no

Disables the feature.

Usage

Use this command to determine whether error-indication is dropped or sent without an IPSec tunnel.
On receiving data packets for a session that does not exist, error-indication needs to be sent back to the peer. If there is no IPSec tunnel present with that peer, error-indication may be either dropped or sent without any IPSec tunnel.

Example

The following command allows error-indication to be sent without any IPSec tunnel:

```
ipsec-allow-error-ind-in-clear
```

ipsec-tunnel-idle-timeout

Configures the IPSec tunnel idle timeout after which IPSec tunnel deletion is triggered.

Platform

ASR 5000

Product

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > GTP-U Service Configuration

configure > context *context_name* **> gtpu-service** *service_name*

Syntax

ipsec-tunnel-idle-timeout *seconds*

default ipsec-tunnel-idle-timeout

seconds

Default: 60
Specifies the number of seconds an IPSec tunnel is idle before tunnel deletion is triggered. *seconds* must be an integer from 10 through 600.

default

Returns the command to its default setting of 60.

Usage

When there are no bearers on a particular IPSec tunnel, GTPUMGR initiates the delete for that tunnel. This timer helps to avoid unnecessary IPSec tunnel deletions for an idle tunnel.

Example

The following command sets the IPsec tunnel idle timeout to *100* seconds:

```
ipsec-tunnel-idle-timeout 100
```

max-retransmissions

Configures the maximum retry limit for GTP-U echo retransmissions.

Platform

ASR 5000

Product

GGSN

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > GTP-U Service Configuration

configure > context *context_name* **> gtpu-service** *service_name*

Syntax

max-retransmissions *num*

no max-retransmissions

num

Default: 4
Specifies the number of GTP-U echo message retransmissions allowed before triggering a path failure error condition. *num* must be an integer from 0 through 15.

no

Disables the feature.

Usage

Use this command to set the maximum number of GTP-U echo message retransmissions in order to define a limit that triggers a path failure error.

Example

The following command sets the maximum GTP-U echo message retransmissions for this service to *10*:

```
max-retransmissions 10
```

path-failure detection-policy

Configures a path failure detection policy on GTP-U echo messages that have been retransmitted the maximum number of retry times.

Platform

ASR 5000

Product

GGSN

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > GTP-U Service Configuration

configure > context *context_name* **> gtpu-service** *service_name*

Syntax

path-failure detection-policy gtp echo

[default | no] path-failure detection-policy

gtp echo

Sets the detection policy to detect a failure upon reaching the maximum number of GTP-U echo message retransmissions.

default

Resets the command to its default setting of enabled.

no

Disables the feature.

Usage

Use this command to set the detection policy for path failures.

Example

The following command sets the path failure detection policy to detect failures upon reaching the maximum number of GTP-U echo message retries:

```
path-failure detection-policy gtp echo
```

retransmission-timeout

Configures retransmission timeout for GTPU echo message retransmissions for this service.

Platform

ASR 5000

Product

GGSN

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > GTP-U Service Configuration

configure > context *context_name* **> gtpu-service** *service_name*

Syntax

retransmission-timeout *seconds*

default retransmission-timeout

default

Returns the command to its default setting of 5.

seconds

Default: 5
Specifies the number of seconds between the re-sending of GTP-U echo messages. *seconds* must be an integer from 1 through 20.

Usage

Use this command to set the number of seconds between the retransmission of GTP-U echo messages.

Example

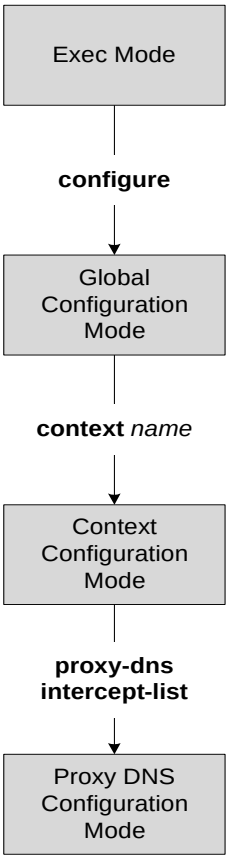
The following command sets the number of seconds between the sending of GTP-U echo messages to 7:

```
retransmission-timeout 7
```

Chapter 141
HA Proxy DNS Configuration Mode Commands

The HA Proxy DNS Configuration Mode is used to create rules for Home Agent (HA) proxy DNS intercept lists that redirect packets with unknown foreign DNS addresses to a home network DNS server.

Important: HA Proxy DNS Intercept is a license-enabled feature.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

pass-thru

Sets IP addresses that should be allowed through the proxy DNS intercept feature.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Proxy DNS Configuration

configure > context *context_name* **> proxy-dns intercept-list**

Syntax

[no] pass-thru *ip_address* **[/***ip_mask* **]**

no

Removes the DNS IP address from the pass-thru rule.

pass-thru *ip_address* **[/***ip_mask* **]**

Specifies an DNS IP address that is allowed through the intercept feature.
ip_address [/*ip_mask*]: Specifies the IP address and network mask bits. *ip_address* [/*ip_mask*] is specified using IPv4 dotted decimal or IPv6 colon-separated-hexadecimal notation. The mask bits are a numeric value which is the number of bits in the subnet mask (CIDR notation).

Usage

Use this command to identify DNS IP addresses that should be allowed through the intercept feature. For a more detailed explanation of the proxy DNS intercept feature, see the **proxy-dns intercept-list** command in the *Context Configuration Mode Commands* chapter. A maximum of 16 intercept rules (either **redirect** or **pass-thru**) are allow for each intercept list.

Important: To allow packets through that do not match either the **pass-thru** or **redirect** rules, set a **pass-thru** rule address as: 0.0.0.0/0. If a packet does not match either the **pass-thru** or **redirect** rule, the packet is dropped.

Example

The following command allows a foreign network's DNS with an IP address of *10.2.55.12* to avoid being redirected:

```
pass-thru 10.2.55.12
```

redirect

Redirects DNS IP addresses from foreign networks matching an IP address in this command to a home network DNS.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Proxy DNS Configuration

configure > context *context_name* **> proxy-dns intercept-list**

Syntax

[no] redirect *any* **[primary-dns** *ip_address* **[secondary-dns** *ip_address* **]]**

no

Removes the DNS IP address from the redirect rule.

primary-dns *ip_address*

Specifies the IP address of the primary home network DNS.
ip_address is specified using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

secondary-dns *ip_address*

Specifies the IP address of the secondary home network DNS.
ip_address is specified using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

Usage

Use this command to identify DNS IP addresses from foreign networks that are to be redirected to the home DNS. For a more detailed explanation of the Proxy DNS feature, see the proxy-dns intercept-list command in the *Context Configuration Mode Commands* chapter. A maximum of 16 intercept rules (either **redirect** or **pass-thru**) are allow for each intercept list.
Since this command is configured in the source context, the destination context containing the path to the home network DNS is identified using the Context Configuration Mode command **ip dns-proxy source-address**.

Important: If a packet does not match the **pass-thru** or **redirect** rule, the packet is dropped. If **primary-dns** or **secondary-dns** is not configured, DNS messages are redirected to the primary-dns-server (or the secondary-dns-server) configured for the subscriber OR inside the context.

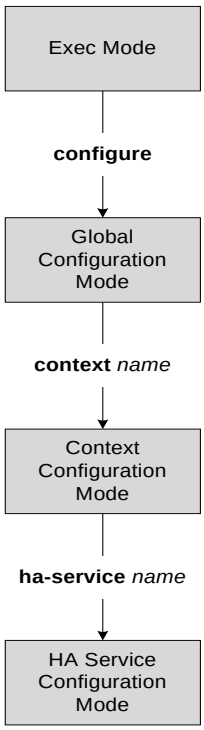
Example

The following command identifies a foreign network DNS with an IP address of *10.2.55.12* and redirects it to a primary home network DNS with an IP address of *10.3.4.5*:

```
predirect 10.2.55.12 primary-dns 10.3.4.5
```

Chapter 142
HA Service Configuration Mode Commands

The HA Service Configuration Mode is used to create and manage the Home Agent (HA) services within the current context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

a11-signalling-packets

Applies Differentiated Services Code Point (DSCP) marking for IP headers carrying outgoing signalling packets.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

a11-signalling-packets ip-header-dscp *ip-header-dscp***{ default | no } a11-signalling-packets ip-header-dscp**

no

Disables DSCP marking for IP header encapsulation for the HA service.

default

Configures DSCP marking for IP header encapsulation for a specific HA service.

ip-header-dscp

Is a hexadecimal number between 0x0 and 0x3F.

Usage

The following command is used to apply DSCP marking for IP header carrying outgoing signalling packets.

Example

The following command applies DSCP marking for IP header carrying outgoing signalling packets.
a11-signalling-packets ip-header-dscp 0x2f

aaa

Configures the sending of subscriber session AAA accounting by the HA service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

aaa { accounting | group *string* **}**

no aaa { accounting | group }

default aaa accounting

no

Disables AAA accounting for the HA service.

default

Configures AAA parameters for specific HA service

accounting

accounting Enables the sending of AAA accounting information for subscriber sessions by the Home Agent (HA), by default is enabled.

group

group configures aaa group for ha-service, **group** has lower priority than subscriber/apn config.
string: size ranges between *1* and *63*.

Usage

Enabling the HA service will send all accounting data (start, stop, and interim) to the configured AAA servers.
The chassis is shipped from the factory with the AAA accounting enabled.

Important: In order for this command to function properly, AAA accounting must be enabled for the context in which the HA service is configured using the aaa accounting subscriber radius command.

Example

The following command disables aaa accounting for the HA service:

```
no aaa accounting
```

access-network

Configures a specific access network configuration.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

access-network accounting identifier *access_network_accounting_identifier***no access-network accounting identifier**

no

Disables a specific access network configuration.

---

accounting

Specifies an access network configuration for accounting

identifier

Specifies an access network accounting identifier

access_network_accounting_identifier

This is an alphanumeric string of 1 through 128 characters.

Usage

This command is used to configure an access network for accounting.

Example

The following command configures an access network for accounting with the identifier *idnt*:

access-network accounting identifier idnt

associate

Associates an HA-service with a QoS policy.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

associate qci-qos-mapping *string*

no associate qci-qos-mapping

no

Disables the association of an HA-service with a QoS policy.

qci-qos-mapping*string*

Maps a QoS Class Identifier (QCI) for this HA service.

string is an alphanumeric string of 1 through 63 characters.

Usage

This command associates an HA-service with a QoS policy.

Example

The following command associates an HA-service with a QCI *map01*.
associate qci-qos-mapping map01

authentication

Configures authentication parameters for a specific HA service within a context.

Platform

ASR 5000

Product

HA

ASN-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

authentication { aaa-distributed-mip-keys [disabled | optional | required] | dmu-refresh-key | imsi-auth| mn-aaa { allow-noauth | always| dereg-noauth | noauth | renew-reg-noauth | renew-and-dereg-noauth } | mn-ha { allow-noauth | always } | pmip-auth | stale-key-disconnect }

no authentication { imsi-auth | pmip-auth }

default authentication { aaa-distributed-mip-keys | dmu-refresh-key | imsi-auth | mn-aaa | mn-ha | pmip-auth | stale-key-disconnect }

no

Disable the parameter.

default

Resets the specified option to its default setting.

aaa-distributed-mip-keys [disabled | optional |required]

Configures use of AAA distributed MIP keys for authenticating RRQ for WiMAX HA calls.
Default is disabled.
disabled: Disables using AAA distributed WiMAX Mobile IP (MIP) keys for authenticating MIP RRQ.
optional: Uses AAA distributed WiMAX MIP keys for authenticating RRQ with fallback option to use static/3GPP2 based MIP keys.
required: AAA distributed WiMAX MIP keys for authenticating MIP RRQ are mandatory

dmu-refresh-key

Typically, when a Dynamic Mobile IP Update (DMU) resets, the next MIP re-registration causes MN-HA authorization failure and the HA rejects the MIP RRQ. This parameter enables the HA to retrieve the MN-HA key again from the AAA during the call and to use the freshly retrieved key value to recheck authentication.
Default is disabled.

imsi-auth

Enable uses the International Subscriber Mobile identity (IMSI) to determine if MN-AAA or MN-FAC extensions are not present in the RRQ.
Default is disabled.

mn-aaa { allow-noauth | always | dereg-noauth | noauth | renew-reg-noauth | renew-and-dereg-noauth }

Specifies how mobile node-to-AAA authentication extension in registration requests from the mobile node should be handled by the HA service.
Default is always.
allow-noauth: Specifies that the HA service does not require authentication for every mobile node registration request. However, if the mn-aaa extension is received, the HA service will authenticate it.
always: Specifies that the HA service will perform authentication each time a mobile node registers.
dereg-noauth: Disables authentication request upon de-registration.
noauth: Specifies that the HA service will not look for mn-aaa extension and will not authenticate it.
renew-reg-noauth: Specifies that the HA service will not perform authentication for mobile node re-registrations. Initial registration and de-registration will be handled normally.
renew-and-dereg-noauth: Disables authentication request upon re-registration and de-registration.

mn-ha { allow-noauth | always }

Specifies whether the HA service looks for an MN-HA authentication extension in the RRQ.
Default is always.
allow-noauth: Allows a request that does not contain the auth extension.
always: A request should always contain the auth extension to be accepted.

pmip-auth

Specifies whether the HA service looks for an MN-HA authentication extension in the RRQ.
Default is always.
allow-noauth: Allows a request that does not contain the auth extension.
always: A request should always contain the auth extension to be accepted.

stale-key-disconnect

If MN-HA auth fails for MIP renew and dereg, disconnects the call immediately.
Disabled by default.

Usage

The **authentication** command, combined with a keyword, can be used to specify how the system will perform authentication of registration request messages.

Example

The following command configures the HA service to always perform mobile node authentication for every registration request.

```
authentication mn-aaa always
```

The following command configures the HA service to always look for an MN-HA authentication extension in the RRQ.

```
authentication mn-ha always
```

bind

Binds the HA service to a logical IP interface serving as the Pi interface and specifies the maximum number of subscribers that can access this service over the interface.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

bind address *address* **[max-subscribers** *count* **]**

no bind address

address

Specifies the IP address (address) of the interface configured as the Pi interface. *address* is specified in IPv4 dotted-decimal notation.

max-subscribers *count*

Default: *500000*
Specifies the maximum number of subscribers that can access this service on this interface.
count can be configured to an integer from 0 through 4000000.

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active packet processing cards installed in the system.

Usage

Associate the HA service to a specific logical IP address. The logical IP address or interface takes on the characteristics of a Pi interface. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of interfaces that you will configuring for use as Pi interfaces
- The maximum number of subscriber sessions that all of these interfaces may handle during peak busy hours
- The average bandwidth for each of the sessions
- The type of physical port to which these interfaces will be bound

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.
Use the **no bind address** command to delete a previously configured binding.

Example

The following command would bind the logical IP interface with the address of *192.168.3.1* to the HA service and specifies that a maximum of *600* simultaneous subscriber sessions can be facilitated by the interface/service at any given time.

```
bind address 192.168.3.1 max-subscribers 600
```

The following command disables a binding that was previously configured:

```
no bind address
```

encapsulation

Configures Mobile IP (MIP) encapsulation types supported for a specific HA service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

[no] encapsulation allow { gre | keyless-gre }

no

Disables MIP encapsulation types supported for specific HA service

allow

Allows encapsulation type for MIP data.

gre

Default: Enabled.
Specifies the use of Generic Routing Encapsulation (GRE) for MIP data.

keyless-gre

Default: Disabled.
Specifies the use of GRE without exchanging keys for MIP data.

Usage

Use to disable or re-enable the use of GRE encapsulation or Key-less encapsulation for MIP sessions.
In case of chassis HA operating with other vendor equipment, which does not support the 3GPP2 to exchange key, this command with **keyless-gre** keyword will make the chassis HA to accept MIP data with legacy GRE.

Example

To disable GRE for MIP sessions, enter the following command:

```
no encapsulation allow gre
```

To re-enable GRE for MIP sessions, enter the following command:

```
encapsulation allow gre
```

To enable key-less GRE for MIP sessions, enter the following command:

```
encapsulation allow keyless-gre
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fa-ha-spi

Configures the security parameter index (SPI) for specific HA service parameters.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

fa-ha-spi remote-address { *fa_ip_address* **|** *fa_ip_address_mask* **} spi-number** *number* **{ encrypted secret** *enc_secret* **| secret** *secret* **} [allow-fa-ha-auth-extension] [description** *string* **] [disallow-fa-ha-auth-extension] [hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }] [replay-protection { nonce | timestamp [timestamp-tolerance tolerance] }] [timestamp-tolerance** *tolerance* **]**

no fa-ha-spiremote-address { *ha_ip_address* **|** *ha_ip_address/mask* **} spi-number** *number*

no

Disables the security parameter index (SPI) for specific HA service parameters.

remote-address { *fa_ip_address* **|** *fa_ip_address/mask* **}**

Specifies the IP address of the FA. *fa_ip_address* is entered using IPv4 dotted-decimal notation with CIDR for the subnet mask.

Important: The system supports unlimited peer FA addresses per HA but only maintains statistics for a maximum of 8,192 peer FAs. If more than 8,192 FAs are attached, older statistics are overwritten.

spi-number *number*

Specifies the SPI (number) which indicates a security context between the FA and the HA in accordance with RFC 2002.
number is an integer value from 256 through 4294967295.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the HA service and the FA. The secret can be either encrypted or non-encrypted.
encrypted secret *enc_secret*: Specifies the encrypted shared key between the HA service and the FA. *enc_secret* must be an alphanumeric string of 1 through 236 characters that is case sensitive.
secret *secret*: Specifies the shared key between the HA service and the FA. *secret* must be an alphanumeric string of 1 through 236 characters that is case sensitive.

allow-fa-ha-auth-extension

Allows validation of FA HA Authentication extension.

---

description *string*

This is a description for the SPI. *string* must be an alphanumeric string of 0 through 31 characters.

---

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5
Specifies the hash-algorithm used between the HA service and the FA.
hmac-md5: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

---

replay-protection { timestamp [timestamp-tolerance tolerance] | nonce }

Specifies the replay-protection scheme that should be implemented by the FA service for this SPI.
nonce: Configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: Configures replay protection to be implemented using timestamps per RFC 2002.
timestamp-tolerance: Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. *tolerance* is measured in seconds and can be configured to an integer from 1 and 65535. The default is 60.

Usage

An SPI is a security mechanism configured and shared by the HA service and the FA. Please refer to RFC 2002 for additional information.
Though it is possible for FAs and HAs to communicate without SPIs being configured, the use of them is recommended for security purposes. It is also recommended that a "default" SPI with a remote address of 0.0.0.0/0 be configured on both the HA and FA to prevent hackers from spoofing addresses.

Important: The SPI configuration on the HA must match the SPI configuration for the FA service on the system in order for the two devices to communicate properly.

A maximum of 2,048 SPIs can be configured per HA service.
Use the **no** version of this command to delete a previously configured SPI.

Example

The following command configures the FA service to use an SPI of *512* when communicating with an HA with the IP address *192.168.0.2*. The key that would be shared between the HA and the FA service is *q397F65*. When communicating with this HA, the FA service will also be configured to use the rfc2002-md5 hash-algorithm.

```
fa-ha-spi remote-address 192.168.0.2 spi-number 512 secret q397F65 hash-
algorithm rfc2002-md5
```

The following command deletes the configured SPI of 400 for an HA with an IP address of *172.100.3.200*:

```
no fa-ha-spi remote-address 172.100.3.200 spi-number 400
```

gre

Configures Generic Routing Encapsulation (GRE) parameters.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

gre { checksum | checksum-verify | reorder-timeout *timeout* **| sequence-mode { none | reorder } | sequence-numbers }**

default gre { checksum | checksum-verify | reorder-timeout | sequence-mode | sequence-numbers }no gre { checksum | checksum-verify | sequence-numbers }

no

Disables the specified functionality.

default

Sets or restores default value assigned for specified parameter.

checksum

Default: disabled
Enables the introduction of the checksum field in outgoing GRE packets.

checksum-verify

Default: disabled
Enables verification of the GRE checksum (if present) in incoming GRE packets.

reorder-timeout *timeout*

Default: 100
Configures the maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets. *timeout* must be an integer from 0 through 5000.

sequence-mode { none | reorder }

Default: none
Configures how incoming out-of-sequence GRE packets should be handled.
none: Disables reordering of incoming out-of-sequence GRE packets.
reorder: Enables reordering of incoming out-of-sequence GRE packets.

sequence-numbers

Default: Disabled
Enables the insertion of sequence numbers into the GRE packets.

Usage

Use this command to configure how the HA service handles GRE packets.

Example

To set the maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets to *500* milliseconds, enter the following command:

```
gre reorder-timeout 500
```

To enable the reordering of incoming out of sequence GRE packets, enter the following command:

```
gre sequence-mode reorder
```

To enable the insertion or removal of GRE sequence numbers in GRE packets, enter the following command:

```
gre sequence-numbers
```

idle-timeout-mode

Configures the sessions idle-timer reset behavior.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

idle-timeout-mode { aggressive | handoff | normal } [upstream-only]

default idle-timeout-mode

default

Resets the idle timeout mode to the default settings.

aggressive

Resets the session idle timer only when MIP user data is detected. This is the default behavior.

handoff

Resets the session idle timer when MIP user data is detected and an inter-Access Gateway/FA handoff occurs.

normal

Resets the session idle timer when MIP user data is detected and any MIP control signaling occurs.

upstream-only

Only upstream user data (data from the mobile node) resets the idle timer for the session. This is disabled by default.

Usage

Use this command to set how the current HA service resets the idle timer for a session.

Example

To reset the idle timer whenever user data is detected or whenever an inter-Access Gateway/FA occurs, use the following command:
idle-timeout-mode handoff

ikev1

Configures IPSec Internet Key Exchange (IKE) parameters.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

ikev1 { aaa-context *aaa_context_string* **| peer-fa** *IPAddress* **crypto-map** *crypto_map_string* **[encrypted] [secret** *secret_string* **] | skew-lifetime** *seconds* **}no ikev1 { aaa-context | peer-fa** *IPAddress* **| skew-lifetime }**

no

Disables IPSec IKE parameters.

aaa-context *aaa_context_string*

Configures AAA context from which to retrieve IKE keys. Must be followed by the context name.

aaa_context_string is an alphanumeric string of 1 through 63 characters.

peer-fa *IPAddress*

Sets the IKE crypto-map for a peer Foreign Agent (FA).

IPAddress is IP address entered using IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

crypto-map *crypto_map_string*

Configures IKE crypto-map. Must be followed by the crypto-map name.

crypto_map_string is an alphanumeric string of 1 through 63 characters.

encrypted designates use of encryption

secret *secret_string* uses a secret that is shared between FA and HA. *secret_string* is an alphanumeric string of 1 through 256 characters.

skew-lifetime *seconds*

Configures the "S" lifetime Skew (in seconds). *seconds* is an integer from 1 through 65534. Default is 10.

Usage

Use this command to configure IPSec IKE parameters.

Example

```
ikev1 peer-fa 11.22.33.44 crypto-map er encrypted secret ert
```

ip context-name

Specifies name of the destination context to be applied to the subscribers.

This configuration overrides the local subscriber configuration as well as the return attributes sent by RADIUS. All calls coming to this HA service are assigned this destination context; the IP address is allocated from the specified IP pool or group that is configured in the context specified in the service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

ip context-name *name*

{ default | no } ip context-name

name

Specifies the name of the context to assign the subscriber to once authenticated. *name* must be an alphanumeric string from 1 through 79 characters.

no

Usage

Removes the current assigned context from the subscriber's data.Set the name of the destination context to be applied to the subscribers.

Example

```
ip context-name sampleName
no ip context-name
```

ip local-port

Configures the local User Datagram Protocol (UDP) port for the Pi interface's IP socket on which to listen for Mobile IP Registration messages.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

ip local-port *number*

default ip local-port

default

Sets or restores the default value assigned for the IP local port.

number

Specifies the UDP port number.
number is an integer from 1 through 65535. Default is 434.

Usage

Specify the UDP port that should be used for communications between the FA service and the HA.

Example

The following command specifies a UDP port of *3950* for the HA service to use to communicate with the HA on the Pi interface:

```
ip local-port 3950
```

ip pool

Specifies name of the IP address pool or group to use for subscriber IP address allocation.

This configuration overrides the local subscriber configuration, as well as the return attributes sent by RADIUS. All calls coming to this HA service are assigned this destination context and an IP address is allocated from the specified IP pool or group that is configured in the context specified in the service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

ip pool *name*

{ default | no } ip pool

name

Specifies the logical name of the IP address pool. *name* must be an alphanumeric string of 1 through 31 characters.

no

Removes the specified IP address pool specified from the current context or disables the option for an IP pool.

default

Clears the IP address pool or group setting.

Usage

Define a pool of IP addresses for the context to use in assigning IPs for this service.

Example

The specifies name of the IP address pool or group to use for subscriber IP address allocation:

```
ip pool pool1
```

The following command removes the specified IP address pool:

```
no ip pool pool1
```

mn-ha-spi

Configures the security parameter index (SPI) between the HA service and the mobile node (MN).

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

mn-ha-spi spi-number *number* **[description** *string* **] [encrypted secret** *enc_secret* **] [hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }] [permit-any-hash-algorithm] [replay-protection { nonce | timestamp }] [secret** *secret* **] [timestamp-tolerance** *tolerance* **]**

no mn-ha-spi spi-number *number*

spi-number *number*

Specifies the SPI (number) which indicates a security context between the mobile node and the HA service in accordance with RFC 2002. *number* can be configured to an integer from 256 through 4294967295.

description *string*

This is a description for the SPI. *string* is an alphanumeric string of 1 through 31 characters.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the HA service and the mobile node. The secret can be either encrypted or non-encrypted.
encrypted secret *enc_secret*: Specifies the encrypted shared key between the HA service and the mobile node. *enc_secret* must be an alphanumeric string of 1 through 254 characters that is case sensitive.
secret *secret*: Specifies the shared key between the HA service and the mobile node. *secret* must be an alphanumeric string of 1 through 127 characters that is case sensitive.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

Default: hmac-md5
Specifies the hash-algorithm used between the HA service and the mobile node.
hmac-md5: Configures the hash-algorithm to implement HMAC-MD5 per RFC 2002bis.
md5: Configures the hash-algorithm to implement MD5 per RFC 1321.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5 per RFC 2002.

permit-any-hash-algorithm

Default: disabled
Allows verification of the MN-HA authenticator using all other hash-algorithms after failure with configured hash-algorithm. The successful algorithm is logged to aid in troubleshooting and used to create the MN-HA authenticator in the Registration Reply message.

replay-protection { nonce | timestamp }

Default: timestamp
Specifies the replay-protection scheme that should be implemented by the HA service for this SPI.
nonce: configures replay protection to be implemented using NONCE per RFC 2002.
timestamp: configures replay protection to be implemented using timestamps per RFC 2002.

timestamp-tolerance *tolerance*

Default: *60*
Specifies the allowable difference (tolerance) in timestamps that is acceptable. If the difference is exceeded, then the session will be rejected. If this is set to *0*, timestamp tolerance checking is disabled at the receiving end.
Tolerance is measured in seconds and can be configured to an integer from 0 through 65535.

Usage

An SPI is a security mechanism configured and shared by the HA service and the mobile node. Please refer to RFC 2002 for additional information.
Use the **no** version of this command to delete a previously configured SPI.

Example

The following command configures the HA service to use an SPI of 640 when communicating with a mobile node. The key that would be shared between the mobile node and the HA service is q397F65.

```
mn-ha-spi spi-number 640 secret q397F65
```

The following command deletes the configured SPI of *400*:

```
no mn-ha-spi spi-number 400
```

nat-traversal

This command enables NAT traversal and also configures the forcing of UDP tunnels for NAT traversal.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

[default | no] nat-traversal [force-accept]

no

Disables NAT traversal or disables forcing the acceptance of UDP tunnels for NAT traversal.

default

Reset the defaults for this command.
Default: NAT traversal disabled, force-accept disabled.

force-accept

This keyword configures the HA to accept requests when NAT is not detected but the Force (F) bit is set in the RRQ with the UDP Tunnel Request. By default this type of request is rejected if NAT is not detected.

Usage

Use this command to enable NAT traversal and enable the forcing of UDP tunnels for NAT traversal.

Example

The following command enables NAT traversal for the current HA service and forces the HA to accept UDP tunnels for NAT traversal:

```
nat-traversal force-accept
```

optimize tunnel-reassembly

Designates that tunnel reassembly optimization will be used for fragmented large packets passed between HA and FA. Default is disabled.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

```
[ default | no ] optimize tunnel-reassembly
```

Usage

Enabling this functionality fragments large packets prior to encapsulation for easier processing. Tunnel reassembly optimization is disabled by default.

Important: You should not use this command without first consulting Cisco Systems Technical Support. This command applies to very specific scenarios where packet reassembly is not supported at the far end of the tunnel. There are cases where the destination network may either discard the data, or be unable to reassemble the packets.

Important: This functionality works best when the HA service is communicating with an FA service running in a system. However, an HA service running in the system communicating with an FA from a different manufacturer will operate correctly even if this parameter is enabled.

Use the **no** version of this command to disable tunnel optimization if enabled.

Example

The following command enables tunnel reassembly optimization:

```
optimize tunnel-reassembly
```

per-domain statistics-collection

Enables per-domain statistics collection.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

[no] per-domain statistics-collection

Usage

Use this command to enable per-domain statistics collection.

Example

The following command enables per-domain statistics collection.

per-domain statistics-collection

policy bc-query-result

Configure the binding cache (BC) query Response Result code.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

policy bc-query-result network-failure *code*

default policy bc-query-resultnetwork-failure

network-failure *code*

Default: *0xFFFF*
Specify the response code for BC responses sent on network failures.
code must be either 0xFFFF or 0xFFFE.

Usage

Use this command to specify the type of response code to send in a P-MIP BC query result.

Example

The following command sets the P-MIP BC query result response code to *0xFFFE*:

```
policy bc-query-result network-failure 0xFFFE
```

policy nw-reachability-fail

Specifies the action to take upon detection of an up-stream network -reachability failure.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

policy nw-reachability-fail { redirect *ip_addr1* **[weight** *value* **] [** *ip_addr2* **[weight** *value* **] ... ip_addr16 [weight** *value* **]] | reject [use-reject-code { admin-prohibited | insufficient-resources }] }**

no policy nw-reachability-fail [redirect *ip_addr1 ... ip_addr16* **]**

---

no

Deletes the network reachability policy completely or deletes the specified redirect addresses fro the policy.

---

reject [use-reject-code { admin-prohibited | insufficient-resources }]

Upon network reachability failure, reject all new calls for this context.
use-reject-code { admin-prohibited | insufficient-resources }: When rejecting calls send the specified reject code. If this keyword is not specified the admin-prohibited reject code is sent by default.

---

reject [use-reject-code { admin-prohibited | insufficient-resources }]

Upon network reachability failure reject all new calls for this context. If no reject code is specified, the HA sends a registration reply code of 81H (admin-prohibited).
use-reject-code { admin-prohibited | insufficient-resources }: Use the specified reject code when rejecting traffic.
admin-prohibited: When this keyword is specified and traffic is rejected, the error code 81H (admin-prohibited) is returned.
insufficient-resources: When this keyword is specified and traffic is rejected, the error code 82H (insufficient resources) is returned.

---

redirect *ip_addr1* **[weight** *value* **] [** *ip_addr2* **[weight** *value* **] ... ip_addr16 [weight** *value* **]]**

Upon network reachability failure redirect all calls to the specified IP address.
ip_addr1: This must entered using IPv4 dotted-decimal notation. Up to 16 IP addresses and optional weight values can be entered on one command line.
weight *value*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. If a weight is not specified the entry is automatically assigned a weight of 1. *value* must be an integer from 1 through 10.

Usage

Use this command to set the action for the HA service to take upon a network reachability failure.

Important: Refer to the Context Configuration mode command **nw-reachability server** to configure network reachability servers.

Important: Refer to the Subscriber Configuration mode command **nw-reachability-server** to bind the network reachability to a specific subscriber.

Important: Refer to the **nw-reachability server server_name** keyword of the Context Configuration mode **ip pool** command to bind the network reachability server to an IP pool.

Example

To set the HA service to reject all new calls on a network reachability failure, enter the following command:

```
policy nw-reachability-fail reject
```

Use the following command to set the HA service to redirect all calls to the HA at IP address *192.168.100.10* and *192.168.200.10* on a network reachability failure:

```
policy nw-reachability-fail redirect 192.168.100.10 192.168.200.10
```

policy overload

Configures the overload policy within the HA service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

policyoverload { redirect*address* **[weight***weight_num* **] [** *address2* **[weight***weight_num* **] ...** *address16* **[weight***weight_num* **]] | reject[use-reject-code { admin-prohibited | insufficient-resources }] }**

no policyoverload [redirect*address* **[** *address2...address16* **]**

---

no policy overload [redirect address [*address2...address16* **]]**

Deletes a previously set policy or removes a redirect IP address.
overload: Without any options deletes the complete overload policy from the PDSN service.
overload redirect *address* [*address2 ... address16*]: deletes up to 16 IP addresses from the overload redirect policy. The IP addresses must be expressed in IP v4 dotted-decimal notation

---

redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ...** *address16* **[weight** *weight_num* **]**

This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the HA service rejects new sessions with a Registration Reply Code of 136H (unknown home agent address) and provides the IP address of an alternate HA. This command can be issued multiple times.
address: The IP address of an alternate HA expressed in IP v4 dotted-decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy, the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified the entry is automatically assigned a weight of 1. *weight_num* must be an integer from 1 through 10.

---

reject [use-reject-code { admin-prohibited | insufficient-resources }]

This option causes any overload traffic to be rejected. If no reject code is specified, the HA sends a registration reply code of 81H (admin-prohibited).
use-reject-code { admin-prohibited | insufficient-resources }: Use the specified reject code when rejecting traffic.
admin-prohibited: When this keyword is specified and traffic is rejected, the error code 81H (admin-prohibited) is returned.

insufficient-resources: When this keyword is specified and traffic is rejected, the error code 82H (insufficient resources) is returned.

Usage

The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system.
The system automatically invokes the overload policy when an on-line software upgrade is started.
Use the **no** version of this command to restore the default policy.
The setting for overload policy is reject.

Example

The following command enables an overload redirect policy for the HA service that will send overload calls to either of two destinations with weights of *1* and *10* respectively:

```
policy overload redirect 192.168.100.10 weight 1 192.168.100.20 weight 10
```

reg-lifetime

Configures Mobile IP session registration lifetime.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

reg-lifetime *time*

{ default | no } reg-lifetime

no

Sets the registration lifetime to infinite.

default

Sets the registration lifetime to default value, 600.

time

Specifies the registration lifetime in seconds.
time is an integer from 1 through 65534.

Usage

Use this command o limit a mobile node's lifetime. If the mobile node requests a shorter lifetime than what is specified, it is granted. However, Per RFC 2002, should a mobile node request a lifetime that is longer than the maximum allowed by this parameter, the HA service will respond with the value configured by this command as part of the Registration Reply. The default is 600 seconds.

Example

The following command configures the registration lifetime for the HA service to be *2400* seconds:

```
reg-lifetime 2400
```

The following command configures an infinite registration lifetime for MIP calls:

```
no reg-lifetime
```

reverse-tunnel

Enables use of reverse tunneling for Mobile IP session. Use no reverse-tunnel command to disable. If disabled, mobile node (MN) packets are not tunneled to the HA in the reverse direction.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

reverse-tunnel

{ default | no } reverse-tunnel

no

Indicates the reverse tunnel option is to be disabled. When omitted, the reverse tunnel option is enabled.

default

Indicates the reverse tunnel option is to be set to the default. When omitted, the reverse tunnel option is enabled.

Usage

Reverse tunneling involves tunneling datagrams originated by the mobile node to the HA service via the FA. When an MN arrives at a foreign network, it listens for agent advertisements and selects an FA that supports reverse tunnels. The MN requests this service when it registers through the selected FA. At this time, the MN may also specify a delivery technique such as Direct or the Encapsulating Delivery Style.
Among the advantages of using reverse-tunneling are that:

- All datagrams from the mobile node seem to originate from its home network
- The FA can keep track of the HA to which the mobile node is registered and tunnel all datagrams from the mobile node to its HA

Use the **no** version of this command to disable reverse tunneling. If reverse tunneling is disabled, and the mobile node does not request it, triangular routing will be performed.
Routing will be used.
The default setting is reverse tunnel enabled.

Important: If reverse tunneling is disabled on the system and a mobile node requests it, the call will be rejected with a reply code of 74H (reverse-tunneling unavailable).

Example

The following command disables reverse-tunneling support for the HA service:

```
no reverse-tunnel
```

revocation

Configures the Registration Revocation feature for a specific HA service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

revocation { enable | max-retransmission *number* **| negotiate-i-bit | retransmission-timeout** *secs* **| send-nai-ext | trigger { handoff | idle-timeout } }**

no revocation { enable | negotiate-i-bit | send-nai-ext | trigger { handoff | idle-timeout } }

default revocation [enable] [max-retransmission] [negotiate-i-bit] [retransmission-timeout] [send-nai-ext] [trigger { handoff | idle-timeout }]

no

Completely disables registration revocation on the HA, disables trigger handoff, or disables revocation on idle timer expiration.

default

Sets or restores the default value assigned for specified parameter.

enable

Enables the MIP registration revocation feature on the HA. When enabled, if revocation is negotiated with an FA and a MIP binding is terminated, the HA can send a Revocation message to the FA. This feature is disabled by default.

max-retransmission *number*

Default: 3
The maximum number of retransmissions of a Revocation message before the revocation fails. *number* must be an integer from 0 through 10.

negotiate-i-bit

Default: disabled
Enables the HA to negotiate the i-bit via PRQ/RRP messages and processes the i-bit revocation messages.

retransmission-timeout *secs*

Default: 3
The number of seconds to wait for a Revocation Acknowledgement from the FA before retransmitting the Revocation message. *secs* must be an integer from 1 through 10.

send-nai-ext

Default: off
Enables sending the NAI extension in the revocation message.

trigger { handoff | idle-timeout }

handoff: Default: Enabled
Triggers the HA to send a Revocation message to the FA when an inter-Access Gateway/FA handoff of the MIP session occurs. If this is disabled, the HA is never triggered to send a Revocation message.
idle-timeout: Default: Enabled
Triggers the HA to send a Revocation message to the FA when a session idle timer expires.

Usage

Use this command to enable or disable the MIP revocation feature on the HA or to change settings for this feature. Both the HA and the FA must have Registration Revocation enabled and FA/HA authorization must be in use for Registration Revocation to be negotiated successfully.

Example

The following command enables Registration Revocation on the HA:

```
revocation enable
```

The following command sets the maximum number of retries for a Revocation message to *10*:

```
revocation max-retransmission 10
```

The following command sets the timeout between retransmissions to *3*:

```
revocation retransmission-timeout 3
```

The behavior of send MIP revocation to FA is as follows:

- 1st retry: Retransmit in 3 seconds after previous MIP revocation send.
- 2nd retry: Retransmit in 6 seconds after previous MIP revocation send (9 seconds after sending initial MIP revocation).
- 3rd retry: Retransmit in 12 seconds after previous MIP revocation send (21 seconds after sending initial MIP revocation).
- 4th retry: Retransmit in 24 seconds after previous MIP revocation send (45 seconds after sending initial MIP revocation).
- 5th retry: Retransmit in 48 seconds after previous MIP revocation send (93 seconds after sending initial MIP revocation).

Important: The value of retransmission-timeout doubles. HA disconnects the session forcibly in 120 seconds after sending initial MIP revocation.

setup-timeout

The maximum time allowed for session setup in seconds. Default is 60 seconds.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

setup-timeout *seconds*

default setup-timeout

default

Sets or restores the default value.

seconds

Default: 60 seconds
The maximum amount of time (in seconds) to allow for setup of a session. *seconds* must be an integer from 1 through 1000000

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

To set the maximum time allowed for setting up a session to 5 minutes (*300* seconds), enter the following command:

```
setup-timeout 300
```

simul-bindings

Specifies the maximum number of "care-of" addresses that can simultaneously be bound for the same user as identified by NAI and Home address.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

simul-bindings *number*

default simul-bindings

default

Sets or restores the default value.

number

Configures the maximum number of simultaneous "care-of" bindings that the HA service will maintain for any given subscriber.
is an integer from 1 through 3.

Usage

Per RFC 2002, the HA service creates a mobile binding record (MBR) for each subscriber session it is facilitating. Each MBR is associated with a care-of address. As the mobile node roams, it is possible that the session will be associated with a new care of address.
Typically, the HA service will delete an old binding and create a new one when the information in the Registration Request changes. However, the mobile could request that the HA maintain previously stored MBRs. This command allows you to configure the maximum number of MBRs that can be stored per subscriber if the requested. The default value is 3.

Example

The following command configures the HA service to support up to 4 MBRs per subscriber:

```
simul-bindings 4
```

threshold dereg-reply-error

Sets an alarm or alert based on the number of de-registration reply errors per HA service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

threshold dereg-reply-error *high_thresh* **[clear** *low_thresh* **]**

no threshold dereg-reply-error

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of de-registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. It can be configured to an integer from 0 through 100000.

clear *low_thresh*

Default: 0
The low threshold number of de-registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. It can be configured to an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of de-registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of de-registration reply errors on the following rules:

- **Enter condition:** Actual number of de-registration reply errors > High Threshold
- **Clear condition:** Actual number of de-registration reply errors < Low Threshold

Example

The following command configures a de-registration reply error threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold reg-reply-error 1000 clear 500
```

threshold init-rrq-rcvd-rate

Sets an alarm or alert based on the average number of calls setup per second for the context.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

threshold init-rrq-rcvd-rate *high_thresh* **[clear** *low_thresh* **]**

no threshold init-rrq-rcvd-rate

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold average number of calls setup per second that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100000.

clear *low_thresh*

Default:0
The low threshold average number of calls setup per second that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* is an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the average number of calls setup per second is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of calls setup per second based on the following rules:

- **Enter condition:** Actual number of calls setup per second is greater than the high threshold.
- **Clear condition:** Actual number of calls setup per second is less that the low threshold.

Example

The following command configures a number of calls setup per second threshold of 1000 and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold init-rrq-rcvd-rate 1000 clear 500
```

threshold ipsec-call-req-rej

Configures a threshold for the total IPSec calls request rejected.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

threshold ipsec-call-req-rej *high_thresh* **[clear** *low_thresh* **]**

no threshold ipsec-call-req-rej

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of IPSec call requests rejected per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default: *0*
Specifies the low threshold number of IPSec call requests rejected per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec call requests rejected is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec IKE requests on the following rules:

- **Enter condition:** Actual number of IPSec IKE requests is greater than the high threshold.
- **Clear condition:** Actual number of IPSec IKE requests is less than the low threshold.

Example

The following command configures a number of IPSec call requests rejected threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-call-req-rej 1000 clear 800
```

threshold ipsec-ike-failrate

Configures a threshold for the percentage of IPSec IKE failures.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

threshold ipsec-ike-failrate *high_thresh* **[clear** *low_thresh* **]**

no threshold ipsec-ike-failrate

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold percentage of IPSec IKE failures per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 100.

clear *low_thresh*

Default: *0*
Specifies the low threshold percentage of IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the percentage of IPSec IKE failures is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the percentage of IPSec IKE failures on the following rules:

- **Enter condition:** Percentage of IPSec IKE failures is greater than the high threshold.
- **Clear condition:** Percentage of IPSec IKE failures is less than the low threshold.

Example

The following command configures a percentage of IPSec IKE failures threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-ike-failrate 90 clear 80
```

threshold ipsec-ike-failures

Configures a threshold for the total IPSec IKE failures.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

threshold ipsec-ike-failures *high_thresh* **[clear** *low_thresh* **]**

no threshold ipsec-ike-failures

no

Deletes the alert or alarm.

high_thresh

Default: *0*
Specifies the high threshold number of IPSec IKE failures per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default:0
Specifies the low threshold number of call IPSec IKE failures per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec IKE failures is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec IKE failures on the following rules:

- **Enter condition:** Actual number of IPSec IKE failures is greater than the high threshold.
- **Clear condition:** Actual number of IPSec IKE failures is less than the low threshold.

Example

The following command configures a number of IPSec IKE failures threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-ike-failures 1000 clear 800
```

threshold ipsec-ike-requests

Configures a threshold for the total IPSec IKE requests.

Platform

ASR 5000

Product

HA

Privilege

no threshold ipsec-tunnels-setup

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of IPSec tunnels setup per second that must be met or exceeded within the polling interval to generate an alert or alarm.
high_thresh is an integer from 0 through 1000000.

clear *low_thresh*

Default:0
Specifies the low threshold number of call IPSec tunnels setup per second that must be met or exceeded within the polling interval to clear an alert or alarm.
low_thresh is an integer from 0 through 1000000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of IPSec tunnels setup is equal to or greater than a specified number per second.
Alerts or alarms are triggered for the number of IPSec tunnels setup on the following rules:

- **Enter condition:** Actual number of IPSec tunnels setup is greater than the high threshold.
- **Clear condition:** Actual number of IPSec tunnels setup is less than the low threshold.

Example

The following command configures a number of IPSec tunnels setup threshold of *1000* and a low threshold of *800* for a system using the Alarm thresholding model:

```
threshold ipsec-tunnels-setup 1000 clear 800
```

threshold reg-reply-error

Set an alarm or alert based on the number of registration reply errors per HA service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

threshold reg-reply-error *high_thresh* **[clear** *low_thresh* **]**

no threshold reg-reply-error

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100000.

clear *low_thresh*

Default:0
Specifies the low threshold number of registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* is an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of registration reply errors on the following rules:

- **Enter condition:** Actual number of registration reply errors is greater than the high threshold.
- **Clear condition:** Actual number of registration reply errors is less than the low threshold.

Example

The following command configures a registration reply error threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold reg-reply-error 1000 clear 500
```

threshold rereg-reply-error

Set an alarm or alert based on the number of re-registration reply errors per HA service.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

threshold rereg-reply-error *high_thresh* **[clear** *low_thresh* **]**

no threshold rereg-reply-error

no

Deletes the alert or alarm.

high_thresh

Default: 0
Specifies the high threshold number of re-registration reply errors that must be met or exceeded within the polling interval to generate an alert or alarm. *high_thresh* is an integer from 0 through 100000.

clear *low_thresh*

Default:0
Specifies the low threshold number of re-registration reply errors that must be met or exceeded within the polling interval to clear an alert or alarm. *low_thresh* is an integer from 0 through 100000.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Use this command to set an alert or an alarm when the number of re-registration reply errors is equal to or greater than a specified number of calls per second.
Alerts or alarms are triggered for the number of re-registration reply errors on the following rules:

- **Enter condition:** Actual number of re-registration reply errors is greater than the high threshold.
- **Clear condition:** Actual number of re-registration reply errors is less than the low threshold.

Example

The following command configures a reregistration reply error threshold of *1000* and a low threshold of *500* for a system using the Alarm thresholding model:

```
threshold dereg-reply-error 1000 clear 500
```

wimax-3gpp2 interworking

Configures the interworking between WiMAX and 3GPP2 network at HA. This support provides handoff capabilities from 4G to 3G (PDSN) network access and vice-versa.

Platform

ASR 5000

Product

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HA Service Configuration

configure > context *context_name* **> ha-service** *service_name*

Syntax

[no | default] wimax-3gpp2 interworking

no

Disables the pre-configured interworking between WiMAX and 3GPP2 networks at HA level.

default

Configures the **WiMAX-3GPP2 interworking** to default setting: disabled.

Usage

Use this command to enable/disable the interworking between WiMAX and 3GPP2 network for seamless session continuity.
This functionality provides HA support for both 4G and 3G technology HA (WiMAX HA and PDSN/HA) for handoff from 4G and 3G network access (ASN GW/FA and PDSN/FA) and vice-versa.

Important: Use this command in conjunction with the **authentication aaa-distributed-mip-keys required** command.

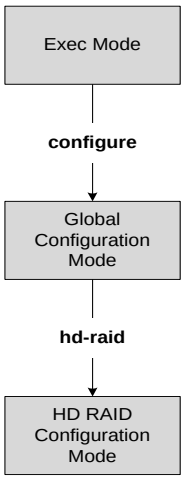
Example

The following command enables the interworking for a subscriber between WiMAX and 3GPP2 network.

```
wimax-3gpp2 interworking
```

Chapter 143
HD RAID Configuration Mode Commands

This mode develops default policies designed to minimize administrative intervention when setting up the RAID on ASR 5000 SMC hard disks or the ASR 5500.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Sets the default value for specified RAID parameters.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HD RAID Configuration

```
configure > hd-raid
```

Syntax

```
default { overwrite [ { invalid | unknown | valid } disk | select }
```

overwrite [invalid disk | unknown disk | valid disk]

Resets the system to automatically overwrite:

- **invalid disk** – empty disks, wrongly partitioned disk and partially constructed disks
- **unknown disk** – disks with a valid RAID superblock but not configured in the standard way; most likely because it has data from a different version
- **valid disk** – a clean RAID component that is not part of the current RAID configuration

select

Resets the system to automatically select the default disk.

Usage

Use this command to reset RAID configuration parameters to their default settings.

Example

The following command resets the system to automatically overwrite invalid RAID disks:

```
default overwrite invalid disk
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

overwrite

Sets the RAID overwrite properties.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HD RAID Configuration

configure > hd-raid

Syntax

[no | default] overwrite { invalid | unknown | valid } disk [-noconfirm]

no

Prevents a disk from being overwritten.

default

Configures the default overwrite action:

invalid

Allows the system to automatically overwrite invalid disks including empty disks, wrongly partitioned disks, and partially constructed disks.
This is the default overwrite action.

unknown

Allows the system to automatically overwrite unknown disks that has a valid RAID superblock but is not configured in the standard way; most likely because it has data from a different version.

valid

Allows the system to automatically overwrite a disk that is a clean RAID component but not part of the current or selected RAID.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Sets a policy for automatically overwriting different disk types. If there is a disk that satisfies the changed overwrite policy then the disk would overwrite immediately.

Example

The following command configures a policy for overwriting invalid RAID disks:

```
overwrite invalid disk -noconfirm
```

select

Configures the disk preference when both hard disks on the ASR 5000 or all FSC disks on the ASR 5500 have valid RAID information.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HD RAID Configuration

configure > hd-raid

Syntax

[default] select { newer | none } disk [-noconfirm]

default

Configures the command to its default condition.

newer

Selects the newer disk by timestamp and event counter in superblocks. If all are the same, then the same array will start with both SMC disks or all FSC disks, but a different array will need admin intervention).

none

Does not select any disk but defers to administrator intervention.

-noconfirm

Indicates that the command is to execute without any additional prompt and confirmation from the user.

Usage

Determines the selected disc when two valid disks from either the same or different RAIDs are running on the ASR 5000 or when valid disks from either the same or different RAIDs are running on the ASR 5500.

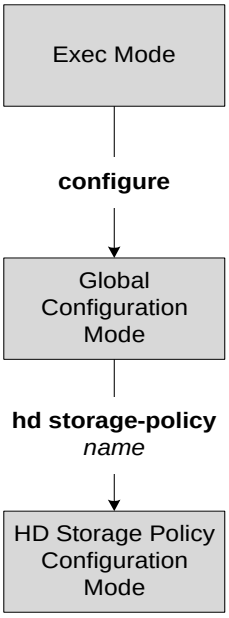
Example

This command forces the RAID to be configured on the newer SMC or FSC hard disk:

```
select newer disk -noconfirm
```

Chapter 144
HD Storage Policy Configuration Mode Commands

The HD Storage Policy Configuration Mode is used to configure directory name and file parameters for Diameter record files being stored on the HD storage device.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

directory

Configures the name of the directory on the HD storage drive where Diameter records are stored.

Platform

ASR 5000

Product

HSGW

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > HD Storage Policy Configuration

configure > hd storage-policy *policy_name*

Syntax

directory name *dir_name*

default directory name

default

Returns the command to its default setting of using the policy name as the directory name.

name *dir_name*

Specifies the name to be applied to the directory. *dir_name* must be an alphanumeric string of 1 through 63 characters.
When configured, the actual directory path is:

```
/hd-raid/records/<record-type>/<dir_name>/
```

So if the directory name variable is entered as "*sgwpgw*", the path is:

```
/hd-raid/records/acr/sgwpgw
```

Usage

Use this command to name a directory on the HD storage drive where Diameter records are to be stored.

Example

The following command configures a directory named *cdr1*:

```
directory name cdr1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

file

Configures file parameters for Diameter records being stored on the HD storage device.

Platform

ASR 5000

Product

HSGW

P-GW

S-GW

Privilege

Administrator

Mode

Exec > Global Configuration > HD Storage Policy Configuration

configure > hd storage-policy *policy_name*

Syntax

file { format acr { custom1...custom10 } | name { extension *string* **| prefix** *string* **} | rotation { record-count** *num* **| time-interval** *sec* **| volume mb** *mbytes* **} }**

default file { format acr | name prefix | rotation { record-count | time-interval | volume } }

no file (extension | rotation { record-count | time-interval } }

default

Returns the command to the default settings for the specified keywords.

no

Removes the configuration for the specified parameters.

format acr { custom1...custom10 }

Default: **custom1**
Specifies the file format used when storing records on the HD storage device. **custom1** is a vendor-specific file format.

name { extension *string* **| prefix** *string* **}**

Specifies a string to be pre-pended or appended to the filenames. By default, the policy name is used for the prefix.
extension *string*: Specifies a file extension to append to the filename. *string* must be an alphanumeric string of 1 through 10 characters.
prefix *string*: Specifies a file prefix to append to the filename. *string* must be an alphanumeric string of 1 through 63 characters. This parameter replaces the policy name used by default.

rotation { record-count *num* **| time-interval** *sec* **| volume mb** *mbytes* **}**

Specifies the triggers that prompt file rotation on the HD storage drive. All options can be configured and upon reaching any of the thresholds, file rotation is initiated.
record-count *num*: File rotation occurs when the number of records reaches the number configured in this keyword. *num* must be an integer from 1000 through 65000. Default = 10000
time-interval *sec*: File rotation occurs at time intervals (in seconds) configured by this keyword. *sec* must be an integer from 30 through 86400. Default = 3600 (1 hour)
volume mb *mbytes*: File rotation occurs when the record volume exceeds the value (in megabytes) configured by this keyword. *mbytes* must be an integer from 2 through 40. Default = 4

Usage

Use this command to configure file parameters for Diameter records being stored on the HD storage device.

Example

The following command sets the file rotation thresholds for files being stored on the HD storage device:

```
file rotation volume mb 4

file rotation record-count 15000

file rotation time-interval 7200
```

The following command replaces the policy name as the prefix of all files being stored through this policy with the prefix *sgw*:

```
file name prefix sgw
```

Chapter 145
HLR Configuration Mode Commands

The HLR Configuration Mode provides the commands and parameters to configure the home location register (HLR) node that is the database containing the subscriber profile and connection information for a specific GPRS/UMTS core network.

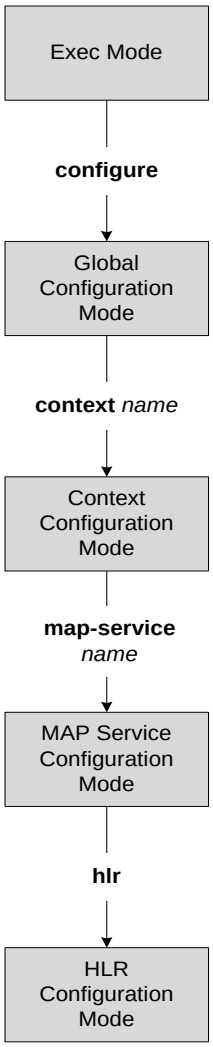
In this mode, your prompt will look similar to:

```
[<context_name>]hostname(config-map-service-<svr_name>-hlr)#
```

The HLR Configuration Mode is a sub-mode derived from the MAP Configuration Mode which controls the MAP service configuration. It is the MAP service that provides the application-layer protocol support used to connect the HLR to other nodes in the network such as the SGSN.

When the mode is accessed, the command line will appear similar to

```
[<ctx_name>]asr5000(config-map-service-<service_name>-hlr)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

acn-version-retention

This command configures the ACN version retention method.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > MAP Service Configuration > HLR Configuration

configure > context *context_name* **> map-service** *service_name* **> hlr**

Syntax

acn-version-retention { per-imsi-prefix | per-subscriber }

default acn-version-retention

default

Returns the configuration to the default value: retains the version information per IMSI prefix.

per-imsi-prefix

Retain ACN version information, for communication with the HLR, on a per IMSI prefix basis.

per-subscriber

Retain ACN version information, for communication with the HLR, on a per buscriber basis.

Usage

By default, the SGSN sends ACN version 3 SAI (service area identity) to the HLR. If the SGSN receives an error message indicating that the HLR does not support that version, then the SGSN tries again with an ACN version 2 SAI. Next time the SGSN communicates with that HLR, it retains that version information and version persists based on the IMSI prefix.
Use this command to enable the SGSN to retain version according to subscriber.

Example

Configure the SGSN to retain version information according to the IMSI prefix:

```
default acn-version-retention
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the MAP Service configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the MAP Service configuration mode.

imsi

This command sets up IMSI (International Mobile Subscriber Identity) -based configuration. The IMSI prefix includes the nobile country code (MCC) and the mobile network code (MNC).

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > MAP Service Configuration > HLR Configuration

configure > context *context_name* **> map-service** *service_name* **> hlr**

Syntax

[no] imsi { any | starts-with *prefix_number* **} { imsi [sgsn-source-address-format point-code-ssn [source-ssn** *ssn* **] | isdn** *isdn_number* **| mobile-global-title** *mgt_number* **[max-gt-address-len** *max_gt_address* **] | point-code** *pt-code* **} }**

no

Removes the imsi-prefix definition from the configuration.

any

Configures acceptance of any IMSI prefix.

start-with *prefix_number*

Selects IMSI prefix-based routing.
prefix_number is a string of up to 15 integers.

imsi

Enables configurable default behavior for routing.
Entering **imsi** with the **any** keyword preserves the default behavior and the E.212 address is used as a destination address and the MAP request will be sent towards the HLR.
If this keyword is not used with the **any** keyword, then the MAP request will be rejected.

isdn *isdn_number*

Defines the E.164 number of the HLR.
isdn_number is a string of integers, up to 15.

mobile-global-title *mgt_number* **[max-gt-address-len** *max_gt_address_length* **]**

Defines the mobile global title address that the MCC/MNC portion of the IMSI will be converted to. If the maximum GT address length is specified (optional) and if the length of the MGT string is greater than defined, then the least significant digits will be omitted.
mgt_number is a string of digits, up to 18 digits in length.

max_gt_address is an integer from 1 to 32.

point-code *pt-code* **source-ssn** *ssn*

Defines the point code for the HLR.
pt-code is a string of digits, up to 11; SS7 format preferred.

sgsn-source-address-format point-code-ssn

Selects HLR call process according to SCCP calling party address of the SGSN. This will be filled at MAP level, including the ITU point code address.

source-ssn *ssn*

Defines the SSN of the source that will be used for the call filtering.
ssn: Must be an integer from 1 to 255.

Usage

Routing will be done according to IMSI parameters configured with this command or according to the mobile global title address (replacing the MCC/MNC portion of the IMSI) is so specified.

Example

```
imsi starts-with 3 isdn 123456789 sgsn-source-address-form at point-code-ssn
```

policy routing

This command configures the policy for the routing of MAP messages. If this command is not configured or disabled (with the **default** keyword), then routing is done according to the configuration of the IMSI parameters.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > MAP Service Configuration > HLR Configuration

configure > context *context_name* **> map-service** *service_name* **> hlr**

Syntax

policy routing { hlr-isdn | ms-isdn }

default policy routing

no policy routing

default

Resets the policy routing to the system default, disabled.

no

Removes the policy routing configuration from the system.

hlr-isdn

Selects HLR-ISDN based routing.

ms-isdn

Selects mobile station (MS)-ISDN based routing.

Usage

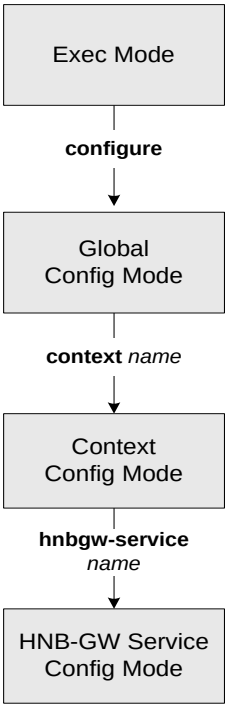
Use this command to set the policy for routing MAP messages.

Example

```
policy routing hlr-isdn
```

Chapter 146
HNB-GW Service Configuration Mode Commands

The 3G UMTS Home-NodeB Gateway Service Configuration Mode manages access to the UMTS core network in a 3G UMTS network through a Femto node.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-control-db

Configures the access control database parameters in an HNB-GW service instance to control HNB and UE access to the HNB-GW node.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

access-control-db imsi-purge-timeout {immidiate | *dur* }

default access-control-db imsi-purge-timeout

default

Sets the default value to HNB-UE access control database on HNB-GW service instance.
The default timeout duration for purging of the IMSI White List from the HNB-GW Access Control database is 24 hours. The HNB-GW service waits for 24 hours after all referenced HNBs have de-registered before purging the records.

immidiate

Sets the HNB-GW service to purge the HNB-UE access control database immediately after all referenced HNBs have de-registered.

imsi-purge-timeout *dur*

Sets the timeout duration (in minutes) for the access control database to wait before purging the IMSI values received as a White List from HMS/BAC.
After all HNBs have de-registered, the Access Control database on HNB-GW maintains the IMSI White List received from HMS/BAC during HNB registration procedure for the configured durations before purging the list.
dur is an integer from 1 through 1440.

Usage

Use this command to configure the HNB-UE access control database parameters on HNB-GW service.
This command sets the timeout duration to maintain the IMSI White List received from HMS/BAC during HNB registration procedure in HNB-GW service for the configured *dur* in minutes after de-registration of all referenced HNBs from HNB-GW node and then purge the database.

Example

Following command sets the HNB-GW service instance to purge all IMSI records from HNB-UE access control database immediately after all referenced HNBs de-registered from HNB-GW service instance.

access-control-db imsi-purge-timeout immidiate

associate gtpu-service

Associates a previously configured GTP-U service to bind the HNB-GW service with an HNB towards the HNB side. A GTP-U service must be configured in Context Configuration mode before using this configuration.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

associate gtpu-service *svc_name*

no associate gtpu-service

no

Removes the associated GTP-U service from this HNB-GW service configuration.

svc_name

Identifies the name of the pre-configured GTP-U service to associate with an HNB-GW service towards the Home-NodeB side.
svc_name is an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure GTP-U data plan between HNB-GW service and Home-NodeB. The service defined for GTP-U can be configured in Context configuration mode.

Important: Another GTP-U service can be used to bind the HNB-GW service towards the Core Network and can be configured in HNB-PS Configuration mode. For more information on GTP-U service configuration, refer *GTP-U Service Configuration Mode Commands*.

Example

Following command associates GTP-U service named *gtpu-hnb1* with specific HNB-GW service towards Home-NodeB side.

```
associate gtpu-service gtpu-hnb1
```

associate rtp pool

Associates a previously defined RTP pool (IP pool) with the HNB-GW service. This pool is used by HNB-GW to send an IP address to HNB where HNB uses it to map the RTP streams over Iuh interface. This command is used for RTP stream management on HNB-GW.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

associate rtp pool *pool_name*

no associate rtp pool

no

Removes the associated RTP pool (IP pool) from this HNB-GW service configuration.

pool_name

Specifies the name of the pre-configured RTP IP pool that the HNB-GW uses to assign IP addresses when mapping RTP streams over the Iuh interface.
pool_name is an alphanumeric string of 1 through 31 characters.

Important: For IP pool (RTP pool) configuration, refer **ip pool** command in *Context Configuration Mode Commands* chapter.

Usage

Use this command to associate an RTP pool (IP Pool) with an HNB-GW service for allotment of RTP IP address to HNB-GW node and send the same to HNB for RTP stream management support. The HNB maps the RTP streams with received IP address(es) while communicating with HNB-GW over Iuh interface where HNB-GW communicates with MSC/VLR through IuCS-over-IP tunnel.
This command is used for RTP stream management on HNB-GW.

Important: This command must be used to provide IP address for mapping of RTP streams on Iuh interface between HNB and HNB-GW.

Example

Following command associates RTP pool named *rtp_1* with HNB-GW service for RTP stream end point from Home-NodeB:

```
associate rtp pool rtp_1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

handin

Allows or disallows the incoming hand-over of an MS in HNB-GW via the Serving Radio Network Subsystem (SRNS) Relocation procedure for the specified packet switched/circuit switched (PS/CS) core network (CN) domain.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

[**no** | **default**] **handin cn-domain** [**cs** | **ps**]

no

Disallows the incoming MS hand-over for the particular CN domain via SRNS Relocation procedure in an HNB-GW service instance.
If hand-over is restricted the relocation request will be rejected with rejection cause “Relocation Not Supported In Target RNC Or Target System”.

default

Sets the HNB-GW service instance to allow the incoming MS hand-over for the particular CN domain via SRNS Relocation procedure in an HNB-GW service instance.

cs

Sets the HNB-GW service instance to allow the incoming MS hand-over for the CS core network domain via SRNS Relocation procedure in an HNB-GW service instance.

ps

Sets the HNB-GW service instance to allow the incoming MS hand-over for the PS core network domain via SRNS Relocation procedure in an HNB-GW service instance.

Usage

Use this command to set HNB-GW service instance for allowing/disallowing incoming hand-over of an MS in HNB-GW via SRNS Relocation procedure for PS or CS core network domain.
If hand-over is restricted the Relocation Request message will be rejected with rejection cause “Relocation Not Supported In Target RNC Or Target System”.

Example

The following command configures the HNB-GW service instance to allow hand-over of an MS in HNB-W via SRNS Relocation procedure for PS core network domain:

handin ps

ip iu-qos-dscp

Enables or disables the DSCP marking parameter for data packets carried over over an IuCS/IuPS interface towards MSC/SGSN. By default this command is **Disabled**.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

ip iu-qos-dscp protocol { sctp payload all | udp payload { gtpu | rtcp| rtp} } *dscp_code*

[default | no] ip iu-qos-dscp protocol { sctp payload all | udp payload { gtpu | rtcp| rtp} }

no

Use this keyword to place the configuration in **pass-through** mode (no marking of DSCP). Use of this keyword is allowed even when there is no previous DSCP parameter set.

Important: In this configuration the **no** keyword does not disable or remove a previous configuration.

default

Enables the DSCP marking on HNB-GW and set/restores the QoS parameters to their default setting.

sctp payload all *dscp_code*

Specifies the QoS traffic pattern towards MSC/SGSN in SCTP protocol association over IuCS/IuPS interface. By this keyword the Traffic classes specified by a user based on SCTP protocol and all type of payload identified based on the transport level port numbers.
By default DSCP codes **cs5** is supported for **all** payloads in SCTP protocol.

udp payload { gtpu | rtcp| rtp} *dscp_code*

Specifies the QoS traffic pattern towards MSC/SGSN in SCTP protocol association over IuCS/IuPS interface. By this keyword the Traffic classes specified by a user based on UDP protocol and GTPU, RTCP, and RTP type of payload identified based on the transport level port numbers.
Default DSCP code in UDP traffic are:

- **GTP-U**: cs1
- **RTCP**: ef

- **RTP**: af41

dscp_code

Specifies the QoS DSCP codes supported for SCTP and UDP traffic and its payloads towards MSC/SGSN over IuCS/IuPS interface.
following type of DSCP codes *dscp_code* are supported over IuH interface:

- **af11**: Marks traffic as Assured Forwarding 11 PHB (high throughput data)
- **af12**: Marks traffic as Assured Forwarding 12 PHB (high throughput data)
- **af13**: Marks traffic as Assured Forwarding 13 PHB (high throughput data)
- **af21**: Marks traffic as Assured Forwarding 21 PHB (low latency data)
- **af22**: Marks traffic as Assured Forwarding 22 PHB (low latency data)
- **af23**: Marks traffic as Assured Forwarding 23 PHB (low latency data)
- **af31**: Marks traffic as Assured Forwarding 31 PHB (multimedia streaming)
- **af32**: Marks traffic as Assured Forwarding 32 PHB (multimedia streaming)
- **af33**: Marks traffic as Assured Forwarding 33 PHB (multimedia streaming)
- **af41**: Marks traffic as Assured Forwarding 41 PHB (multimedia conferencing). This is the default DSCP code for RTP payloads in UDP protocol.
- **af42**: Marks traffic as Assured Forwarding 42 PHB (multimedia conferencing)
- **af43**: Marks traffic as Assured Forwarding 43 PHB (multimedia conferencing)
- **cs1**: Marks traffic with Class Selector 1 (low priority data). This is the default DSCP code for GTP-U payloads in UDP protocol.
- **cs2**: Marks traffic with Class Selector 2 (OAM)
- **cs3**: Marks traffic with Class Selector 3 (broadcast video)
- **cs4**: Marks traffic with Class Selector 4 (real-time interactive)
- **cs5**: Marks traffic with Class Selector 5 (signaling). This is the default DSCP code for all SCTP payloads.
- **cs6**: Marks traffic with Class Selector 6 (network control)
- **df** : Marks traffic as Default Forwarding (best effort: DSCP = 0)
- **ef**: Marks traffic as Expedited Forwarding PHB (telephony). This is the default DSCP code for RTCP payloads in UDP protocol.

Usage

Use this command to enable/disable the DSCP marking for data packets over IuCS/PS interface. This command assigns the DSCP levels to specific traffic patterns in order to ensure that the packets are delivered according to the precedence with which they are tagged. The Diffserv markings are applied to the IP header of every subscriber data packet transmitted over IuCS/IuPs interface(s) towards MSC/SGSN.
This command adds DSCP marking on egress traffic going towards CN (CS/PS). To make the configuration **pass-through** mode or not marking DSCP at all in the packets, **no** variant of command is used. Use of **no** is allowed even when there is no previous DSCP configuration done.

Important: By default this command is **Disabled**.

Important: When DSCP configuration is not specified, the system works in **pass-through** mode and DSCP values in the ingress (from CN) and egress (to HNB) data packets remain unchanged. Multiple traffic classes can share the same code point value.

Following type shown in following tables respectively:

Table 23. Supported DSCP Codes and Service Class

Service Class	DSCP Code	Service Class	DSCP Code
high throughput data	af11 af12 af13	low priority data	cs1
low latency data	af21 af22 af23	OAM	cs2
multimedia streaming	af31 af32 af33	broadcast video	cs3
multimedia conferencing	af41 af42 af43	real-time interactive	cs4
best effort/ default forwarding, value zero	df	Signaling	cs5
telephony	ef	network control	cs6

Example

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

The following command configures the DSCP code for the SCTP IuCS/IuPS streaming traffic pattern for all payloads to be **ef**:

```
ip iu-qos-dscp protocol sctp payload all ef
```

ip iuh-qos-dscp

Enables or disables the DSCP marking parameter for control and data packets transmitted over an IuH interface towards HNB. By default this command is **Disabled**.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

ip iuh-qos-dscp protocol { sctp payload all | udp payload { gtpu | rtcp| rtp} } *dscp_code*

[default | no] ip iuh-qos-dscp protocol { sctp payload all | udp payload { gtpu | rtcp| rtp} }

no

Use this keyword to set the configuration in **pass-through** mode. Use of this keyword is allowed even when there is no previous DSCP parameter set.

Important: In this configuration the **no** keyword does not disable/remove a previous configuration.

default

Enables the DSCP marking on HNB-GW and set/restores the QoS parameters to its default setting.

sctp payload all *dscp_code*

Specifies the QOS traffic pattern towards HNB in SCTP protocol association over IuH interface.
By this keyword the Traffic classes specified by a user based on SCTP protocol and all type of payload identified based on the transport level port numbers.
By default DSCP codes **cs5** is supported for **all** payloads in SCTP protocol.

udp payload { gtpu | rtcp| rtp} *dscp_code*

Specifies the QOS traffic pattern towards HNB in SCTP protocol association over IuH interface.
By this keyword the Traffic classes specified by a user based on UDP protocol and GTPU, RTCP, and RTP type of payload identified based on the transport level port numbers.
Default DSCP code in UDP traffic are:

- **GTP-U**: cs1
- **RTCP**: ef

- **RTP**: af41

dscp_code

Specifies the QOS DSCP codes supported for SCTP and UDP traffic and its payloads towards HNB over IuH interface.
following type of DSCP codes *dscp_code* are supported over IuH interface:

- **af11**: Marks traffic as Assured Forwarding 11 PHB (high throughput data)
- **af12**: Marks traffic as Assured Forwarding 12 PHB (high throughput data)
- **af13**: Marks traffic as Assured Forwarding 13 PHB (high throughput data)
- **af21**: Marks traffic as Assured Forwarding 21 PHB (low latency data)
- **af22**: Marks traffic as Assured Forwarding 22 PHB (low latency data)
- **af23**: Marks traffic as Assured Forwarding 23 PHB (low latency data)
- **af31**: Marks traffic as Assured Forwarding 31 PHB (multimedia streaming)
- **af32**: Marks traffic as Assured Forwarding 32 PHB (multimedia streaming)
- **af33**: Marks traffic as Assured Forwarding 33 PHB (multimedia streaming)
- **af41**: Marks traffic as Assured Forwarding 41 PHB (multimedia conferencing). This is the default DSCP code for RTP payloads in UDP protocol.
- **af42**: Marks traffic as Assured Forwarding 42 PHB (multimedia conferencing)
- **af43**: Marks traffic as Assured Forwarding 43 PHB (multimedia conferencing)
- **cs1**: Marks traffic with Class Selector 1 (low priority data). This is the default DSCP code for GTP-U payloads in UDP protocol.
- **cs2**: Marks traffic with Class Selector 2 (OAM)
- **cs3**: Marks traffic with Class Selector 3 (broadcast video)
- **cs4**: Marks traffic with Class Selector 4 (real-time interactive)
- **cs5**: Marks traffic with Class Selector 5 (signaling). This is the default DSCP code for all SCTP payloads.
- **cs6**: Marks traffic with Class Selector 6 (network control)
- **df** : Marks traffic as Default Forwarding (best effort: DSCP = 0)
- **ef**: Marks traffic as Expedited Forwarding PHB (telephony). This is the default DSCP code for RTCP payloads in UDP protocol.

Usage

Use this command to enable/disable the DSCP marking for control and data packets carried by the IP protocols and their payloads on IuH. This command assigns the DSCP levels to specific traffic patterns in order to ensure that the packets are delivered according to the precedence with which they are tagged. The Diffserv markings are applied to the IP header of every subscriber data packet transmitted over IuH interface(s) towards HNB.
This command adds DSCP marking on egress traffic going towards HNB. To make the configuration **pass-through mode** or not marking DSCP at all in the packets, **no** variant of command is used. Use of **no** is allowed even when there is no previous DSCP configuration done.

Important: By default this command is **Disabled**.

Important: When DSCP configuration is not specified, system works in **pass-through** mode and DSCP value in the ingress (from CN) and egress (to HNB) control and data packets remain unchanged. Multiple traffic classes can share the same code point value.

Following type shown in following tables respectively:

Table 24. Supported DSCP Codes and Service Class

Service Class	DSCP Code	Service Class	DSCP Code
high throughput data	af11 af12 af13	low priority data	cs1
low latency data	af21 af22 af23	OAM	cs2
multimedia streaming	af31 af32 af33	broadcast video	cs3
multimedia conferencing	af41 af42 af43	real-time interactive	cs4
best effort/ default forwarding, value zero	df	Signaling	cs5
telephony	ef	network control	cs6

Example

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

The following command configures the DSCP code for the SCTP IuH streaming traffic pattern for all payloads to be **ef**:

```
ip iuh-qos-dscp protocol sctp payload all ef
```

radio-network-plmn

Creates, remove and enters the HNB-RN-PLMN Configuration mode. In this mode you can configure various parameters for radio network public mobile land networks (PLMNs). A maximum of 16 radio PLMN-IDs can be configured in an HNB-GW service.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

radio-network-plmn mcc *mcc_num* **mnc** *mnc_num* [**-noconfirm**]

no radio-network-plmn mcc *mcc_num* **mnc** *mnc_num*

no

Removes the configured radio network PLMN identifier for an HNB-GW service.

Caution: Removing the PLMN-ID is a disruptive operation; the HNB-GW service will be re-started.

mcc *mcc_num*

Specifies the mobile country code (MCC) part of radio network PLMN identifier as an integer value from 101 through 998.

mnc *mnc_num*

Specifies the mobile network code (MNC) part of radio network PLMN identifier as a 2- or 3-digit integer from 01 through 998.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to configure the radio network PLMN identifier for an HNB-GW service. This command also creates a configuration mode to configure various parameters for defined radio network PLMN identifier in HNB-GW service.

Caution: Changing or removing the PLMN-ID is a disruptive operation; the HNB-GW service will be re-started.

Entering this command results in the following prompt:

```
[context_name]hostname(config-radio-network-plmn)#
```

A maximum of 16 radio network PLMN identifiers are supported for an HNB-GW service.

Example

The following command configures the radio network PLMN identifier with MCC value as *102* and MNC value as *20* for an HNB-GW service:

```
radio-network-plmn mmc 102 mnc 20
```

ranap reset

Configures various Radio Access Network (RAN) Application Part reset procedure parameters in an HNB access network.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

ranap reset {ack-timeout *timer_value* **| guard-timeout** *g_timer* **| hnbgw-initiated | max-retransmissions** *retries***}**

default ranap reset {ack-timeout | guard-timeout | hnbgw-initiated | max-retransmissions }

no ranap hnbgw-initiated

default

Resets the RANAP RESET parameters on HNB-GW service instance.

no

Disables the RANAP RESET procedure related parameters in an HNB-GW service instance.

ack-timeout *timer_value*

Sets the timer value (in seconds) to wait for Reset Acknowledge from SGSN/MSC. This is used during HNB-GW initiated RANAP RESET procedure in HNB-GW service instance.
timer_value is an integer value from 5 through 10. Default: 10

guard-timeout *g_timer_value*

Sets the timer value (in seconds) to send Reset Acknowledge to SGSN/MSC. After this duration the HNB-GW sends RESET-ACK to SGSN/MSC. This is used during SGSN/MSC initiated RANAP RESET procedure in HNB-GW service instance.
g_timer_value is an integer value from 5 through 10. Default: 10

hnbgw-initiated

Enables the HNB-GW Initiated RANAP RESET procedures. Default: Disabled

max-retransmission *retries*

Sets the maximum number of retires allowed for transmission of RESET-ACK message to SGSN/MSC. This is used during RANAP RESET procedure in HNB-GW service instance.
retries is an integer value from 0 through 2. When 0 is used retransmission is disabled. Default: 1

Usage

Use this command to configure the RANAP RESET procedure related parameters in HNB-GW service.

Example

The following command configures the HNB-GW initiated RANAP RESET Procedure for an HNB-GW service:

```
ranap reset hnbgw-initiated
```

rtcp report

Enables or disables the generation of RTP Control Protocol (RTCP) packet/report types on a per HNB-GW service instance basis. It also sets the time interval in seconds between two consecutive RTCP reports.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

rtcp report interval *dur*

[**no** | **default**] **rtcp report interval**

no

Disables the RTCP report generation on HNB-GW service. When RTP configuration is not explicitly mentioned, this is the default behavior.

default

Restores the report interval value to its default value of 5 seconds.

interval *dur*

Sets the time interval (in seconds) between two consecutive RTCP reports as an integer from 5 through 30. Default: 5

Usage

Use this command to configure the enabling or disabling of the generation of RTCP packet/ report types on a per HNB-GW service instance basis and sets the specified time interval in seconds between two consecutive RTCP reports.

RTCP enables the receiver to detect if there is any packet loss and needs to compensate for any delay jitter. RTP and RTCP protocols work independently of the underlying Transport layer and Network layer protocols. Whenever this command is disabled, RTCP report generation stops from the next expiry of the previously configured interval and after enabling, reports are generated only for the calls that established as new calls in the future. For existing calls reports generated as per configuration in place.

RTCP reports are generated for each RAB for RTP received from and sent to IuH interface.

Important: The same interval is applicable for all kinds of RTCP packets/ reports across all sessions on an HNB-GW service.

Example

The following command configures the RTCP report generation interval to *15* seconds on an HNB-GW service for RTP stream:

```
rtcp report interval 15
```

rtp mux

Configures the HNB-GW service to allow an Home-NodeB to multiplex multiple RTP streams in one IP packet. This support is provided for RTP stream management feature on HNB-GW.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

[**no** | **default**]**rtp mux**

default

Sets the multiplexing option to default state of "disabled".

no

Removes the configured option to multiplex multiple RTP stream in one packet by Home-NodeB in HNB-GW configuration.

Usage

Use this command to allow an Home-NodeB to multiplex multiple RTP streams in one IP packet. This configuration support is provided for RTP stream management feature on HNB-GW and it is disabled by default.

Example

The following command sets the HNB-GW to allow HNB to multiplex multiple RTP stream in one packet:

```
rtp mux
```

sctp

Configures the SCTP-related parameters like timeout duration for various timers and cookie life over an IuH interface in an HNB-GW service.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

sctp alpha-rto *alpha_rto_dur*

sctp beta-rto *beta_rto_dur*

sctp checksum-type [adler32 | crc32]

sctp cookie-life *cookie_life*

sctp max-retx [init | path | assoc] *max_retry*

sctp mtu-size [start | min | max] *mtu_byte*

sctp rto { initial *ini_rto_dur* **| min** *min_rto_dur* **| max** *max_rto_dur* **}**

sctp sack-frequency *sack_frq*

sctp sack-period *sack_dur*

sctp max-in-strms *in_strms*

sctp max-out-strms *out_strms*

default sctp {alpha-rto | beta-rto | checksum-type | cookie-life | max-retx [init | path | assoc] | mtu-size [start | min | max] | rto { initial | min | max} | sack-frequency | sack-period | max-in-strms | max-out-strms }

default

Restores the SCTP parameters to default value in HNB-GW service instance. Default values for all parameters are as follows:

- **alpha-rto**: 5 seconds
- **beta-rto**: 10 seconds
- **checksum-type**: CRC32

- **cookie-life**: 600 ms
- **max-retx init**: 5 retries
- **max-retx path**: 5 retries
- **max-retx assoc**: 10 retries
- **mtu-size min**: 508 Bytes
- **mtu-size max**: 1500 Bytes
- **mtu-size start**: 508 Bytes
- **rto initial**: 30 seconds
- **rto min**: 10 seconds
- **rto max**: 600 seconds
- **sack-frequency**: 2
- **sack-period**: 2 ms
- **max-in-strms**: 4
- **max-out-strms**: 4

---

alpha-rto *alpha_rto_dur*

Sets the alpha retransmission timeout duration (in seconds) for SCTP association between HNB and HNB-GW as an integer from 0 through 65535. A "zero" value disables the timer in this configuration. Default: 5

---

beta-rto *beta_rto_dur*

Sets the beta retransmission timeout duration (in seconds) for SCTP association between HNB and HNB-GW an integer from 0 through 65535. A "zero" value disables the timer in this configuration. Default: 10

---

checksum-type [adler32 | crc32]

Sets the checksum algorithm type to be used in SCTP association between HNB and HNB-GW for packet validation. Default: CRC32
adler32: Specifies the SCTP association to use Adler32 checksum algorithm for packet validation. By default this is disabled.
crc32: Specifies the SCTP association to use 32-bit cyclic redundancy check (CRC) algorithm for packet validation. By default this is enabled.

---

cookie-life *cookie_life*

Sets the COOKIE life (in milliseocnds) for SCTP association between HNB and HNB-GW as an integer from 500 through 120000. Default: 600

---

max-retx [init | path | assoc] *max_retry*

Sets the maximum number of retries allowed in SCTP states for SCTP association between HNB and HNB-GW.
init: Sets the maximum attempts allowed after T1-init timer expires. If the T1-init timer expires then the HNB-GW retransmits INIT chunk and re-start the T1-init timer without changing state. This is repeated up to the configured times with this configuration. After that, the HNB-GW aborts the initialization process. Default number of attempts *max_retry* for this state is 5.

path: Sets the maximum attempts allowed after T3-rtx timer expires. Each time the T3-rtx timer expires on any address, or when a HEARTBEAT sent to an idle address is not acknowledged within a RTO, the error counter of that destination address incremented. When the value in the error counter exceeds this protocol parameter of that HNB address, the HNB-GW marks the destination transport address as inactive. Default number of attempts *max_retry* for this state is 5.
assoc: Sets the maximum number of consecutive retransmissions to its peer is allowed. If the value of this counter exceeds the limit configured with this keyword the HNB-GW considers the peer HNB unreachable and stop transmitting any more data to it. The SCTP association is automatically closed when the peer endpoint becomes unreachable. Default number of attempts *max_retry* for this state is 10.
max_retry is an integer from 1 through 255.

---

mtu-size [min | max | sart] *mtu_byte*

Sets the maximum transmission unit (MTU) size in Bytes for SCTP association between HNB and HNB-GW.
min: Sets the minimum size of MTU for SCTP association between HNB and HNB-GW. Default minimum MTU size *mtu_byte* is 508 Bytes.
max: Sets the maximum size of MTU for SCTP association between HNB and HNB-GW. Default maximum MTU size *mtu_byte* is 1500 Bytes.
start: Sets the size of MTU for SCTP association at the start of session between HNB and HNB-GW. Default MTU size *mtu_byte* at initial sate is 508 Bytes.
mtu_byte is an integer from 508 to 65535.

---

rto { initial *ini_rto_dur* **| min** *min_rto_dur* **| max** *max_rto_dur* **}**

Sets the Retransmission TimeOut (RTO) duration parameters for SCTP association between HNB and HNB-GW.
initial *ini_rto_dur*: Sets the initial retransmission timeout duration (in seocnds) for SCTP association between HNB and HNB-GW as an integer from 1 through 1200. Default: 30.
min *min_rto_dur*: Sets the minimal retransmission timeout duration (in seconds) for SCTP association between HNB and HNB-GW as an integer from 1 through 50. Default: 10
max *max_rto_dur*: Sets the maximum retransmission timeout duration (in secinds) for SCTP association between HNB and HNB-GW as an integer from 5 through 1200. Default: 600.

---

sack-frequency *sack_frq*

Sets the number of chunks received before sending the Selective Acknowledgement chunk HNB from HNB-GW in SCTP association. the SACK chunk is sent to the HNB to acknowledge received DATA chunks and to inform the HNB of gaps in subsequently received DATA chunks.
sack_frq is the frequency after which SACK chunk is sent to HNB specified as an integer from 1 through 5. Default: 2

---

sack-period *sack_dur*

Sets the duration (in seconds) after which Selective Acknowledgement chunk is sent to HNB from HNB-GW in SCTP association. The SACK chunk is sent to the HNB to acknowledge received DATA chunks and to inform the HNB of gaps in subsequently received DATA chunks.
sack_dur is an integer from 0 through 5. A “zero” value disables the parameter.

---

max-in-strms *in_strms*

Sets the maximum number of inward SCTP streams allowed on HNB-GW for an associated HNB in an SCTP association as an integer from 1 through 16. Default: 4

max-out-strms *out_strms*

Sets the maximum number of outgoing SCTP streams allowed from HNB-GW for an associated HNB in an SCTP association as an integer from 1 through 16. Default: 4

Usage

Use this command to configure the SCTP protocol messaging and session management parameters in SCTP association between HNB and HNB-GW.

Example

The following command sets the SCTP COOKIE life to *600* milliseconds on HNB-GW for the SCTP association:

```
default sctp cookie-life
```

sctp bind

Configures the SCTP IP address and port that is used for binding the SCTP socket to communicate with the Home-NodeB over an Iuh interface within an HNB-GW service.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

sctp bind { address *address* **| port** *port_num* **}**

[default | no] sctp bind { address | port }

default

Sets the SCTP port to the default value of 600.

address *address*

Specifies the IP address of the HNB-GW Iuh interface in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

port *port_num*

Specifies the SCTP port number to communicate with the Home-NodeBs using Iuh interface as an integer form 1 through 65535.

Usage

Use this command to assign the SCTP IP address and port with SCTP socket on HNB-GW to communicate with the Home-NodeB using Iuh interface. This SCTP configuration provides the IP-address and listen port where HNB-GW service shall bind to listen for incoming SCTP associations from HNB.

Example

The following command sets the SCTP port number *999* on HNB-GW to listen from Home-NodeB over Iuh interface:

```
sctp bind port 999
```

The following command sets the SCTP address *10.2.3.4* of HNB-GW to use with Home-NodeB over Iuh interface:

```
sctp bind address 10.2.3.4
```

sctp connection-timeout

Configures the SCTP connection timeout duration to explicitly remove the SCTP association with a non-responsive HNB in an HNB-GW service.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

sctp connection-timeout *dur*

[default | no] sctp connection-timeout

no

Disables the connection time out configuration on HNB-GW service.

default

Restores the connection timeout duration value to its default value of 10 seconds.

dur

Sets the connection timeout duration (in seconds) after which the association is explicitly removed. In case of an HNB de-registration scenario, the HNB-GW waits for configured amount time before initiating the procedure to clear the SCTP association.
dur is an integer from 5 through 30. Default: 10

Usage

Use this command to configure the minimum duration value before removing the SCTP association between a non-responding HNB and HNB-GW. If HNB registration not happened within the configured period after the SCTP association is established then the SCTP association is explicitly removed. In a scenario where an HNB de-registered due to any reason, the HNB-GW waits for the configured amount of time before initiating the procedure to clear the SCTP association.

Example

The following command sets the SCTP connection timeout duration to *15* second on HNB-GW after expiry of which the SCTP association is removed:

```
sctp connection-timeout 15
```

sctp heart-beat-timeout

Configures the SCTP heartbeat timer parameters for SCTP connection over an IuH interface in an HNB-GW service instance.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

sctp heart-beat-timeout *dur*

[default | no] sctp heart-beat-timeout

no

Disables the heartbeat timer configuration for SCTP over IuH in HNB-GW service instance.

default

Restores the default time out value for heartbeat timer to 30 seconds.

dur

Sets the heartbeat timer timeout duration (in seconds) after which the next heartbeat command is sent to HNB from HNB-GW in SCTP over an IuH interface. In an HNB de-registration scenario, the HNB-GW waits for configured amount time before initiating the procedure to clear the SCTP association.
dur is an integer from 1 through 300. Default: 30

Usage

Use this command to configure the minimum duration value before retransmitting the HEARTBEAT chunk to HNB from HNB-GW in SCTP transmission. By default HNB-GW monitors the reachability of the idle HNBs by sending a HEARTBEAT chunk periodically to the HNB address.
Each time the HEARTBEAT timer expires on any address, or when a HEARTBEAT sent to an idle address is not acknowledged within a Retransmission Timeout duration, the error counter of that HNB incremented. When the value in the error counter exceeds the protocol parameter for maximum retransmission for that destination address, the HNB-GW mark the destination HNB as inactive and a notification is sent to the upper layer.

Example

The following command sets the SCTP HEARTBEAT timeout duration to *15* second on HNB-GW after expiry of which the HNB-GW retransmits the HEARTBAT chunk to HNB over SCTP association:

```
sctp heart-beat-timeout 15
```

security-gateway aaa

Associates a pre-configured AAA Service group to use authentication parameters for Security Gateway (SeGW) functionality in HNB-GW service. The associated AAA server group is a pre-configured via Context Configuration mode.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

security-gateway aaa authentication { first-phase | second-phase } context *ctx_name* **aaa-group** *aaa_grp*

no security-gateway aaa { attribute calling-station-id | authentication { first-phase | second-phase }

no

Removes previously configured AAA authentication or attribute setting from HNB-GW service while using SeGW functionary.

attribute calling-station-id *ms_id*

Specifies the calling station identifier from where the user placed the call.

authentication { first-phase | second-phase } context *ctx_name* **aaa-group** *aaa_grp*

Specifies the AAA authentication parameters to be used while using SeGW functionality in an HNB-GW service.
first-phase: Specifies the parameters to be used for first phase of authentication while using SeGW functionality in an HNB-GW service. This associates the AAA parameters through AAA server group association with in it.
second-phase: Specifies the parameters to be used for second phase of authentication while using SeGW functionality in an HNB-GW service. This associates the AAA parameters through AAA server group association with in it.
context *ctx_name*: Specifies the name of the context to be used for first/second or both phases of authentication.
aaa-group *aaa_grp*: Specifies the name of the AAA server group configured via Context Configuration mode with AAA parameters that will be used for first/second or both phases of authentication.

Important: For more information on AAA server groups, refer *AAA Server Group Configuration Mode Commands*.

Usage

Use this command to associate or tie the AAA authentication or attribute parameters with an HNB-GW service which is to be used for first/second or both phase of authentication while using SeGW functionality in an HNB-GW service or removing AAA attribute “calling-station-id” from AAA message. This functionality is part of SeGW configuration support in an HNB-GW service.

Caution: This is a critical configuration and need to be configured carefully when Security Gateway (SeGW) functionality required on HNB-GW service.

Example

The following command associates an AAA server group named *sec_gw_grp1* with HNB-GW service to use specific AAA authentication parameters in first phase of authentication and another AAA server group named *sec_gw_grp2* to use different AAA authentication parameter in second phase of authentication. Both AAA server groups are configured in same context named *SeGW_ctx1*:

```
security-gateway aaa authentication first-phase context SeGW1 aaa-group
sec_gw_grp1security-gateway aaa authentication second-phase context SeGW1
aaa-group sec_gw_grp2
```

The following command disables a previously configured AAA authentication parameter for first phase of authentication:

```
no security-gateway aaa authentication first-phase
```

security-gateway bind

Binds the SeGW in an HNB-GW service to a logical IP interface serving as an Iuh interface and associates an IPsec IKEv2 crypto-map template.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

security-gateway bind address *address* **crypto-template** *cryp_name* **[context** *ctxt_name***]**

no security-gateway bind

no

Removes a previously configured IPSec IP address use for binding the IKEv2 IPSec tunnel (local bind address) to communicate with the Home-NodeBs using Iuh interface.

bind address *address*

Specifies the IP address for the Iuh interface for the IPSec tunnel. This is the IP address where the HNB-GW service is bound and that is provided to the Home-NodeB during HNB-GW discovery.
The IP address is expressed in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

crypto-template *cryp_name*

Specifies the Crypto-map template to be used for IPsec IKEv2 tunneling for the interface configured as an Iuh.
cryp_name specifies the name of the pre-configured Crypto-map template which is configured in Crypto-Map Template Configuration mode and associated with the HNB-GW service to create an IPSec tunnel with a Home-NodeB during HNB-GW discovery procedure over an Iuh interface.

context *ctx_name*

Specifies the name of the pre-configured context in which the Security Gateway service is configured. By default this command uses the HNB-GW service context for the security Gateway configuration.

Usage

Use this command to associate or tie the HNB-GW service to a specific logical IP address that is used for binding the Iuh socket to communicate with the Home-NodeB using IPSec tunnel. A maximum of one IP address can be configured with this command for one HNB-GW service.
The HNB-GW passes the IP address during setting up the HNB-GW discovery procedure with the Home-NodeB.

Caution: This is a critical configuration. The HNB-GW service cannot be started without this configuration. Any change to this configuration would lead to restarting the HNB-GW service and removing or disabling this configuration stops the HNB-GW service.

Example

The following command binds the logical IP interface with the address of *10.2.3.4* to the HNB-GW service using existing IPsec Crypto-Map template *crypto1* to establish IPSec tunnel with Home-NodeB:

```
security-gateway bind address 10.2.3.4 crypto-template crypto1
```

The following command disables a binding that was previously configured:

```
security-gateway bind address
```

security-gateway username

Configures the options related to user name received from MS.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

[no | defualt] security-gateway username mac-address-stripping

no

Disables previously configured option for user name received from MS.

default

Sets the user name option configuration of default setting of "Disable".

mac-address-stripping

Sets the system to strip the MAC address from the user name received from the MS. Default: Disabled

Usage

Use this command to set the user name related options. By enabling this option system trips the MAC address from the user name received from MS.

Example

The following command sets the system to strip the MAC address from user name received from user MS:

```
security-gateway username mac-address-stripping
```

tnnsf-timer

Configures the NAS Node Selection Function (NNSF) timer (T-NNSF) which is used by the HNB-GW to store the IMSI and the relevant Global-CN-ID in the short term after Paging. This timer is used for Iu-Flex feature support.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

tnnsf-timer *dur*

[no | default] tnnsf-timer

no

Disables/removes the configured timer value of NNSF timer (T-NNSF) from HNB-GW service instance.

default

Sets the timer value of NNSF timer (T-NNSF) for HNB-GW service instance to default value of 30 seconds.

tnnsf-timer *dur*

Configures the NNSF timer (in seconds) which is used by the HNB-GW to store the IMSI and the relevant Global-CN-ID as an integer from 10 through 60. Default: 30

Usage

Use this command to configure the NNSF timer value in seconds for Iu-Flex support.
Whenever the MSC sends the paging request with IMSI, the HNB-GW stores the Global_CN_ID of the node which issued the paging request message for the given IMSI and HNB-GW starts the **tnnsf-timer**. HNBGW stores the mapping of IMSI to Global_CN_ID until the **tnnsf-timer** expires

Example

The following command sets the NNSF timer value to *30* seconds in an HNB-GW service instance:

```
default tnssf-timer
```

ue registration-timeout

Configures the UE registration timeout duration to de-register the connected UE from an HNB-GW service.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration

configure > context *context_name* **> hnbgw-service** *service_name*

Syntax

ue registration-timeout *dur*

[default | no] ue registration-timeout

no

Disables the UE registration timeout duration and explicitly de-registers UE from the HNB-GW service.

default

Restores the UE registration timeout duration value to its default value of 120 seconds.

dur

Sets the UE registration timeout duration (in seconds) after which the UE is de-registered from HNB-GW. In a scenario when all Iu connections are released for a subscriber, the HNB-GW service de-registers the UE after the configured duration only.
dur is an integer from 60 through 300. Default: 120

Usage

Use this command to configure the minimum duration value before de-registering the UE when subscriber fails to establish the Iu connection. If subscriber's Iu session does not established before configured period then UE is de-registered. Also in a scenario where all Iu connections are released for a subscriber, the HNB-GW service waits for configured period before starting UE deregistration procedure.

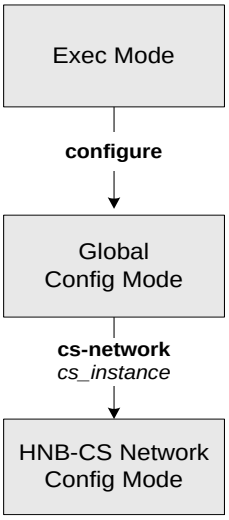
Example

The following command sets the UE registration timeout duration to *150* second on HNB-GW after expiry of which the UE is de-registered:

```
ue registration-timeout 150
```

Chapter 147
HNB-CS Network Configuration Mode Commands

The HNB-CS Network configuration mode provides the commands to create, provide, and manage the circuit switched (CS) network instance allowing the Home Evolved NodeB Gateway (HNB-GW) access with the CS core network in a 3G UMTS network.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate alcap-service

Associates a previously defined Access Link Control Application Part (ALCAP) service with the CS network instance for multiplexing of different users onto one AAL2 transmission path using channel IDs (CIDs). This configuration is provided to support IuCS-over-ATM functionality

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

associate alcap-service *svc_name* **context** *ctx_name*

no associate alcap-service

no

Removes the associated ALCAP service from this HNB-CS network instance configuration.

svc_name

Identifies the name of the ALCAP service preconfigured in Context configuration mode to associate with an HNB-CS network instance for multiplexing of different users onto one AAL2 transmission path using channel IDs (CIDs).
svc_name must be a preconfigured ALCAP service.
Only one instance of this command can be configured.

Caution: If this CLI is not configured any RAB-ASST-REQ requesting AAL2 connection setup shall be rejected with an appropriate cause.

context*ctx_name*

Specifies the name of the context in which ALCAP service is configured.
ctx_name must be an existing context name in which this ALCAP service is configured.

Usage

Use this command to configure IuCS-over-ATM support. This association of ALCAP protocol service configuration in HNB-CS network instance provides multiplexing of different users onto one AAL2 transmission path using channel IDs (CIDs).

Caution: If this CLI is not configured any RAB-ASST-REQ message requesting AAL2 connection setup shall be rejected with an appropriate cause.

Important: This command must not be used more than once to configure IuCS-over-ATM support.

Example

Following command associates ALCAP service *alcap_svc1* configured in context named *Ctx_alcap1* with specific HNB-CS network instance:

```
associate alcap-service alcap_svc1context ctx_alcap1
```

associate rtp pool

Associates a previously defined RTP pool (IP pool) with the CS network instance to be used for assignment of IP address/port as RTP streams end point address over IuCS interface. This configuration support is provided for RTP stream management feature in an HNB-GW service.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

associate rtp pool *pool_name* **context** *ctx_name*

no associate rtp pool

no

Removes the associated RTP pool (IP pool) from this HNB-CS network instance configuration.

pool_name

Identifies the name of the RTP IP pool preconfigured in Context configuration mode to associate with an HNB-CS network instance to be used for assignment of IP address/port over the IuCS interface RTP streams. *pool_name* must be an existing IP pool name configured in Context configuration mode.

Important: For IP pool (RTP pool) configuration, refer *Context Configuration Commands Mode* chapter.

context*ctx_name*

Specifies the name of the context in which RTP pool (IP pool) is configured.
ctx_name must be an existing context name in which this IP pool is configured.

Usage

Use this command to associate RTP pool (IP Pool) with an HNB-CS network instance for allotment of IP address/port over IuCS interface for RTP streams across all sessions. A fixed range of RTP ports from 5000 through 65000 shall be used to allocate to RTP stream.

Important: This command must be used to provide IP address/port for RTP streams end point address over IuCS interface.

Important: This configuration support is provided for RTP stream management feature on an HNB-GW service.

Example

Following command associates RTP pool named *rtp_1* with specific HNB-CS network instance:

```
associate rtp pool rtp_1
```

associate sccp-network

Associates a predefined Signaling Connection Control Part (SCCP) network id with the CS network instance in order to route the messages towards MSC/VLR over IuCS interface.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

associate-sccp-network *sccp_net_id*

no associate-sccp-network

no

Removes the associated SCCP network id from this HNB-CS network instance configuration.

sccp_network_id

Identifies the predefined SCCP network id to associate with an HNB-CS network instance over IuCS/IuFlex interface to enable connection with MSC/VLR(s).
sccp_network_id must be a predefined SCCP network id in Global configuration mode.

Usage

Use this command to associate a preconfigured SCCP network id over IuCS interface in HNB-GW service to connect with CS network elements; i.e. MSC.

Caution: The SCCP network id must be defined in Global Configuration mode before using it with this command.

Important: A single SCCP network configuration instance can not be shared with multiple HNB-CS network instances.

Example

Following command associates SCCP network *2* with specific HNB-CS network instance:

```
associate-sccp-network 2
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

map core-network-id

Maps/associates the CS core network id to a default Mobile Switching Center (MSC) in network using MSC point code in HNB-CS network to allow HNBs to access UMTS network.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

map core-network-id *cn_id* **point-code** *msc_point_code*

no map core-network-id *cn_id*

no

Removes the mapping of a CS core network id with particular MSC point code.

cn_id

Specifies the core network identifier configured to represent a UMTS CS core network as an integer from 0 through 4095.
Multiple instance of this command can be mapped with different MSC point code.

point-code *msc_point_code*

Specifies the SS7 address of the default MSC in the CS network in point code value to a configured HNB-CS network instance.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this MSC point code can be mapped with one CS core network id.

Usage

Use this command to map a UMTS CS core network identifier with a particular MSC point code.
This command can be entered multiple times with same MSC point code to map with one or more CS core network Id, but a particular core network identifier can be mapped to one MSC only.
This command is instrumental in Iu-Flex functionality, whenever HNB-GW receives RESET/RESET-RES messages from MSC with Global CN-ID information element, the response from HNB-GW is sent to the node configured for that particular Global CN-ID.
If the RESET/RESET-RES messages do not have Global CN-ID IE, then the response of those messages is directed to the default MSC which is configured using **msc point-code** command in this mode.

Example

The following command configures the CS core network identifier *101* with an MSC point code *1.2.3*:

```
map core-network-id 101 point-code 1.2.3
```

The following command configures the CS core network identifier *102* with the same MSC point code *1.2.3*:

```
map core-network-id 102 point-code 1.2.3
```

map idnns

Configures the mapping of Intra-Domain NAS Node Selector (IDNNS) IE received from UE in RUA connect message towards HNB-GW to MSC point code. This is an important configuration for CS network resource sharing over Iu-Flex interface.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

map idnns range *idnns_start* **to** *idnns_end* **point-code** *msc_point_code* **[backup point-code** *bkup_msc_point_code***]**

no map idnns range *idnns_start* **to** *idnss_end*

no

Removes the entries of mapping of range of IDNNS received from UE with particular MSC point code.

range *idnns_start* **to** *idnns_end*

Specifies the range of IDNNS received from the UE to map with a particular MSC point code during initial CS core network node selection.
idnns_start is an integer from 0 through 1023 that should be less than *idnns_end*.
idnns_end must be an integer from 0 through 1023 that should be more than *idnns_start*.
The command can be entered more than once to map multiple IDNNS ranges to the same MSC, but overlapping and mapping of the same range to different MSC point codes is not allowed.

point-code *msc_point_code*

Specifies the SS7 address of the MSC in the CS network to map with a range of IDNNS values.
msc_point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

backup point-code *bkup_msc_point_code*

Specifies the SS7 address of the MSC to be used as a backup in the CS network to map with a range of IDNNS values.
bkup_msc_point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

Usage

Use this command to map a NRI received from UE during initial CS network node selection to MSC point code through NRI range mapping over Iu-Flex interface.

The IDNNS refers to the information element in RUA connect message from UE towards RAN (HNB-GW). In IDNNS IE, if the choice of routing mentioned is other than local P-TMSI, then the value it provides is used against this configuration to map the MSC point code.
If backup MSC point-code is specified, then specified MSC works as backup for the IDNS range configured. This Backup MSC is selected if the mapped MSC for a given IDNNS range is going for offloading using **offload-msc point-code** command.
The command can be entered more than once to map multiple IDNNS ranges to same MSC point code, but overlapping and mapping of same range to different MSC point code is not allowed.

Example

The following command maps the IDNNS range from *101* to *201* with MSC point code *1.2.3* and point code *7.8.9* as backup MSC point code:

```
map nri range 101 to 201 point-code 1.2.3 backup point-code 7.8.9
```

The following command removes all IDNNS range matching entries between *301* to *399* from the configuration:

```
no map idnns range 301 to 399
```

map nri

Configures the mapping of Network Resource Identifier (NRI) sent from UE to the MSC point code. This is an important configuration for CS network resource sharing over Iu-Flex interface.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

map nri range *nri_start* **to** *nri_end* **point-code** *msc_point_code*

no map nri range *nri_start* **to** *nri_end*

no

Removes the entries of mapping of range of NRIs received from UE with particular MSC point code.

range *nri_start* **to** *nri_end*

Specifies the range of NRIs received from UE to map with pa articular MSC point code during initial CS core network node selection.
nri_start is an integer from 0 through 1023 that should be less than *nri_end*.
nri_end is an integer from 0 through 1023 that should be more than *nri_start*.
The command can be entered more than once to map multiple NRI ranges to same MSC, but overlapping is not allowed.

point-code *msc_point_code*

Specifies the SS7 address of the MSC in the CS network to map with a range of NRI values.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

Usage

Use this command to map a NRI received from UE during initial CS network node selection to MSC point code through NRI range mapping over Iu-Flex interface.
This configuration is used during initial CS core network node selection when the network resource identifier (NRI) from the UE is available. The NRI range is mapped to MSC point code. This configuration is used when the core network uses Iu-Flex interface.
The command can be entered more than once to map multiple NRI ranges to same MSC point code.
It is possible to configure multiple ranges to more than one MSC however this configuration is required only when the CS core network is configured as Multi-Operator Core Network (MOCN).
When the CS core network is not MOCN and one range is mapped to more than one MSC then MSC is selected randomly in a non-predictable manner.

Example

The following command maps the NRI range from *101* to *201* with MSC point code *1.2.3*:

```
map nri range 101 to 201 point-code 1.2.3
```

The following command maps the NRI range from *301* to *399* with MSC point code *1.2.3*:

```
map nri range 301 to 399 point-code 1.2.3
```

The following command removes all NRI range matching entries between *301* to *399* from the configuration:

```
no map nri range 301 to 399
```

msc deadtime

Configures a timer on the HNB-GW to manage MSC availability in a CS core network on receiving of a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from an SCCP instance.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

msc deadtime { immidiate |*dur* **}**

[no | default] msc deaddtime

no

Marks the peer node (MSC) as always available; it can never be marked down for a specific HNB-CS network instance.

default

Sets the default action for HNB-GW and provisions it as such that the peer node (MSC) is marked down as soon as HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP in a specific HNB-CS network instance. Default: Enabled

immidiate

Sets the HNB-GW to mark the peer node (MSC) down immediately and clears all Iu-CS connections towards the MSC. Default: Disabled

dur

Sets the duration (in seconds) for a timer that starts when the HNB-GW receives a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer MSC. On expiry of this timer the peer MSC is marked as dead and all Iu-CS connections towards that MSC are released.
dur is an integer from 1 through 30.
Only one instance of this command can be configured.

Usage

This command is used to configure a timer on HNB-GW to manage MSC availability in a CS core network on receiving of PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP. This configuration plays important role during RANAP reset procedure as well.

Timer value sets the duration in seconds for a timer which started once HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer MSC. On expiry of this timer the peer MSC is marked as dead and all Iu-CS connections towards that MSC shall be released.

Important: This command can be entered only once. Reentering this command overwrites the previous parameters.

Example

The following command configures the deadtime timer value for *10* seconds on HNB-GW. Once HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer MSC the HNB-GW waits for configured period and on expiry of timer it marks the specific MSC as dead:

```
msc deadtime 10
```

msc point-code

Configures the default MSC point-code within an HNB-CS network instance. This command is used when HNB-GW is to be connected to only one MSC with in a CS network or as default MSC for all HNBs connected through specific HNB-CS network instance.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

[no] msc point-code *point_code*

no

Removes the configured default MSC point code from a specific HNB-CS network instance.

Caution: Removing the MSC point code is a disruptive operation and affects all HNB sessions which are connected to particular MSC through an HNB-CS network instance.

msc *point_code*

Specifies the SS7 address of the default MSC in the CS network to this configured HNB-CS network instance.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this command can be configured.

Usage

Use this command to configure a default MSC to which HNB connects for CS network access through HNB-GW service.
Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

Important: This command can be entered only once. If entered again the previous value shall be overwritten.

Example

The following command configures a default MSC with point code *101.201.101* for HNBs to access CS network through HNB-GW service in this HNB-CS network instance:

```
msc point-code 101.201.101
```

nri length

Configures the network resource identifier (NRI) length in bits to identify a specific MSC serving in a pooled area. At least one NRI value has to be assigned to an MSC serving in a pool. The NRI is coded inside of the temporary mobile subscriber identity (TMSI), located within bits 14 to 23 with an variable length between 0 and 10 bits. Operator needs to set this NRI length to indicates the number of bits that shall be used for the NRI field to set the parameters for Iu-Flex (MSC pooling) functionality.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

nri length *nri_value*

default nri length

default

Sets the NRI length to the default value of 0 and disables the Iu-Flex (MSC pooling) functionality.

nri length *nri_value*

Default: 0
Specifies the number of bits to be used in the P-TMSI (bits 23 to 18) to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length is of zero length.
length is an integer from 1 to 10 that identifies the number of bits. When a non-zero value is configured the CS network is considered to be a pool.

Usage

Use this command to enable the Iu-Flex functionality on HNB-GW. This command identifies a unique MSC serving a pooled area for Iu-Flex functionality and at least one NRI value has to assigned to an MSC serving in a pool. It performs MSC pooling/offloading scenario over Iu-Flex interface. The NRI is stored in the bits 14 to 23 of TMSI. The HNB-GW uses a portion of this NRI to set the parameters for Iu-Flex (MSC pooling) functionality.
If more than one NRI is configured, the HNB-GW service does round-robin between the available NRIs when new subscriber(s) (re)connect.
This command must be used in conjunction with **null nri** command to configured MSC pooling/offloading over Iu-Flex interface.

Example

The following command sets the HNB-GW to a bit length of *6* to derive the values from the NRI field (stored in bits 14 to 23 of TMSI) to set the parameters for Iu-Flex (MSC pooling) functionality:

```
nri length 6
```

null-nri

Configures the null NRI for load redistribution in support of Iu-Flex functionality. The NRI value defined with this command must be unique across the pool areas. This null-NRI is used by HNB-GW for load redistribution during MSC offloading.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

null-nri *null_nri_value*

no null-nri *null_nri_value*

no

Disables/removes the configured null-NRI value used for MSC offloading procedure.

null_nri_value

Specifies the null-NRI value to be used by HNB-GW for load re-distribution during MSC offloading as an integer from 0 through 1023.
Without MOCN configuration this value can be entered only once.
For MOCN a unique null-NRI must be assigned to each MOCN operator identified by its PLMN-ID (MCC+MNC).
A 0 (zero) value configured as a null-NRI indicates the keyword is not to be used. There is no default value for this parameter.

Usage

Use this command to identify the MSC to be used by HNB-GW for load redistribution during MSC offloading over an Iu-Flex interface.
There is one unique null-NRI in a PLMN supporting pool functionality.
Without MOCN configuration this command can be entered only once. For MOCN a unique null-NRI must be assigned to each MOCN operator identified by its PLMN-ID (MCC+MNC).

Example

The following command sets the null-NRI as *1001* to be used by HNB-GW for load redistribution during MSC offloading:

```
null-nri 1001
```

offload-msc

Provisions the HNB-GW to enable or disable the exclusion of a particular primary MSC node during an NAS Node Selection Function (NNSF) procedure when it needs to be offloaded while using Iu-Flex functionality on the HNB-GW.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-CS Network Configuration

configure > cs-network *cs_instance*

Syntax

[no] offload-msc point-code *msc_point_code*

no

Removes the specified primary MSC point code from the exclusion list for NNSF function on HNB-GW and re-enables the inclusion of the primary MSC to be considered by HNB-GW.

point-code *msc_point_code*

Specifies the SS7 address of the primary MSC in the CS network to be excluded for NNSF function on HNB-GW when it needs to be offloaded via Iu-Flex functionality.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this primary MSC point code can be mapped with one CS core network id.

Usage

Use this command to provision the HNB-GW to enable or disable the exclusion of the primary MSC node when it needs to be offloaded.
When this command is enabled for exclusion of primary MSC node during NNSF function in HNB-GW, the HNB-GW excludes the particular node from being considered.
User can re-enable the inclusion of the primary MSC node to be considered for NNSF functionality by **no offload-msc point-code** command.

Important: Offload check is only for the primary point code and NOT for the backup point code.

This command can be used for planned maintenance as well.

Example

The following command configures the HNB-GW to exclude the primary MSC point code *1.2.3* from being considered in NSSF function for Iu-Flex support:

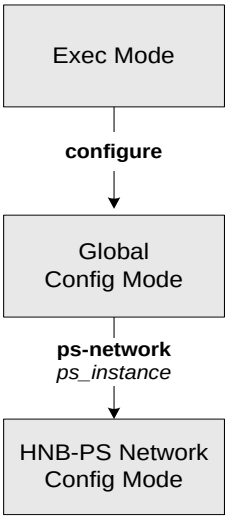
```
offload-msc point-code 1.2.3
```

The following command re-enables the inclusion of MSC point code *1.2.3* from being considered in NSSF function for Iu-Flex support:

```
no offload-msc point-code 1.2.3
```

Chapter 148
HNB-PS Network Configuration Mode Commands

The HNB-PS Network Configuration Mode is used to manage the packet switched (PS) network instance on HNB-GW service to provide HNB access with the PS core network in a 3G UMTS network.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate gtpu-service

Associates a previously configured GTP-U service to provide a GTP-U tunnel with an SGSN towards the core network side. A GTP-U service must be configured in Context Configuration mode before using this configuration.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

configure > ps-network *ps_instance*

Syntax

associate gtpu-service *svc_name* **context** *ctx_name*

no associate gtpu-service

no

Removes the associated GTP-U service from this HNB-GW service configuration.

svc_name

Specifies the name of the preconfigured GTP-U service.

context *ctx_name*

Specifies the name of the context in which the GTP-U service is configured.

Usage

Use this command to configure GTP-U data plan tunnel between HNB-GW service and GSNs in core network. The service defined for GTP-U tunnel must be configured in Context configuration mode.

Important: Another GTP-U service can be used to bind the HNB-GW service to GTP-U tunnel with HNB in HNB access network and can be configured in HNB-GW Service Configuration mode. For more information on GTP-U service configuration, refer to *GTP-U Service Configuration Mode Commands* chapter.

Example

The following command associates GTP-U service *gtpu_svc1* configured in context named *Ctx_gtpu1* with specific HNB-PS network instance for GTP-U tunnel towards GSN in core network:

```
associate gtpu-service gtpu_svc1 context Ctx_gtpu1
```

associate-sccp-network

Associates a previously defined Signaling Connection Control Part (SCCP) network identifier with the PS network instance in order to route the messages towards the SGSN via the IuPS interface.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

configure > ps-network *ps_instance*

Syntax

associate-sccp-network *sccp_net_id*

no associate-sccp-network

no

Removes the associated SCCP network configuration instance from this HNB-PS network instance configuration.

sccp_net_id

Specifies a predefined SCCP network identifier.

Usage

Use this command to associate a predefined SCCP network id with the IuPS interface in HNB-GW service to connect with PS network elements; i.e. SGSN.

Caution: The SCCP network id must be defined in Global Configuration mode before using it with this command.

Important: A single SCCP network id can not be shared with multiple HNB-PS network instances.

Example

The following command associates SCCP network id *2* with specific HNB-PS network instance:

```
associate-sccp-network 2
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

map core-network-id

Maps/associates the PS core network identifier to a default SGSN in the network using an SGSN point code to allow HNBs to access the UMTS network.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

configure > ps-network *ps_instance*

Syntax

map core-network-id *cn_id* **point-code** *sgsn_point_code*

no map core-network-id *cn_id*

no

Removes the mapping of a PS core network id with particular SGSN point code.

cn_id

Specifies the core network identifier configured to represent a UMTS PS core network as n integer from 0 through 4095.
Multiple instance of this command can be mapped with different SGSN point codes.

point-code *sgsn_point_code*

Specifies the SS7 address of the default SGSN in the PS network.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this SGSN point code can be mapped with one PS core network identifier.

Usage

Use this command to map a UMTS PS core network identifier with a particular SGSN point code.
This command can be entered multiple times with same SGSN point code to map with one or more PS core network Id, but a particular core network identifier can be mapped to one SGSN only.
This command is instrumental in Iu-Flex functionality, whenever HNB-GW receives RESET/RESET-RES messages from SGSN with Global CN-ID information element, the response from HNB-GW is sent to the node configured for that particular Global CN-ID.
If the RESET/RESET-RES messages do not have Global CN-ID IE, then the response of those messages is directed to the default SGSN which is configured using **sgsn point-code** command in this mode.

Example

The following command configures the PS core network identifier *101* with an SGSN point code *1.2.3*:

```
map core-network-id 101 point-code 1.2.3
```

The following command configures the PS core network identifier *102* with the same SGSN point code *1.2.3*:

```
map core-network-id 102 point-code 1.2.3
```

map idnns range

Configures the mapping of an Intra-Domain NAS Node Selector (IDNNS) IE received from UE in an RUA connect message towards HNB-GW. This is an important configuration for PS network resource sharing over an Iu-Flex interface.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

configure > ps-network *ps_instance*

Syntax

map idnns range *idnns_start* **to** *idnns_end* **point-code** *sgsn_point_code* [**backup point-code** *bkup_sgsn_point_code*]

no map idnns range *idnns_start* **to** *idnns_end*

no

Removes the entries of mapping of range of IDNNS received from UE with particular SGSN point code.

range *idnns_start* **to** *idnns_end*

Specifies the range of IDNNSs received from UE to map with particular SGSN point codes during the initial PS core network node selection.
idnns_start is an integer from 0 through 1023 that should be less than *idnns_end*.
idnns_end is an integer from 0 through 1023 that should be more than *idnns_start*.
The command can be entered more than once to map multiple IDNNS ranges to the same SGSN. However, overlapping and mapping of the same range to different SGSN point codes is not allowed.

point-code *sgsn_point_code*

Specifies the SS7 address of the SGSN in the PS network.
sgsn_point_code is ann SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

backup point-code *bkup_sgsn_point_code*

Specifies the SS7 address of the SGSN to be used as the backup in the PS network.
bkup_sgsn_point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

Usage

Use this command to map a NRI received from UE during initial PS network node selection to SGSN point code through NRI range mapping over Iu-Flex interface.

The IDNNS refers to the information element in RUA connect message from UE towards RAN (HNB-GW). In IDNNS IE, if the choice of routing mentioned is other than local P-TMSI, then the value it provides is used against this configuration to map the SGSN point code.
If backup SGSN point-code is specified, then specified SGSN works as backup for the IDNS range configured. This Backup SGSN is selected if the mapped SGSN for a given IDNNS range is going for offloading using **offload-sgsn point-code** command.
The command can be entered more than once to map multiple IDNNS ranges to same SGSN point code, but overlapping and mapping of same range to different SGSN point code is not allowed.

Example

The following command maps the IDNNS range from *101* to *201* with SGSN point code *1.2.3* and point code 7.8.9 as backup SGSN point code:

```
map nri range 101 to 201 point-code 1.2.3 backup point-code 7.8.9
```

The following command removes all IDNNS range matching entries between *301* to *399* from the configuration:

```
no map idnns range 301 to 399
```

map nri range

Configures the mapping of the Network Resource Identifier (NRI) received from UE to an SGSN point code. This is an important configuration for PS network resource sharing over Iu-Flex interface.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

configure > ps-network *ps_instance*

Syntax

map nri range *nri_start* **to** *nri_end* **point-code** *sgsn_point_code*

no map nri range *nri_start* **to** *nri_end*

no

Removes the entries of mapping of range of NRIs received from UE with a particular SGSN point code.

range *nri_start* **to** *nri_end*

Specifies the range of NRIs received from UE to map with a particular SGSN point code during initial PS core network node selection.
nri_start is an integer from 0 through 1023 that should be less than *nri_end*.
nri_end is an integer from 0 through 1023 that should be more than *nri_start*.
The command can be entered more than once to map multiple NRI ranges to the same SGSN, but overlapping is not allowed.

point-code *sgsn_point_code*

Specifies the SS7 address of the SGSN in the PS network to map with range of NRI values.
point_code is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.

Usage

Use this command to map a NRI received from UE during initial PS network node selection to SGSN point code through NRI range mapping over Iu-Flex interface.
This configuration is used during initial PS core network node selection when the network resource identifier (NRI) from the UE is available. The NRI range is mapped to SGSN point code. This configuration is used when the core network uses Iu-Flex interface.
The command can be entered more than once to map multiple NRI ranges to same SGSN point code.
It is possible to configure multiple ranges to more than one SGSN however this configuration is required only when the PS core network is configured as Multi-Operator Core Network (MOCN).
When the PS core network is not MOCN and one range is mapped to more than one SGSN then SGSN is selected randomly in a non-predictable manner.

Example

The following command maps the NRI range from *101* to *201* with SGSN point code *1.2.3*:

```
map nri range 101 to 201 point-code 1.2.3
```

The following command maps the NRI range from *301* to *399* with SGSN point code *1.2.3*:

```
map nri range 301 to 399 point-code 1.2.3
```

The following command removes all NRI range matching entries between *301* to *399* from the configuration:

```
no map nri range 301 to 399
```

nri length

Configures the network resource identifier (NRI) length in bits to identify a specific SGSN serving in a pooled area. At least one NRI value must be assigned to an SGSN serving in a pool. The NRI is coded inside of the temporary mobile subscriber identity (TMSI), located within bits 14 to 23 with a variable length between 0 and 10 bits. The operator must set this NRI length to indicates the number of bits that shall be used for the NRI field to set the parameters for Iu-Flex (SGSN pooling) functionality.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

configure > ps-network *ps_instance*

Syntax

nri length *nri_value*

default nri length

default

Sets the NRI length to default value of 0 and disables the Iu-Flex (SGSN pooling) functionality.

nri length *nri_length*

Default: 0
Specifies the number of bits to be used in the P-TMS (bits 23 to 18) to define the network resource identifier (NRI). The NRI length configuration also sets the maximum size of the pool. If not configured, the NRI length is set to zero length.
length is an integer from 1 to 10. When a non-zero value is configured the PS network is considered to be a pool. Default: 0

Usage

Use this command to enable the Iu-Flex functionality on HNB-GW. This command identifies a unique SGSN serving a pooled area for Iu-Flex functionality and at least one NRI value has to assigned to an SGSN serving in a pool. It performs SGSN pooling/offloading scenario over Iu-Flex interface. The NRI is stored in the bits 14 to 23 of TMSI. The HNB-GW uses a portion of this NRI to set the parameters for Iu-Flex (SGSN pooling) functionality.
If more than one NRI is configured, the HNB-GW service does round-robin between the available NRIs when new subscriber(s) (re)connect.
This command must be used in conjunction with **null nri** command to configured SGSN pooling/offloading over Iu-Flex interface.

Example

The following command sets the HNB-GW to use bit length as *6* to derive the values from the NRI field (stored in the bits 14 to 23 of TMSI) to set the parameters for Iu-Flex (SGSN pooling) functionality:

```
nri length 6
```

null-nri

Configures the null network resource identifier (NRI) for load redistribution in support of Iu-Flex functionality. The NRI value defined with this command must be unique across the pool areas. This null-NRI is used by HNB-GW for load redistribution during SGSN offloading.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

configure > ps-network *ps_instance*

Syntax

null-nri *null_nri_value*

no null-nri *null_nri_value*

no

Disables/removes the configured null-NRI value used for SGSN offloading procedure.

null_nri_value

Indicates the null-NRI value to be used by HNB-GW for load re-distribution during SGSN offloading as an integer from 0 through 1023.
Without MOCN configuration this value can be entered only once.For MOCN a unique null-NRI must be assigned to each MOCN operator identify by its PLMN-ID (MCC+MNC).
A 0 (zero) value configured as null-NRI indicates the keyword is not to be used. There is no default value for this parameter.

Usage

Use this command to identify the SGSN by HNB-GW to be used for load redistribution during SGSN offloading over Iu-Flex interface.
There is one unique null-NRI in a PLMN supporting pool functionality.
Without MOCN configuration this command can be entered only once. In case of MOCN a unique null-NRI must be assigned to each MOCN operator identify by its PLMN-id (MCC+MNC).

Example

The following command sets the null-NRI as *1001* to be used by HNB-GW for load redistribution during SGSN offloading:

```
null-nri 1001
```

offload-sgsn

Enables or disables the exclusion of a specified primary SGSN node during the NAS Node Selection Function (NNSF) procedure when it needs to be offloaded using Iu-Flex functionality.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

`configure > ps-network` *`ps_instance`*

Syntax

`[ no ] offload-sgsn point-code` *`sgsn_point_code`*

`no`

Removes the specified primary SGSN point code from the exclusion list for NNSF function on HNB-GW and re-enables the inclusion of the primary SGSN node to be considered by HNB-GW.

`point-code` *`sgsn_point_code`*

Specifies SS7 address of primary SGSN in PS network having specific point code value to be excluded for NNSF function on HNB-GW when it needs to be offloaded in Iu-Flex functionality.
`point_code` is an SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this primary SGSN point code can be mapped with one PS core network id.

Usage

Use this command to provision the HNB-GW to enable or disable the exclusion of the SGSN node when it needs to be offloaded.
When this command is enabled for exclusion of SGSN node during NNSF function in HNB-GW, the HNB-GW excludes the particular node from being considered.
User can re-enable the inclusion of the SGSN node to be considered for NNSF functionality by **`no offload-sgsn point-code`** command.

Important: The offload check is only for the primary point code and NOT for the backup point code.

This command can be used for planned maintenance as well.

Example

The following command configures the HNB-GW to exclude the primary SGSN point code *`1.2.3`* from being considered in NSSF function for Iu-Flex support:

```
offload-sgsn point-code 1.2.3
```

The following command re-enables the inclusion of SGSN point code *1.2.3* from being considered in NSSF function for Iu-Flex support:

```
no offload-sgsn point-code 1.2.3
```

sgsn deadtime

Configures a timer on HNB-GW to manage SGSN availability in a PS core network on receiving of a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

configure > ps-network *ps_instance*

Syntax

sgsn deadtime { immidiate |*dur* **}**

[no | default] sgsn deaddtime

no

Makes the peer node (SGSN) always available for all HNB-PS network instances.

default

Sets the default action for HNB-GW such that the peer node (SGSN) is marked down as soon as HNB-GW receives a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP in a specific HNB-PS network instance. Default: Enabled

immidiate

Sets the HNB-GW to mark the peer node (SGSN) down immediately and clears all Iu-PS connections towards the SGSN. Default: Disabled

dur

Sets the duration (in seconds) for a timer which starts once HNB-GW receives a PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer SGSN. On expiry of this timer the peer SGSN is marked as dead and all Iu-PS connections towards that SGSN are released.
dur is tan integer from 1 through 30.
Only one instance of this command can be configured.

Usage

This command is used to configure a timer on HNB-GW to manage SGSN availability in a PS core network on receiving of PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP.
Timer value sets the duration in seconds for a timer which started once HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer SGSN. On expiry of this timer the peer SGSN is marked as dead and all Iu-PS connections towards that SGSN shall be released.

Important: This command can be entered only once. Reentering this command overwrites the previous parameters.

Example

The following command configures the deadtime timer value for *10* seconds on HNB-GW. Once HNB-GW receives PC-STATE-DOWN or SSN-STATE-DOWN (RANAP) indication from SCCP for a peer SGSN the HNB-GW waits for configured period and on expiry of timer it marks the specific SGSN as dead:

```
sgsn deadtime 10
```

sgsn point-code

Configures the default SGSN point-code with the HNB-PS network instance. This command is used when HNB-GW is to be connected to only one SGSN with in a PS network or as the default SGSN for all HNBs connected through specific HNB-PS network instance.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > HNB-PS Network Configuration

configure > ps-network *ps_instance*

Syntax

[no] sgsn point-code *point_code*

no

Removes the configured default SGSN point code from specific HNB-PS network instance.

Caution: Removing the SGSN point code is a disruptive operation and affects all HNB sessions which are connected to particular SGSN through an HNB-PS network instance.

point_code

Specifies the SS7 address of the default SGSN in a PS network.
point_code is ann SS7 point code in dotted-decimal ###.###.### or 8-digit decimal ######## format.
Only one instance of this command can be configured.

Usage

Use this command to configure a default SGSN to which HNB connects for PS network access through the HNB-GW service.
Point-code is an SS7 address for an element in the SS7 network. Point-codes must be defined in dotted-decimal format in a string of 1 to 11 digits. Format options include:

- 0.0.1 to 7.255.7 for point-code in the ITU range.
- 0.0.1 to 255.255.255 for point-code in the ANSI range.
- 0.0.1 to 15.31.255 for point-code in the TTC Range.
- a string of 1 to 11 digits in dotted-decimal to represent a point-code in a different range.

Important: This command can be entered only once. If entered again the previous value shall be overwritten.

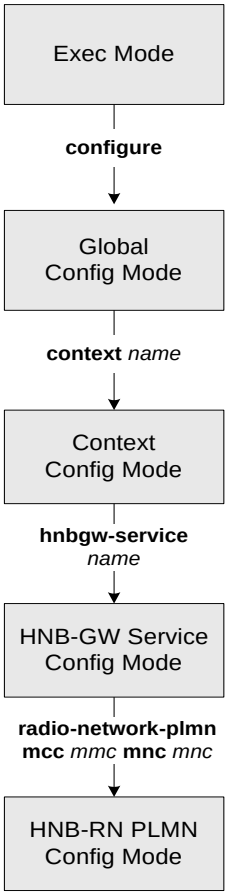
Example

The following command configures a default SGSN with point code *101.201.101* for HNBs to access PS network through HNB-GW service in this HNB-PS network instance:

```
sgsn point-code 101.201.101
```

Chapter 149
HNB-RN PLMN Configuration Mode Commands

This HNB Radio Network PLMN configuration mode defines the radio network PLMN parameters related to the HNB-GW connection with a UMTS Femto radio network.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate cs-network

Associates a preconfigured circuit switched (CS) network within an HNB radio network PLMN with HNB-GW service.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration > HNB-RN PLMN Configuration

configure > context *context_name* **> hnbgw-service** *service_name* **> radio-network-plmn mcc** *mmc_number* **mnc** *mnc_number*

Syntax

[no] associate cs-network *cs_name* **[lac** *lac*]

no

Disassociates/removes the configured CS network with an HNB radio network PLMN.

cs_name

Specifies the name of a preconfigured CS network in Global Configuration mode to be associated with an HNB radio network PLMN.
To configure CS network, refer to the *HNB-CS Configuration Mode Commands* chapter.

lac *lac_id*

Defines the granularity level of the circuit switch network to a location area code (LAC) level as an integer from 1 and 65535.

Usage

Use this command to associate pre-defined CS networks with a radio network PLMN in an HNB-GW service.
The circuit switched network comprises of one or more MSCs, where CS-domain IU-connections shall be routed. In a typical deployment HNB-GW is connected to only one MSC. However due to Iu-flex and networks-sharing requirements, HNB-GW can be connected to more than one MSCs as well.
Another scenario when HNB-GW can be connected to multiple MSCs is when a set of HNBs should be connected to a particular MSC based on their UTRAN location or geographical location.
This command provides configuration to have one or more MSCs such that these are used in load-shared (IuFlex) or network-shared mode. If location based distribution of HNBs to MSCs is desired, more than one circuit switched network configuration will be required.
This configuration allows association of a circuit switched network with a radio network PLMN and granularity can either be at the PLMN level or at the level of a location area (LAC) in that PLMN.
To configure CS network, refer to the *HNB-CS Configuration Mode Commands* chapter.

Example

The following command associates a CS network *umts1* with radio network PLMN with a granularity of LAC *234*:

```
associate cs-network umts1 lac 234
```

associate ps-network

Associates a preconfigured packet switched (PS) network within an HNB radio network PLMN with HNB-GW service.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

configure > context *context_name* **> hnbgw-service** *service_name* **> radio-network-plmn mcc** *mmc_number* **mnc** *mnc_number*

Syntax

[no] associate ps-network *ps_name* **[lac** *lac* **[rac** *rac* **]]**

no

Disassociates/removes the configured PS network with an HNB radio network PLMN configured in HNB-GW service mode.

ps_name

Specifies the name of a preconfigured PS network to be associated with an HNB radio network PLMN configured in HNB-GW service mode.
To configure the PS network, refer to the *HNB PS Configuration Mode Commands* chapter.

lac *lac_id*

Specifies the granularity level of the packet switched network to a location area code (LAC) level as an integer from 1 and 65535.

rac *rac_id*

Specifies the granularity level of the packet switched network to a radio area code (RAC) level expressed as an integer from 1 and 65535.

Usage

Use this command to associate pre-defined PS networks with HNB radio network PLMN in an HNB-GW service.
The packet switched network comprises of one or more SGSNs where PS-domain IU-connections shall be routed. In a typical deployment HNB-GW is connected to only one SGSN. However with IuFlex and network-sharing functionality, HNB-GW can be connected to more than one SGSNs as well.
Another scenario when HNB-GW can be connected to multiple SGSNs is when a set of HNBs should be connected to a particular SGSN based on their UTRAN location or geographical location.

This command provides configuration to have one or more to have one or more SGSNs such that these are used in load-shared (iu-flex) or network-shared mode. If location based distribution of HNBs to SGSNs is desired then more than one packet switched network configuration will be required.
This command allows association of a packet switched network with a radio network PLMN and granularity could either be at the PLMN level or at the level of a location area code (LAC) in that PLMN or at the level of a routing area code (RAC) in that LAC.
To configure PS network, refer *HNB-PS Configuration Mode Commands* chapter.

Example

The following command associates a PS network *umts_ps1* with radio network PLMN with a granularity of LAC *234* and RAC as 123:

```
associate ps-network umts_ps1 lac 234 rac 123
```

end

Use this command to return to the parent configuration mode.

rnc-id

Configures the Radio Network Concentrator (RNC) identifier in a Radio Network PLMN associated with HNB-GW service. The RNC identifier is provided to the HNB during HNB-REGISTRATION.

Platform

ASR 5000

Product

HNB-GW

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HNB-GW Service Configuration > HNB-RN PLMN Configuration

configure > context *context_name* **> hnbgw-service** *service_name* **> radio-network-plmn mcc** *mmc_number* **mnc** *mnc_number*

Syntax

[no] rnc-id *rnc_id* **[lac** *lac_id* **[rac** *rac_id* **| cell-id** *cell_id* **]]**

no

Deletes the LAC and RAC information from the system configuration.

rnc-id

Specifies the RNC identifier as an integer from 1 through 65535.

lac *lac_id*

Specifies the granularity for the location of HNB to a location area code (LAC) and configures the RNC ID for all HNBs operating in particular location-area.
lac_id is an integer from 1 through 65535.

rac *rac_id*

Specifies the granularity level for the location of HNB as a routing area code (RAC) and configures the NC ID for all HNBs operating in particular routing area.
rac_id is an integer from 1 through 65535.

cell-id *cell_id*

Specifies the granularity for the location of HNB to a UTRAN cell level and configures RNC ID for all HNBs operating in particular UTRAN cell area.
cell_id is an integer from 1 through 65535.

Usage

Use this command to configure RNC id for Radio Network PLMN which will be sent to HNBs from HNB-GW during HNB-REGISTRATION procedure. Depending upon the requirement the RNC Identifier can be provided at the desired granularity.
When HNB-REGISTRATION request is received the RNC Id is looked up by matching the parameters received in the request. The most specific entry that matches the request shall have the highest priority, for example in the following configuration:

```
rnc-id 257 lac 1 cell-id 3

rnc-id 258 lac 1 rac 2

rnc-id 259 lac 1

rnc-id 260
```

- If the request is received with LAC=1, RAC=2, and Cell-Id=3, the selected RNC id will be 257.
- If the request is received with LAC=1, RAC=3, and Cell-Id = 3, the selected RNC id will be 258.
- If the request is received with LAC=1 and any other values of RAC and Cell-id, the selected RNC id will be 259. For all other requests 260 will be returned.

Example

The following command configures the HNB-GW service to return an RNC identifier as *102* when an HNB-REGISTRATION request is received with LAC *1*, and RAC *2*:

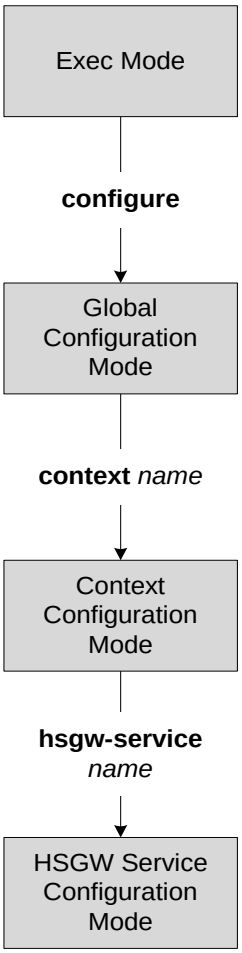
```
rnc-id 102 lac 1 rac 2
```

The following command configures the HNB-GW service to return an RNC identifier as *102* when an HNB-REGISTRATION request is received with LAC *1* and cell-id *4*:

```
rnc-id 102 lac 1 cell-id 5
```

Chapter 150
HSGW Service Configuration Mode Commands

The HSGW Service Configuration Mode is used to create and manage a configuration allowing the HRPD Serving Gateway (HSGW) to communicate, send and receive call data, and session flows to/from a evolved Access Network/evolved Packet Control Function (eAN/ePCF) in an eHRPD network.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

a11-signalling-packets

Enables the DSCP marking feature for IP headers carrying outgoing A11-signalling A11 packets (such as RRP, RU, SU).

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

a11-signalling-packets ip-header-dscp *value*

[default | no] a11-signalling-packets ip-header-dscp

default

Restores the specified parameter to its default setting of 0x0.

no

Disables the specified functionality.

ip-header-dscp *value*

Configures the QoS Differentiated Services Code Point (DSCP) marking for IP header encapsulation. *value*: Represents the DSCP setting as the first six most-significant bits of the ToS field. It can be configured to any hex value from 0x0 through 0x3F. Default is 0x0.

Usage

Use this command to enable or disable the DSCP marking feature for IP headers carrying outgoing A11-signalling A11 packets. DSCP marking is disabled by default.

Example

The following command configures the HSGW service to support DSCP marking for IP headers on A11 packets in outgoing A11-signalling traffic:

```
a11-signalling-packets ip-header-dscp 0x21
```

associate

Associates accounting policies and QCI-QoS mapping parameters with this HSGW service.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

associate { accounting-policy *name* **| qci-qos-mapping** *name* **}**

no associate { accounting-policy [*name* **] | qci-qos-mapping }**

no

Removes the specified associated policy or mapping from the service.

accounting-policy *name*

Specifies an existing accounting policy to associate with the HSGW service as an alphanumeric string of 1 through 63 characters.

qci-qos-mapping *name*

Specifies an existing QCI-QoS mapping configuration as an alphanumeric string of 1 through 63 characters. QCI-QoS mapping is configured through the **qci-qos-mapping** command in the Global Configuration Mode.

Usage

Use this command to associate an accounting policy with the HSGW service.

Example

The following command associates an accounting policy named *acct2* to the HSGW service:

```
associate accounting-policy acct2
```

bind address

Binds the service to a logical IP interface serving as the A10 interface and specifies the maximum number of subscribers that can access this service over the configured interface.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

bind address *ip_address* **[max-subscribers** *num* **]**

no bind address

no

Removes the interface binding from this service.

address *ip_address*

Specifies the IP address of the A10/A11 interface in IPv4 dotted-decimal notation.

max-subscribers *num*

Specifies the maximum number of subscribers that can access this service on this interface as an integer from 0 through 2500000. Default: 2500000

Important: The maximum number of subscribers supported is dependant on the license key installed and the number of active PSCs in the system. A fully loaded system with 13 active PSCs can support 3,000,000 total subscribers. Refer to the license key command and the Usage section (below) for additional information.

Usage

Associate the HSGW service to a specific logical IP address. The logical IP address or interface takes on the characteristics of an A10/A11 interface that provides the session connectivity to/from an eAN/PCF. Only one interface can be bound to a service. The interface should be configured prior to issuing this command.
This command also sets a limit as to the number of simultaneous subscribers sessions that can be facilitated by the service/interface at any given time.
When configuring the **max-subscribers** option, be sure to consider the following:

- The total number of A10/A11 interfaces you will configure
- The total number of subscriber sessions that all of the configured interfaces may handle during peak busy hours
- An average bandwidth per session multiplied by the total number of sessions

- The type of physical port (10/100Base-T or 1000Base-Tx) that these interfaces will be bound to

Taking these factors into account and distributing your subscriber session across all available interfaces will allow you to configure your interfaces to optimally handle sessions without degraded performance.

Example

The following command would bind the logical IP interface with the address of *112.334.556.778* to the HSGW service and specifies that a maximum of *200,000* simultaneous subscriber sessions can be facilitated by the interface/service at any given time:

```
bind address 112.334.556.778 max-subscribers 200000
```

context-retention-timer

Configures the maximum number of consecutive seconds that a UE session context (which includes the LCP, authentication and A10 session context for a given UE) is maintained by the HSGW before it is torn down.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

context-retention-timer timeout [*sec* **]**

[default | no] context-retention-timer timeout

default

Disables the timer.

no

Disables the timer.

timeout [*sec* **]**

Specifies the amount of time (in seconds) that the session context is maintained before it is disassembled as an integer from 1 through 3600. Default: 60

Usage

Use this command to configure a timer to retain session contexts for a specified amount of time before disassembling it.

Example

The following command allows the HSGW to maintain session contexts for *120* seconds before tearing them down:

```
context-retention-timer timeout 120
```

data-available-indicator

Enables sending the Data Available Indicator extension in A10/A11 Registration Reply messages.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

data-available-indicator

Usage

Use this command to enable the sending of the Data Available Indicator extension in A10/A11 Registration Reply messages.

data-over-signaling

Enables the data-over-signaling marking feature for A10 packets.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

[default | no] data-over-signaling

default

Enables the data-over signaling feature for A10 packets.

no

Disables the data-over signaling feature for A10 packets.

Usage

Use this command to enable or disable the data-over signaling feature for A10 packets.

dns-pgw

Identifies the location of the DNS client to the HSGW service.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

dns-pgw context *name*

[default | no] dns-pgw context

default

Returns the command to its default setting of the current context.

no

Removes the configured DNS client context name from this service.

context *name*

Specifies an existing context in which the DNS client is configured as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to identify to the HSGW service the context where the DNS client is configured. The DNS client is used to identify an FQDN for the peer P-GW. This command defaults to the same context as the HSGW service.

Example

The following command identifies the context where the DNS client is configured as *isp3*:

```
dns-pgw context isp3
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

fqdn

Configures the Fully Qualified Domain Name (FQDN) for this HSGW service.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

fqdn *domain_name*

[default | no] fqdn

default

Returns the command to the default setting of "null".

no

Removes the configured FQDN name from this service.

domain_name

Specifies an FQDN for the HSGW service as an alphanumeric string of 1 through 256 characters.

Important: In order to properly interact with other nodes in the network, the FQDN should be 96 alpha and/or numeric characters or less.

Usage

Use this command to configure an FQDN for this HSGW service. The FQDN is used when matching a P-GW with an HSGW.

Topology Matching

You may specify which P-GW you wish an HSGW interface to connect with by enabling topology matching within the FQDNs for both the HSGW service and P-GW service. Topology matching selects geographically closer nodes and reduces backhaul traffic for a specified interface.

The following optional keywords enable or disable topology matching when added to the beginning of an FQDN:

- **topon**.<*interface_name*>.

  Beginning an FQDN with **topon** initiates topology matching with available P-GWs in the network. Once this feature is enabled, the rest of the FQDN is processed from right to left until a matching regional designator is found on a corresponding P-GW FQDN.

- **topoff**.<*interface_name*>.

  By default, topology matching is disabled. If you enable topology matching for any interfaces within a node, however, all interfaces not using this feature should be designated with **topoff**.

Example

The following command configures this HSGW service with an FQDN of *abc123.com*:

```
fqdn abc123.com
```

The following command configures this HSGW service with an FQDN that enables topology matching:

```
fqdn topon.<interface_name>.hsgw01.bos.ma.node.epc.mnc<value>.
mcc<value>.3gppnetwork.org
```

Important: The associated P-GW service must have a corresponding FQDN similar to the following:

```
topon.<interface_name>.pgw01.bos.ma.node.epc.mnc<value>.mcc<value>.3gppne
twork.org
```

fragment

Enables or disables Point-to-Point Protocol (PPP) payload fragmentation.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

[default | no] fragment ppp-data

default

Returns the command to its default setting of enabled.

no

Disables PPP payload fragmentation.

Usage

Use this command to enable or disable PPP payload fragmentation.

gre

Configures Generic Routing Encapsulation (GRE) parameters for the A10 protocol within the HSGW service.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

gre { checksum | checksum-verify | flow control [action { disconnect-session | resume-session }] [timeout *msecs* **] + | ip-header-dscp** *value* **{ all-control-packets | setup-packets-only } | reorder-timeout** *msecs* **| segmentation | sequence-mode { none | reorder } | sequence-numbers | threegppp2-ext-headers qos-marking }**

default gre { checksum | checksum-verify | flow-control | ip-header-dscp | reorder-timeout | sequence-mode | sequence-numbers | threegppp2-ext-headers qos-marking }

no gre { checksum | checksum-verify | flow-control | ip-header-dscp | segmentation | sequence-numbers | threegppp2-ext-headers qos-marking }

default

Restores the specified parameter to its default setting.

no

Disables the specified functionality.

checksum

Enables the introduction of the checksum field in outgoing GRE packets. Default: disabled

checksum-verify

Enables verification of the GRE checksum (if present) in incoming GRE packets. Default: disabled

flow-control [action { disconnect-session | resume-session }] [timeout *msecs* **] +**

Default: no GRE flow-control
Enables 3GPP2 GRE flow control which causes the HSGW to send flow control enabled Normal Vendor Specific Extensions (NVSE) in A11 RRPs.
action { disconnect-session | resume-session }:
Default: disconnect-session
Specifies the action to be taken when timeout is reached:

- **disconnect-session**: Ends the session and releases the call.
- **resume-session**: Switches flow control to XON and resumes delivery of packets to the RAN.

timeout *msecs*
Specifies the amount of time (in milliseconds) to wait for an XON indicator from the RAN (after receiving an XOFF). Also sets the action to be taken if the timeout limit is reached.
msecs is an integer from 1 through 1000000. Default: 1000

---

ip-header-dscp *value* **{ all-control-packets | setup-packets-only }**

Default: Disabled
Configures QoS Differentiated Services Code Point (DSCP) marking for GRE packets.

- *value*: Represents the DSCP setting as the first six most-significant bits of the ToS field. It can be configured to any hexadecimal value from 0x0 through 0x3F.
- **all-control-packets**: Dictates that the DSCP marking is to be provided in all GRE control packets.
- **setup-packets-only**: Dictates that the DSCP marking is to be provided only in GRE setup packets.

---

reorder-timeout *msecs*

Configures the maximum number of milliseconds to wait before processing reordered out-of-sequence GRE packets as an integer from 0 through 5000. Default: 100

---

segmentation

Enables GRE Segmentation for the HSGW service. Default: disabled

---

sequence-mode { none | reorder }

Default: none
Configures handling of incoming out-of-sequence GRE packets.
none: Specifies that sequence numbers in packets are ignored and all arriving packets are processed in the order they arrive.
reorder: Specifies that out of sequence packets are stored in a sequencing queue until one of the conditions is met:

- The reorder timeout occurs: All queued packets are sent for processing and the accepted sequence number is updated to the highest number in the queue.
- The queue is full (five packets): All packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number in the queue.
- An arriving packet has a sequence number such that the difference between this and the packet at the head of the queue is greater than five. All the packets in the queue are sent for processing, the reorder timer is stopped and the accepted sequence number is updated to the highest number that arrived.
- A packet arrives that fills a gap in the sequenced numbers stored in the queue and creates a subset of packets whose sequence numbers are continuous with the current accepted sequence number. This subset of packets in the queue is sent for processing. The reorder timer continues to run and the accepted sequence number is updated to the highest number in the subset delivered.

---

sequence-numbers

Enables insertion of GRE sequence numbers in data that is about to be transmitted over the A10 interface. Data coming into the system containing sequence numbers but that is out of sequence is not re-sequenced.

threegppp2-ext-headers qos-marking

When threegppp2-ext-headers qos-marking is enabled and the PCF negotiates capability in the A11 RRQ, the HSGW will include the QoS optional data attribute in the GRE 3gpp2 extension header.
The **no** keyword, enables qos-marking in the GRE header based on the tos value in the header.

Usage

Use this command to set GRE parameters for the A10 protocol within the HSGW service.

Example

The following command configures the HSGW service to support the inclusion of GRE sequence numbers in outgoing traffic:

```
gre sequence-numbers
```

ip

Enables the use of Robust Header Compression (RoHC) and enters the HSGW Service ROHC Configuration Mode where RoHC parameters are configured for the service.

Configures the local User Datagram Protocol (UDP) port for the A10/A11 interface IP socket.

Sets the parameters for IP source validation. Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network. Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

ip { header-compression rohc | local-port *number* **| source-violation { clear-on-valid-packet | drop-limit** *num* **| period** *secs* **| reneg-limit** *num* **} }**

default ip { header-compression rohc | local-port | source-violation { drop-limit | period | reneg-limit } }

no ip { header-compression rohc | source-violation clear-on-valid-packet }

default

Resets the keyword to its default value.

no

header-compression rohc: Removes the RoHC configuration from this service.
ip source-violation clear-on-valid-packet: Disables the ability of the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet.

header-compression rohc

Specifies that Robust Header Compression will be applied to sessions using this service and enters the HSGW Service RoHC Configuration Mode where RoHC parameters are configured.

local-port *number*

Specifies the UDP port number as an integer from 1 through 65535. Default: 699

source-violation { clear-on-valid-packet | drop-limit *num* **| period** *secs* **| reneg-limit** *num* **}**

clear-on-valid-packet

Configures the service to reset the reneg-limit and drop-limit counters after receipt of a properly addressed packet. Default: disabled

drop-limit *num*

Specifies the number of allowed source violations within a detection period before forcing a call disconnect as an integer from 1 through 1000000. If *num* is not specified, the value is set to the default. Default: 10

period *secs*

Specifies the length of time (in seconds) for a source violation detection period to last; drop-limit and reneg-limit counters are decremented each time this value is reached.

The counters are decremented in this manner: reneg-limit counter is reduced by one (1) each time the period value is reached until the counter is zero (0); drop-limit counter is halved each time the period value is reached until the counter is zero (0). If *secs* is not specified, the value is set to the default.

secs is an integer from 1 through1000000. Default: 120

reneg-limit *num*

Sets the number of allowed source violations within a detection period before forcing a PPP renegotiation. If *num* is not specified, the value is set to the default.

num is an integer from 1 through 1000000. Default: 5

Usage

Header Compression RoHC: Use this command to specify that sessions using this service will have Robust Header Compression applied and configure parameters supporting RoHC.

Entering this command results in the following prompt:

```
[context_name]hostname(config-ip-header-compression-rohc)#
```

HSGW Service RoHC Configuration Mode commands are defined in the HSGW Service RoHC Configuration Mode Commands chapter.

Local Port: Specify the UDP port that should be used for communications between the Packet Control Function (PCF) and the HSGW.

Important: The UDP port setting on the PCF must match the local-port setting for the HSGW service on the system in order for the two devices to communicate.

Source Violation: This function is intended to allow the operator to configure a network to prevent problems such as when a user gets handed back and forth between two HSGWs a number of times during a handoff scenario.

This function operates in the following manner:

When a subscriber packet is received with a source address violation, the system increments both the IP source-violation reneg-limit and drop-limit counters and starts the timer for the IP-source violation period. Every subsequent packet received with a bad source address during the IP-source violation period causes the reneg-limit and drop-limit counters to increment.

For example, if reneg-limit is set to 5, then the system allows 5 packets with a bad source address (source violations), but on the 5th packet, it re-negotiates PPP.

If the drop-limit is set to 10, the above process of receiving 5 source violations and renegotiating PPP occurs only once. After the second 5 source violations, the call is dropped. The period timer continues to count throughout this process.

If the configured source-violation period is exceeded at any time before the call is dropped, the reneg-limit counter is checked. If the reneg-limit counter is greater than zero (0), the reneg-limit is decremented by 1. If the reneg-limit counter equals zero, the drop-limit is decremented by half.

Example

The following command specifies a UDP port of 3950 for the HSGW service to use to communicate with the PCF on the A10/A11 interface:

```
ip local-port 3950
```

The following command sets the drop limit to *15* and leaves the other values at their defaults:

```
ip source-violation drop-limit 15
```

lifetime

Specifies how long an A10 connection can exist before its registration is considered expired.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

lifetime *time*

[default | no] lifetime

default

Resets the lifetime value to the default setting of 1800 seconds.

no

Specifies that an A10 connection can exist for an infinite amount of time.

time

Specifies the time (in seconds) that an A10 connection can exist before its registration is considered expired as an integer from 1 through 65534. Default: 1800

Usage

Use this command to set a limit to the amount of time that a subscriber session can remain up whether or not the session is active or dormant. If the lifetime timer expires before the subscriber terminates the session, the connection is terminated automatically.

Example

The following command specifies a time of *3600* seconds (1 hour) for subscriber sessions on this HSGW service:

```
lifetime 3600
```

max-retransmissions

Configures the maximum number of times the HSGW service will attempt to communicate with an eAN/PCF before it marks it as unreachable.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

max-retransmissions *count*

default max-retransmissions

default

Resets the maximum number of allowed retransmissions to the default value of 5.

count

Specifies the maximum number of times the HSGW service will attempt to communicate with an eAN/PCF before it marks it as unreachable.
count is an integer from 1 through 1000000. Default: 5

Usage

Use this command to limit the number of retransmissions to an eAN/PCF before marking it as unreachable. If the value configured is reached, the call is dropped.

Example

The following command configures the maximum number of retransmissions for the HSGW service to *3*:

```
max-retransmissions 3
```

mobile-access-gateway

Identifies the mobile access gateway (MAG) context through which MIPv6 calls are to be routed.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

mobile-access-gateway context *context_name* **[mag-service** *service_name* **]**

no mobile-access-gateway context

no

Removes the configured MAG context route from this service.

context *context_name* **[mag-service** *service_name* **]**

Specifies the name of the context and, optionally, the service through which MIPv6 sessions are to be routed. *context_name* is an existing context expressed as an alphanumeric string of 1 through 79 characters. *service_name* is an existing MAG service expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify where MIPv6 sessions are routed through this service.

Example

The following command identifies the MAG context *MAG1* as the context through which MIPv6 sessions are to be routed and further narrows the route by specifying the service name (*mag_serv3*):

```
mobile-access-gateway context MAG1 mag-service mag_serv3
```

plmn id

Configures Public Land Mobile Network identifiers used to determine if a mobile station is visiting, roaming or belongs to this network.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

plmn id mcc *number* **mnc** *number*

mcc *number* **mnc** *number*

mcc *number*: Specifies the mobile country code (MCC) portion of the PLMN identifier as an integer fromn 100 through 999.
mnc *number*: Specifies the mobile network code (MNC) portion of the PLMN identifier as a 2- or 3-digit integer from 00 through 999.

Usage

The PLMN identifier is used to aid the HSGW service in the determination of whether or not a mobile station is visiting, roaming, or home. Multiple P-GW services can be configured with the same PLMN identifier. Up to five PLMN IDs can be configured for each P-GW Service. The configured IDs are used in Diameter-EAP-Request messages (as a Visited-Network-Identifier AVP).

Example

The following command configures the PLMN identifier with an MCC of *462* and MNC of *2*:

```
plmn id mcc 462 mnc 02
```

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

policy overload { redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ... address16 [weight** *weight_num* **]] | reject [use reject-code { admin-prohibite | insufficient-resources }] }**

default policy overload

no policy overload [redirect *address* **[** *address2* **] ... [** *address16* **]**

default

Returns the command to it default setting of "reject" with the "admin-prohibited" code.

no

Removes a specified "redirect address" from this service.

redirect *address* **[weight** *weight_num* **] [** *address2* **[weight** *weight_num* **] ...** *address16* **[weight** *weight_num* **]]**

This option enables a redirect policy for overloading conditions. When a redirect policy is invoked, the HSGW service rejects new sessions with an A11 Registration Reply Code of 88H (unknown HSGW address) and provides the IP address of an alternate HSGW. This command can be issued multiple times.
address: The IP address of an alternate HSGW expressed in IPv4 dotted decimal notation. Up to 16 IP addresses can be specified either in one command or by issuing the redirect command multiple times. If you try to add more than 16 IP addresses to the redirect policy the CLI issues an error message. If you specify an IP address and weight that already exists in the redirect policy the new values override the existing values.
weight *weight_num*: When multiple addresses are specified, they are selected in a weighted round-robin scheme. Entries with higher weights are more likely to be chosen. If a weight is not specified, the entry is automatically assigned a weight of 1 (default). *weight_num* must be an integer value from 1 through 10.

reject [use reject-code { admin-prohibite | insufficient-resources }]

This option will cause any overload traffic to be rejected. The HSGW sends an A11 Registration Reply Code of 82H (insufficient resources).

use-reject-code admin-prohibited: When this keyword is specified and traffic is rejected, the error code admin prohibited is returned instead of the error code “insufficient resources”. This is the default behavior.

use-reject-code insufficient-resources: When this keyword is specified and traffic is rejected, the error code “insufficient resources” is returned instead of the error code admin prohibited.

Usage

Policies can be implemented to dictate HSGW service behavior for overload conditions.

The system invokes the overload policy if the number of calls currently being processed exceeds the licensed limit for the maximum number of sessions supported by the system.

The system automatically invokes the overload policy when an on-line software upgrade is started.

Use the **no policy overload** command to delete a previously configured policy. If after deleting the policy setting you desire to return the policy parameter to its default setting, use the **default policy** command.

The chassis is shipped from the factory with the policy options overload disabled

Example

The following command configures the HSGW service to redirect overload traffic to two IPv4 addresses, one priority weighted *1* and the other priority weighted *5*:

```
policy overload redirect 10.2.3.4 weight 1 10.2.3.5 weight 5
```

profile-id-qci-mapping

Associates a configured mapping table for RP QoS Profile ID to LTE QoS Class Index (QCI) mapping with this service.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

profile-id-qci-mapping *name*

no profile-id-qci-mapping [*name* **]**

no

Removes all profile maps or a specific profile map from this service.

name

Specifies the name of an existing Profile ID - QCI Mapping table to be associated with this service as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associate the HSGW service with a configured Profile ID - QCI Mapping table. The table is configured in the Global Configuration Mode using the **profile-id-qci-mapping-table** command.

Example

The following command associates a Profile ID - QCI Mapping table named *table3* with this service:

```
profile-id-qci-mapping table3
```

registration-deny

Configures parameters related to registration rejection.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

registration-deny { handoff connection-setup-record-absent | newcall connection-setup-record-absent } [use-deny-code { poorly-formed-request | reason-unspecified }]

[default | no] registration-deny { handoff connection-setup-record-absent | newcall connection-setup-record-absent }

default | no

Returns the command to its default settings.

handoff connection-setup-record-absent

When enabled, the HSGW denies or discards handoff R-P sessions that do not have an Airlink Connection Setup record in the A11 Registration Request.
Default is disabled. Default HSGW behavior is to accept such requests.

newcall connection-setup-record-absent

When enabled, the HSGW denies or discards new R-P sessions that do not have the Airlink Connection Setup record in the A11 Registration Request.
Default is disabled. Default HSGW behavior is to accept such requests.

use-deny-code { poorly-formed-request | reason-unspecified }

Sets the specified Registration Deny Code when denying a new call or handoff because of a missing connection setup record.

Usage

Use this command to configure parameters relating to the rejection of registration requests.

Example

The following command denies registration for registration requests missing the connection setup record and replies with a use deny code of "poorly formed request":

```
registration-deny handoff connection-setup-record-absent use-deny-code
poorly-formed-request
```

retransmission-timeout

Configures the maximum allowable time for the HSGW service to wait for a response from the eAN/PCF before it attempts to communicate with the eAN/PCF again (if the system is configured to retry the PCF), or marks the eAN/PCF as unreachable.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

retransmission-timeout *time*

[default | no] retransmission-timeout

default

Resets the timeout setting to the default value of 3.

no

Deletes a previously configured timeout value.

time

Specifies the maximum allowable time (in seconds) for the HSGW service to wait for a response from the eAN/PCF before it: a) attempts to communicate with the eAN/PCF again (if the system is configured to retry the PCF), or b) marks the eAN/PCF as unreachable.
time is an integer from 1 through 1000000. Default: 3

Usage

Use the retransmission timeout command in conjunction with the **max-retransmissions** command in order to configure the HSGW service's behavior when it does not receive a response from a particular PCF.

Example

The following command configures a retransmission timeout value of *5* seconds:

```
retransmission-timeout 5
```

rsvp

Configures resource reservation protocol (RSVP) parameters for this HSGW service in support of the network initiated QoS feature.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

rsvp { max-retransmissions *count* **| retransmission-timeout** *seconds* **}**

[default | no] rsvp { max-retransmissions | retransmission-timeout }

default

Resets the maximum number of allowed retransmissions to the default value of 5 or the timeout setting to the default value of 3.

no

Disables the feature.

max-retransmissions *count*

Specifies the maximum retransmission count of RP control packets as an integer from 1 through 1000000. Default: 5

retransmission-timeout *seconds*

Specifies the maximum amount of time (in seconds) to allow for retransmission of RP control packets as an integer from 1 through 1000000. Default: 3

Usage

Use this command to set RSVP parameters for this HSGW service in support of the network initiated QoS feature.

Example

The following command configures the maximum number of retransmissions to *3*:

```
rsvp max-retransmissions 3
```

setup-timeout

Specifies the maximum amount of time allowed for session setup.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

setup-timeout *seconds*

[default| no] setup-timeout

default

Resets the command to the default value of enabled with a timeout of 60 seconds.

no

Disables the feature.

seconds

Specifies the maximum amount of time (in seconds) to allow for setup of a session in this service as an integer from 1 though 1000000. Default: 60

Usage

Use this command to set the maximum amount of time allowed for setting up a session.

Example

The following command sets the maximum time allowed for setting up a session to 5 minutes (300 seconds):

```
setup-timeout 300
```

spi remote-address

Configures the security parameter index (SPI) between the HSGW service and the evolved Access Network/evolved Packet Control Function (eAN/ePCF). This command also configures the redirection of calls based on the PCF zone.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

spi remote-address { *pcf_ip_address* **|** *ip_addr_mask_combo* **} spi-number** *number* **{ encrypted secret** *enc_secret* **| secret** *secret* **} [description** *string* **] [hash-algorithm { md5 | rfc2002-md5 }] [replay-protection { nonce | timestamp }] [timestamp-tolerance** *tolerance* **] [zone** *zone_id* **]**

no spi remote-address *pcf_ip_address* **spi-number** *number*

pcf_ip_address **|** *ip_addr_mask_combo*

pcf_ip_address: Specifies the IP address of the ePCF. *pcf_ip_address* is an IP address expressed in IPv4 dotted decimal notation or IPv6 colon separated notation.
ip_addr_mask_combo: Specifies the IP address and mask bits of the PCF. *ip_addr_mask_combo* must be specified using the form "IP Address/Mask Bits" where the IP address must in IPv4 dotted-decimal or IPv6 colon-separated notation, and the mask bits are a numeric value corresponding to the number of bits in the subnet mask.

spi-number *number*

Specifies the SPI which indicates a security context between the PCF and the HSGW as an integer from 256 through 4294967295.

encrypted secret *enc_secret* **| secret** *secret*

Configures the shared-secret between the HSGW service and the PCF. The secret can be either encrypted or non-encrypted.
encrypted secret *enc_secret*: Specifies the encrypted shared key (*enc_secret*) between the PCF and the HSGW service. *enc_secret* must be between 1 and 236 alpha and/or numeric characters and is case sensitive.
secret *secret*: Specifies the shared key (secret) between the PCF and the HSGW services. *secret* must be between 1 and 127 alpha and/or numeric characters and is case sensitive.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **secret** keyword is the encrypted version of the plain text secret key. Only the encrypted secret key is saved as part of the configuration file.

description *string*

This is a description for the SPI expressed as an alphanumeric string of 1 through 31 characters.

hash-algorithm { md5 | rfc2002-md5 }

Specifies the hash-algorithm used between the HSGW service and the PCF. Default: md5
md5: Configures the hash-algorithm to implement MD5.
rfc2002-md5: Configures the hash-algorithm to implement keyed-MD5.

replay-protection { nonce | timestamp }

Specifies the replay-protection scheme that should be implemented by the HSGW service. Default: timestamp
nonce: Configures replay protection to be implemented using NONCE (Number ONCE).
timestamp: Configures replay protection to be implemented using timestamps.

timestamp-tolerance *tolerance*

Specifies the allowable difference (in seconds) between timestamps as an integer from 0 through 65535. If the difference is exceeded, the session will be rejected. If set to 0, timestamp tolerance checking is disabled at the receiving end. Default: 60

zone *zone_id*

Specifies the different PCF zones to configure in HSGW service. Mapping of a zone-number to a set of HSGWs can be done per HSGW service basis.
zone_id is an integer value from 1 through 32. A maximum of 32 PCF zones can be configured for a HSGW service.

Usage

An SPI is a security mechanism configured and shared by the PCF and the HSGW service. Please refer to *IETF RFC 2002: IP Mobility Support* for additional information.
Multiple SPIs can be configured if the HSGW service is communicating with multiple eAN/ePCFs.

Important: The SPI configuration on the PCF must match the SPI configuration for the HSGW service on the system in order for the two devices to communicate properly.

This command used with the **zone** keyword redirects all calls on the basis of PCF zone to the specific HSGW on the basis of parameters configured using the **policy pcf-zone-match** command.

Example

The following command configures the HSGW service to use an SPI of *256* when communicating with a PCF with the IP address *192.168.0.2*. The key that would be shared between the PCF and the HSGW service is *q397F65*.

```
spi remote-address 192.168.0.2 spi-number 256 secret q397F65
```

The following command creates the configured SPI of *400* for an PCF with an IP address of *172.100.3.200* and zone id as *11*:

```
spi remote-address 172.100.3.200 spi-number 400 zone 11
```

unauthorized-flows

Configures the service to wait a specified number of seconds before triggering a QoS update to downgrade an unauthorized flow.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration

configure > context *context_name* **> hsgw-service** *service_name*

Syntax

unauthorized-flows qos-update wait-timeout *seconds*

[default | no] unauthorized-flows qos-update wait-timeout

default

Returns the command to its default setting.

no

Removes the configure wait-timeout setting for this service.

qos-update wait-timeout *seconds*

Specifies the number of seconds to wait before triggering the QoS update to downgrade the unauthorized flow as an integer from 1 through 65534.

Usage

Use this command to specific a wait timeout trigger for flows that are unauthorized by policy rules received via the Gxa interface from the PCRF. When the wit timer expires, the HSGW triggers a QoS update to downgrade the unauthorized flow.

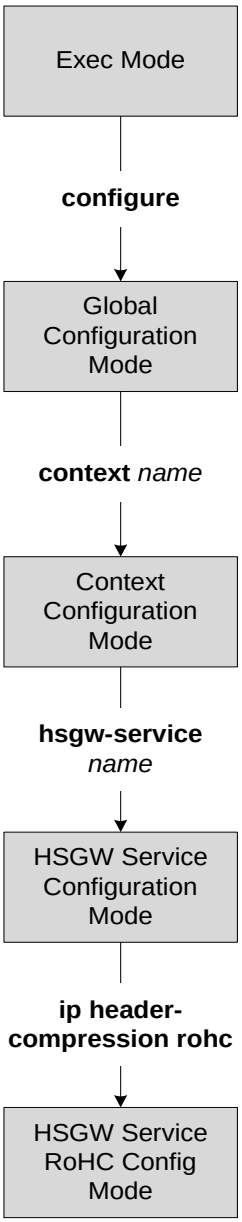
Example

The following command configures the HSGW service to apply the wait time of *30* seconds after receiving an flow unauthorized by the PCRF:

```
unauthorized-flow qos-update wait-timeout 30
```

Chapter 151
HSGW Service RoHC Configuration Mode Commands

The HSGW Service RoHC Configuration Mode is used to configure Robust Header Compression (RoHC) parameters for the service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

cid-mode

This mode allows you to configure options that apply during RoHC compression for the service.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration > HSGW Service RoHC Configuration

configure > context *context_name* **> hsgw-service** *service_name* **> ip header-compression rohc**

Syntax

cid-mode { large | small } max-cid *integer*

default cid-mode

default

Reset all options in the RoHC Profile Compression Configuration mode to their default values.

large

Use large packets with optional information for RoHC

small

This is the default packet size.
Use small RoHC packets.

max-cid *integer*

Specifies the highest context ID number to be used by the compressor as an integer from 0 through 15 when small packet size is selected, and 0 through 31 when large packet size is selected. Default: 15

Usage

Use this command to set the RoHC packet size and define the maximum

Example

The following command sets large RoHC packet size and sets the maximum CID to *100*:

```
cid-mode large max-cid 100
```

The following command sets the cid-mode to the default settings of small packets and max-cid 0:

```
default cid-mode
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

mrru

Specifies the size of the largest reconstructed reception unit that the decompressor is expected to reassemble from segments. The size includes the CRC. If maximum received reconstructed unit (MRRU) is negotiated to be 0, no segment headers are allowed on the channel.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration > HSGW Service RoHC Configuration

configure > context *context_name* **> hsgw-service** *service_name* **> ip header-compression rohc**

Syntax

mrru *num_octets*

default mrru

default

Resets the value of this command to its default setting of 0.

num_octets

Specifies the number of allowed octets for the MRRU as an integer from 0 through 65535. Default: 0

Usage

Use this command to set the size, in octets, of the largest reconstructed reception unit that the decompressor is expected to reassemble from segments.

Example

The following command sets the largest reconstructed reception unit to 1024 octets:

```
mrru 1024
```

The following command resets the MRRU size to its default of 0 octets:

```
default mrru
```

profile

Specifies the header compression profiles to use. A header compression profile is a specification of how to compress the headers of a specific kind of packet stream over a specific kind of link. At least one profile must be specified.

Platform

ASR 5000

Product

HSGW

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSGW Service Configuration > HSGW Service RoHC Configuration

configure > context *context_name* **> hsgw-service** *service_name* **> ip header-compression rohc**

Syntax

profile { [esp-ip] [rtp-udp] [udp-ip] [uncompressed-ip] }

default profile

default

Default: esp-ip rtp-udp udp-ip uncompressed-ip
Returns the RoHC profile configuration to its default setting.

esp-ip

Enables RoHC Profile 0x0003 which is for ESP/IP compression, compression of the header chain up to and including the first ESP header, but not subsequent subheaders.

rtp-udp

Enables RoHC Profile 0x0001 which is for RTP/UDP/IP compression

udp-ip

Enables RoHC Profile 0x0002 which is for UDP/IP compression; compression of the first 12 octets of the UDP payload is not attempted.

uncompressed-ip

Enables RoHC Profile 0x0000 which is for sending uncompressed IP packets.

Usage

Use this command to specify the RoHC header compression profiles.

Example

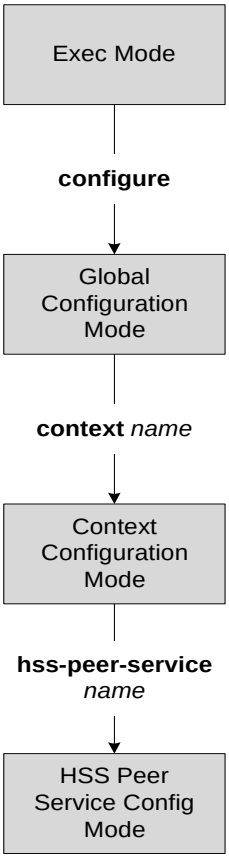
The following command sets the profiles to use as *esp-ip* and *rtp-udp*:

```
profile esp-ip rtp-udp
```

profile

Chapter 152
HSS Peer Service Configuration Mode Commands

The HSS Peer Service Configuration Mode is used to create and manage the Home Subscriber Server (HSS) Peer Service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

auth-request

Configures the number of authentication vectors the MME requests in an Authentication-Information-Request (AIR) message to the HSS for each UE requiring authentication.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSS Peer Service Configuration

configure > context *context_name* **> hss-peer-service** *service_name*

Syntax

auth-request num-auth-vectors *num*

default auth-request num-auth-vectors

num-auth-vectors *num*

Specifies the number of vectors the MME is requesting from the HSS as an integer from 1 through 3. Default = 1

Usage

Use this command to configure the number of authentication vectors the MMErequests in an Authentication-Information-Request (AIR) message to the HSS for each UE requiring authentication.
Receiving multiple vectors from the HSS for a given UE helps reduce the number of messages across the diameter connection plus provides the MME with additional vectors for the UE in the event that the connection or the HSS id disabled.
To view the current number of requested vectors, execute the **show hss-peer-service service name** <*name*> command in the Exec mode.

Example

The following command sets the number of requested vectors to 2:

```
auth-request num-auth-vectors 2
```

diameter hss-dictionary

Specifies the Diameter Credit Control dictionary for the HSS peer service.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSS Peer Service Configuration

configure > context *context_name* **> hss-peer-service** *service_name*

Syntax

diameter hss-dictionary { custom1 | standard | standard-r9 } [eir-dictionary { custom1 | standard | standard-r9 }]

default diameter hss-dictionary

default

Sets the dictionary to default **standard-r9** for HSS service.

custom1

Sets the Diameter dictionary to a customer-specific HSS Diameter dictionary. Default: Disabled

standard

Sets the Diameter dictionary to the standard HSS peer dictionary. Default: Disabled

standard-r9

Sets the Diameter dictionary to the standard HSS peer dictionary for release 9. Default: Enabled

eir-dictionary { custom1 | standard }

Specifies that an Equipment Identity Register (EIR) dictionary is to be used in conjunction with the HSS Diameter dictionary.
custom1: Sets the EIR Diameter dictionary to a customer-specific EIR Diameter dictionary.
standard: Sets the EIR Diameter dictionary to the standard HSS peer dictionary.
standard-r9: Sets the EIR Diameter dictionary to the standard HSS peer dictionary for release 9.

Usage

Use this command to select the Diameter dictionary for the HSS peer service.

Example

The following command sets the Diameter dictionary to IETF RFC 4006 specific:

```
diameter hss-dictionary standard
```

diameter hss-endpoint

Associates a preconfigured Diameter origin endpoint with this HSS peer service.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSS Peer Service Configuration

configure > context *context_name* **> hss-peer-service** *service_name*

Syntax

diameter hss-endpoint *endpoint_name* **[eir-endpoint** *eir_endpoint_name* **]**

no diameter hss-endpoint

no

Removes previously associated Diameter origin endpoint from this HSS peer service.

endpoint_name

Identifies a preconfigured Diameter endpoint specific to the HSS interface. The endpoint must be present in all Diameter messages and is the endpoint that originates the diameter message.
endpoint_name is a preconfigured Diameter endpoint name expressed as an alphanumeric string of 1 through 63 characters.

eir-endpoint *eir_endpoint_name*

Identifies a preconfigured Diameter endpoint specific to the S13 Equipment Identity Register (EIR) interface.
eir_endpoint_name must be an existing Diameter endpoint expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to associated a Diameter origin endpoint to create a Diameter-based S6a interface association in this HSS peer service to provide AAA functionality to the EPS bearer context.
Optionally, use this command to associate a Diameter origin endpoint to create a Diameter-based S13 interface association in this HSS peer service to provide IMEI query capability between the MME and an EIR.
Refer to the *Diameter Endpoint Configuration Mode Commands* chapter for more information on Diameter endpoint configuration parameters.

Example

The following command associates the preconfigured Diameter endpoint *hss_1* with this HSS peer service for HSS interface support.

```
diameter hss-endpoint hss_1
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

failure-handling

Configures failure handling behavior in the event of a failure with the HSS peer service. It also defines the action on various error codes on the Diameter interface during authentication or session activities.

Platform

ASR 5000

Product

MME

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > HSS Peer Service Configuration

configure > context *context_name* **> hss-peer-service** *service_name*

Syntax

failure-handling { authentication-information-request | check-identity-request| notify-request | purge-ue-request | update-location-request } { diameter-result-code *start_error_code* **[to** *end_error_code* **] | request-timeout } action { continue | retry-and-terminate | terminate }**

no failure-handling { authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request } diameter-result-code *start_error_code* **[to** *end_error_code* **]**

default failure-handling { authentication-information-request | check-identity-request | notify-request | purge-ue-request | update-location-request } request-timeout

no

Removes the preconfigured failure handling procedures for calls in an HSS peer service.

default

Sets the default action for failure handling procedure for calls in an HSS peer service.
For default actions on Diameter result/error codes see the *Usage* section below.

authentication-information-request

Configures the MME-HSS service to handle the failures in an Auth-Information-Request message.

check-identity-request

Configures the MME-HSS service to handle the failures in a Check-Identity-Information-Request message.

notify-request

Configures the MME-HSS service to handle the failures in a Notify-Request message.

purge-ue-request

Configures the MME-HSS service to handle the failures in a Purge-UE-Request message.

update-location-request

Configures the HSS peer service to handle the failures in an Update-Location-Request message.

diameter-result-code *start_error_code* **[to** *end_error_code***]**

Configures the HSS peer service to handle the failures for various request message having specific single or range of Diameter result codes in a request message.
start_error_code specifies an individual error code for Diameter protocol as an integer from 3000 through 5999. This will be the starting of code if a range of error codes is specified with the optional keyword **to** *end_error_code*.
to *end_error_code* is used to specify a range of error codes to handle by this command.
end_error_code specifies the end error code for Diameter protocol as an integer from 3000 through 5999.

request-timeout

Configures the HSS peer service to handle the failures for various request messages if response to that message is not received before timeout duration exhausted.

action { continue | retry-and-terminate | terminate }

Specifies the action to be taken on failure of any message as a policy for failure handling.

- **continue**: On receipt of any error, the system allows the HSS peer service to continue with the session procedure without any interruption.

  For 12.0 and earlier releases the **continue** option in failure handling for IMEI procedures has the same behaviour as that of the **retry-and-terminate** option.

- **retry-and-terminate**: On receipt of any error, the system instructs the HSS peer service to retry the procedure. The system will retry up to the configured number of attempts and terminate the session/procedure if it received a subsequent number of errors after retry attempts.

- **terminate**: The system allows the HSS peer service to terminate the session procedure without any retry attempt on the event of any failure.

Usage

Use this command to configure the failure handling behavior in the event of a communication failure with the HSS peer service.
The following are the default action for Diameter result codes:

- For all protocol error codes 3000 to 3999, the default action is terminate. For all transient error codes 4000, 4001, 4004 to 4180, and 4182 to 4999, the default action is continue.
- For transient error codes 4002, 4003, and 4181, the default action is retry.
- For error code 4001, the default action is terminate.
- For permanent error codes 5000 to 5999, the default action is terminate

Example

The following command will allow HSS peer service to continue if any failure in Auth-Information-Request message occurred with Diameter error code *3050*:

```
failure-handling authentication-information-request diameter-result-code
3050 action continue
```

request timeout

Configures the application request timeout between the HSS peer service and HSS node. The MME waits for this duration before retransmitting the request to corresponding HSS node.

Platform

ASR 5000

Product

MME

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > HSS Peer Service Configuration

configure > context *context_name* **> hss-peer-service** *service_name*

Syntax

request timeout *dur*

[no | default] request timeout

no

Disables the configured application request timeout value.

default

Sets the application request time out duration to default value of 300 seconds.

dur

Specifies the application request timeout duration (in seconds) as an integer from 1 through 300. The MME will wait for this duration before retrying the request with corresponding HSS. Default: 300

Usage

Use this command to set the waiting period for HSS peer service in seconds after which the request is deemed to have failed or system will resend the request.

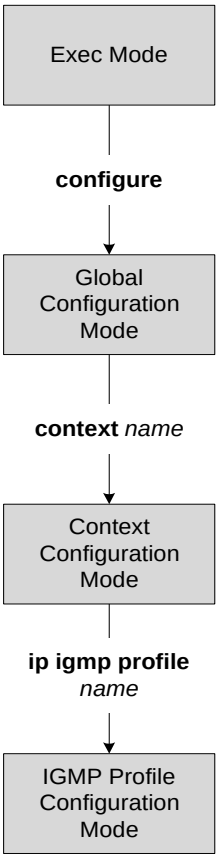
Example

The following example configures the application request timeout duration to 300 seconds:

```
default request timeout
```

Chapter 153
IGMP Profile Configuration Mode Commands

The Internet Group Management Protocol (IGMP) Profile Configuration Mode is used to create and manage the IGMP parameters for an Ethernet interface.



Important: Available commands or keywords/variables vary based on platform type, product version, and installed license(s).

default ip igmp

Configures default IGMP parameters.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IGMP Profile Configuration

configure > context *context_name* **> ip igmp profile** *profile_name*

Syntax

default ip igmp { query | require | robustness | unsolicited-report-interval | version }

Usage

Specify the IGMP parameters for the default profile. Refer to the remaining command description in this chapter for additional information.

Example

To apply enable echo mode on this interface, use the following command:

bfd echo

ip igmp query

Configures the maximum response time for IGMP queries.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IGMP Profile Configuration

configure > context *context_name* **> ip igmp profile** *profile_name*

Syntax

ip igmp query max-response-time *seconds*

---

max-response-time ***seconds***

Specify the maximum number of seconds that the system will wait for an IGMP response as an integer from 1 through 25.

Usage

Specify the maximum response time for IGMP queries.

Example

```
ip igmp query max-response-time 10
```

ip igmp require router-alert

Sets the router alert flag to ON in IP IGMP packets.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IGMP Profile Configuration

configure > context *context_name* **> ip igmp profile** *profile_name*

Syntax

[no] ip igmp require router-alert

---

no

Sets the router alert flag to OFF in IP IGMP packets.

Usage

Sets the router alert flag to ON in IP IGMP packets.

Example

```
ip igmp require router-alert
```

ip igmp robustness

Sets the Robustness value in IP IGMP packets. The Robustness variable allows tuning for the expected packet loss on a subnet. If a subnet is expected to be lossy, the Robustness variable may be increased. IGMP is robust to packet losses. The Robustness variable should not be set to 1 (one).

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IGMP Profile Configuration

configure > context *context_name* **> ip igmp profile** *profile_name*

Syntax

ip igmp robustness *value*

value

Sets the robustness value as an integer from 1 through 10. Default: 2

Usage

Sets the robustness value in IP IGMP packets.

Example

```
ip igmp robustness 7
```

ip igmp unsolicited-report-interval

Sets the Unsolicited Report Interval which is the time between repetitions of a host's initial report of membership in a group.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IGMP Profile Configuration

configure > context *context_name* **> ip igmp profile** *profile_name*

Syntax

ip igmp unsolicited-report-interval *seconds*

seconds

Specifies the number of seconds between repetitions of a host's initial report of membership in a group as an integer from 1 through 25. Default: 10

Usage

Set the Unsolicited Report Interval which is the time between repetitions of a host's initial report of membership in a group.

Example

```
ip igmp unsolicited-report-interval 15
```

ip igmp version

Sets the IGMP version to be supported by this interface.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IGMP Profile Configuration

configure > context *context_name* **> ip igmp profile** *profile_name*

Syntax

ip igmp version { v1 | v2 | v3 }

---

v1 | v2 | v3

Specifies the IGMP Version number:

- **v1:** Version 1, RFC 1112
- **v2**: Version 2, RFC 2236
- **v3**: Version 3, RFC 4604

Usage

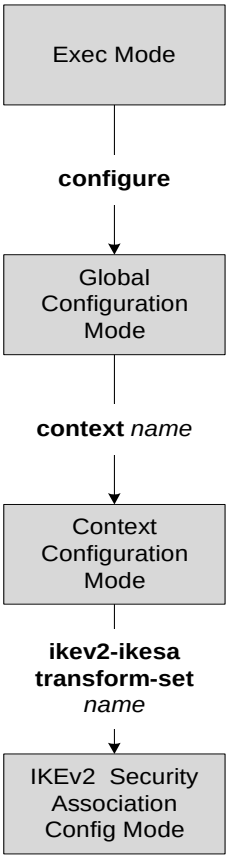
Set the IGMP version to be supported by this interface.

Example

```
ip igmp version v2
```

Chapter 154
IKEv2 Security Association Configuration Mode Commands

The IKEv2 Security Association Configuration Mode is used to configure a Security Association (SA) at the outset of an IPSec session. A security association is the collection of algorithms and parameters (such as keys) that is being used to encrypt and authenticate a particular flow in one direction. In normal bi-directional traffic, the flows are secured by a pair of security associations.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Sets the default properties for the selected parameter.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IKEv2 Security Association Configuration

configure > context *context_name* **> ikev2-ikesa transform-set** *set_name*

Syntax

default { encryption | group | hmac | lifetime | prf }

Set the defaults for the following parameters:

- **encryption**: Default algorithm for the IKEv2 IKE SA is AES-CBC-128.
- **group**: Default Diffie-Hellman group is Group 2.
- **hmac**: Default IKEv2 IKE SA hashing algorithm is SHA1-96.
- **lifetime**: Default lifetime for SAs derived from this transform-set is 86400 seconds.
- **prf**: Default PRF for the IKEv2 IKE SA is SHA1.

Usage

Configure default parameters for the IKEv2 IKE SA transform-set.

Example

Use the following configuration to set the default encryption algorithm:

```
default encryption
```

encryption

Configures the appropriate encryption algorithm and encryption key length for the IKEv2 IKE security association. AES-CBC-128 is the default.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IKEv2 Security Association Configuration

configure > context *context_name* **> ikev2-ikesa transform-set** *set_name*

Syntax

encryption { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc | null }

default encryption

3des-cbc

Data Encryption Standard Cipher Block Chaining encryption applied to the message three times using three different cypher keys (triple DES).

aes-cbc-128

Advanced Encryption Standard Cipher Block Chaining with a key length of 128 bits.

aes-cbc-256

Advanced Encryption Standard Cipher Block Chaining with a key length of 256 bits.

des-cbc

Data Encryption Standard Cipher Block Chaining. Encryption using a 56-bit key size. Relatively insecure.

null

Configures no IKEv2 IKE Security Association Encryption Algorithm. All IKEv2 IPsec Child Security Association protected traffic will be sent in the clear.

Usage

IKEv2 requires a confidentiality algorithm to be applied in order to work.
In cipher block cryptography, the plaintext is broken into blocks usually of 64 or 128 bits in length. In cipher block chaining (CBC) each encrypted block is chained into the next block of plaintext to be encrypted. A randomly-generated vector is applied to the first block of plaintext in lieu of an encrypted block. CBC provides confidentiality, but not message integrity.
Because RFC 4307 calls for interoperability between IPSec and IKEv2, the IKEv2 confidentiality algorithms must be the same as those configured for IPSec in order for there to be an acceptable match during the IKE

message exchange. Because of RFC4307, in IKEv2, there is no viable NULL option, it is available for testing only.

Example

The following command configures the encryption to be aes-cbc-128:

```
encryption aes-cbc-128
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

group

Configures the appropriate key exchange cryptographic strength by applying a Diffie-Hellman group. Default is Group 2.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IKEv2 Security Association Configuration

configure > context *context_name* **> ikev2-ikesa transform-set** *set_name*

Syntax

group { 1 | 2 | 5 | 14 }

default group

1

Configures crypto strength at the Group 1 level. Lowest security.

2

Configures crypto strength at the Group 2 (default) level. Medium security.
This is the default setting for this command.

5

Configures crypto strength at the Group 5 level. Higher security.

14

Configures crypto strength at the Group 14 level. Highest security

Usage

Diffie-Hellman groups are used to determine the length of the base prime numbers used during the key exchange process in IKEv2. The cryptographic strength of any key derived depends, in part, on the strength of the Diffie-Hellman group upon which the prime numbers are based.
Group 1 provides 768 bits of keying strength, Group 2 provides 1024 bits, Group 5 provides 1536 bits and Group 14 provides 2048 bits of encryption strength.
Configuring a DH group also enables Perfect Forward Secrecy, which is disabled by default.

Example

This command configures crypto strength at the Group 14 level. Highest security group 14:

```
default group
```

hmac

Configures the IKEv2 IKE SA integrity algorithm. Default is SHA1-96.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IKEv2 Security Association Configuration

configure > context *context_name* **> ikev2-ikesa transform-set** *set_name*

Syntax

hmac { aes-xcbc-96 | md5-96 | sha1-96 | sha2-256-128 | sha2-384-192 | sha2-512-256 }

default hmac

aes-xcbc-96

HMAC-AES-XCBC uses a 128-bit secret key and produces a 128-bit authenticator value.

md5-96

HMAC-MD5 uses a 128-bit secret key and produces a 128-bit authenticator value.

sha1-96

HMAC-SHA-1 uses a 160-bit secret key and produces a 160-bit authenticator value. This is the default setting for this command.

sha2-256-128

HMAC-SHA-256 uses a 256-bit secret key and produces a 128-bit authenticator value.

sha2-384-192

HMAC-SHA-384 uses a 384-bit secret key and produces a 192-bit authenticator value.

sha2-512-256

HMAC-SHA-512 uses a 512-bit secret key and produces a 256-bit authenticator value.

Usage

IKEv2 requires an integrity algorithm be configured in order to work.
A keyed-Hash Message Authentication Code, or HMAC, is a type of message authentication code (MAC) calculated using a cryptographic hash function in combination with a secret key to verify both data integrity and message authenticity. A hash takes a message of any size and transforms it into a message of a fixed size: the authenticator value. This is truncated and transmitted. The authenticator value is reconstituted by the receiver and the first truncated bits are compared for a 100 percent match.

Because RFC 4306 calls for interoperability between IPSec and IKEv2, the IKEv2 integrity algorithms must be the same as those configured for IPSec in order for there to be an acceptable match during the IKE message exchange.

Example

This command configures HMAC value md5-96:

```
hmac md5-96
```

lifetime

Configures the lifetime of a security association (SA) in seconds.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IKEv2 Security Association Configuration

configure > context *context_name* **> ikev2-ikesa transform-set** *set_name*

Syntax

lifetime *sec*

default lifetime

lifetime *sec*

Sets the value of the timeout parameter in seconds as an integer from 60 through 86400. Default: 86400

Usage

The secret keys that are used for various aspects of a configuration should only be used for a limited amount of time before timing out. This exposes a limited amount of data to the possibility of hacking. If the SA expires, the options are then to either close the SA and open an new one, or renew the existing SA.

Example

The following command sets the lifetime timeout to 120 seconds:

```
lifetime 120
```

prf

Selects one of the HMAC integrity algorithms to act as the IKE Pseudo-Random Function. A PRF produces a string of bits that an attacker cannot distinguish from random bit string without knowledge of the secret key. The default is SHA1.

Platform

ASR 5000

Product

PDIF

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IKEv2 Security Association Configuration

configure > context *context_name* **> ikev2-ikesa transform-set** *set_name*

Syntax

prf { aes-xcbc-128 | md5 | sha1 | sha2-256 | sha2-384 | sha2-512 }

default prf

aes-xcbc-128

Configure IKEv2 IKE Security Association Pseudo Algorithm to be AES-XCBC-128.

md5

MD5 uses a 128-bit secret key and produces a 128-bit authenticator value.

sha1

SHA-1 uses a 160-bit secret key and produces a 160-bit authenticator value.
SHA-1 is considered cryptographically stronger than MD5, but it takes more CPU cycles to compute.
This is the default setting for this command.

sha2-256

PRF-HMAC-SHA-256 uses a 256-bit secret key.

sha2-384

PRF-HMAC-SHA-384 uses a 384-bit secret key.

sha2-512

PRF-HMAC-SHA-512 uses a 512-bit secret key.

Usage

This command generates keying material for all the cryptographic algorithms used in both the IKE_SA and the CHILD_SAs.

Example

This configuration sets the PRF to be value sha2-256:

```
prf sha2-256
```

Chapter 155
IMEI Profile Configuration Mode

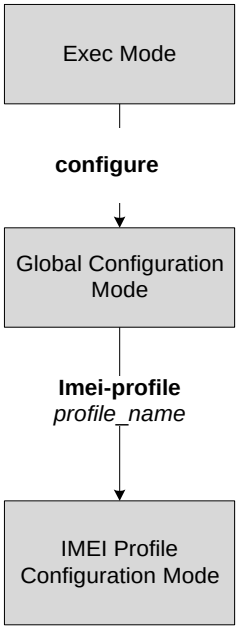
The IMEI profile configuration mode defines a set of parameters controlling the SGSN behavior when a Request is received from a device in the specified IMEI (International Mobile Equipment Identity) range. An IMEI profile is a key element in the Operator Policy feature and an IMEI profile is not used or valid unless it is associated with an IMEI range and this association is specified in an operator policy (see the *Operator Policy Configuration Mode Commands* chapter elsewhere in the *Command Line Interface Reference*).

Essentially, an IMEI profile is a template which groups a set of device-specific commands that may be applicable to one or more IMEIs. The same IMEI profile can be associated with multiple IMEI ranges and multiple operator policies.

An SGSN supports a total of 1000 IMEI profile configurations.

When this mode is accessed, the command prompt should resemble:

```
[local]asr5000(imei-profile-<profile_name>)#
```



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

associate

Associate an APN remap table with this IMEI profile.

Note that an APN remap table can be associated with an IMEI profile before the table has actually been created/configured.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > IMEI Profile Configuration

configure > imei-profile *profile_name*

Syntax

associate apn-remap-table *table_name*

no associate apn-remap-table

no

Disables the configured remap table association.

table_name

Define the name of an APN remap table that is to be associated with this IMEI profile for call routing based in IMEI.

Usage

Use this command to associate an APN remap table with this IMEI profile. With such an association, it is possible to override an APN call-routing based on an IMEI.
For example, with the APN exceptions defined in an APN remap table (refer to the *APN Remap Table Configuration Mode* chapter), a blank APN or an incorrect APN could be overriden. So during PDP Activation for in incoming call, the call could be rerouted based on an IMEI in the range defined for the IMEI profile.

Example

Associate the APN remap table ‘remapHO’ (remaps all calls with blank APNS to the head-office) to this IMEI profile:

```
associate apn-remap-table remapHO
```

blacklist

Blacklist all mobile devices that fit the IMEI definitions associated with this IMEI profile.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > IMEI Profile Configuration

configure > imei-profile *profile_name*

Syntax

blacklist

remove blacklist

remove

Including this keyword with the command, removes the blacklist command from the IMEI profile configuration.

Usage

Blacklists subscribers whose devices bear IMEI that match the defined IMEI range for this profile.

Example

Use this command to black list all subscribers with IMEI that fall within the range set for this IMEI profile:

blacklist

description

Define a descriptive string relevant to the specific APN profile.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > IMEI Profile Configuration

configure > imei-profile *profile_name*

Syntax

description *description*

remove description

remove

Removes the configured description from this APN profile.

description

Enter an alphanumeric string of 1 to 100 alphanumeric characters. The string may include spaces, punctuation, and case-sensitive letters if the string is enclosed in double quotes (“).

Usage

Define information that identifies this particularly APN profile.

Example

Indicate that this IMEI profile *IMEIprof1* is to be used for customers in the United Kingdom and that the profile:

```
description "IMEIprof1 defines routing actions based on IMEI for
customers in the UK."
```

direct-tunnel

Instruct the SGSN to enable/disable a direct tunnel between the RNC and the GGSN based on the IuPS service configuration.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > IMEI Profile Configuration

configure > imei-profile *profile_name*

Syntax

direct-tunnel check-iups-service

no direct-tunnel

no direct-tunnel

This command instructs the SGSN to disable the direct tunnel function between the GGSN and the RNC.

Usage

Direct tunnel is enabled by default on the GGSN and often on the RNC. This leaves it to the SGSN's configuration to actually enable or disable a direct tunnel.
With the SGSN, the options for configuring a direct tunnel are complex -- enable/disable on the basis of APNs, or RNCs, or GGSNs, or on the basis of the IMEI range. Refer to the *SGSN Administration Guide* for configuration details.

Example

Assuming the IuPS service configuration has enabled DT for associated RNCs, then use this command to enable DT from the RNC to the GGSN associated with this IMEI profile:

```
direct tunnel check-iups-service
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Move to the previous configuration mode.

ggsn-address

Identify the target GGSN for traffic being managed by this IMEI profile.

Platform

ASR 5000

Product

SGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > IMEI Profile Configuration

configure > imei-profile *profile_name*

Syntax

ggsn-address *IPv4/IPv6_address*

IPv4/IPv6_address

Enter the IP address of the target GGSN. Enter the address in either standard IPv4 dotted decimal format or in standard IPv6 colon notation format.

Usage

Use this command to define the IP address of the target GGSN to be associated with this IMEI profile.

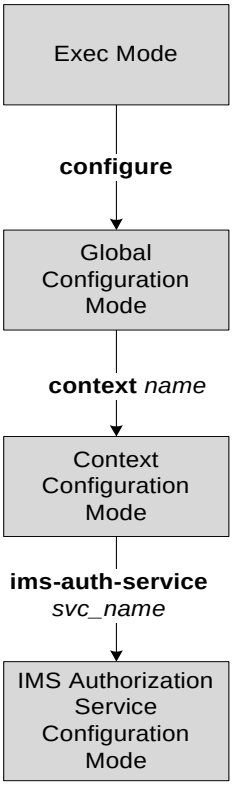
Example

The following command identifes the address of the GGSN associated with this IMEI profile as 123.123.11.1

ggsn-address *123.123.11.1*

Chapter 156
IMS Authorization Service Configuration Mode Commands

The IMS Authorization Service Configuration Mode enables to configure IP Multimedia Subsystem (IMS) authorization services to manage policy control functions and Gx interface support.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

p-cscf discovery

This command defines the method of Proxy-Call Session Control Function (P-CSCF) discovery to be used.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Authorization Service Configuration

configure > context *context_name* **> ims-auth-service** *service_name*

Syntax

p-cscf discovery { table { 1 | 2 } [algorithm { ip-address-modulus | msisdn-modulus | round-robin }] | diameter-configured }

[default | no] p-cscf discovery

---

default

Sets the P-CSCF discovery to default parameter.

---

no

Removes/deletes configured parameters for P-CSCF discovery.

---

table { 1 | 2 }

Specifies that which P-CSCF table is to be used to obtain the primary and secondary P-CSCF addresses. Total 2 tables can be configured for P-CSCF discovery.

---

algorithm { ip-address-modulus | msisdn-modulus | round-robin }

Specifies the algorithm to select the row from the P-CSCF table to be used for P-CSCF discovery.

- **ip-address-modulus**: This algorithm divides the IP address, in binary, of the subscriber by the number of rows in the table, and the remainder is used as an index into the specified table to select the row.
- **msisdn-modulus**: This algorithm divides the MSISDN value, in binary without the leading "+", of the subscriber by the number of rows in the table, and the remainder is used as an index in the specific table to select the row.
- **round-robin**: This algorithm rotates all rows in the active table for selection of the row in round-robin way. If no algorithm is specified this is the default behavior.

Default: **round-robin**

diameter-configured

This option enables the table number and algorithm specified by the **diameter host-select table** configuration in Policy Control Configuration mode.
If the primary host in that configuration is down it assumes that the primary P-CSCF in the row of P-CSCF table is also down, and it does not return that IP address in the create PDP context response.
This option also performs the deactivation processing of the PDP contexts when Diameter Policy Control Application (DPCA) switches, host tables as detailed in the **diameter host-select** command description in Policy Control Configuration mode.

Usage

Use this command to configure the table and row selection methods to select IP address/host address for P-CSCF discovery.

Example

The following command specifies **table 1** with **round-robin** algorithm to select the rows with IP address for P-CSCF discovery.

```
p-cscf discovery table 1 algorithm round-robin
```

p-cscf table

This command adds/appends rows with primary and/or secondary IPv4/IPv6 addresses to a P-CSCF discovery table with precedence for P-CSCF discovery.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Authorization Service Configuration

configure > context *context_name* **> ims-auth-service** *service_name*

Syntax

p-cscf table { 1 | 2 } row-precedence *precedence_value* **{ address** *ip_address* **| ipv6-address** *ipv6_address* **} [secondary { address** *ip_address* **| ipv6-address** *ipv6_address* **}]**

no p-cscf table { 1 | 2 } row-precedence *precedence_value*

no

Removes/deletes configured row with precedence in specified table for P-CSCF discovery address.

{ 1 | 2 }

Specifies which P-CSCF table is to be used to add/append the primary and secondary P-CSCF addresses. Two tables can be configured for P-CSCF discovery address.

row-precedence *precedence_value*

This keyword adds/appends the row with the specified row-precedence to the P-CSCF address table.
In 8.1 and later releases, *precedence_value* must be an integer from 1 through 128, and a maximum of 128 rows can be added to a table.
In release 8.0, *precedence_value* must be an integer from 1 through 100, and a maximum of 16 rows can be added to a table.

secondary

Specifies the secondary IPv4/IPv6 address to be entered in P-CSCF table rows.

address *ip_address*

Specifies the primary and/or secondary IPv4 address for P-CSCF discovery table. This keyword, if used with **secondary** keyword, specifies the secondary IPv4 address.
ip_address must be entered in IPv4 dotted-decimal notation.

ipv6-address *ipv6_address*

Specifies the primary and/or secondary IPv6 address for P-CSCF discovery table. This keyword, if used with **secondary** keyword, specifies the secondary IPv6 address.

ipv6_address must be entered in IPv6 colon-separated-hexadecimal notation.

Usage

Use this command to add rows with primary and/or secondary IP addresses for P-CSCF discovery. The row is added with the specified row-precedence.
The operator can add/remove rows to the table that is not currently selected by the **diameter host-select table** command in Policy Control Configuration Mode.

Example

The following command adds a row in **table 2** with primary IP address *10.2.3.4*, secondary IP address as *50.6.7.8*, and row-precedence value as *20* for P-CSCF discovery.

```
p-cscf table 2 row-precedence 20 address 10.2.3.4 secondary 50.6.7.8
```

policy-control

This command enters the Policy Control Configuration mode for Diameter Policy Control Application (DPCA) to configure Diameter authorization and policy control parameter for IMS authorization.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Authorization Service Configuration

configure > context *context_name* **> ims-auth-service** *service_name*

Syntax

[no] policy-control

no

Disables the pre-configured policy control parameters for IMS authorization in this IMS authorization service.

Usage

Use this command to enter the Policy Control Configuration Mode to configure the policy control parameters for Diameter authorization and charging policy in IMS Authorization Service.
Entering this command results in the following prompt:
`[context_name]hostname(config-imsa-dpca)#`
Policy Control configuration commands are described in the *Policy Control Configuration Mode Commands* chapter.

qos-update-timeout

This command is obsolete in release 11.0 and later releases. This command sets the Quality of Service update timeout for a subscriber in IMS authorization service.

Platform

ASR 5000

Product

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Authorization Service Configuration

configure > context *context_name* **> ims-auth-service** *service_name*

Syntax

qos-update-timeout *timeout_duration*

no qos-update-timeout

---

no

Disables the pre-configured QoS update timeout parameter in this IMS authorization service.

---

timeout_duration

Specifies the duration of timeout in seconds as an integer from 0 through 3600.
Default: 60

Usage

Use this command to set the maximum time to wait for a subscriber to initiate the update QoS procedure in IMS authorization service.

Example

The following command sets the QoS update timeout to *90* seconds.

```
qos-update-timeout 90
```

signaling-flag

This command specifies whether a request for a PDP context dedicated to signaling (for IMS sessions) should be granted or denied.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Authorization Service Configuration

configure > context *context_name* **> ims-auth-service** *service_name*

Syntax

signaling-flag { deny | permit }

default signaling-flag

default

Sets the signaling flag to default mode of deny.

deny

Denies the request for a signaling PDP context for IMS session and keeps signaling co-existed with other traffic on PDP contexts. Default: Enabled

permit

Permits the request for a signaling PDP context for IMS session and a separate signaling context activated. Default: Disabled

Usage

Use this command to allow or deny the activation of a dedicated PDP context for signaling. The user equipment (UE) may indicate that the PDP context should be dedicated for IP multimedia (IM) signaling by setting the IP Multimedia Core Network (IM-CN) signaling flag in the Protocol Configuration Options (PCO).
The **deny** option causes the system to inform the UE that the PDP context will not be dedicated for IM signaling and signaling will co-exist with other traffic on PDP context.
The **permit** option is used to activate the signaling context for signal traffic and the other traffic uses other PDP context for traffic with the following destinations:

- Towards the DHCP and DNS servers for the IMS domain
- Towards the P-CSCF(s)

The UE is not trusted to follow these restrictions, and the system monitors and restricts the traffic from the dedicated PDP context. The **signaling-flow class-map** command is used to configure the restrictions.

Example

The following command denies the request for a signaling PDP context for IMS session.

```
default signaling-flag
```

signaling-flow

This command specifies the packet filters and policy servers for bandwidth control and singling context enforcement that define the traffic that is allowed through the dedicated signaling context.

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Authorization Service Configuration

configure > context *context_name* **> ims-auth-service** *service_name*

Syntax

signaling-flow permit server-address *ipv4/ipv6_address* **[server-port {** *port_num* **| range** *start_port* **to** *end_port* **}] [description** *STRING* **]**

no signaling-flow permit server-address *ipv4/ipv6_address* **[server-port {** *port_num* **| range** *start_port* **to** *end_port* **}]**

no

Disables the signaling flow option configured with this command.

server-address *ipv4/ipv6_address*

The server address refers to the destination IP address in uplink packets, and the source IP address in downlink packets.
ipv4/ipv6_address is an IP address in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation and can be used with a subnet mask.
A maximum of 16 signaling server addresses can be configured per IMS Authorization service.

server-port { *port_num* **| range** *start_port* **to** *end_port* **}**

Specifies the TCP/UDP port number(s) of the server to be used for communication.
port_num must be an integer from 1 through 65535.
range *start_port* **to** *end_port* provides the option to configure the range of ports on server for communication.
start_port must be an integer from 1 through 65535 but lesser than *end_port*, and *end_port* must be an integer from 1 through 65535 but greater than *start_port*.

description *STRING*

Specifies the customized description for configured signaling server as an alphanumeric string of 1 through 63 characters.

Usage

Traffic that matches any instance of the signaling-flow command will be forwarded via the signaling PDP context. In addition, the policy server gives policy gates to use for the signaling PDP context.

Example

The following command sets the packet filter server address to *10.2.3.4* with port number *1234* for packet filtering.

```
signaling-flow server-address 10.2.3.4 server-port 1234
```

traffic-policy

This command specifies the action on packets which do not match any policy gates in the general purpose PDP context.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Authorization Service Configuration

configure > context *context_name* **> ims-auth-service** *service_name*

Syntax

traffic-policy general-pdp-context no-matching-gates direction { downlink | uplink } { forward | discard }

default traffic-policy general-pdp-context no-matching-gates direction { downlink | uplink }

default

Sets the default traffic policy for packets without any policy gate match in general purpose PDP context. By default packets which do not have any matching policy gate are forwarded.

no-matching gates

Applies traffic policy for packets which do not match any policy gate.

direction { downlink | uplink }

Specifies the direction of traffic to apply this traffic policy in general PDP context.
downlink: Specifies the traffic from system to MN. Default is set to forward.
uplink: Specifies the traffic from MN to system. Default is set to forward.

forward

Forwards the packets which do not match any policy gates. Default: Enabled

discard

Discards the packets which do not match any policy gates. Default: Disabled

Usage

This command provides configuration on traffic policy applied on packets which are not matching any policy gate in general PDP context. Packets can either be forwarded or discarded on the basis of operator's configuration.
This command needs to be configured once for downlink and once for uplink separately.

Example

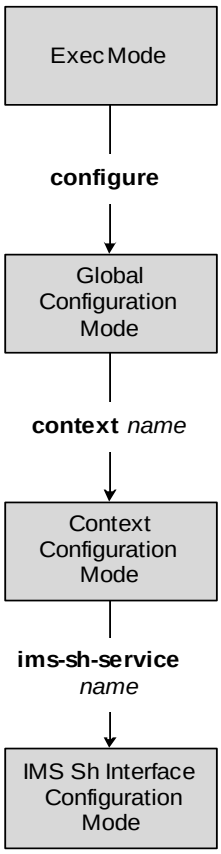
The following command discards uplink packets which do not match any policy gate in general purpose PDP context.

```
traffic-policy general-pdp-context no-matching-gates direction uplink
discard
```

Chapter 157
IMS Sh Service Configuration Mode Commands

The IMS Sh Interface Configuration Mode is used to configure various Diameter parameters in order for:

PDIF to communicate with the HSS server. HSS server is used for MAC address validation in the IKEv2 exchanges to set up SAs and for storing part of the user profile.SCM to communicate with the HSS server. HSS server is used for retrieval and update of call feature parameters and call restriction data.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

diameter

This command configures Diameter parameters.

Platform

ASR 5000

Product

PDIF

SCM

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Sh Interface Configuration

configure > context *context_name* **> ims-sh-service** *service_name*

Syntax

diameter { dictionary { custom1 | standard | endpoint *string* **}**

default diameter { dictionary | endpoint }

no diameter endpoint

no

Removes previously configured endpoint.

default

Configures parameters to the default value.

dictionary

Specifies the dictionary to use.

- **custom1**: A custom dictionary
- **standard**: The standard dictionary

Important: SCM uses only the standard dictionary.

endpoint *string*

Selects an endpoint to use in the configuration.
string must be the endpoint name, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

The Diameter endpoint contains information on the peer names and IP addresses and port, and the local IP address to use for Diameter.

You can have more than one Diameter endpoint configured on the chassis and the ims-sh-service needs to know which Diameter endpoint to use. This command is to select the appropriate Diameter endpoint, even if only one has been configured.

Example

The following example selects a diameter endpoint *diam1:*

```
diameter endpoint diam1
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to change to the Exec Mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

failure-handling

This command configures the action to take in the event of an HSS server request failure.

Platform

ASR 5000

Product

PDIF

SCM

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Sh Interface Configuration

configure > context *context_name* **> ims-sh-service** *service_name*

Syntax

[default] failure-handling { profile-update-request | user-data-request } { { diameter-result-code *result_code* **[to** *result_code* **] } | timeout } action { continue | retry-and-terminate | terminate } } }**

default

Resets configuration for the specified keyword to the default setting.

profile-update-request

Configures failure-handling as a result of a profile update request error.

user-data-request

Configures failure-handling as a result of a user data request.

diameter-result-code *result_code* **[to** *result_code* **]**

The Result-Code data field contains a space representing errors. Diameter provides the following classes of errors, all identified by the thousands digit in the decimal notation:

- 3xxx (Protocol Errors)
- 4xxx (Transient Failures)
- 5xxx (Permanent Failure)

result_code specifies either a result code value (**diameter-result-code** *3001*) or a range of result code values (**diameter-result-code** *3000* **to** *9999*) to which the failure-handling applies.

action

Configures the action to take depending on the diameter-result-code:

- Continue the session
- Retry and then terminate
- Terminate the session

request-timeout action

Configures the action to take as a result of a request timeout error:

- Continue the session
- Retry and then terminate
- Terminate the session

Usage

Configures all failure-handling parameters.

Example

The following command configures profile-update-request failure-handling using a result-code configuration with the terminate session option:

```
failure-handling profile-update-request diameter-result-code 3005 to 3600action terminate
```

request

Configures application request timeout.

ASR 5000

Product

PDIF

SCM

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > IMS Sh Interface Configuration

configure > context *context_name* **> ims-sh-service** *service_name*

Syntax

request timeout *secs*

[no | default] request timeout

no

Disables a configured timeout request.

default

Default: 300 seconds
Resets configuration to the default setting.

request timeout *secs*

Configures the request timeout in seconds.
secs must be an integer from 1 through 300.

Usage

Specifies the session request timeout period in seconds after which the request is deemed to have failed.

Example

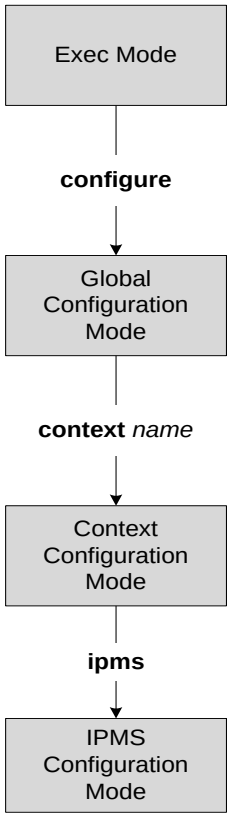
The following example configures the default timeout request of 300 seconds:

```
default request timeout
```

Chapter 158
IPMS Client Configuration Mode Commands

The IPMS Client Configuration Mode is used to enable the Intelligent Packet Monitoring System (IPMS) client service on an Access Gateway and to set basic service-wide options in a context.

Important: This is a license enabled external application support. For more information on this product, refer to the *IPMS Installation and Administration Guide*.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

export keys

Enables the encryption key export in specific key exchange events to IPMS server from IPMS-enabled AGW.

Important: This is a license enabled customer specific command.

Platform

ASR 5000

Product

IPMS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPMS Configuration

configure > context *context_name* **> ipms**

Syntax

no

Removes the configured source IP address from this context for IPMS client communication with IPMS server.

ikev2

Enables the security association (SA) key export for Internet Key Exchange (IKEv2) protocol to IPMS server.

Usage

Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

Example

The following command assigns the IP address *10.2.3.4* to the IPMS client service in context to communicate with IPMS server. This is the IP address allocated for IPMS client service on chassis.

```
source address 10.2.3.4
```

heartbeat

Configures the IPMS heartbeating between the IPMS-enabled AGW and the IPMS server.

Platform

ASR 5000

Product

IPMS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPMS Configuration

configure > context *context_name* **> ipms**

Syntax

heartbeat period *dur* [**permitted-failure***no_of_failures*]

[**no** | **default**] **heartbeat**

default

Configures the heartbeat period and permitted number of failures to the default values of 10 seconds and 1 failure respectively.

no

Disables/removes the configured heartbeat period and permitted number of failures.

period *dur*

Specifies the periodicity (in seconds) between heartbeat messages as an integer from 1 through 3600. Default: 10

permitted-failure *no_of_failures*

Specifies the number of errors/failures allowed before declaring an IPMS server as dead/unreachable as an integer from 1 through 10. Default: 1

Usage

Use this command to configure the heartbeat message periodicity and permissible failure of heartbeat message response before declaring an IPMS server as dead or unreachable. When an IPMS server is declared down an SNMP trap is sent.

Example

Following command configures the heartbeat message periodicity to *5* second and number of failures allowed as *3* to determine an IPMS server as dead.

```
heartbeat period 5 permitted-failure 3
```

server

Configures the IPMS server address and ports on which the IPMS client on an IPMS-enabled AGW communicates. This is the IP address and port range of the IPMS server.

Platform

ASR 5000

Product

IPMS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPMS Configuration

configure > context *context_name* **> ipms**

Syntax

server address*ip_address* [**seconary**] [**start-port** *start_port* [**end-port** *end_port*]][**secondary**]

no server address *ip_address*

no

Removes the configured IPMS server IP address and port range from this context.

address *ip_address*

Specifies the IP address of the IPMS server to which the IPMS client service communicates in IPv4 dotted-decimal notation.
A maximum of 4 IPMS severs can be configured with this command in one context.

[start-port *start_port***[end-port** *end_port* **]]**

Default: 45001 source port
45005 end port
Specifies the range of UDP ports on which IPMS client communicates with the IPMS server.
start-port *start_port*: Specifies starting port number as an integer from 1 through 65535 that is less than *end_port*, if end-port is specified.
end-port *end_port*: Specifies is the end port number as an integer from 1 through 65535 that is more than *start_port*.

secondary

The secondary keyword is used to configure the specified server address as secondary IP address on the IPMS client interface.

Usage

Use this command to configure/remove the IPMS servers. Up to 4 different IPMS servers can be configured with this command. UDP port number can also be configured with this command. IPMS client will search for this IP address to push the event and traffic logs.

Example

The following command configures IPMS server having IP address *10.2.3.4* in the IPMS client service export the event and traffic logs for intelligent packet monitoring functionality. It also specifies the UDP port range from *48000* to *48005* for communication.

```
server address 10.2.3.4 start-port 48000 end-port 48005
```

source

Configures the source address of the IPMS client in this context to communicate with the IPMS server. This is the IP address for IPMS client on the chassis.

Platform

ASR 5000

Product

IPMS

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPMS Configuration

configure > context *context_name* **> ipms**

Syntax

source address*ip_address*

address *ip_address*

Specifies the IP address of the IPMS client on the AGW in this context. This is the address which is bound to the IPMS client service in this context.
ip_address is expressed in IPv4 dotted-decimal notation.

Usage

Monitor subscribers which have complaints of service availability or to monitor a test user for system verification.

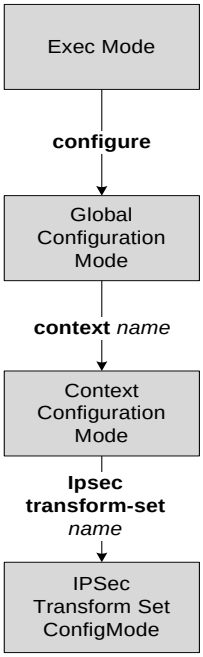
Example

The following command assigns the IP address *10.2.3.4* to the IPMS client service in context to communicate with IPMS server. This is the IP address allocated for IPMS client service on chassis.

source address 10.2.3.4

Chapter 159
IPSec Transform Set Configuration Mode Commands

The IPSec Transform Set Configuration Mode is used to configure IPSec security parameters. There are two core protocols, the Authentication Header (AH) and Encapsulating Security Payload (ESP). AH may be considered redundant as ESP can provide the same authentication services that AH does.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

encryption

Configures the appropriate IPSec ESP encryption algorithm and encryption key length. AES-CBC-128 is the default.

Platform

ASR 5000

Product

PDIF

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSec Transform Set Configuration

configure > context *context_name* **> ipsec transform-set** *set_name*

Syntax

encryption { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc | null }

default encryption

3des-cbc

Data Encryption Standard Cipher Block Chaining encryption applied to the message three times using three different cypher keys (triple DES).

aes-cbc-128

Advanced Encryption Standard Cipher Block Chaining with a key length of 128 bits. This is the default setting for this command.

aes-cbc-256

Advanced Encryption Standard Cipher Block Chaining with a key length of 256 bits.

des-cbc

Data Encryption Standard Cipher Block Chaining. Encryption using a 56-bit key size. Relatively insecure.

null

The NULL encryption algorithm represents the optional use of applying encryption within ESP. ESP can then be used to provide authentication and integrity without confidentiality.

default

Sets the default IPSec ESP algorithm to AES-CBC-128.

Usage

In cipher block cryptography, the plaintext is broken into blocks usually of 64 or 128 bits in length. In cipher block chaining (CBC) each encrypted block is chained into the next block of plaintext to be encrypted. A

randomly generated vector is applied to the first block of plaintext in lieu of an encrypted block. CBC provides confidentiality, but not message integrity.
Because RFC 4307 calls for interoperability between IPSec and IKEv2, the IKEv2 confidentiality algorithms must be the same as those configured for IPSec in order for there to be an acceptable match during the IKE message exchange. In IKEv2, there is no NULL option.

Example

The following command configures the encryption to be the default aes-cbc-128:

```
default encryption
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

group

Configures the appropriate key exchange cryptographic strength and activate Perfect Forward Secrecy by applying a Diffie-Hellman group.

Platform

ASR 5000

Product

PDIF

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSec Transform Set Configuration

configure > context *context_name* **> ipsec transform-set** *set_name*

Syntax

group { 1 | 2 | 5 | 14 | none }

default group

default group

Configures the default crypto strength to be **none** and disables Perfect Forward Secrecy.

1

Configures crypto strength at the Group 1 level. Lowest security.

2

Configures crypto strength at the Group 2 level. Medium security.

5

Configures crypto strength at the Group 5 level. Higher security.

14

Configures crypto strength at the Group 14 level. Highest security.

none

Applies no group and disables Perfect Forward Secrecy. This is the default.

default

Sets the default Diffie-Hellman group algorithm to none. This also deactivates PFS.

Usage

Diffie-Hellman groups are used to determine the length of the base prime numbers used during the key exchange process. The cryptographic strength of any key derived depends, in part, on the strength of the Diffie-Hellman group upon which the prime numbers are based.
Group 1 provides 768 bits of keying strength, Group 2 provides 1024 bits, Group 5 provides 1536 bits and Group14 2048 bits. Selecting a group automatically activates Perfect Forward Secrecy. The default value is none, which disables PFS

Example

This command configures security at Group 2 and activates PFS:

```
group 2
```

hmac

Configures the IPSec ESP integrity algorithm using a Hash-based Message Authentication Code (HMAC).

Platform

ASR 5000

Product

PDIF

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSec Transform Set Configuration

configure > context *context_name* **> ipsec transform-set** *set_name*

Syntax

hmac { aes-xcbc-96 | md5-96 | sha1-96 | null }

default hmac

aes-xcbc-96

AES-XCBC-96 uses a 128-bit secret key and produces a 128-bit authenticator value.

md5-96

MD5-96 uses a 128-bit secret key and produces a 128-bit authenticator value.

sha1-96

SHA-1 uses a 160-bit secret key and produces a 160-bit authenticator value.
This is the default setting for this command.

null

Configures the hmac value to be null. The NULL encryption algorithm represents the optional use of applying encryption within ESP. ESP can then be used to provide authentication and integrity without confidentiality.

default hmac

Sets the default IPSec hashing algorithm to SHA1-96.

Usage

HMAC is an encryption technique used by IPSec to make sure that a message has not been altered.
A keyed-Hash-based Message Authentication Code (HMAC), is a type of message authentication code that is calculated using a cryptographic hash function in combination with a secret key to verify both data integrity and message authenticity. A hash takes a message of any size and transforms it into a message of a fixed size: the authenticator value. This is truncated to 96 bits and transmitted. The authenticator value is reconstituted by the receiver and the first 96 bits are compared for a 100 percent match.

Because RFC 4306 calls for interoperability between IPSec and IKEv2, the IKEv2 integrity algorithms must be the same as those configured for IPSec in order for there to be an acceptable match during the IKE message exchange.

Example

The following command configures the default HMAC value (SHA1-96):

```
default hmac
```

mode

Configures the security of IP datagrams based on header placement. Tunnel mode applies security to a completely encapsulated IP datagram, while Transport does not. Default is Tunnel mode.

Platform

ASR 5000

Product

PDIF

SCM

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSec Transform Set Configuration

configure > context *context_name* **> ipsec transform-set** *set_name*

Syntax

mode { transport | tunnel }

default mode

transport

In Transport mode, the IPSec header is applied only over the IP payload, not over the IP header in front of it. The AH and/or ESP headers appear between the original IP header and the IP payload, as follows:
Original IP header, IPSec headers (AH and/or ESP), IP payload (including transport header).
Transport mode is used for host-to-host communications and is generally unsuited to PDIF traffic.

tunnel

In Tunnel mode, the original IP header is left intact, so a complete IP datagram is encapsulated, forming a virtual tunnel between IPSec-capable devices. The IP datagram is passed to IPSec, where a new IP header is created ahead of the AH and/or ESP IPSec headers, as follows:
New IP header, IPSec headers (AH and/or ESP), old IP header, IP payload.
Tunnel mode is used for network-to-network communications (secure tunnels between routers) or host-to-network and host-to-host communications over the Internet.
This is the default setting for this command.

default mode

Sets the default IPSec Mode to Tunnel.

Usage

IPSec modes are closely related to the function of the two core protocols, the Authentication Header (AH) and Encapsulating Security Payload (ESP). Both of these protocols provide protection by adding to a datagram a header (and possibly other fields) containing security information. The choice of mode does not affect the method by which each generates its header, but rather, changes what specific parts of the IP datagram are protected and how the headers are arranged to accomplish this.

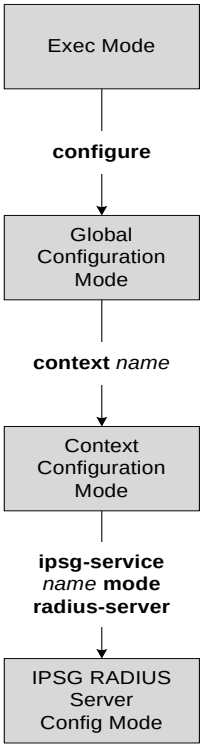
Example

The following command configures the default Tunnel mode:

```
default mode
```

Chapter 160
IPSG RADIUS Server Configuration Mode Commands

The IP Services Gateway (IPSG) RADIUS Server Configuration Mode is used to create and configure IPSG RADIUS Server services in the current context. This mode enables configuring the system to receive RADIUS accounting requests as if it is a RADIUS accounting server, and reply after accessing those requests for subscriber information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind

This command allows you to bind the current IPSG service to a logical AAA interface, and specify the number of subscriber sessions allowed.

Platform

ASR 5000

Product

IPSG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSG RADIUS Server Configuration

configure > context *context_name* **> ipsg-service** *service_name* **mode radius-server**

Syntax

bind accounting-proxy address *ipv4/ipv6_address* **[max-subscribers** *max_sessions* **| port** *port_number* **| source-context** *source_context* **]**

bind address *ipv4/ipv6_address* **[max-subscribers** *max_sessions* **| port** *port_number* **| source-context** *source_context* **]+**

bind authentication-proxy address *ipv4/ipv6_address* **[acct-port** *port_number* **| auth-port** *port_number* **| max-subscribers** *max_sessions* **| source-context** *source_context* **]**

no bind

---

no

If previously configured, removes the binding for the service.

---

bind accounting-proxy address *ipv4/ipv6_address* **[max-subscribers** *max_sessions* **| port** *port_number* **| source-context** *source_context* **]**

- **accounting-proxy address** *ipv4/ipv6_address*: Specifies the IP address of the interface where accounting proxy requests are received by this service in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
- **max-subscribers** *max_sessions*: Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit.

  In StarOS 9.0 and later releases, *max_sessions* must be an integer from 0 through 4000000.

  In StarOS 8.3 and earlier releases, *max_sessions* must be an integer from 0 through 3000000.
- **port** *port_number*: Specifies the port number of the interface where accounting requests are received by this service.

  port_number must be an integer from 1 through 65535.

  Default: 1813
- **source-context** *source_context*: Specifies the source context where RADIUS accounting requests are received.

source_context must be an alphanumeric string of 1 through 79 characters.

This keyword should be configured if the source of the RADIUS requests is in a different context than the IPSG service. If this keyword is not configured, the system will default to the context in which the IPSG service is configured.

---

bind address *ipv4/ipv6_address* **[max-subscribers** *max_sessions* **| port** *port_number* **| source-context** *source_context* **]+**

- **address** *ipv4/ipv6_address*: Specifies the IP address of the interface where accounting requests are received by this service in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
- **max-subscribers** *max_sessions*: Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit.

  In StarOS 9.0 and later releases, *max_sessions* must be an integer from 0 through 4000000.

  In StarOS 8.3 and earlier releases, *max_sessions* must be an integer from 0 through 3000000.
- **port** *port_number*: Specifies the port number of the interface where accounting requests are received by this service.

  port_number must be an integer from 1 through 65535.

  Default: 1813
- **source-context** *source_context*: Specifies the source context where RADIUS accounting requests are received.

  source_context must be an alphanumeric string of 1 through 79 characters.

  This keyword should be configured if the source of the RADIUS requests is in a different context than the IPSG service. If this keyword is not configured, the system will default to the context in which the IPSG service is configured.

---

bind authentication-proxy address *ipv4/ipv6_address* **[acct-port** *port_number* **| auth-port** *port_number* **| max-subscribers** *max_sessions* **| source-context** *source_context* **]**

- **authentication-proxy address** *ipv4/ipv6_address*: Specifies the IP address of the interface where authentication proxy requests are received by this service in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.

  Important: Enabling authentication proxy also enables accounting proxy.
- **acct-port** *port_number*: Specifies the port number of the interface where accounting proxy requests are received by this service.

  port_number must be an integer from 0 through 65535.

  Default: 1813
- **auth-port** *port_number*: Specifies the port number of the interface where authentication proxy requests are received by this service.

  port_number must be an integer from 0 through 65535.

  Default: 1812
- **max-subscribers** *max_sessions*: Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit.

In StarOS 9.0 and later releases, *max_sessions* must be an integer from 0 through 4000000.

In StarOS 8.3 and earlier releases, *max_sessions* must be an integer from 0 through 3000000.

- **source-context** *source_context*: Specifies the source context where RADIUS accounting requests are received.

  source_context must be an alphanumeric string of 1 through 79 characters.

  This keyword should be configured if the source of the RADIUS requests is in a different context then the IPSG service. If this keyword is not configured, the system will default to the context in which the IPSG service is configured.

Usage

Use this command to bind the IPSG RADIUS Server service to a logical AAA interface and specify the number of allowed subscriber sessions. If the AAA interface is not located in this context, configure the **source-context** parameter.
Use the accounting and authentication proxy settings to enable RADIUS proxy server functionality on the IPSG. These commands are used when the NAS providing the RADIUS request messages is incapable of sending them to two separate devices. The IPSG in RADIUS Server mode proxies the RADIUS request and response messages while performing the user identification task in order to provide services to the session.

Example

The following command binds the service to a AAA interface with and IP address of *10.2.3.4* located in the source context named *aaa_ingress*:

```
bind address 10.2.3.4 source-context aaa_ingress
```

connection authorization

This command allows you to configure the RADIUS authorization password that must be matched by the RADIUS accounting requests received by the current IPSG service.

Platform

ASR 5000

Product

IPSG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSG RADIUS Server Configuration

configure > context *context_name* **> ipsg-service** *service_name* **mode radius-server**

Syntax

connection authorization [encrypted] password *password*

no connection authorization

no

Deletes the RADIUS authorization from the current IPSG RADIUS Server service.

[encrypted] password *password*

- **encrypted**: Specifies that the RADIUS authorization password is encrypted.
- **password** *password*: Specifies the password that must be matched by incoming RADIUS accounting requests.

  In StarOS 12.1 and earlier releases, *password* must be an alphanumeric string of 1 through 63 characters.

Usage

The IPSG RADIUS server service does not terminate RADIUS user authentication so the user password is unknown.
Use this command to configure the authorization password that the RADIUS accounting requests must match in order for the service to examine and extract user information.

Example

The following command sets the RADIUS authorization password that must be matched by the RADIUS accounting requests sent to this service. The password is encrypted, and the password used in this example is "*secret*".

```
connection authorization encrypted password secret
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

profile

This command allows you to configure the IPSG service to use APN or subscriber profile.

Important: Note that the eWAG service uses only the APN profile. Whereas, the IPSG service uses both APN and subscriber profiles.

Platform

ASR 5000

Product

IPSG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSG RADIUS Server Configuration

`configure > context` *`context_name`* **`> ipsg-service`** *`service_name`* **`mode radius-server`**

Syntax

`profile { APN | subscriber }`

`default profile`

`default`

Configures this command with its default setting.
Default: **`APN`**

`APN`

Specifies to use APN profile for the service.

`subscriber`

Important: This option is supported only for the IPSG RADIUS Server service.

Specifies to use subscriber profile for the service.

Usage

Use this command to set the service to support APN profiles (supporting Gx through the enabling of **`ims-auth-service`**) or for basic subscriber profile lookup.

Example

The following command specifies to use the subscriber profile:

```
profile subscriber
```

radius accounting

This command allows you to specify the IP address and shared secret of the RADIUS accounting client from which RADIUS accounting requests are received. The RADIUS client can be either the access gateway or the RADIUS accounting server depending on which device is sending accounting requests.

Platform

ASR 5000

Product

IPSG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSG RADIUS Server Configuration

configure > context *context_name* **> ipsg-service** *service_name* **mode radius-server**

Syntax

radius accounting { client { *ipv4/ipv6_address* **|** *ipv4/ipv6_address/mask* **} [encrypted] key** *key* **[acct-onoff [aaa-context** *aaa_context_name* **] [aaa-group** *aaa_server_group_name* **] [clear-sessions] +] [dictionary** *dictionary* **] [disconnect-message [dest-port** *destination_port_number* **] + | interim create-new-call }**

no radius accounting { client { *ipv4/ipv6_address* **|** *ipv4/ipv6_address/mask* **} | interim create-new-call }**

default radius accounting interim create-new-call

no

If previously configured, removes the specified configuration.

ipv4/ipv6_address **|** *ipv4/ipv6_address/mask*

Specifies the IP address, and optionally subnet mask of the RADIUS client from which RADIUS accounting requests are received.
ipv4/ipv6_address/*ipv4/ipv6_address/mask* must be in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
A maximum of 16 IP addresses can be configured.

[encrypted] key *key*

- **encrypted**: Specifies that the shared key between the RADIUS client and this service is encrypted.
- **key** *key*: Specifies the shared key between the RADIUS client and this service.

  In StarOS 12.1 and earlier releases, *key* must be an alphanumeric string of 1 through 127 characters and is case sensitive.

acct-onoff [aaa-context *aaa_context_name* **] [aaa-group** *aaa_server_group_name* **] [clear-sessions] +**

Important: This option is applicable only to the IPSG Proxy Mode.

Specifies to proxy accounting On/Off messages to AAA server.

- **aaa-context** *aaa_context_name*: Specifies the context to find AAA server groups. If not specified, by default, the AAA context will be the source context.

  aaa_context_name must be the name of a AAA context, and must be an alphanumeric string of 1 through 79 characters.

- **aaa-group** *aaa_server_group_name*: Specifies the AAA server group. If not specified, by default, the AAA server group will be *default*.

  aaa_server_group_name must be the name of AAA server group, and must be an alphanumeric string of 1 through 63 characters.

- **clear-sessions**: Specifies to clear IPSG sessions on receiving accounting On/Off messages.
- **+**: Indicates that more than one of the preceding options may be specified in a single command.

dictionary *dictionary*

Specifies the dictionary to use.

Important: In this release, eWAG supports only the **starent-vsa1** dictionary.

dictionary can be one of the following.

Dictionary	Description
3gpp2	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.
custom*X*	These are customized dictionaries. For information on custom dictionaries, please contact your Cisco account representative. *X* is the integer value of the custom dictionary.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
starent	This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.

Dictionary	Description
starent-vsa1	This dictionary consists not only of the 3GPP2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary. ***Important:*** In StarOS 12.0 and later releases, no new attributes can be added to the **starent-vsa1** dictionary. If there are new attributes to be added, you can only add them to the **starent** dictionary. For more information, please contact your Cisco account representative.
starent-vsa1-835	This dictionary consists not only of the 3GPP2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.

Important: For information on the specific dictionary to use for your deployment contact your Cisco account representative.

disconnect-message [dest-port *destination_port_number* **]**

Specifies to send RADIUS disconnect message to the configured RADIUS accounting client in call failure scenarios.
dest-port *destination_port_number*: Specifies the port number to which the disconnect message must be sent.
destination_port_number must be an integer from 1 through 65535.

interim create-new-call

Important: This option does not apply to the IPSG Proxy Mode.

Specifies to create a new session upon receipt of a RADIUS interim message.
Default: Disabled

Usage

Use this command to configure the communication parameters for the RADIUS client from which RADIUS accounting requests are received.

Example

The following command configures the service to communicate with a RADIUS client with an IP address of *10.2.3.4* and an encrypted shared secret of *key1234*:

```
radius accounting client 10.2.3.4 encrypted key key1234
```

radius dictionary

This command allows you to specify the RADIUS dictionary for the current IPSG service.

Platform

ASR 5000

Product

radius dictionary *dictionary_name*

default radius dictionary

default

Specifies to use the default dictionary.
Default: **starent-vsa1**

dictionary *dictionary_name*

Specifies the dictionary to use.

Important: In this release, eWAG supports only the **starent-vsa1** dictionary.

dictionary_name must be one of the following.

Dictionary	Description
3gpp2	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.
custom*XX*	These are customized dictionaries. For information on custom dictionaries, please contact your Cisco account representative. *XX* is the integer value of the custom dictionary.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
starent	This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.

Dictionary	Description
starent-vsa1	This dictionary consists not only of the 3GPP2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.
starent-vsa1-835	This dictionary consists not only of the 3GPP2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.

Important: For information on the specific dictionary to use for your deployment contact your Cisco account representative.

Usage

Use this command to specify the RADIUS dictionary to use for the IPSG RADIUS Server service.

Example

The following command specifies to use the *custom10* RADIUS dictionary:

```
radius dictionary custom10
```

setup-timeout

This command allows you to configure a timeout for session setup attempts for the current IPSG service.

Platform

ASR 5000

Product

IPSG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSG RADIUS Server Configuration

configure > context *context_name* **> ipsg-service** *service_name* **mode radius-server**

Syntax

setup-timeout *setup_timeout_seconds*

default setup-timeout

default

Configures this command with its default setting.
Default: 60 seconds

setup_timeout_seconds

Specifies the time period, in seconds, for which a session setup attempt is allowed to continue before being terminated.
setup_timeout_seconds must be an integer from 1 through 1000000.

Usage

Use this command to configure a timeout for IPSG session setup attempts.

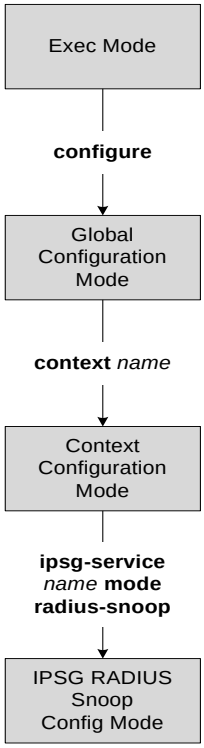
Example

The following command configures the timeout for session setup attempts to *30* seconds:

```
setup-timeout 30
```

Chapter 161
IPSG RADIUS Snoop Configuration Mode Commands

The IP Services Gateway (IPSG) RADIUS Snoop Configuration Mode is used to create and configure IPSG services within the current context. The IPSG RADIUS Snoop Mode configures the system to inspect RADIUS accounting requests on the way to the RADIUS accounting server and extract user information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bind

This command allows you to configure the service to accept data on any interface configured in the context. Optionally, you can also configure the system to limit the number of sessions processed by this service.

Platform

ASR 5000

Product

IPSG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSG RADIUS Snoop Configuration

configure > context *context_name* **> ipsg-service** *service_name* **mode radius-snoop**

Syntax

bind [max-subscribers *max_sessions* **]**

no bind

no

If previously configured, deletes the binding configuration for the service.

max-subscribers *max_sessions*

Specifies the maximum number of subscriber sessions allowed for the service. If this option is not configured, the system defaults to the license limit.
In StarOS 9.0 and later releases, *max_sessions* must be an integer from 0 through 4000000.
In StarOS 8.3 and earlier releases, *max_sessions* must be an integer from 0 through 3000000.

Usage

Use this command to initiate the service and begin accepting data on any interface configured in the context.

Example

The following command prepares the system to receive subscriber sessions on any interface in the context and limits the sessions to *10000*:

```
bind max-subscribers 10000
```

connection authorization

This command allows you to configure the RADIUS authorization password that must be matched by the RADIUS accounting requests "snooped" by this service.

Platform

ASR 5000

Product

IPSG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSG RADIUS Snoop Configuration

configure > context *context_name* **> ipsg-service** *service_name* **mode radius-snoop**

Syntax

connection authorization [encrypted] password *password*

no connection authorization

---

no

Deletes the RADIUS connection authorization configuration from the current IPSG RADIUS snoop service.

[encrypted] password *password*

- **encrypted**: Specifies that the received RADIUS authorization password is encrypted.
- **password** *password*: Specifies the password that must be matched by incoming RADIUS accounting requests.

  In StarOS 12.1 and earlier releases, *password* must be an alphanumeric string of 1 through 63 characters.

Usage

RADIUS accounting requests being examined by the IPSG RADIUS snoop service are destined for a RADIUS Accounting Server. Since the "snoop" service does not terminate user authentication, the user password is unknown.
Use this command to configure the authorization password that the RADIUS accounting requests must match in order for the service to examine and extract user information.

Example

The following command sets the RADIUS authorization password that must be matched by the RADIUS accounting requests "snooped" by this service. The password is encrypted, and the password used in this example is "*secret*".

```
connection authorization encrypted password secret
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

radius

This command allows you to specify the RADIUS accounting servers where accounting requests are sent after being "inspected" by this service.

Platform

ASR 5000

Product

IPSG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSG RADIUS Snoop Configuration

configure > context *context_name* **> ipsg-service** *service_name* **mode radius-snoop**

Syntax

[no] radius { accounting server *ipv4/ipv6_address* **[port** *port_number* **| source-context** *context_name* **] | dictionary { 3gpp2 | 3gpp2-835 | custom***XX* **| standard | starent | starent-835 | starent-vsa1 | starent-vsa1-835 } }**

no

Removes the RADIUS accounting server identifier from this service.

radius accounting server *ipv4/ipv6_address*

Specifies the IP address of a RADIUS accounting server where accounting requests are sent after being "snooped" by this service in IPv4 dotted-decimal or IPv6 colon-separated-hexadecimal notation.
Up to 16 addresses can be configured.

port *port_number*

Specifies the port number of the RADIUS Accounting Server where accounting requests are sent after being "snooped" by this service.
port_number must be an integer from 1 through 65535.
Default: 1813

source-context *context_name*

Specifies the source context where RADIUS accounting requests are received.
context_name must be an alphanumeric string of 1 through 79 characters.
If this keyword is not configured, the system will default to the context in which the IPSG service is configured.

dictionary { 3gpp2 | 3gpp2-835 | custom *XX* **| standard | starent | starent-835 | starent-vsa1 | starent-vsa1-835 }**

Specifies what dictionary to use. The possible values are described in the following table:

Dictionary	Description

Dictionary	Description
3gpp	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in 3GPP 32.015.
3gpp2	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.
custom*XX*	These are customized dictionaries. For information on custom dictionaries, please contact your Cisco account representative. *XX* is the integer value of the custom dictionary.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
starent	This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.
starent-vsa1	This dictionary consists not only of the 3gpp2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0–255). This is the default dictionary.

Usage

Use this command to specify the RADIUS Accounting Servers where accounting requests are sent after being snooped by this service.

Example

The following command specifies the IP address (*10.2.3.4*) of a RADIUS Accounting Server whose accounting requests are to be “snooped”, and the source context (*aaa_ingress*) where the requests are received on the system:

```
radius accounting server 10.2.3.4 source-context aaa_ingress
```

setup-timeout

This command allows you to configure the timeout value for IPSG session setup attempts.

Platform

ASR 5000

Product

IPSG

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPSG RADIUS Snoop Configuration

configure > context *context_name* **> ipsg-service** *service_name* **mode radius-snoop**

Syntax

setup-timeout *setup_timeout*

default setup-timeout

setup_timeout

Specifies the period of time (in seconds) the IPSG session setup is allowed to continue before the setup attempt is terminated.
setup_timeout must be an integer from 1 through 1000000.
Default: 60

Usage

Use this command to prevent IPSG session setup attempts from continuing without termination.

Example

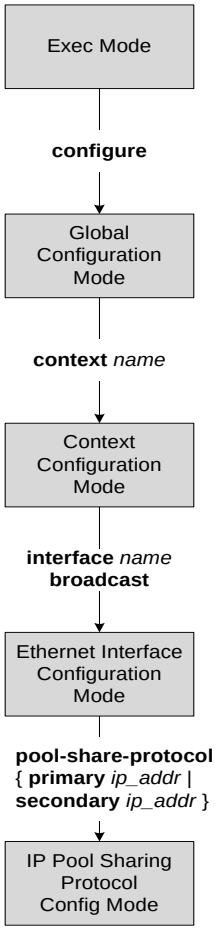
The following command configures the session setup timeout setting to *20* seconds:

```
setup-timeout 20
```

Chapter 162
IPSP Configuration Mode Commands

The IPSP Configuration Mode is used to configure properties for the IP Pool Sharing Protocol (IPSP). System-based HA services use IPSP during an offline-software upgrade to avoid the assignment of duplicate IP addresses to sessions while allowing them to maintain the same address, and to preserve network capacity

Important: For information on configuring and using IPSP refer to the *System AdministrationGuide*.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

dead-interval

Configures the retry time to connect to the remote system for the IP Pool Sharing Protocol.

Platform

ASR 5000

Product

PDSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration > IP Pool Sharing Protocol Configuration

configure > context *context_name* **> interface** *interface_name* **broadcast > pool-share-protocol { primary** *ip_address* **| secondary** *ip_address* **}**

Syntax

dead-interval*seconds*

[no | default] dead-interval

no

Disables the dead interval. On loss of connectivity to the remote system, no retries are attempted and the remote system is marked dead immediately on failure.

default

Resets the dead interval to the default of 3600 seconds.

seconds

Default: 3600 seconds
The amount of time in seconds to wait before retrying the remote system. *seconds* must be an integer from 25 through 259200.

Usage

Use this command to set the amount of time to wait before retrying to connect with the remote system for the IP pool sharing protocol.

Example

Use the following command to set the interval to 180 seconds (3 minutes):
dead-interval 180

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

reserved-free-percentage

This command is used to set the amount of free addresses reserved for use on the primary HA.

Platform

ASR 5000

Product

PDSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Ethernet Interface Configuration > IP Pool Sharing Protocol Configuration

configure > context *context_name* **> interface** *interface_name* **broadcast > pool-share-protocol { primary** *ip_address* **| secondary** *ip_address* **}**

Syntax

reserved-free-percentage *value*

default reserved-free-percentage

value

Default: 100
value specifies the percentage of free addresses reserved for the use on the primary HA for IP pool sharing during upgrade. It must be an integer from 0 through 100.

Usage

This command is used with **pool-sharing-protocol active mode** on the primary HA. Before using this command, **pool-sharing-protocol** in the Ethernet Interface Configuration Mode must be configured.
For more information, refer to the *Ethernet Interface Configuration Mode Commands* chapter in this guide.

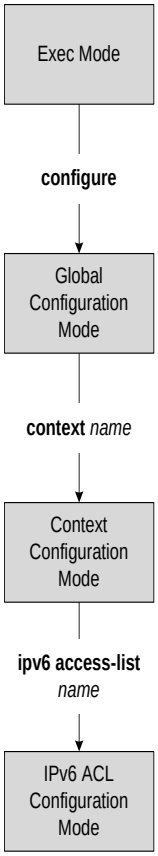
Example

To reserve 40 percent of free addresses in primary HA for IP pool sharing, enter the following command:

```
reserved-free-percentage 40
```

Chapter 163
IPv6 ACL Configuration Mode Commands

The IPv6 Access Control List Configuration Mode is used to create and manage IPv6 access privileges.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

deny/permit (by source IP address masking)

Used to filter subscriber sessions based on the IPv6 address mask sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

{ deny | permit } [log] *source_address source_wildcard*

after { deny | permit } [log] *source_address source_wildcard*

before { deny | permit } [log] *source_address source_wildcard*

no { deny | permit } [log] *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.

- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

Example

The following command defines two rules with the second logging filtered packets:

```
permit 2001:4A2B::1f3F

deny log 2001:4A2B::1f3F
```

The following sets the insertion point to before the first rule defined above:

```
before permit 2001:4A2B::1f3F
```

The following command sets the insertion point after the second rule defined above:

```
after deny log 2001:4A2B::1f3F
```

The following deletes the first rule defined above:

```
no permit 2001:4A2B::1f3F
```

deny/permit (any)

Used to filter subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

`configure > context` *`context_name`* **`> ipv6 access-list`** *`ipv6_acl_name`*

Syntax

```
{ deny | permit } [ log ] any

after { deny | permit } [ log ] any

before { deny | permit } [ log ] any

no { deny | permit } [ log ] any
```

`after`

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

`before`

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

`no`

Removes the rule which exactly matches the options specified.

`deny | permit`

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

any

Indicates all packets will match the filter regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules.

Important: It is suggested that any rule which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines two rules with the second logging filtered packets:

```
permit any

deny log any
```

The following sets the insertion point to before the first rule defined above:

```
before permit any
```

The following command sets the insertion point after the second rule defined above:

```
after deny log any
```

The following deletes the first rule defined above:

```
no permit any
```

deny/permit (by host IP address)

Used to filter subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

{ deny | permit } [log] host *source_host_address*

after { deny | permit } [log] host *source_host_address*

before { deny | permit } [log] host *source_host_address*

no { deny | permit } [log] host *source_host_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines two rules with the second logging filtered packets:

```
permit host 2001:4A2B::1f3F

deny log host 2001:4A2B::1f3F
```

The following sets the insertion point to before the first rule defined above:

```
before permit host 2001:4A2B::1f3F
```

The following command sets the insertion point after the second rule defined above:

```
after deny log host 2001:4A2B::1f3F
```

The following deletes the first rule defined above:

```
no permit host 2001:4A2B::1f3F
```

deny/permit (by source ICMP packets)

Used to filter subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

{ deny | permit } [log] icmp { *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after { deny | permit } [log] icmp { *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

before { deny | permit } [log] icmp { *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

no { deny | permit } [log] icmp { *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type is an integer from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type is an integer from 0 through 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP filtering allows flexible controls for pairs of individual hosts or groups by IP masking which allows the filtering of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines two rules with the second logging filtered packets:

```
permit icmp host 2001:4A2B::1f3F4 any 168

deny log icmp 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410 168 11
```

The following sets the insertion point to before the first rule defined above:

```
before permit icmp host 2001:4A2B::1f3F any 168
```

The following command sets the insertion point after the second rule defined above:

```
after deny log icmp 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410
168 11
```

The following deletes the first rule defined above:

```
no permit icmp host 2001:4A2B::1f3F any 168
```

deny/permit (by IP packets)

Used to filter subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Platform

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

{ deny | permit } [log] ip { *source_address source_wildcard* | any | host *source_host_address* **} { *dest_address dest_wildcard* | any | host** *dest_host_address* **} [fragment] [protocol***num* **]**

after { deny | permit } [log] ip { *source_address source_wildcard* | any | host *source_host_address* **} { *dest_address dest_wildcard* | any | host** *dest_host_address* **} [fragment] [protocol***num* **]**

before { deny | permit } [log] ip { *source_address source_wildcard* | any | host *source_host_address* **} { *dest_address dest_wildcard* | any | host** *dest_host_address* **} [fragment] [protocol***num* **]**

no { deny | permit } [log] ip { *source_address source_wildcard* | any | host *source_host_address* **} { *dest_address dest_wildcard* | any | host** *dest_host_address* **} [fragment] [protocol***num* **]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: indicates the rule, when matched, drops the corresponding packets.
- **permit**: indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

fragment

Indicates packet filtering is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be any integer ranging from 0 to 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines two rules with the second logging filtered packets:

```
permit ip host 2001:4A2B::1f3F any fragment

deny log ip 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410
```

The following sets the insertion point to before the first rule defined above:

```
before permit ip host 2001:4A2B::1f3F any fragment
```

The following command sets the insertion point after the second rule defined above:

```
after deny log ip 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410
```

The following deletes the first rule defined above:

```
no permit ip host 2001:4A2B::1f3F any fragment
```

deny/permit (by TCP/UDP packets)

Used to filter subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

no { deny | permit } [log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dst_port*] }

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

tcp | udp

Specifies the filter is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Filter applies to TPC packets.
- **udp**: Filter applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines four rules with the second and fourth rules logging filtered packets:

```
permit tcp host 2001:4A2B::1f3F any

deny log udp 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410

permit tcp host 2001:4A2B::1f3F gt 1023 any
```

The following sets the insertion point to before the first rule defined above:

```
before permit tcp host 2001:4A2B::1f3F any
```

The following command sets the insertion point after the second rule defined above:

```
after deny log udp 2001:4A2B::1f3F 2001:4a2b::1f00 host fe80::a02:410
```

The following deletes the third rule defined above:

```
no permit tcp host 2001:4A2B::1f3F gt 1023 any
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

```

Usage

Use this command to return to the parent configuration mode.

readdress server

Alter the destination address and port number in TCP or UDP packet headers to redirect packets to a different server.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

redirect_address

The IP address to which the IP packets are redirected. TCP or UDP packet headers are rewritten to contain the new destination address. This must expressed in IPv6 colon-separated-hexadecimal notation.

port *port_number*

The number of the port at the redirect address where the packets are sent. TCP or UDP packet headers are rewritten to contain the new destination port number.

tcp | udp

Specifies the redirect is to be applied to the IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TCP packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer from 0 through 65535.

Usage

Use this command to define a rule that redirects packets to a different destination address. The TCP and UDP packet headers are modified with the new destination address and destination port.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the server at *fe80::c0a8:a04*, UDP packets coming from any host with a destination of any host are matched:

```
readdress server fe80::c0a8:a04 udp any any
```

The following sets the insertion point to before the rule defined above:

```
before readdress server fe80::c0a8:a04 udp any any
```

The following deletes the rule defined above:

```
no readdress server fe80::c0a8:a04 udp any any
```

redirect context (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

`configure > context` *`context_name`* **`> ipv6 access-list`** *`ipv6_acl_name`*

Syntax

`redirect context` *`context_id`* **`[ log ]`** *`source_address source_wildcard`*

`after redirect context` *`context_id`* **`[ log ]`** *`source_address source_wildcard`*

`before redirect context` *`context_id`* **`[ log ]`** *`source_address source_wildcard`*

`no redirect context` *`context_id`* **`[ log ]`** *`source_address source_wildcard`*

`after`

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

`before`

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

`no`

Removes the rule which exactly matches the options specified.

`context` *`context_id`*

Specifies the context identification number of the context to which packets are redirected. At the executive mode prompt, use the **`show context all`** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

Filters by the IP address(es) from which the packet originated. This option filters all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

Filters packets for a group of addresses specified in conjunction with the *source_address* option.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23* and the source IP and wildcard of *2002::c6a2:1600* and *2002::c6a2:1600*:

```
redirect context 23 2002::c6a2:1600 2002::c6a2:1600
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 2002::c6a2:1600 2002::c6a2:1600
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 2002::c6a2:1600 2002::c6a2:1600
```

The following deletes the first rule defined above:

```
no redirect context 23 2002::c6a2:1600 2002::c6a2:1600
```

redirect context (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

`configure > context` *`context_name`* **`> ipv6 access-list`** *`ipv6_acl_name`*

Syntax

`redirect context` *`context_id`* **`[ log ] any`**

`after redirect context` *`context_id`* **`[ log ] any`**

`before redirect context` *`context_id`* **`[ log ] any`**

`no redirect context` *`context_id`* **`[ log ] any`**

`after`

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

`before`

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

`no`

Removes the rule which exactly matches the options specified.

`context` *`context_id`*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **`show context all`** command to display context names and context IDs.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`any`

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: It is suggested that any rule which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23* and any source IP:

```
redirect context 23 any
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 any
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 any
```

The following deletes the first rule defined above:

```
no redirect context 23 any
```

redirect context (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect context *context_id* **[log] host** *source_ip_address*

after redirect context *context_id* **[log] host** *source_ip_address*

before redirect context *context_id* **[log] host** *source_ip_address*

no redirect context *context_id* **[log] host** *source_ip_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

`context` *`context_id`*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **`show context all`** command to display context names and context IDs.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`host`

Specifies that the rule applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *`23`* and a host IP address of *`fe80::c0a8:c80b`*:

```
redirect context 23 host fe80::c0a8:c80b
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 host fe80::c0a8:c80b
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 host fe80::c0a8:c80b
```

The following deletes the first rule defined above:

```
no redirect context 23 host fe80::c0a8:c80b
```

redirect context (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

after redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

before redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

no redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. Type is an integer from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered type is an integer from 0 through 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possibly be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23*, and ICMP packets coming from the host with the IP address *2002::c6a2:6419*:

```
redirect context 23 icmp host 2002::c6a2:6419
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 icmp host 2002::c6a2:6419
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 icmp host 2002::c6a2:6419
```

The following deletes the first rule defined above:

```
no redirect context 23 icmp host 2002::c6a2:6419
```

redirect context (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect context *context_id* **[log] ip { ***source_address source_wildcard* **| any | host** *source_host_address* **} { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

after redirect context *context_id* **[log] ip { ***source_address source_wildcard* **| any | host** *source_host_address* **} { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

before redirect context *context_id* **[log] ip { ***source_address source_wildcard* **| any | host** *source_host_address* **} { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

no redirect context *context_id* **[log] ip { ***source_address source_wildcard* **| any | host** *source_host_address* **} { ***dest_address dest_wildcard* **| any | host** *dest_host_address* **} [fragment] [protocol** *num* **]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num is an integer from 0 through 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23*, and IP packets coming from the host with the IP address *2002::c6a2:6419*, and fragmented packets for any destination are matched:

```
redirect context 23 ip host 2002::c6a2:6419 any fragment
```

The following sets the insertion point to before the first rule defined above:

```
before redirect context 23 ip host 198.162.100.25 any fragment
```

The following command sets the insertion point after the second rule defined above:

```
after redirect context 23 ip host 2002::c6a2:6419 any fragment
```

The following deletes the first rule defined above:

```
no redirect context 23 ip host 2002::c6a2:6419 any fragment
```

redirect context (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect context *context_id* **[log] { tcp | udp } { { source_address source_wildcard | any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { dest_address dest_wildcard | any | host** *dest_host_address* **} [eq** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dst_port* **] }**

after redirect context *context_id* **[log] { tcp | udp } { { source_address** *source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { dest_address dest_wildcard | any | host** *dest_host_address* **} [eq** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dst_port* **] }**

before redirect context *context_id* **[log] { tcp | udp } { { source_address** *source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { dest_address dest_wildcard | any | host** *dest_host_address* **} [eq** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dst_port* **] }**

no redirect context *context_id* **[log] { tcp | udp } { { source_address source_wildcard | any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { dest_address dest_wildcard | any | host** *dest_host_address* **} [eq** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dst_port* **] }**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to an integer from 0 through 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of *23*, and UDP packets coming from any host are matched:

```
redirect context 23 udp any
```

The following sets the insertion point to before the rule defined above:

```
before redirect context 23 udp any
```

The following command sets the insertion point after the rule defined above:

```
after redirect context 23 udp any
```

The following deletes the rule defined above:

```
no redirect context 23 udp any
```

redirect css delivery-sequence

This is a restricted command. In StarOS 9.0 and later, this command is obsoleted.

redirect css service (any)

Used to redirect subscriber sessions based on any packet received with Content Service Steering (CSS) enabled. This command is also used to set the access control list insertion point.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

`configure > context` *`context_name`* **`> ipv6 access-list`** *`ipv6_acl_name`*

Syntax

`redirect css service` *`svc_name`* **`[ log ] any`**

`after redirect css service` *`svc_name`* **`[ log ] any`**

`before redirect css service` *`svc_name`* **`[ log ] any`**

`no redirect css service` *`svc_name`* **`[ log ] any`**

`after`

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

`before`

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definitions which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

`no`

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the CSS service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured CSS services.
`svc_name` must be a string of 1 through 15 characters.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`any`

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definitions to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **`log`** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service with the name *`css-svc1`* and any source IP:

```
redirect css service css-svc1 any
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 any
```

The following command sets the insertion point after the second rule definitions above:

```
after redirect css service css-svc1 any
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 any
```

redirect css service (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

`configure > context` *`context_name`* **`> ipv6 access-list`** *`ipv6_acl_name`*

Syntax

`redirect css service` *`svc_name`* **`[ log ] host`** *`source_host_address`*

`after redirect css service` *`svc_name`* **`[ log ] host`** *`source_host_address`*

`before redirect css service` *`svc_name`* **`[ log ] host`** *`source_host_address`*

`no redirect css service` *`svc_name`* **`[ log ] host`** *`source_host_address`*

`after`

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

`before`

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

`no`

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured CSS services.
`svc_name` must be an alphanumeric string of 1 through 15 characters.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service with the name *`css-svc1`* and a host IP address of *`fe80::c0a8:c80b`*:

```
redirect css service css-svc1 host fe80::c0a8:c80b
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 host fe80::c0a8:c80b
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 host fe80::c0a8:c80b
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 host fe80::c0a8:c80b
```

redirect css service (by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [***icmp_type* **[** *icmp_code* **]]**

after redirect css service *svc_name* **[log] icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [***icmp_type* **[** *icmp_code* **]]**

before redirect css service *svc_name* **[log] icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [***icmp_type* **[** *icmp_code* **]]**

no redirect css service *svc_name* **[log] icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [***icmp_type* **[** *icmp_code* **]]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured charging services.
svc_name must be an alphanumeric string of 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type is an integer from 0 through 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service named *css-svc1*, and ICMP packets coming from the host with the IP address *2002::c6a2:6419*:

```
redirect css service css-svc1 icmp host 2002::c6a2:6419
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 icmp host 2002::c6a2:6419
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 icmp host 2002::c6a2:64195
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 icmp host 2002::c6a2:6419
```

redirect css service (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after redirect css service *svc_name* **[log] ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

before redirect css service *svc_name* **[log] ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

no redirect css service *svc_name* **[log] ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service named *css-svc1*, and IP packets coming from the host with the IP address *2002::c6a2:6419*, and fragmented packets for any destination are matched:

```
redirect css service css-svc1 ip host 2002::c6a2:6419 any fragment
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 ip host 2002::c6a2:6419 any fragment
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 ip host 2002::c6a2:6419 any fragment
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 ip host 2002::c6a2:6419 any fragment
```

redirect css service (by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log]** *source_address source_wildcard*

after redirect css service *svc_name* **[log]** *source_address source_wildcard*

before redirect css service *svc_name* **[log]** *source_address source_wildcard*

no redirect css service *svc_name* **[log]** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured CSS services.
`svc_name` must be an alphanumeric string of 1 through 15 characters.

`log`

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a CSS service named *`css-svc1`*:

```
redirect css service css=svc1 2002::c6a2:6419
```

redirect css service (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured charging services.
svc_name must be an alphanumeric string of 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to an integer from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.

- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to an integer from 0 to 65535

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service named *css-svc1*, and UDP packets coming from any host are matched:

```
redirect css service css-svc1 udp any
```

The following sets the insertion point to before the rule definition above:

```
before redirect css service css-svc1 udp any
```

The following command sets the insertion point after the rule definition above:

```
after redirect css service css-svc1 udp any
```

The following deletes the rule definition above:

```
no redirect css service css-svc1 udp any
```

redirect css service (for downlink, any)

Used to redirect subscriber sessions based on any packet received in the downlink (from the Mobile Node) direction. This command is also used to set the access control list insertion point.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] downlink any**

after redirect css service *svc_name* **[log] downlink any**

before redirect css service *svc_name* **[log] downlink any**

no redirect css service *svc_name* **[log] downlink any**

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured CSS services.
`svc_name` must be an alphanumeric string of 1 through 15 characters.

`downlink`

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`any`

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **`log`** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the CSS service with the name *`css-svc1`* and any source IP:

```
redirect css service css-svc1 downlink any
```

The following sets the insertion point to before the first rule definition above:

```
before redirect service css-svc1 downlink any
```

The following command sets the insertion point after the second rule definition above:

```
after redirect service css-svc1 downlink any chgsvc1 downlink any
```

The following deletes the first rule definition above:

```
no redirect service css-svc1 downlink any
```

redirect css service (for downlink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the downlink (from the Mobile Node) direction.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] downlink host** *source_host_address*

after redirect css service *svc_name* **[log] downlink host** *source_host_address*

before redirect css service *svc_name* **[log] downlink host** *source_host_address*

no redirect css service *svc_name* **[log] downlink host** *source_host_address*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured CSS services.
`svc_name` must be an alphanumeric string of 1 through 15 characters.

`downlink`

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *`css-svc1`* and a host IP address of *`fe80::c0a8:c80b`*:

```
redirect service css-svc1 downlink host fe80::c0a8:c80b
```

The following sets the insertion point to before the first rule definition above:

```
before redirect service css-svc1 downlink host fe80::c0a8:c80b
```

The following command sets the insertion point after the second rule definition above:

```
after redirect service css-svc1 downlink host fe80::c0a8:c80b
```

The following deletes the first rule definition above:

```
no redirect service css-svc1 downlink host fe80::c0a8:c80b
```

redirect css service (for downlink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the downlink (from the Mobile Node) direction.

Platform

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

after redirect css service *svc_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

before redirect css service *svc_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

no redirect css service *svc_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value from 0 through 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *css-svc1*, and ICMP packets coming in the downlink (from the Mobile Node) direction from the host with the IP address *2002::c6a2:6419*:

```
redirect css service css-svc1 downlink icmp host 2002::c6a2:6419
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 downlink icmp host 2002::c6a2:6419
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 downlink icmp host 2002::c6a2:6419
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 downlink icmp host 2002::c6a2:6419
```

redirect css service (for downlink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the downlink (from the Mobile Node) direction.

Platform

ASR 5000

Product

All

Privilege

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after redirect css service *svc_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

before redirect css service *svc_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

no redirect css service *svc_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be a string of 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *css-svc1*, and downlink IP packets coming from the host with the IP address *2002::c6a2:6419*, and fragmented packets for any destination are matched:

```
redirect css service css-svc1 downlink ip host 2002::c6a2:6419 any
fragment
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 downlink ip host 2002::c6a2:6419 any
fragment
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 downlink ip host 2002::c6a2:6419 any
fragment
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 downlink ip host 2002::c6a2:6419 any
fragment
```

redirect css service (for downlink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the downlink (from the Mobile Node) direction.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

after redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

before redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

no redirect css service *svc_name* **[log] downlink** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured CSS services.
`svc_name` must be an alphanumeric string of 1 through 15 characters.

`downlink`

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

`source_address`

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a charging service named *`css-svc1`*:

```
redirect css service css-svc1 donwlink fe80::c0a8:a04
```

redirect css service (for downlink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the downlink (from the Mobile Node) direction.

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to an integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *css-svc1*, and UDP packets coming from any host are matched:

```
redirect css service css-svc1 downlink udp any
```

The following sets the insertion point to before the rule definition above:

```
before redirect css service css-svc1 downlink udp any
```

The following command sets the insertion point after the rule definition above:

```
after redirect css service css-svc1 downlink udp any
```

The following deletes the rule definition above:

```
no redirect css service css-svc1 downlink udp any
```

redirect css service (for uplink, any)

Used to redirect subscriber sessions based on any packet received in the uplink (to the Mobile Node) direction. This command is also used to set the access control list insertion point.

`no redirect css service` *`svc_name`* **`[ log ] uplink any`**

`after`

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

`before`

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

`no`

Removes the rule definition which exactly matches the options specified.

`css service` *`svc_name`*

The name of the Content Service steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **`show css service all`** command to display the names of all configured CSS services.
`svc_name` must be an alphanumeric string of 1 through 15 characters.

`uplink`

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`any`

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **`log`** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *`css-svc1`* and any source IP:

```
redirect css service css-svc1 uplink any
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service css-svc1 uplink any
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service css-svc1 uplink any
```

The following deletes the first rule definition above:

```
no redirect css service css-svc1 uplink any
```

redirect css service (for uplink, by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address in the uplink (to the Mobile Node) direction.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] uplink host** *source_host_address*

after redirect css service *svc_name* **[log] uplink host** *source_host_address*

before redirect css service *svc_name* **[log] uplink host** *source_host_address*

no redirect css service *svc_name* **[log] uplink host** *source_host_address*

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must ben alphanumeric string of 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *css-svc1* and a host IP address of *fe80::c0a8:c80b*:

```
redirect service css-svc1 uplink host fe80::c0a8:c80b
```

The following sets the insertion point to before the first rule definition above:

```
before redirect service css-svc1 uplink host fe80::c0a8:c80b
```

The following command sets the insertion point after the second rule definition above:

```
after redirect service css-svc1 uplink host fe80::c0a8:c80b
```

The following deletes the first rule definition above:

```
no redirect service css-svc1 uplink host fe80::c0a8:c80b
```

redirect css service (for uplink, by ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets in the uplink (to the Mobile Node) direction.

Platform

ASR 5000

Product

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] uplink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the Content Service Steering (CSS) service to which packets are to be redirected. At the executive mode prompt, use the **show css service all** command to display the names of all configured CSS services.
svc_name must be an alphanumeric string of 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value from 0 through 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets in the uplink (to the Mobile Node) direction from the host with the IP address *198.162.100.25*:

```
redirect css service chgsvc1 uplink icmp host 198.162.100.25
```

The following sets the insertion point to before the first rule definition above:

```
before redirect css service chgsvc1 uplink icmp host 198.162.100.25
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service chgsvc1 uplink icmp host 198.162.100.25
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink icmp host 198.162.100.25
```

redirect css service (for uplink, by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets in the uplink (to the Mobile Node) direction.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] uplink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after redirect css service *svc_name* **[log] uplink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

before redirect css service *svc_name* **[log] uplink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

no redirect css service *svc_name* **[log] uplink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string of 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and uplink IP packets going to the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched:

```
redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment
```

The following sets the insertion point to before the first rule definition above:

```
redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment
```

The following command sets the insertion point after the second rule definition above:

```
after redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

redirect css service (for uplink, by source IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source in the uplink (to the Mobile Node) direction.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect css service *svc_name* **[log] uplink** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string of 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*:

```
redirect css service chgsvc1 uplink 1:1:1:1:1:1:1:1
```

redirect css service (for uplink, by TCP/UDP packets)

Used to redirect subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the uplink (to the Mobile Node) direction.

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service *svc_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
svc_name must be a string of 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to an integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched:

```
redirect css service chgsvc1 uplink udp any
```

The following sets the insertion point to before the rule definition above:

```
before redirect css service chgsvc1 uplink udp any
```

The following command sets the insertion point after the rule definition above:

```
after redirect css service chgsvc1 uplink udp any
```

The following deletes the rule definition above:

```
no redirect css service chgsvc1 uplink udp any
```

redirect nexthop (by IP address masking)

Used to redirect subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Platform

ASR 5000

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *192.168.10.4*, the context with the context ID of *23* and the source IP and wildcard of *198.162.22.0* and *0.0.0.31*:

```
redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following sets the insertion point to before the first rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following command sets the insertion point after the second rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

redirect nexthop (any)

Used to redirect subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: It is suggested that any rule which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *192.168.10.4*, the context with the context ID of *23* and any source IP:

```
redirect nexthop 192.168.10.4 context 23 any
```

The following sets the insertion point to before the first rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 any
```

The following command sets the insertion point after the second rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 any
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 any
```

redirect nexthop (by host IP address)

Used to redirect subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > IPv6 ACL Configuration

configure > context *context_name* **> ipv6 access-list** *ipv6_acl_name*

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] host** *source_ip_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *192.168.10.4*, the context with the context ID of *23* and a host IP address of *192.168.200.11*:

```
redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following sets the insertion point to before the first rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following command sets the insertion point after the second rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

redirect nexthop (by source ICMP packets)

Used to redirect subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] icmp { source_address source_wildcard | any | host** *source_host_address* **} { dest_address** *dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alpha and/or numeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value from 0 through 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value from 0 through 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *fe80::c0a8:a04*, the context with the context ID of *23*, and ICMP packets coming from the host with the IP address *2002::c6a2:64195*:

```
redirect nexthop fe80::c0a8:a04 context 23 icmp host 2002::c6a2:6419
```

The following sets the insertion point to before the first rule defined above:

```
before redirect nexthop fe80::c0a8:a04 context 23 icmp host
2002::c6a2:6419
```

The following command sets the insertion point after the second rule defined above:

```
after redirect nexthop fe80::c0a8:a04 context 23 icmp host
2002::c6a2:6419
```

The following deletes the first rule defined above:

```
no redirect nexthop fe80::c0a8:a04 context 23 icmp host 2002::c6a2:6419
```

redirect nexthop (by IP packets)

Used to redirect subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 through 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be an integer from 0 through 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

redirect nexthop (by TCP/UDP packets)

Used to redirect subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The IP address to which the IP packets are redirected.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 through 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TCP packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) form which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB).

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv6 colon-separated-hexadecimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at *fe80::c0a8:a04*, the context with the context ID of *23*, and UDP packets coming from any host are matched:

```
redirect nexthop fe80::c0a8:a04 context 23 udp any
```

The following sets the insertion point to before the rule defined above:

```
before redirect nexthop fe80::c0a8:a04 context 23 udp any
```

The following command sets the insertion point after the rule defined above:

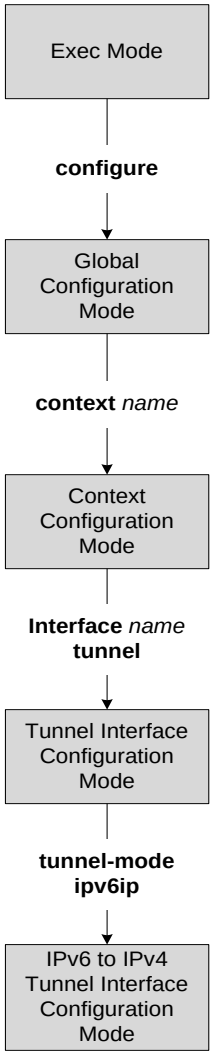
```
after redirect nexthop fe80::c0a8:a04 context 23 udp any
```

The following command deletes the first rule defined above:

```
no redirect nexthop fe80::c0a8:a04 context 23 udp any
```

Chapter 164
IPv6 to IPv4 Tunnel Interface Configuration Mode Commands

The IPv6 to IPv4 Tunnel Interface Configuration Mode is used to create and manage the IP interface for addresses, address resolution options, etc.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

destination address

Configures the destination of the tunnelled packets for a manual tunnel.

Platform

ASR 5000

Product

All

Privilege

Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > IPv6 to IPv4 Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode ipv6ip**

Syntax

destination address *address*
no destination address

no

Removes configuration for the specified keyword.

address

Specifies the IP address of the destination device. *address* must be specified in IPv4 dotted decimal or IPv6 colon-separated-hexadecimal notation.

Usage

Use this command to configure the IP address of the destination end of the tunnel.

Example

The following command sets the destination address for packets on this tunnelled interface to *10.2.3.4*:

```
destination address 10.2.3.4
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

mode

Configures the mode of IPv6 to IPv4 tunneling. The default is set to manual mode.

Platform

ASR 5000

Product

All

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > IPv6 to IPv4 Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode ipv6ip**

Syntax

mode { 6to4 | manual }
default mode

6to4

Configures automatic IPv6-to-IPv4 (6to4) tunnels as specified in RFC 3056.

manual

Configures point-to-point manual IPv6-to-IPv4 tunnels by specifying the IPv4 address of the tunnel remote end.

default

Resets the mode of IPv6-to-IPv4 tunneling to manual mode.

Usage

There can be only one IPv6-to-IPv4 tunnel possible in a context. Once an IPv6-to-IPv4 tunnel is configured, all subsequent tunnels will be configured as manual tunnels.

Example

The following command configures the mode to IPv6-to-IPv4 (*6to4*).

```
mode 6to4
```

The following command configures the mode to *6to4*.

```
mode manual
```

source

Configures the source of tunneled packets.

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > IPv6 to IPv4 Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode ipv6ip**

Syntax

source { address *ip_address* **| interface***interface_name***}**

no source { address | interface }

address *ip_address*

Specifies the IPv4 address to use as the source address of the tunnel.

ip_address must be expressed in IPv4 dotted-decimal notation.

interface *interface_name*

Specifies the name of a non-tunnel IPv4 interface, whose address is used as the source address of the tunnel. *interface* must be an alphanumeric string of 1 through 79 characters.

no source { address | interface }

Removes configuration for the specified keyword.

Usage

Configures the source IPv4 address of the tunnel by either specifying the IP address (host address) or by specifying another configured non-tunnel IPv4 interface. The source address must be an existing interface address before it is used. State of source address will affect the operational state of the tunnel.

Example

The following command configures the source address of the tunnel.

```
source address 10.2.3.4
```

The following command specifies the source interface as *testsource1*.

```
source interface testsource1
```

tos

Configures the type of service (TOS) settings of the outer IPv4 header of the tunneled packets.

Platform

ASR 5000

Product

PDSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > IPv6 to IPv4 Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode ipv6ip**

Syntax

tos { copy | value *tos_value* **}**

default tos

copy

Copies the DC octet of the IPv6 packet to the TOS octet of IPv4 packet.

default

Configures default setting for the specified keyword.

value *tos_value*

Configures the raw TOS value ranging from 0 to 255. The default is 0.

Usage

Sets the TOS parameter to be used in the tunnel transport protocol or copies the TOS value from the original IPv6 DC byte to the TOS value of the encapsulating IPv4 header.

Example

The following command sets the tos value to *1*:

```
tos value 1
```

ttl

Configures the TTL (Time to live) value of the outer IPv4 header of the tunneled packets.

Platform

ASR 5000

Product

PDSN

HA

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > Tunnel Interface Configuration > IPv6 to IPv4 Tunnel Interface Configuration

configure > context *context_name* **> interface** *interface_name* **tunnel > tunnel-mode ipv6ip**

Syntax

ttl value *ttl_value*

default

Configures default setting for the specified keyword.

value *ttl_value*

ttl_value is an integer from 1 through 255. The default is 16.

Usage

Configures the TTL parameter to be used in the tunnel transport protocol.

Example

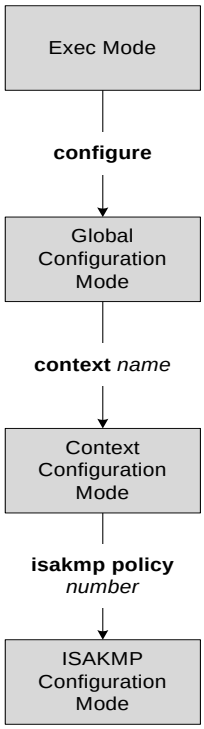
The following command sets the TTL value to *25*.

```
ttl value 25
```

Chapter 165
ISAKMP Configuration Mode Commands

The ISAKMP Configuration Mode is used to configure Internet Security Association Key Management Protocol (ISAKMP) policies that are used to define Internet Key Exchange (IKE) security associations (SAs).

Modification(s) to an existing ISAKMP policy configuration will not take effect until the related security association has been cleared. Refer to the **`clear crypto security-association`** command described in the *Exec Mode (A–C) Commands* chapter for more information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

authentication

Configures the ISAKMP policy authentication mode.

Platform

ASR 5000

Product

PDSN

HA

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > ISAKMP Configuration

configure > context *context_name* **> isakmp policy** *policy_number*

Syntax

authentication preshared-key

[default | no] authentication

default authentication

Restores the default setting of this parameter. This command is enabled by default.

no authentication

Disables the preshared key authentication mode.

preshared-key

Specifies that the policy will be authenticated through the use of the pre-shared key.

Usage

When the system is configured to use ISAKMP-type crypto maps for establishing IPSec tunnels, this command is used to indicate that the policy will be authenticated through the use of the pre-shared key configured in the ISAKMP crypto map.

Example

The following command sets policy authentication mode to use a pre-shared key:

```
authentication preshared-key
```

encryption

Configures the encryption protocol to use to protect subsequent IKE SA negotiations.

Platform

ASR 5000

Product

PDSN

HA

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > ISAKMP Configuration

configure > context *context_name* **> isakmp policy** *policy_number*

Syntax

encryption { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc }

[default | no] encryption

default encryption

Restores the default setting of this parameter.

no encryption

Removes a previously configured encryption type.

3des-cbc

Specifies that the encryption protocol is Triple Data Encryption Standard (3DES) in chain block (CBC) mode.

aes-cbc-128

Specifies that the encryption protocol is Advanced Encryption Standard (AES) in CBC mode with a 128-bit key.

aes-cbc-256

Specifies that the encryption protocol is Advanced Encryption Standard (AES) in CBC mode with a 256-bit key.

des-cbc

Specifies that the encryption protocol is DES in CBC mode. This is the default setting.

Usage

Once the D-H exchange between the system and the security gateway has been successfully completed, subsequent IKE SA negotiations will be protected using the protocol specified by this command.

Example

The following command sets the IKE encryption method to 3des-cbc:

```
encryption 3des-cbc
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

group

Configures the Oakely group (also known as the Diffie-Hellman [D-H] group) in which the D-H exchange occurs.

Platform

ASR 5000

Product

PDSN

HA

GGSN

Privilege

Security Administrator, Administrator

Mode

Exec > Global Configuration > Context Configuration > ISAKMP Configuration

configure > context *context_name* **> isakmp policy** *policy_number*

Syntax

group { 1 | 2 | 5 }

[default | no] group

default group

Restores the default setting of this parameter.

no group

Removes a previously configured group.

{ 1 | 2 | 5 }

Default: **1**
Specifies the number of the Oakley group. The following groups are allowed:

- **1**: Enables Oakley Group 1 using a 768-bit modp as defined in RFC 2409.
- **2**: Enables Oakley Group 2, using a 1024-bit modp as defined in RFC 2409.
- **5**: Enables Oakley Group 5, using a 1536-bit modp as defined in RFC 3526.

Usage

Specifies the Oakley group that determine the length of the base prime numbers that are used during the key exchange process.

Example

The following command sets the group to *5* which specifies 1536-bit base prime numbers:

```
group 5
```

hash

Configures the IKE hash protocol to use during IKE SA negotiations.

Platform

ASR 5000

Product

PDSN

HA

GGSN

Privilege

Security Administrator, Administrator\

Mode

Exec > Global Configuration > Context Configuration > ISAKMP Configuration

configure > context *context_name* **> isakmp policy** *policy_number*

Syntax

hash { md5 | sha1 }

[default | no] hash

default

Restores the default setting of this parameter.

no

Removes a previously configured hash algorithm.

md5
