THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If the equipment causes interference to radio or television reception, which can be determined by turning the equipment off and on, users are encouraged to try to correct the interference by using one or more of the following measures:

Reorient or relocate the receiving antenna.

Increase the separation between the equipment and receiver.

Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.

Consult the dealer or an experienced radio/TV technician for help.

Modifications to this product not authorized by Cisco could void the FCC approval and negate your authority to operate the product.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Cisco and the Cisco Logo are trademarks of Cisco Systems, Inc. and/or its affiliates in the U.S. and other countries. A listing of Cisco's trademarks can be found at www.cisco.com/go/trademarks. [Insert any required attribution of a third party mark.] [Other] Third party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

Chapter 1

Statistics and Counters Overview

This document organizes and provides descriptive information for the various non-MIB forms of statistics, often called counters, generated by the ASR 5000. For this document, these statistics are divided into two categories: bulk statistics and statistics output by CLI **show** commands.

Bulk statistics are typically collected within configured time frames and then the data is put into files or moved to remote systems where the data is processed. The bulk statistic variables are organized by shared concepts (such as service or interface) into schema; for example, the system schema includes all the statistics collected for the system. The schema chapters in this document contain the bulk statistic variables for each schema.

The output statistics usually provide a greater degree of granularity than the bulk statistics because:

- the dynamic content is captured at the time the CLI command is entered,
- the output statistic represents a single element, where the bulk statistic value is often a combination of values for multiple elements,
- the statistical display can be finetuned based on the keywords included in the **show** command when it is entered.

The output statistics are organized by the CLI **show** command that generates their display; for example, **show power all cards** displays the current power status for each card in every slot of the chassis. Some of the **show** command outputs do not present statistics but display configuration information for reference purposes; for example, **show gs-service full name <service_name>** will display the configuration for the named Gs service.

 **IMPORTANT:** The variables listed below are common to (used by) all bulk statistic schema.

Table 1. Common Bulk Statistic Variables

Variables	Description	Data Type
uptime	The total uptime (in seconds) of the system that created the file. Type: Counter	Int32
host	The system hostname that created the file Type: Information	String
ipaddr	The default management (local context) IP address in dotted decimal format. An empty string is inserted if no address is available. Type: Information	String
date	The UTC date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day. Type: Information	String

Variables	Description	Data Type
date3	The UTC date that the collection file was created in YYMMDD format where YY represents the year, MM represents the month and DD represents the day. Type: Information	String
time	The UTC time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds. Type: Information	String
time2	The UTC time that the collection file was created in HH:MM:SS format where HH represents the hours, MM represents the minutes, and SS represents the seconds. Type: Information	String
time3	The UTC time that the collection file was created in HH:MM format where HH represents the hours, MM represents the minutes. Type: Information	String
epochtime	The number of seconds since Jan 1, 1970, 00:00:00 GMT. Type: Counter	Int32
schemas	Provides all the schemas. Type: Information	String
schema-delta	Provides schemas if they have changed since last output. Type: Information	String
localdate	The date (adjusted for the local timezone) that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day. Type: Information	String
localdate3	The date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day. The date displays in local time, not UTC. Type: Information	String
localtime	The time (adjusted for the local timezone) that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds. Type: Information	String
localtime2	The time (adjusted for the local timezone) that the collection file was created in HH:MM:SS format where HH represents the hours, MM represents the minutes, and SS represents the seconds. Type: Information	String
localtime3	The time that the collection file was created in HH:MM:SS format where HH represents the hours, MM represents the minutes, and SS represents the seconds. The time displays in local time, not UTC. Type: Information	String
localtz	The name of the local time zone. Type: Information	String
localzoffset	The local offset from GMT in the form "-0400" Type: Information	String
swbuild	The software build number of the operating system. Type: Information	String

Common Syntax Options

The following defines common syntax block options. These options appear in similar commands and are detailed here for easy reference.

Schema Format String Syntax

The schema format string is used to define the structure of generated bulk statistics data. The string may contain static text, dynamic content, and bulk statistic variables, or any combination.

Static text includes any ASCII characters which are of a fixed value. Static text may also include control characters by using escaped character sequences.

Escaped character short cuts are supported such as ‘\n’ for new line and ‘\t’ for tab.

Variables within the format string must be enclosed in double ampersands, e.g., “%var%”. The actual variables supported are command-dependent and are described with each command.

Chapter 2

AAL2 Schema Statistics

The AAL2 schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 2. Bulk Statistic Variables in the AAL2 Schema

Variables	Description	Data Type
vpnname	The name of the context in which AAL2 service is configured. This is a key variable.	String

Common Syntax Options

Variables	Description	Data Type
vpnid	The identity number of the context in which AAL2 service is configured. This is a key variable.	String
servname	The name of the AAL2 service for which statistics are collected or displayed. This is a key variable.	String
uplink-pkts-tx	Indicates the total number of AAL2 Uplink Packets transmitted. Trigger: When AAL2 Uplink Packets are transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
uplink-byts-tx	Indicates the total number of AAL2 Uplink Bytes transmitted. Trigger: When AAL2 Uplink Bytes are transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
downlink-pkts-rx	Indicates the total number of AAL2 Downlink Packets received. Trigger: When AAL2 Downlink Packets are received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
downlink-byts-rx	Indicates the total number of AAL2 Downlink Bytes received. Trigger: When AAL2 Downlink Bytes are received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
downlink-pkts-dropped	Indicates the total number of AAL2 Downlink packets dropped. Trigger: When AAL2 Downlink packets are dropped by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
downlink-pkts-drop-rab-not-in-conn-state	Indicates the total number of AAL2 Downlink Packets dropped with cause RAB not in CONNETED state. Trigger: When AAL2 Downlink Packets are dropped by ALCAP Service with cause RAB not in CONNETED state. Availability: Across all ALCAP Services.	Unsigned Int32
downlink-pkts-drop-cause-misc	Indicates the total number of AAL2 Downlink Packets dropped with cause Miscellaneous. Trigger: When AAL2 Downlink Packets are dropped by ALCAP Service with cause Miscellaneous. Availability: Across all ALCAP Services.	Unsigned Int32
downlink-byts-dropped	Indicates the total number of AAL2 Downlink bytes dropped. Trigger: When AAL2 Downlink bytes are dropped by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
downlink-byts-drop-rab-not-in-conn-state	Indicates the total number of AAL2 Downlink bytes dropped with cause RAB not in CONNETED state. Trigger: When AAL2 Downlink bytes are dropped by ALCAP Service with cause RAB not in CONNETED state. Availability: Across all ALCAP Services.	Unsigned Int32
downlink-byts-drop-cause-misc	Indicates the total number of AAL2 Downlink bytes dropped with cause Miscellaneous. Trigger: When AAL2 Downlink Bytes are dropped by ALCAP Service with cause Miscellaneous. Availability: Across all ALCAP Services.	Unsigned Int32

Chapter 3

ALCAP Schema Statistics

The ALCAP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 3. Bulk Statistic Variables in the ALCAP Schema

Variables	Description	Data Type
vpnname	The name of the context in which the ALCAP service is configured. This is a key variable.	String

Variables	Description	Data Type
vpnid	The identity number of the context in which ALCAP service is configured. This is a key variable.	String
servname	The name of the ALCAP service for which statistics are collected or displayed. This is a key variable.	String
num-aal2-channels-in-idle-state	Indicates the total number of AAL2 channels in IDLE state. Trigger: When AAL2 channel goes to IDLE state. Availability: Across all ALCAP Services. Type: Gauge	Unsigned Int32
num-aal2-channels-in-connected-state	Indicates the total number of AAL2 channels in CONNECTED state. Trigger: When AAL2 channel goes to CONNECTED state. Availability: Across all ALCAP Services. Type: Gauge	Unsigned Int32
num-aal2-channels-in-connecting	Indicates the total number of AAL2 channels in CONNECTING state. Trigger: When AAL2 channel goes to CONNECTING state. Availability: Across all ALCAP Services. Type: Gauge	Unsigned Int32
num-aal2-channels-in-rel-pending-state	Indicates the total number of AAL2 channels in RELEASE PENDING state. Trigger: When AAL2 channel goes to RELEASE PENDING state. Availability: Across all ALCAP Services. Type: Gauge	Unsigned Int32
num-aal2-channels-in-reset-pending-state	Indicates the total number of AAL2 channels in RESET PENDING state. Trigger: When AAL2 channel goes to RESET PENDING state. Availability: Across all ALCAP Services. Type: Gauge	Unsigned Int32
num-aal2-paths-in-locally-blocked-state	Indicates the total number of AAL2 Paths in LOCALLY BLOCKED state. Trigger: When AAL2 Path goes to LOCALLY BLOCKED state. Availability: Across all ALCAP Services. Type: Gauge	Unsigned Int32
num-aal2-paths-in-remote-blocked-state	Indicates the total number of AAL2 Paths in REMOTE BLOCKED state. Trigger: When AAL2 Path goes to REMOTE BLOCKED state. Availability: Across all ALCAP Services. Type: Gauge	Unsigned Int32
num-aal2-paths-in-blocked-state	Indicates the total number of AAL2 Paths in BLOCKED (REMOTE + LOCAL) state. Trigger: When AAL2 Path goes to BLOCKED (REMOTE + LOCAL) state. Availability: Across all ALCAP Services. Type: Gauge	Unsigned Int32
num-aal2-paths-in-reset-pending-state	Indicates the total number of AAL2 Paths in RESET PENDING state. Trigger: When AAL2 Path goes to RESET PENDING state. Availability: Across all ALCAP Services. Type: Gauge	Unsigned Int32
est-req-tx	Indicates the total number of Establish Request message transmitted. Trigger: When Establish Request is transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
est-confirm-rx	Indicates the total number of Establish Confirm message received. Trigger: When Establish Confirm message is received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
est-confirm-rx-drop-no-conn-to-handle	Indicates the total number of Establish Confirm message received for Dropped/No Connection To Handle. Trigger: When Establish Confirm message is received by ALCAP Service for Dropped/No Connection To Handle. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx	Indicates the total number of Release Request message transmitted. Trigger: When Release Request is transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-unallocated-no-tx	Indicates the total number of Release Request message transmitted for Unallocated (unassigned) number. Trigger: When Release Request is Transmitted by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-no-route-to-dest-tx	Indicates the total number of Release Request message transmitted for No route to destination. Trigger: When Release Request is Transmitted by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-normal-unspecified-tx	Indicates the total number of Release Request message transmitted for Normal/unspecified. Trigger: When Release Request is Transmitted by ALCAP Service for Normal/unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-no-cir-channel-avail-tx	Indicates the total number of Release Request message transmitted for No circuit/channel available. Trigger: When Release Request is Transmitted by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-nw-out-of-order-tx	Indicates the total number of Release Request message transmitted for Network out of order. Trigger: When Release Request is Transmitted by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-temp-failure-tx	Indicates the total number of Release Request message transmitted for Temporary failure. Trigger: When Release Request is Transmitted by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-switching-equip-congestion-tx	Indicates the total number of Release Request message transmitted for Switching equipment congestion. Trigger: When Release Request is Transmitted by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
rel-req-tx-req-cir-channel-not-avail-tx	Indicates the total number of Release Request message transmitted for Requested circuit/channel not available. Trigger: When Release Request is Transmitted by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-res-unavail-unspecified-tx	Indicates the total number of Release Request message transmitted for Resource unavailable/unspecified. Trigger: When Release Request is Transmitted by ALCAP Service for Resource unavailable/unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-aal-param-cant-be-supported-tx	Indicates the total number of Release Request message transmitted for AAL parameters cannot be supported. Trigger: When Release Request is Transmitted by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-inv-msg-unspecified-tx	Indicates the total number of Release Request message transmitted for Invalid message/unspecified. Trigger: When Release Request is Transmitted by ALCAP Service for Invalid message/unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-mandatory-ie-missing-tx	Indicates the total number of Release Request message transmitted for Mandatory information element is missing. Trigger: When Release Request is Transmitted by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-msg-type-non-exist-not-impl-tx	Indicates the total number of Release Request message transmitted for Message type non-existent or not implemented. Trigger: When Release Request is Transmitted by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-ie-param-non-exist-not-impl-tx	Indicates the total number of Release Request message transmitted for Information element/parameter non-existent or not implemented. Trigger: When Release Request is Transmitted by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-invalid-ie-contents-tx	Indicates the total number of Release Request message transmitted for Invalid information element contents. Trigger: When Release Request is Transmitted by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-tx-recovery-on-timer-exp-tx	Indicates the total number of Release Request message transmitted for Recovery on timer expiry. Trigger: When Release Request is Transmitted by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
rel-req-tx-msg-unrec-param-discard-tx	Indicates the total number of Release Request message transmitted for Message with unrecognized parameter/discarded. Trigger: When Release Request is Transmitted by ALCAP Service for Message with unrecognized parameter/discarded. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx	Indicates the total number of Release Request message received. Trigger: When Release Request is Received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-unallocated-no-rx	Indicates the total number of Release Request message received for Unallocated (unassigned) number. Trigger: When Release Request is Received by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-no-route-to-dest-rx	Indicates the total number of Release Request message received for No route to destination. Trigger: When Release Request is Received by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-normal-unspecified-rx	Indicates the total number of Release Request message received for Normal, unspecified. Trigger: When Release Request is Received by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-no-cir-channel-avail-rx	Indicates the total number of Release Request message received for No circuit/channel available. Trigger: When Release Request is Received by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-nw-out-of-order-rx	Indicates the total number of Release Request message received for Network out of order. Trigger: When Release Request is Received by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-temp-failure-rx	Indicates the total number of Release Request message received for Temporary failure. Trigger: When Release Request is Received by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-switching-equip-congestion-rx	Indicates the total number of Release Request message received for Switching equipment congestion. Trigger: When Release Request is Received by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
rel-req-rx-req-cir-channel-not-avail-rx	Indicates the total number of Release Request message received for Requested circuit/channel not available. Trigger: When Release Request is Received by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-res-unavail-unspecified-rx	Indicates the total number of Release Request message received for Resource unavailable, unspecified. Trigger: When Release Request is Received by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-aal-param-cant-be-supported-rx	Indicates the total number of Release Request message received for AAL parameters cannot be supported. Trigger: When Release Request is Received by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-inv-msg-unspecified-rx	Indicates the total number of Release Request message received for Invalid message, unspecified. Trigger: When Release Request is Received by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-mandatory-ie-missing-rx	Indicates the total number of Release Request message received for Mandatory information element is missing. Trigger: When Release Request is Received by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-msg-type-non-exist-not-impl-rx	Indicates the total number of Release Request message received for Message type non-existent or not implemented. Trigger: When Release Request is Received by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-ie-param-non-exist-not-impl-rx	Indicates the total number of Release Request message received for Information element/parameter non-existent or not implemented. Trigger: When Release Request is Received by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-invalid-ie-contents-rx	Indicates the total number of Release Request message received for Invalid information element contents. Trigger: When Release Request is Received by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
rel-req-rx-recovery-on-timer-exp-rx	Indicates the total number of Release Request message received for Recovery on timer expiry. Trigger: When Release Request is Received by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
rel-req-rx-msg-unrec-param-discard-rx	Indicates the total number of Release Request message received for Message with unrecognized parameter, discarded. Trigger: When Release Request is Received by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx	Indicates the total number of Release Confirm message transmitted. Trigger: When Release Confirm message is transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-unallocated-no-tx	Indicates the total number of Release Confirm message received for Unallocated (unassigned) number. Trigger: When Release confirm is Transmitted by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-no-route-to-dest-tx	Indicates the total number of Release Confirm message received for No route to destination. Trigger: When Release confirm is Transmitted by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-normal-unspecified-tx	Indicates the total number of Release Confirm message received for Normal, unspecified. Trigger: When Release confirm is Transmitted by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-no-cir-channel-avail-tx	Indicates the total number of Release Confirm message received for No circuit/channel available. Trigger: When Release confirm is Transmitted by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-nw-out-of-order-tx	Indicates the total number of Release Confirm message received for Network out of order. Trigger: When Release confirm is Transmitted by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-temp-failure-tx	Indicates the total number of Release Confirm message received for Temporary failure. Trigger: When Release confirm is Transmitted by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-switching-equip-congestion-tx	Indicates the total number of Release Confirm message received for Switching equipment congestion. Trigger: When Release confirm is Transmitted by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
rel-confirm-tx-req-cir-channel-not-avail-tx	Indicates the total number of Release Confirm message received for Requested circuit/channel not available. Trigger: When Release confirm is Transmitted by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-res-unavail-unspecified-tx	Indicates the total number of Release Confirm message received for Resource unavailable, unspecified. Trigger: When Release confirm is Transmitted by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-aal-param-cant-be-supported-tx	Indicates the total number of Release Confirm message received for AAL parameters cannot be supported. Trigger: When Release confirm is Transmitted by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-inv-msg-unspecified-tx	Indicates the total number of Release Confirm message received for Invalid message, unspecified. Trigger: When Release confirm is Transmitted by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-mandatory-ie-missing-tx	Indicates the total number of Release Confirm message received for Mandatory information element is missing. Trigger: When Release confirm is Transmitted by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-msg-type-non-exist-not-impl-tx	Indicates the total number of Release Confirm message received for Message type non-existent or not implemented. Trigger: When Release confirm is Transmitted by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-ie-param-non-exist-not-impl-tx	Indicates the total number of Release Confirm message received for Information element/parameter non-existent or not implemented. Trigger: When Release confirm is Transmitted by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-invalid-ie-contents-tx	Indicates the total number of Release Confirm message received for Invalid information element contents. Trigger: When Release confirm is Transmitted by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-tx-recovery-on-timer-exp-tx	Indicates the total number of Release Confirm message received for Recovery on timer expiry. Trigger: When Release confirm is Transmitted by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
rel-confirm-tx-msg-unrec-param-discard-tx	Indicates the total number of Release Confirm message received for Message with unrecognized parameter, discarded. Trigger: When Release confirm is Transmitted by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx	Indicates the total number of Release Confirm message received. Trigger: When Release Confirm message is received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-unallocated-no-rx	Indicates the total number of Release confirm Received for Unallocated (unassigned) number. Trigger: When Release Confirm message is received by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-no-route-to-dest-rx	Indicates the total number of Release confirm Received for No route to destination. Trigger: When Release Confirm message is received by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-normal-unspecified-rx	Indicates the total number of Release confirm Received for Normal, unspecified. Trigger: When Release Confirm message is received by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-no-cir-channel-avail-rx	Indicates the total number of Release confirm Received for No circuit/channel available. Trigger: When Release Confirm message is received by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-nw-out-of-order-rx	Indicates the total number of Release confirm Received for Network out of order. Trigger: When Release Confirm message is received by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-temp-failure-rx	Indicates the total number of Release confirm Received for Temporary failure. Trigger: When Release Confirm message is received by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-switching-equip-congestion-rx	Indicates the total number of Release confirm Received for Switching equipment congestion. Trigger: When Release Confirm message is received by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-req-cir-channel-not-avail-rx	Indicates the total number of Release confirm Received for Requested circuit/channel not available. Trigger: When Release Confirm message is received by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
rel-confirm-rx-res-unavail- unspecified-rx	Indicates the total number of Release confirm Received for Resource unavailable, unspecified. Trigger: When Release Confirm message is received by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-aal-param- cant-be-supported-rx	Indicates the total number of Release confirm Received for AAL parameters cannot be supported. Trigger: When Release Confirm message is received by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-inv-msg- unspecified-rx	Indicates the total number of Release confirm Received for Invalid message, unspecified. Trigger: When Release Confirm message is received by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-mandatory-ie- missing-rx	Indicates the total number of Release confirm Received for Mandatory information element is missing. Trigger: When Release Confirm message is received by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-msg-type- non-exist-not-impl-rx	Indicates the total number of Release confirm Received for Message type non-existent or not implemented. Trigger: When Release Confirm message is received by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-ie-param- non-exist-not-impl-rx	Indicates the total number of Release confirm Received for Information element/parameter non-existent or not implemented. Trigger: When Release Confirm message is received by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-invalid-ie- contents-rx	Indicates the total number of Release confirm Received for Invalid information element contents. Trigger: When Release Confirm message is received by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-recovery-on- timer-exp-rx	Indicates the total number of Release confirm Received for Recovery on timer expiry. Trigger: When Release Confirm message is received by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32
rel-confirm-rx-msg-unrec- param-discard-rx	Indicates the total number of Release confirm Received for Message with unrecognized parameter, discarded. Trigger: When Release Confirm message is received by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
modify-req-tx	Indicates the total number of Modify Request message transmitted. Trigger: When Modify Request is Transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
modify-req-rx	Indicates the total number of Modify Request message received. Trigger: When Modify Request is Received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
modify-ack-tx	Indicates the total number of Modify Acknowledge Transmitted. Trigger: When Modify Acknowledge is Transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
modify-ack-rx	Indicates the total number of Modify Acknowledge message received. Trigger: When Modify Acknowledge is Received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
modify-rej-tx	Indicates the total number of Modify Reject Transmitted. Trigger: When Modify Reject is Transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
modify-rej-rx	Indicates the total number of Modify Reject message received. Trigger: When Modify Reject is Received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
blo-req-tx	Indicates the total number of Block Request message transmitted. Trigger: When Block Request is Transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
blo-req-rx	Indicates the total number of Block Request message received for. Trigger: When Block Request is Received by ALCAP Service for. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx	Indicates the total number of Block Confirm message received. Trigger: When Block confirm is Transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-unallocated-no-tx	Indicates the total number of Block Confirm message received for Unallocated (unassigned) number. Trigger: When Block confirm is Transmitted by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-no-route-to-dest-tx	Indicates the total number of Block Confirm message received for No route to destination. Trigger: When Block confirm is Transmitted by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-normal-unspecified-tx	Indicates the total number of Block Confirm message received for Normal, unspecified. Trigger: When Block confirm is Transmitted by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
blo-cfm-tx-no-cir-channel-avail-tx	Indicates the total number of Block Confirm message received for No circuit/channel available. Trigger: When Block confirm is Transmitted by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-nw-out-of-order-tx	Indicates the total number of Block Confirm message received for Network out of order. Trigger: When Block confirm is Transmitted by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-temp-failure-tx	Indicates the total number of Block Confirm message received for Temporary failure. Trigger: When Block confirm is Transmitted by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-switching-equip-congestion-tx	Indicates the total number of Block Confirm message received for Switching equipment congestion. Trigger: When Block confirm is Transmitted by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-req-cir-channel-not-avail-tx	Indicates the total number of Block Confirm message received for Requested circuit/channel not available. Trigger: When Block confirm is Transmitted by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-res-unavail-unspecified-tx	Indicates the total number of Block Confirm message received for Resource unavailable, unspecified. Trigger: When Block confirm is Transmitted by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-aal-param-cant-be-supported-tx	Indicates the total number of Block Confirm message received for AAL parameters cannot be supported. Trigger: When Block confirm is Transmitted by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-inv-msg-unspecified-tx	Indicates the total number of Block Confirm message received for Invalid message, unspecified. Trigger: When Block confirm is Transmitted by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-mandatory-ie-missing-tx	Indicates the total number of Block Confirm message received for Mandatory information element is missing. Trigger: When Block confirm is Transmitted by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
blo-cfm-tx-msg-type-non-exist-not-impl-tx	Indicates the total number of Block Confirm message received for Message type non-existent or not implemented. Trigger: When Block confirm is Transmitted by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-ie-param-non-exist-not-impl-tx	Indicates the total number of Block Confirm message received for Information element/parameter non-existent or not implemented. Trigger: When Block confirm is Transmitted by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-invalid-ie-contents-tx	Indicates the total number of Block Confirm message received for Invalid information element contents. Trigger: When Block confirm is Transmitted by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-recovery-on-timer-exp-tx	Indicates the total number of Block Confirm message received for Recovery on timer expiry. Trigger: When Block confirm is Transmitted by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-tx-msg-unrec-param-discard-tx	Indicates the total number of Block Confirm message received for Message with unrecognized parameter, discarded. Trigger: When Block confirm is Transmitted by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx	Indicates the total number of Block confirm message received. Trigger: When Block Confirm message is received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-unallocated-no-rx	Indicates the total number of Block Confirm message received for Unallocated (unassigned) number. Trigger: When Block Confirm message is received by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-no-route-to-dest-rx	Indicates the total number of Block Confirm message received for No route to destination. Trigger: When Block Confirm message is received by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-normal-unspecified-rx	Indicates the total number of Block Confirm message received for Normal, unspecified. Trigger: When Block Confirm message is received by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
blo-cfm-rx-no-cir-channel-avail-rx	Indicates the total number of Block Confirm message received for No circuit/channel available. Trigger: When Block Confirm message is received by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-nw-out-of-order-rx	Indicates the total number of Block Confirm message received for Network out of order. Trigger: When Block Confirm message is received by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-temp-failure-rx	Indicates the total number of Block Confirm message received for Temporary failure. Trigger: When Block Confirm message is received by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-switching-equip-congestion-rx	Indicates the total number of Block Confirm message received for Switching equipment congestion. Trigger: When Block Confirm message is received by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-req-cir-channel-not-avail-rx	Indicates the total number of Block Confirm message received for Requested circuit/channel not available. Trigger: When Block Confirm message is received by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-res-unavail-unspecified-rx	Indicates the total number of Block Confirm message received for Resource unavailable, unspecified. Trigger: When Block Confirm message is received by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-aal-param-cant-be-supported-rx	Indicates the total number of Block Confirm message received for AAL parameters cannot be supported. Trigger: When Block Confirm message is received by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-inv-msg-unspecified-rx	Indicates the total number of Block Confirm message received for Invalid message, unspecified. Trigger: When Block Confirm message is received by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-mandatory-ie-missing-rx	Indicates the total number of Block Confirm message received for Mandatory information element is missing. Trigger: When Block Confirm message is received by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
blo-cfm-rx-msg-type-non-exist-not-impl-rx	Indicates the total number of Block Confirm message received for Message type non-existent or not implemented. Trigger: When Block Confirm message is received by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-ie-param-non-exist-not-impl-rx	Indicates the total number of Block Confirm message received for Information element/parameter non-existent or not implemented. Trigger: When Block Confirm message is received by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-invalid-ie-contents-rx	Indicates the total number of Block Confirm message received for Invalid information element contents. Trigger: When Block Confirm message is received by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-recovery-on-timer-exp-rx	Indicates the total number of Block Confirm message received for Recovery on timer expiry. Trigger: When Block Confirm message is received by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32
blo-cfm-rx-msg-unrec-param-discard-rx	Indicates the total number of Block Confirm message received for Message with unrecognized parameter, discarded. Trigger: When Block Confirm message is received by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-req-tx	Indicates the total number of Unblock Request message transmitted. Trigger: When Unblock Request is Transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-req-rx	Indicates the total number of Unblock Request message received. Trigger: When Unblock Request is Received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx	Indicates the total number of Unblock Confirm message transmitted. Trigger: When Unblock Confirm message is transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-unallocated-no-tx	Indicates the total number of Unblock Confirm message transmitted for Unallocated (unassigned) number. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-no-route-to-dest-tx	Indicates the total number of Unblock Confirm message transmitted for No route to destination. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
unblo-cfm-tx-normal- unspecified-tx	Indicates the total number of Unblock Confirm message transmitted for Normal, unspecified. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-no-cir- channel-avail-tx	Indicates the total number of Unblock Confirm message transmitted for No circuit/channel available. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-nw-out-of- order-tx	Indicates the total number of Unblock Confirm message transmitted for Network out of order. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-temp-failure-tx	Indicates the total number of Unblock Confirm message transmitted for Temporary failure. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-switching- equip-congestion-tx	Indicates the total number of Unblock Confirm message transmitted for Switching equipment congestion. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-req-cir- channel-not-avail-tx	Indicates the total number of Unblock Confirm message transmitted for Requested circuit/channel not available. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-res-unavail- unspecified-tx	Indicates the total number of Unblock Confirm message transmitted for Resource unavailable, unspecified. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-aal-param- cant-be-supported-tx	Indicates the total number of Unblock Confirm message transmitted for AAL parameters cannot be supported. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-inv-msg- unspecified-tx	Indicates the total number of Unblock Confirm message transmitted for Invalid message, unspecified. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
unblo-cfm-tx-mandatory-ie-missing-tx	Indicates the total number of Unblock Confirm message transmitted for Mandatory information element is missing. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-msg-type-non-exist-not-impl-tx	Indicates the total number of Unblock Confirm message transmitted for Message type non-existent or not implemented. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-ie-param-non-exist-not-impl-tx	Indicates the total number of Unblock Confirm message transmitted for Information element/parameter non-existent or not implemented. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-invalid-ie-contents-tx	Indicates the total number of Unblock Confirm message transmitted for Invalid information element contents. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-recovery-on-timer-exp-tx	Indicates the total number of Unblock Confirm message transmitted for Recovery on timer expiry. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-tx-msg-unrec-param-discard-tx	Indicates the total number of Unblock Confirm message transmitted for Message with unrecognized parameter, discarded. Trigger: When Unblock Confirm message is transmitted by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx	Indicates the total number of Unblock Confirm message received. Trigger: When Unblock Confirm message is received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-unallocated-no-rx	Indicates the total number of Unblock Confirm message received for Unallocated (unassigned) number. Trigger: When Unblock Confirm message is received by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-no-route-to-dest-rx	Indicates the total number of Unblock Confirm message received for No route to destination. Trigger: When Unblock Confirm message is received by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
unblo-cfm-rx-normal- unspecified-rx	Indicates the total number of Unblock Confirm message received for Normal, unspecified. Trigger: When Unblock Confirm message is received by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-no-cir- channel-avail-rx	Indicates the total number of Unblock Confirm message received for No circuit/channel available. Trigger: When Unblock Confirm message is received by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-nw-out-of- order-rx	Indicates the total number of Unblock Confirm message received for Network out of order. Trigger: When Unblock Confirm message is received by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-temp-failure- rx	Indicates the total number of Unblock Confirm message received for Temporary failure. Trigger: When Unblock Confirm message is received by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-switching- equip-congestion-rx	Indicates the total number of Unblock Confirm message received for Switching equipment congestion. Trigger: When Unblock Confirm message is received by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-req-cir- channel-not-avail-rx	Indicates the total number of Unblock Confirm message received for Requested circuit/channel not available. Trigger: When Unblock Confirm message is received by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-res-unavail- unspecified-rx	Indicates the total number of Unblock Confirm message received for Resource unavailable, unspecified. Trigger: When Unblock Confirm message is received by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-aal-param- cant-be-supported-rx	Indicates the total number of Unblock Confirm message received for AAL parameters cannot be supported. Trigger: When Unblock Confirm message is received by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-inv-msg- unspecified-rx	Indicates the total number of Unblock Confirm message received for Invalid message, unspecified. Trigger: When Unblock Confirm message is received by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
unblo-cfm-rx-mandatory-ie-missing-rx	Indicates the total number of Unblock Confirm message received for Mandatory information element is missing. Trigger: When Unblock Confirm message is received by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-msg-type-non-exist-not-impl-rx	Indicates the total number of Unblock Confirm message received for Message type non-existent or not implemented. Trigger: When Unblock Confirm message is received by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-ie-param-non-exist-not-impl-rx	Indicates the total number of Unblock Confirm message received for Information element/parameter non-existent or not implemented. Trigger: When Unblock Confirm message is received by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-invalid-ie-contents-rx	Indicates the total number of Unblock Confirm message received for Invalid information element contents. Trigger: When Unblock Confirm message is received by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-recovery-on-timer-exp-rx	Indicates the total number of Unblock Confirm message received for Recovery on timer expiry. Trigger: When Unblock Confirm message is received by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32
unblo-cfm-rx-msg-unrec-param-discard-rx	Indicates the total number of Unblock Confirm message received for Message with unrecognized parameter, discarded. Trigger: When Unblock Confirm message is received by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32
reset-req-tx	Indicates the total number of Reset Request message transmitted. Trigger: When Reset Request is Transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
reset-req-rx	Indicates the total number of Reset Request message received. Trigger: When Reset Request is Received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx	Indicates the total number of Reset Confirm message transmitted. Trigger: When Reset Confirm message is transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-unallocated-no-tx	Indicates the total number of Reset Confirm message transmitted for Unallocated (unassigned) number. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
res-cfm-tx-no-route-to-dest-tx	Indicates the total number of Reset Confirm message transmitted for No route to destination. Trigger: When Reset Confirm message is transmitted by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-normal-unspecified-tx	Indicates the total number of Reset Confirm message transmitted for Normal, unspecified. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-no-cir-channel-avail-tx	Indicates the total number of Reset Confirm message transmitted for No circuit/channel available. Trigger: When Reset Confirm message is transmitted by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-nw-out-of-order-tx	Indicates the total number of Reset Confirm message transmitted for Network out of order. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-temp-failure-tx	Indicates the total number of Reset Confirm message transmitted for Temporary failure. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-switching-equip-congestion-tx	Indicates the total number of Reset Confirm message transmitted for Switching equipment congestion. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-req-cir-channel-not-avail-tx	Indicates the total number of Reset Confirm message transmitted for Requested circuit/channel not available. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-res-unavail-unspecified-tx	Indicates the total number of Reset Confirm message transmitted for Resource unavailable, unspecified. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-aal-param-cant-be-supported-tx	Indicates the total number of Reset Confirm message transmitted for AAL parameters cannot be supported. Trigger: When Reset Confirm message is transmitted by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
res-cfm-tx-inv-msg- unspecified-tx	Indicates the total number of Reset Confirm message transmitted for Invalid message, unspecified. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-mandatory-ie- missing-tx	Indicates the total number of Reset Confirm message transmitted for Mandatory information element is missing. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-msg-type-non- exist-not-impl-tx	Indicates the total number of Reset Confirm message transmitted for Message type non-existent or not implemented. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-ie-param-non- exist-not-impl-tx	Indicates the total number of Reset Confirm message transmitted for Information element/parameter non-existent or not implemented. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-invalid-ie- contents-tx	Indicates the total number of Reset Confirm message transmitted for Invalid information element contents. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-recovery-on- timer-exp-tx	Indicates the total number of Reset Confirm message transmitted for Recovery on timer expiry. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-tx-msg-unrec- param-discard-tx	Indicates the total number of Reset Confirm message transmitted for Message with unrecognized parameter, discarded. Trigger: When Reset Confirm message is transmitted by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx	Indicates the total number of Reset Confirm message received. Trigger: When Reset Confirm message is received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-unallocated-no-rx	Indicates the total number of Reset Confirm message received for Unallocated (unassigned) number. Trigger: When Reset Confirm message is received by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
res-cfm-rx-no-route-to-dest-rx	Indicates the total number of Reset Confirm message received for No route to destination. Trigger: When Reset Confirm message is received by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-normal-unspecified-rx	Indicates the total number of Reset Confirm message received for Normal, unspecified. Trigger: When Reset Confirm message is received by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-no-cir-channel-avail-rx	Indicates the total number of Reset Confirm message received for No circuit/channel available. Trigger: When Reset Confirm message is received by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-nw-out-of-order-rx	Indicates the total number of Reset Confirm message received for Network out of order. Trigger: When Reset Confirm message is received by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-temp-failure-rx	Indicates the total number of Reset Confirm message received for Temporary failure. Trigger: When Reset Confirm message is received by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-switching-equip-congestion-rx	Indicates the total number of Reset Confirm message received for Switching equipment congestion. Trigger: When Reset Confirm message is received by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-req-cir-channel-not-avail-rx	Indicates the total number of Reset Confirm message received for Requested circuit/channel not available. Trigger: When Reset Confirm message is received by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-res-unavail-unspecified-rx	Indicates the total number of Reset Confirm message received for Resource unavailable, unspecified. Trigger: When Reset Confirm message is received by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-aal-param-cant-be-supported-rx	Indicates the total number of Reset Confirm message received for AAL parameters cannot be supported. Trigger: When Reset Confirm message is received by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
res-cfm-rx-inv-msg- unspecified-rx	Indicates the total number of Reset Confirm message received for Invalid message, unspecified. Trigger: When Reset Confirm message is received by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-mandatory-ie- missing-rx	Indicates the total number of Reset Confirm message received for Mandatory information element is missing. Trigger: When Reset Confirm message is received by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-msg-type-non- exist-not-impl-rx	Indicates the total number of Reset Confirm message received for Message type non-existent or not implemented. Trigger: When Reset Confirm message is received by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-ie-param-non- exist-not-impl-rx	Indicates the total number of Reset Confirm message received for Information element/parameter non-existent or not implemented. Trigger: When Reset Confirm message is received by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-invalid-ie- contents-rx	Indicates the total number of Reset Confirm message received for Invalid information element contents. Trigger: When Reset Confirm message is received by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-recovery-on- timer-exp-rx	Indicates the total number of Reset Confirm message received for Recovery on timer expiry. Trigger: When Reset Confirm message is received by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32
res-cfm-rx-msg-unrec- param-discard-rx	Indicates the total number of Reset Confirm message received for Message with unrecognized parameter, discarded. Trigger: When Reset Confirm message is received by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx	Indicates the total number of Confusion message transmitted . Trigger: When Confusion message is transmitted by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-unallocated-no- tx	Indicates the total number of Confusion message transmitted for Unallocated (unassigned) number. Trigger: When Confusion message is transmitted by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
confusion-tx-no-route-to-dest-tx	Indicates the total number of Confusion message transmitted for No route to destination. Trigger: When Confusion message is transmitted by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-normal-unspecified-tx	Indicates the total number of Confusion message transmitted for Normal, unspecified. Trigger: When Confusion message is transmitted by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-no-cir-channel-avail-tx	Indicates the total number of Confusion message transmitted for No circuit/channel available. Trigger: When Confusion message is transmitted by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-nw-out-of-order-tx	Indicates the total number of Confusion message transmitted for Network out of order. Trigger: When Confusion message is transmitted by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-temp-failure-tx	Indicates the total number of Confusion message transmitted for Temporary failure. Trigger: When Confusion message is transmitted by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-switching-equip-congestion-tx	Indicates the total number of Confusion message transmitted for Switching equipment congestion. Trigger: When Confusion message is transmitted by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-req-cir-channel-not-avail-tx	Indicates the total number of Confusion message transmitted for Requested circuit/channel not available. Trigger: When Confusion message is transmitted by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-res-unavail-unspecified-tx	Indicates the total number of Confusion message transmitted for Resource unavailable, unspecified. Trigger: When Confusion message is transmitted by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-aal-param-cant-be-supported-tx	Indicates the total number of Confusion message transmitted for AAL parameters cannot be supported. Trigger: When Confusion message is transmitted by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
confusion-tx-inv-msg- unspecified-tx	Indicates the total number of Confusion message transmitted for Invalid message, unspecified. Trigger: When Confusion message is transmitted by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-mandatory-ie- missing-tx	Indicates the total number of Confusion message transmitted for Mandatory information element is missing. Trigger: When Confusion message is transmitted by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-msg-type-non- exist-not-impl-tx	Indicates the total number of Confusion message transmitted for Message type non-existent or not implemented. Trigger: When Confusion message is transmitted by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-ie-param-non- exist-not-impl-tx	Indicates the total number of Confusion message transmitted for Information element/parameter non-existent or not implemented. Trigger: When Confusion message is transmitted by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-invalid-ie- contents-tx	Indicates the total number of Confusion message transmitted for Invalid information element contents. Trigger: When Confusion message is transmitted by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-recovery-on- timer-exp-tx	Indicates the total number of Confusion message transmitted for Recovery on timer expiry. Trigger: When Confusion message is transmitted by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-tx-msg-unrec- param-discard-tx	Indicates the total number of Confusion message transmitted for Message with unrecognized parameter, discarded. Trigger: When Confusion message is transmitted by ALCAP Service for Message with unrecognized parameter, discarded. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx	Indicates the total number of Confusion message received. Trigger: When Confusion message is received by ALCAP Service. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-unallocated-no- rx	Indicates the total number of Confusion message received for Unallocated (unassigned) number. Trigger: When Confusion message is received by ALCAP Service for Unallocated (unassigned) number. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
confusion-rx-no-route-to-dest-rx	Indicates the total number of Confusion message received for No route to destination. Trigger: When Confusion message is received by ALCAP Service for No route to destination. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-normal-unspecified-rx	Indicates the total number of Confusion message received for Normal, unspecified. Trigger: When Confusion message is received by ALCAP Service for Normal, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-no-cir-channel-avail-rx	Indicates the total number of Confusion message received for No circuit/channel available. Trigger: When Confusion message is received by ALCAP Service for No circuit/channel available. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-nw-out-of-order-rx	Indicates the total number of Confusion message received for Network out of order. Trigger: When Confusion message is received by ALCAP Service for Network out of order. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-temp-failure-rx	Indicates the total number of Confusion message received for Temporary failure. Trigger: When Confusion message is received by ALCAP Service for Temporary failure. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-switching-equip-congestion-rx	Indicates the total number of Confusion message received for Switching equipment congestion. Trigger: When Confusion message is received by ALCAP Service for Switching equipment congestion. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-req-cir-channel-not-avail-rx	Indicates the total number of Confusion message received for Requested circuit/channel not available. Trigger: When Confusion message is received by ALCAP Service for Requested circuit/channel not available. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-res-unavail-unspecified-rx	Indicates the total number of Confusion message received for Resource unavailable, unspecified. Trigger: When Confusion message is received by ALCAP Service for Resource unavailable, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-aal-param-cant-be-supported-rx	Indicates the total number of Confusion message received for AAL parameters cannot be supported. Trigger: When Confusion message is received by ALCAP Service for AAL parameters cannot be supported. Availability: Across all ALCAP Services.	Unsigned Int32

Variables	Description	Data Type
confusion-rx-inv-msg- unspecified-rx	Indicates the total number of Confusion message received for Invalid message, unspecified. Trigger: When Confusion message is received by ALCAP Service for Invalid message, unspecified. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-mandatory-ie- missing-rx	Indicates the total number of Confusion message received for Mandatory information element is missing. Trigger: When Confusion message is received by ALCAP Service for Mandatory information element is missing. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-msg-type-non- exist-not-impl-rx	Indicates the total number of Confusion message received for Message type non-existent or not implemented. Trigger: When Confusion message is received by ALCAP Service for Message type non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-ie-param-non- exist-not-impl-rx	Indicates the total number of Confusion message received for Information element/parameter non-existent or not implemented. Trigger: When Confusion message is received by ALCAP Service for Information element/parameter non-existent or not implemented. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-invalid-ie- contents-rx	Indicates the total number of Confusion message received for Invalid information element contents. Trigger: When Confusion message is received by ALCAP Service for Invalid information element contents. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-recovery-on- timer-exp-rx	Indicates the total number of Confusion message received for Recovery on timer expiry. Trigger: When Confusion message is received by ALCAP Service for Recovery on timer expiry. Availability: Across all ALCAP Services.	Unsigned Int32
confusion-rx-msg-unrec- param-discard-rx	Indicates the total number of Confusion message received for Message with unrecognized parameter or discarded. Trigger: When Confusion message is received by ALCAP Service for Message with unrecognized parameter/discarded. Availability: Across all ALCAP Services	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 4

APN Schema Statistics

The APN schema provides operational statistics that can be used for monitoring and troubleshooting the following products: GGSN, P-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 4. Bulk Statistics Variables in the APN Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the APN configuration. This is a key variable. Type: Information	String
vpnid	The identification number of the context configured on the system that is currently facilitating the APN configuration. This is an internal reference number. This is a key variable. Type: Information	Int32
apn	The name of the APN for which statistics are displayed. This is a key variable. Type: Information	String
uplnk-bytes	The number of bytes sent from the APN towards Internet/PDN on the Gi interface. Type: Counter	Int64
dnlnk-bytes	The number of bytes sent from the APN towards MS on the GTP interface. Type: Counter	Int64
uplnk-pkts	The number of IP packets sent from the APN towards Internet/PDN on the Gi interface. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
dnlnk-pkts	The number of IP packets sent from the APN towards MS on the GTP interface. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
uplnk-bytes-drop	The number of bytes sent from the APN towards Internet/PDN on the Gi interface dropped. Type: Counter	Int64
dnlnk-bytes-drop	The number of bytes sent from the APN towards MS on the GTP interface dropped. Type: Counter	Int64
uplnk-drop	The number of IP packets sent from the APN towards Internet/PDN on the Gi interface dropped. Type: Counter	Int32
dnlnk-drop	The number of IP packets sent from the APN towards MS on the GTP interface dropped. Type: Counter	Int32
bad-hdr	The total number of IP packets received and dropped due to bad header. Type: Counter	Int32
ttnl-excd	The number of IP packets dropped because they were received with a TTL value of 0. Type: Counter	Int32

Variables	Description	Data Type
frag-sent	The number of times IP packets were fragmented before sending on the GTP tunnel. Type: Counter	Int32
frag-fail	The number of packets which failed in fragmentation. Type: Counter	Int32
inacl-drop	The number of IP packets received that were dropped due to ACL filtering. Type: Counter	Int32
outacl-drop	The number of outbound IP packets that were dropped due to ACL filtering. Type: Counter	Int32
inexcd-mbr-pkt-drop	Data Statistics – IP input excd MBR packets dropped Type: Counter	Int32
outexcd-mbr-pkt-drop	Data Statistics – IP output excd MBR packets dropped Type: Counter	Int32
inexcd-gbr-pkt-drop	Data Statistics – IP input excd GBR packets dropped Type: Counter	Int32
outexcd-gbr-pkt-drop	Data Statistics – IP output excd GBR packets dropped Type: Counter	Int32
inexcd-ambr-pkt-drop	Data Statistics – IP in excd APN packets AMBR dropped Type: Counter	Int32
outexcd-ambr-pkt-drop	Data Statistics – IP out excd APN packets AMBR dropped Type: Counter	Int32
inmisc-pkt-drop	Data Statistics – IP input misc packets dropped Type: Counter	Int32
outmisc-pkt-drop	Data Statistics – IP output misc packets dropped Type: Counter	Int32
inexcd-mbr-byte-drop	Data Statistics – IP input excd MBR bytes dropped Type: Counter	Int32
outexcd-mbr-byte-drop	Data Statistics – IP output excd MBR bytes dropped Type: Counter	Int32
inexcd-gbr-byte-drop	Data Statistics – IP input excd GBR bytes dropped Type: Counter	Int32
outexcd-gbr-byte-drop	Data Statistics – IP output excd GBR bytes dropped Type: Counter	Int32
inexcd-ambr-byte-drop	Data Statistics – IP in excd APN AMBR bytes dropped Type: Counter	Int32
outexcd-ambr-byte-drop	Data Statistics – IP out excd APN AMBR bytes dropped Type: Counter	Int32
inmisc-byte-drop	Data Statistics – IP input misc bytes dropped Type: Counter	Int32

Variables	Description	Data Type
outmisc-byte-drop	Data Statistics – IP output misc bytes dropped Type: Counter	Int32
bad-src-addr	The number of IP packets received for which a source violation was detected resulting in the packets being dropped. Type: Counter	Int32
addr-stat	The total number of PDP contexts facilitated by the APN that used static IP addresses. Type: Counter	Int32
addr-lpool	The total number of PDP contexts facilitated by the APN that were allocated IP addresses from pools configured locally. Type: Counter	Int32
addr-rad	The total number of PDP contexts facilitated by the APN that were allocated IP addresses from a RADIUS server. Type: Counter	Int32
addr-dhcp	The total number of PDP contexts facilitated by the APN that were allocated IP addresses from DHCP. Type: Counter	Int32
addr-dhcp-rly	The total number of PDP contexts facilitated by the APN that were allocated IP addresses by DHCP Relay. Type: Counter	Int32
addr-no-alloc	The total number of PDP contexts facilitated by the APN that were not allocated IP addresses. Type: Counter	Int32
sess-curr	The number of PDP contexts currently facilitated by the APN. Type: Gauge	Int32
sess-curr-all	The total number of PDP contexts currently being facilitated by the entire system. Type: Gauge	Int32
sess-tot	The total number of PDP contexts facilitated by the APN. Type: Counter	Int32
sess-tot-all	The total number of PDP contexts that have been facilitated by the entire system. Type: Counter	Int32
att-pdp-ctxt	The total CPC req per APN Type: Counter	Int32
att-deact-pdp-ggsn	The total DPC Req Tx per APN Type: Counter	Int32
succ-deact-pdp-ggsn	The total DPC Req Tx Accepted Type: Counter	Int32
att-deact-pdp-ms	The total DPC Req Rx per APN Type: Counter	Int32
succ-deact-pdp-ms	The total Deactivate PDP Context Req successful from MS. Type: Counter	Int32

Variables	Description	Data Type
dyn-ipv4-attempt	The total number of IPv4 PDP contexts requesting dynamically assigned IP addresses that were attempted. Type: Counter	Int32
dyn-ipv6-attempt	The total number of IPv6 PDP contexts requesting dynamically assigned IP addresses that were attempted. Type: Counter	Int32
dyn-ipv4-success	The total number of IPv4 PDP contexts requesting dynamically assigned IP addresses that were successfully setup. Type: Counter	Int32
dyn-ipv6-success	The total number of IPv6 PDP contexts requesting dynamically assigned IP addresses that were successfully setup. Type: Counter	Int32
data-fromuseravg-bps	The sum of average data rate in bits per seconds (bps) from all the users under this VPN. Type: Gauge	Int64
data-touseravg-bps	The sum of average data rate in bps towards all the users under this VPN. Type: Gauge	Int64
data-fromusersust-bps	The sustained data rate in bps from the user. Type: Gauge	Int64
data-tousersust-bps	The sustained data rate in bps towards the user. Type: Gauge	Int64
data-fromuseravg-pps	The average data rate in packets per seconds (pps) from the user. Type: Gauge	Int64
data-touseravg-pps	The average data rate in pps towards the user. Type: Gauge	Int64
data-fromusersust-pps	The sustained data rate in pps from the user. Type: Gauge	Int64
data-tousersust-pps	The sustained data rate in pps towards the user. Type: Gauge	Int64
qosconv-pkts-uplnk	The number of packets with Conversational QoS sent from the APN towards Internet/PDN on the Gi interface. Type: Counter	Int32
qosconv-pkts-dnlnk	The number of packets with Conversational QoS sent from the APN towards MS on the GTP interface. Type: Counter	Int32
qosstrm-pkts-uplnk	The number of packets with Streaming QoS sent from the APN towards Internet/PDN on the Gi interface. Type: Counter	Int32
qosstrm-pkts-dnlnk	The number of packets with Streaming QoS sent from the APN towards MS on the GTP interface. Type: Counter	Int32

Variables	Description	Data Type
qosint1-pkts-uplnk	The number of packets with Interactive QoS for priority 1 sent from the APN towards Internet/PDN on the Gi interface. Type: Counter	Int32
qosint1-pkts-dnlnk	The number of packets with Interactive QoS for priority 1 sent from the APN towards MS on the GTP interface. Type: Counter	Int32
qosint2-pkts-uplnk	The number of packets with Interactive QoS for priority 2 sent from the APN towards Internet/PDN on the Gi interface. Type: Counter	Int32
qosint2-pkts-dnlnk	The number of packets with Interactive QoS for priority 2 sent from the APN towards MS on the GTP interface. Type: Counter	Int32
qosint3-pkts-uplnk	The number of packets with Interactive QoS for priority 3 sent from the APN towards Internet/PDN on the Gi interface. Type: Counter	Int32
qosint3-pkts-dnlnk	The number of packets with Interactive QoS for priority 3 sent from the APN towards MS on the GTP interface. Type: Counter	Int32
qosint-pkts-uplnk	Total number of packets with Interactive QoS for all priorities (priority 1, 2, and 3) sent from the APN towards Internet/PDN on the Gi interface. Type: Counter	Int32
qosint-pkts-dnlnk	Total number of packets with Interactive QoS for all priorities (priority 1, 2, and 3) sent from the APN towards MS on the GTP interface. Type: Counter	Int32
qosback-pkts-uplnk	The number of packets with Background QoS sent from the APN towards Internet/PDN on the Gi interface. Type: Counter	Int32
qosback-pkts-dnlnk	The number of packets with Background QoS sent from the APN towards MS on the GTP interface. Type: Counter	Int32
auth-req-sent	The total authentication requests sent from the APN towards AAA on Ga interface. Type: Counter	Int32
auth-acc-rcvd	The total authentication accept messages received by the APN on Ga Interface from AAA. Type: Counter	Int32
auth-timeout	The total authentication requests that timed out. Type: Counter	Int32
acc-req-sent	The total accounting requests sent from the APN towards AAA on Ga interface. Type: Counter	Int32

Variables	Description	Data Type
acc-rsp-rcvd	The total accounting response messages received by the APN on Ga Interface from AAA. Type: Counter	Int32
acc-req-timeout	The total accounting requests that timed out. Type: Counter	Int32
act-defbear	The total number of active default bearers. Type: Gauge	Int32
act-dedbear	The total number of active dedicated bearers. Type: Gauge	Int32
setup-defbear	The total number of default bearers setup. Type: Counter	Int32
setup-dedbear	The total number of dedicated bearers setup. Type: Counter	Int32
rel-defbear	The total number of released default bearers. Type: Counter	Int32
rel-dedbear	The total number of released dedicated bearers. Type: Counter	Int32
rel-fail-defbear	The total number of default bearers with release failures. Type: Counter	Int32
rel-fail-dedbear	The total number of dedicated bearers with release failures. Type: Counter	Int32
rej-defbear	The total number of rejected default bearers. Type: Counter	Int32
rej-dedbear	The total number of rejected dedicated bearers. Type: Counter	Int32
mod-uebear	The total number of UE-initiated modified bearers. Type: Counter	Int32
mod-nwbear	The total number of network-initiated modified bearers. Type: Counter	Int32
ue-init-modfail	The total number of failed UE-initiated modified bearers. Type: Counter	Int32
nw-init-modfail	The total number of failed network-initiated modified bearers. Type: Counter	Int32
pdn-ipv4-actsess	The total number of active IPv4 sessions. Type: Gauge	Int32
pdn-ipv4-setupsess	The total number of IPv4 session setup. Type: Counter	Int32
pdn-ipv4-relsess	The total number of released IPv4 sessions. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
pdn-ipv6-actsess	The total number of active IPv6 sessions. Type: Gauge	Int32
pdn-ipv6-setupsess	The total number of IPv6 session setup. Type: Counter	Int32
pdn-ipv6-relsess	The total number of released IPv6 sessions. Type: Counter	Int32
pdn-ipv4v6-actsess	The total number of active IPv4-in-IPv6 sessions. Type: Gauge	Int32
pdn-ipv4v6-setupsess	The total number of IPv4-in-IPv6 session setup. Type: Counter	Int32
pdn-ipv4v6-relsess	The total number of released IPv4-in-IPv6 sessions. Type: Counter	Int32
addr-ipv6-stateless-autocnf	The total number of allocated IPv6 addresses from stateless auto-configuration. Type: Counter	Int32
qci1-actbear	The total number of QCI1 active bearers. Type: Gauge	Int32
qci1-setupbear	The total number of QCI1 bearers setup. Type: Counter	Int32
qci1-relbear	The total number of QCI1 released bearers. Type: Counter	Int32
qci1-uplinkpkt-fwd	The total number of QCI1 uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci1-dwlinkpkt-fwd	The total number of QCI1 downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci1-uplinkbyte-fwd	The total number of QCI1 uplink bytes forwarded. Type: Counter	Int64
qci1-dwlinkbyte-fwd	The total number of QCI1 downlink bytes forwarded. Type: Counter	Int64
qci1-uplinkpkt-drop	The total number of QCI1 uplink packets dropped. Type: Counter	Int32
qci1-dwlinkpkt-drop	The total number of QCI1 downlink packets dropped. Type: Counter	Int32
qci1-uplinkbyte-drop	The total number of QCI1 uplink bytes dropped. Type: Counter	Int64
qci1-dwlinkbyte-drop	The total number of QCI1 downlink bytes dropped. Type: Counter	Int64

Variables	Description	Data Type
qci2-actbear	The total number of QCI2 active bearers. Type: Gauge	Int32
qci2-setupbear	The total number of QCI2 bearers setup. Type: Counter	Int32
qci2-relbear	The total number of QCI2 released bearers. Type: Counter	Int32
qci2-uplinkpkt-fwd	The total number of QCI2 uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci2-dwlinkpkt-fwd	The total number of QCI2 downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci2-uplinkbyte-fwd	The total number of QCI2 uplink bytes forwarded. Type: Counter	Int64
qci2-dwlinkbyte-fwd	The total number of QCI2 downlink bytes forwarded. Type: Counter	Int64
qci2-uplinkpkt-drop	The total number of QCI2 uplink packets dropped. Type: Counter	Int32
qci2-dwlinkpkt-drop	The total number of QCI2 downlink packets dropped. Type: Counter	Int32
qci2-uplinkbyte-drop	The total number of QCI2 uplink bytes dropped. Type: Counter	Int64
qci2-dwlinkbyte-drop	The total number of QCI2 downlink bytes dropped. Type: Counter	Int64
qci3-actbear	The total number of QCI3 active bearers. Type: Gauge	Int32
qci3-setupbear	The total number of QCI3 bearers setup. Type: Counter	Int32
qci3-relbear	The total number of QCI3 released bearers. Type: Counter	Int32
qci3-uplinkpkt-fwd	The total number of QCI3 uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci3-dwlinkpkt-fwd	The total number of QCI3 downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64

■ Common Syntax Options

Variables	Description	Data Type
qci3-uplinkbyte-fwd	The total number of QCI3 uplink bytes forwarded. Type: Counter	Int64
qci3-dwlinkbyte-fwd	The total number of QCI3 downlink bytes forwarded. Type: Counter	Int64
qci3-uplinkpkt-drop	The total number of QCI3 uplink packets dropped. Type: Counter	Int32
qci3-dwlinkpkt-drop	The total number of QCI3 downlink packets dropped. Type: Counter	Int32
qci3-uplinkbyte-drop	The total number of QCI3 uplink bytes dropped. Type: Counter	Int64
qci3-dwlinkbyte-drop	The total number of QCI3 downlink bytes dropped. Type: Counter	Int64
qci4-actbear	The total number of QCI4 active bearers. Type: Gauge	Int32
qci4-setupbear	The total number of QCI4 bearers setup. Type: Counter	Int32
qci4-relbear	The total number of QCI4 released bearers. Type: Counter	Int32
qci4-uplinkpkt-fwd	The total number of QCI4 uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci4-dwlinkpkt-fwd	The total number of QCI4 downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci4-uplinkbyte-fwd	The total number of QCI4 uplink bytes forwarded. Type: Counter	Int64
qci4-dwlinkbyte-fwd	The total number of QCI4 downlink bytes forwarded. Type: Counter	Int64
qci4-uplinkpkt-drop	The total number of QCI4 uplink packets dropped. Type: Counter	Int32
qci4-dwlinkpkt-drop	The total number of QCI4 downlink packets dropped. Type: Counter	Int32
qci4-uplinkbyte-drop	The total number of QCI4 uplink bytes dropped. Type: Counter	Int64
qci4-dwlinkbyte-drop	The total number of QCI4 downlink bytes dropped. Type: Counter	Int64
qci5-actbear	The total number of QCI5 active bearers. Type: Gauge	Int32

Variables	Description	Data Type
qci5-setupbear	The total number of QCI5 bearers setup. Type: Counter	Int32
qci5-relbear	The total number of QCI5 released bearers. Type: Counter	Int32
qci5-uplinkpkt-fwd	The total number of QCI5 uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci5-dwlinkpkt-fwd	The total number of QCI5 downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci5-uplinkbyte-fwd	The total number of QCI5 uplink bytes forwarded. Type: Counter	Int64
qci5-dwlinkbyte-fwd	The total number of QCI5 downlink bytes forwarded. Type: Counter	Int64
qci5-uplinkpkt-drop	The total number of QCI5 uplink packets dropped. Type: Counter	Int32
qci5-dwlinkpkt-drop	The total number of QCI5 downlink packets dropped. Type: Counter	Int32
qci5-uplinkbyte-drop	The total number of QCI5 uplink bytes dropped. Type: Counter	Int64
qci5-dwlinkbyte-drop	The total number of QCI5 downlink bytes dropped. Type: Counter	Int64
qci6-actbear	The total number of QCI6 active bearers. Type: Gauge	Int32
qci6-setupbear	The total number of QCI6 bearers setup. Type: Counter	Int32
qci6-relbear	The total number of QCI6 released bearers. Type: Counter	Int32
qci6-uplinkpkt-fwd	The total number of QCI6 uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci6-dwlinkpkt-fwd	The total number of QCI6 downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci6-uplinkbyte-fwd	The total number of QCI6 uplink bytes forwarded. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
qci6-dwlinkbyte-fwd	The total number of QCI6 downlink bytes forwarded. Type: Counter	Int64
qci6-uplinkpkt-drop	The total number of QCI6 uplink packets dropped. Type: Counter	Int32
qci6-dwlinkpkt-drop	The total number of QCI6 downlink packets dropped. Type: Counter	Int32
qci6-uplinkbyte-drop	The total number of QCI6 uplink bytes dropped. Type: Counter	Int64
qci6-dwlinkbyte-drop	The total number of QCI6 downlink bytes dropped. Type: Counter	Int64
qci7-actbear	The total number of QCI7 active bearers. Type: Gauge	Int32
qci7-setupbear	The total number of QCI7 bearers setup. Type: Counter	Int32
qci7-relbear	The total number of QCI7 released bearers. Type: Counter	Int32
qci7-uplinkpkt-fwd	The total number of QCI7 uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci7-dwlinkpkt-fwd	The total number of QCI7 downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci7-uplinkbyte-fwd	The total number of QCI7 uplink bytes forwarded. Type: Counter	Int64
qci7-dwlinkbyte-fwd	The total number of QCI7 downlink bytes forwarded. Type: Counter	Int64
qci7-uplinkpkt-drop	The total number of QCI7 uplink packets dropped. Type: Counter	Int32
qci7-dwlinkpkt-drop	The total number of QCI7 downlink packets dropped. Type: Counter	Int32
qci7-uplinkbyte-drop	The total number of QCI7 uplink bytes dropped. Type: Counter	Int64
qci7-dwlinkbyte-drop	The total number of QCI7 downlink bytes dropped. Type: Counter	Int64
qci8-actbear	The total number of QCI8 active bearers. Type: Gauge	Int32
qci8-setupbear	The total number of QCI8 bearers setup. Type: Counter	Int32

Variables	Description	Data Type
qci8-relbear	The total number of QCI8 released bearers. Type: Counter	Int32
qci8-uplinkpkt-fwd	The total number of QCI8 uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci8-dwlinkpkt-fwd	The total number of QCI8 downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci8-uplinkbyte-fwd	The total number of QCI8 uplink bytes forwarded. Type: Counter	Int64
qci8-dwlinkbyte-fwd	The total number of QCI8 downlink bytes forwarded. Type: Counter	Int64
qci8-uplinkpkt-drop	The total number of QCI8 uplink packets dropped. Type: Counter	Int32
qci8-dwlinkpkt-drop	The total number of QCI8 downlink packets dropped. Type: Counter	Int32
qci8-uplinkbyte-drop	The total number of QCI8 uplink bytes dropped. Type: Counter	Int64
qci8-dwlinkbyte-drop	The total number of QCI8 downlink bytes dropped. Type: Counter	Int64
qci9-actbear	The total number of QCI9 active bearers. Type: Gauge	Int32
qci9-setupbear	The total number of QCI9 bearers setup. Type: Counter	Int32
qci9-relbear	The total number of QCI9 released bearers. Type: Counter	Int32
qci9-uplinkpkt-fwd	The total number of QCI9 uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci9-dwlinkpkt-fwd	The total number of QCI9 downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
qci9-uplinkbyte-fwd	The total number of QCI9 uplink bytes forwarded. Type: Counter	Int64
qci9-dwlinkbyte-fwd	The total number of QCI9 downlink bytes forwarded. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
qci9-uplinkpkt-drop	The total number of QCI9 uplink packets dropped. Type: Counter	Int32
qci9-dwlinkpkt-drop	The total number of QCI9 downlink packets dropped. Type: Counter	Int32
qci9-uplinkbyte-drop	The total number of QCI9 uplink bytes dropped. Type: Counter	Int64
qci9-dwlinkbyte-drop	The total number of QCI9 downlink bytes dropped. Type: Counter	Int64
nonstdqci-nongbr-actbear	The total number of non-standard QCI, non-GBR active bearers. Type: Gauge	Int32
nonstdqci-nongbr-setupbear	The total number of non-standard QCI, non-GBR bearers setup. Type: Counter	Int32
nonstdqci-nongbr-relbear	The total number of non-standard QCI, non-GBR released bearers. Type: Counter	Int32
nonstdqci-nongbr-uplinkpkt-fwd	The total number of non-standard QCI, non-GBR uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
nonstdqci-nongbr-dwlinkpkt-fwd	The total number of non-standard QCI, non-GBR downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
nonstdqci-nongbr-uplinkbyte-fwd	The total number of non-standard QCI, non-GBR uplink bytes forwarded. Type: Counter	Int64
nonstdqci-nongbr-dwlinkbyte-fwd	The total number of non-standard QCI, non-GBR downlink bytes forwarded. Type: Counter	Int64
nonstdqci-nongbr-uplinkpkt-drop	The total number of non-standard QCI, non-GBR uplink packets dropped. Type: Counter	Int32
nonstdqci-nongbr-dwlinkpkt-drop	The total number of non-standard QCI, non-GBR downlink packets dropped. Type: Counter	Int32
nonstdqci-nongbr-uplinkbyte-drop	The total number of non-standard QCI, non-GBR uplink bytes dropped. Type: Counter	Int64
nonstdqci-nongbr-dwlinkbyte-drop	The total number of non-standard QCI, non-GBR downlink bytes dropped. Type: Counter	Int64
nonstdqci-gbr-actbear	The total number of non-standard QCI, GBR active bearers. Type: Gauge	Int32
nonstdqci-gbr-setupbear	The total number of non-standard QCI, GBR bearers setup. Type: Counter	Int32
nonstdqci-gbr-relbear	The total number of non-standard QCI, GBR released bearers. Type: Counter	Int32

Variables	Description	Data Type
nonstdqci-gbr-uplinkpkt-fwd	The total number of non-standard QCI, GBR uplink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
nonstdqci-gbr-dwlinkpkt-fwd	The total number of non-standard QCI, GBR downlink packets forwarded. Type: Counter	v12.2 and earlier: Int32 v12.3/14.0 and later: Int64
nonstdqci-gbr-uplinkbyte-fwd	The total number of non-standard QCI, GBR uplink bytes forwarded. Type: Counter	Int64
nonstdqci-gbr-dwlinkbyte-fwd	The total number of non-standard QCI, GBR downlink bytes forwarded. Type: Counter	Int64
nonstdqci-gbr-uplinkpkt-drop	The total number of non-standard QCI, GBR uplink packets dropped. Type: Counter	Int32
nonstdqci-gbr-dwlinkpkt-drop	The total number of non-standard QCI, GBR downlink packets dropped. Type: Counter	Int32
nonstdqci-gbr-uplinkbyte-drop	The total number of non-standard QCI, GBR uplink bytes dropped. Type: Counter	Int64
nonstdqci-gbr-dwlinkbyte-drop	The total number of non-standard QCI, GBR downlink bytes dropped. Type: Counter	Int64

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 5

ASNGW Schema Statistics

The ASNGW schema provides operational statistics that can be used for monitoring and troubleshooting the following products: ASNGW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 5. Bulk Statistic Variables ASN-GW Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the ASN GW service. This is a key variable.	String
vpnid	The identification number of the context configured on the system that is currently facilitating the ASN GW service. This is an internal reference number. This is a key variable.	Int32
servname	The name of the ASN GW service for which the statistics are displayed. This is a key variable.	String
servid	The identification number of the ASN GW service for which the statistics are displayed. This is a key variable.	Int32
peeripaddr	IP address of the peer ASN GW.	String
r6mspreattreq-totsent	The total number of MS pre-attachment request messages sent on the R6 interface.	Int32
r6mspreattreq-retranssent	The total number of MS pre-attachment request messages re-transmitted on the R6 interface.	Int32
r6mspreattreq-totsendfail	The total number of failures occurred during transaction ID generation and R6 MS Pre-attachment request message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6mspreattreq-totrec	The total number of MS pre-attachment request messages received on the R6 interface.	Int32
r6mspreattreq-totacc	The total number of MS pre-attachment request messages accepted on the R6 interface.	Int32
r6mspreattreq-totrelay	The total number of MS pre-attachment request messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a MS pre-attachment request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6mspreattreq-totdenied	The total number of MS pre-attachment request messages denied on the R6 interface.	Int32
r6mspreattreq-totdiscard	The total number of MS pre-attachment request messages discarded on the R6 interface.	Int32
r6mspreattreq-badform	The total number of badly formed MS pre-attachment request messages on the R6 interface.	Int32
r6mspreattreq-decodeerr	The total number of MS pre-attachment request messages on the R6 interface with decode error.	Int32
r6mspreattreq-unspecerr	The total number of MS pre-attachment request messages on the R6 interface with unspecified error.	Int32
r6mspreattreq-missmandtlv	The total number of MS pre-attachment request messages on the R6 interface with missing mandatory TLVs.	Int32
r6mspreattreq-tlvvalinval	The total number of MS pre-attachment request messages on the R6 interface with invalid TLV value.	Int32
r6mspreattreq-unknownltlv	The total number of MS pre-attachment request messages on the R6 interface with unknown TLVs.	Int32

Variables	Description	Data Type
r6mspreattreq-duptlvfound	The total number of MS pre-attachment request messages on the R6 interface with duplicate TLVs.	Int32
r6mspreattreq-nosessfound	The total number of MS pre-attachment request messages on the R6 interface without any session information.	Int32
r6mspreattreq-adminprohib	The total number of MS pre-attachment request messages discarded or denied due to admin prohibits. Triggers: Changes every time a MS pre-attachment request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6mspreattreq-noresourcedrop	The total number of MS pre-attachment request messages discarded or denied due to resource unavailability. Triggers: Changes every time a MS pre-attachment request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6mspreattreq-transiderr	The total number of MS pre-attachment request messages on the R6 interface with transaction ID errors.	Int32
r6mspreattrsp-totsent	The total number of MS pre-attachment response messages sent on the R6 interface.	Int32
r6mspreattrsp-retranssent	The total number of MS pre-attachment response messages re-transmitted on the R6 interface.	Int32
r6mspreattrsp-totsefail	The total number of failures occurred during transaction ID generation and R6 MS Pre-attachment response message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6mspreattrsp-totrec	The total number of MS pre-attachment response messages received on the R6 interface.	Int32
r6mspreattrsp-totacc	The total number of MS pre-attachment response messages accepted on the R6 interface.	Int32
r6mspreattrsp-totelay	The total number of MS pre-attachment response messages denied on the R6 interface.	Int32
r6mspreattrsp-totdenied	The total number of MS pre-attachment response messages discarded on the R6 interface.	Int32
r6mspreattrsp-totdiscard	The total number of badly formed MS pre-attachment response messages on the R6 interface.	Int32
r6mspreattrsp-badform	The total number of MS pre-attachment response messages on the R6 interface with decode error.	Int32
r6mspreattrsp-decodeerr	The total number of MS pre-attachment response messages on the R6 interface with unspecified error.	Int32
r6mspreattrsp-unspecerr	The total number of MS pre-attachment response messages on the R6 interface with missing mandatory TLVs.	Int32
r6mspreattrsp-missmandtlv	The total number of MS pre-attachment response messages on the R6 interface with invalid TLV value.	Int32
r6mspreattrsp-tlvvalinval	The total number of MS pre-attachment response messages denied on the R6 interface.	Int32

Common Syntax Options

Variables	Description	Data Type
r6mspreattrsp-unknownTLV	The total number of MS pre-attachment response messages on the R6 interface with unknown TLVs.	Int32
r6mspreattrsp-duptlVfound	The total number of MS pre-attachment response messages on the R6 interface with duplicate TLVs.	Int32
r6mspreattrsp-nosessfound	The total number of MS pre-attachment response messages on the R6 interface without any session information.	Int32
r6mspreattrsp-adminprohib	The total number of MS pre-attachment response messages discarded or denied due to admin prohibit. Triggers: Changes every time a MS pre-attachment response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6mspreattrsp-noresourceDroP	The total number of MS pre-attachment response messages discarded or denied due to resource unavailability. Triggers: Changes every time a MS pre-attachment response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6mspreattrsp-transiderr	The total number of MS pre-attachment response messages on the R6 interface with transaction ID errors.	Int32
r6mspreattack-totsent	The total number of MS pre-attachment acknowledgement messages sent on the R6 interface.	Int32
r6mspreattack-retranssent	The total number of MS pre-attachment acknowledgement messages re-transmitted on the R6 interface.	Int32
r6mspreattack-totSendfail	The total number of failures occurred during transaction ID generation and R6 MS Pre-attachment acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6mspreattack-totrec	The total number of MS pre-attachment acknowledgement messages received on the R6 interface.	Int32
r6mspreattack-totacc	The total number of MS pre-attachment acknowledgement messages accepted on the R6 interface.	Int32
r6mspreattack-totrelay	The total number of MS pre-attachment acknowledgement messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a MS pre-attachment acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6mspreattack-totdenied	The total number of MS pre-attachment acknowledgement messages denied on the R6 interface.	Int32
r6mspreattack-totdiscard	The total number of MS pre-attachment acknowledgement messages discarded on the R6 interface.	Int32
r6mspreattack-badform	The total number of badly formed MS pre-attachment acknowledgement messages on the R6 interface.	Int32

Variables	Description	Data Type
r6mspreattack-decodeerr	The total number of MS pre-attachment acknowledgement messages on the R6 interface with decode error.	Int32
r6mspreattack-unspeccerr	The total number of MS pre-attachment acknowledgement messages on the R6 interface with unspecified error.	Int32
r6mspreattack-missmandtlv	The total number of MS pre-attachment acknowledgement messages on the R6 interface with missing mandatory TLVs.	Int32
r6mspreattack-tlvvalinval	The total number of MS pre-attachment acknowledgement messages on the R6 interface with invalid TLV value.	Int32
r6mspreattack-unknowntlv	The total number of MS pre-attachment acknowledgement messages on the R6 interface with unknown TLVs.	Int32
r6mspreattack-duptlvfound	The total number of MS pre-attachment acknowledgement messages on the R6 interface with duplicate TLVs.	Int32
r6mspreattack-nosessfound	The total number of MS pre-attachment acknowledgement messages on the R6 interface without any session information.	Int32
r6mspreattack-adminprohib	The total number of MS pre-attachment acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a MS pre-attachment acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6mspreattack-noresourcedrop	The total number of MS pre-attachment acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a MS pre-attachment acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6mspreattack-transiderr	The total number of MS pre-attachment acknowledgement messages on the R6 interface with transaction ID errors.	Int32
r6nwexitmsstachareq-totsent	The total number of network exit MS state change request messages sent on the R6 the interface.	Int32
r6nwexitmsstachareq-retranssent	The total number of network exit MS state change request messages re-transmitted on the R6 interface.	Int32
r6nwexitmsstachareq-totsendfail	The total number of failures occurred during transaction ID generation and R6 network exit MS state change request message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6nwexitmsstachareq-totrec	The total number of network exit MS state change request messages received on the R6 interface.	Int32
r6nwexitmsstachareq-totacc	The total number of network exit MS state change request messages accepted on the R6 interface.	Int32

Variables	Description	Data Type
r6nwexitmsstachareq-totrelay	The total number of network exit MS state change request messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a network exit MS state change request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6nwexitmsstachareq-totdenied	The total number of network exit MS state change request messages denied on the R6 interface.	Int32
r6nwexitmsstachareq-totdiscard	The total number of network exit MS state change request messages discarded on the R6 interface.	Int32
r6nwexitmsstachareq-badform	The total number of badly formed network exit MS state change request messages on the R6 interface.	Int32
r6nwexitmsstachareq-decodeerr	The total number of network exit MS state change request messages on the R6 interface with decode error.	Int32
r6nwexitmsstachareq-unspecerr	The total number of network exit MS state change request messages on the R6 interface with unspecified error.	Int32
r6nwexitmsstachareq-mismandtlv	The total number of network exit MS state change request messages on the R6 interface with missing mandatory TLVs.	Int32
r6nwexitmsstachareq-tlvvalinval	The total number of network exit MS state change request messages on the R6 interface with invalid TLV value.	Int32
r6nwexitmsstachareq-unknowntrlv	The total number of network exit MS state change request messages on the R6 interface with unknown TLVs.	Int32
r6nwexitmsstachareq-duptlvfound	The total number of network exit MS state change request messages on the R6 interface with duplicate TLVs.	Int32
r6nwexitmsstachareq-nosessfound	The total number of network exit MS state change request messages on the R6 interface without any session information.	Int32
r6nwexitmsstachareq-adminprohib	The total number of network exit MS state change request messages on the R6 interface with transaction ID errors.	Int32
r6nwexitmsstachareq-noresourcedrop	The total number of network exit MS state change request messages discarded or denied due to resource unavailability. Triggers: Changes every time a network exit MS state change request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6nwexitmsstachareq-transiderr	The total number of network exit MS state change request messages discarded or denied due to transaction ID errors.	Int32
r6nwexitmsstacharsp-totsent	The total number of network exit MS state change response messages sent on the R6 interface.	Int32
r6nwexitmsstacharsp-retranssent	The total number of network exit MS state change response messages re-transmitted on the R6 interface.	Int32

Variables	Description	Data Type
r6nwexitmsstacharsp-totsendfail	The total number of failures occurred during transaction ID generation and R6 network exit MS state change response message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6nwexitmsstacharsp-totrec	The total number of network exit MS state change response messages received on the R6 interface.	Int32
r6nwexitmsstacharsp-totacc	The total number of network exit MS state change response messages accepted on the R6 interface.	Int32
r6nwexitmsstacharsp-totrelay	The total number of network exit MS state change response messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a network exit MS state change response message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6nwexitmsstacharsp-totdenied	The total number of network exit MS state change response messages denied on the R6 interface.	Int32
r6nwexitmsstacharsp-totdiscard	The total number of network exit MS state change response messages discarded on the R6 interface.	Int32
r6nwexitmsstacharsp-badform	The total number of badly formed network exit MS state change response messages on the R6 interface.	Int32
r6nwexitmsstacharsp-decodeerr	The total number of network exit MS state change response messages on the R6 interface with decode error.	Int32
r6nwexitmsstacharsp-unspecerr	The total number of network exit MS state change response messages on the R6 interface with unspecified error.	Int32
r6nwexitmsstacharsp-missmandtlv	The total number of network exit MS state change response messages on the R6 interface with missing mandatory TLVs.	Int32
r6nwexitmsstacharsp-tlvvalinval	The total number of network exit MS state change response messages on the R6 interface with invalid TLV value.	Int32
r6nwexitmsstacharsp-unknowntrlv	The total number of network exit MS state change response messages on the R6 interface with unknown TLVs.	Int32
r6nwexitmsstacharsp-duptlvfound	The total number of network exit MS state change response messages on the R6 interface with duplicate TLVs.	Int32
r6nwexitmsstacharsp-nosessfound	The total number of network exit MS state change response messages on the R6 interface without any session information.	Int32
r6nwexitmsstacharsp-adminprohib	The total number of network exit MS state change response messages discarded or denied due to admin prohibit. Triggers: Changes every time a network exit MS state change response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r6nwexitmsstacharsp-noresourcedrop	The total number of network exit MS state change response messages discarded or denied due to resource unavailability. Triggers: Changes every time a network exit MS state change response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service.	Int32
r6nwexitmsstacharsp-transiderr	The total number of network exit MS state change response messages on the R6 interface with transaction ID errors.	Int32
r6contextreq-totsent	The total number of context request messages sent on the R6 interface.	Int32
r6contextreq-retranssent	The total number of context request messages re-transmitted on the R6 interface.	Int32
r6contextreq-totsendfail	The total number of failures occurred during transaction ID generation and R6 Context Request message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6contextreq-totrec	The total number of context request messages received on the R6 interface.	Int32
r6contextreq-totacc	The total number of context request messages accepted on the R6 interface.	Int32
r6contextreq-totrelay	The total number of context request messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a context request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6contextreq-totdenied	The total number of context request messages denied on the R6 interface.	Int32
r6contextreq-totdiscard	The total number of context request messages discarded on the R6 interface.	Int32
r6contextreq-badform	The total number of badly formed context request messages on the R6 interface.	Int32
r6contextreq-decodeerr	The total number of context request messages on the R6 interface with decode error.	Int32
r6contextreq-unspecerr	The total number of context request messages on the R6 interface with unspecified error.	Int32
r6contextreq-missmandtlv	The total number of context request messages on the R6 interface with missing mandatory TLVs.	Int32
r6contextreq-tlvvalinval	The total number of context request messages on the R6 interface with invalid TLV value.	Int32
r6contextreq-unknowntrlv	The total number of context request messages on the R6 interface with unknown TLVs.	Int32
r6contextreq-duptlvfound	The total number of context request messages on the R6 interface with duplicate TLVs.	Int32
r6contextreq-nosessfound	The total number of context request messages on the R6 interface without any session information.	Int32
r6contextreq-adminprohib	The total number of context request messages discarded or denied due to admin prohibit. Triggers: Changes every time a context request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Variables	Description	Data Type
r6contextreq-noresourcedrop	The total number of context request messages discarded or denied due to resource unavailability. Triggers: Changes every time a context request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service.	Int32
r6contextreq-transiderr	The total number of context request messages on the R6 interface with transaction ID errors.	Int32
r6contextrepo-totsent	The total number of context report messages sent on the R6 interface.	Int32
r6contextrepo-retranssent	The total number of context report messages re-transmitted on the R6 interface.	Int32
r6contextrepo-totsendfail	The total number of failures occurred during transaction ID generation and R6 Context Report message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6contextrepo-totrec	The total number of context report messages received on the R6 interface.	Int32
r6contextrepo-totacc	The total number of context report messages =accepted on the R6 interface.	Int32
r6contextrepo-totrelay	The total number of context report messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a context report message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6contextrepo-totdenied	The total number of context report messages denied on the R6 interface.	Int32
r6contextrepo-totdiscard	The total number of context report messages discarded on the R6 interface.	Int32
r6contextrepo-badform	The total number of badly formed context report messages on the R6 interface.	Int32
r6contextrepo-decodeerr	The total number of context report messages on the R6 interface with decode error.	Int32
r6contextrepo-unspecerr	The total number of context report messages on the R6 interface with unspecified error.	Int32
r6contextrepo-misssmandtlv	The total number of context report messages on the R6 interface with missing mandatory TLVs.	Int32
r6contextrepo-tlvvalinval	The total number of context report messages on the R6 interface with invalid TLV value.	Int32
r6contextrepo-unknown_tlv	The total number of context report messages on the R6 interface with unknown TLVs.	Int32
r6contextrepo-duptlvfound	The total number of context report messages on the R6 interface with duplicate TLVs.	Int32
r6contextrepo-nosessfound	The total number of context report messages on the R6 interface without any session information.	Int32
r6contextrepo-adminprohib	The total number of context report messages discarded or denied due to admin prohibit. Triggers: Changes every time a context report message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r6contextrepo-noresourcedrop	The total number of context report messages discarded or denied due to resource unavailability. Triggers: Changes every time a context report message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6contextrepo-transiderr	The total number of context report messages on the R6 interface with transaction ID errors.	Int32
r6contextack-totsent	The total number of context acknowledgement messages sent on the R6 interface.	Int32
r6contextack-retranssent	The total number of context acknowledgement messages re-transmitted on the R6 interface.	Int32
r6contextack-totsendfail	The total number of failures occurred during transaction ID generation and R6 Context acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6contextack-totrec	The total number of context acknowledgement messages received on the R6 interface.	Int32
r6contextack-totacc	The total number of context acknowledgement messages accepted on the R6 interface.	Int32
r6contextack-totrelay	The total number of context acknowledgement messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a context acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6contextack-totdenied	The total number of context acknowledgement messages denied on the R6 interface.	Int32
r6contextack-totdiscard	The total number of context acknowledgement messages discarded on the R6 interface.	Int32
r6contextack-badform	The total number of badly formed context acknowledgement messages on the R6 interface.	Int32
r6contextack-decodeerr	The total number of context acknowledgement messages on the R6 interface with decode error.	Int32
r6contextack-unspecerr	The total number of context acknowledgement messages on the R6 interface with unspecified error.	Int32
r6contextack-missmandtlv	The total number of context acknowledgement messages on the R6 interface with missing mandatory TLVs.	Int32
r6contextack-tlvvalinval	The total number of context acknowledgement messages on the R6 interface with invalid TLV value.	Int32
r6contextack-unknowntrlv	The total number of context acknowledgement messages on the R6 interface with unknown TLVs.	Int32
r6contextack-duptlvfound	The total number of context acknowledgement messages on the R6 interface with duplicate TLVs.	Int32
r6contextack-nosessfound	The total number of context acknowledgement messages on the R6 interface without any session information.	Int32

Variables	Description	Data Type
r6contextack-adminprohib	The total number of context acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a context acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6contextack-noresourcedrop	The total number of context acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a context acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6contextack-transiderr	The total number of context acknowledgement messages on the R6 interface with transaction ID errors.	Int32
r6autheaptra-totsent	The total number of authentication EAP transfer messages sent on the R6 interface.	Int32
r6autheaptra-retranssent	The total number of authentication EAP transfer messages re-transmitted on the R6 interface.	Int32
r6autheaptra-totsendfail	The total number of failures occurred during transaction ID generation and R6 EAP transfer message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6autheaptra-totrec	The total number of authentication EAP transfer messages received on the R6 interface.	Int32
r6autheaptra-totacc	The total number of authentication EAP transfer messages accepted on the R6 interface.	Int32
r6autheaptra-totrelay	The total number of authentication EAP transfer messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an authentication EAP transfer message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6autheaptra-totdenied	The total number of authentication EAP transfer messages denied on the R6 interface.	Int32
r6autheaptra-totdiscard	The total number of authentication EAP transfer messages discarded on the R6 interface.	Int32
r6autheaptra-badform	The total number of badly formed authentication EAP transfer messages on the R6 interface.	Int32
r6autheaptra-decodeerr	The total number of authentication EAP transfer messages on the R6 interface with decode error.	Int32
r6autheaptra-unspecerr	The total number of authentication EAP transfer messages on the R6 interface with unspecified error.	Int32
r6autheaptra-missmandtlv	The total number of authentication EAP transfer messages on the R6 interface with missing mandatory TLVs.	Int32
r6autheaptra-tlvvalinval	The total number of authentication EAP transfer messages on the R6 interface with invalid TLV value.	Int32
r6autheaptra-unknowntrlv	The total number of authentication EAP transfer messages on the R6 interface with unknown TLVs.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r6autheaptra-duptlvfound	The total number of authentication EAP transfer messages on the R6 interface with duplicate TLVs.	Int32
r6autheaptra-nosessfound	The total number of authentication EAP transfer messages on the R6 interface without any session information.	Int32
r6autheaptra-adminprohib	The total number of authentication EAP transfer messages discarded or denied due to admin prohibit. Triggers: Changes every time an authentication EAP transfer message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6autheaptra-noresourcedrop	The total number of authentication EAP transfer messages discarded or denied due to resource unavailability. Triggers: Changes every time an authentication EAP transfer message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6autheaptra-transiderr	The total number of authentication EAP transfer messages on the R6 interface with transaction ID errors.	Int32
r6autheapsta-totrec	The total number of authentication EAP start messages sent on the R6 interface.	Int32
r6autheapsta-totacc	The total number of authentication EAP start messages accepted on the R6 interface.	Int32
r6autheapsta-totrelay	The total number of authentication EAP start messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an authentication EAP start message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6autheapsta-totdenied	The total number of authentication EAP start messages denied on the R6 interface.	Int32
r6autheapsta-totdiscard	The total number of authentication EAP start messages discarded on the R6 interface.	Int32
r6autheapsta-badform	The total number of badly formed authentication EAP start messages on the R6 interface.	Int32
r6autheapsta-decodeerr	The total number of authentication EAP start messages on the R6 interface with decode error.	Int32
r6autheapsta-unspecerr	The total number of authentication EAP start messages on the R6 interface with unspecified error.	Int32
r6autheapsta-missmandtlv	The total number of authentication EAP start messages on the R6 interface with missing mandatory TLVs.	Int32
r6autheapsta-tlvvalinval	The total number of authentication EAP start messages on the R6 interface with invalid TLV value.	Int32
r6autheapsta-unknowntrlv	The total number of authentication EAP start messages on the R6 interface with unknown TLVs.	Int32
r6autheapsta-duptlvfound	The total number of authentication EAP start messages on the R6 interface with duplicate TLVs.	Int32

Variables	Description	Data Type
r6autheapsta-nosessfound	The total number of authentication EAP start messages on the R6 interface without any session information.	Int32
r6autheapsta-adminprohib	The total number of authentication EAP start messages discarded or denied due to admin prohibit. Triggers: Changes every time an authentication EAP start message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6autheapsta-noresourcedrop	The total number of authentication EAP start messages discarded or denied due to resource unavailability. Triggers: Changes every time an authentication EAP start message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6autheapsta-transiderr	The total number of authentication EAP start messages on the R6 interface with transaction ID errors.	Int32
r6msattreq-totsent	The total number of MS attachment request messages sent on the R6 interface.	Int32
r6msattreq-retranssent	The total number of MS attachment request messages re-transmitted on the R6 interface.	Int32
r6msattreq-totsendfail	The total number of failures occurred during transaction ID generation and R6 MS Attachment Request message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6msattreq-totrec	The total number of MS attachment request messages received on the R6 interface.	Int32
r6msattreq-totacc	The total number of MS attachment request messages accepted on the R6 interface.	Int32
r6msattreq-totrelay	The total number of MS attachment request messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an MS attachment request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6msattreq-totdenied	The total number of MS attachment request messages denied on the R6 interface.	Int32
r6msattreq-totdiscard	The total number of MS attachment request messages discarded on the R6 interface.	Int32
r6msattreq-badform	The total number of badly formed MS attachment request messages on the R6 interface.	Int32
r6msattreq-decodeerr	The total number of MS attachment request messages on the R6 interface with decode error.	Int32
r6msattreq-unspecerr	The total number of MS attachment request messages on the R6 interface with unspecified error.	Int32
r6msattreq-mismandtlv	The total number of MS attachment request messages on the R6 interface with missing mandatory TLVs.	Int32
r6msattreq-tlvvalinval	The total number of MS attachment request messages on the R6 interface with invalid TLV value.	Int32
r6msattreq-unknowntrlv	The total number of MS attachment request messages on the R6 interface with unknown TLVs.	Int32

Common Syntax Options

Variables	Description	Data Type
r6msattreq-duptlvfound	The total number of MS attachment request messages on the R6 interface with duplicate TLVs.	Int32
r6msattreq-nosessfound	The total number of MS attachment request messages on the R6 interface without any session information.	Int32
r6msattreq-adminprohib	The total number of MS attachment request messages discarded or denied due to admin prohibit. Triggers: Changes every time an MS attachment request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6msattreq-noresourcedrop	The total number of MS attachment request messages discarded or denied due to resource unavailability. Triggers: Changes every time an MS attachment request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6msattreq-transiderr	The total number of MS attachment request messages on the R6 interface with transaction ID errors.	Int32
r6msattrsp-totsent	The total number of MS attachment response messages sent on the R6 interface.	Int32
r6msattrsp-retransent	The total number of MS attachment response messages re-transmitted on the R6 interface.	Int32
r6msattrsp-totsefail	The total number of failures occurred during transaction ID generation and R6 MS Attachment Response message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6msattrsp-totrec	The total number of MS attachment response messages received on the R6 interface.	Int32
r6msattrsp-totacc	The total number of MS attachment response messages accepted on the R6 interface.	Int32
r6msattrsp-totrelay	The total number of MS attachment response messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an MS attachment response message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6msattrsp-totdenied	The total number of MS attachment response messages denied on the R6 interface.	Int32
r6msattrsp-totdiscard	The total number of MS attachment response messages discarded on the R6 interface.	Int32
r6msattrsp-badform	The total number of badly formed MS attachment response messages on the R6 interface.	Int32
r6msattrsp-decodeerr	The total number of MS attachment response messages on the R6 interface with decode error.	Int32
r6msattrsp-unspecerr	The total number of MS attachment response messages on the R6 interface with unspecified error.	Int32
r6msattrsp-missmandtlv	The total number of MS attachment response messages on the R6 interface with missing mandatory TLVs.	Int32
r6msattrsp-tlvvalinval	The total number of MS attachment response messages on the R6 interface with invalid TLV value.	Int32

Variables	Description	Data Type
r6msattrsp-unknowntlv	The total number of MS attachment response messages on the R6 interface with unknown TLVs.	Int32
r6msattrsp-duptlvfound	The total number of MS attachment response messages on the R6 interface with duplicate TLVs.	Int32
r6msattrsp-nosessfound	The total number of MS attachment response messages on the R6 interface without any session information.	Int32
r6msattrsp-adminprohib	The total number of MS attachment response messages discarded or denied due to admin prohibit. Triggers: Changes every time an MS attachment response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6msattrsp-noresourcedrop	The total number of MS attachment response messages discarded or denied due to resource unavailability. Triggers: Changes every time an MS attachment response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6msattrsp-transiderr	The total number of MS attachment response messages on the R6 interface with transaction ID errors.	Int32
r6msattack-totsent	The total number of MS attachment acknowledgement messages sent on the R6 interface.	Int32
r6msattack-retranssent	The total number of MS attachment acknowledgement messages re-transmitted on the R6 interface.	Int32
r6msattack-totsefail	The total number of failures occurred during transaction ID generation and R6 MS attachment acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6msattack-totrec	The total number of MS attachment acknowledgement messages received on the R6 interface.	Int32
r6msattack-totacc	The total number of MS attachment acknowledgement messages accepted on the R6 interface.	Int32
r6msattack-totrelay	The total number of MS attachment acknowledgement messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an MS attachment acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6msattack-totdenied	The total number of MS attachment acknowledgement messages denied on the R6 interface.	Int32
r6msattack-totdiscard	The total number of MS attachment acknowledgement messages discarded on the R6 interface.	Int32
r6msattack-badform	The total number of badly formed MS attachment acknowledgement messages on the R6 interface.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r6msattack-decodeerr	The total number of MS attachment acknowledgement messages on the R6 interface with decode error.	Int32
r6msattack-unspecerr	The total number of MS attachment acknowledgement messages on the R6 interface with unspecified error.	Int32
r6msattack-missmandtlv	The total number of MS attachment acknowledgement messages on the R6 interface with missing mandatory TLVs.	Int32
r6msattack-tlvvalinval	The total number of MS attachment acknowledgement messages on the R6 interface with invalid TLV value.	Int32
r6msattack-unknownctlv	The total number of MS attachment acknowledgement messages on the R6 interface with unknown TLVs.	Int32
r6msattack-duptlvfound	The total number of MS attachment acknowledgement messages on the R6 interface with duplicate TLVs.	Int32
r6msattack-nosessfound	The total number of MS attachment acknowledgement messages on the R6 interface without any session information.	Int32
r6msattack-adminprohib	The total number of MS attachment acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time an MS attachment acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6msattack-noresourcedrop	The total number of MS attachment acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time an MS attachment acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6msattack-transiderr	The total number of MS attachment acknowledgement messages on the R6 interface with transaction ID errors.	Int32
r6datapathpreregreq-totsent	The total number of data path pre-registration request messages sent on the R6 interface.	Int32
r6datapathpreregreq-retranssent	The total number of data path pre-registration request messages re-transmitted on the R6 interface.	Int32
r6datapathpreregreq-totsendfail	The total number of failures occurred during transaction ID generation and R6 data path pre-registration request message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6datapathpreregreq-totrec	The total number of data path pre-registration request messages received on the R6 interface.	Int32
r6datapathpreregreq-totacc	The total number of data path pre-registration request messages accepted on the R6 interface.	Int32

Variables	Description	Data Type
r6datapathpreregreq-totrelay	The total number of data path pre-registration request messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a data path pre-registration request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6datapathpreregreq-totdenied	The total number of data path pre-registration request messages denied on the R6 interface.	Int32
r6datapathpreregreq-totdiscard	The total number of data path pre-registration request messages discarded on the R6 interface.	Int32
r6datapathpreregreq-badform	The total number of badly formed data path pre-registration request messages on the R6 interface.	Int32
r6datapathpreregreq-decodeerr	The total number of data path pre-registration request messages on the R6 interface with decode error.	Int32
r6datapathpreregreq-unspecerr	The total number of data path pre-registration request messages on the R6 interface with unspecified error.	Int32
r6datapathpreregreq-missmandtlv	The total number of data path pre-registration request messages on the R6 interface with missing mandatory TLVs.	Int32
r6datapathpreregreq-tlvvalinval	The total number of data path pre-registration request messages on the R6 interface with invalid TLV value.	Int32
r6datapathpreregreq-unknowntrlv	The total number of data path pre-registration request messages on the R6 interface with unknown TLVs.	Int32
r6datapathpreregreq-duptrlvfound	The total number of data path pre-registration request messages on the R6 interface with duplicate TLVs.	Int32
r6datapathpreregreq-nosessfound	The total number of data path pre-registration request messages on the R6 interface without any session information.	Int32
r6datapathpreregreq-adminprohib	The total number of data path pre-registration request messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path pre-registration request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6datapathpreregreq-noresourcedrop	The total number of data path pre-registration request messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path pre-registration request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6datapathpreregreq-transiderr	The total number of data path pre-registration request messages on the R6 interface with transaction ID errors.	Int32
r6datapathpreregsp-totsent	The total number of data path pre-registration response messages sent on the R6 interface.	Int32

Common Syntax Options

Variables	Description	Data Type
r6datapathpreregrsp-retransent	The total number of data path pre-registration response messages re-transmitted on the R6 interface.	Int32
r6datapathpreregrsp-totendfail	The total number of failures occurred during transaction ID generation and R6 data path pre-registration response message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6datapathpreregrsp-totrec	The total number of data path pre-registration response messages received on the R6 interface.	Int32
r6datapathpreregrsp-totacc	The total number of data path pre-registration response messages accepted on the R6 interface.	Int32
r6datapathpreregrsp-totrelay	The total number of data path pre-registration response messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a data path pre-registration response message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6datapathpreregrsp-totdenied	The total number of data path pre-registration response messages denied on the R6 interface.	Int32
r6datapathpreregrsp-totdiscard	The total number of data path pre-registration response messages discarded on the R6 interface.	Int32
r6datapathpreregrsp-badform	The total number of badly formed data path pre-registration response messages on the R6 interface.	Int32
r6datapathpreregrsp-decodeerr	The total number of data path pre-registration response messages on the R6 interface with decode error.	Int32
r6datapathpreregrsp-unspecerr	The total number of data path pre-registration response messages on the R6 interface with unspecified error.	Int32
r6datapathpreregrsp-mismandtlv	The total number of data path pre-registration response messages on the R6 interface with missing mandatory TLVs.	Int32
r6datapathpreregrsp-tlvvalinval	The total number of data path pre-registration response messages on the R6 interface with invalid TLV value.	Int32
r6datapathpreregrsp-unknownnltv	The total number of data path pre-registration response messages on the R6 interface with unknown TLVs.	Int32
r6datapathpreregrsp-duptlvfound	The total number of data path pre-registration response messages on the R6 interface with duplicate TLVs.	Int32
r6datapathpreregrsp-nosessfound	The total number of data path pre-registration response messages on the R6 interface without any session information.	Int32
r6datapathpreregrsp-adminprohib	The total number of data path pre-registration response messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path pre-registration response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Variables	Description	Data Type
r6datapathpreregsp-noreourcedrop	The total number of data path pre-registration response messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path pre-registration response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6datapathpreregsp-transiderr	The total number of data path pre-registration response messages on the R6 interface with transaction ID errors.	Int32
r6datapathpreregack-totsent	The total number of data path pre-registration acknowledgement messages sent on the R6 interface.	Int32
r6datapathpreregack-retranssent	The total number of data path pre-registration acknowledgement messages re-transmitted on the R6 interface.	Int32
r6datapathpreregack-totendfail	The total number of failures occurred during transaction ID generation and R6 data path pre-registration acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6datapathpreregack-totrec	The total number of data path pre-registration acknowledgement messages received on the R6 interface.	Int32
r6datapathpreregack-totacc	The total number of data path pre-registration acknowledgement messages accepted on the R6 interface.	Int32
r6datapathpreregack-totrelay	The total number of data path pre-registration acknowledgement messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a data path pre-registration acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6datapathpreregack-totdenied	The total number of data path pre-registration acknowledgement messages denied on the R6 interface.	Int32
r6datapathpreregack-totdiscard	The total number of data path pre-registration acknowledgement messages discarded on the R6 interface.	Int32
r6datapathpreregack-badform	The total number of badly formed data path pre-registration acknowledgement messages on the R6 interface.	Int32
r6datapathpreregack-decodeerr	The total number of data path pre-registration acknowledgement messages on the R6 interface with decode error.	Int32
r6datapathpreregack-unspecerr	The total number of data path pre-registration acknowledgement messages on the R6 interface with unspecified error.	Int32
r6datapathpreregack-missmandtlv	The total number of data path pre-registration acknowledgement messages on the R6 interface with missing mandatory TLVs.	Int32
r6datapathpreregack-tlvvalinval	The total number of data path pre-registration acknowledgement messages on the R6 interface with invalid TLV value.	Int32
r6datapathpreregack-unknowntrlv	The total number of data path pre-registration acknowledgement messages on the R6 interface with unknown TLVs.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r6datapathpreregack-duptlvfound	The total number of data path pre-registration acknowledgement messages on the R6 interface with duplicate TLVs.	Int32
r6datapathpreregack-nosessfound	The total number of data path pre-registration acknowledgement messages on the R6 interface without any session information.	Int32
r6datapathpreregack-adminprohib	The total number of data path pre-registration acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path pre-registration acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6datapathpreregack-noresourcedrop	The total number of data path pre-registration acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path pre-registration acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6datapathpreregack-transiderr	The total number of data path pre-registration acknowledgement messages on the R6 interface with transaction ID errors.	Int32
r6datapathregreq-totsent	The total number of data path registration request messages sent on the R6 interface.	Int32
r6datapathregreq-retranssent	The total number of data path registration request messages re-transmitted on the R6 interface.	Int32
r6datapathregreq-totsendfail	The total number of failures occurred during transaction ID generation and R6 data path registration request message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6datapathregreq-totrec	The total number of data path registration request messages received on the R6 interface.	Int32
r6datapathregreq-totacc	The total number of data path registration request messages accepted on the R6 interface.	Int32
r6datapathregreq-totrelay	The total number of data path registration request messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a data path registration request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6datapathregreq-totdenied	The total number of data path registration request messages denied on the R6 interface.	Int32
r6datapathregreq-totdiscard	The total number of data path registration request messages discarded on the R6 interface.	Int32
r6datapathregreq-badform	The total number of badly formed data path registration request messages on the R6 interface.	Int32
r6datapathregreq-decodeerr	The total number of data path registration request messages on the R6 interface with decode error.	Int32
r6datapathregreq-unspecerr	The total number of data path registration request messages on the R6 interface with unspecified error.	Int32
r6datapathregreq-missmandtlv	The total number of data path registration request messages on the R6 interface with missing mandatory TLVs.	Int32

Variables	Description	Data Type
r6datapathregreq-tlvvalinval	The total number of data path registration request messages on the R6 interface with invalid TLV value.	Int32
r6datapathregreq-unknown_tlv	The total number of data path registration request messages on the R6 interface with unknown TLVs.	Int32
r6datapathregreq-dup_tlv_found	The total number of data path registration request messages on the R6 interface with duplicate TLVs.	Int32
r6datapathregreq-no_session_found	The total number of data path registration request messages on the R6 interface without any session information.	Int32
r6datapathregreq-admin_prohibit	The total number of data path registration request messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path registration request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6datapathregreq-no_resource_drop	The total number of data path registration request messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path registration request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6datapathregreq-transaction_id_err	The total number of data path registration request messages on the R6 interface with transaction ID errors.	Int32
r6datapathregrsp-tot_sent	The total number of data path registration response messages sent on the R6 interface.	Int32
r6datapathregrsp-retransmit	The total number of data path registration response messages re-transmitted on the R6 interface.	Int32
r6datapathregrsp-tot_send_fail	The total number of failures occurred during transaction ID generation and R6 data path registration response message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6datapathregrsp-tot_rec	The total number of data path registration response messages received on the R6 interface.	Int32
r6datapathregrsp-tot_acc	The total number of data path registration response messages accepted on the R6 interface.	Int32
r6datapathregrsp-tot_relay	The total number of data path registration response messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a data path registration response message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6datapathregrsp-tot_denied	The total number of data path registration response messages denied on the R6 interface.	Int32
r6datapathregrsp-tot_discard	The total number of data path registration response messages discarded on the R6 interface.	Int32
r6datapathregrsp-bad_form	The total number of badly formed data path registration response messages on the R6 interface.	Int32

Variables	Description	Data Type
r6datapathregrsp-decodeerr	The total number of data path registration response messages on the R6 interface with decode error.	Int32
r6datapathregrsp-unspecerr	The total number of data path registration response messages on the R6 interface with unspecified error.	Int32
r6datapathregrsp-missmandtlv	The total number of data path registration response messages on the R6 interface with missing mandatory TLVs.	Int32
r6datapathregrsp-tlvvalinval	The total number of data path registration response messages on the R6 interface with invalid TLV value.	Int32
r6datapathregrsp-unknownctlv	The total number of data path registration response messages on the R6 interface with unknown TLVs.	Int32
r6datapathregrsp-dupctlvfound	The total number of data path registration response messages on the R6 interface with duplicate TLVs.	Int32
r6datapathregrsp-nosessfound	The total number of data path registration response messages on the R6 interface without any session information.	Int32
r6datapathregrsp-adminprohib	The total number of data path registration response messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path registration response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6datapathregrsp-noresourcedrop	The total number of data path registration response messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path registration response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6datapathregrsp-transiderr	The total number of data path registration response messages on the R6 interface with transaction ID errors.	Int32
r6datapathregack-totsent	The total number of data path registration acknowledgement messages sent on the R6 interface.	Int32
r6datapathregack-retranssent	The total number of data path registration acknowledgement messages re-transmitted on the R6 interface.	Int32
r6datapathregack-totsendfail	The total number of failures occurred during transaction ID generation and R6 data path registration acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6datapathregack-totrec	The total number of data path registration acknowledgement messages received on the R6 interface.	Int32
r6datapathregack-totacc	The total number of data path registration acknowledgement messages accepted on the R6 interface.	Int32

Variables	Description	Data Type
r6datapathregack-totrelay	The total number of data path registration acknowledgement messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a data path registration acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6datapathregack-totdenied	The total number of data path registration acknowledgement messages denied on the R6 interface.	Int32
r6datapathregack-totdiscard	The total number of data path registration acknowledgement messages discarded on the R6 interface.	Int32
r6datapathregack-badform	The total number of badly formed data path registration acknowledgement messages on the R6 interface.	Int32
r6datapathregack-decodeerr	The total number of data path registration acknowledgement messages on the R6 interface with decode error.	Int32
r6datapathregack-unspecerr	The total number of data path registration acknowledgement messages on the R6 interface with unspecified error.	Int32
r6datapathregack-missmandtlv	The total number of data path registration acknowledgement messages on the R6 interface with missing mandatory TLVs.	Int32
r6datapathregack-tlvvalinval	The total number of data path registration acknowledgement messages on the R6 interface with invalid TLV value.	Int32
r6datapathregack-unknowntrlv	The total number of data path registration acknowledgement messages on the R6 interface with unknown TLVs.	Int32
r6datapathregack-duptlvfound	The total number of data path registration acknowledgement messages on the R6 interface with duplicate TLVs.	Int32
r6datapathregack-nosessfound	The total number of data path registration acknowledgement messages on the R6 interface without any session information.	Int32
r6datapathregack-adminprohib	The total number of data path registration acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path registration acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6datapathregack-noresourcedrop	The total number of data path registration acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path registration acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6datapathregack-transiderr	The total number of data path registration acknowledgement messages on the R6 interface with transaction ID errors.	Int32
r6pathmodreq-totsent	The total number of data path modification request messages sent on the R6 interface.	Int32
r6pathmodreq-retranssent	The total number of retransmitted data path modification request messages sent on the R6 interface.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r6pathmodreq-totsendfail	The total number of failed data path modification request messages sent on the R6 interface.	Int32
r6pathmodreq-totrec	The total number of data path modification request messages received on the R6 interface.	Int32
r6pathmodreq-totacc	The total number of accepted data path modification request messages sent on the R6 interface.	Int32
r6pathmodreq-totrelay	The total number of data path modification request messages relayed on the R6 interface.	Int32
r6pathmodreq-totdenied	The total number of denied data path modification request messages sent on the R6 interface.	Int32
r6pathmodreq-totdiscard	The total number of discarded data path modification request messages sent on the R6 interface.	Int32
r6pathmodreq-badform	The total number of data path modification request messages with a bad format sent on the R6 interface.	Int32
r6pathmodreq-decodeerr	The total number of data path modification request messages with decode errors sent on the R6 interface.	Int32
r6pathmodreq-unspecerr	The total number of data path modification request messages with unspecified errors sent on the R6 interface.	Int32
r6pathmodreq-missmandtlv	The total number of data path modification request messages sent on the R6 interface with a missing mandatory TLV.	Int32
r6pathmodreq-tlvvalinval	The total number of data path modification request messages sent on the R6 interface with an invalid TLV.	Int32
r6pathmodreq-unknowntlv	The total number of data path modification request messages sent on the R6 interface with an unknown TLV.	Int32
r6pathmodreq-duptlvfound	The total number of data path modification request messages sent on the R6 interface found with a duplicate TLV.	Int32
r6pathmodreq-nosessfound	The total number of data path modification request messages sent on the R6 interface with no session found.	Int32
r6pathmodreq-adminprohib	The total number of data path modification request messages sent on the R6 interface with administration prohibited.	Int32
r6pathmodreq-noresourcedrop	The total number of data path modification request messages discarded or denied due to resource unavailability.	Int32
r6pathmodreq-transiderr	The total number of data path modification request messages sent on the R6 interface with transaction ID errors.	Int32
r6pathmodrsp-totsent	The total number of data path modification response messages sent on the R6 interface.	Int32
r6pathmodrsp-retranssent	The total number of retransmitted data path modification response messages sent on the R6 interface.	Int32
r6pathmodrsp-totsendfail	The total number of failed data path modification response messages sent on the R6 interface.	Int32

Variables	Description	Data Type
r6pathmodrsp-totrec	The total number of data path modification response messages received on the R6 interface.	Int32
r6pathmodrsp-totacc	The total number of accepted data path modification response messages sent on the R6 interface.	Int32
r6pathmodrsp-totrelay	The total number of data path modification response messages relayed on the R6 interface.	Int32
r6pathmodrsp-totdenied	The total number of denied data path modification response messages sent on the R6 interface.	Int32
r6pathmodrsp-totdiscard	The total number of discarded data path modification response messages sent on the R6 interface.	Int32
r6pathmodrsp-badform	The total number of data path modification response messages with a bad format sent on the R6 interface.	Int32
r6pathmodrsp-decodeerr	The total number of data path modification response messages with decode errors sent on the R6 interface.	Int32
r6pathmodrsp-unspecerr	The total number of data path modification response messages with unspecified errors sent on the R6 interface.	Int32
r6pathmodrsp-missmandtlv	The total number of data path modification response messages sent on the R6 interface with a missing mandatory TLV.	Int32
r6pathmodrsp-tlvvalinval	The total number of data path modification response messages sent on the R6 interface with an invalid TLV.	Int32
r6pathmodrsp-unknownctlv	The total number of data path modification response messages sent on the R6 interface with an unknown TLV.	Int32
r6pathmodrsp-duptlvfound	The total number of data path modification response messages sent on the R6 interface found with a duplicate TLV.	Int32
r6pathmodrsp-nosessfound	The total number of data path modification response messages sent on the R6 interface with no session found.	Int32
r6pathmodrsp-adminprohib	The total number of data path modification response messages sent on the R6 interface with administration prohibited.	Int32
r6pathmodrsp-noresourcedrop	The total number of data path modification response messages sent on the R6 interface discarded or denied due to resource unavailability.	Int32
r6pathmodrsp-transiderr	The total number of data path modification response messages sent on the R6 interface with transaction ID errors.	Int32
r6pathmodack-totsent	The total number of data path modification acknowledgement messages sent on the R6 interface.	Int32
r6pathmodack-retranssent	The total number of retransmitted data path modification acknowledgement messages sent on the R6 interface.	Int32
r6pathmodack-totsendfail	The total number of failed data path modification acknowledgement messages sent on the R6 interface.	Int32

Variables	Description	Data Type
r6pathmodack-totrec	The total number of data path modification acknowledgement messages received on the R6 interface.	Int32
r6pathmodack-totacc	The total number of data path modification acknowledgement messages received on the R6 interface.	Int32
r6pathmodack-totrelay	The total number of data path modification acknowledgement messages relayed on the R6 interface.	Int32
r6pathmodack-totdenied	The total number of denied data path modification acknowledgement messages sent on the R6 interface.	Int32
r6pathmodack-totdiscard	The total number of discarded data path modification acknowledgement messages sent on the R6 interface.	Int32
r6pathmodack-badform	The total number of data path modification acknowledgement messages with a bad format sent on the R6 interface.	Int32
r6pathmodack-decodeerr	The total number of data path modification acknowledgement messages with decode errors sent on the R6 interface.	Int32
r6pathmodack-unspecerr	The total number of data path modification acknowledgement messages with unspecified errors sent on the R6 interface.	Int32
r6pathmodack-mismandtlv	The total number of data path modification acknowledgement messages sent on the R6 interface with a missing mandatory TLV.	Int32
r6pathmodack-tlvvalinval	The total number of data path modification acknowledgement messages sent on the R6 interface with an invalid TLV.	Int32
r6pathmodack-unknowntrlv	The total number of data path modification acknowledgement messages sent on the R6 interface with an unknown TLV.	Int32
r6pathmodack-duptlvfound	The total number of data path modification acknowledgement messages sent on the R6 interface found with a duplicate TLV.	Int32
r6pathmodack-nosessfound	The total number of data path modification acknowledgement messages sent on the R6 interface with no session found.	Int32
r6pathmodack-adminprohib	The total number of data path modification acknowledgement messages sent on the R6 interface with administration prohibited.	Int32
r6pathmodack-noresourcedrop	The total number of data path modification acknowledgement messages sent on the R6 discarded or denied due to resource unavailability.	Int32
r6pathmodack-transiderr	The total number of data path modification acknowledgement messages sent on the R6 interface with transaction ID errors.	Int32
r6datapathdereqreq-totsent	The total number of data path de-registration request messages sent on the R6 interface.	Int32
r6datapathdereqreq-retranssent	The total number of data path de-registration request messages re-transmitted on the R6 interface.	Int32
r6datapathdereqreq-totsendfail	The total number of failures occurred during transaction ID generation and R6 data path de-registration request message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32

Variables	Description	Data Type
r6datapathderegreq-totrec	The total number of data path de-registration request messages received on the R6 interface.	Int32
r6datapathderegreq-totacc	The total number of data path de-registration request messages accepted on the R6 interface.	Int32
r6datapathderegreq-totrelay	The total number of data path de-registration request messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a data path de-registration request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6datapathderegreq-totdenied	The total number of data path de-registration request messages denied on the R6 interface.	Int32
r6datapathderegreq-totdiscard	The total number of data path de-registration request messages discarded on the R6 interface.	Int32
r6datapathderegreq-badform	The total number of badly formed data path de-registration request messages on the R6 interface.	Int32
r6datapathderegreq-decodeerr	The total number of data path de-registration request messages on the R6 interface with decode error.	Int32
r6datapathderegreq-unspecerr	The total number of data path de-registration request messages on the R6 interface with unspecified error.	Int32
r6datapathderegreq-missmandtlv	The total number of data path de-registration request messages on the R6 interface with missing mandatory TLVs.	Int32
r6datapathderegreq-tlvvalinval	The total number of data path de-registration request messages on the R6 interface with invalid TLV value.	Int32
r6datapathderegreq-unknowntrlv	The total number of data path de-registration request messages on the R6 interface with unknown TLVs.	Int32
r6datapathderegreq-duptlvfound	The total number of data path de-registration request messages on the R6 interface with duplicate TLVs.	Int32
r6datapathderegreq-nosessfound	The total number of data path de-registration request messages on the R6 interface without any session information.	Int32
r6datapathderegreq-adminprohib	The total number of data path de-registration request messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path de-registration request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6datapathderegreq-noresourcedrop	The total number of data path de-registration request messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path de-registration request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.services.	Int32

Variables	Description	Data Type
r6datapathderegreq-transiderr	The total number of data path de-registration request messages on the R6 interface with transaction ID errors.	Int32
r6datapathderegsp-totsent	The total number of data path de-registration response messages sent on the R6 interface.	Int32
r6datapathderegsp-retranssent	The total number of data path de-registration response messages re-transmitted on the R6 interface.	Int32
r6datapathderegsp-totsefail	The total number of failures occurred during transaction ID generation and R6 data path de-registration response message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6datapathderegsp-totrec	The total number of data path de-registration response messages received on the R6 interface.	Int32
r6datapathderegsp-totacc	The total number of data path de-registration response messages accepted on the R6 interface.	Int32
r6datapathderegsp-totrelay	The total number of data path de-registration response messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a data path de-registration response message is relayed by the R6 interface. Availability: across all ASNGW services.services.	Int32
r6datapathderegsp-totdenied	The total number of data path de-registration response messages denied on the R6 interface.	Int32
r6datapathderegsp-totdiscard	The total number of data path de-registration response messages discarded on the R6 interface.	Int32
r6datapathderegsp-badform	The total number of badly formed data path de-registration response messages on the R6 interface.	Int32
r6datapathderegsp-decodeerr	The total number of data path de-registration response messages on the R6 interface with decode error.	Int32
r6datapathderegsp-unspecerr	The total number of data path de-registration response messages on the R6 interface with unspecified error.	Int32
r6datapathderegsp-missmandtlv	The total number of data path de-registration response messages on the R6 interface with missing mandatory TLVs.	Int32
r6datapathderegsp-tlvvalinval	The total number of data path de-registration response messages on the R6 interface with invalid TLV value.	Int32
r6datapathderegsp-unknown_tlv	The total number of data path de-registration response messages on the R6 interface with unknown TLVs.	Int32
r6datapathderegsp-dup_tlv_found	The total number of data path de-registration response messages on the R6 interface with duplicate TLVs.	Int32
r6datapathderegsp-no-session-found	The total number of data path de-registration response messages on the R6 interface without any session information.	Int32

Variables	Description	Data Type
r6datapathderegsp-adminprohib	The total number of data path de-registration response messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path de-registration response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6datapathderegsp-noresourcedrop	The total number of data path de-registration response messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path de-registration response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6datapathderegsp-transiderr	The total number of data path de-registration response messages on the R6 interface with transaction ID errors.	Int32
r6keychadir-totsent	The total number of key change direct messages sent on the R6 interface.	Int32
r6keychadir-retranssent	The total number of failures occurred during transaction ID generation and R6 Key change directive message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6keychadir-totsendfail	The total number of key change direct messages re-transmitted on the R6 interface.	Int32
r6keychadir-totrec	The total number of key change direct messages received on the R6 interface.	Int32
r6keychadir-totacc	The total number of key change direct messages accepted on the R6 interface.	Int32
r6keychadir-totrelay	The total number of key change directive messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a key change directive message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6keychadir-totdenied	The total number of key change direct messages denied on the R6 interface.	Int32
r6keychadir-totdiscard	The total number of key change direct messages discarded on the R6 interface.	Int32
r6keychadir-badform	The total number of badly formed key change direct messages on the R6 interface.	Int32
r6keychadir-decodeerr	The total number of key change direct messages on the R6 interface with decode error.	Int32
r6keychadir-unspecerr	The total number of key change direct messages on the R6 interface with unspecified error.	Int32
r6keychadir-missmandtlv	The total number of key change direct messages on the R6 interface with missing mandatory TLVs.	Int32
r6keychadir-tlvvalinval	The total number of key change direct messages on the R6 interface with invalid TLV value.	Int32
r6keychadir-unknowntrlv	The total number of key change direct messages on the R6 interface with unknown TLVs.	Int32
r6keychadir-duptlvfound	The total number of key change direct messages on the R6 interface with duplicate TLVs.	Int32
r6keychadir-nosessfound	The total number of key change direct messages on the R6 interface without any session information.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r6keychadir-adminprohib	The total number of key change directive messages discarded or denied due to admin prohibit. Triggers: Changes every time a key change directive message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6keychadir-noresourcedrop	The total number of key change directive messages discarded or denied due to resource unavailability. Triggers: Changes every time a key change directive message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6keychadir-transiderr	The total number of key change direct messages on the R6 interface with transaction ID errors.	Int32
r6keychaack-totsent	The total number of key change acknowledgement messages sent on the R6 interface.	Int32
r6keychaack-retranssent	The total number of failures occurred during transaction ID generation and R6 Key change acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6keychaack-totsefail	The total number of key change acknowledgement messages re-transmitted on the R6 interface.	Int32
r6keychaack-totrec	The total number of key change acknowledgement messages received on the R6 interface.	Int32
r6keychaack-totacc	The total number of key change acknowledgement messages accepted on the R6 interface.	Int32
r6keychaack-totrelay	The total number of key change acknowledgement messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a key change acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6keychaack-totdenied	The total number of key change acknowledgement messages denied on the R6 interface.	Int32
r6keychaack-totdiscard	The total number of key change acknowledgement messages discarded on the R6 interface.	Int32
r6keychaack-badform	The total number of badly formed key change acknowledgement messages on the R6 interface.	Int32
r6keychaack-decodeerr	The total number of key change acknowledgement messages on the R6 interface with decode error.	Int32
r6keychaack-unspecerr	The total number of key change acknowledgement messages on the R6 interface with unspecified error.	Int32
r6keychaack-missmandtlv	The total number of key change acknowledgement messages on the R6 interface with missing mandatory TLVs.	Int32
r6keychaack-tlvvalinval	The total number of key change acknowledgement messages on the R6 interface with invalid TLV value.	Int32

Variables	Description	Data Type
r6keychaack-unknownctlv	The total number of key change acknowledgement messages on the R6 interface with unknown TLVs.	Int32
r6keychaack-duptlvfound	The total number of key change acknowledgement messages on the R6 interface with duplicate TLVs.	Int32
r6keychaack-nosessfound	The total number of key change acknowledgement messages on the R6 interface without any session information.	Int32
r6keychaack-adminprohib	The total number of key change acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a key change acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6keychaack-noresourcedrop	The total number of key change acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a key change acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6keychaack-transiderr	The total number of key change acknowledgement messages on the R6 interface with transaction ID errors.	Int32
r6keychacnf-totrec	The total number of key change confirm messages received on the R6 interface.	Int32
r6keychacnf-totacc	The total number of key change confirm messages accepted on the R6 interface.	Int32
r6keychacnf-totrelay	The total number of key change confirm messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a key change confirm message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6keychacnf-totdenied	The total number of key change confirm messages denied on the R6 interface.	Int32
r6keychacnf-totdiscard	The total number of key change confirm messages discarded on the R6 interface.	Int32
r6keychacnf-badform	The total number of badly formed key change confirm messages on the R6 interface.	Int32
r6keychacnf-decodeerr	The total number of key change confirm messages on the R6 interface with decode error.	Int32
r6keychacnf-unspecerr	The total number of key change confirm messages on the R6 interface with unspecified error.	Int32
r6keychacnf-mismandctlv	The total number of key change confirm messages on the R6 interface with missing mandatory TLVs.	Int32
r6keychacnf-tlvvalinval	The total number of key change confirm messages on the R6 interface with invalid TLV value.	Int32
r6keychacnf-unknownctlv	The total number of key change confirm messages on the R6 interface with unknown TLVs.	Int32
r6keychacnf-duptlvfound	The total number of key change confirm messages on the R6 interface with duplicate TLVs.	Int32

Common Syntax Options

Variables	Description	Data Type
r6keychacnf-nosessfound	The total number of key change confirm messages on the R6 interface without any session information.	Int32
r6keychacnf-adminprohib	The total number of key change confirm messages discarded or denied due to admin prohibit. Triggers: Changes every time a key change confirm message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6keychacnf-noresourcedrop	The total number of key change confirm messages discarded or denied due to resource unavailability. Triggers: Changes every time a key change confirm message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r6keychacnf-transiderr	The total number of key change confirm messages on the R6 interface with transaction ID errors.	Int32
r6cmackeycounupd-totsent	The total number of CMAC key count update messages sent on the R6 interface.	Int32
r6cmackeycounupd-retranssent	The total number of CMAC key count update messages re-transmitted on the R6 interface.	Int32
r6cmackeycounupd-totsendfail	The total number of failures occurred during transaction ID generation and R6 CMAC key count update message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6cmackeycounupd-totrec	The total number of CMAC key count update messages received on the R6 interface.	Int32
r6cmackeycounupd-totacc	The total number of CMAC key count update messages accepted on the R6 interface.	Int32
r6cmackeycounupd-totrelay	The total number of CMAC key count update messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a CMAC key count update message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6cmackeycounupd-totdenied	The total number of CMAC key count update messages denied on the R6 interface.	Int32
r6cmackeycounupd-totdiscard	The total number of CMAC key count update messages discarded on the R6 interface.	Int32
r6cmackeycounupd-badform	The total number of badly formed CMAC key count update messages on the R6 interface.	Int32
r6cmackeycounupd-decodeerr	The total number of CMAC key count update messages on the R6 interface with decode error.	Int32
r6cmackeycounupd-unspecerr	The total number of CMAC key count update messages on the R6 interface with unspecified error.	Int32
r6cmackeycounupd-missmandtlv	The total number of CMAC key count update messages on the R6 interface with missing mandatory TLVs.	Int32

Variables	Description	Data Type
r6cmackeycounupd-tlvvalinval	The total number of CMAC key count update messages on the R6 interface with invalid TLV value.	Int32
r6cmackeycounupd-unknownnltv	The total number of CMAC key count update messages on the R6 interface with unknown TLVs.	Int32
r6cmackeycounupd-duptlvfound	The total number of CMAC key count update messages on the R6 interface with duplicate TLVs.	Int32
r6cmackeycounupd-nosessfound	The total number of CMAC key count update messages on the R6 interface without any session information.	Int32
r6cmackeycounupd-adminprohib	The total number of CMAC key count update messages discarded or denied due to admin prohibit. Triggers: Changes every time a CMAC key count update message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6cmackeycounupd-noresourcedrop	The total number of CMAC key count update messages discarded or denied due to resource unavailability. Triggers: Changes every time a CMAC key count update message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6cmackeycounupd-transiderr	The total number of CMAC key count update messages on the R6 interface with transaction ID errors.	Int32
r6cmackeycounack-totsent	The total number of CMAC key count acknowledgement messages sent on the R6 interface.	Int32
r6cmackeycounack-retranssent	The total number of CMAC key count acknowledgement messages re-transmitted on the R6 interface.	Int32
r6cmackeycounack-totsendfail	The total number of failures occurred during transaction ID generation and R6 CMAC key count acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6cmackeycounack-totrec	The total number of CMAC key count acknowledgement messages received on the R6 interface.	Int32
r6cmackeycounack-totacc	The total number of CMAC key count acknowledgement messages accepted on the R6 interface.	Int32
r6cmackeycounack-totrelay	The total number of CMAC key count acknowledgement messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a CMAC key count acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6cmackeycounack-totdenied	The total number of CMAC key count acknowledgement messages denied on the R6 interface.	Int32
r6cmackeycounack-totdiscard	The total number of CMAC key count acknowledgement messages discarded on the R6 interface.	Int32

Variables	Description	Data Type
r6cmackeycounack-badform	The total number of badly formed CMAC key count acknowledgement messages on the R6 interface.	Int32
r6cmackeycounack-decodeerr	The total number of CMAC key count acknowledgement messages on the R6 interface with decode error.	Int32
r6cmackeycounack-unspecerr	The total number of CMAC key count acknowledgement messages on the R6 interface with unspecified error.	Int32
r6cmackeycounack-missmandtlv	The total number of CMAC key count acknowledgement messages on the R6 interface with missing mandatory TLVs.	Int32
r6cmackeycounack-tlvvalinval	The total number of CMAC key count acknowledgement messages on the R6 interface with invalid TLV value.	Int32
r6cmackeycounack-unknowntrlv	The total number of CMAC key count acknowledgement messages on the R6 interface with unknown TLVs.	Int32
r6cmackeycounack-duptlvfound	The total number of CMAC key count acknowledgement messages on the R6 interface with duplicate TLVs.	Int32
r6cmackeycounack-nosessfound	The total number of CMAC key count acknowledgement messages on the R6 interface without any session information.	Int32
r6cmackeycounack-adminprohib	The total number of CMAC key count acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a CMAC key count acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6cmackeycounack-noresourcedrop	The total number of CMAC key count acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a CMAC key count acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6cmackeycounack-transiderr	The total number of CMAC key count acknowledgement messages on the R6 interface with transaction ID errors.	Int32
r6horeq-totsent	The total number of R6 handover request messages sent on the R6 interface.	Int32
r6horeq-retranssent	The total number of R6 handover request messages re-transmitted on the R6 interface.	Int32
r6horeq-totsendfail	The total number of failures occurred during transaction ID generation and R6 handover request message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6horeq-totrec	The total number of R6 handover request messages received on the R6 interface.	Int32
r6horeq-totacc	The total number of R6 handover request messages accepted on the R6 interface.	Int32
r6horeq-totrelay	The total number of R6 handover request messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an R6 handover request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32

Variables	Description	Data Type
r6horeq-totdenied	The total number of R6 handover request messages denied on the R6 interface.	Int32
r6horeq-totdiscard	The total number of R6 handover request messages discarded on the R6 interface.	Int32
r6horeq-badform	The total number of badly formed R6 handover request messages on the R6 interface.	Int32
r6horeq-decodeerr	The total number of R6 handover request messages on the R6 interface with decode error.	Int32
r6horeq-unspecerr	The total number of R6 handover request messages on the R6 interface with unspecified error.	Int32
r6horeq-missmandtlv	The total number of R6 handover request messages on the R6 interface with missing mandatory TLVs.	Int32
r6horeq-tlvvalinval	The total number of R6 handover request messages on the R6 interface with invalid TLV value.	Int32
r6horeq-unknowntrlv	The total number of R6 handover request messages on the R6 interface with unknown TLVs.	Int32
r6horeq-duptlvfound	The total number of R6 handover request messages on the R6 interface with duplicate TLVs.	Int32
r6horeq-nosessfound	The total number of R6 handover request messages on the R6 interface without any session information.	Int32
r6horeq-adminprohib	The total number of R6 handover request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 handover request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6horeq-noresourcedrop	The total number of R6 handover request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 handover request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6horeq-transiderr	The total number of R6 handover request messages on the R6 interface with transaction ID errors.	Int32
r6horsp-totsent	The total number of R6 handover response messages sent on the R6 interface.	Int32
r6horsp-retranssent	The total number of R6 handover response messages re-transmitted on the R6 interface.	Int32
r6horsp-totsendfail	The total number of failures occurred during transaction ID generation and R6 handover response message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6horsp-totrec	The total number of R6 handover response messages received on the R6 interface.	Int32
r6horsp-totacc	The total number of R6 handover response messages accepted on the R6 interface.	Int32

Variables	Description	Data Type
r6horsp-totrelay	The total number of R6 handover response messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an R6 handover response message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6horsp-totdenied	The total number of R6 handover response messages denied on the R6 interface.	Int32
r6horsp-totdiscard	The total number of R6 handover response messages discarded on the R6 interface.	Int32
r6horsp-badform	The total number of badly formed R6 handover response messages on the R6 interface.	Int32
r6horsp-decodeerr	The total number of R6 handover response messages on the R6 interface with decode error.	Int32
r6horsp-unspecerr	The total number of R6 handover response messages on the R6 interface with unspecified error.	Int32
r6horsp-missmandtlv	The total number of R6 handover response messages on the R6 interface with missing mandatory TLVs.	Int32
r6horsp-tlvvalinval	The total number of R6 handover response messages on the R6 interface with invalid TLV value.	Int32
r6horsp-unknowntrlv	The total number of R6 handover response messages on the R6 interface with unknown TLVs.	Int32
r6horsp-duptlvfound	The total number of R6 handover response messages on the R6 interface with duplicate TLVs.	Int32
r6horsp-nosessfound	The total number of R6 handover response messages on the R6 interface without any session information.	Int32
r6horsp-adminprohib	The total number of R6 handover response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 handover response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6horsp-noresourcedrop	The total number of R6 handover response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 handover response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6horsp-transiderr	The total number of R6 handover response messages on the R6 interface with transaction ID errors.	Int32
r6hoack-totsent	The total number of R6 handover acknowledgement messages sent on the R6 interface.	Int32
r6hoack-retranssent	The total number of R6 handover acknowledgement messages re-transmitted on the R6 interface.	Int32
r6hoack-totsendfail	The total number of failures occurred during transaction ID generation and R6 handover acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32

Variables	Description	Data Type
r6hoack-totrec	The total number of R6 handover acknowledgement messages received on the R6 interface.	Int32
r6hoack-totacc	The total number of R6 handover acknowledgement messages accepted on the R6 interface.	Int32
r6hoack-totrelay	The total number of R6 handover acknowledgement messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an R6 handover acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6hoack-totdenied	The total number of R6 handover acknowledgement messages denied on the R6 interface.	Int32
r6hoack-totdiscard	The total number of R6 handover acknowledgement messages discarded on the R6 interface.	Int32
r6hoack-badform	The total number of badly formed R6 handover acknowledgement messages on the R6 interface.	Int32
r6hoack-decodeerr	The total number of R6 handover acknowledgement messages on the R6 interface with decode error.	Int32
r6hoack-unspecerr	The total number of R6 handover acknowledgement messages on the R6 interface with unspecified error.	Int32
r6hoack-misssmandtlv	The total number of R6 handover acknowledgement messages on the R6 interface with missing mandatory TLVs.	Int32
r6hoack-tlvvalinval	The total number of R6 handover acknowledgement messages on the R6 interface with invalid TLV value.	Int32
r6hoack-unknowntrlv	The total number of R6 handover acknowledgement messages on the R6 interface with unknown TLVs.	Int32
r6hoack-duptlvfound	The total number of R6 handover acknowledgement messages on the R6 interface with duplicate TLVs.	Int32
r6hoack-nosessfound	The total number of R6 handover acknowledgement messages on the R6 interface without any session information.	Int32
r6hoack-adminprohib	The total number of R6 handover acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 handover acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6hoack-noresourcedrop	The total number of R6 handover acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 handover acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6hoack-transiderr	The total number of R6 handover acknowledgement messages on the R6 interface with transaction ID errors.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r6hocnf-totsent	The total number of R6 handover confirm messages sent on the R6 interface.	Int32
r6hocnf-retranssent	The total number of R6 handover confirm messages re-transmitted on the R6 interface.	Int32
r6hocnf-totsendfail	The total number of failures occurred during transaction ID generation and R6 handover confirm message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6hocnf-totrec	The total number of R6 handover confirm messages received on the R6 interface.	Int32
r6hocnf-totacc	The total number of R6 handover confirm messages accepted on the R6 interface.	Int32
r6hocnf-totrelay	The total number of R6 handover confirm messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an R6 handover confirm message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6hocnf-totdenied	The total number of R6 handover confirm messages denied on the R6 interface.	Int32
r6hocnf-totdiscard	The total number of R6 handover confirm messages discarded on the R6 interface.	Int32
r6hocnf-badform	The total number of badly formed R6 handover confirm messages on the R6 interface.	Int32
r6hocnf-decodeerr	The total number of R6 handover confirm messages on the R6 interface with decode error.	Int32
r6hocnf-unspeccerr	The total number of R6 handover confirm messages on the R6 interface with unspecified error.	Int32
r6hocnf-mismandtlv	The total number of R6 handover confirm messages on the R6 interface with missing mandatory TLVs.	Int32
r6hocnf-tlvvalinval	The total number of R6 handover confirm messages on the R6 interface with invalid TLV value.	Int32
r6hocnf-unknowntlv	The total number of R6 handover confirm messages on the R6 interface with unknown TLVs.	Int32
r6hocnf-duptlvfound	The total number of R6 handover confirm messages on the R6 interface with duplicate TLVs.	Int32
r6hocnf-nosessfound	The total number of R6 handover confirm messages on the R6 interface without any session information.	Int32
r6hocnf-adminprohib	The total number of R6 handover confirm messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 handover confirm message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6hocnf-noresourcedrop	The total number of R6 handover confirm messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 handover confirm message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32

Variables	Description	Data Type
r6hocnf-transiderr	The total number of R6 handover confirm messages on the R6 interface with transaction ID errors.	Int32
r6hocmpl-totsent	The total number of R6 handover complete messages sent on the R6 interface.	Int32
r6hocmpl-retranssent	The total number of R6 handover complete messages re-transmitted on the R6 interface.	Int32
r6hocmpl-totsendfail	The total number of failures occurred during transaction ID generation and R6 handover complete message not sent for specific interface. This counter is used to count the error while sending the R6 packets.	Int32
r6hocmpl-totrec	The total number of R6 handover complete messages received on the R6 interface.	Int32
r6hocmpl-totacc	The total number of R6 handover complete messages accepted on the R6 interface.	Int32
r6hocmpl-totrelay	The total number of R6 handover complete messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an R6 handover complete message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6hocmpl-totdenied	The total number of R6 handover complete messages denied on the R6 interface.	Int32
r6hocmpl-totdiscard	The total number of R6 handover complete messages discarded on the R6 interface.	Int32
r6hocmpl-badform	The total number of badly formed R6 handover complete messages on the R6 interface.	Int32
r6hocmpl-decodeerr	The total number of R6 handover complete messages on the R6 interface with decode error.	Int32
r6hocmpl-unspecerr	The total number of R6 handover complete messages on the R6 interface with unspecified error.	Int32
r6hocmpl-missmandtlv	The total number of R6 handover complete messages on the R6 interface with missing mandatory TLVs.	Int32
r6hocmpl-tlvvalinval	The total number of R6 handover complete messages on the R6 interface with invalid TLV value.	Int32
r6hocmpl-unknowntrlv	The total number of R6 handover complete messages on the R6 interface with unknown TLVs.	Int32
r6hocmpl-duptlvfound	The total number of R6 handover complete messages on the R6 interface with duplicate TLVs.	Int32
r6hocmpl-nosessfound	The total number of R6 handover complete messages on the R6 interface without any session information.	Int32
r6hocmpl-adminprohib	The total number of R6 handover complete messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 handover complete message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r6hocmpl-noresourcedrop	The total number of R6 handover complete messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 handover complete message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6hocmpl-transiderr	The total number of R6 handover complete messages on the R6 interface with transaction ID errors.	Int32
r6unknown-totrec	The total number of unknown messages received on the R6 interface.	Int32
r6unknown-totacc	The total number of unknown messages accepted on the R6 interface.	Int32
r6unknown-totrelay	The total number of unknown messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an unknown message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6unknown-totdenied	The total number of unknown messages denied on the R6 interface.	Int32
r6unknown-totdiscard	The total number of unknown messages discarded on the R6 interface.	Int32
r6unknown-badform	The total number of badly formed unknown messages on the R6 interface.	Int32
r6unknown-decodeerr	The total number of unknown messages on the R6 interface with decode error.	Int32
r6unknown-unspeccerr	The total number of unknown messages on the R6 interface with unspecified error.	Int32
r6unknown-missmandtlv	The total number of unknown messages on the R6 interface with missing mandatory TLVs.	Int32
r6unknown-tlvvalinval	The total number of unknown messages on the R6 interface with invalid TLV value.	Int32
r6unknown-unknownctlv	The total number of unknown messages on the R6 interface with unknown TLVs.	Int32
r6unknown-duptlvfound	The total number of unknown messages on the R6 interface with duplicate TLVs.	Int32
r6unknown-nosessfound	The total number of unknown messages on the R6 interface without any session information.	Int32
r6unknown-adminprohib	The total number of unknown messages discarded or denied due to admin prohibit. Triggers: Changes every time an unknown message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6unknown-noresourcedrop	The total number of unknown messages discarded or denied due to resource unavailability. Triggers: Changes every time an unknown message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6unknown-transiderr	The total number of unknown messages on the R6 interface with transaction ID errors.	Int32
r6datagrerec-totpackrec	The total number of data packets received through GRE tunnel R6 interface.	Int32
r6datagrerec-prottyperror	Total number of protectd type errors received through GRE tunnel R6 interface.	Int32

Variables	Description	Data Type
r6datagrerec-totbytrec	The total number of data bytes received through GRE tunnel R6 interface.	Int32
r6datagrerec-grekeyabs	The total number of data message received without GRE key through GRE tunnel R6 interface.	Int32
r6datagrerec-grechkerr	The total number of data message received with checksum error through GRE tunnel R6 interface.	Int32
r6datagrerec-invpacklen	The total number of data message received with invalid packet length error through GRE tunnel R6 interface.	Int32
r6datagrerec-nosessfou	The total number of data message received through GRE tunnel without session information the R6 interface.	Int32
r6datagrerec-unspecerr	The total number of data message received through GRE tunnel with unspecified error R6 interface.	Int32
r6datagresend-totpacksent	Total number of data packets sent through GRE tunnel R6 interface.	Int32
r6datagresend-senderr	Total number of errors happend while sending data packets through GRE tunnel R6 interface.	Int32
r6datagresend-totbysent	Total number of data bytes sent through GRE tunnel R6 interface.	Int32
r6datagresend-unspeerr	The total number of data message sent through GRE tunnel with unspecified error R6 interface.	Int 32
r6imexitstaind-totsent	The total number of R6 Idle Mode Exit State Indication messages sent to the base station.	Int32
r6imexitstaind-retranssent	The total number of Idle Mode Exit State Indication messages retransmitted on the R6 interface to the base station.	Int32
r6imexitstaind-totsendfail	The total number of Idle Mode Exit State Indication message failures received from the base station and relayed on the R6 interface. This counter is used to count the error while sending the R6 packets.	Int32
r6imexitstaind-totrec	The total number of R6 Idle Mode Exit State Indication messages received by the base station.	Int32
r6imexitstaind-totacc	The total number of R6 Idle Mode Exit State Indication messages accepted by base station.	Int32
r6imexitstaind-totrelay	The total number of R6 Idle Mode Exit State Indication messages sent to the base station and relayed on the R6 interface. Triggers: Changes every time an R6 Idle Mode Exit State Indication message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6imexitstaind-totdenied	The total number of Idle Mode Exit State Indication messages denied on the R6 interface.	Int32
r6imexitstaind-totdiscard	The total number of Idle Mode Exit State Indication messages discarded on the R6 interface.	Int32
r6imexitstaind-badform	The total number of badly formed R6 Idle Mode Exit State Indication messages sent to the base station.	Int32

Variables	Description	Data Type
r6imexitstaind-decodeerr	The total number of R6 Idle Mode Exit State Indication messages sent to the base station with decode errors.	Int32
r6imexitstaind-unspecerr	The total number of R6 Idle Mode Exit State Indication messages sent to the base station with unspecified errors.	Int32
r6imexitstaind-missmandtlv	The total number of R6 Idle Mode Exit State Indication messages sent to the base station with missing mandatory TLVs.	Int32
r6imexitstaind-tlvvalinval	The total number of R6 Idle Mode Exit State Indication messages sent to the base station with an invalid TLV.	Int32
r6imexitstaind-unknownctlv	The total number of R6 Idle Mode Exit State Indication messages sent to the base station with an unknown TLV.	Int32
r6imexitstaind-dupctlvfound	The total number of R6 Idle Mode Exit State Indication messages sent to the base station with duplicate TLVs.	Int32
r6imexitstaind-nosessfound	The total number of R6 Idle Mode Exit State Indication messages sent to the base station without any session information.	Int32
r6imexitstaind-admprohibit	The total number of R6 Idle Mode Exit State Indication messages sent to the base station that were discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Idle Mode Exit State Indication message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r6imexitstaind-noresourcedrop	The total number of R6 Idle Mode Exit State Indication messages sent to the base station that were discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Idle Mode Exit State Indication message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r6imexitstaind-transiderr	The total number of R6 Idle Mode Exit State Indication messages sent to the base station with a transaction ID error.	Int32
r6imexitstaindack-totsent	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station.	Int32
r6imexitstaindack-retranssent	The total number of Idle Mode Exit State Indication Acknowledgement messages retransmitted on the R6 interface to the base station.	Int32
r6imexitstaindack-totsendfail	The total number of Idle Mode Exit State Indication Acknowledgement message failures received from the base station and relayed on the R6 interface. This counter is used to count the error while sending the R6 packets.	Int 32
r6imexitstaindack-totrec	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages received by the base station.	Int32
r6imexitstaindack-totacc	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages accepted by base station.	

Variables	Description	Data Type
r6imexitstaindack-totrelay	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station and relayed on the R6 interface. Triggers: Changes every time an R6 Idle Mode Exit State Indication Acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6imexitstaindack-totdenied	The total number of Idle Mode Exit State Indication Acknowledgement messages denied on the R6 interface	Int32
r6imexitstaindack-totdiscard	The total number of Idle Mode Exit State Indication Acknowledgement messages discarded on the R6 interface.	Int32
r6imexitstaindack-badform	The total number of badly formed R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station.	Int32
r6imexitstaindack-decodeerr	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station with decode errors.	Int32
r6imexitstaindack-unspecerr	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station with unspecified errors.	Int32
r6imexitstaindack-missmandtlv	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station with missing mandatory TLVs.	Int32
r6imexitstaindack-tlvvalinval	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station with an invalid TLV.	Int32
r6imexitstaindack-unknowntrlv	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station with an unknown TLV.	Int32
r6imexitstaindack-duptlvfound	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station with duplicate TLVs.	Int32
r6imexitstaindack-nosessfound	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station without any session information.	Int32
r6imexitstaindack-admprohibit	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station that were discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Idle Mode Exit State Indication Acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r6imexitstaindack-noresourcedrop	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station that were discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Idle Mode Exit State Indication Acknowledgement message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r6imexitstaindack-transiderr	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages sent to the base station with a transaction ID error.	Int32
r6datapathderegack-totsent	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station.	Int32

Variables	Description	Data Type
r6datapathderegack-retransent	The total number of Data Path Deregistration Acknowledgement messages retransmitted on the R6 interface to the base station.	Int32
r6datapathderegack-totendfail	The total number of Data Path Deregistration Acknowledgement message failures received from the base station and relayed on the R6 interface. This counter is used to count the error while sending the R6 packets.	Int32
r6datapathderegack-totrec	The total number of R6 Data Path Deregistration Acknowledgement messages received by the base station.	Int32
r6datapathderegack-totacc	The total number of R6 Idle Mode Exit State Indication Acknowledgement messages accepted by base station.	Int32
r6datapathderegack-totrelay	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station and relayed on the R6 interface. Triggers: Changes every time an R6 Idle Mode Exit State Indication Acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6datapathderegack-totdenied	The total number of Data Path Deregistration Acknowledgement messages denied on the R6 interface	Int32
r6datapathderegack-totdiscard	The total number of Data Path Deregistration Acknowledgement messages discarded on the R6 interface.	Int32
r6datapathderegack-badform	The total number of badly formed R6 Data Path Deregistration Acknowledgement messages sent to the base station.	Int32
r6datapathderegack-decodeerr	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station with decode errors.	Int32
r6datapathderegack-unspecerr	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station with unspecified errors.	Int32
r6datapathderegack-missmandtlv	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station with missing mandatory TLVs.	Int32
r6datapathderegack-tlvvalinval	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station with an invalid TLV.	Int32
r6datapathderegack-unknownnlv	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station with an unknown TLV.	Int32
r6datapathderegack-dupltlvfound	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station with duplicate TLVs.	Int32
r6datapathderegack-nosessfound	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station without any session information.	Int32
r6datapathderegack-admprohibit	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station that were discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Idle Mode Exit State Indication Acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32

Variables	Description	Data Type
r6datapathderegack-noresourcedrop	The total number of R6 Data Path Deregistration Acknowledgement messages sent to the base station that were discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Idle Mode Exit State Indication Acknowledgement message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r6datapathderegack-transiderr	The total number of R6Data Path Deregistration Acknowledgement messages sent to the base station with a transaction ID error.	Int32
r4nwexitmsstachareq-totsent	The total number of network exit MS state change request messages sent on the R4 interface.	Int32
r4nwexitmsstachareq-retranssent	The total number of network exit MS state change request messages re-transmitted on the the R4 interface.	Int32
r4nwexitmsstachareq-totsendfail	The total number of failures occurred during transaction ID generation and R4 network exit MS state change request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4nwexitmsstachareq-totrec	The total number of network exit MS state change request messages received on the the R4 interface.	Int32
r4nwexitmsstachareq-totacc	The total number of network exit MS state change request messages accepted on the the R4 interface.	Int32
r4nwexitmsstachareq-totrelay	The total number of network exit MS state change request messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time a network exit MS state change request message is relayed by the the the R4 interface. Availability: across all ASNGW services.	Int32
r4nwexitmsstachareq-totdenied	The total number of network exit MS state change request messages denied on the the R4 interface.	Int32
r4nwexitmsstachareq-totdiscard	The total number of network exit MS state change request messages discarded on the the R4 interface.	Int32
r4nwexitmsstachareq-badform	The total number of badly formed network exit MS state change request messages on the the R4 interface.	Int32
r4nwexitmsstachareq-decodeerr	The total number of network exit MS state change request messages on the the R4 interface with decode error.	Int32
r4nwexitmsstachareq-unspecerr	The total number of network exit MS state change request messages on the the R4 interface with unspecified error.	Int32
r4nwexitmsstachareq-missmandtlv	The total number of network exit MS state change request messages on the the R4 interface with missing mandatory TLVs.	Int32
r4nwexitmsstachareq-tlvvalinval	The total number of network exit MS state change request messages on the the R4 interface with invalid TLV value.	Int32
r4nwexitmsstachareq-unknowntrlv	The total number of network exit MS state change request messages on the the R4 interface with unknown TLVs.	Int32

Common Syntax Options

Variables	Description	Data Type
r4nwexitmsstachareq-duptlvfound	The total number of network exit MS state change request messages on the the R4 interface with duplicate TLVs.	Int32
r4nwexitmsstachareq-nosessfound	The total number of network exit MS state change request messages on the the R4 interface without any session information.	Int32
r4nwexitmsstachareq-adminprohib	The total number of network exit MS state change request messages discarded or denied due to admin prohibit. Triggers: Changes every time a network exit MS state change request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4nwexitmsstachareq-noresourcedrop	The total number of network exit MS state change request messages discarded or denied due to resource unavailability. Triggers: Changes every time a network exit MS state change request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4nwexitmsstachareq-transiderr	The total number of network exit MS state change request messages on the the R4 interface with transaction ID errors.	Int32
r4nwexitmsstacharsp-totsent	The total number of network exit MS state change response messages sent on the the R4 interface.	Int32
r4nwexitmsstacharsp-retranssent	The total number of network exit MS state change response messages re-transmitted on the the R4 interface.	Int32
r4nwexitmsstacharsp-totendfail	The total number of failures occurred during transaction ID generation and R4 network exit MS state change response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4nwexitmsstacharsp-totrec	The total number of network exit MS state change response messages received on the the R4 interface.	Int32
r4nwexitmsstacharsp-totacc	The total number of network exit MS state change response messages accepted on the the R4 interface.	Int32
r4nwexitmsstacharsp-totrelay	The total number of network exit MS state change response messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time a network exit MS state change response message is relayed by the the the R4 interface. Availability: across all ASNGW services.	Int32
r4nwexitmsstacharsp-totdenied	The total number of network exit MS state change response messages denied on the the R4 interface.	Int32
r4nwexitmsstacharsp-totdiscard	The total number of network exit MS state change response messages discarded on the the R4 interface.	Int32
r4nwexitmsstacharsp-badform	The total number of badly formed network exit MS state change response messages on the the R4 interface.	Int32
r4nwexitmsstacharsp-decodeerr	The total number of network exit MS state change response messages on the the R4 interface with decode error.	Int32

Variables	Description	Data Type
r4nwexitmsstacharsp- unspecerr	The total number of network exit MS state change response messages on the the R4 interface with unspecified error.	Int32
r4nwexitmsstacharsp- missmandtlv	The total number of network exit MS state change response messages on the the R4 interface with missing mandatory TLVs.	Int32
r4nwexitmsstacharsp- tlvvalinval	The total number of network exit MS state change response messages on the the R4 interface with invalid TLV value.	Int32
r4nwexitmsstacharsp- unknowntlv	The total number of network exit MS state change response messages on the the R4 interface with unknown TLVs.	Int32
r4nwexitmsstacharsp- dupltlvfound	The total number of network exit MS state change response messages on the the R4 interface with duplicate TLVs.	Int32
r4nwexitmsstacharsp- nosessfound	The total number of network exit MS state change response messages on the the R4 interface without any session information.	Int32
r4nwexitmsstacharsp- adminprohib	The total number of network exit MS state change response messages discarded or denied due to admin prohibit. Triggers: Changes every time a network exit MS state change response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4nwexitmsstacharsp- noresource	The total number of network exit MS state change response messages discarded or denied due to resource unavailability. Triggers: Changes every time a network exit MS state change response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4nwexitmsstacharsp- transiderr	The total number of network exit MS state change response messages on the the R4 interface with transaction ID errors.	Int32
r4contextreq-totsent	The total number of context request messages sent on the the R4 interface.	Int32
r4contextreq-retranssent	The total number of context request messages re-transmitted on the the R4 interface.	Int32
r4contextreq-totsendfail	The total number of failures occurred during transaction ID generation and R4 Context Request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4contextreq-totrec	The total number of context request messages received on the the R4 interface.	Int32
r4contextreq-totacc	The total number of context request messages accepted on the the R4 interface.	Int32
r4contextreq-totrelay	The total number of context request messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time a context request message is relayed by the the the R4 interface. Availability: across all ASNGW services.	Int32
r4contextreq-totdenied	The total number of context request messages denied on the the R4 interface.	Int32
r4contextreq-totdiscard	The total number of context request messages discarded on the the R4 interface.	Int32
r4contextreq-badform	The total number of badly formed context request messages on the the R4 interface.	Int32

Common Syntax Options

Variables	Description	Data Type
r4contextreq-decodeerr	The total number of context request messages on the the R4 interface with decode error.	Int32
r4contextreq-unspecerr	The total number of context request messages on the the R4 interface with unspecified error.	Int32
r4contextreq-missmandtlv	The total number of context request messages on the the R4 interface with missing mandatory TLVs.	Int32
r4contextreq-tlvvalinval	The total number of context request messages on the the R4 interface with invalid TLV value.	Int32
r4contextreq-unknowntrlv	The total number of context request messages on the the R4 interface with unknown TLVs.	Int32
r4contextreq-duptlvfound	The total number of context request messages on the the R4 interface with duplicate TLVs.	Int32
r4contextreq-nosessfound	The total number of context request messages on the the R4 interface without any session information.	Int32
r4contextreq-adminprohib	The total number of context request messages discarded or denied due to admin prohibit. Triggers: Changes every time a context request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4contextreq-noresourcedrop	The total number of context request messages discarded or denied due to resource unavailability. Triggers: Changes every time a context request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4contextreq-transiderr	The total number of context request messages on the the R4 interface with transaction ID errors.	Int32
r4contextrepo-totsent	The total number of context report messages sent on the the R4 interface.	Int32
r4contextrepo-retranssent	The total number of context report messages re-transmitted on the the R4 interface.	Int32
r4contextrepo-totendfail	The total number of failures occurred during transaction ID generation and R4 Context Report message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4contextrepo-totrec	The total number of context report messages received on the the R4 interface.	Int32
r4contextrepo-totacc	The total number of context report messages accepted on the the R4 interface.	Int32
r4contextrepo-totrelay	The total number of context report messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time a context report message is relayed by the the the R4 interface. Availability: across all ASNGW services.	Int32
r4contextrepo-totdenied	The total number of context report messages denied on the the R4 interface.	Int32
r4contextrepo-totdiscard	The total number of context report messages discarded on the the R4 interface.	Int32

Variables	Description	Data Type
r4contextrepo-badform	The total number of badly formed context report messages on the the R4 interface.	Int32
r4contextrepo-decodeerr	The total number of context report messages on the the R4 interface with decode error.	Int32
r4contextrepo-unspecerr	The total number of context report messages on the the R4 interface with unspecified error.	Int32
r4contextrepo-missmandtlv	The total number of context report messages on the the R4 interface with missing mandatory TLVs.	Int32
r4contextrepo-tlvvalinval	The total number of context report messages on the the R4 interface with invalid TLV value.	Int32
r4contextrepo-unknowntrlv	The total number of context report messages on the the R4 interface with unknown TLVs.	Int32
r4contextrepo-duptlvfound	The total number of context report messages on the the R4 interface with duplicate TLVs.	Int32
r4contextrepo-nosessfound	The total number of context report messages on the the R4 interface without any session information.	Int32
r4contextrepo-adminprohib	The total number of context report messages discarded or denied due to admin prohibit. Triggers: Changes every time a context report message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4contextrepo-noresourcedrop	The total number of context report messages discarded or denied due to resource unavailability. Triggers: Changes every time a context report message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4contextrepo-transiderr	The total number of context report messages on the the R4 interface with transaction ID errors.	Int32
r4contextack-totsent	The total number of context acknowledgement messages sent on the the R4 interface.	Int32
r4contextack-retranssent	The total number of context acknowledgement messages re-transmitted on the the R4 interface.	Int32
r4contextack-totsendfail	The total number of failures occurred during transaction ID generation and R4 Context acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4contextack-totrec	The total number of context acknowledgement messages received on the the R4 interface.	Int32
r4contextack-totacc	The total number of context acknowledgement messages accepted on the the R4 interface.	Int32
r4contextack-totrelay	The total number of context acknowledgement messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time a context acknowledgement message is relayed by the the the R4 interface. Availability: across all ASNGW services.	Int32
r4contextack-totdenied	The total number of context acknowledgement messages denied on the the R4 interface.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r4contextack-totdiscard	The total number of context acknowledgement messages discarded on the the R4 interface.	Int32
r4contextack-badform	The total number of badly formed context acknowledgement messages on the the R4 interface.	Int32
r4contextack-decodeerr	The total number of context acknowledgement messages on the the the R4 interface with decode error.	Int32
r4contextack-unspecerr	The total number of context acknowledgement messages on the the the R4 interface with unspecified error.	Int32
r4contextack-missmandtlv	The total number of context acknowledgement messages on the the the R4 interface with missing mandatory TLVs.	Int32
r4contextack-tlvvalinval	The total number of context acknowledgement messages on the the the R4 interface with invalid TLV value.	Int32
r4contextack-unknowntrlv	The total number of context acknowledgement messages on the the the R4 interface with unknown TLVs.	Int32
r4contextack-duptlvfound	The total number of context acknowledgement messages on the the the R4 interface with duplicate TLVs.	Int32
r4contextack-nosessfound	The total number of context acknowledgement messages on the the the R4 interface without any session information.	Int32
r4contextack-adminprohib	The total number of context acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a context acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4contextack-noresourcedrop	The total number of context acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a context acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4contextack-transiderr	The total number of context acknowledgement messages on the the the R4 interface with transaction ID errors.	Int32
r4autheaptra-totsent	The total number of authentication EAP transfer messages sent on the the the R4 interface.	Int32
r4autheaptra-retranssent	The total number of authentication EAP transfer messages re-transmitted on the the the R4 interface.	Int32
r4autheaptra-totsefail	The total number of failures that occurred during transaction ID generation and R4 EAP transfer message failure. This counter is used to count the error while sending the R4 packets.	Int32
r4autheaptra-totrec	The total number of authentication EAP transfer messages received on the the the R4 interface.	Int32

Variables	Description	Data Type
r4autheaptra-totacc	The total number of authentication EAP transfer messages accepted on the the the R4 interface.	Int32
r4autheaptra-totrelay	The total number of authentication EAP transfer messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time an authentication EAP transfer message is relayed by the the the R4 interface. Availability: across all ASNGW services.	Int32
r4autheaptra-totdenied	The total number of authentication EAP transfer messages denied on the the the R4 interface.	Int32
r4autheaptra-totdiscard	The total number of authentication EAP transfer messages discarded on the the the R4 interface.	Int32
r4autheaptra-badform	The total number of badly formed authentication EAP transfer messages on the the the R4 interface.	Int32
r4autheaptra-decodeerr	The total number of authentication EAP transfer messages on the the R4 interface with decode error.	Int32
r4autheaptra-unspecerr	The total number of authentication EAP transfer messages on the the R4 interface with unspecified error.	Int32
r4autheaptra-missmandtlv	The total number of authentication EAP transfer messages on the the R4 interface with missing mandatory TLVs.	Int32
r4autheaptra-tlvvalinval	The total number of authentication EAP transfer messages on the the R4 interface with invalid TLV value.	Int32
r4autheaptra-unknowntrlv	The total number of authentication EAP transfer messages on the the R4 interface with unknown TLVs.	Int32
r4autheaptra-duptlvfound	The total number of authentication EAP transfer messages on the the R4 interface with duplicate TLVs.	Int32
r4autheaptra-nosessfound	The total number of authentication EAP transfer messages on the the R4 interface without any session information.	Int32
r4autheaptra-adminprohib	The total number of authentication EAP transfer messages on the the R4 interface discarded or denied due to admin prohibit.	Int32
r4autheaptra-noresourcedrop	The total number of authentication EAP transfer messages on the the R4 interface discarded or denied due to resource unavailability.	Int32
r4autheaptra-transiderr	The total number of authentication EAP transfer messages on the the R4 interface with transaction ID errors.	Int32
r4autheapsta-totrec	The total number of authentication EAP start messages sent on the the R4 interface.	Int32
r4autheapsta-totacc	The total number of authentication EAP start messages accepted on the the R4 interface.	Int32

Common Syntax Options

Variables	Description	Data Type
r4autheapsta-totrelay	The total number of authentication EAP start messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time an authentication EAP start message is relayed by the the the R4 interface. Availability: across all ASNGW services.	Int32
r4autheapsta-totdenied	The total number of authentication EAP start messages denied on the the R4 interface.	Int32
r4autheapsta-totdiscard	The total number of authentication EAP start messages discarded on the the R4 interface.	Int32
r4autheapsta-badform	The total number of badly formed authentication EAP start messages on the the R4 interface.	Int32
r4autheapsta-decodeerr	The total number of authentication EAP start messages on the the R4 interface with decode error.	Int32
r4autheapsta-unspecerr	The total number of authentication EAP start messages on the the R4 interface with unspecified error.	Int32
r4autheapsta-missmandtlv	The total number of authentication EAP start messages on the the R4 interface with missing mandatory TLVs.	Int32
r4autheapsta-tlvvalinval	The total number of authentication EAP start messages on the the R4 interface with invalid TLV value.	Int32
r4autheapsta-unknowntlv	The total number of authentication EAP start messages on the the R4 interface with unknown TLVs.	Int32
r4autheapsta-duptlvfound	The total number of authentication EAP start messages on the the R4 interface with duplicate TLVs.	Int32
r4autheapsta-nosessfound	The total number of authentication EAP start messages on the the R4 interface without any session information.	Int32
r4autheapsta-adminprohib	The total number of authentication EAP start messages discarded or denied due to admin prohibit. Triggers: Changes every time an authentication EAP start message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4autheapsta-noresourcedrop	The total number of authentication EAP start messages discarded or denied due to resource unavailability. Triggers: Changes every time an authentication EAP start message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4autheapsta-transiderr	The total number of authentication EAP start messages on the the R4 interface with transaction ID errors.	Int32
r4datapathpreregreq-totsent	The total number of data path pre-registration request messages sent on the the R4 interface.	Int32
r4datapathpreregreq-retranssent	The total number of data path pre-registration request messages re-transmitted on the the R4 interface.	Int32

Variables	Description	Data Type
r4datapathpreregreq-totsendfail	The total number of failures occurred during transaction ID generation and R4 data path pre-registration request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathpreregreq-totrec	The total number of data path pre-registration request messages received on the the R4 interface.	Int32
r4datapathpreregreq-totacc	The total number of data path pre-registration request messages accepted on the the R4 interface.	Int32
r4datapathpreregreq-totrelay	The total number of data path pre-registration request messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a data path pre-registration request message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4datapathpreregreq-totdenied	The total number of data path pre-registration request messages denied on the the R4 interface.	Int32
r4datapathpreregreq-totdiscard	The total number of data path pre-registration request messages discarded on the the R4 interface.	Int32
r4datapathpreregreq-badform	The total number of badly formed data path pre-registration request messages on the the R4 interface.	Int32
r4datapathpreregreq-decodeerr	The total number of data path pre-registration request messages on the the R4 interface with decode error.	Int32
r4datapathpreregreq-unspecerr	The total number of data path pre-registration request messages on the the R4 interface with unspecified error.	Int32
r4datapathpreregreq-missmandtlv	The total number of data path pre-registration request messages on the the R4 interface with missing mandatory TLVs.	Int32
r4datapathpreregreq-tlvvalinval	The total number of data path pre-registration request messages on the the R4 interface with invalid TLV value.	Int32
r4datapathpreregreq-unknowntrlv	The total number of data path pre-registration request messages on the the R4 interface with unknown TLVs.	Int32
r4datapathpreregreq-duptlvfound	The total number of data path pre-registration request messages on the the R4 interface with duplicate TLVs.	Int32
r4datapathpreregreq-nosessfound	The total number of data path pre-registration request messages on the the R4 interface without any session information.	Int32
r4datapathpreregreq-adminprohib	The total number of data path pre-registration request messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path pre-registration request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r4datapathpreregreq-noresourcedrop	The total number of data path pre-registration request messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path pre-registration request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4datapathpreregreq-transiderr	The total number of data path pre-registration request messages on the the R4 interface with transaction ID errors.	Int32
r4datapathpreregresp-totsent	The total number of data path pre-registration response messages sent on the the R4 interface.	Int32
r4datapathpreregresp-retranssent	The total number of data path pre-registration response messages re-transmitted on the the R4 interface.	Int32
r4datapathpreregresp-totsendfail	The total number of failures occurred during transaction ID generation and R4 data path pre-registration response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathpreregresp-totrec	The total number of data path pre-registration response messages received on the the R4 interface.	Int32
r4datapathpreregresp-totacc	The total number of data path pre-registration response messages accepted on the the R4 interface.	Int32
r4datapathpreregresp-totrelay	The total number of data path pre-registration response messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time a data path pre-registration response message is relayed by the the the R4 interface. Availability: across all ASNGW services.	Int32
r4datapathpreregresp-totdenied	The total number of data path pre-registration response messages denied on the the R4 interface.	Int32
r4datapathpreregresp-totdiscard	The total number of data path pre-registration response messages discarded on the the R4 interface.	Int32
r4datapathpreregresp-badform	The total number of badly formed data path pre-registration response messages on the the R4 interface.	Int32
r4datapathpreregresp-decodeerr	The total number of data path pre-registration response messages on the the R4 interface with decode error.	Int32
r4datapathpreregresp-unspecerr	The total number of data path pre-registration response messages on the the R4 interface with unspecified error.	Int32
r4datapathpreregresp-missmandtlv	The total number of data path pre-registration response messages on the the R4 interface with missing mandatory TLVs.	Int32
r4datapathpreregresp-tlvvalinval	The total number of data path pre-registration response messages on the the R4 interface with invalid TLV value.	Int32
r4datapathpreregresp-unknowntlv	The total number of data path pre-registration response messages on the the R4 interface with unknown TLVs.	Int32

Variables	Description	Data Type
r4datapathpreregsp-dupltvfound	The total number of data path pre-registration response messages on the the R4 interface with duplicate TLVs.	Int32
r4datapathpreregsp-nosessfound	The total number of data path pre-registration response messages on the the R4 interface without any session information.	Int32
r4datapathpreregsp-adminprohib	The total number of data path pre-registration response messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path pre-registration response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4datapathpreregsp-noresourcedrop	The total number of data path pre-registration response messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path pre-registration response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4datapathpreregsp-transiderr	The total number of data path pre-registration response messages on the the R4 interface with transaction ID errors.	Int32
r4datapathpreregack-totsent	The total number of data path pre-registration acknowledgement messages sent on the the R4 interface.	Int32
r4datapathpreregack-retranssent	The total number of data path pre-registration acknowledgement messages re-transmitted on the the R4 interface.	Int32
r4datapathpreregack-totsendfail	The total number of failures occurred during transaction ID generation and R4 data path pre-registration acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathpreregack-totrec	The total number of data path pre-registration acknowledgement messages received on the the R4 interface.	Int32
r4datapathpreregack-totacc	The total number of data path pre-registration acknowledgement messages accepted on the the R4 interface.	Int32
r4datapathpreregack-totrelay	The total number of data path pre-registration acknowledgement messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time a data path pre-registration acknowledgement message is relayed by the the the R4 interface. Availability: across all ASNGW services.	Int32
r4datapathpreregack-totdenied	The total number of data path pre-registration acknowledgement messages denied on the the R4 interface.	Int32
r4datapathpreregack-totdiscard	The total number of data path pre-registration acknowledgement messages discarded on the the R4 interface.	Int32
r4datapathpreregack-badform	The total number of badly formed data path pre-registration acknowledgement messages on the the R4 interface.	Int32
r4datapathpreregack-decodeerr	The total number of data path pre-registration acknowledgement messages on the the R4 interface with decode error.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r4datapathpreregack- unspecerr	The total number of data path pre-registration acknowledgement messages on the the R4 interface with unspecified error.	Int32
r4datapathpreregack- missmandtlv	The total number of data path pre-registration acknowledgement messages on the the R4 interface with missing mandatory TLVs.	Int32
r4datapathpreregack- tlvvalinval	The total number of data path pre-registration acknowledgement messages on the the R4 interface with invalid TLV value.	Int32
r4datapathpreregack- unknownctlv	The total number of data path pre-registration acknowledgement messages on the the R4 interface with unknown TLVs.	Int32
r4datapathpreregack- dupctlvfound	The total number of data path pre-registration acknowledgement messages on the the R4 interface with duplicate TLVs.	Int32
r4datapathpreregack- nosessfound	The total number of data path pre-registration acknowledgement messages on the the R4 interface without any session information.	Int32
r4datapathpreregack- adminprohib	The total number of data path pre-registration acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path pre-registration acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4datapathpreregack- noresourceprop	The total number of data path pre-registration acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path pre-registration acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4datapathpreregack- transiderr	The total number of data path pre-registration acknowledgement messages on the the R4 interface with transaction ID errors.	Int32
r4datapathregreq-totsent	The total number of data path registration request messages sent on the the R4 interface.	Int32
r4datapathregreq- retranssent	The total number of data path registration request messages re-transmitted on the the R4 interface.	Int32
r4datapathregreq- totsefail	The total number of failures occurred during transaction ID generation and R4 data path registration request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathregreq-totrec	The total number of data path registration request messages received on the the R4 interface.	Int32
r4datapathregreq-totacc	The total number of data path registration request messages accepted on the the R4 interface.	Int32
r4datapathregreq-totrelay	The total number of data path registration request messages received from the base station and relayed on the the the R4 interface. Triggers: Changes every time a data path registration request message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32

Variables	Description	Data Type
r4datapathregreq-totdenied	The total number of data path registration request messages denied on the the R4 interface.	Int32
r4datapathregreq-totdiscard	The total number of data path registration request messages discarded on the the R4 interface.	Int32
r4datapathregreq-badform	The total number of badly formed data path registration request messages on the the R4 interface.	Int32
r4datapathregreq-decodeerr	The total number of data path registration request messages on the the R4 interface with decode error.	Int32
r4datapathregreq-unspecerr	The total number of data path registration request messages on the R4 interface with unspecified error.	Int32
r4datapathregreq-missmandtlv	The total number of data path registration request messages on the R4 interface with missing mandatory TLVs.	Int32
r4datapathregreq-tlvvalinval	The total number of data path registration request messages on the R4 interface with invalid TLV value.	Int32
r4datapathregreq-unknowntrlv	The total number of data path registration request messages on the R4 interface with unknown TLVs.	Int32
r4datapathregreq-duptrlvfound	The total number of data path registration request messages on the R4 interface with duplicate TLVs.	Int32
r4datapathregreq-nosessfound	The total number of data path registration request messages on the R4 interface without any session information.	Int32
r4datapathregreq-adminprohib	The total number of data path registration request messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path registration request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4datapathregreq-noresourcedrop	The total number of data path registration request messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path registration request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r4datapathregreq-transiderr	The total number of data path registration request messages on the R4 interface with transaction ID errors.	Int32
r4datapathregrsp-totsent	The total number of data path registration response messages sent on the R4 interface.	Int32
r4datapathregrsp-retranssent	The total number of data path registration response messages re-transmitted on the R4 interface.	Int32
r4datapathregrsp-totsendfail	The total number of failures occurred during transaction ID generation and R4 data path registration response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathregrsp-totrec	The total number of data path registration response messages received on the R4 interface.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r4datapathregrsp-totacc	The total number of data path registration response messages accepted on the R4 interface.	Int32
r4datapathregrsp-totrelay	The total number of data path registration response messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a data path registration response message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4datapathregrsp-totdenied	The total number of data path registration response messages denied on the R4 interface.	Int32
r4datapathregrsp-totdiscard	The total number of data path registration response messages discarded on the R4 interface.	Int32
r4datapathregrsp-badform	The total number of badly formed data path registration response messages on the R4 interface.	Int32
r4datapathregrsp-decodeerr	The total number of data path registration response messages on the R4 interface with decode error.	Int32
r4datapathregrsp-unspecerr	The total number of data path registration response messages on the R4 interface with unspecified error.	Int32
r4datapathregrsp-missmandtlv	The total number of data path registration response messages on the R4 interface with missing mandatory TLVs.	Int32
r4datapathregrsp-tlvvalinval	The total number of data path registration response messages on the R4 interface with invalid TLV value.	Int32
r4datapathregrsp-unknowntrlv	The total number of data path registration response messages on the R4 interface with unknown TLVs.	Int32
r4datapathregrsp-duptrlvfound	The total number of data path registration response messages on the R4 interface with duplicate TLVs.	Int32
r4datapathregrsp-nosessfound	The total number of data path registration response messages on the R4 interface without any session information.	Int32
r4datapathregrsp-adminprohib	The total number of data path registration response messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path registration response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4datapathregrsp-noresourcedrop	The total number of data path registration response messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path registration response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4datapathregrsp-transiderr	The total number of data path registration response messages on the R4 interface with transaction ID errors.	Int32
r4datapathregack-totsent	The total number of data path registration acknowledgement messages sent on the R4 interface.	Int32

Variables	Description	Data Type
r4datapathregack-retranssent	The total number of data path registration acknowledgement messages re-transmitted on the R4 interface.	Int32
r4datapathregack-totsendfail	The total number of failures occurred during transaction id generation and R4 data path registration acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathregack-totrec	The total number of data path registration acknowledgement messages received on the R4 interface.	Int32
r4datapathregack-totacc	The total number of data path registration acknowledgement messages accepted on the R4 interface.	Int32
r4datapathregack-totrelay	The total number of data path registration acknowledgement messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a data path registration acknowledgement message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4datapathregack-totdenied	The total number of data path registration acknowledgement messages denied on the R4 interface.	Int32
r4datapathregack-totdiscard	The total number of data path registration acknowledgement messages discarded on the R4 interface.	Int32
r4datapathregack-badform	The total number of badly formed data path registration acknowledgement messages on the R4 interface.	Int32
r4datapathregack-decodeerr	The total number of data path registration acknowledgement messages on the R4 interface with decode error.	Int32
r4datapathregack-unspecerr	The total number of data path registration acknowledgement messages on the R4 interface with unspecified error.	Int32
r4datapathregack-misssmandtlv	The total number of data path registration acknowledgement messages on the R4 interface with missing mandatory TLVs.	Int32
r4datapathregack-tlvvalinval	The total number of data path registration acknowledgement messages on the R4 interface with invalid TLV value.	Int32
r4datapathregack-unknowntrlv	The total number of data path registration acknowledgement messages on the R4 interface with unknown TLVs.	Int32
r4datapathregack-duptlvfound	The total number of data path registration acknowledgement messages on the R4 interface with duplicate TLVs.	Int32
r4datapathregack-nosessfound	The total number of data path registration acknowledgement messages on the R4 interface without any session information.	Int32
r4datapathregack-adminprohib	The total number of data path registration acknowledgement messages denied on the R4 interface.	Int32
r4datapathregack-noresourcedrop	The total number of data path registration acknowledgement messages discarded or denied due on the R4 interface to resource unavailability.	Int32

Common Syntax Options

Variables	Description	Data Type
r4datapathregack-transiderr	The total number of data path registration acknowledgement messages on the R4 interface with transaction ID errors.	Int32
r4pathmodreq-totsent	The total number of data path modification request messages sent on the R4 interface.	Int32
r4pathmodreq-retranssent	The total number of data path modification request messages re-transmitted on the R4 interface.	Int32
r4pathmodreq-totendfail	The total number of failed data path modification requests that occurred. This counter is used to count the error while sending the R4 packets.	Int32
r4pathmodreq-totrec	The total number of data path modification request messages received on the R4 interface.	Int32
r4pathmodreq-totacc	The total number of data path modification request messages accepted on the R4 interface.	Int32
r4pathmodreq-totrelay	The total number of data path modification request messages received from the base station and relayed on the the R4 interface.	Int32
r4pathmodreq-totdenied	The total number of data path modification request messages denied on the R4 interface.	Int32
r4pathmodreq-totdiscard	The total number of data path modification request messages discarded on the R4 interface.	Int32
r4pathmodreq-badform	The total number of badly formed data path modification request messages on the R4 interface.	Int32
r4pathmodreq-decodeerr	The total number of data path modification request messages on the R4 interface with decode error.	Int32
r4pathmodreq-unspecerr	The total number of data path modification request messages on the R4 interface with unspecified error.	Int32
r4pathmodreq-missmandtlv	The total number of data path modification request messages on the R4 interface with missing mandatory TLVs.	Int32
r4pathmodreq-tlvvalinval	The total number of data path modification request messages on the R4 interface with invalid TLV value.	Int32
r4pathmodreq-unknowntrlv	The total number of data path modification request messages on the R4 interface with unknown TLVs.	Int32
r4pathmodreq-duptlvfound	The total number of data path modification request messages on the R4 interface with duplicate TLVs.	Int32
r4pathmodreq-nosessfound	The total number of data path modification request messages on the R4 interface without any session information.	Int32
r4pathmodreq-adminprohib	The total number of administratively prohibited data path modification request messages on the R4 interface.	Int32
r4pathmodreq-noresourcedrop	The total number of data path modification request messages discarded or denied on the R4 interface due to a lack of resources.	Int32
r4pathmodreq-transiderr	The total number of data path modification request messages on the R4 interface with transaction ID errors.	Int32

Variables	Description	Data Type
r4pathmodrsp-totsent	The total number of data path modification response messages sent on the R4 interface.	Int32
r4pathmodrsp-retranssent	The total number of data path modification response messages re-transmitted on the R4 interface.	Int32
r4pathmodrsp-totsefail	The total number of failed data path modification response that occurred. This counter is used to count the error while sending the R4 packets.	Int32
r4pathmodrsp-totrec	The total number of data path modification response messages received on the R4 interface.	Int32
r4pathmodrsp-totacc	The total number of data path modification response messages accepted on the R4 interface.	Int32
r4pathmodrsp-totrelay	The total number of data path modification response messages received from the base station and relayed on the the R4 interface.	Int32
r4pathmodrsp-totdenied	The total number of data path modification response messages denied on the R4 interface.	Int32
r4pathmodrsp-totdiscard	The total number of data path modification response messages discarded on the R4 interface.	Int32
r4pathmodrsp-badform	The total number of badly formed data path modification response messages on the R4 interface.	Int32
r4pathmodrsp-decodeerr	The total number of data path modification response messages on the R4 interface with decode error.	Int32
r4pathmodrsp-unspecerr	The total number of data path modification response messages on the R4 interface with unspecified error.	Int32
r4pathmodrsp-missmandtlv	The total number of data path modification response messages on the R4 interface with missing mandatory TLVs.	Int32
r4pathmodrsp-tlvvalinval	The total number of data path modification response messages on the R4 interface with invalid TLV value.	Int32
r4pathmodrsp-unknowntrlv	The total number of data path modification response messages on the R4 interface with unknown TLVs.	Int32
r4pathmodrsp-duptlvfound	The total number of data path modification response messages on the R4 interface with duplicate TLVs.	Int32
r4pathmodrsp-nosessfound	The total number of data path modification response messages on the R4 interface without any session information.	Int32
r4pathmodrsp-adminprohib	The total number of administratively prohibited data path modification response messages on the R4 interface.	Int32
r4pathmodrsp-noresourcedrop	The total number of data path modification response messages discarded or denied on the R4 interface due to resource unavailability.	Int32
r4pathmodrsp-transiderr	The total number of data path modification response messages on the R4 interface with transaction ID errors.	Int32
r4pathmodack-totsent	The total number of data path modification acknowledgement messages sent on the R4 interface.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r4pathmodack-retranssent	The total number of data path modification acknowledgement messages re-transmitted on the R4 interface.	Int32
r4pathmodack-totendfail	The total number of failed data path modification acknowledgement that occurred. This counter is used to count the error while sending the R4 packets.	Int32
r4pathmodack-totrec	The total number of data path modification acknowledgement messages received on the R4 interface.	Int32
r4pathmodack-totacc	The total number of data path modification acknowledgement messages accepted on the R4 interface.	Int32
r4pathmodack-totrelay	The total number of data path modification acknowledgement messages received from the base station and relayed on the the R4 interface.	Int32
r4pathmodack-totdenied	The total number of data path modification acknowledgement messages denied on the R4 interface.	Int32
r4pathmodack-totdiscard	The total number of data path modification acknowledgement messages discarded on the R4 interface.	Int32
r4pathmodack-badform	The total number of badly formed data path modification acknowledgement messages on the R4 interface.	Int32
r4pathmodack-decodeerr	The total number of data path modification acknowledgement messages on the R4 interface with decode error.	Int32
r4pathmodack-unspecerr	The total number of data path modification acknowledgement messages on the R4 interface with unspecified error.	Int32
r4pathmodack-missmandtlv	The total number of data path modification acknowledgement messages on the R4 interface with missing mandatory TLVs.	Int32
r4pathmodack-tlvvalinval	The total number of data path modification acknowledgement messages on the R4 interface with invalid TLV value.	Int32
r4pathmodack-unknownctlv	The total number of data path modification acknowledgement messages on the R4 interface with unknown TLVs.	Int32
r4pathmodack-duptlvfound	The total number of data path modification acknowledgement messages on the R4 interface with duplicate TLVs.	Int32
r4pathmodack-nosessfound	The total number of data path modification acknowledgement messages on the R4 interface without any session information.	Int32
r4pathmodack-adminprohib	The total number of administratively prohibited data path modification acknowledgement messages on the R4 interface.	Int32
r4pathmodack-noresourcedrop	The total number of data path modification acknowledgement messages discarded or denied on the R4 interface due to resource unavailability.	Int32
r4pathmodack-transiderr	The total number of data path modification acknowledgement messages on the R4 interface with transaction ID errors.	Int32
r4datapathdereqreq-totsent	The total number of data path deregistration request messages sent on the R4 interface.	Int32

Variables	Description	Data Type
r4datapathderegreq-retranssent	The total number of data path deregistration request messages re-transmitted on the R4 interface.	Int32
r4datapathderegreq-totsefail	The total number of failures occurred during transaction id generation and R4 data path de-registration request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathderegreq-totrec	The total number of data path deregistration request messages received on the R4 interface.	Int32
r4datapathderegreq-totacc	The total number of data path deregistration request messages accepted on the R4 interface.	Int32
r4datapathderegreq-totrelay	The total number of data path de-registration request messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a data path de-registration request message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4datapathderegreq-totdenied	The total number of data path deregistration request messages denied on the R4 interface.	Int32
r4datapathderegreq-totdiscard	The total number of data path deregistration request messages discarded on the R4 interface.	Int32
r4datapathderegreq-badform	The total number of badly formed data path deregistration request messages on the R4 interface.	Int32
r4datapathderegreq-decodeerr	The total number of data path deregistration request messages on the R4 interface with decode error.	Int32
r4datapathderegreq-unspecerr	The total number of data path deregistration request messages on the R4 interface with unspecified error.	Int32
r4datapathderegreq-missmandtlv	The total number of data path deregistration request messages on the R4 interface with missing mandatory TLVs.	Int32
r4datapathderegreq-tlvvalinval	The total number of data path deregistration request messages on the R4 interface with invalid TLV value.	Int32
r4datapathderegreq-unknownntlv	The total number of data path deregistration request messages on the R4 interface with unknown TLVs.	Int32
r4datapathderegreq-duptlvfound	The total number of data path deregistration request messages on the R4 interface with duplicate TLVs.	Int32
r4datapathderegreq-nosessfound	The total number of data path deregistration request messages on the R4 interface without any session information.	Int32
r4datapathderegreq-adminprohib	The total number of data path de-registration request messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path de-registration request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r4datapathderegreq-noresourcedrop	The total number of data path de-registration request messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path de-registration request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4datapathderegreq-transiderr	The total number of data path deregistration request messages on the R4 interface with transaction ID errors.	Int32
r4datapathderegresp-totsent	The total number of data path deregistration response messages sent on the R4 interface.	Int32
r4datapathderegresp-retranssent	The total number of data path deregistration response messages re-transmitted on the R4 interface.	Int32
r4datapathderegresp-totsendfail	The total number of failures occurred during transaction id generation and R4 data path de-registration response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathderegresp-totrec	The total number of data path deregistration response messages received on the R4 interface.	Int32
r4datapathderegresp-totacc	The total number of data path deregistration response messages accepted on the R4 interface.	Int32
r4datapathderegresp-totrelay	The total number of data path de-registration response messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a data path de-registration response message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4datapathderegresp-totdenied	The total number of data path deregistration response messages denied on the R4 interface.	Int32
r4datapathderegresp-totdiscard	The total number of data path deregistration response messages discarded on the R4 interface.	Int32
r4datapathderegresp-badform	The total number of badly formed data path deregistration response messages on the R4 interface.	Int32
r4datapathderegresp-decodeerr	The total number of data path deregistration response messages on the R4 interface with decode error.	Int32
r4datapathderegresp-unspecerr	The total number of data path deregistration response messages on the R4 interface with unspecified error.	Int32
r4datapathderegresp-missmandtlv	The total number of data path deregistration response messages on the R4 interface with missing mandatory TLVs.	Int32
r4datapathderegresp-tlvvalinval	The total number of data path deregistration response messages on the R4 interface with invalid TLV value.	Int32
r4datapathderegresp-unknowntrlv	The total number of data path deregistration response messages on the R4 interface with unknown TLVs.	Int32
r4datapathderegresp-duptlvfound	The total number of data path deregistration response messages on the R4 interface with duplicate TLVs.	Int32

Variables	Description	Data Type
r4datapathderegsp-nosessfound	The total number of data path deregistration response messages on the R4 interface without any session information.	Int32
r4datapathderegsp-adminprohib	The total number of data path de-registration response messages discarded or denied due to admin prohibit. Triggers: Changes every time a data path de-registration response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4datapathderegsp-noresourcedrop	The total number of data path de-registration response messages discarded or denied due to resource unavailability. Triggers: Changes every time a data path de-registration response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4datapathderegsp-transiderr	The total number of data path deregistration response messages on the R4 interface with transaction ID errors.	Int32
r4keychadir-totsent	The total number of key change directive messages sent on the R4 interface.	Int32
r4keychadir-retranssent	The total number of key change directive messages re-transmitted on the R4 interface.	Int32
r4keychadir-totsefail	The total number of failures occurred during transaction id generation and R4 Key Change Directive message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4keychadir-totrec	The total number of key change directive messages received on the R4 interface.	Int32
r4keychadir-totacc	The total number of key change directive messages accepted on the R4 interface.	Int32
r4keychadir-totrelay	The total number of key change directive messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a key change directive message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4keychadir-totdenied	The total number of key change directive messages denied on the R4 interface.	Int32
r4keychadir-totdiscard	The total number of key change directive messages discarded on the R4 interface.	Int32
r4keychadir-badform	The total number of badly formed key change directive messages on the R4 interface.	Int32
r4keychadir-decodeerr	The total number of key change directive messages on the R4 interface with decode error.	Int32
r4keychadir-unspecerr	The total number of key change directive messages on the R4 interface with unspecified error.	Int32
r4keychadir-missmandtlv	The total number of key change directive messages on the R4 interface with missing mandatory TLVs.	Int32
r4keychadir-tlvvalinval	The total number of key change directive messages on the R4 interface with invalid TLV value.	Int32
r4keychadir-unknowntrlv	The total number of key change directive messages on the R4 interface with unknown TLVs.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r4keychadir-duptlvfound	The total number of key change directive messages on the R4 interface with duplicate TLVs.	Int32
r4keychadir-nosessfound	The total number of key change directive messages on the R4 interface without any session information.	Int32
r4keychadir-adminprohib	The total number of key change directive messages discarded or denied due to admin prohibit. Triggers: Changes every time a key change directive message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4keychadir-noresourcedrop	The total number of key change directive messages discarded or denied due to resource unavailability. Triggers: Changes every time a key change directive message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4keychadir-transiderr	The total number of key change directive messages on the R4 interface with transaction ID errors.	Int32
r4keychaack-totsent	The total number of key change acknowledgement messages sent on the R4 interface.	Int32
r4keychaack-retranssent	The total number of key change acknowledgement messages re-transmitted on the R4 interface.	Int32
r4keychaack-totsendfail	The total number of failures occurred during transaction id generation and R4 Key Change acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4keychaack-totrec	The total number of key change acknowledgement messages received on the R4 interface.	Int32
r4keychaack-totacc	The total number of key change acknowledgement messages accepted on the R4 interface.	Int32
r4keychaack-totrelay	The total number of key change acknowledgement messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a key change acknowledgement message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4keychaack-totdenied	The total number of key change acknowledgement messages denied on the R4 interface.	Int32
r4keychaack-totdiscard	The total number of key change acknowledgement messages discarded on the R4 interface.	Int32
r4keychaack-badform	The total number of badly formed key change acknowledgement messages on the R4 interface.	Int32
r4keychaack-decodeerr	The total number of key change acknowledgement messages on the R4 interface with decode error.	Int32
r4keychaack-unspecerr	The total number of key change acknowledgement messages on the R4 interface with unspecified error.	Int32

Variables	Description	Data Type
r4keychaack-mismandtlv	The total number of key change acknowledgement messages on the R4 interface with missing mandatory TLVs.	Int32
r4keychaack-tlvvalinval	The total number of key change acknowledgement messages on the R4 interface with invalid TLV value.	Int32
r4keychaack-unknowntlv	The total number of key change acknowledgement messages on the R4 interface with unknown TLVs.	Int32
r4keychaack-duptlvfound	The total number of key change acknowledgement messages on the R4 interface with duplicate TLVs.	Int32
r4keychaack-nosessfound	The total number of key change acknowledgement messages on the R4 interface without any session information.	Int32
r4keychaack-adminprohib	The total number of key change acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a key change acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4keychaack-noresourcedrop	The total number of key change acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a key change acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4keychaack-transiderr	The total number of key change acknowledgement messages on the R4 interface with transaction ID errors.	Int32
r4keychacnf-totrec	The total number of key change confirm messages received on the R4 interface.	Int32
r4keychacnf-totacc	The total number of key change confirm messages accepted on the R4 interface.	Int32
r4keychacnf-totrelay	The total number of key change confirm messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a key change confirm message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4keychacnf-totdenied	The total number of key change confirm messages denied on the R4 interface.	Int32
r4keychacnf-totdiscard	The total number of key change confirm messages discarded on the R4 interface.	Int32
r4keychacnf-badform	The total number of badly formed key change confirm messages on the R4 interface.	Int32
r4keychacnf-decodeerr	The total number of key change confirm messages on the R4 interface with decode error.	Int32
r4keychacnf-unspecerr	The total number of key change confirm messages on the R4 interface with unspecified error.	Int32
r4keychacnf-mismandtlv	The total number of key change confirm messages on the R4 interface with missing mandatory TLVs.	Int32
r4keychacnf-tlvvalinval	The total number of key change confirm messages on the R4 interface with invalid TLV value.	Int32

Common Syntax Options

Variables	Description	Data Type
r4keychacnf-unknowntlv	The total number of key change confirm messages on the R4 interface with unknown TLVs.	Int32
r4keychacnf-duptlvfound	The total number of key change confirm messages on the R4 interface with duplicate TLVs.	Int32
r4keychacnf-nosessfound	The total number of key change confirm messages on the R4 interface without any session information.	Int32
r4keychacnf-adminprohib	The total number of key change confirm messages discarded or denied due to admin prohibit. Triggers: Changes every time a key change confirm message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4keychacnf-noresourcedrop	The total number of key change confirm messages discarded or denied due to resource unavailability. Triggers: Changes every time a key change confirm message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4keychacnf-transiderr	The total number of key change confirm messages on the R4 interface with transaction ID errors.	Int32
r4cmackeycounupd-totsent	The total number of CMAC key count update messages sent on the R4 interface.	Int32
r4cmackeycounupd-retranssent	The total number of CMAC key count update messages re-transmitted on the R4 interface.	Int32
r4cmackeycounupd-totsendfail	The total number of failures occurred during transaction id generation and R4 CMAC key count update message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4cmackeycounupd-totrec	The total number of CMAC key count update messages received on the R4 interface.	Int32
r4cmackeycounupd-totacc	The total number of CMAC key count update messages accepted on the R4 interface.	Int32
r4cmackeycounupd-totrelay	The total number of CMAC key count update messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a CMAC key count update message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4cmackeycounupd-totdenied	The total number of CMAC key count update messages denied on the R4 interface.	Int32
r4cmackeycounupd-totdiscard	The total number of CMAC key count update messages discarded on the R4 interface.	Int32
r4cmackeycounupd-badform	The total number of badly formed CMAC key count update messages on the R4 interface.	Int32
r4cmackeycounupd-decodeerr	The total number of CMAC key count update messages on the R4 interface with decode error.	Int32

Variables	Description	Data Type
r4cmackeycounupd- unspecerr	The total number of CMAC key count update messages on the R4 interface with unspecified error.	Int32
r4cmackeycounupd- missmandtlv	The total number of CMAC key count update messages on the R4 interface with missing mandatory TLVs.	Int32
r4cmackeycounupd- tlvvalinval	The total number of CMAC key count update messages on the R4 interface with invalid TLV value.	Int32
r4cmackeycounupd- unknownltlv	The total number of CMAC key count update messages on the R4 interface with unknown TLVs.	Int32
r4cmackeycounupd- dupltlvfound	The total number of CMAC key count update messages on the R4 interface with duplicate TLVs.	Int32
r4cmackeycounupd- nosessfound	The total number of CMAC key count update messages on the R4 interface without any session information.	Int32
r4cmackeycounupd- adminprohib	The total number of CMAC key count update messages discarded or denied due to admin prohibit. Triggers: Changes every time a CMAC key count update message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4cmackeycounupd- noresourcedrop	The total number of CMAC key count update messages discarded or denied due to resource unavailability. Triggers: Changes every time a CMAC key count update message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4cmackeycounupd- transiderr	The total number of CMAC key count update messages on the R4 interface with transaction ID errors.	Int32
r4cmackeycounack- totsent	The total number of CMAC key count acknowledgement messages sent on the R4 interface.	Int32
r4cmackeycounack- retranssent	The total number of CMAC key count acknowledgement messages re-transmitted on the R4 interface.	Int32
r4cmackeycounack- totsendfail	The total number of failures occurred during transaction id generation and R4 CMAC key count acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4cmackeycounack- totrec	The total number of CMAC key count acknowledgement messages received on the R4 interface.	Int32
r4cmackeycounack- totacc	The total number of CMAC key count acknowledgement messages accepted on the R4 interface.	Int32
r4cmackeycounack- totrelay	The total number of CMAC key count acknowledgement messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time a CMAC key count acknowledgement message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r4cmackeycounack-totdenied	The total number of CMAC key count acknowledgement messages denied on the R4 interface.	Int32
r4cmackeycounack-totdiscard	The total number of CMAC key count acknowledgement messages discarded on the R4 interface.	Int32
r4cmackeycounack-badform	The total number of badly formed CMAC key count acknowledgement messages on the R4 interface.	Int32
r4cmackeycounack-decodeerr	The total number of CMAC key count acknowledgement messages on the R4 interface with decode error.	Int32
r4cmackeycounack-unspecerr	The total number of CMAC key count acknowledgement messages on the R4 interface with unspecified error.	Int32
r4cmackeycounack-mismandtlv	The total number of CMAC key count acknowledgement messages on the R4 interface with missing mandatory TLVs.	Int32
r4cmackeycounack-tlvvalinval	The total number of CMAC key count acknowledgement messages on the R4 interface with invalid TLV value.	Int32
r4cmackeycounack-unknowntrlv	The total number of CMAC key count acknowledgement messages on the R4 interface with unknown TLVs.	Int32
r4cmackeycounack-duptlvfound	The total number of CMAC key count acknowledgement messages on the R4 interface with duplicate TLVs.	Int32
r4cmackeycounack-nosessfound	The total number of CMAC key count acknowledgement messages on the R4 interface without any session information.	Int32
r4cmackeycounack-adminprohib	The total number of CMAC key count acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a CMAC key count acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4cmackeycounack-noresourcedrop	The total number of CMAC key count acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a CMAC key count acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4cmackeycounack-transiderr	The total number of CMAC key count acknowledgement messages on the R4 interface with transaction ID errors.	Int32
r4imentstachareq-totsent	The total number of R4 idle mode entry MS state change request messages sent on the R4 interface.	Int32
r4imentstachareq-retranssent	The total number of R4 idle mode entry MS state change request messages re-transmitted on the R4 interface.	Int32
r4imentstachareq-totsendfail	The total number of failures occurred during transaction id generation and R4 idle mode entry MS state change request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32

Variables	Description	Data Type
r4imentstachareq-totrec	The total number of R4 idle mode entry MS state change request messages received on the R4 interface.	Int32
r4imentstachareq-totacc	The total number of R4 idle mode entry MS state change request messages accepted on the R4 interface.	Int32
r4imentstachareq-totrelay	The total number of R4 idle mode entry MS state change request messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 idle mode entry MS state change request message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4imentstachareq-totdenied	The total number of R4 idle mode entry MS state change request messages denied on the R4 interface.	Int32
r4imentstachareq-totdiscard	The total number of R4 idle mode entry MS state change request messages discarded on the R4 interface.	Int32
r4imentstachareq-badform	The total number of badly formed R4 idle mode entry MS state change request messages on the R4 interface.	Int32
r4imentstachareq-decodeerr	The total number of R4 idle mode entry MS state change request messages on the R4 interface with decode error.	Int32
r4imentstachareq-unspecerr	The total number of R4 idle mode entry MS state change request messages on the R4 interface with unspecified error.	Int32
r4imentstachareq-missmandtlv	The total number of R4 idle mode entry MS state change request messages on the R4 interface with missing mandatory TLVs.	Int32
r4imentstachareq-tlvvalinval	The total number of R4 idle mode entry MS state change request messages on the R4 interface with invalid TLV value.	Int32
r4imentstachareq-unknowntrlv	The total number of R4 idle mode entry MS state change request messages on the R4 interface with unknown TLVs.	Int32
r4imentstachareq-duptlvfound	The total number of R4 idle mode entry MS state change request messages on the R4 interface with duplicate TLVs.	Int32
r4imentstachareq-nosessfound	The total number of R4 idle mode entry MS state change request messages on the R4 interface without any session information.	Int32
r4imentstachareq-adminprohib	The total number of R4 idle mode entry MS state change request messages discarded or denied due to admin prohibit. Triggers: Changes every time a R4 idle mode entry MS state change request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4imentstachareq-noresourcedrop	The total number of R4 idle mode entry MS state change request messages discarded or denied due to resource unavailability. Triggers: Changes every time a R4 idle mode entry MS state change request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r4imentstachareq-transiderr	The total number of R4 idle mode entry MS state change request messages on the R4 interface with transaction ID errors.	Int32
r4imentstacharsp-totsent	The total number of R4 idle mode entry MS state change response messages sent on the R4 interface.	Int32
r4imentstacharsp-retranssent	The total number of R4 idle mode entry MS state change response messages re-transmitted on the R4 interface.	Int32
r4imentstacharsp-totsendfail	The total number of failures occurred during transaction id generation and R4 idle mode entry MS state change response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4imentstacharsp-totrec	The total number of R4 idle mode entry MS state change response messages received on the R4 interface.	Int32
r4imentstacharsp-totacc	The total number of R4 idle mode entry MS state change response messages accepted on the R4 interface.	Int32
r4imentstacharsp-totrelay	The total number of R4 idle mode entry MS state change response messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 idle mode entry MS state change response message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32

r4imentstacharsp-totdiscard	The total number of R4 idle mode entry MS state change response messages discarded on the R4 interface.	Int32
r4imentstacharsp-badform	The total number of badly formed R4 idle mode entry MS state change response messages on the R4 interface.	Int32
r4imentstacharsp-decodeerr	The total number of R4 idle mode entry MS state change response messages on the R4 interface with decode error.	Int32
r4imentstacharsp-unspeccerr	The total number of R4 idle mode entry MS state change response messages on the R4 interface with unspecified error.	Int32
r4imentstacharsp-missmandtlv	The total number of R4 idle mode entry MS state change response messages on the R4 interface with missing mandatory TLVs.	Int32
r4imentstacharsp-tlvvalinval	The total number of R4 idle mode entry MS state change response messages on the R4 interface with invalid TLV value.	Int32
r4imentstacharsp-unknowntrlv	The total number of R4 idle mode entry MS state change response messages on the R4 interface with unknown TLVs.	Int32
r4imentstacharsp-duptrlvfound	The total number of R4 idle mode entry MS state change response messages on the R4 interface with duplicate TLVs.	Int32
r4imentstacharsp-nosessfound	The total number of R4 idle mode entry MS state change response messages on the R4 interface without any session information.	Int32

Variables	Description	Data Type
r4imentstacharsp-adminprohib	The total number of R4 idle mode entry MS state change response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 idle mode entry MS state change response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4imentstacharsp-noresourcedrop	The total number of R4 idle mode entry MS state change response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 idle mode entry MS state change response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4imentstacharsp-transiderr	The total number of R4 idle mode entry MS state change response messages on the R4 interface with transaction ID errors.	Int32
r4imentstachaack-totsent	The total number of R4 idle mode entry state change acknowledgement messages sent on the R4 interface.	Int32
r4imentstachaack-retranssent	The total number of R4 idle mode entry state change acknowledgement messages re-transmitted on the R4 interface.	Int32
r4imentstachaack-totsendfail	The total number of failures occurred during transaction id generation and R4 idle mode entry state change acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4imentstachaack-totrec	The total number of R4 idle mode entry state change acknowledgement messages received on the R4 interface.	Int32
r4imentstachaack-totacc	The total number of R4 idle mode entry state change acknowledgement messages accepted on the R4 interface.	Int32
r4imentstachaack-totrelay	The total number of R4 idle mode entry state change acknowledgement messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 idle mode entry state change acknowledgement message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4imentstachaack-totdenied	The total number of R4 idle mode entry state change acknowledgement messages denied on the R4 interface.	Int32
r4imentstachaack-totdiscard	The total number of R4 idle mode entry state change acknowledgement messages discarded on the R4 interface.	Int32
r4imentstachaack-badform	The total number of badly formed R4 idle mode entry state change acknowledgement messages on the R4 interface.	Int32
r4imentstachaack-decodeerr	The total number of R4 idle mode entry state change acknowledgement messages on the R4 interface with decode error.	Int32
r4imentstachaack-unspecerr	The total number of R4 idle mode entry state change acknowledgement messages on the R4 interface with unspecified error.	Int32
r4imentstachaack-missmandtlv	The total number of R4 idle mode entry state change acknowledgement messages on the R4 interface with missing mandatory TLVs.	Int32

Variables	Description	Data Type
r4imentstachaack-tlvvalinval	The total number of R4 idle mode entry state change acknowledgement messages on the R4 interface with invalid TLV value.	Int32
r4imentstachaack-unknownTLV	The total number of R4 idle mode entry state change acknowledgement messages on the R4 interface with unknown TLVs.	Int32
r4imentstachaack-dupTLVfound	The total number of R4 idle mode entry state change acknowledgement messages on the R4 interface with duplicate TLVs.	Int32
r4imentstachaack-nosessfound	The total number of R4 idle mode entry state change acknowledgement messages on the R4 interface without any session information.	Int32
r4imentstachaack-adminprohib	The total number of R4 idle mode entry state change acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 idle mode entry state change acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4imentstachaack-noresourcedrop	The total number of R4 idle mode entry state change acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 idle mode entry state change acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4imentstachaack-transiderr	The total number of R4 idle mode entry state change acknowledgement messages on the R4 interface with transaction ID errors.	Int32
r4anchorpcind-totsent	The total number of R4 anchor paging controller indicator messages sent on the R4 interface.	Int32
r4anchorpcind-retranssent	The total number of R4 anchor paging controller indicator messages re-transmitted on the R4 interface.	Int32
r4anchorpcind-totsendfail	The total number of failures occurred during transaction id generation and R4 anchor paging controller indicator message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4anchorpcind-totrec	The total number of R4 anchor paging controller indicator messages received on the R4 interface.	Int32
r4anchorpcind-totacc	The total number of R4 anchor paging controller indicator messages accepted on the R4 interface.	Int32
r4anchorpcind-totrelay	The total number of R4 anchor paging controller indicator messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 anchor paging controller indicator message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4anchorpcind-totdenied	The total number of R4 anchor paging controller indicator messages denied on the R4 interface.	Int32
r4anchorpcind-totdiscard	The total number of R4 anchor paging controller indicator messages discarded on the R4 interface.	Int32

Variables	Description	Data Type
r4anchorpcind-badform	The total number of badly formed R4 anchor paging controller indicator messages on the R4 interface.	Int32
r4anchorpcind-decodeerr	The total number of R4 anchor paging controller indicator messages on the R4 interface with decode error.	Int32
r4anchorpcind-unspecerr	The total number of R4 anchor paging controller indicator messages on the R4 interface with unspecified error.	Int32
r4anchorpcind-missmandtlv	The total number of R4 anchor paging controller indicator messages on the R4 interface with missing mandatory TLVs.	Int32
r4anchorpcind-tlvvalinval	The total number of R4 anchor paging controller indicator messages on the R4 interface with invalid TLV value.	Int32
r4anchorpcind-unknowntrlv	The total number of R4 anchor paging controller indicator messages on the R4 interface with unknown TLVs.	Int32
r4anchorpcind-duptlvfound	The total number of R4 anchor paging controller indicator messages on the R4 interface with duplicate TLVs.	Int32
r4anchorpcind-nosessfound	The total number of R4 anchor paging controller indicator messages on the R4 interface without any session information.	Int32
r4anchorpcind-adminprohib	The total number of R4 anchor paging controller indicator messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 anchor paging controller indicator message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4anchorpcind-noresourcedrop	The total number of R4 anchor paging controller indicator messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 anchor paging controller indicator message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4anchorpcind-transiderr	The total number of R4 anchor paging controller indicator messages on the R4 interface with transaction ID errors.	Int32
r4anchorpack-totsent	The total number of R4 anchor paging controller acknowledgement messages sent on the R4 interface.	Int32
r4anchorpack-retranssent	The total number of R4 anchor paging controller acknowledgement messages re-transmitted on the R4 interface.	Int32
r4anchorpack-totsendfail	The total number of failures occurred during transaction id generation and R4 anchor paging controller acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4anchorpack-totrec	The total number of R4 anchor paging controller acknowledgement messages received on the R4 interface.	Int32
r4anchorpack-totacc	The total number of R4 anchor paging controller acknowledgement messages accepted on the R4 interface.	Int32

Variables	Description	Data Type
r4anchorpcack-totrelay	The total number of R4 anchor paging controller acknowledgement messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 anchor paging controller acknowledgement message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4anchorpcack-totdenied	The total number of R4 anchor paging controller acknowledgement messages denied on the R4 interface.	Int32
r4anchorpcack-totdiscard	The total number of R4 anchor paging controller acknowledgement messages discarded on the R4 interface.	Int32
r4anchorpcack-badform	The total number of badly formed R4 anchor paging controller acknowledgement messages on the R4 interface.	Int32
r4anchorpcack-decodeerr	The total number of R4 anchor paging controller acknowledgement messages on the R4 interface with decode error.	Int32
r4anchorpcack-unspecerr	The total number of R4 anchor paging controller acknowledgement messages on the R4 interface with unspecified error.	Int32
r4anchorpcack-mismandtlv	The total number of R4 anchor paging controller acknowledgement messages on the R4 interface with missing mandatory TLVs.	Int32
r4anchorpcack-tlvvalinval	The total number of R4 anchor paging controller acknowledgement messages on the R4 interface with invalid TLV value.	Int32
r4anchorpcack-unknowntrlv	The total number of R4 anchor paging controller acknowledgement messages on the R4 interface with unknown TLVs.	Int32
r4anchorpcack-duptlvfound	The total number of R4 anchor paging controller acknowledgement messages on the R4 interface with duplicate TLVs.	Int32
r4anchorpcack-nosessfound	The total number of R4 anchor paging controller acknowledgement messages on the R4 interface without any session information.	Int32
r4anchorpcack-adminprohib	The total number of R4 anchor paging controller acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 anchor paging controller acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4anchorpcack-noresourcedrop	The total number of R4 anchor paging controller acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 anchor paging controller acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4anchorpcack-transiderr	The total number of R4 anchor paging controller acknowledgement messages on the R4 interface with transaction ID errors.	Int32
r4imexitstachareq-totsent	The total number of R4 idle mode exit MS state change request messages sent on the R4 interface.	Int32

Variables	Description	Data Type
r4imexitstachareq-retranssent	The total number of R4 idle mode exit MS state change request messages re-transmitted on the R4 interface.	Int32
r4imexitstachareq-totsefail	The total number of failures occurred during transaction id generation and R4 idle mode exit MS state change request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4imexitstachareq-totrec	The total number of R4 idle mode exit MS state change request messages received on the R4 interface.	Int32
r4imexitstachareq-totacc	The total number of R4 idle mode exit MS state change request messages accepted on the R4 interface.	Int32
r4imexitstachareq-totrelay	The total number of R4 idle mode exit MS state change request messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 idle mode exit MS state change request message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4imexitstachareq-totdenied	The total number of R4 idle mode exit MS state change request messages denied on the R4 interface.	Int32
r4imexitstachareq-totdiscard	The total number of R4 idle mode exit MS state change request messages discarded on the R4 interface.	Int32
r4imexitstachareq-badform	The total number of badly formed R4 idle mode exit MS state change request messages on the R4 interface.	Int32
r4imexitstachareq-decodeerr	The total number of R4 idle mode exit MS state change request messages on the R4 interface with decode error.	Int32
r4imexitstachareq-unspeccerr	The total number of R4 idle mode exit MS state change request messages on the R4 interface with unspecified error.	Int32
r4imexitstachareq-missmandtlv	The total number of R4 idle mode exit MS state change request messages on the R4 interface with missing mandatory TLVs.	Int32
r4imexitstachareq-tlvvalinval	The total number of R4 idle mode exit MS state change request messages on the R4 interface with invalid TLV value.	Int32
r4imexitstachareq-unknowntrlv	The total number of R4 idle mode exit MS state change request messages on the R4 interface with unknown TLVs.	Int32
r4imexitstachareq-duptlvfound	The total number of R4 idle mode exit MS state change request messages on the R4 interface with duplicate TLVs.	Int32
r4imexitstachareq-nosessfound	The total number of R4 idle mode exit MS state change request messages on the R4 interface without any session information.	Int32
r4imexitstachareq-adminprohib	The total number of R4 idle mode exit MS state change request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 idle mode exit MS state change request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Variables	Description	Data Type
r4imexitstachareq-noresourcedrop	The total number of R4 idle mode exit MS state change request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 idle mode exit MS state change request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4imexitstachareq-transiderr	The total number of R4 idle mode exit MS state change request messages on the R4 interface with transaction ID errors.	Int32
r4imexitstacharsp-totsent	The total number of R4 idle mode exit MS state change response messages sent on the R4 interface.	Int32
r4imexitstacharsp-retranssent	The total number of R4 idle mode exit MS state change response messages re-transmitted on the R4 interface.	Int32
r4imexitstacharsp-totsendfail	The total number of failures that occurred during transaction id generation and R4 idle mode exit MS state change response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4imexitstacharsp-totrec	The total number of R4 idle mode exit MS state change response messages received on the R4 interface.	Int32
r4imexitstacharsp-totacc	The total number of R4 idle mode exit MS state change response messages accepted on the R4 interface.	Int32
r4imexitstacharsp-totrelay	The total number of R4 idle mode exit MS state change response messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 idle mode exit MS state change response message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4imexitstacharsp-totdenied	The total number of R4 idle mode exit MS state change response messages denied on the R4 interface.	Int32
r4imexitstacharsp-totdiscard	The total number of R4 idle mode exit MS state change response messages discarded on the R4 interface.	Int32
r4imexitstacharsp-badform	The total number of badly formed R4 idle mode exit MS state change response messages on the R4 interface.	Int32
r4imexitstacharsp-decodeerr	The total number of R4 idle mode exit MS state change response messages on the R4 interface with decode error.	Int32
r4imexitstacharsp-unspecerr	The total number of R4 idle mode exit MS state change response messages on the R4 interface with unspecified error.	Int32
r4imexitstacharsp-missmandtlv	The total number of R4 idle mode exit MS state change response messages on the R4 interface with missing mandatory TLVs.	Int32
r4imexitstacharsp-tlvvalinval	The total number of R4 idle mode exit MS state change response messages on the R4 interface with invalid TLV value.	Int32
r4imexitstacharsp-unknowntlv	The total number of R4 idle mode exit MS state change response messages on the R4 interface with unknown TLVs.	Int32

Variables	Description	Data Type
r4imexitstacharsp-duptlvfound	The total number of R4 idle mode exit MS state change response messages on the R4 interface with duplicate TLVs.	Int32
r4imexitstacharsp-nosessfound	The total number of R4 idle mode exit MS state change response messages on the R4 interface without any session information.	Int32
r4imexitstacharsp-adminprohib	The total number of R4 idle mode exit MS state change response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 idle mode exit MS state change response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4imexitstacharsp-noresourcedrop	The total number of R4 idle mode exit MS state change response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 idle mode exit MS state change response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4imexitstacharsp-transiderr	The total number of R4 idle mode exit MS state change response messages on the R4 interface with transaction ID errors.	Int32
r4inipagreq-totsent	The total number of R4 initial paging request messages sent on the R4 interface.	Int32
r4inipagreq-retranssent	The total number of R4 initial paging request messages re-transmitted on the R4 interface.	Int32
r4inipagreq-totsendfail	The total number of failures occurred during transaction id generation and R4 initial paging request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4inipagreq-totrec	The total number of R4 initial paging request messages received on the R4 interface.	Int32
r4inipagreq-totacc	The total number of R4 initial paging request messages accepted on the R4 interface.	Int32
r4inipagreq-totrelay	The total number of R4 initial paging request messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 initial paging request message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4inipagreq-totdenied	The total number of R4 initial paging request messages denied on the R4 interface.	Int32
r4inipagreq-totdiscard	The total number of R4 initial paging request messages discarded on the R4 interface.	Int32
r4inipagreq-badform	The total number of badly formed R4 initial paging request messages on the R4 interface.	Int32
r4inipagreq-decodeerr	The total number of R4 initial paging request messages on the R4 interface with decode error.	Int32
r4inipagreq-unspecerr	The total number of R4 initial paging request messages on the R4 interface with unspecified error.	Int32
r4inipagreq-missmandtlv	The total number of R4 initial paging request messages on the R4 interface with missing mandatory TLVs.	Int32
r4inipagreq-tlvvalinval	The total number of R4 initial paging request messages on the R4 interface with invalid TLV value.	Int32

Common Syntax Options

Variables	Description	Data Type
r4inipagreq-unknownTLV	The total number of R4 initial paging request messages on the R4 interface with unknown TLVs.	Int32
r4inipagreq-duptlvfound	The total number of R4 initial paging request messages on the R4 interface with duplicate TLVs.	Int32
r4inipagreq-nosessfound	The total number of R4 initial paging request messages on the R4 interface without any session information.	Int32
r4inipagreq-adminprohib	The total number of R4 initial paging request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 initial paging request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4inipagreq-noresourcedrop	The total number of R4 initial paging request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 initial paging request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4inipagreq-transiderr	The total number of R4 initial paging request messages on the R4 interface with transaction ID errors.	Int32
r4inipagrsp-totsent	The total number of R4 initial paging response messages sent on the R4 interface.	Int32
r4inipagrsp-retranssent	The total number of R4 initial paging response messages re-transmitted on the R4 interface.	Int32
r4inipagrsp-totendfail	The total number of failures occurred during transaction id generation and R4 initial paging response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4inipagrsp-totrec	The total number of R4 initial paging response messages received on the R4 interface.	Int32
r4inipagrsp-totacc	The total number of R4 initial paging response messages accepted on the R4 interface.	Int32
r4inipagrsp-totrelay	The total number of R4 initial paging response messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 initial paging response message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4inipagrsp-totdenied	The total number of R4 initial paging response messages denied on the R4 interface.	Int32
r4inipagrsp-totdiscard	The total number of R4 initial paging response messages discarded on the R4 interface.	Int32
r4inipagrsp-badform	The total number of badly formed R4 initial paging response messages on the R4 interface.	Int32
r4inipagrsp-decodeerr	The total number of R4 initial paging response messages on the R4 interface with decode error.	Int32
r4inipagrsp-unspecerr	The total number of R4 initial paging response messages on the R4 interface with unspecified error.	Int32

Variables	Description	Data Type
r4inipagrsp-misssmandtlv	The total number of R4 initial paging response messages on the R4 interface with missing mandatory TLVs.	Int32
r4inipagrsp-tlvvalinval	The total number of R4 initial paging response messages on the R4 interface with invalid TLV value.	Int32
r4inipagrsp-unknowntlv	The total number of R4 initial paging response messages on the R4 interface with unknown TLVs.	Int32
r4inipagrsp-duptlvfound	The total number of R4 initial paging response messages on the R4 interface with duplicate TLVs.	Int32
r4inipagrsp-nosessfound	The total number of R4 initial paging response messages on the R4 interface without any session information.	Int32
r4inipagrsp-adminprohib	The total number of R4 initial paging response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 initial paging response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4inipagrsp-noresourcedrop	The total number of R4 initial paging response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 initial paging response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4inipagrsp-transiderr	The total number of R4 initial paging response messages on the R4 interface with transaction ID errors.	Int32
r4delmsentreq-totsent	The total number of R4 delete MS entry request messages sent on the R4 interface.	Int32
r4delmsentreq-retranssent	The total number of R4 delete MS entry request messages re-transmitted on the R4 interface.	Int32
r4delmsentreq-totsendfail	The total number of failures occurred during transaction id generation and R4 delete MS entry request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4delmsentreq-totrec	The total number of R4 delete MS entry request messages received on the R4 interface.	Int32
r4delmsentreq-totacc	The total number of R4 delete MS entry request messages accepted on the R4 interface.	Int32
r4delmsentreq-totrelay	The total number of R4 delete MS entry request messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 delete MS entry request message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4delmsentreq-totdenied	The total number of R4 delete MS entry request messages denied on the R4 interface.	Int32
r4delmsentreq-totdiscard	The total number of R4 delete MS entry request messages discarded on the R4 interface.	Int32
r4delmsentreq-badform	The total number of badly formed R4 delete MS entry request messages on the R4 interface.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r4delmsentreq-decodeerr	The total number of R4 delete MS entry request messages on the R4 interface with decode error.	Int32
r4delmsentreq-unspecerr	The total number of R4 delete MS entry request messages on the R4 interface with unspecified error.	Int32
r4delmsentreq-missmandtlv	The total number of R4 delete MS entry request messages on the R4 interface with missing mandatory TLVs.	Int32
r4delmsentreq-tlvvalinval	The total number of R4 delete MS entry request messages on the R4 interface with invalid TLV value.	Int32
r4delmsentreq-unknownctlv	The total number of R4 delete MS entry request messages on the R4 interface with unknown TLVs.	Int32
r4delmsentreq-dupctlvfound	The total number of R4 delete MS entry request messages on the R4 interface with duplicate TLVs.	Int32
r4delmsentreq-nosessfound	The total number of R4 delete MS entry request messages on the R4 interface without any session information.	Int32
r4delmsentreq-adminprohib	The total number of R4 delete MS entry request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 delete MS entry request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4delmsentreq-noresourcedrop	The total number of R4 delete MS entry request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 delete MS entry request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4delmsentreq-transiderr	The total number of R4 delete MS entry request messages on the R4 interface with transaction ID errors.	Int32
r4delmsentrsp-totsent	The total number of R4 delete MS entry response messages sent on the R4 interface.	Int32
r4delmsentrsp-retranssent	The total number of R4 delete MS entry response messages re-transmitted on the R4 interface.	Int32
r4delmsentrsp-totsendfail	The total number of failures occurred during transaction id generation and R4 delete MS entry response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4delmsentrsp-totrec	The total number of R4 delete MS entry response messages received on the R4 interface.	Int32
r4delmsentrsp-totacc	The total number of R4 delete MS entry response messages accepted on the R4 interface.	Int32
r4delmsentrsp-totrelay	The total number of R4 delete MS entry response messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 delete MS entry response message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4delmsentrsp-totdenied	The total number of R4 delete MS entry response messages denied on the R4 interface.	Int32

Variables	Description	Data Type
r4delmsentrsp-totdiscard	The total number of R4 delete MS entry response messages discarded on the R4 interface.	Int32
r4delmsentrsp-badform	The total number of badly formed R4 delete MS entry response messages on the R4 interface.	Int32
r4delmsentrsp-decodeerr	The total number of R4 delete MS entry response messages on the R4 interface with decode error.	Int32
r4delmsentrsp-unspecerr	The total number of R4 delete MS entry response messages on the R4 interface with unspecified error.	Int32
r4delmsentrsp-missmandtlv	The total number of R4 delete MS entry response messages on the R4 interface with missing mandatory TLVs.	Int32
r4delmsentrsp-tlvvalinval	The total number of R4 delete MS entry response messages on the R4 interface with invalid TLV value.	Int32
r4delmsentrsp-unknownltlv	The total number of R4 delete MS entry response messages on the R4 interface with unknown TLVs.	Int32
r4delmsentrsp-duptlvfound	The total number of R4 delete MS entry response messages on the R4 interface with duplicate TLVs.	Int32
r4delmsentrsp-nosessfound	The total number of R4 delete MS entry response messages on the R4 interface without any session information.	Int32
r4delmsentrsp-adminprohib	The total number of R4 delete MS entry response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 delete MS entry response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4delmsentrsp-noresourcedrop	The total number of R4 delete MS entry response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 delete MS entry response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4delmsentrsp-transiderr	The total number of R4 delete MS entry response messages on the R4 interface with transaction ID errors.	Int32
r4horeq-totsent	The total number of R4 handover request messages sent on the R4 interface.	Int32
r4horeq-retranssent	The total number of R4 handover request messages re-transmitted on the R4 interface.	Int32
r4horeq-totsendfail	The total number of failures occurred during transaction id generation and R4 handover request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4horeq-totrec	The total number of R4 handover request messages received on the R4 interface.	Int32
r4horeq-totacc	The total number of R4 handover request messages accepted on the R4 interface.	Int32

Variables	Description	Data Type
r4horeq-totrelay	The total number of R4 handover request messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 handover request message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4horeq-totdenied	The total number of R4 handover request messages denied on the R4 interface.	Int32
r4horeq-totdiscard	The total number of R4 handover request messages discarded on the R4 interface.	Int32
r4horeq-badform	The total number of badly formed R4 handover request messages on the R4 interface.	Int32
r4horeq-decodeerr	The total number of R4 handover request messages on the R4 interface with decode error.	Int32
r4horeq-unspecerr	The total number of R4 handover request messages on the R4 interface with unspecified error.	Int32
r4horeq-missmandtlv	The total number of R4 handover request messages on the R4 interface with missing mandatory TLVs.	Int32
r4horeq-tlvvalinval	The total number of R4 handover request messages on the R4 interface with invalid TLV value.	Int32
r4horeq-unknowntrlv	The total number of R4 handover request messages on the R4 interface with unknown TLVs.	Int32
r4horeq-duptlvfound	The total number of R4 handover request messages on the R4 interface with duplicate TLVs.	Int32
r4horeq-nosessfound	The total number of R4 handover request messages on the R4 interface without any session information.	Int32
r4horeq-adminprohib	The total number of R4 handover request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 handover request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4horeq-noresourcedrop	The total number of R4 handover request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 handover request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4horeq-transiderr	The total number of R4 handover request messages on the R4 interface with transaction ID errors.	Int32
r4horsp-totsent	The total number of R4 handover response messages sent on the R4 interface.	Int32
r4horsp-retranssent	The total number of R4 handover response messages re-transmitted on the R4 interface.	Int32
r4horsp-totsendfail	The total number of failures occurred during transaction id generation and R4 handover response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4horsp-totrec	The total number of R4 handover response messages received on the R4 interface.	Int32

Variables	Description	Data Type
r4horsp-totacc	The total number of R4 handover response messages accepted on the R4 interface.	Int32
r4horsp-totrelay	The total number of R4 handover request messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 handover request message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4horsp-totdenied	The total number of R4 handover response messages denied on the R4 interface.	Int32
r4horsp-totdiscard	The total number of R4 handover response messages discarded on the R4 interface.	Int32
r4horsp-badform	The total number of badly formed R4 handover response messages on the R4 interface.	Int32
r4horsp-decodeerr	The total number of R4 handover response messages on the R4 interface with decode error.	Int32
r4horsp-unspecerr	The total number of R4 handover response messages on the R4 interface with unspecified error.	Int32
r4horsp-missmandtlv	The total number of R4 handover response messages on the R4 interface with missing mandatory TLVs.	Int32
r4horsp-tlvvalinval	The total number of R4 handover response messages on the R4 interface with invalid TLV value.	Int32
r4horsp-unknowntlv	The total number of R4 handover response messages on the R4 interface with unknown TLVs.	Int32
r4horsp-duptlvfound	The total number of R4 handover response messages on the R4 interface with duplicate TLVs.	Int32
r4horsp-nosessfound	The total number of R4 handover response messages on the R4 interface without any session information.	Int32
r4horsp-adminprohib	The total number of R4 handover response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 handover response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4horsp-noresourcedrop	The total number of R4 handover response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 handover response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4horsp-transiderr	The total number of R4 handover response messages on the R4 interface with transaction ID errors.	Int32
r4hoack-totsent	The total number of R4 handover acknowledgement messages sent on the R4 interface.	Int32
r4hoack-retranssent	The total number of R4 handover acknowledgement messages re-transmitted on the R4 interface.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r4hoack-totsendfail	The total number of failures occurred during transaction id generation and R4 handover acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4hoack-totrec	The total number of R4 handover acknowledgement messages received on the R4 interface.	Int32
r4hoack-totacc	The total number of R4 handover acknowledgement messages accepted on the R4 interface.	Int32
r4hoack-totrelay	The total number of R4 handover acknowledgement messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 handover acknowledgement message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4hoack-totdenied	The total number of R4 handover acknowledgement messages denied on the R4 interface.	Int32
r4hoack-totdiscard	The total number of R4 handover acknowledgement messages discarded on the R4 interface.	Int32
r4hoack-badform	The total number of badly formed R4 handover acknowledgement messages on the R4 interface.	Int32
r4hoack-decodeerr	The total number of R4 handover acknowledgement messages on the R4 interface with decode error.	Int32
r4hoack-unspecerr	The total number of R4 handover acknowledgement messages on the R4 interface with unspecified error.	Int32
r4hoack-missmandtlv	The total number of R4 handover acknowledgement messages on the R4 interface with missing mandatory TLVs.	Int32
r4hoack-tlvvalinval	The total number of R4 handover acknowledgement messages on the R4 interface with invalid TLV value.	Int32
r4hoack-unknowntlv	The total number of R4 handover acknowledgement messages on the R4 interface with unknown TLVs.	Int32
r4hoack-duptlvfound	The total number of R4 handover acknowledgement messages on the R4 interface with duplicate TLVs.	Int32
r4hoack-nosessfound	The total number of R4 handover acknowledgement messages on the R4 interface without any session information.	Int32
r4hoack-adminprohib	The total number of R4 handover acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 handover acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Variables	Description	Data Type
r4hoack-noresourcedrop	The total number of R4 handover acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 handover acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4hoack-transiderr	The total number of R4 handover acknowledgement messages on the R4 interface with transaction ID errors.	Int32
r4hocnf-totsent	The total number of R4 handover confirm messages sent on the R4 interface.	Int32
r4hocnf-retranssent	The total number of R4 handover confirm messages re-transmitted on the R4 interface.	Int32
r4hocnf-totsendfail	The total number of failures occurred during transaction id generation and R4 handover confirm message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4hocnf-totrec	The total number of R4 handover confirm messages received on the R4 interface.	Int32
r4hocnf-totacc	The total number of R4 handover confirm messages accepted on the R4 interface.	Int32
r4hocnf-totrelay	The total number of R4 handover confirm messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 handover confirm message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4hocnf-totdenied	The total number of R4 handover confirm messages denied on the R4 interface.	Int32
r4hocnf-totdiscard	The total number of R4 handover confirm messages discarded on the R4 interface.	Int32
r4hocnf-badform	The total number of badly formed R4 handover confirm messages on the R4 interface.	Int32
r4hocnf-decodeerr	The total number of R4 handover confirm messages on the R4 interface with decode error.	Int32
r4hocnf-unspecerr	The total number of R4 handover confirm messages on the R4 interface with unspecified error.	Int32
r4hocnf-mismandtlv	The total number of R4 handover confirm messages on the R4 interface with missing mandatory TLVs.	Int32
r4hocnf-tlvvalinval	The total number of R4 handover confirm messages on the R4 interface with invalid TLV value.	Int32
r4hocnf-unknowntlv	The total number of R4 handover confirm messages on the R4 interface with unknown TLVs.	Int32
r4hocnf-duptlvfound	The total number of R4 handover confirm messages on the R4 interface with duplicate TLVs.	Int32
r4hocnf-nosessfound	The total number of R4 handover confirm messages on the R4 interface without any session information.	Int32

Variables	Description	Data Type
r4hocnf-adminprohib	The total number of R4 handover confirm messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 handover confirm message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4hocnf-noresourcedrop	The total number of R4 handover confirm messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 handover confirm message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4hocnf-transiderr	The total number of R4 handover confirm messages on the R4 interface with transaction ID errors.	Int32
r4hocmpl-totsent	The total number of R4 handover complete messages sent on the R4 interface.	Int32
r4hocmpl-retranssent	The total number of R4 handover complete messages re-transmitted on the R4 interface.	Int32
r4hocmpl-totsendfail	The total number of failures occurred during transaction id generation and R4 handover complete message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4hocmpl-totrec	The total number of R4 handover complete messages received on the R4 interface.	Int32
r4hocmpl-totacc	The total number of R4 handover complete messages accepted on the R4 interface.	Int32
r4hocmpl-totrelay	The total number of R4 handover complete messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 handover complete message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4hocmpl-totdenied	The total number of R4 handover complete messages denied on the R4 interface.	Int32
r4hocmpl-totdiscard	The total number of R4 handover complete messages discarded on the R4 interface.	Int32
r4hocmpl-badform	The total number of badly formed R4 handover complete messages on the R4 interface.	Int32
r4hocmpl-decodeerr	The total number of R4 handover complete messages on the R4 interface with decode error.	Int32
r4hocmpl-unspecerr	The total number of R4 handover complete messages on the R4 interface with unspecified error.	Int32
r4hocmpl-missmandtlv	The total number of R4 handover complete messages on the R4 interface with missing mandatory TLVs.	Int32
r4hocmpl-tlvvalinval	The total number of R4 handover complete messages on the R4 interface with invalid TLV value.	Int32
r4hocmpl-unknowntlv	The total number of R4 handover complete messages on the R4 interface with unknown TLVs.	Int32
r4hocmpl-duptlvfound	The total number of R4 handover complete messages on the R4 interface with duplicate TLVs.	Int32

Variables	Description	Data Type
r4hocmpl-nosessfound	The total number of R4 handover complete messages on the R4 interface without any session information.	Int32
r4hocmpl-adminprohib	The total number of R4 handover complete messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 handover complete message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4hocmpl-noresourcedrop	The total number of R4 handover complete messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 handover complete message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4hocmpl-transiderr	The total number of R4 handover complete messages on the the R4 interface with transaction ID errors.	Int32
r4unknown-totrec	The total number of unknown messages sent on the R4 interface.	Int32
r4unknown-totacc	The total number of unknown messages re-transmitted on the R4 interface.	Int32
r4unknown-totrelay	The total number of R4 unknown messages received from the base station and relayed on the the R4 interface. Triggers: Changes every time an R4 unknown message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4unknown-totdenied	The total number of unknown denied messages received on the R4 interface.	Int32
r4unknown-totdiscard	The total number of unknown discarded messages accepted on the R4 interface.	Int32
r4unknown-badform	The total number of unknown badly formed messages on the R4 interface.	Int32
r4unknown-decodeerr	The total number of unknown messages discarded on the R4 interface.	Int32
r4unknown-unspecerr	The total number of unknown unspecified error messages on the R4 interface.	Int32
r4unknown-mismandtlv	The total number of unknown messages on the R4 interface with missing mandatory TLV.	Int32
r4unknown-tlvvalinval	The total number of unknown messages on the R4 interface with an invalid TLV.	Int32
r4unknown-unknowntlv	The total number of unknown messages on the R4 interface with unknown TLVs.	Int32
r4unknown-duptlvfound	The total number of messages on the R4 interface with duplicate TLV values.	Int32
r4unknown-nosessfound	The total number of messages on the R4 interface with no session information.	Int32
r4unknown-adminprohib	The total number of R4 unknown messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 unknown message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r4unknown-noresourcedrop	The total number of R4 unknown messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 unknown message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4unknown-transiderr	The total number of unknown messages on the R4 interface with transaction ID errors.	Int32
r4datagrerec-totpackrec	The total number of data packets received through the GRE tunnel on the R4 interface.	Int32
r4datagrerec-prottyperror	Total number of protected type errors received through the GRE tunnel the R4 interface.	Int32
r4datagrerec-totbytrec	The total number of data bytes received through the GRE tunnel the R4 interface.	Int32
r4datagrerec-grekeyabs	The total number of data message received without the GRE key through GRE tunnel the R4 interface.	Int32
r4datagrerec-grechkerr	The total number of data message received with checksum error through the GRE tunnel the R4 interface.	Int32
r4datagrerec-invpacklen	Total number of protectd type errors received throughthe GRE tunnel the R4 interface.	Int32
r4datagrerec-nosessfou	The total number of data bytes received through the GRE tunnel the R4 interface.	Int32
r4datagrerec-unspecerr	The total number of data message received without a GRE key through the GRE tunnel the R4 interface.	Int32
r4prelocind-totsent	The total number of R4 PC Relocation Indication messages sent to the ASNPC.	Int32
r4prelocind-retranssent	The total number of PC Relocation Indication messages retransmitted on the the R4 interface to the ASNPC.	Int32
r4prelocind-totsendfail	The total number of PC Relocation Indication message failures received from the ASNPC and relayed on the the R4 interface. This counter is used to count the error while sending the R4 packets.	Int32
r4prelocind-totrec	The total number of R4 PC Relocation Indication messages received by the ASNPC.	Int32
r4prelocind-totacc	The total number of R4 PC Relocation Indication messages accepted by the ASNPC.	Int32
r4prelocind-totrelay	The total number of R4 PC Relocation Indication messages sent to the ASNPC and relayed on the R6 interface. Triggers: Changes every time an R4 PC Relocation Indication message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32
r4prelocind-totdenied	The total number of PC Relocation Indication messages denied on the the R4 interface.	Int32
r4prelocind-totdiscard	The total number of PC Relocation Indication messages discarded on the the R4 interface.	Int32
r4prelocind-badform	The total number of badly formed R4 PC Relocation Indication messages sent to the ASNPC.	Int32
r4prelocind-decodeerr	The total number of R4 PC Relocation Indication messages sent to the ASNPC with decode errors.	Int32

Variables	Description	Data Type
r4prelocind-unspecerr	The total number of R4 PC Relocation Indication messages sent to the ASNPC with unspecified errors.	Int32
r4prelocind-mismandtlv	The total number of R4 PC Relocation Indication messages sent to the ASNPC with missing mandatory TLVs.	Int32
r4prelocind-tlvvalinval	The total number of R4 PC Relocation Indication messages sent to the ASNPC with an invalid TLV.	Int32
r4prelocind-unknowntrlv	The total number of R4 PC Relocation Indication messages sent to the ASNPC with an unknown TLV.	Int32
r4prelocind-duptlvfound	The total number of R4 PC Relocation Indication messages sent to the ASNPC with duplicate TLVs.	Int32
r4prelocind-nosessfound	The total number of R4 PC Relocation Indication messages sent to the ASNPC without any session information.	Int32
r4prelocind-admprohibit	The total number of R4 PC Relocation Indication messages sent to the ASNPC that were discarded or denied due to admin prohibit. Triggers: Changes every time an R4 PC Relocation Indication message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r4prelocind-noresourcedrop	The total number of R4 PC Relocation Indication messages sent to the ASNPC that were discarded or denied due to resource unavailability. Triggers: Changes every time an R4 PC Relocation Indication message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r4prelocind-transiderr	The total number of R4 PC Relocation Indication messages sent to the ASNPC with a transaction ID error.	Int32
r4imexitstaind-totsent	The total number of Idle Mode Exit State Indication messages sent to the peer ASNGW.	Int32
r4imexitstaind-retranssent	The total number of Idle Mode Exit State Indication messages retransmitted on the the R4 interface to the peer ASNGW.	Int32
r4imexitstaind-totsendfail	The total number of Idle Mode Exit State Indication message failures received from the peer ASNGW and relayed on the the R4 interface. This counter is used to count the error while sending the R4 packets.	Int 32
r4imexitstaind-totrec	The total number of R4 Idle Mode Exit State Indication messages received by the peer ASNGW.	Int32
r4imexitstaind-totacc	The total number of R4 Idle Mode Exit State Indication messages accepted by the peer ASNGW.	Int32
r4imexitstaind-totrelay	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNPC and relayed on the R6 interface. Triggers: Changes every time an R4 Idle Mode Exit State Indication message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r4imexitstaind-totdenied	The total number of Idle Mode Exit State Indication messages to the peer ASNGW that were denied on the the R4 interface.	Int32
r4imexitstaind-totdiscard	The total number of Idle Mode Exit State Indication messages sent to the peer ASNGW that were discarded on the the R4 interface.	Int32
r4imexitstaind-badform	The total number of badly formed R4 Idle Mode Exit State Indication messages sent to the peer ASNGW.	Int32
r4imexitstaind-decodeerr	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW with decode errors.	Int32
r4imexitstaind-unspecerr	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW with unspecified errors.	Int32
r4imexitstaind-missmandtlv	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW with missing mandatory TLVs.	Int32
r4imexitstaind-tlvvalinval	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW with an invalid TLV.	Int32
r4imexitstaind-unknowntrlv	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW with an unknown TLV.	Int32
r4imexitstaind-duptlvfound	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW with duplicate TLVs.	Int32
r4imexitstaind-nosessfound	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW without any session information.	Int32
r4imexitstaind-admprohibit	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW that were discarded or denied due to admin prohibit. Triggers: Changes every time an Idle Mode Exit State Indication message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r4imexitstaind-noresourcedrop	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW that were discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Idle Mode Exit State Indication message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r4imexitstaind-transiderr	The total number of R4 Idle Mode Exit State Indication messages sent to the peer ASNGW with a transaction ID error.	Int32
r4prelocack-totsent	The number of PC Relocation Acknowledgement messages sent to the ASNPC.	Int32
r4prelocack-retranssent	The total number of PC Relocation Acknowledgement messages retransmitted on the the R4 interface to the ASNPC.	Int32
r4prelocack-totsefail	The total number of PC Relocation Acknowledgement message failures sent to the ASNPC and relayed on the the R4 interface. This counter is used to count the error while sending the R4 packets.	Int32
r4prelocack-totrec	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC.	Int32

Variables	Description	Data Type
r4prelocack-totacc	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC.	Int32
r4prelocack-totrelay	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC and relayed on the the R4 interface. Triggers: Changes every time an R4 Idle Mode Exit State Indication message is relayed by the the R4 interface. Availability: across all ASNGW services.	Int 32
r4prelocack-totdenied	The total number of PC Relocation Acknowledgement messages sent to the ASNPC that were denied on the the R4 interface.	Int32
r4prelocack-totdiscard	The total number of PC Relocation Acknowledgement messages sent to the ASNPC that were discarded on the the R4 interface.	Int32
r4prelocack-badform	The total number of badly formed R4 PC Relocation Acknowledgement messages sent to the ASNPC.	Int32
r4prelocack-decodeerr	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC with decode errors.	Int32
r4prelocack-unspecerr	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC with unspecified errors.	Int32
r4prelocack-missmandtlv	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC with missing mandatory TLVs.	Int32
r4prelocack-tlvvalinval	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC with an invalid TLV.	Int32
r4prelocack-unknowntlv	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC with an unknown TLV.	Int32
r4prelocack-duptlvfound	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC with duplicate TLVs.	Int32
r4prelocack-nosessfound	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC without any session information.	Int32
r4prelocack-admprohibit	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC that were discarded or denied due to admin prohibit. Triggers: Changes every time an R4 PC Relocation Acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r4prelocack-noresourcedrop	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNPC that were discarded or denied due to resource unavailability. Triggers: Changes every time an R4 PC Relocation Acknowledgement message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r4prelocack-transiderr	The total number of R4 IPC Relocation Acknowledgement messages sent to the ASNPC with a transaction ID error.	Int32
r4imexitstaindack-totsent	The total number of Idle Mode Exit State Indication Acknowledgement messages sent to the peer ASNGW.	Int32

Common Syntax Options

Variables	Description	Data Type
r4imexitstaindack-retransent	The total number of Idle Mode Exit State Indication Acknowledgement messages retransmitted on the the R4 interface to the peer ASNGW.	Int32
r4imexitstaindack-totsefail	The total number of Idle Mode Exit State Indication Acknowledgement message sent to the peer ASNGW that failed.	Int32
r4imexitstaindack-totrec	The total number of Idle Mode Exit State Indication Acknowledgement messages received on the the R4 interface to the peer ASNGW.	Int32
r4imexitstaindack-totacc	The total number of accepted Idle Mode Exit State Indication Acknowledgement messages sent to the peer ASNGW.	Int32
r4imexitstaindack-totrelay	The total number of Idle Mode Exit State Indication Acknowledgement messages relayed on the the R4 interface to the peer ASNGW.	Int32
r4imexitstaindack-totdenied	The total number of denied Idle Mode Exit State Indication Acknowledgement messages sent to the peer ASNGW.	Int32
r4imexitstaindack-totdiscard	The total number of discarded Idle Mode Exit State Indication Acknowledgement messages sent on the the R4 interface to the peer ASNGW.	Int32
r4imexitstaindack-badform	The total number of badly formed Idle Mode Exit State Indication Acknowledgement messages sent to the peer ASNG	Int32
r4imexitstaindack-decodeerr	The total number of Idle Mode Exit State Indication Acknowledgement messages retransmitted on the the R4 interface to the peer ASNGW with decode errors.	Int32
r4imexitstaindack-unspecerr	The total number of Idle Mode Exit State Indication messages sent to the peer ASNGW on the the R4 interface with unspecified errors.	Int32
r4imexitstaindack-missmandtlv	The total number of Idle Mode Exit State Acknowledgement Indication messages sent to the peer ASNGW with missing mandatory TLVs..	Int32
r4imexitstaindack-tlvvalinval	The total number of Idle Mode Exit State Acknowledgement Indication messages sent to the peer ASNGW with an invalid TLV.	Int32
r4imexitstaindack-unknowntrlv	The total number of Idle Mode Exit State Acknowledgement Indication messages with an unknown TLV sent to the peer ASNGW on the the R4 interface.	Int32
r4imexitstaindack-duptlvfound	The total number of Idle Mode Exit State Acknowledgement Indication messages with duplicate TLVs sent to the peer ASNGW over the the R4 interface.	Int32
r4imexitstaindack-nosessfound	The total number of Idle Mode Exit State Acknowledgement Indication messages sent to the peer ASNGW over the the R4 interface with no session information.	Int32
r4imexitstaindack-admprohibit	The total number of Idle Mode Exit State Indication Acknowledgement messages sent on the the R4 interface to the peer ASNGW discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Idle Mode Exit State Indication message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Variables	Description	Data Type
r4imexitstaindack-noresourcesdrop	The total number of Idle Mode Exit State Indication Acknowledgement messages sent to the peer ASNGW on the the R4 interface that were discarded or denied due to resource unavailability. Triggers: Changes every time an Idle Mode Exit State Indication Acknowledgement message is discarded or denied due to resource unavailability. This counter is used to count the error while sending the R4 packets.	Int 32
r4imexitstaindack-transiderr	The total number of R4 Idle Mode Exit State Indication Acknowledgement messages sent to the peer ASNGW on the the R4 interface with transaction errors.	Int32
r4datapathderegack-totsent	The total number of Data Path Deregistration Acknowledgement messages sent to the peer ASNGW on the the R4 interface.	Int32
r4datapathderegack-retranssent	The total number retransmitted Data Path Deregistration Acknowledgement messages sent to the peer ASNGW on the the R4 interface.	Int32
r4datapathderegack-totsendfail	The total number of failed Data Path Deregistration Acknowledgement messages sent on the the R4 interface to the peer ASNGW.	Int32
r4datapathderegack-totrec	The total number of received Data Path Deregistration Acknowledgement messages sent to the peer ASNGW on the the R4 interface.	Int32
r4datapathderegack-totacc	The total number of accepted Data Path Deregistration Acknowledgement messages sent on the the R4 interface to the peer ASNGW.	Int32
r4datapathderegack-totrelay	The total number of relayed Data Path Deregistration Acknowledgement messages sent to the peer ASNGW on the the R4 interface.	Int32
r4datapathderegack-totdenied	The total number of denied Data Path Deregistration Acknowledgement messages sent on the the R4 interface to the peer ASNGW.	Int32
r4datapathderegack-totdiscard	The total number of discarded Data Path Deregistration Acknowledgement messages sent to the peer ASNGW on the the R4 interface.	Int32
r4datapathderegack-badform	The total number of badly formed Data Path Deregistration Acknowledgement messages sent to the peer ASNGW on the the R4 interface. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathderegack-decodeerr	The total number of Data Path Deregistration Acknowledgement messages sent to the peer ASNGW with decode errors.	Int32
r4datapathderegack-unspecerr	The total number of Data Path Deregistration Acknowledgement messages with unspecified errors sent to the peer ASNGW on the the R4 interface.	Int32
r4datapathderegack-missmandtlv	The total number of Data Path Deregistration Acknowledgement messages with missing mandatory TLVs sent to the peer ASNGW on the the R4 interface.	Int32
r4datapathderegack-tlvvalinval	The total number of Data Path Deregistration Acknowledgement messages with invalid TLVs sent to the peer ASNGW on the the R4 interface.	Int32
r4datapathderegack-unknowntlv	The total number of Data Path Deregistration Acknowledgement messages with unknown TLVs sent to the peer ASNGW on the the R4 interface.	Int32
r4datapathderegack-duptlvfound	The total number of Data Path Deregistration Acknowledgement messages with duplicate TLVs sent to the peer ASNGW on the the R4 interface.	Int32

Common Syntax Options

Variables	Description	Data Type
r4datapathderegack-nosessfound	The total number of Data Path Deregistration Acknowledgement messages sent to the peer ASNGW over the the R4 interface with no session information.	Int32
r4datapathderegack-admprohibit	The total number of Data Path Deregistration Acknowledgement messages sent on the the R4 interface to the peer ASNGW discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Data Path Deregistration Acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4datapathderegack-noresourcedrop	The total number of Data Path Deregistration Acknowledgement messages sent to the peer ASNGW on the the R4 interface that were discarded or denied due to resource unavailability. Triggers: Changes every time an Data Path Deregistration Acknowledgement message is discarded or denied due to resource unavailability. This counter is used to count the error while sending the R4 packets.	Int32
r4datapathderegack-transiderr	The total number of R4 Data Path Deregistration Acknowledgement messages sent to the peer ASNGW on the the R4 interface with transaction ID errors.	Int32
r6keepalivereq-totsent	The total number of R6 Keep-alive Request messages sent to the base station.	Int32
r6keepalivereq-retranssent	The total number of Keep-alive Request messages retransmitted on the R6 interface to the base station.	Int32
r6keepalivereq-totsendfail	The total number of Keep-alive Request message failures received from the base station and relayed on the R6 interface. This counter is used to count the error while sending the R6 packets.	Int32
r6keepalivereq-totrec	The total number of R6 Keep-alive Request messages received by the base station.	Int32
r6keepalivereq-totacc	The total number of R6 Keep-alive Request messages accepted by base station.	Int32
r6keepalivereq-totrelay	The total number of R6 Keep-alive Request messages sent to the base station and relayed on the R6 interface. Triggers: Changes every time an R6 Keep-alive Request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6keepalivereq-totdenied	The total number of Keep-alive Request messages denied on the R6 interface.	Int32
r6keepalivereq-totdiscard	The total number of discarded Keep-alive Request messages relayed on the R6 interface.	Int32
r6keepalivereq-badform	The total number of badly formed R6 Keep-alive Request messages sent to the base station.	Int32
r6keepalivereq-decodeerr	The total number of R6 Keep-alive Request messages sent to the base station with decode errors.	Int32
r6keepalivereq-unspecerr	The total number of R6 Keep-alive Request messages sent to the base station with unspecified errors.	Int32
r6keepalivereq-missmandtlv	The total number of R6 Keep-alive Request messages sent to the base station with missing mandatory TLVs.	Int32
r6keepalivereq-tlvvalinval	The total number of R6 Keep-alive Request messages sent to the base station with an invalid TLV.	Int32

Variables	Description	Data Type
r6keepalivereq-unknownctlv	The total number of R6 Keep-alive Request messages sent to the base station with an unknown TLV.	Int32
r6keepalivereq-duptlvfound	The total number of R6 Keep-alive Request messages sent to the base station with duplicate TLVs.	Int32
r6keepalivereq-nosessfound	The total number of R6 Keep-alive Request messages sent to the base station without any session information.	Int32
r6keepalivereq-admprohibit	The total number of R6 Keep-alive Request messages sent to the base station that were discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Keep-alive Request message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r6keepalivereq-noresourcedrop	The total number of R6 Keep-alive Request messages sent to the base station that were discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Keep-alive Request message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r6keepalivereq-transiderr	The total number of R6 Keep-alive Request messages sent to the base station with a transaction ID error.	Int32
r6keepaliversp-totsent	The total number of R6 Keep-alive Response messages sent to the base station.	Int32
r6keepaliversp-retranssent	The total number of Keep-alive Response messages retransmitted on the R6 interface to the base station.	Int 32
r6keepaliversp-totsendfail	The total number of Keep-alive Response message failures received by the base station and relayed on the R6 interface. This counter is used to count the error while sending the R6 packets.	Int32
r6keepaliversp-totrec	The total number of R6 Keep-alive Response messages received by the base station.	Int32
r6keepaliversp-totacc	The total number of R6 Keep-alive Response messages accepted by base station.	Int32
r6keepaliversp-totrelay	The total number of R6 Keep-alive Response messages relayed to the base station on the R6 interface. Triggers: Changes every time an R6 Keep-alive Response message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6keepaliversp-totdenied	The total number of Keep-alive Response messages denied on the R6 interface.	Int32
r6keepaliversp-totdiscard	The total number of Keep-alive Response messages discarded on the R6 interface.	Int32
r6keepaliversp-badform	The total number of badly formed R6 Keep-alive Response messages sent to the base station.	Int32
r6keepaliversp-decodeerr	The total number of R6 Keep-alive Response messages sent to the base station with decode errors.	Int32
r6keepaliversp-unspecerr	The total number of R6 Keep-alive Response messages sent to the base station with unspecified errors.	Int32

Common Syntax Options

Variables	Description	Data Type
r6keepaliversp-missmandtlv	The total number of R6 Keep-alive Response messages sent to the base station with missing mandatory TLVs.	Int32
r6keepaliversp-tlvvalinval	The total number of R6 Keep-alive Response messages sent to the base station with an invalid TLV.	Int32
r6keepaliversp-unknownTLV	The total number of R6 Keep-alive Response messages sent to the base station with an unknown TLV.	Int32
r6keepaliversp-dupTLVfound	The total number of R6 Keep-alive Response messages sent to the base station with duplicate TLVs.	Int32
r6keepaliversp-nosessfound	The total number of R6 Keep-alive Response messages sent to the base station without any session information.	Int32
r6keepaliversp-admprohibit	The total number of R6 Keep-alive Response messages sent to the base station that were discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Keep-alive Response message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r6keepaliversp-noresourcedrop	The total number of R6 Keep-alive Response messages sent to the base station that were discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Keep-alive Response message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r6keepaliversp-transiderr	The total number of R6 Keep-alive Response messages sent to the base station with a transaction ID error.	Int32
r6capabilityreq-totsent	The total number of capability negotiation request messages sent to the base station on the R6 interface.	Int32
r6capabilityreq-retranssent	The total number of retransmitted capability request negotiation messages retransmitted on the R6 interface to the base station.	Int32
r6capabilityreq-totsendfail	The total number of capability negotiation request message failures received by the base station relayed on the R6 interface.	Int32
r6capabilityreq-totrec	The total number of capability negotiation request messages received by the base station on the R6 interface.	Int32
r6capabilityreq-totacc	The total number of capability negotiation request messages relayed on the R6 interface that were accepted by base station.	Int32
r6capabilityreq-totrelay	The total number of capability negotiation request messages relayed to the base station on the R6 interface.	Int32
r6capabilityreq-totdenied	The total number of denied capability negotiation request messages relayed on the R6 interface.	Int32
r6capabilityreq-totdiscard	The total number of discarded capability negotiation request messages relayed on the R6 interface.	Int32
r6capabilityreq-badform	The total number of badly formed capability negotiation request messages sent to the base station on the R6 interface.	Int32

Variables	Description	Data Type
r6capabilityreq-decodeerr	The total number of R6 capability negotiation request messages sent to the base station with decode errors.	Int32
r6capabilityreq-unspecerr	The total number of R6 capability negotiation request messages sent to the base station with unspecified errors.	Int32
r6capabilityreq-missmandtlv	The total number of R6 capability negotiation request messages sent to the base station with missing mandatory TLVs.	Int32
r6capabilityreq-tlvvalinval	The total number of R6 capability negotiation request messages sent to the base station with an invalid TLV.	Int32
r6capabilityreq-unknowntrlv	The total number of R6 capability negotiation request messages sent to the base station with an unknown TLV.	Int32
r6capabilityreq-duptlvfound	The total number of R6 capability negotiation request messages sent to the base station with duplicate TLVs.	Int32
r6capabilityreq-nosessfound	The total number of R6 capability negotiation request messages sent to the base station without any session information.	Int32
r6capabilityreq-admprohibit	The total number of R6 capability negotiation request messages sent to the base station that were discarded or denied due to admin prohibit.	Int32
r6capabilityreq-noresourcedrop	The total number of R6 capability negotiation request messages sent to the base station that were discarded or denied due to resource unavailability.	Int32
r6capabilityreq-transiderr	The total number of R6 capability negotiation request messages sent to the base station with a transaction ID error.	Int32
r6capabilityrsp-totsent	The total number of R6 capability negotiation response messages sent to the base station.	Int32
r6capabilityrsp-retranssent	The total number of retransmitted capability negotiation response messages retransmitted on the R6 interface to the base station.	Int32
r6capabilityrsp-totsendfail	The total number of capability negotiation response message failures received by the base station relayed on the R6 interface.	Int32
r6capabilityrsp-totrec	The total number of capability negotiation response messages received by the base station on the R6 interface.	Int32
r6capabilityrsp-totacc	The total number of capability negotiation response messages relayed on the R6 interface that were accepted by base station.	Int32
r6capabilityrsp-totrelay	The total number of capability negotiation response messages relayed to the base station on the R6 interface.	Int32
r6capabilityrsp-totdenied	The total number of denied capability negotiation response messages relayed on the R6 interface.	Int32
r6capabilityrsp-totdiscard	The total number of discarded capability negotiation response messages relayed on the R6 interface.	Int32
r6capabilityrsp-badform	The total number of badly formed capability negotiation response messages sent to the base station on the R6 interface.	Int32

Common Syntax Options

Variables	Description	Data Type
r6capabilityrsp-decodeerr	The total number of R6 capability negotiation response messages sent to the base station with decode errors.	Int32
r6capabilityrsp-unspecerr	The total number of R6 capability negotiation response messages sent to the base station with unspecified errors.	Int32
r6capabilityrsp-missmandtlv	The total number of R6 capability negotiation response messages sent to the base station with missing mandatory TLVs.	Int32
r6capabilityrsp-tlvvalinval	The total number of R6 capability negotiation response messages sent to the base station with an invalid TLV.	Int32
r6capabilityrsp-unknowntrlv	The total number of R6 capability negotiation response messages sent to the base station with an unknown TLV.	Int32
r6capabilityrsp-duptrlvfound	The total number of R6 capability negotiation response messages sent to the base station with duplicate TLVs.	Int32
r6capabilityrsp-nosessfound	The total number of R6 capability negotiation response messages sent to the base station without any session information.	Int32
r6capabilityrsp-admprohibit	The total number of R6 capability negotiation response messages sent to the base station that were discarded or denied due to admin prohibit.	Int32
r6capabilityrsp-noresourcedrop	The total number of R6 capability negotiation response messages sent to the base station that were discarded or denied due to resource unavailability.	Int32
r6capabilityrsp-transiderr	The total number of R6 capability negotiation response messages sent to the base station with a transaction ID error.	Int32
r6capabilityack-totsent	The total number of capability negotiation acknowledgement messages sent to the base station on the R6 interface.	Int32
r6capabilityack-retranssent	The total number of R6 capability negotiation acknowledgement messages retransmitted to the base station.	Int32
r6capabilityack-totsendfail	The total number of capability negotiation acknowledgment message failures received by the base station relayed on the R6 interface.	Int32
r6capabilityack-totrec	The total number of capability negotiation acknowledgment messages received by the base station on the R6 interface.	Int32
r6capabilityack-totacc	The total number of capability negotiation acknowledgment messages relayed on the R6 interface that were accepted by base station.	Int32
r6capabilityack-totrelay	The total number of capability negotiation acknowledgment messages relayed to the base station on the R6 interface.	Int32
r6capabilityack-totdenied	The total number of denied capability negotiation acknowledgment messages relayed on the R6 interface.	Int32
r6capabilityack-totdiscard	The total number of discarded capability negotiation acknowledgment messages relayed on the R6 interface.	Int32
r6capabilityack-badform	The total number of badly formed capability negotiation acknowledgment messages sent to the base station on the R6 interface.	Int32

Variables	Description	Data Type
r6capabilityack-decodeerr	The total number of R6 capability negotiation acknowledgment messages sent to the base station with decode errors.	Int32
r6capabilityack-unspecerr	The total number of R6 capability negotiation acknowledgment messages sent to the base station with unspecified errors.	Int32
r6capabilityack-missmandtlv	The total number of R6 capability negotiation acknowledgment messages sent to the base station with missing mandatory TLVs.	Int32
r6capabilityack-tlvvalinval	The total number of R6 capability negotiation acknowledgment messages sent to the base station with an invalid TLV.	Int32
r6capabilityack-unknownltv	The total number of R6 capability negotiation acknowledgment messages sent to the base station with an unknown TLV.	Int32
r6capabilityack-duptlvfound	The total number of R6 capability negotiation acknowledgment messages sent to the base station with duplicate TLVs.	Int32
r6capabilityack-nosessfound	The total number of R6 capability negotiation acknowledgment messages sent to the base station without any session information.	Int32
r6capabilityack-admprohibit	The total number of R6 capability negotiation acknowledgment messages sent to the base station that were discarded or denied due to admin prohibit.	Int32
r6capabilityack-noresourcedrop	The total number of R6 capability negotiation acknowledgment messages sent to the base station that were discarded or denied due to resource unavailability.	Int32
r6capabilityack-transiderr	The total number of R6 capability negotiation acknowledgment messages sent to the base station with a transaction ID error.	Int32
r4capabilityreq-totsent	The total number of capability negotiation request messages sent to the base station on the R4 interface.	Int32
r4capabilityreq-retranssent	The total number of retransmitted capability request negotiation messages retransmitted on the R4 interface to the base station.	Int32
r4capabilityreq-totsendfail	The total number of capability negotiation request message failures received by the base station relayed on the R4 interface.	Int32
r4capabilityreq-totrec	The total number of capability negotiation request messages received by the base station on the R4 interface.	Int32
r4capabilityreq-totacc	The total number of capability negotiation request messages relayed on the R4 interface that were accepted by base station.	Int32
r4capabilityreq-totrelay	The total number of capability negotiation request messages relayed to the base station on the R4 interface.	Int32
r4capabilityreq-totdenied	The total number of denied capability negotiation request messages relayed on the R4 interface.	Int32
r4capabilityreq-totdiscard	The total number of discarded capability negotiation request messages relayed on the R4 interface.	Int32
r4capabilityreq-badform	The total number of badly formed capability negotiation request messages sent to the base station on the R4 interface.	Int32

Common Syntax Options

Variables	Description	Data Type
r4capabilityreq-decodeerr	The total number of R4 capability negotiation request messages sent to the base station with decode errors.	Int32
r4capabilityreq-unspecerr	The total number of R4 capability negotiation request messages sent to the base station with unspecified errors.	Int32
r4capabilityreq-missmandtlv	The total number of R4 capability negotiation request messages sent to the base station with missing mandatory TLVs.	Int32
r4capabilityreq-tlvvalinval	The total number of R4 capability negotiation request messages sent to the base station with an invalid TLV.	Int32
r4capabilityreq-unknowntrlv	The total number of R4 capability negotiation request messages sent to the base station with an unknown TLV.	Int32
r4capabilityreq-duptlvfound	The total number of R4 capability negotiation request messages sent to the base station with duplicate TLVs.	Int32
r4capabilityreq-nosessfound	The total number of R4 capability negotiation request messages sent to the base station without any session information.	Int32
r4capabilityreq-admprohibit	The total number of R4 capability negotiation request messages sent to the base station that were discarded or denied due to admin prohibit.	Int32
r4capabilityreq-noresourcedrop	The total number of R4 capability negotiation request messages sent to the base station that were discarded or denied due to resource unavailability.	Int32
r4capabilityreq-transiderr	The total number of R4 capability negotiation request messages sent to the base station with a transaction ID error.	Int32
r4capabilityrsp-totsent	The total number of R4 capability negotiation response messages sent to the base station.	Int32
r4capabilityrsp-retranssent	The total number of retransmitted capability negotiation response messages retransmitted on the R4 interface to the base station.	Int32
r4capabilityrsp-totsefail	The total number of capability negotiation response message failures received by the base station relayed on the R4 interface.	Int32
r4capabilityrsp-totrec	The total number of capability negotiation response messages received by the base station on the R4 interface.	Int32
r4capabilityrsp-totacc	The total number of capability negotiation response messages relayed on the R4 interface that were accepted by base station.	Int32
r4capabilityrsp-totrelay	The total number of capability negotiation response messages relayed to the base station on the R4 interface.	Int32
r4capabilityrsp-totdenied	The total number of denied capability negotiation response messages relayed on the R4 interface.	Int32
r4capabilityrsp-totdiscard	The total number of discarded capability negotiation response messages relayed on the R4 interface.	Int32
r4capabilityrsp-badform	The total number of badly formed capability negotiation response messages sent to the base station on the R4 interface.	Int32

Variables	Description	Data Type
r4capabilityrsp-decodeerr	The total number of R4 capability negotiation response messages sent to the base station with decode errors.	Int32
r4capabilityrsp-unspecerr	The total number of R4 capability negotiation response messages sent to the base station with unspecified errors.	Int32
r4capabilityrsp-missmandtlv	The total number of R4 capability negotiation response messages sent to the base station with missing mandatory TLVs.	Int32
r4capabilityrsp-tlvvalinval	The total number of R4 capability negotiation response messages sent to the base station with an invalid TLV.	Int32
r4capabilityrsp-unknownltv	The total number of R4 capability negotiation response messages sent to the base station with an unknown TLV.	Int32
r4capabilityrsp-duptlvfound	The total number of R4 capability negotiation response messages sent to the base station with duplicate TLVs.	Int32
r4capabilityrsp-nosessfound	The total number of R4 capability negotiation response messages sent to the base station without any session information.	Int32
r4capabilityrsp-admprohibit	The total number of R4 capability negotiation response messages sent to the base station that were discarded or denied due to admin prohibit.	Int32
r4capabilityrsp-noresourcedrop	The total number of R4 capability negotiation response messages sent to the base station that were discarded or denied due to resource unavailability.	Int32
r4capabilityrsp-transiderr	The total number of R4 capability negotiation response messages sent to the base station with a transaction ID error.	Int32
r4capabilityack-totsent	The total number of capability negotiation acknowledgement messages sent to the base station on the R4 interface.	Int32
r4capabilityack-retranssent	The total number of R4 capability negotiation acknowledgement messages retransmitted to the base station.	Int32
r4capabilityack-totsendfail	The total number of capability negotiation acknowledgment message failures received by the base station relayed on the R4 interface.	Int32
r4capabilityack-totrec	The total number of capability negotiation acknowledgment messages received by the base station on the R4 interface.	Int32
r4capabilityack-totacc	The total number of capability negotiation acknowledgment messages relayed on the R4 interface that were accepted by base station.	Int32
r4capabilityack-totrelay	The total number of capability negotiation acknowledgment messages relayed to the base station on the R4 interface.	Int32
r4capabilityack-totdenied	The total number of denied capability negotiation acknowledgment messages relayed on the R4 interface.	Int32
r4capabilityack-totdiscard	The total number of discarded capability negotiation acknowledgment messages relayed on the R4 interface.	Int32
r4capabilityack-badform	The total number of badly formed capability negotiation acknowledgment messages sent to the base station on the R4 interface.	Int32

Common Syntax Options

Variables	Description	Data Type
r4capabilityack-decodeerr	The total number of R4 capability negotiation acknowledgment messages sent to the base station with decode errors.	Int32
r4capabilityack-unspecerr	The total number of R4 capability negotiation acknowledgment messages sent to the base station with unspecified errors.	Int32
r4capabilityack-missmandtlv	The total number of R4 capability negotiation acknowledgment messages sent to the base station with missing mandatory TLVs.	Int32
r4capabilityack-tlvvalinval	The total number of R4 capability negotiation acknowledgment messages sent to the base station with an invalid TLV.	Int32
r4capabilityack-unknowntrlv	The total number of R4 capability negotiation acknowledgment messages sent to the base station with an unknown TLV.	Int32
r4capabilityack-duptlvfound	The total number of R4 capability negotiation acknowledgment messages sent to the base station with duplicate TLVs.	Int32
r4capabilityack-nosessfound	The total number of R4 capability negotiation acknowledgment messages sent to the base station without any session information.	Int32
r4capabilityack-admprohibit	The total number of R4 capability negotiation acknowledgment messages sent to the base station that were discarded or denied due to admin prohibit.	Int32
r4capabilityack-noresourcedrop	The total number of R4 capability negotiation acknowledgment messages sent to the base station that were discarded or denied due to resource unavailability.	Int32
r4capabilityack-transiderr	The total number of R4 capability negotiation acknowledgment messages sent to the base station with a transaction ID error.	Int32
r4datagresend-totpacksent	The total number of data message received with checksum error through GRE tunnel the R4 interface.	Int32
r4datagresend-senderr	The total number of data message received with invalid packet length error through GRE tunnel the R4 interface.	Int32
r4datagresend-totbytssent	The total number of data message received through GRE tunnel without session information the the R4 interface.	Int32
r4datagresend-unspeerr	The total number of data message received through GRE tunnel with unspecified error the the R4 interface.	Int32
r6mspreattreq-congestion	The total number of R6 MS pre-attachment request messages discarded or denied due to congestion or overload. Triggers: Changes every time an R6 MS pre-attachment request message is discarded or denied due to congestion or overload. Availability: across all the ASNGW service	Int32
total-sessions-connected	The total number of active sessions currently connected through the ASN GW.	Int32
 IMPORTANT: For information on statistics that are common to all schema see the <i>Statistics and Counters Overview</i> chapter.		

Chapter 6

ASNPC Schema Statistics

The ASNPC schema provides operational statistics that can be used for monitoring and troubleshooting the following products: ASNPC

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 6. Bulk Statistic Variables in the ASN-PC Schema

Variables	Description	Data Type
-----------	-------------	-----------

Common Syntax Options

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the ASN PC service. This is a key variable.	String
vpnid	The identification number of the context configured on the system that is currently facilitating the ASN PC service. This is an internal reference number. This is a key variable.	Int32
servname	The name of the ASN PC service for which the statistics are displayed. This is a key variable.	String
servid	The identification number of the ASN PC service for which the statistics are displayed. This is a key variable.	Int32
r6imentstachareq-totsent	The number of Idle Mode Entry State Change Requests sent to the base station on the R6 interface.	Int32
r6imentstachareq-retranssent	The total number of Idle Mode Entry State Change Requests re-transmitted on R6 the interface to the base station.	Int32
r6imentstachareq-totsendfail	The total number of failures that occurred during transaction ID generation of R6 Idle Mode Entry State Change Request messages. This counter is used to count the error while sending the R6 packets.	Int32
r6imentstachareq-totrec	The total number of Idle Mode Entry State Change Request messages received on R6 interface.	Int32
r6imentstachareq-totacc	The total number of Idle Mode Entry State Change Request messages accepted on R6 interface.	Int32
r6imentstachareq-totrelay	The total number of Idle Mode Entry State Change Requests messages relayed to the base station on the R6 interface. Triggers: Changes every time an Idle Mode Entry State Change Request message is relayed over the R6 interface. Availability: across all ASNGW services.	Int32
r6imentstachareq-totdenied	The total number of Idle Mode Entry State Change Request messages denied on R6 interface.	Int32
r6imentstachareq-totdiscard	The total number of Idle Mode Entry State Change Request messages discarded on R6 interface.	Int32
r6imentstachareq-badform	The total number of Idle Mode Entry State Change Request messages sent on the R6 interface.	Int32
r6imentstachareq-decodeerr	The total number of Idle Mode Entry State Change Request messages on R6 interface with decode error.	Int32
r6imentstachareq-unspecerr	The total number of Idle Mode Entry State Change Request messages on R6 interface with unspecified error.	Int32
r6imentstachareq-missmandtlv	The total number of Idle Mode Entry State Change Request messages on R6 interface with missing mandatory TLVs.	Int32
r6imentstachareq-tlvvalinval	The total number of Idle Mode Entry State Change Request messages on R6 interface with invalid TLV value.	Int32

Variables	Description	Data Type
r6imentstachareq-unknownnltv	The total number of Idle Mode Entry State Change Request messages on R6 interface with unknown TLVs.	Int32
r6imentstachareq-duptlvfound	The total number of Idle Mode Entry State Change Request messages on R6 interface with duplicate TLVs.	Int32
r6imentstachareq-nosessfound	The total number of Idle Mode Entry State Change Request messages on R6 interface without any session information.	Int32
r6imentstachareq-admprohibit	The total number of Idle Mode Entry State Change Request messages on R6 interface with transaction ID errors.	Int32
r6imentstachareq-noresourcedrop	The total number of Idle Mode Entry State Change Request messages discarded or denied due to admin prohibit. Triggers: Changes every time an Idle Mode Entry State Change Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6imentstachareq-transiderr	The total number of Idle Mode Entry State Change Request messages discarded or denied due to transaction ID errors	Int32
r6imentstacharsp-totsent	The total number of Idle Mode Entry State Change Responses sent to the Base Station.	Int32
r6imentstacharsp-retranssent	The total number of Idle Mode Entry State Change Responses re-transmitted on R6 the interface.	Int32
r6imentstacharsp-totsendfail	The total number of failures that occurred during transaction ID generation of R6 Idle Mode Entry State Change Response messages. This counter is used to count the error while sending the R6 packets.	Int32
r6imentstacharsp-totrec	The total number of Idle Mode Entry State Change Response messages received on R6 interface.	Int32
r6imentstacharsp-totacc	The total number of Idle Mode Entry State Change Response messages accepted on R6 interface.	Int32
r6imentstacharsp-totrelay	The total number of Idle Mode Entry State Change Response messages relayed to the base station on the R6 interface. Triggers: Changes every time an Idle Mode Entry State Change Response message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6imentstacharsp-totdenied	The total number of Idle Mode Entry State Change Response messages denied on R6 interface.	Int32
r6imentstacharsp-totdiscard	The total number of Idle Mode Entry State Change Response messages discarded on R6 interface.	Int32
r6imentstacharsp-badform	The total number of Idle Mode Entry State Change Response messages sent on the R6 interface.	Int32
r6imentstacharsp-decodeerr	The total number of Idle Mode Entry State Change Response messages on R6 interface with decode error.	Int32
r6imentstacharsp-unspecerr	The total number of Idle Mode Entry State Change Response messages on R6 interface with unspecified error.	Int32

Common Syntax Options

Variables	Description	Data Type
r6imentstacharsp-missmandtlv	The total number of Idle Mode Entry State Change Response messages on R6 interface with missing mandatory TLVs.	Int32
r6imentstacharsp-tlvvalinval	The total number of Idle Mode Entry State Change Response messages on R6 interface with invalid TLV value.	Int32
r6imentstacharsp-unknownTLV	The total number of Idle Mode Entry State Change Response messages on R6 interface with unknown TLVs.	Int32
r6imentstacharsp-dupTLVfound	The total number of Idle Mode Entry State Change Response messages on R6 interface with duplicate TLVs	Int32
r6imentstacharsp-nosessfound	The total number of Idle Mode Entry State Change Response messages on R6 interface without any session information.	Int32
r6imentstacharsp-admprohibit	The total number of Idle Mode Entry State Change Response messages on R6 interface with transaction ID errors.	Int32
r6imentstacharsp-noresourcedrop	The total number of Idle Mode Entry State Change Response messages discarded or denied due to admin prohibit. Triggers: Changes every time an Idle Mode Entry State Change Response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6imentstacharsp-transiderr	The total number of Idle Mode Entry State Change Response messages discarded or denied due to transaction ID errors	Int32
r6imentstachaack-totsent	The total number of Idle Mode Entry State Change Acknowledgements sent to the Base Station.	Int32
r6imentstachaack-retranssent	The total number of Idle Mode Entry State Change Acknowledgement messages re-transmitted on R6 interface.	Int32
r6imentstachaack-totsendfai	The total number of R6 idle Mode Entry State Change Acknowledgement messages sent to the base station. This counter is used to count the error while sending the R6 packets.	Int32
r6imentstachaack-totrec	The total number of R6 Idle Mode Entry State Change Acknowledgement messages received on R6 interface.	Int32
r6imentstachaack-totacc	The total number of R6 Idle Mode Entry State Change Acknowledgement messages accepted on R6 interface.	Int32
r6imentstachaack-totrelay	The total number of R6 Idle Mode Entry State Change Acknowledgement messages relayed to the base station on the R6 interface. Triggers: Changes every time an R6 Idle Mode Entry State Change Acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6imentstachaack-totdenied	The total number of R6 Idle Mode Entry State Change Acknowledgement messages denied on R6 interface.	Int32
r6imentstachaack-totdiscard	The total number of R6 Idle Mode Entry State Change Acknowledgement messages discarded on R6 interface.	Int32

Variables	Description	Data Type
r6imentstachaack-badform	The total number of badly formed R6 Idle Mode Entry State Change Acknowledgement messages on R6 interface.	Int32
r6imentstachaack-decodeerr	The total number of R6 Idle Mode Entry State Change Acknowledgement messages on R6 interface with decode error.	Int32
r6imentstachaack-unspecerr	The total number of R6 Idle Mode Entry State Change Acknowledgement messages on R6 interface with unspecified error.	Int32
r6imentstachaack-missmandtlv	The total number of R6 Idle Mode Entry State Change Acknowledgement messages on R6 interface with missing mandatory TLVs.	Int32
r6imentstachaack-tlvvalinval	The total number of R6 Idle Mode Entry State Change Acknowledgement messages on R6 interface with invalid TLV value	Int32
r6imentstachaack-unknowntrlv	The total number of R6 Idle Mode Entry State Change Acknowledgement messages on R6 interface with unknown TLVs	Int32
r6imentstachaack-duptrlvfound	The total number of R6 Idle Mode Entry State Change Acknowledgement messages on R6 interface with duplicate TLVs.	Int32
r6imentstachaack-nosessfound	The total number of R6 Idle Mode Entry State Change Acknowledgement messages on R6 interface without any session information.	Int32
r6imentstachaack-adminprohib	The total number of R6 Idle Mode Entry State Change Acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Idle Mode Entry State Change Acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6imentstachaack-noresourcedrop	The total number of R6 Idle Mode Entry State Change Acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Idle Mode Entry State Change Acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6imentstachaack-transiderr	The total number of R6 Idle Mode Entry State Change Acknowledgement messages on R6 interface with transaction ID errors.	Int32
r6imexitstachareq-totsent	The total number of Idle Mode Exit State Change Requests sent to the Base Station.	Int32
r6imexitstachareq-retranssent	The total number of R6 Idle Mode Exit State Change Request messages sent to the base station.	Int32
r6imexitstachareq-totsefail	The total number of R6 Idle Mode Exit State Change Request messages sent to the base station. This counter is used to count the error while sending the R6 packets.	Int32
r6imexitstachareq-totrec	The total number of R6 Idle Mode Exit State Change Request messages received on R6 interface.	Int32
r6imexitstachareq-totacc	The total number of R6 Idle Mode Exit State Change Request messages accepted on R6 interface.	Int32

Variables	Description	Data Type
r6imexitstachareq-totrelay	The total number of R6 Idle Mode Exit State Change Request messages relayed to the base station on the R6 interface. Triggers: Changes every time an R6 Idle Mode Exit State Change Request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6imexitstachareq-totdenied	The total number of R6 Idle Mode Exit State Change Request messages denied on R6 interface.	Int32
r6imexitstachareq-totdiscard	The total number of R6 Idle Mode Exit State Change Request messages discarded on R6 interface.	Int32
r6imexitstachareq-badform	The total number of badly formed R6 Idle Mode Exit State Change Request messages on R6 interface.	Int32
r6imexitstachareq-decodeerr	The total number of R6 Idle Mode Exit State Change Request messages on R6 interface with decode error.	Int32
r6imexitstachareq-unspecerr	The total number of R6 Idle Mode Exit State Change Request messages on R6 interface with unspecified error.	Int32
r6imexitstachareq-mismandtlv	The total number of R6 Idle Mode Exit State Change Request messages on R6 interface with missing mandatory TLVs.	Int32
r6imexitstachareq-tlvvalinval	The total number of R6 Idle Mode Exit State Change Request messages on R6 interface with invalid TLV value	Int32
r6imexitstachareq-unknowntrlv	The total number of R6 Idle Mode Exit State Change Request messages on R6 interface with unknown TLVs	Int32
r6imexitstachareq-duptlvfound	The total number of R6 Idle Mode Exit State Change Request messages on R6 interface with duplicate TLVs.	Int32
r6imexitstachareq-nosessfound	The total number of R6 Idle Mode Exit State Change Request messages on R6 interface without any session information.	Int32
r6imexitstachareq-admprohibit	The total number of R6 Idle Mode Exit State Change Request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Idle Mode Exit State Change Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6imexitstachareq-noresourcedrop	The total number of R6 Idle Mode Exit State Change Request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Idle Mode Exit State Change Request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6imexitstachareq-transiderr	The total number of R6 Idle Mode Exit State Change Request messages on R6 interface with transaction ID errors.	Int32
r6imexitstacharsp-totsent	The total number of Idle Mode Exit State Change Responses sent to the Base Station.	Int32
r6imexitstacharsp-retranssent	The total number of R6 Idle Mode Exit State Change Response messages re-transmitted on R6 interface.	Int32

Variables	Description	Data Type
r6imexitstacharsp-totsendfail	The total number of failed R6 idle Mode Exit State Change Response messages sent to the base station. This counter is used to count the error while sending the R6 packets.	Int32
r6imexitstacharsp-totrec	The total number of R6 Idle Mode Exit State Change Response messages received on R6 interface.	Int32
r6imexitstacharsp-totacc	The total number of R6 Idle Mode Exit State Change Response messages accepted on R6 interface.	Int32
r6imexitstacharsp-totrelay	The total number of R6 Idle Mode Exit State Change Response messages relayed to the base station on the R6 interface. Triggers: Changes every time an R6 Idle Mode Exit State Change Response message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6imexitstacharsp-totdenied	The total number of R6 Idle Mode Exit State Change Response messages denied on R6 interface.	Int32
r6imexitstacharsp-totdiscard	The total number of R6 Idle Mode Exit State Change Response messages discarded on R6 interface.	Int32
r6imexitstacharsp-badform	The total number of badly formed R6 Idle Mode Exit State Change Response messages on R6 interface.	Int32
r6imexitstacharsp-decodeerr	The total number of R6 Idle Mode Exit State Change Response messages on R6 interface with decode error.	Int32
r6imexitstacharsp-unspecerr	The total number of R6 Idle Mode Exit State Change Response messages on R6 interface with unspecified error.	Int32
r6imexitstacharsp-missmandtlv	The total number of R6 Idle Mode Exit State Change Response messages on R6 interface with missing mandatory TLVs.	Int32
r6imexitstacharsp-unknowntrlv	The total number of R6 Idle Mode Exit State Change Response messages on R6 interface with an unknown TLV value.	Int32
r6imexitstacharsp-duptlvfound	The total number of R6 Idle Mode Exit State Change Response messages on R6 interface with duplicate TLVs.	Int32
r6imexitstacharsp-nosessfound	The total number of R6 Idle Mode Exit State Change Response messages on R6 interface without any session information.	Int32
r6imexitstacharsp-admprohibit	The total number of R6 Idle Mode Exit State Change Response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Idle Mode Exit State Change Response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6imexitstacharsp-noresourcedrop	The total number of R6 Idle Mode Exit State Change Response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Idle Mode Exit State Change Response message is discarded or denied due to resource unavailability. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r6imexitstacharsp-transiderr	The total number of R6 Idle Mode Exit State Change Response messages with translation ID errors.	Int32
r6locupdreq-totsent	The total number of R6 Location Update Request messages sent to the base station.	Int32
r6locupdreq-retranssent	The total number of R6 Location Update Request messages re-transmitted on R6 interface.	Int32
r6locupdreq-totsendfail	The total number of failed R6 Location Update Request messages sent to the base station. This counter is used to count the error while sending the R6 packets.	Int32
r6locupdreq-totrec	The total number of R6 Location Update Request Location Update Request messages received on R6 interface.	Int32
r6locupdreq-totacc	The total number of R6 Location Update Request messages accepted on R6 interface.	Int32
r6locupdreq-totrelay	The total number of R6 Location Update Request messages relayed to the base station on the R6 interface. Triggers: Changes every time an R6 Location Update Request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6locupdreq-totdenied	The total number of R6 Location Update Request messages denied on R6 interface.	Int32
r6locupdreq-totdiscard	The total number of R6 Location Update Request messages discarded on R6 interface.	Int32
r6locupdreq-badform	The total number of badly formed R6 Location Update Request messages on R6 interface.	Int32
r6locupdreq-decodeerr	The total number of R6 Location Update Request messages on R6 interface with decode errors.	Int32
r6locupdreq-unspecerr	The total number of R6 Location Update Request messages on R6 interface with unspecified error.	Int32
r6locupdreq-missmandtlv	The total number of R6 Location Update Request messages on R6 interface with missing mandatory TLVs.	Int32
r6locupdreq-tlvvalinval	The total number of R6 Location Update Request messages on R6 interface with an unknown TLV value.	Int32
r6locupdreq-unknowntlv	The total number of R6 Location Update Request messages on R6 interface with unknown TLVs.	Int32
r6locupdreq-duptlvfound	The total number of R6 Location Update Request messages on R6 interface with duplicate TLVs.	Int32
r6locupdreq-nosessfound	The total number of R6 Location Update Request messages without any session information.	Int32
r6locupdreq-admprohibit	The total number of R6 Location Update Request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Location Update Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Variables	Description	Data Type
r6locupdreq-noresourcedrop	The total number of R6 Location Update Request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Location Update Request message is discarded or denied due to resource unavailability. Availability: across all ASNGW services.	Int32
r6locupdreq-transiderr	The total number of R6 Location Update Request messages with translation ID errors.	Int32
r6locupdrsp-totsent	The total number of Location Update Responses sent to the Base Station.	Int32
r6locupdrsp-totsendfail	The total number of failed R6 Location Update Response messages sent on the R6 interface. This counter is used to count the error while sending the R6 packets.	Int32
r6locupdrsp-totrec	The total number of R6 Location Update Response messages received on R6 interface.	Int32
r6locupdrsp-totacc	The total number of R6 Location Update Response messages accepted on R6 interface.	Int32
r6locupdrsp-totrelay	The total number of R6 Location Update Response messages relayed to the base station on the R6 interface. Triggers: Changes every time an R6 Location Update Response message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6locupdrsp-totdenied	The total number of R6 Location Update Response messages denied on R6 interface.	Int32
r6locupdrsp-totdiscard	The total number of R6 Location Update Response messages discarded on R6 interface.	Int32
r6locupdrsp-badform	The total number of badly formed R6 Location Update Response messages on R6 interface.	Int32
r6locupdrsp-decodeerr	The total number of R6 Location Update Response messages on R6 interface with decode errors.	Int32
r6locupdrsp-unspecerr	The total number of R6 Location Update Response messages on R6 interface with unspecified error.	Int32
r6locupdrsp-mismandtlv	The total number of R6 Location Update Response messages on R6 interface with missing mandatory TLVs.	Int32
r6locupdrsp-tlvvalinval	The total number of R6 Location Update Response messages on R6 interface with an unknown TLV value.	Int32
r6locupdrsp-unknowntlv	The total number of R6 Location Update Response messages on R6 interface with unknown TLVs.	Int32
r6locupdrsp-duptlvfound	The total number of R6 Location Update Response messages on R6 interface with duplicate TLVs.	Int32
r6locupdrsp-nosessfound	The total number of R6 Location Update Response messages without any session information.	Int32

Common Syntax Options

Variables	Description	Data Type
r6locupdrsp-admprohibit	The total number of R6 Location Update Response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Location Update Response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6locupdrsp-noresourcedrop	The total number of R6 Location Update Response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Location Update Response message is discarded or denied due to resource unavailability. Availability: across all ASNGW services.	Int32
r6locupdrsp-transiderr	The total number of R6 Location Update Response messages with translation ID errors	Int32
r6locupdcnf-totsent	Indicates the number of R6 Location Update Confirm messages sent to the Base Station.	Int32
r6locupdcnf-retranssent	The total number of Location Update Confirm messages retransmitted on the R6 interface to the base station.	Int32
r6locupdcnf-totsendfail	The total number of Location Update Confirm message failures received from the base station and relayed on the R6 interface. This counter is used to count the error while sending the R6 packets.	Int32
r6locupdcnf-totrec	The total number of R6 Location Update Confirm messages received by the base station.	Int32
r6locupdcnf-totacc	The total number of R6 Location Update Confirm messages accepted by base station.	Int32
r6locupdcnf-totrelay	The total number of R6 Location Update Confirm messages sent to the base station and relayed on the R6 interface. Triggers: Changes every time an R6 Location Update Confirm message is relayed by the R6 interface. Availability: across all ASNGW services	Int32
r6locupdcnf-totdenied	The total number of Location Update Confirm messages denied on the R6 interface.	Int32
r6locupdcnf-totdiscard	The total number of Location Update Confirm messages discarded on the R6 interface.	Int32
r6locupdcnf-badform	The total number of badly formed R6 Location Update Confirm messages sent to the base station.	Int32
r6locupdcnf-decodeerr	The total number of R6 Location Update Confirm messages sent to the base station with decode errors.	Int32
r6locupdcnf-unspecerr	The total number of R6 Location Update Confirm messages sent to the base station with unspecified errors.	Int32
r6locupdcnf-missmandtlv	The total number of R6 Location Update Confirm messages sent to the base station with missing mandatory TLVs.	Int32
r6locupdcnf-tlvvalinval	The total number of R6 Location Update Confirm messages sent to the base station with an invalid TLV.	Int32
r6locupdcnf-unknowntlv	The total number of R6 Location Update Confirm messages sent to the base station with an unknown TLV.	Int32

Variables	Description	Data Type
r6locupdcnf-duptlvfound	The total number of R6 Location Update Confirm messages sent to the base station with duplicate TLVs.	Int32
r6locupdcnf-nosessfound	The total number of R6 Location Update Confirm messages sent to the base station without any session information.	Int32
r6locupdcnf-admprohibit	The total number of R6 Location Update Confirm messages sent to the base station that were discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Location Update Confirm message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r6locupdcnf-noresourcedrop	The total number of R6 Location Update Confirm messages sent to the base station that were discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Location Update Confirm message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r6locupdcnf-transiderr	The total number of R6 Location Update Confirm messages sent to the base station with a transaction ID error.	Int32
r6pagannouce-totsent	The total number of R6 Paging Announcement messages sent to the Base Station.	Int32
r6pagannouce-retranssent	The total number of Paging Announcement messages retransmitted on the R6 interface to the base station.	Int32
r6pagannouce-totsendfail	The total number of Paging Announcement message failures received from the base station and relayed on the R6 interface. This counter is used to count the error while sending the R6 packets.	Int32
r6pagannouce-totrec	The total number of R6 Paging Announcement messages received by the base station.	Int32
r6pagannouce-totacc	The total number of R6 Paging Announcement messages accepted by base station.	Int32
r6pagannouce-totrelay	The total number of R6 Paging Announcement messages sent to the base station and relayed on the R6 interface. Triggers: Changes every time an R6 Paging Announcement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6pagannouce-totdenied	The total number of Paging Announcement messages denied on the R6 interface.	Int32
r6pagannouce-totdiscard	The total number of Paging Announcement messages discarded on the R6 interface.	Int32
r6pagannouce-badform	The total number of badly formed R6 Paging Announcement messages sent to the base station.	Int32
r6pagannouce-decodeerr	The total number of R6 Paging Announcement messages sent to the base station with decode errors.	Int32
r6pagannouce-unspecerr	The total number of R6 Paging Announcement messages sent to the base station with unspecified errors.	Int32
r6pagannouce-missmandtlv	The total number of R6 Paging Announcement messages sent to the base station with missing mandatory TLVs.	Int32

Common Syntax Options

Variables	Description	Data Type
r6pagannouce-tlvvalinval	The total number of R6 Paging Announcement messages sent to the base station with an invalid TLV.	Int32
r6pagannouce-unknown_tlv	The total number of R6 Paging Announcement messages sent to the base station with an unknown TLV.	Int32
r6pagannouce-dup_tlvfound	The total number of R6 Paging Announcement messages sent to the base station with duplicate TLVs.	Int32
r6pagannouce-no_sessfound	The total number of R6 Paging Announcement messages sent to the base station without any session information.	Int32
r6pagannouce-admprohibit	The total number of R6 Paging Announcement messages sent to the base station that were discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Paging Announcement message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r6pagannouce-no_resource_drop	The total number of R6 Paging Announcement messages sent to the base station that were discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Paging Announcement message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r6pagannouce-trans_iderr	The total number of R6 Paging Announcement messages sent to the base station with a transaction ID error.	Int32
r6keepalivereq-totrec	The total number of R6 Keep-alive Request messages received by the base station.	Int32
r6keepalivereq-totacc	The total number of R6 Keep-alive Request messages accepted by base station.	Int32
r6keepalivereq-totrelay	The total number of R6 Keep-alive Request messages sent to the base station and relayed on the R6 interface. Triggers: Changes every time an R6 Keep-alive Request message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6keepalivereq-totdenied	The total number of Keep-alive Request messages denied on the R6 interface.	Int32
r6keepalivereq-totdiscard	The total number of Keep-alive Request messages discarded on the R6 interface.	Int32
r6keepalivereq-badform	The total number of badly formed R6 Keep-alive Request messages sent to the base station.	Int32
r6keepalivereq-decodeerr	The total number of R6 Keep-alive Request messages sent to the base station with decode errors.	Int32
r6keepalivereq-unspeccerr	The total number of R6 Keep-alive Request messages sent to the base station with unspecified errors.	Int32
r6keepalivereq-missmand_tlv	The total number of R6 Keep-alive Request messages sent to the base station with missing mandatory TLVs.	Int32
r6keepalivereq-tlvvalinval	The total number of R6 Keep-alive Request messages sent to the base station with an invalid TLV.	Int32

Variables	Description	Data Type
r6keepalivereq-unknownctlv	The total number of R6 Keep-alive Request messages sent to the base station with an unknown TLV.	Int32
r6keepalivereq-duptlvfound	The total number of R6 Keep-alive Request messages sent to the base station with duplicate TLVs.	Int32
r6keepalivereq-nosessfound	The total number of R6 Keep-alive Request messages sent to the base station without any session information.	Int32
r6keepalivereq-admprohibit	The total number of R6 Keep-alive Request messages sent to the base station that were discarded or denied due to admin prohibit. Triggers: Changes every time an R6 Keep-alive Request message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r6keepalivereq-noresourcedrop	The total number of R6 Keep-alive Request messages sent to the base station that were discarded or denied due to resource unavailability. Triggers: Changes every time an R6 Keep-alive Request message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r6keepalivereq-transiderr	The total number of R6 Keep-alive Request messages sent to the base station with a transaction ID error.	Int32
r6keepaliversp-totsent	The total number of Keep-alive Response messages sent to the Base Station on the R6 interface.	Int32
r6keepaliversp-retranssent	The total number of Keep-alive Response messages retransmitted on the R6 interface.	Int32
r6keepaliversp-totsefail	The total number of failed Keep-alive Response messages that occurred during transaction ID generation. This counter is used to count the error while sending the R6 packets.	Int32
r6unknown-totrec	The total number of Unknown messages received on R6 interface.	Int32
r6unknown-totacc	The total number of Unknown messages accepted on R6 interface.	Int32
r6unknown-totrelay	The total number of Unknown messages received from the base station and relayed on the R6 interface. Triggers: Changes every time an Unknown message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r6unknown-totdenied	The total number of Unknown messages denied on R6 interface.	Int32
r6unknown-totdiscard	The total number of Unknown messages discarded on R6 interface.	Int32
r6unknown-badform	The total number of badly formed Unknown messages on R6 interface	Int32
r6unknown-decodeerr	The total number of Unknown messages on R6 interface with decode error.	Int32
r6unknown-unspecerr	The total number of Unknown messages on R6 interface with unspecified error.	Int32
r6unknown-missmandtlv	The total number of Unknown messages on R6 interface with missing mandatory TLVs.	Int32
r6unknown-tlvvalinval	The total number of Unknown messages on R6 interface with invalid TLV value	Int32
r6unknown-unknownctlv	The total number of Unknown messages on R6 interface with unknown TLV value	Int32

Common Syntax Options

Variables	Description	Data Type
r6unknown-duptlvfound	The total number of Unknown messages on R6 interface with duplicate TLVs.	Int32
r6unknown-nosessfound	The total number of Unknown messages on R6 interface without any session information.	Int32
r6unknown-admprohibit	The total number of Unknown messages discarded or denied due to admin prohibit. Triggers: Changes every time an Unknown message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r6unknown-noresourcedrop	The total number of Unknown messages discarded or denied due to resource unavailability. Triggers: Changes every time an Unknown message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r6unknown-transiderr	The total number of Unknown messages on R6 interface with transaction ID errors.	Int32
r4imentstachareq-totsent	The total number of R4 Idle Mode Entry State Change Request messages sent to the ASNGW.	Int32
r4imentstachareq-retranssent	The total number of R4 Idle Mode Entry State Change Request messages re-transmitted on R4 interface.	Int32
r4imentstachareq-totsendfail	The total number of failures occurred during transaction id generation and R4 Idle Mode Entry State Change Request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4imentstachareq-totrec	The total number of R4 Idle Mode Entry State Change Request messages received on R4 interface.	Int32
r4imentstachareq-totacc	The total number of R4 Idle Mode Entry State Change Request messages accepted on R4 interface.	Int32
r4imentstachareq-totrelay	The total number of R4 Idle Mode Entry State Change Request messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Idle Mode Entry State Change Request message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4imentstachareq-totdenied	The total number of R4 Idle Mode Entry State Change Request messages denied on R4 interface.	Int32
r4imentstachareq-totdiscard	The total number of R4 Idle Mode Entry State Change Request messages discarded on R4 interface.	Int32
r4imentstachareq-badform	The total number of badly formed R4 Idle Mode Entry State Change Request messages on R4 interface.	Int32
r4imentstachareq-decodeerr	The total number of R4 Idle Mode Entry State Change Request messages on R4 interface with decode error.	Int32
r4imentstachareq-unspecerr	The total number of R4 Idle Mode Entry State Change Request messages on R4 interface with unspecified error.	Int32
r4imentstachareq-missmandtlv	The total number of R4 Idle Mode Entry State Change Request messages on R4 interface with missing mandatory TLVs.	Int32

Variables	Description	Data Type
r4imentstachareq-tlvvalinval	The total number of R4 Idle Mode Entry State Change Request messages on R4 interface with invalid TLV value	Int32
r4imentstachareq-unknown_tlv	The total number of R4 Idle Mode Entry State Change Request messages on R4 interface with unknown TLVs.	Int32
r4imentstachareq-duplicate_tlv_found	The total number of R4 Idle Mode Entry State Change Request messages on R4 interface with duplicate TLVs.	Int32
r4imentstachareq-no-session_found	The total number of R4 Idle Mode Entry State Change Request messages on R4 interface without any session information	Int32
r4imentstachareq-admin_prohibit	The total number of R4 Idle Mode Entry State Change Request messages discarded or denied due to admin prohibit. Triggers: Changes every time a R4 Idle Mode Entry State Change Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4imentstachareq-no-resource_drop	The total number of R4 Idle Mode Entry State Change Request messages discarded or denied due to resource unavailability. Triggers: Changes every time a R4 idle mode entry MS state change request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4imentstachareq-transaction_id_err	The total number of R4 Idle Mode Entry State Change Request messages on R4 interface with transaction ID errors.	Int32
r4imentstacharsp-tot_sent	The number of Idle Mode Entry State Change Responses sent to the ASNGW.	Int32
r4imentstacharsp-retransmit	The total number of R4 Idle Mode Entry State Change Response messages re-transmitted on R4 interface.	Int32
r4imentstacharsp-tot_send_fail	The total number of failures occurred during transaction id generation and R4 Idle Mode Entry State Change Response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4imentstacharsp-tot_rec	The total number of R4 Idle Mode Entry State Change Response messages received on R4 interface	Int32
r4imentstacharsp-tot_acc	The total number of R4 Idle Mode Entry State Change Response messages accepted on R4 interface.	Int32
r4imentstacharsp-tot_relay	The total number of R4 Idle Mode Entry State Change Response messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Idle Mode Entry State Change Response message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4imentstacharsp-tot_denied	The total number of R4 Idle Mode Entry State Change Response messages denied on R4 interface.	Int32
r4imentstacharsp-tot_discard	The total number of R4 Idle Mode Entry State Change Response messages discarded on R4 interface.	Int32

Variables	Description	Data Type
r4imentstacharsp-badform	The total number of badly formed R4 idle mode entry MS state change response messages on R4 interface.	Int32
r4imentstacharsp-decodeerr	The total number of R4 Idle Mode Entry State Change Response messages on R4 interface with decode error.	Int32
r4imentstacharsp-unspecerr	The total number of R4 Idle Mode Entry State Change Response messages on R4 interface with unspecified error.	Int32
r4imentstacharsp-missmandtlv	The total number of R4 Idle Mode Entry State Change Response messages on R4 interface with missing mandatory TLVs.	Int32
r4imentstacharsp-tlvvalinval	The total number of R4 Idle Mode Entry State Change Response messages on R4 interface with invalid TLV value.	Int32
r4imentstacharsp-unknowntrlv	The total number of R4 Idle Mode Entry State Change Response messages on R4 interface with unknown TLVs.	Int32
r4imentstacharsp-duptlvfound	The total number of R4 Idle Mode Entry State Change Response messages on R4 interface with duplicate TLVs.	Int32
r4imentstacharsp-nosessfound	The total number of R4 Idle Mode Entry State Change Response messages on R4 interface without any session information.	Int32
r4imentstacharsp-admprohibit	The total number of R4 Idle Mode Entry State Change Response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Idle Mode Entry State Change Response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4imentstacharsp-noresourcedrop	The total number of R4 Idle Mode Entry State Change Response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Idle Mode Entry State Change Response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4imentstacharsp-transiderr	The total number of R4 Idle Mode Entry State Change Response messages on R4 interface with transaction ID errors.	Int32
r4imentstachaack-totsent	The total number of Idle Mode Entry State Change Acknowledgements sent to the ASNGW.	Int32
r4imentstachaack-retranssent	The total number of R4 Idle Mode Entry State Change Acknowledgement messages re-transmitted to the ASNGW on the R4 interface.	Int32
r4imentstachaack-totsendfail	The total number of failures that occurred during transaction id generation and R4 Idle Mode Entry State Change Acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4imentstachaack-totrec	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on R4 interface	Int32
r4imentstachaack-totacc	The total number of R4 Idle Mode Entry State Change Acknowledgement messages accepted on R4 interface by the ASNGW.	Int32

Variables	Description	Data Type
r4imentstachaack-totrelay	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Idle Mode Entry State Change Acknowledgement message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4imentstachaack-totdenied	The total number of R4 Idle Mode Entry State Change Acknowledgement messages denied by the ASNGW on the R4 interface.	Int32
r4imentstachaack-totdiscard	The total number of R4 Idle Mode Entry State Change Acknowledgement messages discarded by the ASNGW on the R4 interface	Int32
r4imentstachaack-badform	The total number of badly formed R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on the R4 interface.	Int32
r4imentstachaack-decodeerr	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on the R4 interface with decode errors.	Int32
r4imentstachaack-unspecerr	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on the R4 interface with unspecified error.	Int32
r4imentstachaack-missmandtlv	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on the R4 interface with missing mandatory TLVs.	Int32
r4imentstachaack-tlvvalinval	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on the R4 interface with invalid TLV value.	Int32
r4imentstachaack-unknowntrlv	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on the R4 interface with unknown TLVs.	Int32
r4imentstachaack-duptlvfound	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on the R4 interface with duplicate TLVs.	Int32
r4imentstachaack-nosessfound	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on the R4 interface without any session information.	Int32
r4imentstachaack-admprohibit	The total number of R4 Idle Mode Entry State Change Acknowledgement messages discarded or denied by the ASNGW on the R4 interface due to admin prohibit. Triggers: Changes every time an R4 Idle Mode Entry State Change Acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services	Int32
r4imentstachaack-noresourcedrop	The total number of R4 Idle Mode Entry State Change Acknowledgement messages discarded or denied by the ASNGW on the R4 interface due to resource unavailability. Triggers: Changes every time an R4 Idle Mode Entry State Change Acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4imentstachaack-transiderr	The total number of R4 Idle Mode Entry State Change Acknowledgement messages received by the ASNGW on the R4 interface with transaction ID errors.	Int32
r4imexitstachareq-totsent	The total number of Idle Mode Exit State Change Requests sent to the ASNGW.	Int32
r4imexitstachareq-retranssent	The total number of R4R4 Idle Mode Exit State Change Request messages re-transmitted on R4 interface.	Int32

Common Syntax Options

Variables	Description	Data Type
r4imexitstachareq-totsefail	The total number of R4 idle Mode Exit State Change Request messages sent to the base station. This counter is used to count the error while sending the R4 packets.	Int32
r4imexitstachareq-totrec	The total number of R4 Idle Mode Exit State Change Request messages received on R4 interface.	Int32
r4imexitstachareq-totacc	The total number of R4 Idle Mode Exit State Change Request messages accepted on R4 interface.	Int32
r4imexitstachareq-totrelay	The total number of R4 Idle Mode Exit State Change Request messages relayed to the base station on the R4 interface. Triggers: Changes every time an R4 Idle Mode Exit State Change Request message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4imexitstachareq-totdenied	The total number of R4 Idle Mode Exit State Change Request messages denied on R4 interface.	Int32
r4imexitstachareq-totdiscard	The total number of R4 Idle Mode Exit State Change Request messages discarded on R4 interface.	Int32
r4imexitstachareq-badform	The total number of badly formed R4 Idle Mode Exit State Change Request messages on R4 interface.	Int32
r4imexitstachareq-decodeerr	The total number of R4 Idle Mode Exit State Change Request messages on R4 interface with decode error.	Int32
r4imexitstachareq-unspecerr	The total number of R4 Idle Mode Exit State Change Request messages on R4 interface with unspecified error.	Int32
r4imexitstachareq-mismandtlv	The total number of R4 Idle Mode Exit State Change Request messages on R4 interface with missing mandatory TLVs.	Int32
r4imexitstachareq-tlvvalinval	The total number of R4 Idle Mode Exit State Change Request messages on R4 interface with invalid TLV value	Int32
r4imexitstachareq-unknown_tlv	The total number of R4 Idle Mode Exit State Change Request messages on R4 interface with unknown TLVs	Int32
r4imexitstachareq-dup_tlvfound	The total number of R4 Idle Mode Exit State Change Request messages on R4 interface with duplicate TLVs.	Int32
r4imexitstachareq-no_sessionfound	The total number of R4 Idle Mode Exit State Change Request messages on R4 interface without any session information.	Int32
r4imexitstachareq-adminprohibit	The total number of R4 Idle Mode Exit State Change Request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Idle Mode Exit State Change Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Variables	Description	Data Type
r4imexitstachareq-noresourcedrop	The total number of R4 Idle Mode Exit State Change Request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Idle Mode Exit State Change Request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4imexitstachareq-transiderr	The total number of R4 Idle Mode Exit State Change Request messages on R4 interface with transaction ID errors.	Int32
r4imexitstacharsp-totsent	The total number of Idle Mode Exit State Change Responses sent to the Base Station.	Int32
r4imexitstacharsp-retranssent	The total number of R4 Idle Mode Exit State Change Response messages re-transmitted on R4 interface.	Int32
r4imexitstacharsp-totendfail	The total number of failed R4 idle Mode Exit State Change Response messages sent to the base station. This counter is used to count the error while sending the R4 packets.	Int32
r4imexitstacharsp-totrec	The total number of R4 Idle Mode Exit State Change Response messages received on R4 interface.	Int32
r4imexitstacharsp-totacc	The total number of R4 Idle Mode Exit State Change Response messages accepted on R4 interface.	Int32
r4imexitstacharsp-totrelay	The total number of R4 Idle Mode Exit State Change Response messages relayed to the base station on the R4 interface. Triggers: Changes every time an R4 Idle Mode Exit State Change Response message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4imexitstacharsp-totdenied	The total number of R4 Idle Mode Exit State Change Response messages denied on R4 interface.	Int32
r4imexitstacharsp-totdiscard	The total number of R4 Idle Mode Exit State Change Response messages discarded on R4 interface.	Int32
r4imexitstacharsp-badform	The total number of badly formed R4 Idle Mode Exit State Change Response messages on R4 interface.	Int32
r4imexitstacharsp-decodeerr	The total number of R4 Idle Mode Exit State Change Response messages on R4 interface with decode error.	Int32
r4imexitstacharsp-unspecerr	The total number of R4 Idle Mode Exit State Change Response messages on R4 interface with unspecified error.	Int32
r4imexitstacharsp-missmandtlv	The total number of R4 Idle Mode Exit State Change Response messages on R4 interface with missing mandatory TLVs.	Int32
r4imexitstacharsp-tlvvalinval	The total number of R4 Idle Mode Exit State Change Response messages on R4 interface with an invalid TLV value.	Int32
r4imexitstacharsp-unknowntrlv	The total number of R4 Idle Mode Exit State Change Response messages on R4 interface with unknown TLVs.	Int32
r4imexitstacharsp-duptlvfound	The total number of R4 Idle Mode Exit State Change Response messages on R4 interface with duplicate TLVs.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r4imexitstacharsp-nosessfound	The total number of R4 Idle Mode Exit State Change Response messages with no session information.	Int32
r4imexitstacharsp-admprohibit	The total number of R4 Idle Mode Exit State Change Response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Idle Mode Exit State Change Response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4imexitstacharsp-noresourcedrop	The total number of R4 Idle Mode Exit State Change Response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Idle Mode Exit State Change Response message is discarded or denied due to resource unavailability. Availability: across all ASNGW services.	Int32
r4imexitstacharsp-transiderr	The total number of R4 Idle Mode Exit State Change Response messages with translation ID errors.	Int32
r4inipagreq-totsent	The total number of Initial Paging Requests sent to the ASNGW.	Int32
r4inipagreq-retranssent	The total number of R4 Initial Paging Request messages re-transmitted on R4 interface.	Int32
r4inipagreq-totendfail	The total number of failures occurred during transaction id generation and R4 Initial Paging Request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4inipagreq-totrec	The total number of R4 Initial Paging Request messages received on R4 interface.	Int32
r4inipagreq-totacc	The total number of R4 Initial Paging Request messages accepted on R4 interface.	Int32
r4inipagreq-totrelay	The total number of R4 Initial Paging Request messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Initial Paging Request message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4inipagreq-totdenied	The total number of R4 Initial Paging Request messages denied on R4 interface.	Int32
r4inipagreq-totdiscard	The total number of R4 Initial Paging Request messages discarded on R4 interface.	Int32
r4inipagreq-badform	The total number of badly formed R4 Initial Paging Request messages on R4 interface.	Int32
r4inipagreq-decodeerr	The total number of R4 Initial Paging Request messages on R4 interface with decode error.	Int32
r4inipagreq-unspecerr	The total number of R4 Initial Paging Request messages on R4 interface with unspecified error.	Int32
r4inipagreq-missmandtlv	The total number of R4 Initial Paging Request messages on R4 interface with missing mandatory TLVs.	Int32
r4inipagreq-tlvvalinval	The total number of R4 Initial Paging Request messages on R4 interface with invalid TLV value.	Int32
r4inipagreq-unknowntrlv	The total number of R4 Initial Paging Request messages on R4 interface with unknown TLVs.	Int32

Variables	Description	Data Type
r4inipagreq-duptlvfound	The total number of R4 Initial Paging Request messages on R4 interface with duplicate TLVs.	Int32
r4inipagreq-nosessfound	The total number of R4 Initial Paging Request messages on R4 interface without any session information.	Int32
r4inipagreq-admprohibit	The total number of R4 Initial Paging Request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Initial Paging Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4inipagreq-noresourcedrop	The total number of R4 Initial Paging Request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Initial Paging Request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4inipagreq-transiderr	The total number of R4 Initial Paging Request messages on R4 interface with transaction ID errors.	Int32
r4inipagrsp-totsent	The total number of Initiate Paging Responses sent to the ASNGW.	Int32
r4inipagrsp-retranssent	The total number of R4 Initial Paging Response messages re-transmitted on R4 interface.	Int32
r4inipagrsp-totsefail	The total number of failures occurred during transaction id generation and R4 Initial Paging Response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4inipagrsp-totrec	The total number of R4 Initial Paging Response messages received on R4 interface.	Int32
r4inipagrsp-totacc	The total number of R4 Initial Paging Response messages accepted on R4 interface.	Int32
r4inipagrsp-totrelay	The total number of R4 Initial Paging Response messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Initial Paging Response message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4inipagrsp-totdenied	The total number of R4 Initial Paging Response messages denied on R4 interface	Int32
r4inipagrsp-totdiscard	The total number of R4 Initial Paging Response messages discarded on R4 interface.	Int32
r4inipagrsp-badform	The total number of badly formed R4 Initial Paging Response messages on R4 interface.	Int32
r4inipagrsp-decodeerr	The total number of R4 Initial Paging Response messages on R4 interface with decode error.	Int32
r4inipagrsp-unspecerr	The total number of R4 Initial Paging Response messages on R4 interface with unspecified error.	Int32
r4inipagrsp-missmandtlv	The total number of R4 Initial Paging Response messages on R4 interface with missing mandatory TLVs.	Int32
r4inipagrsp-tlvvalinval	The total number of R4 Initial Paging Response messages on R4 interface with invalid TLV value.	Int32

Common Syntax Options

Variables	Description	Data Type
r4inipagrsp-unknownTLV	The total number of R4 Initial Paging Response messages on R4 interface with unknown TLVs.	Int32
r4inipagrsp-duptlvfound	The total number of R4 Initial Paging Response messages on R4 interface with duplicate TLVs.	Int32
r4inipagrsp-nosessfound	The total number of R4 Initial Paging Response messages on R4 interface without any session information.	Int32
r4inipagrsp-admprohibit	The total number of R4 Initial Paging Response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Initial Paging Response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4inipagrsp-noresourcedrop	The total number of R4 Initial Paging Response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Initial Paging Response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4inipagrsp-transiderr	The total number of R4 Initial Paging Response messages on R4 interface with transaction ID errors.	Int32
r4nwexitmsstachareq-totsent	The total number of Network Exit MS State Change Requests sent to the ASNGW.	Int32
r4nwexitmsstachareq-retranssent	The total number of Network Exit MS State Change Request messages re-transmitted on the R4 interface.	Int32
r4nwexitmsstachareq-totsendfail	The total number of failures occurred during transaction ID generation and R4 Network Exit MS State Change Request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4nwexitmsstachareq-totrec	The total number of Network Exit MS State Change Request messages received on R4 interface	Int32
r4nwexitmsstachareq-totacc	The total number of Network Exit MS State Change Request messages accepted on R4 interface	Int32
r4nwexitmsstachareq-totrelay	The total number of Network Exit MS State Change Request messages received from the base station and relayed on the R4 interface. Triggers: Changes every time a Network Exit MS State Change Request message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4nwexitmsstachareq-totdenied	The total number of Network Exit MS State Change Request messages denied on R4 interface.	Int32
r4nwexitmsstachareq-totdiscard	The total number of Network Exit MS State Change Request messages discarded on R4 interface.	Int32
r4nwexitmsstachareq-badform	The total number of badly formed Network Exit MS State Change Request messages on R4 interface.	Int32

Variables	Description	Data Type
r4nwexitmsstachareq-decodeerr	The total number of Network Exit MS State Change Request messages on R4 interface with decode error.	Int32
r4nwexitmsstachareq-unspeccerr	The total number of Network Exit MS State Change Request messages on R4 interface with unspecified error.	Int32
r4nwexitmsstachareq-missmandtlv	The total number of Network Exit MS State Change Request messages on R4 interface with missing mandatory TLVs.	Int32
r4nwexitmsstachareq-tlvvalinval	The total number of Network Exit MS State Change Request messages on R4 interface with invalid TLV value.	Int32
r4nwexitmsstachareq-unknowntrlv	The total number of Network Exit MS State Change Request messages on R4 interface with unknown TLVs.	Int32
r4nwexitmsstachareq-duptlvfound	The total number of Network Exit MS State Change Request messages on R4 interface with duplicate TLVs.	Int32
r4nwexitmsstachareq-nosessfound	The total number of Network Exit MS State Change Request messages on R4 interface without any session information.	Int32
r4nwexitmsstachareq-admprohibit	The total number of Network Exit MS State Change Request messages on R4 interface with transaction ID errors.	Int32
r4nwexitmsstachareq-noresourcedrop	The total number of Network Exit MS State Change Request messages discarded or denied due to admin prohibit. Triggers: Changes every time a Network Exit MS State Change Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4nwexitmsstachareq-transiderr	The total number of Network Exit MS State Change Request messages discarded or denied due to transaction ID errors.	Int32
r4nwexitmsstacharsp-totsent	The total number of Network Exit MS State Change Responses sent to the ASNGW.	Int32
r4nwexitmsstacharsp-retranssent	The total number of Network Exit MS State Change Response messages re-transmitted on R4 interface.	Int32
r4nwexitmsstacharsp-totsendfail	The total number of Network Exit MS State Change Response failures that occurred during transaction ID generation and R4 Network Exit MS State Change Response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4nwexitmsstacharsp-totrec	The total number of Network Exit MS State Change Response messages received on R4 interface.	Int32
r4nwexitmsstacharsp-totacc	The total number of Network Exit MS State Change Response messages accepted on R4 interface.	Int32
r4nwexitmsstacharsp-totrelay	The total number of Network Exit MS State Change Response messages received from the base station and relayed on the R4 interface. Triggers: Changes every time a Network Exit MS State Change Response message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r4nwexitmsstacharsp-totdenied	The total number of Network Exit MS State Change Response messages denied on R4 interface.	Int32
r4nwexitmsstacharsp-totdiscard	The total number of Network Exit MS State Change Response messages discarded on R4 interface.	Int32
4nwexitmsstacharsp-badform	The total number of badly formed Network Exit MS State Change Response messages on R4 interface.	Int32
r4nwexitmsstacharsp-decodeerr	The total number of Network Exit MS State Change Response messages on R4 interface with decode error.	Int32
r4nwexitmsstacharsp-unspecerr	The total number of Network Exit MS State Change Response messages on R4 interface with unspecified error.	Int32
r4nwexitmsstacharsp-missmandtlv	The total number of Network Exit MS State Change Response messages on R4 interface with missing mandatory TLVs.	Int32
r4nwexitmsstacharsp-tlvvalinval	The total number of Network Exit MS State Change Response messages on R4 interface with invalid TLV value.	Int32
r4nwexitmsstacharsp-unknowntrlv	The total number of Network Exit MS State Change Response messages on R4 interface with unknown TLVs.	Int32
r4nwexitmsstacharsp-duptlvfound	The total number of Network Exit MS State Change Response messages on R4 interface with duplicate TLVs.	Int32
r4nwexitmsstacharsp-nosessfound	The total number of Network Exit MS State Change Response messages on R4 interface without any session information.	Int32
r4nwexitmsstacharsp-admprohibit	The total number of Network Exit MS State Change Response messages discarded or denied due to admin prohibit. Triggers: Changes every time a Network Exit MS State Change Response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4nwexitmsstacharsp-noresourcedrop	The total number of Network Exit MS State Change Response messages discarded or denied due to resource unavailability. Triggers: Changes every time a Network Exit MS State Change Response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service.	Int32
r4nwexitmsstacharsp-transiderr	The total number of Network Exit MS State Change Response messages on R4 interface with transaction ID errors.	Int32
r4delmsentreq-totsent	The total number of Delete MS Entry Requests sent to the ASNGW on the R4 interface.	Int32
r4delmsentreq-retranssent	The total number of R4 Delete MS Entry Request messages re-transmitted on R4 interface	Int32
r4delmsentreq-totendfail	The total number of failures occurred during transaction id generation and R4 Delete MS Entry Request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4delmsentreq-totrec	The total number of R4 Delete MS Entry Request messages received on R4 interface.	Int32
r4delmsentreq-totacc	The total number of R4 Delete MS Entry Request messages accepted on R4 interface	Int32

Variables	Description	Data Type
r4delmsentreq-totrelay	The total number of R4 Delete MS Entry Request messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Delete MS Entry Request message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4delmsentreq-totdenied	The total number of R4 Delete MS Entry Request messages denied on R4 interface.	Int32
r4delmsentreq-totdiscard	The total number of R4 Delete MS Entry Request messages discarded on R4 interface.	Int32
r4delmsentreq-badform	The total number of badly formed R4 Delete MS Entry Request messages on R4 interface.	Int32
r4delmsentreq-decodeerr	The total number of R4 Delete MS Entry Request messages on R4 interface with decode error.	Int32
r4delmsentreq-unspecerr	The total number of R4 Delete MS Entry Request messages on R4 interface with unspecified error.	Int32
r4delmsentreq-missmandtlv	The total number of R4 Delete MS Entry Request messages on R4 interface with missing mandatory TLVs.	Int32
r4delmsentreq-tlvvalinval	The total number of R4 Delete MS Entry Request messages on R4 interface with invalid TLV value.	Int32
r4delmsentreq-unknowntrlv	The total number of R4 Delete MS Entry Request messages on R4 interface with unknown TLVs.	Int32
r4delmsentreq-duptlvfound	The total number of R4 Delete MS Entry Request messages on R4 interface with duplicate TLVs.	Int32
r4delmsentreq-nosessfound	The total number of R4 Delete MS Entry Request messages on R4 interface without any session information.	Int32
r4delmsentreq-admprohibit	The total number of R4 Delete MS Entry Request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Delete MS Entry Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4delmsentreq-noresourcedrop	The total number of R4 Delete MS Entry Request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Delete MS Entry Request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4delmsentreq-transiderr	The total number of R4 Delete MS Entry Request messages on R4 interface with transaction ID errors.	Int32
r4delmsentrsp-totsent	The total number of Delete MS Entry Responses sent to the ASNGW.	Int32
r4delmsentrsp-retranssent	The total number of R4 Delete MS Entry Response messages retransmitted on the R4 interface.	Int32
r4delmsentrsp-totsendfail	The total number of failures occurred during transaction id generation and R4 Delete MS Entry Response message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32

Common Syntax Options

Variables	Description	Data Type
r4delmsentrsp-totrec	The total number of R4 Delete MS Entry Response messages received on R4 interface.	Int32
r4delmsentrsp-totacc	The total number of R4 Delete MS Entry Response messages accepted on the R4 interface.	Int32
r4delmsentrsp-totrelay	The total number of R4 Delete MS Entry Response messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Delete MS Entry Response message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4delmsentrsp-totdenied	The total number of R4 Delete MS Entry Response messages denied on R4 interface.	Int32
r4delmsentrsp-totdiscard	The total number of R4 Delete MS Entry Response messages discarded on R4 interface.	Int32
r4delmsentrsp-badform	The total number of badly formed R4 Delete MS Entry Response messages on R4 interface.	Int32
r4delmsentrsp-decodeerr	The total number of R4 Delete MS Entry Response messages on R4 interface with decode error.	Int32
r4delmsentrsp-unspecerr	The total number of R4 Delete MS Entry Response messages on R4 interface with unspecified error.	Int32
r4delmsentrsp-missmandtlv	The total number of R4 Delete MS Entry Response messages on R4 interface with missing mandatory TLVs.	Int32
r4delmsentrsp-tlvvalinval	The total number of R4 Delete MS Entry Response messages on R4 interface with invalid TLV value.	Int32
r4delmsentrsp-unknowntlv	The total number of R4 Delete MS Entry Response messages on R4 interface with unknown TLVs.	Int32
r4delmsentrsp-duptlvfound	The total number of R4 Delete MS Entry Response messages on R4 interface with duplicate TLVs.	Int32
r4delmsentrsp-nosessfound	The total number of R4 Delete MS Entry Response messages on R4 interface without any session information.	Int32
r4delmsentrsp-admprohibit	The total number of R4 Delete MS Entry Response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Delete MS Entry Response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4delmsentrsp-noresourcedrop	The total number of R4 Delete MS Entry Response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Delete MS Entry Response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4delmsentrsp-transiderr	The total number of R4 Delete MS Entry Response messages on R4 interface with transaction ID errors.	Int32
r4anchorpcind-totsent	The total number of Anchor Paging Controller Indicator messages sent to the ASNGW on the R4 interface.	Int32

Variables	Description	Data Type
r4anchorpcind-retranssent	The total number of R4 Anchor Paging Controller Indicator messages re-transmitted on R4 interface.	Int32
r4anchorpcind-totsendfail	The total number of failures occurred during transaction id generation and R4 Anchor Paging Controller Indicator message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4anchorpcind-totrec	The total number of R4 Anchor Paging Controller Indicator messages received on R4 interface.	Int32
r4anchorpcind-totacc	The total number of R4 Anchor Paging Controller Indicator messages accepted on R4 interface.	Int32
r4anchorpcind-totrelay	The total number of R4 Anchor Paging Controller Indicator messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Anchor Paging Controller Indicator message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4anchorpcind-totdenied	The total number of R4 Anchor Paging Controller Indicator messages denied on R4 interface.	Int32
r4anchorpcind-totdiscard	The total number of R4 Anchor Paging Controller Indicator messages discarded on R4 interface.	Int32
r4anchorpcind-badform	The total number of badly formed R4 Anchor Paging Controller Indicator messages on R4 interface.	Int32
r4anchorpcind-decodeerr	The total number of R4 Anchor Paging Controller Indicator messages on R4 interface with decode error.	Int32
r4anchorpcind-unspecerr	The total number of R4 Anchor Paging Controller Indicator messages on R4 interface with unspecified error.	Int32
r4anchorpcind-missmandtlv	The total number of R4 Anchor Paging Controller Indicator messages on R4 interface with missing mandatory TLVs.	Int32
r4anchorpcind-tlvvalinval	The total number of R4 Anchor Paging Controller Indicator messages on R4 interface with invalid TLV value.	Int32
r4anchorpcind-unknowntrlv	The total number of R4 Anchor Paging Controller Indicator messages on R4 interface with unknown TLVs.	Int32
r4anchorpcind-duptlvfound	The total number of R4 Anchor Paging Controller Indicator messages on R4 interface with duplicate TLVs.	Int32
r4anchorpcind-nosessfound	The total number of R4 Anchor Paging Controller Indicator messages on R4 interface without any session information.	Int32
r4anchorpcind-admprohibit	The total number of R4 Anchor Paging Controller Indicator messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Anchor Paging Controller Indicator message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32

Common Syntax Options

Variables	Description	Data Type
r4anchorpcind-noresource-drop	The total number of R4 Anchor Paging Controller Indicator messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Anchor Paging Controller Indicator message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4anchorpcind-transiderr	The total number of R4 Anchor Paging Controller Indicator messages on R4 interface with transaction ID errors.	Int32
r4anchorpcack-totsent	The total number of Anchor Paging Controller Acknowledgements sent to the ASNGW.	Int32
r4anchorpcack-retranssent	The total number of R4 Anchor Paging Controller Acknowledgement messages re-transmitted on R4 interface.	Int32
r4anchorpcack-totsendfail	The total number of failures occurred during transaction id generation and R4 Anchor Paging Controller Acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4anchorpcack-totrec	The total number of R4 Anchor Paging Controller Acknowledgement messages received on R4 interface.	Int32
r4anchorpcack-totacc	The total number of R4 Anchor Paging Controller Acknowledgement messages accepted on R4 interface.	Int32
r4anchorpcack-totrelay	The total number of R4 Anchor Paging Controller Acknowledgement messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Anchor Paging Controller Acknowledgement message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4anchorpcack-totdenied	The total number of R4 Anchor Paging Controller Acknowledgement messages denied on R4 interface.	Int32
r4anchorpcack-totdiscard	The total number of R4 Anchor Paging Controller Acknowledgement messages discarded on R4 interface.	Int32
r4anchorpcack-badform	The total number of badly formed R4 Anchor Paging Controller Acknowledgement messages on R4 interface.	Int32
r4anchorpcack-decodeerr	The total number of R4 Anchor Paging Controller Acknowledgement messages on R4 interface with decode error.	Int32
r4anchorpcack-unspeccerr	The total number of R4 Anchor Paging Controller Acknowledgement messages on R4 interface with unspecified error.	Int32
r4anchorpcack-missmandtlv	The total number of R4 Anchor Paging Controller Acknowledgement messages on R4 interface with missing mandatory TLVs.	Int32
r4anchorpcack-tlvvalinval	The total number of R4 Anchor Paging Controller Acknowledgement messages on R4 interface with invalid TLV value.	Int32
r4anchorpcack-unknowntlv	The total number of R4 Anchor Paging Controller Acknowledgement messages on R4 interface with unknown TLVs.	Int32
r4anchorpcack-dupltlvfound	The total number of R4 Anchor Paging Controller Acknowledgement messages on R4 interface with duplicate TLVs.	Int32

Variables	Description	Data Type
r4anchorpack-nosessfound	The total number of R4 Anchor Paging Controller Acknowledgement messages on R4 interface without any session information.	Int32
r4anchorpack-adminprohib	The total number of R4 Anchor Paging Controller Acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Anchor Paging Controller Acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4anchorpack-noresourcedrop	The total number of R4 Anchor Paging Controller Acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Anchor Paging Controller Acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4anchorpack-transiderr	The total number of R4 Anchor Paging Controller Acknowledgement messages on R4 interface with transaction ID errors.	Int32
r4locupdreq-totsent	The total number of Location Update Requests sent to the peer ASNPC over the R4 interface.	Int32
r4locupdreq-retranssent	The total number of R4 Location Update Request messages re-transmitted on R4 interface.	Int32
r4locupdreq-totsefail	The total number of failures occurred during transaction id generation and R4 Location Update Request messages not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4locupdreq-totrec	The total number of R4 Location Update Request messages received on R4 interface.	Int32
r4locupdreq-totacc	The total number of R4 Location Update Request messages accepted on R4 interface.	Int32
r4locupdreq-totrelay	The total number of R4 Location Update Request messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Location Update Request message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4locupdreq-totdenied	The total number of R4 Location Update Request messages denied on R4 interface.	Int32
r4locupdreq-totdiscard	The total number of R4 Location Update Request messages discarded on R4 interface.	Int32
r4locupdreq-badform	The total number of badly formed R4 Location Update Request messages on R4 interface.	Int32
r4locupdreq-decodeerr	The total number of R4 Location Update Request messages on R4 interface with decode error.	Int32
r4locupdreq-unspecerr	The total number of R4 Location Update Request messages on R4 interface with unspecified error.	Int32
r4locupdreq-missmandtlv	The total number of R4 Location Update Request messages on R4 interface with missing mandatory TLVs.	Int32
r4locupdreq-tlvvalinval	The total number of R4 Location Update Request messages on R4 interface with invalid TLV value.	Int32

Common Syntax Options

Variables	Description	Data Type
r4locupdreq-unknownflv	The total number of R4 Location Update Request messages on R4 interface with unknown TLVs.	Int32
r4locupdreq-duptlvfound	The total number of R4 Location Update Request messages on R4 interface with duplicate TLVs.	Int32
r4locupdreq-nosessfound	The total number of R4 Location Update Request messages on R4 interface without any session information.	Int32
r4locupdreq-admprohibit	The total number of R4 Location Update Request messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Location Update Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4locupdreq-noresourceprop	The total number of R4 Location Update Request messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Location Update Request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4locupdreq-transiderr	The total number of R4 Location Update Request messages on R4 interface with transaction ID errors.	Int32
r4locupdrsp-totsent	The total number of Location Update Responses sent to the peer ASNPC.	Int32
r4locupdrsp-retranssent	The total number of R4 Location Update Response messages re-transmitted on R4 interface.	Int32
r4locupdrsp-totsefail	The total number of failures occurred during transaction id generation and R4 Location Update Response messages not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4locupdrsp-totrec	The total number of R4 Location Update Response messages received on R4 interface.	Int32
r4locupdrsp-totacc	The total number of R4 Location Update Response messages accepted on R4 interface.	Int32
r4locupdrsp-totrelay	The total number of R4 Location Update Response messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Location Update Response message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4locupdrsp-totdenied	The total number of R4 Location Update Response messages denied on R4 interface.	Int32
r4locupdrsp-totdiscard	The total number of R4 Location Update Response messages discarded on R4 interface.	Int32
r4locupdrsp-badform	The total number of badly formed R4 Location Update Response messages on R4 interface.	Int32
r4locupdrsp-decodeerr	The total number of R4 Location Update Response messages on R4 interface with decode error.	Int32
r4locupdrsp-unspecerr	The total number of R4 Location Update Response messages on R4 interface with unspecified error.	Int32

Variables	Description	Data Type
r4locupdrsp-missmandtlv	The total number of R4 Location Update Response messages on R4 interface with missing mandatory TLVs.	Int32
r4locupdrsp-tlvvalinval	The total number of R4 Location Update Response messages on R4 interface with invalid TLV value.	Int32
r4locupdrsp-unknowntrlv	The total number of R4 Location Update Response messages on R4 interface with unknown TLVs.	Int32
r4locupdrsp-duptlvfound	The total number of R4 Location Update Response messages on R4 interface with duplicate TLVs.	Int32
r4locupdrsp-nosessfound	The total number of R4 Location Update Response messages on R4 interface without any session information.	Int32
r4locupdrsp-admprohibit	The total number of R4 Location Update Response messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Location Update Response message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4locupdrsp-noresourcedrop	The total number of R4 Location Update Response messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Location Update Response message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4locupdrsp-transiderr	The total number of R4 Location Update Response messages on R4 interface with transaction ID errors.	Int32
r4locupdcnf-totsent	The total number of Location Update Confirmations sent to the peer ASNPC.	Int32
r4locupdcnf-retranssent	The total number of R4 Location Update Confirmation messages re-transmitted on R4 interface.	Int32
r4locupdcnf-totsefail	The total number of failures occurred during transaction id generation and R4 Location Update Confirmation messages not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4locupdcnf-totrec	The total number of R4 Location Update Confirmation messages received on R4 interface.	Int32
r4locupdcnf-totacc	The total number of R4 Location Update Confirmation messages accepted on R4 interface.	Int32
r4locupdcnf-totrelay	The total number of R4 Location Update Confirmation messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Location Update Confirmation message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4locupdcnf-totdenied	The total number of R4 Location Update Confirmation messages denied on R4 interface.	Int32
r4locupdcnf-totdiscard	The total number of R4 Location Update Confirmation messages discarded on R4 interface.	Int32
r4locupdcnf-badform	The total number of badly formed R4 Location Update Confirmation messages on R4 interface.	Int32

■ Common Syntax Options

Variables	Description	Data Type
r4locupdcnf-decodeerr	The total number of R4 Location Update Confirmation messages on R4 interface with decode error.	Int32
r4locupdcnf-unspeccerr	The total number of R4 Location Update Confirmation messages on R4 interface with unspecified error.	Int32
r4locupdcnf-missmandtlv	The total number of R4 Location Update Confirmation messages on R4 interface with missing mandatory TLVs.	Int32
r4locupdcnf-tlvvalinval	The total number of R4 Location Update Confirmation messages on R4 interface with invalid TLV value.	Int32
r4locupdcnf-unknownltlv	The total number of R4 Location Update Confirmation messages on R4 interface with unknown TLVs.	Int32
r4locupdcnf-duptlvfound	The total number of R4 Location Update Confirmation messages on R4 interface with duplicate TLVs.	Int32
r4locupdcnf-nosessfound	The total number of R4 Location Update Confirmation messages on R4 interface without any session information.	Int32
r4locupdcnf-admprohibit	The total number of R4 Location Update Confirmation messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Location Update Confirmation message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4locupdcnf-noresourcedrop	The total number of R4 Location Update Confirmation messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Location Update Confirmation message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4locupdcnf-transiderr	The total number of R4 Location Update Confirmation messages on R4 interface with transaction ID errors.	Int32
r4prelocind-totsent	The total number of PC Relocation Indicator messages sent to the ASNGW on the R4 interface.	Int32
r4prelocind-retranssent	The total number of R4 PC Relocation Indicator messages re-transmitted on R4 interface.	Int32
r4prelocind-totsendfail	The total number of failures occurred during transaction id generation and R4 PC Relocation Indicator messages not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4prelocind-totrec	The total number of R4 PC Relocation Indicator messages received on R4 interface.	Int32
r4prelocind-totacc	The total number of R4 PC Relocation Indicator messages accepted on R4 interface.	Int32
r4prelocind-totrelay	The total number of R4 PC Relocation Indicator messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 PC Relocation Indicator message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4prelocind-totdenied	The total number of R4 PC Relocation Indicator messages denied on R4 interface.	Int32

Variables	Description	Data Type
r4prelocind-totdiscard	The total number of R4 PC Relocation Indicator messages discarded on R4 interface.	Int32
r4prelocind-badform	The total number of badly formed R4 PC Relocation Indicator messages on R4 interface.	Int32
r4prelocind-decodeerr	The total number of R4 PC Relocation Indicator messages on R4 interface with decode error.	Int32
r4prelocind-unspecerr	The total number of R4 PC Relocation Indicator messages on R4 interface with unspecified error.	Int32
r4prelocind-mismandtlv	The total number of R4 PC Relocation Indicator messages on R4 interface with missing mandatory TLVs.	Int32
r4prelocind-tlvvalinval	The total number of R4 PC Relocation Indicator messages on R4 interface with invalid TLV value.	Int32
r4prelocind-unknowntrlv	The total number of R4 PC Relocation Indicator messages on R4 interface with unknown TLVs.	Int32
r4prelocind-duptlvfound	The total number of R4 PC Relocation Indicator messages on R4 interface with duplicate TLVs.	Int32
r4prelocind-nosessfound	The total number of R4 PC Relocation Indicator messages on R4 interface without any session information.	Int32
r4prelocind-admprohibit	The total number of R4 PC Relocation Indicator messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 PC Relocation Indicator message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4prelocind-noresourcedrop	The total number of R4 PC Relocation Indicator messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 PC Relocation Indicator message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4prelocind-transiderr	The total number of R4 PC Relocation Indicator messages on R4 interface with transaction ID errors.	Int32
r4prelocack-totsent	The total number of PC Relocation Acknowledgement messages sent to the ASNGW.	Int32
r4prelocack-retranssent	The total number of PC Relocation Acknowledgement messages retransmitted on the R4 interface to the ASNGW.	Int32
r4prelocack-totsendfail	The total number of PC Relocation Acknowledgement message failures sent to the ASNGW and relayed on the R4 interface. This counter is used to count the error while sending the R4 packets.	Int32
r4prelocack-totrec	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW.	Int32
r4prelocack-totacc	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW	Int32

Common Syntax Options

Variables	Description	Data Type
r4prelocack-totrelay	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW and relayed on the R4 interface. Triggers: Changes every time an R4 Idle Mode Exit State Indication message is relayed by the R4 interface. Availability: across all ASNGW services	Int32
r4prelocack-totdenied	The total number of PC Relocation Acknowledgement messages sent to the ASNGW that were denied on the R4 interface	Int32
r4prelocack-totdiscard	The total number of PC Relocation Acknowledgement messages sent to the ASNGW that were discarded on the R4 interface.	Int32
r4prelocack-badform	The total number of badly formed R4 PC Relocation Acknowledgement messages sent to the ASNGW.	Int32
r4prelocack-decodeerr	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW with decode errors.	Int32
r4prelocack-unspecerr	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW with unspecified errors.	Int32
r4prelocack-missmandtlv	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW with missing mandatory TLVs.	Int32
r4prelocack-tlvvalinval	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW with an invalid TLV.	Int32
r4prelocack-unknowntlv	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW with an unknown TLV.	Int32
r4prelocack-duptlvfound	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW with duplicate TLVs.	Int32
r4prelocack-nosessfound	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW without any session information.	Int32
r4prelocack-admprohibit	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW that were discarded or denied due to admin prohibit. Triggers: Changes every time an R4 PC Relocation Acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASN GW services.	Int32
r4prelocack-noresourcedrop	The total number of R4 PC Relocation Acknowledgement messages sent to the ASNGW that were discarded or denied due to resource unavailability. Triggers: Changes every time an R4 PC Relocation Acknowledgement message is discarded or denied due to resource unavailability. Availability: across all ASN GW services.	Int32
r4prelocack-transiderr	The total number of R4 IPC Relocation Acknowledgement messages sent to the ASNGW with a transaction ID error.	Int32
r4contextreq-totsent	The total number of Context Request messages sent to the ASNGW.	Int32
r4contextreq-retranssent	The total number of Context Request messages re-transmitted to the ASNGW on R4 interface.	Int32

Variables	Description	Data Type
r4contextreq-totsendfail	The total number of failures that occurred during transaction ID generation and R4 Context Request message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4contextreq-totrec	The total number of Context Request messages received by the ASNGW on R4 interface.	Int32
r4contextreq-totacc	The total number of Context Request messages accepted by the ASNGW on R4 interface.	Int32
r4contextreq-totrelay	The total number of Context Request messages received on the ASNGW from the base station and relayed on the R4 interface. Triggers: Changes every time a Context Request message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4contextreq-totdenied	The total number of Context Request messages denied by the ASNGW on R4 interface.	Int32
r4contextreq-totdiscard	The total number of Context Request messages discarded by the ASNGW on R4 interface.	Int32
r4contextreq-badform	The total number of badly formed Context Request messages on R4 interface.	Int32
r4contextreq-decodeerr	The total number of Context Request messages on R4 interface with decode error.	Int32
r4contextreq-unspecerr	The total number of Context Request messages on R4 interface with unspecified error.	Int32
r4contextreq-missmandtlv	The total number of Context Request messages on R4 interface with missing mandatory TLVs.	Int32
r4contextreq-tlvvalinval	The total number of Context Request messages on R4 interface with invalid TLV value.	Int32
r4contextreq-unknowntrlv	The total number of Context Request messages on R4 interface with unknown TLVs.	Int32
r4contextreq-duptlvfound	The total number of Context Request messages on R4 interface with duplicate TLV values.	Int32
r4contextreq-nosessfound	The total number of Context Request messages on R4 interface without any session information.	Int32
r4contextreq-adminprohib	The total number of Context Request messages discarded or denied due to admin prohibit. Triggers: Changes every time a Context Request message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4contextreq-noresourcedrop	The total number of Context Request messages discarded or denied due to resource unavailability. Triggers: Changes every time a Context Request message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service.	Int32
r4contextreq-transiderr	The total number of Context Request messages on R4 interface with transaction ID errors.	Int32
r4contextrpt-totsent	The total number of Context Report messages sent to the ASNGW.	Int32
r4contextrpt-retranssent	The total number of Context Report messages re-transmitted to the ASNGW on R4 interface.	Int32
r4contextrpt-totsendfail	The total number of failures that occurred during transaction ID generation and R4 Context Report message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32

Common Syntax Options

Variables	Description	Data Type
r4contextrpt-totrec	The total number of Context Report messages received by the ASNGW on R4 interface.	Int32
r4contextrpt-totacc	The total number of Context Report messages accepted by the ASNGW on R4 interface.	Int32
r4contextrpt-totrelay	The total number of Context Report messages received on the ASNGW from the base station and relayed on the R4 interface. Triggers: Changes every time a Context Report message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4contextrpt-totdenied	The total number of Context Report messages denied by the ASNGW on R4 interface.	Int32
r4contextrpt-totdiscard	The total number of Context Report messages discarded by the ASNGW on R4 interface.	Int32
r4contextrpt-badform	The total number of badly formed Context Report messages on R4 interface.	Int32
r4contextrpt-decodeerr	The total number of Context Report messages on R4 interface with decode error.	Int32
r4contextrpt-unspecerr	The total number of Context Report messages on R4 interface with unspecified error.	Int32
r4contextrpt-missmandtlv	The total number of Context Report messages on R4 interface with missing mandatory TLVs.	Int32
r4contextrpt-tlvvalinval	The total number of Context Report messages on R4 interface with invalid TLV value.	Int32
r4contextrpt-unknowntrlv	The total number of Context Report messages on R4 interface with unknown TLVs.	Int32
r4contextrpt-duptlvfound	The total number of Context Report messages on R4 interface with duplicate TLV values.	Int32
r4contextrpt-nosessfound	The total number of Context Report messages on R4 interface without any session information.	Int32
r4contextrpt-adminprohib	The total number of Context Report messages discarded or denied due to admin prohibit. Triggers: Changes every time a Context Report message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4contextrpt-noresourcedrop	The total number of Context Report messages discarded or denied due to resource unavailability. Triggers: Changes every time a Context Report message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service.	Int32
r4contextrpt-transiderr	The total number of Context Report messages on R4 interface with transaction ID errors.	Int32
r4cmackeycountupd-totsent	The total number of CMAC Key Count Update messages sent to the ASNGW.	Int32
r4cmackeycountupd-retranssent	The total number of CMAC Key Count Update messages re-transmitted on R4 inter	Int32
r4cmackeycountupd-totsendfail	The total number of failures occurred during transaction ID generation and R4 CMAC Key Count Update message not sent for specific interface. This counter is used to count the error while sending the R4 packets.	Int32
r4cmackeycountupd-totrec	The total number of CMAC Key Count Update messages received on R4 interface.	Int32

Variables	Description	Data Type
r4cmackeycountupd-totacc	The total number of CMAC Key Count Update messages accepted on R4 interface.	Int32
r4cmackeycountupd-totrelay	The total number of CMAC Key Count Update messages received from the base station and relayed on the R4 interface. Triggers: Changes every time a CMAC Key Count Update message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4cmackeycountupd-totdenied	The total number of CMAC Key Count Update messages denied on R4 interface.	Int32
r4cmackeycountupd-totdiscard	The total number of CMAC Key Count Update messages discarded on R4 interface.	Int32
r4cmackeycountupd-badform	The total number of badly formed CMAC Key Count Update messages on R4 interface.	Int32
r4cmackeycountupd-decodeerr	The total number of CMAC Key Count Update messages on R4 interface with decode error.	Int32
r4cmackeycountupd-unspecerr	The total number of CMAC Key Count Update messages on R4 interface with unspecified error.	Int32
r4cmackeycountupd-missmandtlv	The total number of CMAC Key Count Update messages on R4 interface with missing mandatory TLVs.	Int32
r4cmackeycountupd-tlvvalinval	The total number of CMAC Key Count Update messages on R4 interface with invalid TLV value.	Int32
r4cmackeycountupd-unknowntrlv	The total number of CMAC Key Count Update messages on R4 interface with unknown TLVs.	Int32
r4cmackeycountupd-duptlvfound	The total number of CMAC Key Count Update messages on R4 interface with duplicate TLVs.	Int32
r4cmackeycountupd-nosessfound	The total number of CMAC Key Count Update messages on R4 interface without any session information.	Int32
r4cmackeycountupd-adminprohib	The total number of CMAC Key Count Update messages discarded or denied due to admin prohibit. Triggers: Changes every time a CMAC Key Count Update message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4cmackeycountupd-noresourcedrop	The total number of CMAC Key Count Update messages discarded or denied due to resource unavailability. Triggers: Changes every time a CMAC Key Count Update message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4cmackeycountupd-transiderr	The total number of CMAC Key Count Update messages on R4 interface with transaction ID errors.	Int32

Common Syntax Options

Variables	Description	Data Type
r4cmackeycountack-totsent	The total number of CMAC Key Count Acknowledgement messages sent to the ASNGW.	Int32
r4cmackeycountack-retranssent	The total number of CMAC Key Count Acknowledgement messages re-transmitted on R6 interface	Int32
r4cmackeycountack-totsendfail	The total number of failures occurred during transaction ID generation and R6 CMAC Key Count Acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets	Int32
r4cmackeycountack-totrec	The total number of failures occurred during transaction ID generation and R6 CMAC Key Count Acknowledgement message not sent for specific interface. This counter is used to count the error while sending the R6 packets	Int32
r4cmackeycountack-totacc	The total number of CMAC Key Count Acknowledgement messages accepted on R6 interface.	Int32
r4cmackeycountack-totrelay	The total number of CMAC Key Count Acknowledgement messages received from the base station and relayed on the R6 interface. Triggers: Changes every time a CMAC Key Count Acknowledgement message is relayed by the R6 interface. Availability: across all ASNGW services.	Int32
r4cmackeycountack-totdenied	The total number of CMAC Key Count Acknowledgement messages denied on R6 interface.	Int32
r4cmackeycountack-totdiscard	The total number of CMAC Key Count Acknowledgement messages discarded on R6 interface.	Int32
r4cmackeycountack-badform	The total number of badly formed CMAC Key Count Acknowledgement messages on R6 interface.	Int32
r4cmackeycountack-decodeerr	The total number of CMAC Key Count Acknowledgement messages on R6 interface with decode error.	Int32
r4cmackeycountack-unspecerr	The total number of CMAC Key Count Acknowledgement messages on R6 interface with unspecified error.	Int32
r4cmackeycountack-mismandtlv	The total number of CMAC Key Count Acknowledgement messages on R6 interface with missing mandatory TLVs.	Int32
r4cmackeycountack-tlvvalinval	The total number of CMAC Key Count Acknowledgement messages on R6 interface with invalid TLV value.	Int32
r4cmackeycountack-unknowntrlv	The total number of CMAC Key Count Acknowledgement messages on R6 interface with unknown TLVs.	Int32
r4cmackeycountack-duptlvfound	The total number of CMAC Key Count Acknowledgement messages on R6 interface with duplicate TLVs.	Int32
r4cmackeycountack-nosessfound	The total number of CMAC Key Count Acknowledgement messages on R6 interface without any session information.	Int32

Variables	Description	Data Type
r4cmackeycountack-adminprohib	The total number of CMAC Key Count Acknowledgement messages discarded or denied due to admin prohibit. Triggers: Changes every time a CMAC Key Count Acknowledgement message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4cmackeycountack-noresourcedrop	The total number of CMAC Key Count Acknowledgement messages discarded or denied due to resource unavailability. Triggers: Changes every time a CMAC Key Count Acknowledgement message is discarded or denied due to resource unavailability. Availability: across all the ASNGW services.	Int32
r4cmackeycountack-transiderr	The total number of CMAC Key Count Acknowledgement messages on R6 interface with transaction ID errors.	Int32
r4unknown-totrec	The total number of Unknown messages received on the R4 interface.	Int32
r4unknown-totacc	The total number of Unknown messages accepted on R4 interface.	Int32
r4unknown-totrelay	The total number of R4 Unknown messages received from the base station and relayed on the R4 interface. Triggers: Changes every time an R4 Unknown message is relayed by the R4 interface. Availability: across all ASNGW services.	Int32
r4unknown-totdenied	The total number of Unknown messages denied on the R4 interface.	Int32
r4unknown-totdiscard	The total number of Unknown messages discarded on R4 interface.	Int32
r4unknown-badform	The total number of Unknown badly formed messages on the R4 interface.	Int32
r4unknown-decodeerr	The total number of Unknown decode errors on R4 interface.	Int32
r4unknown-unspecerr	The total number of Unknown messages with unspecified errors on R4 interface.	Int32
r4unknown-misssmandtlv	The total number of Unknown messages on R4 interface with missing TLVs.	Int32
r4unknown-tlvvalinval	The total number of Unknown messages on R4 interface with invalid TLV values.	Int32
r4unknown-unknowntlv	The total number of Unknown messages on R4 interface with unknown TLVs.	Int32
r4unknown-duptlvfound	The total number of Unknown messages on R4 interface with duplicate TLV values.	Int32
r4unknown-nosessfound	The total number of Unknown messages on R4 interface with no session information.	Int32
r4unknown-admprohibit	The total number of R4 Unknown messages discarded or denied due to admin prohibit. Triggers: Changes every time an R4 Unknown message is discarded or denied due to admin prohibit. Availability: across all ASNGW services.	Int32
r4unknown-noresourcedrop	The total number of R4 Unknown messages discarded or denied due to resource unavailability. Triggers: Changes every time an R4 Unknown message is discarded or denied due to resource unavailability. Availability: across all the ASNGW service	Int32
r4unknown-transiderr	The total number of R4 Unknown messages with transaction ID errors.	Int32

■ Common Syntax Options

Variables	Description	Data Type
total-sessions-connected	The total number of active sessions currently connected through the ASN PC.	Int32
 IMPORTANT: For information on statistics that are common to all schema see the <i>Statistics and Counters Overview</i> chapter.		

Chapter 7

BCMCS Schema Statistics

The BCMCS schema provides operational statistics that can be used for monitoring and troubleshooting the following products: PDSN

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 7. Bulk Statistic Variables in the BCMCS Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	Description: The name of the context configured on the system that is currently facilitating the BCMCS configuration. This is a key variable.	String
vpnid	Description: The identification number of the context configured on the system that is currently facilitating the BCMCS configuration. This is an internal reference number. This is a key variable.	Int32
servname	Description: The name of the BCMCS service for which the statistics are displayed. This is a key variable.	String
srsp-recv-total	Description: This proprietary counter indicates the total number of A11-BC service requests received by PDSN service acting as the BSN. Triggers: - Incremented when an A11-BC Service Request is received by the PDSN service. Availability: per PDSN service, per PCF, per session Type: Counter	Int32
srsp-accept-total	Description: This proprietary counter indicates the total number of A11-BC service requests accepted by the PDSN service acting as the BSN. Triggers: - Incremented when an A11-BC Service Request is accepted by the PDSN service. Availability: per PDSN service, per PCF, per session Type: Counter	Int32
srsp-denied-total	Description: This proprietary counter indicates the total number of A11-BC service requests denied by the PDSN service acting as the BSN. Triggers: - Incremented when an A11-BC Service Request is denied by the PDSN service. Availability: per PDSN service, per PCF, per session Type: Counter	Int32
srsp-reply-total	Description: This proprietary counter indicates the total number of A11-BC service responses sent by the PDSN service acting as the BSN. Triggers: - Incremented when an A11-BC Service Request is sent by the PDSN service. Availability: per PDSN service, per PCF, per session Type: Counter	Int32
srsp-discard-total	This proprietary counter indicates the total number of A11-BC service requests discarded by the PDSN service acting as the BSN. Triggers: - Incremented when an A11-BC Service Request is discarded by the PDSN service. Availability: per PDSN service, per PCF, per session Type: Counter	Int32
srsp-accept-initial	Description: This proprietary counter indicates the total number of initial A11-BC service requests received and accepted by the PDSN service acting as the BSN. Triggers: - Incremented when an initial A11-BC Service Request is received and accepted by the PDSN service. Availability: per PDSN service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
srsp-recv-initial	<p>Description: This proprietary counter indicates the total number of initial A11-BC service requests received by the PDSN service acting as the BSN.</p> <p>Triggers: - Incremented when an initial A11-BC Service Request is received by the PDSN service.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
srsp-denied-initial	<p>Description: This proprietary counter indicates the total number of initial A11-BC service requests received and rejected by the PDSN service acting as the BSN.</p> <p>Triggers: - Incremented when an initial A11-BC Service Request is received and rejected by the PDSN service.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32

upd-trans	<p>Description: This proprietary counter indicates the total number of initial A11-BC registration updates for which no acknowledgement was received from PCF.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - Incremented when an initial A11-BC Registration request is transmitted by the PDSN service. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upd-ttlnoetrans	<p>Description: This proprietary counter indicates the total number of A11-BC registration updates that were not re-transmitted due to TTL expiration.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is derived as total A11-BC Registration updates transmitted less total A11-BC Registration requests retransmitted. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
upd-retrans	<p>Description: This proprietary counter indicates the total number of A11-BC registration updates that were re-transmitted.</p> <p>Triggers: - This counter is incremented when PDSN service retransmits A11-BC Registration update.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upd-received	<p>Description: This proprietary counter indicates the total number of A11-BC registration update Acks that were received.</p> <p>Triggers: - This counter is incremented when PDSN service receives A11-BC Registration Ack from PCF.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upd-ack-received	<p>Description: This proprietary counter indicates the total number of A11-BC registration update Acks that were received.</p> <p>Triggers: - This counter is incremented when PDSN service receives A11-BC Registration Ack from PCF.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upd-discard	<p>Description: This proprietary counter indicates the total number A11-BC registration update Acks that were received and discarded by the PDSN service acting as the BSN.</p> <p>Triggers: - This counter is incremented when PDSN service receives A11-BC Registration Ack from PCF is discarded in PDSN service.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upd-senderror	<p>Description: This proprietary counter indicates the total number of A11-BC registration update for which errors were experienced during transmission.</p> <p>Triggers: - This counter is incremented when BSN experiences error during transmission of A11-BC Registration update.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upd-lifetime	<p>Description: This proprietary counter indicates the total number of A11-BC registration updates sent due to Lifetimer Expiry.</p> <p>Triggers: - This counter is incremented when BSN sends A11-BC Registration update due to lifetimer expiry.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
upd-uplyrinit	<p>Description: This proprietary counter indicates the total number of A11-BC registration updates initiated by upper processing layers.</p> <p>Triggers: - This counter is incremented when BSN sends A11-BC Registration update due to a trigger from upper layer.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upd-other	<p>Description: This proprietary counter indicates the total number of A11-BC registration updates due to reasons other than those listed here.</p> <p>Triggers: - This counter is incremented when BSN sends A11-BC Registration update due to reasons other than those listed here.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upd-smgredit	<p>Description: This proprietary counter indicates the total number of A11-BC registration updates due to sessmgr exit.</p> <p>Triggers: - This counter is incremented when BSN sends A11-BC Registration update due to session manager exit.</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upddeny-unspec	<p>Description: This proprietary counter indicates the total number of A11-BC registration Acknowledge received from PCF with reply code of 80H (Registration Denied - reason unspecified).</p> <p>Triggers: - This counter is incremented when PDSN service receives A11-BC Registration Acknowledge with reply code of 80H (Registration Denied - reason unspecified).</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upddeny-adminprohib	<p>Description: This proprietary counter indicates the total number of A11-BC registration Acknowledge received from PCF with reply code of 81H (Registration Denied - administratively prohibited).</p> <p>Triggers: - This counter is incremented when PDSN service receives A11-BC Registration Acknowledge with reply code of 81H (Registration Denied - administratively prohibited).</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upddeny-auth	<p>Description: This proprietary counter indicates the total number of A11-BC registration Acknowledge received from PCF with reply code of 83H (Registration Denied - mobile node failed authentication).</p> <p>Triggers: - This counter is incremented when PDSN service receives A11-BC Registration Acknowledge with reply code of 83H (Registration Denied - mobile node failed authentication).</p> <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
upddeny-idmismatch	<p>Description: This proprietary counter indicates the total number of A11-BC registration Acknowledge received from PCF with reply code of 85H (Registration Denied - identification mismatch).</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when PDSN service receives A11-BC Registration Acknowledge with reply code of 85H (Registration Denied - identification mismatch). <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
upddeny-badrequest	<p>Description: This proprietary counter indicates the total number of A11-BC registration Acknowledge received from PCF with reply code of 86H (Registration Denied - poorly formed request).</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when PDSN service receives A11-BC Registration Acknowledge with reply code of 86H (Registration Denied - poorly formed request). <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
sec-violations	<p>Description: This proprietary counter indicates the total number of security violations happened in A11 signaling.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when security violation occurs in BC A11 signaling due to bad authenticator, bad spi etc ... <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
sec-badauth	<p>Description: This proprietary counter indicates the total number of security violations happened in A11 signaling due to a mis-computed authenticator field.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when security violation occurs in BC A11 signaling due to bad authenticator field. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
sec-badid	<p>Description: This proprietary counter indicates the total number of security violations happened in A11 signaling due to bad identification field</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when security violation occurs in BC A11 signaling due to bad identification field. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
sec-badspi	<p>Description: This proprietary counter indicates the total number of security violations happened in A11 signaling due to bad to the receipt of a Security Parameter Index (SPI) that was in the reserved range (0 through 255).</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when security violation occurs in BC A11 signaling due to the receipt of a Security Parameter Index (SPI) that was in the reserved range (0 through 255). <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
sec-mnhaauth	<p>Description: This proprietary counter indicates the total number of security violations happened in A11 signaling due to missing mobile node-home agent authentication extensions.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when security violation occurs in BC A11 signaling due to missing mobile node-home agent authentication extensions. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
sec-regupdate	<p>Description: This proprietary counter indicates the total number of security violations happened in A11 signaling due to missing registration update authentication extensions.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when security violation occurs in BC A11 signaling due to missing registration update authentication extensions. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
disc-absent	<p>Description: This proprietary counter indicates the total number of A11-BC registration acknowledgements that were received and discarded due to the session having been already ended because the acknowledgement was late.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when A11-BC registration acknowledgement is received and discarded due to session being already disconnected. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
disc-nomem	<p>Description: This proprietary counter indicates the total number of A11-BC registration acknowledgements that were received and discarded due to insufficient memory.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when A11-BC registration acknowledgement is received discarded due to insufficient memory. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
disc-malform	<p>Description: This proprietary counter indicates the total number of A11-BC registration acknowledgements that were received and discarded due to being poorly formed.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when A11-BC registration acknowledgement is received discarded due to being poorly formed. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
disc-authfail	<p>Description: This proprietary counter indicates the total number of A11-BC registration acknowledgements that were received and discarded due to the mobile node failing authentication.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when A11-BC registration acknowledgement is received discarded due to the mobile node failing authentication. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
disc-bounce	<p>Description: This proprietary counter indicates the total number A11-BC registration acknowledgements that were received and discarded due to internal communication messages between an A11 Manager task and a Session Manager bouncing (not successfully sent).</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when message bounces occurs between A11 Manager and Session Manager while trying to process an A11 BC Registration Acknowledge <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
disc-inputq	<p>Description: This proprietary counter indicates the total number A11-BC registration acknowledges that were received and discarded due to the queue in which incoming calls are kept prior to being processed exceeded its capacity.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when A11 BC registration acknowledge is discarded due to the queue in which incoming calls are kept prior to being processed exceeded its capacity. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
disc-mismatchid	<p>Description: This proprietary counter indicates the total number A11-BC registration acknowledges that were received and discarded due to due to reply code 85H (Registration Denied - identification mismatch).</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when A11 BC registration acknowledge is discarded due to reply code 85H (Registration Denied - identification mismatch). <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
disc-invpktlen	<p>Description: This proprietary counter indicates the total number A11-BC registration acknowledges that were received and discarded due to due to to having an invalid packet length.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when A11 BC registration acknowledge is discarded due to to it having an invalid packet length. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32
disc-misc	<p>Description: This proprietary counter indicates the total number A11-BC registration acknowledges that were received and discarded due any other reasons.</p> <p>Triggers:</p> <ul style="list-style-type: none"> - This counter is incremented when A11 BC registration acknowledge is discarded due to to any other reasons. <p>Availability: per PDSN service, per PCF, per session</p> <p>Type: Counter</p>	Int32

IMPORTANT: See Bulk Statistics Overview for statistics that are common to all schema.

Chapter 8

Card Schema Statistics

The Card schema provides operational statistics that can be used for monitoring and troubleshooting the following products: All

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 8. Bulk Statistic Variables in the Card-level Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
card	Description: Chassis slot number between 1 and 16. This is a key variable. (for ASR 5000 platforms) Type: Information	Int32
cpubusy	Description: Total CPU busy (across all CPUs, as percentage) Type: Gauge	Float
cpuidle	Description: Total CPU idle (across all CPUs, as percentage) Type: Gauge	Float
numproc	Description: Total number of processes Type: Gauge	Int32
memused	Description: Total amount of memory used (across all processors) Type: Gauge	Int32
memtotal	Description: Total amount of memory available (across all processors) Type: Gauge	Int32
numcpu	Description: The total number of CPUs Type: Gauge	Int32
cpu0-cpubusy	Description: The percentage of time that CPU 0 was busy Type: Gauge	Float
cpu0-cpuidle	Description: The percentage of time that CPU 0 was idle Type: Gauge	Float
cpu0-numproc	Description: The number of processes running on CPU 0 Type: Gauge	Int32
cpu0-memused	Description: The amount of memory used on CPU 0 Type: Gauge	Int32
cpu0-memtotal	Description: The total amount of memory available for CPU 0 Type: Gauge	Int32
cpu0-name	Description: A string designating the name of CPU 0. Type: Information	String
cpu0-cpuused-user	Description: The percentage of resources on CPU 0 used in user session processing. Type: Gauge	Float
cpu0-cpuused-sys	Description: The percentage of resources on CPU 0 used by system tasks. Type: Gauge	Float
cpu0-cpuused-io	Description: The percentage of resources on CPU 0 used by input/output functions. Type: Gauge	Float
cpu0-cpuused-irq	Description: The percentage of resources on CPU 0 used by interrupt requests. Type: Gauge	Float
cpu0-cpuused-idle	Description: The percentage of resources on CPU 0 that are idle. Type: Gauge	Float

Variables	Description	Data Type
cpu1-cpubusy	Description: The percentage of time that CPU 1 was busy Type: Gauge	Float
cpu1-cpuidle	Description: The percentage of time that CPU 1 was idle Type: Gauge	Float
cpu1-numproc	Description: The number of processes running on CPU 1 Type: Gauge	Int32
cpu1-memused	Description: The amount of memory used on CPU 1 Type: Gauge	Int32
cpu1-memtotal	Description: The total amount of memory available for CPU 2 Type: Gauge	Int32
cpu1-name	Description: A string designating the name of CPU 1. Type: Information	String
cpu1-cpuused-user	Description: The percentage of resources on CPU 1 used in user session processing. Type: Gauge	Float
cpu1-cpuused-sys	Description: The percentage of resources on CPU 1 used by system tasks. Type: Gauge	Float
cpu1-cpuused-io	Description: The percentage of resources on CPU 1 used by input/output functions. Type: Gauge	Float
cpu1-cpuused-irq	Description: The percentage of resources on CPU 1 used by interrupt requests. Type: Gauge	Float
cpu1-cpuused-idle	Description: The percentage of resources on CPU 1 that are idle. Type: Gauge	Float
cpu2-cpubusy	Description: The percentage of time that CPU 2 was busy Type: Gauge	Float
cpu2-cpuidle	Description: The percentage of time that CPU 2 was idle Type: Gauge	Float
cpu2-numproc	Description: The number of processes running on CPU 2 Type: Gauge	Int32
cpu2-memused	Description: The amount of memory used on CPU 2 Type: Gauge	Int32
cpu2-memtotal	Description: The total amount of memory available for CPU 2 Type: Gauge	Int32
cpu2-name	Description: A string designating the name of CPU 2. Type: Information	String
cpu2-cpuused-user	Description: The percentage of resources on CPU 2 used in user session processing. Type: Gauge	Float
cpu2-cpuused-sys	Description: The percentage of resources on CPU 2 used by system tasks. Type: Gauge	Float

Variables	Description	Data Type
cpu2-cpuused-io	Description: The percentage of resources on CPU 2 used by input/output functions. Type: Gauge	Float
cpu2-cpuused-irq	Description: The percentage of resources on CPU 2 used by interrupt requests. Type: Gauge	Float
cpu2-cpuused-idle	Description: The percentage of resources on CPU 2 that are idle. Type: Gauge	Float
cpu3-cpubusy	Description: The percentage of time that CPU 3 was busy Type: Gauge	Float
cpu3-cpuidle	Description: The percentage of time that CPU 3 was idle Type: Gauge	Float
cpu3-numproc	Description: The number of processes running on CPU 3 Type: Gauge	Int32
cpu3-memused	Description: The amount of memory used on CPU 3 Type: Gauge	Int32
cpu3-memtotal	Description: The total amount of memory available for CPU 3 Type: Gauge	Int32
cpu3-name	Description: A string designating the name of CPU 3. Type: Information	String
cpu3-cpuused-user	Description: The percentage of resources on CPU 3 used in user session processing. Type: Gauge	Float
cpu3-cpuused-sys	Description: The percentage of resources on CPU 3 used by system tasks. Type: Gauge	Float
cpu3-cpuused-io	Description: The percentage of resources on CPU 3 used by input/output functions. Type: Gauge	Float
cpu3-cpuused-irq	Description: The percentage of resources on CPU 3 used by interrupt requests. Type: Gauge	Float
cpu3-cpuused-idle	Description: The percentage of resources on CPU 3 that are idle. Type: Gauge	Float
15avg-cpubusy	Average CPU usage across all CPUs on this card over a 15-minute period Type: Gauge	Float
15peak-cpubusy	Description: Peak CPU usage across all CPUs on this card. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
5avg-cpubusy	Description: Average CPU usage across all CPUs on this card over a 5-minute period Type: Gauge	Float
5peak-cpubusy	Description: Peak CPU usage across all CPUs on this card. This is the peak 1-minute average over the last 5 minutes. Type: Gauge	Float

Variables	Description	Data Type
1avg-cpubusy	Description: Average CPU usage across all CPUs on this card over a 1-minute period Type: Gauge	Float
15avg-memused	Description: Average memory usage across all CPUs on this card over a 15-minute period Type: Gauge	Float
15peak-memused	Description: Peak memory usage across all CPUs on this card. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
5avg-memused	Description: Average memory usage across all CPUs on this card over a 5-minute period Type: Gauge	Float
5peak-memused	Description: Peak memory usage across all CPUs on this card. This is the peak 1-minute average over the last 5-minutes. Type: Gauge	Float
1avg-memused	Description: Average memory usage across all CPUs on this card over a 1-minute period. Type: Gauge	Float
cpu0-15avg-cpubusy	Description: Average CPU usage for CPU 0 on this card over a 15-minute period Type: Gauge	Float
cpu0-15peak-cpubusy	Description: Peak CPU usage for CPU 0. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
cpu0-5avg-cpubusy	Description: Average CPU usage for CPU 0 on this card over a 5-minute period Type: Gauge	Float
cpu0-5peak-cpubusy	Description: Peak CPU usage for CPU 0. This is the peak 1-minute average over the last 5 minutes. Type: Gauge	Float
cpu0-1avg-cpubusy	Description: Average CPU usage for CPU 0 on this card over a 1-minute period Type: Gauge	Float
cpu0-15avg-memused	Description: Average memory usage for CPU 0 over a 15-minute period Type: Gauge	Float
cpu0-15peak-memused	Description: Peak memory usage for CPU 0. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
cpu0-5avg-memused	Description: Average memory usage for CPU 0 over a 5-minute period Type: Gauge	Float
cpu0-5peak-memused	Description: Peak memory usage for CPU 0. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
cpu0-1avg-memused	Description: Average memory usage for CPU 0 over a 1-minute period Type: Gauge	Float
cpu1-15avg-cpubusy	Description: Average CPU usage for CPU 1 on this card over a 15-minute period Type: Gauge	Float

Common Syntax Options

Variables	Description	Data Type
cpu1-15peak-cpubusy	Description: Peak CPU usage for CPU 1. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
cpu1-5avg-cpubusy	Description: Average CPU usage for CPU 1 on this card over a 5-minute period Type: Gauge	Float
cpu1-5peak-cpubusy	Description: Peak CPU usage for CPU 1. This is the peak 1-minute average over the last 5 minutes. Type: Gauge	Float
cpu1-1avg-cpubusy	Description: Average CPU usage for CPU 1 on this card over a 1-minute period Type: Gauge	Float
cpu1-15avg-memused	Description: Average memory usage for CPU 1 over a 15-minute period Type: Gauge	Float
cpu1-15peak-memused	Description: Peak memory usage for CPU 1. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
cpu1-5avg-memused	Description: Average memory usage for CPU 1 over a 5-minute period Type: Gauge	Float
cpu1-5peak-memused	Description: Peak memory usage for CPU 1. This is the peak 1-minute average over the last 5 minutes. Type: Gauge	Float
cpu1-1avg-memused	Average memory usage for CPU 1 over a 1-minute period Type: Gauge	Float
cpu2-15avg-cpubusy	Description: Average CPU usage for CPU 2 on this card over a 15-minute period Type: Gauge	Float
cpu2-15peak-cpubusy	Description: Peak CPU usage for CPU 2 This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
cpu2-5avg-cpubusy	Description: Average CPU usage for CPU 2 on this card over a 5-minute period Type: Gauge	Float
cpu2-5peak-cpubusy	Description: Peak CPU usage for CPU 2. This is the peak 1-minute average over the last 5 minutes. Type: Gauge	Float
cpu2-1avg-cpubusy	Description: Average CPU usage for CPU 2 on this card over a -minute period Type: Gauge	Float
cpu2-15avg-memused	Description: Average memory usage for CPU 2 over a 15-minute period Type: Gauge	Float
cpu2-15peak-memused	Description: Peak memory usage for CPU 2. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float

Variables	Description	Data Type
cpu2-5avg-memused	Description: Average memory usage for CPU 2 over a 5-minute period Type: Gauge	Float
cpu2-5peak-memused	Description: Peak memory usage for CPU 2. This is the peak 1-minute average over the last 5 minutes. Type: Gauge	Float
cpu2-1avg-memused	Description: Average memory usage for CPU 2 over a 1-minute period Type: Gauge	Float
cpu3-15avg-cpubusy	Description: Average CPU usage for CPU 3 on this card over a 15-minute period Type: Gauge	Float
cpu3-15peak-cpubusy	Description: Peak CPU usage for CPU 3. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
cpu3-5avg-cpubusy	Description: Average CPU usage for CPU 3 on this card over a 5-minute period Type: Gauge	Float
cpu3-5peak-cpubusy	Description: Peak CPU usage for CPU 3. This is the peak 1-minute average over the last 5 minutes. Type: Gauge	Float
cpu3-1avg-cpubusy	Description: Average CPU usage for CPU 3 on this card over a 1-minute period Type: Gauge	Float
cpu3-15avg-memused	Description: Average memory usage for CPU 3 over a 5 minute period Type: Gauge	Float
cpu3-15peak-memused	Description: Peak memory usage for CPU 3. This is the peak 1-minute average over the last 15 minutes. Type: Gauge	Float
cpu3-5avg-memused	Description: Average memory usage for CPU 3 over a 15-minute period Type: Gauge	Float
cpu3-5peak-memused	Description: Peak memory usage for CPU 3. This is the peak 1-minute average over the last 5 minutes. Type: Gauge	Float
cpu3-1avg-memused	Description: Average memory usage for CPU 3 over a 1-minute period Type: Gauge	Float
task-sessmgr-num	Description: Total number of active sessmgr tasks across all CPUs on this card. Type: Gauge	Int32
task-sessmgr-avgcpu	Description: Average percentage of CPU utilization of all active sessmgr tasks across all CPUs on this card. Type: Gauge	Float
task-sessmgr-avgmem	Description: Average percentage of allocated memory utilization of all active sessmgr tasks across all CPUs on this card. Type: Gauge	Float

■ Common Syntax Options

Variables	Description	Data Type
task-sessmgr-maxcpu	Description: Maximum percentage of CPU utilization of the busiest sessmgr task across all CPUs on this card. Type: Gauge	Float
task-sessmgr-maxmem	Description: Maximum percentage of allocated memory utilization of the peak sessmgr task across all CPUs on this card. Type: Gauge	Float
task-a1l1mgr-num	Description: Total number of active a1l1mgr tasks across all CPUs on this card. Type: Gauge	Int32
task-a1l1mgr-maxcpu	Description: Maximum percentage of CPU utilization of the busiest a1l1mgr task across all CPUs on this card. Type: Gauge	Float
task-a1l1mgr-maxmem	Description: Maximum percentage of allocated memory utilization of the peak a1l1mgr task across all CPUs on this card. Type: Gauge	Float
task-l2tpmgr-num	Description: Total number of active l2tpmgr tasks across all CPUs on this card. Type: Gauge	Int32
task-l2tpmgr-maxcpu	Description: Maximum percentage of CPU utilization of the busiest l2tpmgr task across all CPUs on this card. Type: Gauge	Float
task-l2tpmgr-maxmem	Description: Maximum percentage of allocated memory utilization of the peak l2tpmgr task across all CPUs on this card. Type: Gauge	Float
task-famgr-num	Description: Total number of active famgr tasks across all CPUs on this card. Type: Gauge	Int32
task-famgr-maxcpu	Description: Maximum percentage of CPU utilization of the busiest famgr task across all CPUs on this card. Type: Gauge	Float
task-famgr-maxmem	Description: Maximum percentage of allocated memory utilization of the peak famgr task across all CPUs on this card. Type: Gauge	Float
task-hamgr-num	Description: Total number of active hamgr tasks across all CPUs on this card. Type: Gauge	Int32
task-hamgr-maxcpu	Description: Maximum percentage of CPU utilization of the busiest hamgr task across all CPUs on this card. Type: Gauge	Float
task-hamgr-maxmem	Description: Maximum percentage of allocated memory utilization of the peak hamgr task across all CPUs on this card. Type: Gauge	Float
task-acsmgr-num	Description: Total number of active acsmgr tasks across all CPUs on this card. Type: Gauge	Int32

Variables	Description	Data Type
task-acsmgr-avgcpu	Description: Average percentage of CPU utilization of all active acsmgr tasks across all CPUs on this card. Type: Gauge	Float
task-acsmgr-avgmem	Description: Average percentage of allocated memory utilization of all active acsmgr tasks across all CPUs on this card. Type: Gauge	Float
task-acsmgr-maxcpu	Description: Maximum percentage of CPU utilization of the busiest acsmgr task across all CPUs on this card. Type: Gauge	Float
task-acsmgr-maxmem	Description: Maximum percentage of allocated memory utilization of the peak acsmgr task across all CPUs on this card. Type: Gauge	Float
task-vpnmgr-num	Description: Total number of active vpnmgr tasks across all CPUs on this card. Type: Gauge	Int32
task-vpnmgr-maxcpu	Description: Maximum percentage of CPU utilization of the busiest vpnmgr task across all CPUs on this card. Type: Gauge	Float
task-vpnmgr-maxmem	Description: Maximum percentage of allocated memory utilization of the peak vpnmgr task across all CPUs on this card. Type: Gauge	Float
npuutil-now	Description: NPU utilization at this moment. Type: Gauge	Int32
npuutil-5minave	Description: Average NPU utilization over a 5-minute period. Type: Gauge	Int32
npuutil-15minave	Description: Average NPU utilization over a 15-minute period. Type: Gauge	Int32
npuutil-rxpkts-5secave	Description: Average NPU utilization while receiving packets over a 5-second period. Type: Gauge	Float
npuutil-rxbytes-5secave	Description: Average NPU utilization while receiving bytes over a 5-second period. Type: Gauge	Float
npuutil-txpkts-5secave	Description: Average NPU utilization while transmitting packets over a 5-second period. Type: Gauge	Float
npuutil-txbytes-5secave	Description: Average NPU utilization while transmitting bytes over a 5-second period. Type: Gauge	Float
npuutil-rxpkts-5minave	Description: Average NPU utilization while receiving packets over a 5-minute period. Type: Gauge	Float
npuutil-rxbytes-5minave	Description: Average NPU utilization while receiving bytes over a 5-minute period. Type: Gauge	Float
npuutil-txpkts-5minave	Description: Average NPU utilization while transmitting packets over a 5-minute period. Type: Gauge	Float

Variables	Description	Data Type
npuutil-txbytes-5minave	Description: Average NPU utilization while transmitting bytes over a 5-minute period. Type: Gauge	Float
npuutil-rxpkts-15minave	Description: Average NPU utilization while receiving packets over a 15-minute period. Type: Gauge	Float
npuutil-rxbytes-15minave	Description: Average NPU utilization while receiving bytes over a 15-minute period Type: Gauge	Float
npuutil-txpkts-15minave	Description: Average NPU utilization while transmitting packets over a 15-minute period. Type: Gauge	Float
npuutil-txbytes-15minave	Description: Average NPU utilization while transmitting bytes over a 15-minute period. Type: Gauge	Float

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 9

Closed R-P Schema Statistics

The Closed R-P schema provides operational statistics that can be used for monitoring and troubleshooting the following products: PDSN

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 9. Bulk Statistic Variables in the Closed R-P Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Common Syntax Options

Variables	Description	Data Type
vpnname	Description: The name of the context configured on the system that is currently facilitating the Closed R-P PDSN service. This is a key variable.	String
vpnid	Description: The identification number of the context configured on the system that is currently facilitating the Closed R-P PDSN service. This is an internal reference number. This is a key variable.	Int32
servname	Description: Displays the name of the Closed R-P PDSN service for which the statistics are displayed. This is a key variable.	String
tun-conn-attempt	Description: This proprietary counter indicates the total number of tunnel connection attempts. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-conn-success	Description: This proprietary counter indicates the total number of successful tunnel connections Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-conn-fail	Description: This proprietary counter indicates the total number of failed tunnel connections. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-conn-curactive	Description: This proprietary counter indicates the total number of currently active tunnel connections. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-attempts	Description: This proprietary counter indicates the total number of session connection attempts. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-successful	Description: This proprietary counter indicates the total number of successful session connections. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-failed	Description: This proprietary counter indicates the total number of failed session connections. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-curactive	Description: This proprietary counter indicates the total number of currently active session connections. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	int2
sess-intrapdsnho-attempt	Description: This proprietary counter indicates the total number of Intra-PDSN Hand-Offs connection attempts Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
sess-intrapdsnho-success	Description: This proprietary counter indicates the total number of successful Intra-PDSN Hand-Offs connections. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-intrapdsnho-failed	Description: This proprietary counter indicates the total number of failed Intra-PDSN Hand-Offs connections. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-interpdsnho-attempt	Description: This proprietary counter indicates the total number of Inter-PDSN Hand-Offs connection attempts. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-malformed	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to malformed packets. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-ctrlfield	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to control field errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-pkflen	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to packet length errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-avplen	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to AVP length errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-protover	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to protocol version errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-md5	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to MD5 errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-invattr	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to invalid attribute errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-unkattr	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to unknown attribute errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
recv-err-invssid	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to invalid session ID errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-invstate	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to invalid state errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-unkmsg	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to unknown message errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-unmatchpktlen	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to unmatched packet length errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
recv-err-InvTunID	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to invalid tunnel length errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-genclear	Description: This proprietary counter indicates the total number of tunnels cleared normally. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-ctrlconnexists	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to a pre-existing control connection. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-unauth	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to unauthorized errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-badproto	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to bad protocol errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-reqshutdown	Description: This proprietary counter indicates the total number of tunnel disconnects experienced due to requester shutdown. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-statemacherr	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to state machine errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
tun-badlen	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to wrong length errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-oor	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to out-of-range errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-noresource	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to insufficient resources. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-vendspec	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to vendor-specific errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-tryanotherlns	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced resulting in “Try Another LNS” message generation. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-unkavp	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to unknown AVP with M-bit errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-ipsecdisc	Description: This proprietary counter indicates the total number of tunnel disconnects experienced due to IPSEC. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-ipsecfail	Description: This proprietary counter indicates the total number of tunnel failures experienced due to IPSEC. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-license	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to license exceeded errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-newcallpoldisc	Description: This proprietary counter indicates the total number of tunnel disconnects experienced due to new call policies. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-maxretry	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to the maximum number of retries being exceeded. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
tun-syslimit	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to reaching the system tunnel limit. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
tun-miscerr	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to miscellaneous errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-nogeneral	Description: This proprietary counter indicates the total number of sessions for which there were no general errors experienced. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-admin	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to administrative reasons. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-lossofcarr	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to loss of carrier. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-remoteadmin	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to remote administrative reasons. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-nofactemp	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to temporary no facility available errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-nofacperm	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to permanent no facility available errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-invdest	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to invalid destination errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-nocarrier	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due no carrier being detected. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-busysig	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to receipt of a busy signal. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
sess-nodialtime	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to receipt of no dial tone. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-lactimeout	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to LAC timeout. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-noframing	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to no appropriate framing. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-noctrlconn	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to no control connection existing. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-badlen	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to wrong length errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-oor	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to out-of-range errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-noresource	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to insufficient resources. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-invsessid	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to an invalid session ID. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-vendspec	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to vendor specific errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-tryanotherlns	Description: This proprietary counter indicates the total number of session disconnects/failures experienced resulting in “Try Another LNS” message generation. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-unkavp	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to unknown AVP with M-bit errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
sess-maxtunnel	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to reaching the maximum tunnel limit. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-ipsecfail	Description: This proprietary counter indicates the total number of session failures experienced due to IPSEC. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-ipsecdisc	Description: This proprietary counter indicates the total number of session disconnects experienced due to IPSEC. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-newcallpoldisc	Description: This proprietary counter indicates the total number of session disconnects experienced due to new call policies. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-license	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to license exceeded errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-servmismatch	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to service mismatch errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-miscerr	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to miscellaneous errors. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-hocomplete	Description: This proprietary counter indicates the total number of session disconnects experienced due to handoff completions. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-invho	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to invalid handoffs. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
sess-duplssess	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to duplicate sessions. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
ttlprepaid	Description: This proprietary counter indicates the total number of Prepaid calls facilitated by the service. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
curprepaid	Description: This proprietary counter indicates the total number of Prepaid calls currently being facilitated by the service. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
ttlonlineauthsucc	Description: This proprietary counter indicates the total number of successful Online Authentications for the service. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
ttlonlineauthfail	Description: This proprietary counter indicates the total number of successful Online Authentications for the service. Availability: per Closed-RP PDSN service, per PCF, per session Type: Counter	Int32
 IMPORTANT: For information on statistics that are common to all schema see the <i>Statistics and Counters Overview</i> chapter.		

Chapter 10

Context Schema Statistics

The Context schema provides operational statistics that can be used for monitoring and troubleshooting the following products: All

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 10. Bulk Statistic Variables in the Context Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	Description: Name of the VPN context. This is a key variable. Type: Information	String
vpnid	Description: Identifier for VPN context. This is a key variable. Type: Information	Int32
sfw-total-rxpackets	Description: Total number of packets received by the Stateful Firewall in-line service. Triggers: Increments when a packet is received by the Stateful Firewall in-line service. Availability: Per Active Charging Service Type: Counter	Int64
sfw-total-rxbytes	Description: Total number of bytes received by the Stateful Firewall in-line service. Triggers: Increments when a packet having layload is received by the Stateful Firewall in-line service. Availability: Per Active Charging Service Type: Counter	Int64
sfw-total-txpackets	Description: Total number of packets transmitted by the Stateful Firewall in-line service. Triggers: Increments when a packet is sent by the Stateful Firewall in-line service. Availability: Per Active Charging Service Type: Counter	Int64
sfw-total-txbytes	Description: Total number of bytes transmitted by the Stateful Firewall in-line service. Triggers: Increments when a packet having layload is forwarded by the Stateful Firewall in-line service. Availability: Per Active Charging Service Type: Counter	Int64
sfw-total-injectedpkts	Description: Total number of packets injected by the Stateful Firewall in-line service. Triggers: Increments when a Firewall module creates and sends packets like RST. Availability: Per Active Charging Service Type: Counter	Int64
sfw-total-injectedbytes	Description: Total number of bytes injected by the Stateful Firewall in-line service. Triggers: Increments when a Firewall module creates and sends packets like RST with data. Availability: Per Active Charging Service Type: Counter	Int64
sfw-dnlnk-dropkts	Description: Total number of packets dropped by the Stateful Firewall in-line service in downlink direction. Triggers: Increments when Firewall drops a downlink packet due to any reason. Availability: Per Active Charging Service Type: Counter	Int64

Variables	Description	Data Type
sfw-dnlnk-dropbytes	Description: Total number of bytes dropped by the Stateful Firewall in-line service in downlink direction. Triggers: Increments when Firewall drops a downlink packet with data due to any reason. Availability: Per Active Charging Service Type: Counter	Int64
sfw-uplnk-droppkts	Description: Total number of packets dropped by the Stateful Firewall in-line service in uplink direction. Triggers: Increments when Firewall drops an uplink packet due to any reason. Availability: Per Active Charging Service Type: Counter	Int64
sfw-uplnk-dropbytes	Description: Total number of bytes dropped by the Stateful Firewall in-line service in uplink direction. Triggers: Increments when Firewall drops an uplink packet with data due to any reason. Availability: Per Active Charging Service Type: Counter	Int64
sfw-total-malpackets	Description: Total number of invalid packets received by the Stateful Firewall in-line service. Triggers: Increments when any packet is malformed and dropped by Firewall. Availability: Per Active Charging Service Type: Counter	Int64
sfw-ip-discardpackets	Description: Total number of IP packets discarded by the Stateful Firewall in-line service. Triggers: Increments when any IP packet is discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-ip-malpackets	Description: Total number of invalid IP packets received by the Stateful Firewall in-line service. Triggers: Increments when any IP packet is malformed and discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-icmp-discardpackets	Description: Total number of invalid ICMP packets discarded by the Stateful Firewall in-line service. Triggers: Increments when any ICMP packet is discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-icmp-malpackets	Description: Total number of invalid ICMP packets received by the Stateful Firewall in-line service. Triggers: Increments when any ICMP packet is malformed and discarded. Availability: Per Active Charging Service Type: Counter	Int64

Variables	Description	Data Type
sfw-tcp-discardpackets	Description: Total number of invalid TCP packets discarded by the Stateful Firewall in-line service. Triggers: Increments when any TCP packet is discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-tcp-malpackets	Description: Total number of invalid TCP packets received by the Stateful Firewall in-line service. Triggers: Increments when any TCP packet is malformed and discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-udp-discardpackets	Description: Total number of invalid UDP packets discarded by the Stateful Firewall in-line service. Triggers: Increments when any UDP packet is discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-udp-malpackets	Description: Total number of invalid UDP packets received by the Stateful Firewall in-line service. Triggers: Increments when any UDP packet is malformed and discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-ipv6-discardpackets	Description: Total number of IPv6 packets discarded by the Stateful Firewall in-line service. Triggers: Increments when any IPv6 packet is discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-ipv6-malpackets	Description: Total number of malformed IPv6 packets identified by the Stateful Firewall in-line service. Triggers: Increments when any IPv6 packet is malformed and discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-icmpv6-discardpackets	Description: Total number of ICMPv6 packets discarded by the Stateful Firewall in-line service. Triggers: Increments when any ICMPv6 packet is discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-icmpv6-malpackets	Description: Total number of malformed ICMPv6 packets identified by the Stateful Firewall in-line service. Triggers: Increments when any ICMPv6 packet is malformed and discarded. Availability: Per Active Charging Service Type: Counter	Int64
sfw-total-dosattacks	Description: Total number of DoS attacks detected by the Stateful Firewall in-line service. Triggers: Increments when a DOS attack is detected. Availability: Per Active Charging Service Type: Counter	Int64

Variables	Description	Data Type
sfw-total-flows	Description: Total number of flows processed by the Stateful Firewall in-line service. Triggers: Increments when a new flow is processed by Firewall. Availability: Per Active Charging Service Type: Counter	Int32
dns-local-unknown-atmpts	Description: Total number of local (resolved at system SESSMGR level) Unknown query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-local-a-atmpts	Description: Total number of local (resolved at system SESSMGR level) A (32-bit IPv4 address record) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-local-ns-atmpts	Description: Total number of local (resolved at system SESSMGR level) query attempts to Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-local-cname-atmpts	Description: Total number of local (resolved at system SESSMGR level) CNAME (Canonical Name Record) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-local-ptr-atmpts	Description: Total number of local (resolved at system SESSMGR level) PTR (Pointer Record) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-local-srv-atmpts	Description: Total number of local (resolved at system SESSMGR level) SRV (Service Locator) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-local-aaaa-atmpts	Description: Total number of local (resolved at system SESSMGR level) AAAA (128-bit IPv6 address record) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-local-naptr-atmpts	Description: Total number of local (resolved at system SESSMGR level) NAPTR (Naming Authority Pointer) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-local-unknown-succs	Description: Total number of local (resolved at system SESSMGR level) Unknown query successes. Availability: Per DNS Client Type: Counter	Int32
dns-local-a-succs	Description: Total number of local (resolved at system SESSMGR level) A (32-bit IPv4 address record) query successes. Availability: Per DNS Client Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
dns-local-ns-succs	Description: Total number of local (resolved at system SESSMGR level) query successes from Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-local-cname-succs	Description: Total number of local (resolved at system SESSMGR level) CNAME (Canonical Name Record) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-local-ptr-succs	Description: Total number of local (resolved at system SESSMGR level) PTR (Pointer Record) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-local-srv-succs	Description: Total number of local (resolved at system SESSMGR level) SRV (Service Locator) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-local-aaaa-succs	Description: Total number of local (resolved at system SESSMGR level) AAAA (128-bit IPv6 address record) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-local-naptr-succs	Description: Total number of local (resolved at system SESSMGR level) NAPTR (Naming Authority Pointer) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-local-unknown-fails	Description: Total number of local (resolved at system SESSMGR level) Unknown query failures. Availability: Per DNS Client Type: Counter	Int32
dns-local-a-fails	Description: Total number of local (resolved at system SESSMGR level) A (32-bit IPv4 address record) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-local-ns-fails	Description: Total number of local (resolved at system SESSMGR level) query failures from Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-local-cname-fails	Description: Total number of local (resolved at system SESSMGR level) CNAME (Canonical Name Record) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-local-ptr-fails	Description: Total number of local (resolved at system SESSMGR level) PTR (Pointer Record) query failures. Availability: Per DNS Client Type: Counter	Int32

Variables	Description	Data Type
dns-local-srv-fails	Description: Total number of local (resolved at system SESSMGR level) SRV (Service Locator) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-local-aaaa-fails	Description: Total number of local (resolved at system SESSMGR level) AAAA (128-bit IPv6 address record) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-local-naptr-fails	Description: Total number of local (resolved at system SESSMGR level) NAPTR (Naming Authority Pointer) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-local-total-queries	Description: Total number of domain name lookups cached in local (resolved at system SESSMGR level) location. Availability: Per DNS Client Type: Counter	Int32
dns-local-positive-cache-hits	Description: Total number of local (resolved at system SESSMGR level) hits with positive response. Availability: Per DNS Client Type: Counter	Int32
dns-local-negative-cache-hits	Description: Total number of local (resolved at system SESSMGR level) hits with negative response. Availability: Per DNS Client Type: Counter	Int32
dns-local-cache-hits-not-found	Description: Total number of hits which have no record in local (resolved at system SESSMGR level) cache memory. Availability: Per DNS Client Type: Counter	Int32
dns-central-unknown-atmpts	Description: Total number of central (resolved at system VPNMGR level) Unknown query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-central-a-atmpts	Description: Total number of central (resolved at system VPNMGR level) A (32-bit IPv4 address record) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-central-ns-atmpts	Description: Total number of central (resolved at system VPNMGR level) query attempts to Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-central-cname-atmpts	Description: Total number of central (resolved at system VPNMGR level) CNAME (Canonical Name Record) query attempts. Availability: Per DNS Client Type: Counter	Int32

Variables	Description	Data Type
dns-central-ptr-atmpts	Description: Total number of central (resolved at system VPNMGR level) PTR (Pointer Record) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-central-srv-atmpts	Description: Total number of central (resolved at system VPNMGR level) SRV (Service Locator) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-central-aaaa-atmpts	Description: Total number of central (resolved at system VPNMGR level) AAAA (128-bit IPv6 address record) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-central-naptr-atmpts	Description: Total number of central (resolved at system VPNMGR level) NAPTR (Naming Authority Pointer) query attempts. Availability: Per DNS Client Type: Counter	Int32
dns-central-unknown-succs	Description: Total number of central (resolved at system VPNMGR level) Unknown query successes. Availability: Per DNS Client Type: Counter	Int32
dns-central-a-succs	Description: Total number of central (resolved at system VPNMGR level) A (32-bit IPv4 address record) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-central-ns-succs	Description: Total number of central (resolved at system VPNMGR level) query successes from Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-central-cname-succs	Description: Total number of central (resolved at system VPNMGR level) CNAME (Canonical Name Record) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-central-ptr-succs	Description: Total number of central (resolved at system VPNMGR level) PTR (Pointer Record) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-central-srv-succs	Description: Total number of central (resolved at system VPNMGR level) SRV (Service Locator) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-central-aaaa-succs	Description: Total number of central (resolved at system VPNMGR level) AAAA (128-bit IPv6 address record) query successes. Availability: Per DNS Client Type: Counter	Int32

Variables	Description	Data Type
dns-central-naptr-succs	Description: Total number of central (resolved at system VPNMGR level) NAPTR (Naming Authority Pointer) query successes. Availability: Per DNS Client Type: Counter	Int32
dns-central-unknown-fails	Description: Total number of central (resolved at system VPNMGR level) Unknown query failures. Availability: Per DNS Client Type: Counter	Int32
dns-central-a-fails	Description: Total number of central (resolved at system VPNMGR level) A (32-bit IPv4 address record) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-central-ns-fails	Description: Total number of central (resolved at system VPNMGR level) query failures from Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-central-cname-fails	Description: Total number of central (resolved at system VPNMGR level) CNAME (Canonical Name Record) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-central-ptr-fails	Description: Total number of central (resolved at system VPNMGR level) PTR (Pointer Record) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-central-srv-fails	Description: Total number of central (resolved at system VPNMGR level) SRV (Service Locator) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-central-aaaa-fails	Description: Total number of central (resolved at system VPNMGR level) AAAA (128-bit IPv6 address record) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-central-naptr-fails	Description: Total number of central (resolved at system VPNMGR level) NAPTR (Naming Authority Pointer) query failures. Availability: Per DNS Client Type: Counter	Int32
dns-central-total-queries	Description: Total number of domain name lookups cached in central (resolved at system VPNMGR level) location. Availability: Per DNS Client Type: Counter	Int32
dns-central-positive-cache-hits	Description: Total number of central (resolved at system VPNMGR level) hits with positive response. Availability: Per DNS Client Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
dns-central-negative-cache-hits	Description: Total number of central (resolved at system VPNMGR level) hits with negative response. Availability: Per DNS Client Type: Counter	Int32
dns-central-cache-hits-not-found	Description: Total number of hits which have no record in central (resolved at system VPNMGR level) cache memory. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-unknown-atmpts	Description: Total number of Unknown query attempts resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-a-atmpts	Description: Total number of A (32-bit IPv4 address record) query attempts resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-ns-atmpts	Description: Total number of Name Server query attempts resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-cname-atmpts	Description: Total number of CNAME (Canonical Name Record) query attempts resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-ptr-atmpts	Description: Total number of PTR (Pointer Record) query attempts resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-srv-atmpts	Description: Total number of SRV (Service Locator) query attempts resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-aaaa-atmpts	Description: Total number of AAAA (128-bit IPv6 address record) query attempts resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-naptr-atmpts	Description: Total number of NAPTR (Naming Authority Pointer) query attempts resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-unknown-succs	Description: Total number of Unknown query successes resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32

Variables	Description	Data Type
dns-primary-ns-a-succs	Description: Total number of A (32-bit IPv4 address record) query successes resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-ns-succs	Description: Total number of Name Server query successes resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-cname-succs	Description: Total number of CNAME (Canonical Name Record) query successes resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-ptr-succs	Description: Total number of PTR (Pointer Record) query successes resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-srv-succs	Description: Total number of SRV (Service Locator) query successes resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-aaaa-succs	Description: Total number of AAAA (128-bit IPv6 address record) query successes resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-naptr-succs	Description: Total number of NAPTR (Naming Authority Pointer) query successes resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-unknown-fails	Description: Total number of Unknown query failures resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-a-fails	Description: Total number of A (32-bit IPv4 address record) query failures resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-ns-fails	Description: Total number of Name Server query failures resolved at external Primary Name Server. Type: Counter	Int32
dns-primary-ns-cname-fails	Description: Total number of CNAME (Canonical Name Record) query failures resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
dns-primary-ns-ptr-fails	Description: Total number of PTR (Pointer Record) query failures resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-srv-fails	Description: Total number of SRV (Service Locator) query failures resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-aaaa-fails	Description: Total number of AAAA (128-bit IPv6 address record) query failures resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-naptr-fails	Description: Total number of NAPTR (Naming Authority Pointer) query failures resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-rsp-rejected	Description: Total number of queries for a domain for which connection refused resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-query-timeouts	Description: Total number of query timeouts resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-primary-ns-domain-not-found	Description: Total number of queries where domain name not found resolved at external Primary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-unknown-atmpts	Description: Total number of Unknown query attempts resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-a-atmpts	Description: Total number of A (32-bit IPv4 address record) query attempts resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-ns-atmpts	Description: Total number of Name Server query attempts resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-cname-atmpts	Description: Total number of CNAME (Canonical Name Record) query attempts resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32

Variables	Description	Data Type
dns-secondary-ns-ptr-atmpts	Description: Total number of PTR (Pointer Record) query attempts resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-srv-atmpts	Description: Total number of SRV (Service Locator) query attempts resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-aaaa-atmpts	Description: Total number of AAAA (128-bit IPv6 address record) query attempts resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-naptr-atmpts	Description: Total number of NAPTR (Naming Authority Pointer) query attempts resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-unknown-succs	Description: Total number of Unknown query successes resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-a-succs	Description: Total number of A (32-bit IPv4 address record) query successes resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-ns-succs	Description: Total number of Name Server query successes resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-cname-succs	Description: Total number of CNAME (Canonical Name Record) query successes resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-ptr-succs	Description: Total number of PTR (Pointer Record) query successes resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-srv-succs	Description: Total number of SRV (Service Locator) query successes resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-aaaa-succs	Description: Total number of AAAA (128-bit IPv6 address record) query successes resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
dns-secondary-ns-naptr-succs	Description: Total number of NAPTR (Naming Authority Pointer) query successes resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-unknown-fails	Description: Total number of Unknown query failures resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	
dns-secondary-ns-a-fails	Description: Total number of A (32-bit IPv4 address record) query failures resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-ns-fails	Description: Total number of Name Server query failures resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	
dns-secondary-ns-cname-fails	Description: Total number of CNAME (Canonical Name Record) query failures resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	
dns-secondary-ns-ptr-fails	Description: Total number of PTR (Pointer Record) query failures resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	
dns-secondary-ns-srv-fails	Description: Total number of SRV (Service Locator) query failures resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-aaaa-fails	Description: Total number of AAAA (128-bit IPv6 address record) query failures resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-naptr-fails	Description: Total number of NAPTR (Naming Authority Pointer) query failures resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-rsp-rejected	Description: Total number of queries for a domain for which connection refused resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
dns-secondary-ns-query-timeouts	Description: Total number of query timeouts resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32

Variables	Description	Data Type
dns-secondary-ns-domain-not-found	Description: Total number of queries where domain name not found resolved at external Secondary Name Server. Availability: Per DNS Client Type: Counter	Int32
bgp-maxroute	Description: Maximum number of BGP routes. It is the sum of all the VRFs in a context. Availability: Per DNS Client Type: Information	Int32
bgp-totroute	Description: Total number of BGP routes. It is the sum of all the VRFs in a context. Availability: Per DNS Client Type: Information	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 11

CS-Network-RANAP Schema Statistics

The CS-Network-RANAP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 11. Bulk Statistic Variables in the CS-Network-RANAP Schema

Variables	Description	Data Type
-----------	-------------	-----------

■ Common Syntax Options

Variables	Description	Data Type
nwnname	Indicates the name of the Circuit Switch (CS) Network connected with specific HNB-GW on which statistics are collected or displayed. This is a key variable.	String
dest-pt-code	Indicates the destination point code in SS7 notation of MSC in core network connected with specific HNB-GW of which statistics are collected or displayed. This is a key variable.	String
initial-ue-tx	Indicates the total number of Initial UE message transmitted. Trigger: When Initial UE message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
dir-transfer-rx	Indicates the total number of Direct Transfer message received. Trigger: When Direct Transfer message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
dir-transfer-tx	Indicates the total number of Direct Transfer message transmitted. Trigger: When Direct Transfer message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reset-rx	Indicates the total number of Reset message received. Trigger: When Reset message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reset-tx	Indicates the total number of Reset message transmitted. Trigger: When Reset message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reset-ack-rx	Indicates the total number of Reset Ack message received. Trigger: When Reset Ack message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reset-ack-tx	Indicates the total number of Reset Ack message transmitted. Trigger: When Reset Ack message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reset-res-rx	Indicates the total number of Reset Resource message received. Trigger: When Reset Resource message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reset-res-tx	Indicates the total number of Reset Resource message transmitted. Trigger: When Reset Resource message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reset-res-ack-rx	Indicates the total number of Reset Resource Ack message received. Trigger: When Reset Resource Ack message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reset-res-ack-tx	Indicates the total number of Reset Resource Ack message transmitted. Trigger: When Reset Resource Ack message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
iu-rel-req-tx	Indicates the total number of Iu Release Request message transmitted. Trigger: When Iu Release Request message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
iu-rel-cmd-rx	Indicates the total number of Iu Release Command message received. Trigger: When Iu Release Command message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
iu-rel-comp-tx	Indicates the total number of Iu Release Complete message transmitted. Trigger: When Iu Release Complete message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
paging-req-rx	Indicates the total number of Paging Request message received. Trigger: When Paging Request message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rsp-tx	Indicates the total number of RAB Assignment Response message transmitted. Trigger: When RAB Assignment Response message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rsp-tx-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rsp-tx-total-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rsp-tx-rab-fail-local-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rsp-tx-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Release Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rsp-tx-total-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Release Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rsp-tx-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Release Fail (Local). Availability: Across all CS Networks.	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
rab-ass-rsp-tx-rab-que-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Queued. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-req-rx	Indicates the total number of RAB Assignment Request message is received by CS Network. Trigger: When RAB Assignment Request message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-req-rx-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message is received by CS Network for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by CS Network for RAB Setup/Modify. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-req-rx-rab-rel-rx	Indicates the total number of RAB Assignment Request message is received by CS Network for RAB Release. Trigger: When RAB Assignment Request message is received by CS Network for RAB Release. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rab-setup-mod-timer-exp	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify Timer Expire. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify Timer Expire. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rab-rel-timer-exp	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Release Timer Expire. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Release Timer Expire. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rab-setup-mod-rel-local-failure	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-local-fail-invalid-rab-id	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Radio Network Layer cause Invalid Rab Id. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Radio Network Layer cause Invalid Rab Id. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
rab-ass-local-fail-interact-with-othr-proc	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Radio Network Layer cause Interaction With Other Proc. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Radio Network Layer cause Interaction With Other Proc. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-local-fail-sig-trans-res-fail	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Transport Layer cause Sig Transport Resource Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Transport Layer cause Sig Transport Resource Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-local-fail-iu-conn-fail-to-estab	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Transport Layer cause Iu Transport Conn failed to Establish. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Transport Layer cause Iu Transport Conn failed to Establish. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-local-fail-trans-syn-err	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Transfer syntax error. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Transfer syntax error. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-local-fail-abs-syn-err-ign	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Abstract syntax error(Ignore). Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Abstract syntax error(Ignore). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-local-fail-semantic-err	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Semantic error. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Semantic error. Availability: Across all CS Networks.	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
rab-ass-local-fail-abs-syn-err-rej	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Abstract syntax error (Reject). Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Abstract syntax error (Reject). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-local-fail-msg-not-comp	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Msg not compatible with receiver state. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Msg not compatible with receiver state. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-local-fail-falsely-construct-msg	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Abstract syntax error (Falsely constructed msg). Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer cause Abstract syntax error (Falsely constructed msg). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-local-fail-no-res-avalable	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Miscellaneous cause No Resource Available. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Miscellaneous cause No Resource Available. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-rep-rx-local-fail-unspecified	Indicates the total number of RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Miscellaneous cause Unspecified. Trigger: When RAB Assignment Response message is transmitted by CS Network for RAB Setup/Modify/Release Local Failure with Miscellaneous cause Unspecified. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr-codec-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with AMR Codec for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by CS Network with AMR Codec for RAB Setup/Modify. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr-codec-rab-rel-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with AMR Codec for RAB Release. Trigger: When RAB Assignment Request message is received by CS Network with AMR Codec for RAB Release. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
rab-ass-amr-codec-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Setup/Modify Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr-codec-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Setup/Modify Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr-codec-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Setup/Modify Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr-codec-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Release Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr-codec-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Release Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr-codec-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Release Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr-codec-rab-que-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR Codec for RAB Queued. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr2-codec-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with AMR2 Codec for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by CS Network with AMR2 Codec for RAB Setup/Modify. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr2-codec-rab-rel-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with AMR2 Codec for RAB Release. Trigger: When RAB Assignment Request message is received by CS Network with AMR2 Codec for RAB Release. Availability: Across all CS Networks.	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
rab-ass-amr2-codec-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Setup/Modify Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr2-codec-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Setup/Modify Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr2-codec-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Setup/Modify Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr2-codec-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Release Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr2-codec-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Release Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr2-codec-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Release Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-amr2-codec-rab-que-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by CS Network with AMR2 Codec for RAB Queued. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-other-codec-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with Other Codec for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by CS Network with Other Codec for RAB Setup/Modify. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-other-codec-rab-rel-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with Other Codec for RAB Release. Trigger: When RAB Assignment Request message is received by CS Network with Other Codec for RAB Release. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
rab-ass-other-codec-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Setup/Modify Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-other-codec-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Setup/Modify Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-other-codec-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Setup/Modify Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-other-codec-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Release Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-other-codec-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Release Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-other-codec-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with Other Codec for RAB Release Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-other-codec-rab-que-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Other Codec Class for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by CS Network with Other Codec Class for RAB Queued. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-no-codec-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with No Codec for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by CS Network with No Codec for RAB Setup/Modify. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-no-codec-rab-rel-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with No Codec for RAB Release. Trigger: When RAB Assignment Request message is received by CS Network with No Codec for RAB Release. Availability: Across all CS Networks.	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
rab-ass-no-codec-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Setup/Modify Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-no-codec-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Setup/Modify Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-no-codec-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Setup/Modify Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-no-codec-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Release Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-no-codec-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Release Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-no-codec-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Release Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-no-codec-rab-que-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by CS Network with No Codec for RAB Queued. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-unkwn-codec-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with Unknown Codec for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by CS Network with Unknown Codec for RAB Setup/Modify. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-unkwn-codec-rab-rel-rx	Indicates the total number of RAB Assignment Request message is received by CS Network with Unknown Codec for RAB Release. Trigger: When RAB Assignment Request message is received by CS Network with Unknown Codec for RAB Release. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
rab-ass-unkwn-codec-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Setup/Modify Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-unkwn-codec-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Setup/Modify Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-unkwn-codec-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Setup/Modify Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-unkwn-codec-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Release Success. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-unkwn-codec-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Release Fail. Availability: Across all CS Networks.	Unsigned Int32
rab-ass-unkwn-codec-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Release Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
rab-ass-unkwn-codec-rab-que-tx	Indicates the total number of RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by CS Network with Unknown Codec for RAB Queued. Availability: Across all CS Networks.	Unsigned Int32
rab-time	Indicates the total duration in seconds when RAB was active in CS Network. Trigger: When RAB become inactive in CS Network. Availability: Across all CS Networks.	Unsigned Int64
reloc-req-rx	Indicates the total number of Relocation Request message is received by CS Network. Trigger: When Relocation Request message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-rx-rab-setup-rx	Indicates the total number of Relocation Request message is received by CS Network for RAB Setup. Trigger: When Relocation Request message is received by CS Network for RAB Setup. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
reloc-req-ack-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network. Trigger: When Relocation Request Ack message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-tx-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for RAB Setup Success. Trigger: When Relocation Request Ack is transmitted by CS Network for RAB Setup Success. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-tx-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for RAB Setup Fail. Trigger: When Relocation Request Ack is transmitted by CS Network for RAB Setup Fail. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-tx-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for RAB Setup Fail (Local). Trigger: When Relocation Request Ack is transmitted by CS Network for RAB Setup Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-invalid-rab-id	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Radio Network Layer cause Invalid Rab Id. Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Radio Network Layer cause Invalid Rab Id. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-interact-othr-proc	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Radio Network Layer cause Interaction With Other Proc. Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Radio Network Layer cause Interaction With Other Proc. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-sig-trans-res-fail	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Transport Layer cause Sig Transport Resource Fail. Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Transport Layer cause Sig Transport Resource Fail. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-iu-conn-fail-to-estab	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Transport Layer cause Iu Transport Conn failed to Establish. Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Transport Layer cause Iu Transport Conn failed to Establish. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
reloc-req-ack-local-fail-trans-syn-err	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Transfer syntax error. Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Transfer syntax error. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-abs-syn-err-ign	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Abstract syntax error(Ignore). Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Abstract syntax error(Ignore). Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-semantic-err	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Semantic error. Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Semantic error. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-abs-syn-err-rej	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Abstract syntax error (Reject). Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Abstract syntax error (Reject). Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-msg-not-comp	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Msg not compatible with receiver state. Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Msg not compatible with receiver state. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-falsely-construct-msg	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Abstract syntax error (Falsely constructed msg). Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Protocol Layer cause Abstract syntax error (Falsely constructed msg). Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-no-res-avalable	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Miscellaneous cause No Resource Available. Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Miscellaneous cause No Resource Available. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-ack-local-fail-undefined	Indicates the total number of Relocation Request Ack message is transmitted by CS Network for Local RAB Setup Failure with Miscellaneous cause Undefined. Trigger: When Relocation Request Ack is transmitted by CS Network for Local RAB Setup Failure with Miscellaneous cause Undefined. Availability: Across all CS Networks.	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
reloc-req-amr-codec-rab-setup-rx	Indicates the total number of Relocation Request message is received by CS Network with AMR Codec for RAB Setup. Trigger: When Relocation Request message is received by CS Network with AMR Codec for RAB Setup. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-amr-codec-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with AMR Codec for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by CS Network with AMR Codec for RAB Setup Success. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-amr-codec-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with AMR Codec for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by CS Network with AMR Codec for RAB Setup Fail. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-amr-codec-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with AMR Codec for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by CS Network with AMR Codec for RAB Setup Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
reloc-req-amr2-codec-rab-setup-rx	Indicates the total number of Relocation Request message is received by CS Network with AMR2 Codec for RAB Setup. Trigger: When Relocation Request message is received by CS Network with AMR2 Codec for RAB Setup. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-amr2-codec-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with AMR2 Codec for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by CS Network with AMR2 Codec for RAB Setup Success. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-amr2-codec-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with AMR2 Codec for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by CS Network with AMR2 Codec for RAB Setup Fail. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-amr2-codec-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with AMR2 Codec for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by CS Network with AMR2 Codec for RAB Setup Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
reloc-req-other-codec-rab-setup-rx	Indicates the total number of Relocation Request message is received by CS Network with Other Codec for RAB Setup. Trigger: When Relocation Request message is received by CS Network with Other Codec for RAB Setup. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
reloc-req-other-codec-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with Other Codec for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by CS Network with Other Codec for RAB Setup Success. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-other-codec-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with Other Codec for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by CS Network with Other Codec for RAB Setup Fail. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-other-codec-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with Other Codec for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by CS Network with Other Codec for RAB Setup Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
reloc-req-no-codec-rab-setup-rx	Indicates the total number of Relocation Request message is received by CS Network with No Codec for RAB Setup. Trigger: When Relocation Request message is received by CS Network with No Codec for RAB Setup. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-no-codec-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with No Codec for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by CS Network with No Codec for RAB Setup Success. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-no-codec-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with No Codec for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by CS Network with No Codec for RAB Setup Fail. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-no-codec-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with No Codec for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by CS Network with No Codec for RAB Setup Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
reloc-req-unkwn-codec-rab-setup-rx	Indicates the total number of Relocation Request message is received by CS Network with Unknown Codec for RAB Setup. Trigger: When Relocation Request message is received by CS Network with Unknown Codec for RAB Setup. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-unkwn-codec-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with Unknown Codec for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by CS Network with Unknown Codec for RAB Setup Success. Availability: Across all CS Networks.	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
reloc-req-unkwn-codec-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with Unknown Codec for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by CS Network with Unknown Codec for RAB Setup Fail. Availability: Across all CS Networks.	Unsigned Int32
reloc-req-unkwn-codec-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message is transmitted by CS Network with Unknown Codec for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by CS Network with Unknown Codec for RAB Setup Fail (Local). Availability: Across all CS Networks.	Unsigned Int32
reloc-detect-tx	Indicates the total number of Relocation Detect message is transmitted by CS Network. Trigger: When Relocation Detect message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reloc-comp-tx	Indicates the total number of Relocation Complete message is transmitted by CS Network. Trigger: When Relocation Complete message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
total-reloc-fail-tx	Indicates the total number of Relocation Failure message is transmitted by CS Network. Trigger: When Relocation Failure is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-local-tx	Indicates the total number of Relocation Failure message is transmitted by CS Network for Relocation Failure (Local). Trigger: When Relocation Failure is transmitted by CS Network for Relocation Failure (Local). Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-invalid-rab-id	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Radio Network Layer cause Invalid RAB Id. Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Radio Network Layer cause Invalid RAB Id. Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-interact-othr-proc	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Radio Network Layer Cause Interaction with other procedure.. Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Radio Network Layer Cause Interaction with other procedure.. Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-sig-trans-res-fail	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Transport Layer cause Sig Transport Resource Fail. Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Transport Layer cause Sig Transport Resource Fail. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
reloc-fail-tx-local-fail-iu-conn-fail-to-estab	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Transport Layer cause Iu Transport Conn failed to Establish. Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Transport Layer cause Iu Transport Conn failed to Establish. Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-trans-syn-err	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Protocol Layer cause Transfer syntax error. Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Protocol Layer cause Transfer syntax error. Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-abs-syn-err-ign	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Protocol Layer cause Abstract syntax error(Ignore). Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Protocol Layer cause Abstract syntax error(Ignore). Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-semantic-err	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Protocol Layer cause Semantic error. Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Protocol Layer cause Semantic error. Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-abs-syn-err-rej	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Protocol Layer cause Abstract syntax error (Reject). Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Protocol Layer cause Abstract syntax error (Reject). Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-msg-not-comp	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Protocol Layer cause Msg not compatible with receiver state. Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Protocol Layer cause Msg not compatible with receiver state. Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-falsely-construct-msg	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Protocol Layer cause Abstract syntax error (Falsely constructed msg). Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Protocol Layer cause Abstract syntax error (Falsely constructed msg). Availability: Across all CS Networks.	Unsigned Int32
reloc-fail-tx-local-fail-no-res-available	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Miscellaneous cause No Resource Available. Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Miscellaneous cause No Resource Available. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
reloc-fail-tx-local-fail-unspecified	Indicates the total number of Relocation Failure message received by CS Network for Local Relocation Failure with Miscellaneous cause Unspecified. Trigger: When Relocation Failure message is received by CS Network for Local Relocation Failure with Miscellaneous cause Unspecified. Availability: Across all CS Networks.	Unsigned Int32
reloc-reqd-tx	Indicates the total number of Relocation Required message is transmitted by CS Network. Trigger: When Relocation Required message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
fwd-srns-ctx-req-tx	Indicates the total number of Relocation Prep Failure message received by CS Network. Trigger: When Relocation Prep Failure message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
srns-ctx-req-rx	Indicates the total number of Fwd SRNS Context Request message is transmitted by CS Network. Trigger: When Fwd SRNS Context Request message is transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
srns-ctx-rsp-tx	Indicates the total number of Relocation Command message received by CS Network. Trigger: When Relocation Command message is received by CS Network. Availability: Across all CS Networks.	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 12

CS-Network-RTP Schema Statistics

The CS-Network-RTP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 12. Bulk Statistic Variables in the CS-Network-RTP Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
nwnname	Indicates the name of the Circuit Switch (CS) Network connected with specific HNB-GW on which statistics are collected or displayed. This is a key variable.	String
dest-pt-code	Indicates the destination point code in SS7 notation of MSC in core network connected with specific HNB-GW of which statistics are collected or displayed. This is a key variable.	String
rtp-uplink-pkts-tx	Indicates the total number of RTP Uplink Packets transmitted. Trigger: When RTP Uplink Packets are transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtp-uplink-byts-tx	Indicates the total number of RTP Uplink Bytes transmitted. Trigger: When RTP Uplink Bytes are transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtp-downlink-pkts-rx	Indicates the total number of RTP Downlink Packets received. Trigger: When RTP Downlink Packets are received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtp-downlink-byts-rx	Indicates the total number of RTP Downlink Bytes received. Trigger: When RTP Downlink Bytes are received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtp-downlink-pkts-dropped	Indicates the total number of RTP Downlink Packets dropped. Trigger: When RTP Downlink Packets are dropped by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtp-downlink-pkts-drop-rab_not-in_conn_state	Indicates the total number of RTP Downlink Packets dropped with cause RAB not in CONNETED state. Trigger: When RTP Downlink Packets are dropped by CS Network with cause RAB not in CONNETED state. Availability: Across all CS Networks.	Unsigned Int32
rtp-downlink-pkts-dropped-misc	Indicates the total number of RTP Downlink Packets dropped with cause Miscellaneous. Trigger: When RTP Downlink Packets are dropped by CS Network with cause Miscellaneous. Availability: Across all CS Networks.	Unsigned Int32
rtp-downlink-byts-dropped	Indicates the total number of RTP Downlink Bytes dropped. Trigger: When RTP Downlink Bytes are dropped by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtp-downlink-byts-drop-rab_not-in_conn_state	Indicates the total number of RTP Downlink Bytes dropped with cause RAB not in CONNETED state. Trigger: When RTP Downlink Bytes are dropped by CS Network with cause RAB not in CONNETED state. Availability: Across all CS Networks.	Unsigned Int32
rtp-downlink-byts-dropped-misc	Indicates the total number of RTP Downlink Bytes dropped with cause Miscellaneous. Trigger: When RTP Downlink Bytes are dropped by CS Network with cause Miscellaneous. Availability: Across all CS Networks.	Unsigned Int32

Variables	Description	Data Type
rtcp-uplink-pkts-tx	Indicates the total number of RTCP Uplink Packets transmitted. Trigger: When RTCP Uplink Packets are transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtcp-uplink-byts-tx	Indicates the total number of RTCP Uplink Bytes transmitted. Trigger: When RTCP Uplink Bytes are transmitted by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtcp-downlink-pkts-rx	Indicates the total number of RTCP Downlink Packets received. Trigger: When RTCP Downlink Packets are received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtcp-downlink-byts-rx	Indicates the total number of RTCP Downlink Bytes received. Trigger: When RTCP Downlink Bytes are received by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtcp-downlink-pkts-dropped	Indicates the total number of RTCP Downlink Packets dropped. Trigger: When RTCP Downlink Packets are dropped by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtcp-downlink-pkts-drop-rab_not-in_conn_state	Indicates the total number of RTCP Downlink Packets dropped with cause RAB not in CONNETED state. Trigger: When RTCP Downlink Packets are dropped by CS Network with cause RAB not in CONNETED state. Availability: Across all CS Networks.	Unsigned Int32
rtcp-downlink-pkts-dropped-misc	Indicates the total number of RTCP Downlink Packets dropped with cause Miscellaneous. Trigger: When RTCP Downlink Packets are dropped by CS Network with cause Miscellaneous. Availability: Across all CS Networks.	Unsigned Int32
rtcp-downlink-byts-dropped	Indicates the total number of RTCP Downlink Bytes dropped. Trigger: When RTCP Downlink Bytes are dropped by CS Network. Availability: Across all CS Networks.	Unsigned Int32
rtcp-downlink-byts-drop-rab_not-in_conn_state	Indicates the total number of RTCP Downlink Bytes dropped with cause RAB not in CONNETED state. Trigger: When RTCP Downlink Bytes are dropped by CS Network with cause RAB not in CONNETED state. Availability: Across all CS Networks.	Unsigned Int32
rtcp-downlink-byts-dropped-misc	Indicates the total number of RTCP Downlink Bytes dropped with cause Miscellaneous. Trigger: When RTCP Downlink Bytes are dropped by CS Network with cause Miscellaneous. Availability: Across all CS Networks.	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 13

CSCF Schema Statistics

The CSCF schema provides operational statistics that can be used for monitoring and troubleshooting the following products: SCM

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 13. Bulk Statistic Variables in the CSCF Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	VPN Name This is a key variable. Type: Information	String
vpnid	VPN ID This is a key variable. Type: Information	Int32
svcname	Service Name This is a key variable. Type: Information	String
svcid	Service ID This is a key variable. Type: Information	Int32
curregusers	Current Registered Users Type: Gauge	Int32
failedauth	Total number of Failed Authentications. Type: Counter	Int64
regexp	Total number of Registration Expires. Type: Counter	Int64
total-roaming-ue-regs	Total number of Registrations from Roaming UE. Type: Counter	Int64
total-roaming-ue-succ-regs	Total number of 200 OK Registrations from Roaming UE. Type: Counter	Int64
total-roaming-ue-fail-regs	Total number of Failed Registrations from Roaming UE. Type: Counter	Int64
total-roaming-ue-regs-403	Total number of 403 responses to Registration from Roaming UE. Type: Counter	Int64
total-roaming-ue-re-regs	Total number of Re-Registrations from Roaming UE. Type: Counter	Int64
total-roaming-ue-succ-re-regs	Total number of 200 OK Re-Registrations from Roaming UE. Type: Counter	Int64
total-roaming-ue-fail-re-regs	Total number of Failed Re-Registrations from Roaming UE. Type: Counter	Int64
total-roaming-ue-re-regs-403	Total number of 403 responses to Re-Registration from Roaming UE. Type: Counter	Int64
total-roaming-ue-de-regs	Total number of De-Registrations from Roaming UE. Type: Counter	Int64
total-roaming-ue-succ-de-regs	Total number of 200 OK De-Registrations from Roaming UE. Type: Counter	Int64

Variables	Description	Data Type
total-roaming-ue-fail-de-regs	Total number of Failed De-Registrations from Roaming UE. Type: Counter	Int64
total-roaming-ue-de-regs-403	Total number of 403 responses to De-Registration from Roaming UE. Type: Counter	Int64
de-regs-fromue	Total number of De-registrations from UE. Type: Counter	Int64
de-regs-fromnw	Total number of De-registrations from Network. Type: Counter	Int64
sec-regs	Total number of Secure Registrations. Type: Counter	Int64
fail-sec-regs	Total number of Failed Secure Registrations Type: Counter	Int64
emerg-regs	Total number of Emergency Registrations. Type: Counter	Int64
mo-call-succ-rate	Mobile Originating calls success rate. Type: Gauge	Float
mt-call-succ-rate	Mobile Terminating calls success rate. Type: Gauge	Float
mo-voice-call-succ-rate	Mobile Originating VOICE calls success rate. Type: Gauge	Float
mt-voice-call-succ-rate	Mobile Terminating VOICE calls success rate. Type: Gauge	Float
mo-video-call-succ-rate	Mobile Originating VIDEO calls success rate. Type: Gauge	Float
mt-video-call-succ-rate	Mobile Terminating VIDEO calls success rate. Type: Gauge	Float
callattrx	Total number of Call Attempts received. Type: Counter	Int64
callatttx	Total number of Call Attempts transmitted. Type: Counter	Int64
callsucrx	Total number of Call Success received. Type: Counter	Int64
callsuctx	Total number of Call Success transmitted. Type: Counter	Int64
callfailrx	Total number of Call Failures received. Type: Counter	Int64
callfailtx	Total number of Call Failures transmitted. Type: Counter	Int64

Variables	Description	Data Type
curscfsess	Total number of current CSCF Sessions. Type: Gauge	Int32
totalcscfsess	Total number of CSCF Sessions. Type: Counter	Int64
call-resp-3xxrx	Total number of Call 3xx Responses received. Type: Counter	Int64
call-resp-3xxtx	Total number of Call 3xx Responses transmitted. Type: Counter	Int64
call-resp-402rx	Total number of Call 402 Responses received. Type: Counter	Int64
call-resp-402tx	Total number of Call 402 Responses transmitted. Type: Counter	Int64
call-resp-403rx	Total number of Call 403 Responses received. Type: Counter	Int64
call-resp-403tx	Total number of Call 403 Responses transmitted. Type: Counter	Int64
call-resp-404rx	Total number of Call 404 Responses received. Type: Counter	Int64
call-resp-404tx	Total number of Call 404 Responses transmitted. Type: Counter	Int64
call-resp-407rx	Total number of Call 407 Responses received. Type: Counter	Int64
call-resp-407tx	Total number of Call 407 Responses transmitted. Type: Counter	Int64
call-resp-408rx	Total number of Call 408 Responses received. Type: Counter	Int64
call-resp-408tx	Total number of Call 408 Responses transmitted. Type: Counter	Int64
call-resp-420rx	Total number of Call 420 Responses received. Type: Counter	Int64
call-resp-420tx	Total number of Call 420 Responses transmitted. Type: Counter	Int64
call-resp-421rx	Total number of Call 421 Responses received. Type: Counter	Int64
call-resp-421tx	Total number of Call 421 Responses transmitted. Type: Counter	Int64
call-resp-480rx	Total number of Call 480 Responses received. Type: Counter	Int64

■ Common Syntax Options

Variables	Description	Data Type
call-resp-480tx	Total number of Call 480 Responses transmitted. Type: Counter	Int64
call-resp-486rx	Total number of Call 486 Responses received. Type: Counter	Int64
call-resp-486tx	Total number of Call 486 Responses transmitted. Type: Counter	Int64
call-resp-487rx	Total number of Call 487 Responses received. Type: Counter	Int64
call-resp-487tx	Total number of Call 487 Responses transmitted. Type: Counter	Int64
call-resp-488rx	Total number of Call 488 Responses received. Type: Counter	Int64
call-resp-488tx	Total number of Call 488 Responses transmitted. Type: Counter	Int64
call-resp-4xxrx	Total number of Call 4xx Responses received. Type: Counter	Int64
call-resp-4xxtx	Total number of Call 4xx Responses transmitted. Type: Counter	Int64
call-resp-500rx	Total number of Call 500 Responses received. Type: Counter	Int64
call-resp-500tx	Total number of Call 500 Responses transmitted. Type: Counter	Int64
call-resp-503rx	Total number of Call 503 Responses received. Type: Counter	Int64
call-resp-503tx	Total number of Call 503 Responses transmitted. Type: Counter	Int64
call-resp-5xxrx	Total number of Call 5xx Responses received. Type: Counter	Int64
call-resp-5xxtx	Total number of Call 5xx Responses transmitted. Type: Counter	Int64
call-resp-6xxrx	Total number of Call 6xx Responses received. Type: Counter	Int64
call-resp-6xxtx	Total number of Call 6xx Responses transmitted. Type: Counter	Int64
call-rel-atrx	Total number of Call Release Attempts received. Type: Counter	Int64
call-rel-attx	Total number of Call Release Attempts transmitted. Type: Counter	Int64

Variables	Description	Data Type
call-rel-succrx	Total number of Call Release Success received. Type: Counter	Int64
call-rel-succtx	Total number of Call Release Success transmitted. Type: Counter	Int64
call-rel-failrx	Total number of Call Release Failures received. Type: Counter	Int64
call-rel-failtx	Total number of Call Release Failures transmitted. Type: Counter	Int64
reg-atrx	Total number of Registration Attempts received. Type: Counter	Int64
reg-attx	Total number of Registration Attempts transmitted. Type: Counter	Int64
reg-succrx	Total number of Registration Successes received. Type: Counter	Int64
reg-succtx	Total number of Registration Successes transmitted. Type: Counter	Int64
reg-failrx	Total number of Registration Failures received. Type: Counter	Int64
reg-failtx	Total number of Registration Failures transmitted. Type: Counter	Int64
reg-resp-401rx	Total number of Registration 401 Responses received. Type: Counter	Int64
reg-resp-401tx	Total number of Registration 401 Responses transmitted. Type: Counter	Int64
reg-resp-403rx	Total number of Registration 403 Responses received. Type: Counter	Int64
reg-resp-403tx	Total number of Registration 403 Responses transmitted. Type: Counter	Int64
reg-resp-404rx	Total number of Registration 404 Responses received. Type: Counter	Int64
reg-resp-404tx	Total number of Registration 404 Responses transmitted. Type: Counter	Int64
reg-resp-420rx	Total number of Registration 420 Responses received. Type: Counter	Int64
reg-resp-420tx	Total number of Registration 420 Responses transmitted. Type: Counter	Int64
reg-resp-439rx	Total number of Registration 439 Responses received. Type: Counter	Int64

Variables	Description	Data Type
reg-resp-439tx	Total number of Registration 439 Responses transmitted. Type: Counter	Int64
reg-resp-4xxrx	Total number of Registration 4xx Responses received. Type: Counter	Int64
reg-resp-4xxtx	Total number of Registration 4xx Responses transmitted. Type: Counter	Int64
reg-resp-500rx	Total number of Registration 500 Responses received. Type: Counter	Int64
reg-resp-500tx	Total number of Registration 500 Responses transmitted. Type: Counter	Int64
reg-resp-5xxrx	Total number of Registration 5xx Responses received. Type: Counter	Int64
reg-resp-5xxtx	Total number of Registration 5xx Responses transmitted. Type: Counter	Int64
reg-resp-6xxrx	Total number of Registration 6xx Responses received. Type: Counter	Int64
reg-resp-6xxtx	Total number of Registration 6xx Responses transmitted. Type: Counter	Int64
rereg-atrx	Total number of Refresh Registration Attempts received. Type: Counter	Int64
rereg-attx	Total number of Refresh Registration Attempts transmitted. Type: Counter	Int64
rereg-sucrx	Total Refresh Registration Successes received. Type: Counter	Int64
rereg-succtx	Total number of Refresh Registration Successes transmitted. Type: Counter	Int64
rereg-failrx	Total number of Refresh Registration Failures received. Type: Counter	Int64
rereg-failtx	Total number of Refresh Registration Failures transmitted. Type: Counter	Int64
rereg-resp-401rx	Total number of Refresh Registration 401 Responses received. Type: Counter	Int64
rereg-resp-401tx	Total number of Refresh Registration 401 Responses transmitted. Type: Counter	Int64
rereg-resp-403rx	Total number of Refresh Registration 403 Responses received. Type: Counter	Int64
rereg-resp-403tx	Total number of Refresh Registration 403 Responses transmitted. Type: Counter	Int64

Variables	Description	Data Type
rereg-resp-404rx	Total number of Refresh Registration 404 Responses received. Type: Counter	Int64
rereg-resp-404tx	Total number of Refresh Registration 404 Responses transmitted. Type: Counter	Int64
rereg-resp-420rx	Total number of Refresh Registration 420 Responses received. Type: Counter	Int64
rereg-resp-420tx	Total number of Refresh Registration 420 Responses transmitted. Type: Counter	Int64
rereg-resp-439rx	Total number of Refresh Registration 439 Responses received. Type: Counter	Int64
rereg-resp-439tx	Total number of Refresh Registration 439 Responses transmitted. Type: Counter	Int64
rereg-resp-4xxrx	Total number of Refresh Registration 4xx Responses received. Type: Counter	Int64
rereg-resp-4xxtx	Total number of Refresh Registration 4xx Responses transmitted. Type: Counter	Int64
rereg-resp-500rx	Total number of Refresh Registration 500 Responses received. Type: Counter	Int64
rereg-resp-500tx	Total number of Refresh Registration 500 Responses transmitted. Type: Counter	Int64
rereg-resp-5xxrx	Total number of Refresh Registration 5xx Responses received. Type: Counter	Int64
rereg-resp-5xxtx	Total number of Refresh Registration 5xx Responses transmitted. Type: Counter	Int64
rereg-resp-6xxrx	Total number of Refresh Registration 6xx Responses received. Type: Counter	Int64
rereg-resp-6xxtx	Total number of Refresh Registration 6xx Responses transmitted. Type: Counter	Int64
dereg-atrx	Total number of Deregistration Attempts received. Type: Counter	Int64
dereg-attx	Total number of Deregistration Attempts transmitted. Type: Counter	Int64
dereg-sucrx	Total number of Deregistration Successes received. Type: Counter	Int64
dereg-succtx	Total number of Deregistration Successes transmitted. Type: Counter	Int64
dereg-failrx	Total number of Deregistration Failures received. Type: Counter	Int64

Variables	Description	Data Type
dereg-failtx	Total number of Deregistration Failures transmitted. Type: Counter	Int64
dereg-resp-401rx	Total number of Deregister 401 Responses received. Type: Counter	Int64
dereg-resp-401tx	Total number of Deregister 401 Responses transmitted. Type: Counter	Int64
dereg-resp-403rx	Total number of Deregister 403 Responses received. Type: Counter	Int64
dereg-resp-403tx	Total number of Deregister 403 Responses transmitted. Type: Counter	Int64
dereg-resp-404rx	Total number of Deregister 404 Responses received. Type: Counter	Int64
dereg-resp-404tx	Total number of Deregister 404 Responses transmitted. Type: Counter	Int64
dereg-resp-420rx	Total number of Deregister 420 Responses received. Type: Counter	Int64
dereg-resp-420tx	Total number of Deregister 420 Responses transmitted. Type: Counter	Int64
dereg-resp-4xxrx	Total number of Deregister 4xx Responses received. Type: Counter	Int64
dereg-resp-4xxtx	Total number of Deregister 4xx Responses transmitted. Type: Counter	Int64
dereg-resp-500rx	Total number of Deregister 500 Responses received. Type: Counter	Int64
dereg-resp-500tx	Total number of Deregister 500 Responses transmitted. Type: Counter	Int64
dereg-resp-5xxrx	Total number of Deregister 5xx Responses received. Type: Counter	Int64
dereg-resp-5xxtx	Total number of Deregister 5xx Responses transmitted. Type: Counter	Int64
dereg-resp-6xxrx	Total number of Deregister 6xx Responses received. Type: Counter	Int64
dereg-resp-6xxtx	Total number of Deregister 6xx Responses transmitted. Type: Counter	Int64
subscribe-attempt-rx	Total number of Subscribe attempts received. Type: Counter	Int64
subscribe-attempt-tx	Total number of Subscribe attempts transmitted. Type: Counter	Int64

Variables	Description	Data Type
subscribe-success-rx	Total number of Subscribe successes received. Type: Counter	Int64
subscribe-success-tx	Total number of Subscribe successes transmitted. Type: Counter	Int64
subscribe-failure-rx	Total number of Subscribe failures received. Type: Counter	Int64
subscribe-failure-tx	Total number of Subscribe failures transmitted. Type: Counter	Int64
notify-attempt-rx	Total number of Notify attempts received. Type: Counter	Int64
notify-attempt-tx	Total number of Notify attempts transmitted. Type: Counter	Int64
notify-success-rx	Total number of Notify successes received. Type: Counter	Int64
notify-success-tx	Total number of Notify successes transmitted. Type: Counter	Int64
notify-failure-rx	Total number of Notify failures received. Type: Counter	Int64
notify-failure-tx	Total number of Notify failures transmitted. Type: Counter	Int64
publish-attempt-rx	Total number of Publish attempts received. Type: Counter	Int64
publish-attempt-tx	Total number of Publish Attempts attempts transmitted. Type: Counter	Int64
publish-success-rx	Total number of Publish successes received. Type: Counter	Int64
publish-success-tx	Total number of Publish successes transmitted. Type: Counter	Int64
publish-failure-rx	Total number of Publish failures received. Type: Counter	Int64
publish-failure-tx	Total number of Publish failures transmitted. Type: Counter	Int64
msgsum-sub-attrx	Total number of “msg-summary” Subscription attempts received. Type: Counter	Int64
msgsum-sub-atttx	Total number of “msg-summary” Subscription attempts transmitted. Type: Counter	Int64
msgsum-sub-succrx	Total number of “msg-summary” Subscription successes received. Type: Counter	Int64

■ Common Syntax Options

Variables	Description	Data Type
msgsum-sub-succtx	Total number of “msg-summary” Subscription successes transmitted. Type: Counter	Int64
msgsum-sub-failrx	Total number of “msg-summary” Subscription failures received. Type: Counter	Int64
msgsum-sub-failtx	Total number of “msg-summary” Subscription failures transmitted. Type: Counter	Int64
msgsum-sub-resp-200rx	Total number of “msg-summary” Subscription 200 Responses received. Type: Counter	Int64
msgsum-sub-resp-200tx	Total number of “msg-summary” Subscription 200 Responses transmitted. Type: Counter	Int64
msgsum-sub-resp-202rx	Total number of “msg-summary” Subscription 202 Responses received. Type: Counter	Int64
msgsum-sub-resp-202tx	Total number of “msg-summary” Subscription 202 Responses transmitted. Type: Counter	Int64
msgsum-sub-resp-400rx	Total number of “msg-summary” Subscription 400 Responses received. Type: Counter	Int64
msgsum-sub-resp-400tx	Total number of “msg-summary” Subscription 400 Responses transmitted. Type: Counter	Int64
msgsum-sub-resp-403rx	Total number of “msg-summary” Subscription 403 Responses received. Type: Counter	Int64
msgsum-sub-resp-403tx	Total number of “msg-summary” Subscription 403 Responses transmitted. Type: Counter	Int64
msgsum-sub-resp-481rx	Total number of “msg-summary” Subscription 481 Responses received. Type: Counter	Int64
msgsum-sub-resp-481tx	Total number of “msg-summary” Subscription 481 Responses transmitted. Type: Counter	Int64
msgsum-sub-resp-489rx	Total number of “msg-summary” Subscription 489 Responses received. Type: Counter	Int64
msgsum-sub-resp-489tx	Total number of “msg-summary” Subscription 489 Responses transmitted. Type: Counter	Int64
msgsum-sub-resp-500rx	Total number of “msg-summary” Subscription 500 Responses received. Type: Counter	Int64
msgsum-sub-resp-500tx	Total number of “msg-summary” Subscription 500 Responses transmitted. Type: Counter	Int64
msgsum-sub-resp-3xxrx	Total number of “msg-summary” Subscription 3XX Responses received. Type: Counter	Int64
msgsum-sub-resp-3xxtx	Total number of “msg-summary” Subscription 3XX Responses transmitted. Type: Counter	Int64

Variables	Description	Data Type
msgsum-subs-resp-4xxrx	Total number of “msg-summary” Subscription 4XX Responses received. Type: Counter	Int64
msgsum-subs-resp-4xxtx	Total number of “msg-summary” Subscription 4XX Responses transmitted. Type: Counter	Int64
msgsum-subs-resp-5xxrx	Total number of “msg-summary” Subscription 5XX Responses received. Type: Counter	Int64
msgsum-subs-resp-5xxtx	Total number of “msg-summary” Subscription 5XX Responses transmitted. Type: Counter	Int64
msgsum-subs-resp-6xxrx	Total number of “msg-summary” Subscription 6XX Responses received. Type: Counter	Int64
msgsum-subs-resp-6xxtx	Total number of “msg-summary” Subscription 6XX Responses transmitted. Type: Counter	Int64
msgsum-resubs-atrx	Total number of “msg-summary” Refresh Subscription Attempts received. Type: Counter	Int64
msgsum-resubs-attx	Total number of “msg-summary” Refresh Subscription Attempts transmitted. Type: Counter	Int64
msgsum-resubs-sucrx	Total number of “msg-summary” Refresh Subscription Successes received. Type: Counter	Int64
msgsum-resubs-suctx	Total number of “msg-summary” Refresh Subscription Successes transmitted. Type: Counter	Int64
msgsum-resubs-failrx	Total number of “msg-summary” Refresh Subscription Failures received. Type: Counter	Int64
msgsum-resubs-failtx	Total number of “msg-summary” Refresh Subscription Failures transmitted. Type: Counter	Int64
msgsum-resubs-resp-200rx	Total number of “msg-summary” Refresh Subscription 200 Responses received. Type: Counter	Int64
msgsum-resubs-resp-200tx	Total number of “msg-summary” Refresh Subscription 200 Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-202rx	Total number of “msg-summary” Refresh Subscription 202 Responses received. Type: Counter	Int64
msgsum-resubs-resp-202tx	Total number of “msg-summary” Refresh Subscription 202 Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-400rx	Total number of “msg-summary” Refresh Subscription 400 Responses received. Type: Counter	Int64
msgsum-resubs-resp-400tx	Total number of “msg-summary” Refresh Subscription 400 Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-403rx	Total number of “msg-summary” Refresh Subscription 403 Responses received. Type: Counter	Int64

Variables	Description	Data Type
msgsum-resubs-resp-403tx	Total number of “msg-summary” Refresh Subscription 403 Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-481rx	Total number of “msg-summary” Refresh Subscription 481 Responses received. Type: Counter	Int64
msgsum-resubs-resp-481tx	Total number of “msg-summary” Refresh Subscription 481 Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-489rx	Total number of “msg-summary” Refresh Subscription 489 Responses received. Type: Counter	Int64
msgsum-resubs-resp-489tx	Total number of “msg-summary” Refresh Subscription 489 Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-500rx	Total number of “msg-summary” Refresh Subscription 500 Responses received. Type: Counter	Int64
msgsum-resubs-resp-500tx	Total number of “msg-summary” Refresh Subscription 500 Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-3xxrx	Total number of “msg-summary” Refresh Subscription 3XX Responses received. Type: Counter	Int64
msgsum-resubs-resp-3xxtx	Total number of “msg-summary” Refresh Subscription 3XX Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-4xxrx	Total number of “msg-summary” Refresh Subscription 4XX Responses received. Type: Counter	Int64
msgsum-resubs-resp-4xxtx	Total number of “msg-summary” Refresh Subscription 4XX Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-5xxrx	Total number of “msg-summary” Refresh Subscription 5XX Responses received. Type: Counter	Int64
msgsum-resubs-resp-5xxtx	Total number of “msg-summary” Refresh Subscription 5XX Responses transmitted. Type: Counter	Int64
msgsum-resubs-resp-6xxrx	Total number of “msg-summary” Refresh Subscription 6XX Responses received. Type: Counter	Int64
msgsum-resubs-resp-6xxtx	Total number of “msg-summary” Refresh Subscription 6XX Responses transmitted. Type: Counter	Int64
msgsum-unsubs-attrx	Total number of “msg-summary” Un-Subscription Attempts received. Type: Counter	Int64
msgsum-unsubs-atttx	Total number of “msg-summary” Un-Subscription Attempts transmitted. Type: Counter	Int64
msgsum-unsubs-sucrx	Total number of “msg-summary” Un-Subscription Successes received. Type: Counter	Int64
msgsum-unsubs-succtx	Total number of “msg-summary” Un-Subscription Successes transmitted. Type: Counter	Int64

Variables	Description	Data Type
msgsum-unsubs-failrx	Total number of “msg-summary” Un-Subscription Failures received. Type: Counter	Int64
msgsum-unsubs-failtx	Total number of “msg-summary” Un-Subscription Failures transmitted. Type: Counter	Int64
msgsum-unsubs-resp-200rx	Total number of “msg-summary” Un-Subscription 200 Responses received. Type: Counter	Int64
msgsum-unsubs-resp-200tx	Total number of “msg-summary” Un-Subscription 200 Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-202rx	Total number of “msg-summary” Un-Subscription 202 Responses received. Type: Counter	Int64
msgsum-unsubs-resp-202tx	Total number of “msg-summary” Un-Subscription 202 Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-400rx	Total number of “msg-summary” Un-Subscription 400 Responses received. Type: Counter	Int64
msgsum-unsubs-resp-400tx	Total number of “msg-summary” Un-Subscription 400 Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-403rx	Total number of “msg-summary” Un-Subscription 403 Responses received. Type: Counter	Int64
msgsum-unsubs-resp-403tx	Total number of “msg-summary” Un-Subscription 403 Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-481rx	Total number of “msg-summary” Un-Subscription 481 Responses received. Type: Counter	Int64
msgsum-unsubs-resp-481tx	Total number of “msg-summary” Un-Subscription 481 Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-489rx	Total number of “msg-summary” Un-Subscription 489 Responses received. Type: Counter	Int64
msgsum-unsubs-resp-489tx	Total number of “msg-summary” Un-Subscription 489 Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-500rx	Total number of “msg-summary” Un-Subscription 500 Responses received. Type: Counter	Int64
msgsum-unsubs-resp-500tx	Total number of “msg-summary” Un-Subscription 500 Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-3xxrx	Total number of “msg-summary” Un-Subscription 3XX Responses received. Type: Counter	Int64
msgsum-unsubs-resp-3xxtx	Total number of “msg-summary” Un-Subscription 3XX Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-4xxrx	Total number of “msg-summary” Un-Subscription 4XX Responses received. Type: Counter	Int64

Variables	Description	Data Type
msgsum-unsubs-resp-4xxrx	Total number of “msg-summary” Un-Subscription 4XX Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-5xxrx	Total number of “msg-summary” Un-Subscription 5XX Responses received. Type: Counter	Int64
msgsum-unsubs-resp-5xxtx	Total number of “msg-summary” Un-Subscription 5XX Responses transmitted. Type: Counter	Int64
msgsum-unsubs-resp-6xxrx	Total number of “msg-summary” Un-Subscription 6XX Responses received. Type: Counter	Int64
msgsum-unsubs-resp-6xxtx	Total number of “msg-summary” Un-Subscription 6XX Responses transmitted. Type: Counter	Int64
msgsum-notify-atrx	Total number of “msg-summary” Notify Attempts received. Type: Counter	Int64

pres-unsubs-failrx	Total number of “presence” Un-Subscription Failures received. Type: Counter	Int64
pres-unsubs-failtx	Total number of “presence” Un-Subscription Failures transmitted. Type: Counter	Int64
pres-unsubs-resp-200rx	Total number of “presence” Un-Subscription 200 Responses received. Type: Counter	Int64
pres-unsubs-resp-200tx	Total number of “presence” Un-Subscription 200 Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-202rx	Total number of “presence” Un-Subscription 202 Responses received. Type: Counter	Int64
pres-unsubs-resp-202tx	Total number of “presence” Un-Subscription 202 Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-400rx	Total number of “presence” Un-Subscription 400 Responses received. Type: Counter	Int64
pres-unsubs-resp-400tx	Total number of “presence” Un-Subscription 400 Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-403rx	Total number of “presence” Un-Subscription 403 Responses received. Type: Counter	Int64

■ Common Syntax Options

Variables	Description	Data Type
pres-unsubs-resp-403tx	Total number of “presence” Un-Subscription 403 Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-481rx	Total number of “presence” Un-Subscription 481 Responses received. Type: Counter	Int64
pres-unsubs-resp-481tx	Total number of “presence” Un-Subscription 481 Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-489rx	Total number of “presence” Un-Subscription 489 Responses received. Type: Counter	Int64
pres-unsubs-resp-489tx	Total number of “presence” Un-Subscription 489 Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-500rx	Total number of “presence” Un-Subscription 500 Responses received. Type: Counter	Int64
pres-unsubs-resp-500tx	Total number of “presence” Un-Subscription 500 Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-3xxrx	Total number of “presence” Un-Subscription 3XX Responses received. Type: Counter	Int64
pres-unsubs-resp-3xxtx	Total number of “presence” Un-Subscription 3XX Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-4xxrx	Total number of “presence” Un-Subscription 4XX Responses received. Type: Counter	Int64
pres-unsubs-resp-4xxtx	Total number of “presence” Un-Subscription 4XX Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-5xxrx	Total number of “presence” Un-Subscription 5XX Responses received. Type: Counter	Int64
pres-unsubs-resp-5xxtx	Total number of “presence” Un-Subscription 5XX Responses transmitted. Type: Counter	Int64
pres-unsubs-resp-6xxrx	Total number of “presence” Un-Subscription 6XX Responses received. Type: Counter	Int64
pres-unsubs-resp-6xxtx	Total number of “presence” Un-Subscription 6XX Responses transmitted. Type: Counter	Int64
pres-notify-atrx	Total number of “presence” Notify Attempts received. Type: Counter	Int64
pres-notify-attx	Total number of “presence” Notify Attempts transmitted. Type: Counter	Int64
pres-notify-succrx	Total number of “presence” Notify Successes received. Type: Counter	Int64
pres-notify-succtx	Total number of “presence” Notify Successes transmitted. Type: Counter	Int64

Variables	Description	Data Type
pres-notify-failrx	Total number of “presence” Notify Failures received. Type: Counter	Int64
pres-notify-failtx	Total number of “presence” Notify Failures transmitted. Type: Counter	Int64
pres-notify-resp-3xxrx	Total number of “presence” Notify 3XX Responses received. Type: Counter	Int64
pres-notify-resp-3xxtx	Total number of “presence” Notify 3XX Responses transmitted. Type: Counter	Int64
pres-notify-resp-400rx	Total number of “presence” Notify 400 Responses received. Type: Counter	Int64
pres-notify-resp-400tx	Total number of “presence” Notify 400 Responses transmitted. Type: Counter	Int64
pres-notify-resp-481rx	Total number of “presence” Notify 481 Responses received. Type: Counter	Int64
pres-notify-resp-481tx	Total number of “presence” Notify 481 Responses transmitted. Type: Counter	Int64
pres-notify-resp-489rx	Total number of “presence” Notify 489 Responses received. Type: Counter	Int64
pres-notify-resp-489tx	Total number of “presence” Notify 489 Responses transmitted. Type: Counter	Int64
pres-notify-resp-4xxrx	Total number of “presence” Notify 4XX Responses received. Type: Counter	Int64
pres-notify-resp-4xxtx	Total number of “presence” Notify 4XX Responses transmitted. Type: Counter	Int64
pres-notify-resp-500rx	Total number of “presence” Notify 500 Responses received. Type: Counter	Int64
pres-notify-resp-500tx	Total number of “presence” Notify 500 Responses transmitted. Type: Counter	Int64
pres-notify-resp-5xxrx	Total number of “presence” Notify 5XX Responses received. Type: Counter	Int64
pres-notify-resp-5xxtx	Total number of “presence” Notify 5XX Responses transmitted. Type: Counter	Int64
pres-notify-resp-6xxrx	Total number of “presence” Notify 6XX Responses received. Type: Counter	Int64
pres-notify-resp-6xxtx	Total number of “presence” Notify 6XX Responses transmitted. Type: Counter	Int64
pres-pub-atrx	Total number of “presence” Publish Attempts received. Type: Counter	Int64

Variables	Description	Data Type
pres-pub-atttx	Total number of “presence” Publish Attempts transmitted. Type: Counter	Int64
pres-pub-succrx	Total number of “presence” Publish Successes received. Type: Counter	Int64
pres-pub-succtx	Total number of “presence” Publish Successes transmitted. Type: Counter	Int64
pres-pub-failrx	Total number of “presence” Publish Failures received. Type: Counter	Int64
pres-pub-failtx	Total number of “presence” Publish Failures transmitted. Type: Counter	Int64
pres-pub-resp-3xxrx	Total number of “presence” Publish 3XX Responses received. Type: Counter	Int64
pres-pub-resp-3xctx	Total number of “presence” Publish 3XX Responses transmitted. Type: Counter	Int64
pres-pub-resp-400rx	Total number of “presence” Publish 400 Responses received. Type: Counter	Int64
pres-pub-resp-400tx	Total number of “presence” Publish 400 Responses transmitted. Type: Counter	Int64
pres-pub-resp-404rx	Total number of “presence” Publish 404 Responses received. Type: Counter	Int64
pres-pub-resp-404tx	Total number of “presence” Publish 404 Responses transmitted. Type: Counter	Int64
pres-pub-resp-412rx	Total number of “presence” Publish 412 Responses received. Type: Counter	Int64
pres-pub-resp-412tx	Total number of “presence” Publish 412 Responses transmitted. Type: Counter	Int64
pres-pub-resp-423rx	Total number of “presence” Publish 423 Responses received. Type: Counter	Int64
pres-pub-resp-423tx	Total number of “presence” Publish 423 Responses transmitted. Type: Counter	Int64
pres-pub-resp-489rx	Total number of “presence” Publish 489 Responses received. Type: Counter	Int64
pres-pub-resp-489tx	Total number of “presence” Publish 489 Responses transmitted. Type: Counter	Int64
pres-pub-resp-4xxrx	Total number of “presence” Publish 4XX Responses received. Type: Counter	Int64
pres-pub-resp-4xctx	Total number of “presence” Publish 4XX Responses transmitted. Type: Counter	Int64

Variables	Description	Data Type
pres-pub-resp-500rx	Total number of “presence” Publish 500 Responses received. Type: Counter	Int64
pres-pub-resp-500tx	Total number of “presence” Publish 500 Responses transmitted. Type: Counter	Int64
pres-pub-resp-503rx	Total number of “presence” Publish 503 Responses received. Type: Counter	Int64
pres-pub-resp-503tx	Total number of “presence” Publish 503 Responses transmitted. Type: Counter	Int64
pres-pub-resp-5xxrx	Total number of “presence” Publish 5XX Responses received. Type: Counter	Int64
pres-pub-resp-5xxtx	Total number of “presence” Publish 5XX Responses transmitted. Type: Counter	Int64
pres-pub-resp-6xxrx	Total number of “presence” Publish 6XX Responses received. Type: Counter	Int64
pres-pub-resp-6xxtx	Total number of “presence” Publish 6XX Responses transmitted. Type: Counter	Int64
pres-unpub-atrx	Total number of “presence” Un-Publish Attempts received. Type: Counter	Int64
pres-unpub-attx	Total number of “presence” Un-Publish Attempts transmitted. Type: Counter	Int64
pres-unpub-succrx	Total number of “presence” Un-Publish Successes received. Type: Counter	Int64
pres-unpub-succtx	Total number of “presence” Un-Publish Successes transmitted. Type: Counter	Int64
pres-unpub-failrx	Total number of “presence” Un-Publish Failures received. Type: Counter	Int64
pres-unpub-failtx	Total number of “presence” Un-Publish Failures transmitted. Type: Counter	Int64
pres-unpub-resp-3xxrx	Total number of “presence” Un-Publish 3XX Responses received. Type: Counter	Int64
pres-unpub-resp-3xxtx	Total number of “presence” Un-Publish 3XX Responses transmitted. Type: Counter	Int64
pres-unpub-resp-400rx	Total number of “presence” Un-Publish 400 Responses received. Type: Counter	Int64
pres-unpub-resp-400tx	Total number of “presence” Un-Publish 400 Responses transmitted. Type: Counter	Int64
pres-unpub-resp-404rx	Total number of “presence” Un-Publish 404 Responses received. Type: Counter	Int64

■ Common Syntax Options

Variables	Description	Data Type
pres-unpub-resp-404tx	Total number of “presence” Un-Publish 404 Responses transmitted. Type: Counter	Int64
pres-unpub-resp-412rx	Total number of “presence” Un-Publish 412 Responses received. Type: Counter	Int64

reg-unpub-failtx	Total number of “reg” Un-Publish Failures transmitted. Type: Counter	Int64
reg-unpub-resp-3xxrx	Total number of “reg” Un-Publish 3XX Responses received. Type: Counter	Int64
reg-unpub-resp-3xxtx	Total number of “reg” Un-Publish 3XX Responses transmitted. Type: Counter	Int64
reg-unpub-resp-400rx	Total number of “reg” Un-Publish 400 Responses received. Type: Counter	Int64
reg-unpub-resp-400tx	Total number of “reg” Un-Publish 400 Responses transmitted. Type: Counter	Int64
reg-unpub-resp-404rx	Total number of “reg” Un-Publish 404 Responses received. Type: Counter	Int64
reg-unpub-resp-404tx	Total number of “reg” Un-Publish 404 Responses transmitted. Type: Counter	Int64
reg-unpub-resp-412rx	Total number of “reg” Un-Publish 412 Responses received. Type: Counter	Int64
reg-unpub-resp-412tx	Total number of “reg” Un-Publish 412 Responses transmitted. Type: Counter	Int64
reg-unpub-resp-423rx	Total number of “reg” Un-Publish 423 Responses received. Type: Counter	Int64
reg-unpub-resp-423tx	Total number of “reg” Un-Publish 423 Responses transmitted. Type: Counter	Int64
reg-unpub-resp-489rx	Total number of “reg” Un-Publish 489 Responses received. Type: Counter	Int64
reg-unpub-resp-489tx	Total number of “reg” Un-Publish 489 Responses transmitted. Type: Counter	Int64
reg-unpub-resp-4xxrx	Total number of “reg” Un-Publish 4XX Responses received. Type: Counter	Int64
reg-unpub-resp-4xxtx	Total number of “reg” Un-Publish 4XX Responses transmitted. Type: Counter	Int64

Variables	Description	Data Type
reg-unpub-resp-500rx	Total number of “reg” Un-Publish 500 Responses received. Type: Counter	Int64
reg-unpub-resp-500tx	Total number of “reg” Un-Publish 500 Responses transmitted. Type: Counter	Int64
reg-unpub-resp-503rx	Total number of “reg” Un-Publish 503 Responses received. Type: Counter	Int64
reg-unpub-resp-503tx	Total number of “reg” Un-Publish 503 Responses transmitted. Type: Counter	Int64
reg-unpub-resp-5xxrx	Total number of “reg” Un-Publish 5XX Responses received. Type: Counter	Int64
reg-unpub-resp-5xxtx	Total number of “reg” Un-Publish 5XX Responses transmitted. Type: Counter	Int64
reg-unpub-resp-6xxrx	Total number of “reg” Un-Publish 6XX Responses received. Type: Counter	Int64
reg-unpub-resp-6xxtx	Total number of “reg” Un-Publish 6XX Responses transmitted. Type: Counter	Int64
winfo-sub-attrx	Total number of “winfo” Subscription Attempts received. Type: Counter	Int64
winfo-sub-atttx	Total number of “winfo” Subscription Attempts transmitted. Type: Counter	Int64
winfo-sub-succrx	Total number of “winfo” Subscription Successes received. Type: Counter	Int64
winfo-sub-succtx	Total number of “winfo” Subscription Successes transmitted. Type: Counter	Int64
winfo-sub-failrx	Total number of “winfo” Subscription Failures received. Type: Counter	Int64
winfo-sub-failtx	Total number of “winfo” Subscription Failures transmitted. Type: Counter	Int64
winfo-sub-resp-200rx	Total number of “winfo” Subscription 200 Responses received. Type: Counter	Int64
winfo-sub-resp-200tx	Total number of “winfo” Subscription 200 Responses transmitted. Type: Counter	Int64
winfo-sub-resp-202rx	Total number of “winfo” Subscription 202 Responses received. Type: Counter	Int64
winfo-sub-resp-202tx	Total number of “winfo” Subscription 202 Responses transmitted. Type: Counter	Int64
winfo-sub-resp-400rx	Total number of “winfo” Subscription 400 Responses received. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
winfo-subscription-400tx	Total number of “winfo” Subscription 400 Responses transmitted. Type: Counter	Int64
winfo-subscription-403rx	Total number of “winfo” Subscription 403 Responses received. Type: Counter	Int64
winfo-subscription-403tx	Total number of “winfo” Subscription 403 Responses transmitted. Type: Counter	Int64
winfo-subscription-481rx	Total number of “winfo” Subscription 481 Responses received. Type: Counter	Int64
winfo-subscription-481tx	Total number of “winfo” Subscription 481 Responses transmitted. Type: Counter	Int64
winfo-subscription-489rx	Total number of “winfo” Subscription 489 Responses received. Type: Counter	Int64
winfo-subscription-489tx	Total number of “winfo” Subscription 489 Responses transmitted. Type: Counter	Int64
winfo-subscription-500rx	Total number of “winfo” Subscription 500 Responses received. Type: Counter	Int64
winfo-subscription-500tx	Total number of “winfo” Subscription 500 Responses transmitted. Type: Counter	Int64
winfo-subscription-3xxrx	Total number of “winfo” Subscription 3XX Responses received. Type: Counter	Int64
winfo-subscription-3xxtx	Total number of “winfo” Subscription 3XX Responses transmitted. Type: Counter	Int64
winfo-subscription-4xxrx	Total number of “winfo” Subscription 4XX Responses received. Type: Counter	Int64
winfo-subscription-4xxtx	Total number of “winfo” Subscription 4XX Responses transmitted. Type: Counter	Int64
winfo-subscription-5xxrx	Total number of “winfo” Subscription 5XX Responses received. Type: Counter	Int64
winfo-subscription-5xxtx	Total number of “winfo” Subscription 5XX Responses transmitted. Type: Counter	Int64
winfo-subscription-6xxrx	Total number of “winfo” Subscription 6XX Responses received. Type: Counter	Int64
winfo-subscription-6xxtx	Total number of “winfo” Subscription 6XX Responses transmitted. Type: Counter	Int64
winfo-resub-attemptrx	Total number of “winfo” Refresh Subscription Attempts received. Type: Counter	Int64
winfo-resub-attempttx	Total number of “winfo” Refresh Subscription Attempts transmitted. Type: Counter	Int64

Variables	Description	Data Type
winfo-resubs-succrx	Total number of “winfo” Refresh Subscription Successes received. Type: Counter	Int64
winfo-resubs-succtx	Total number of “winfo” Refresh Subscription Successes transmitted. Type: Counter	Int64
winfo-resubs-failrx	Total number of “winfo” Refresh Subscription Failures received. Type: Counter	Int64
winfo-resubs-failtx	Total number of “winfo” Refresh Subscription Failures transmitted. Type: Counter	Int64
winfo-resubs-resp-200rx	Total number of “winfo” Refresh Subscription 200 Responses received. Type: Counter	Int64
winfo-resubs-resp-200tx	Total number of “winfo” Refresh Subscription 200 Responses transmitted. Type: Counter	Int64
winfo-resubs-resp-202rx	Total number of “winfo” Refresh Subscription 202 Responses received. Type: Counter	Int64
winfo-resubs-resp-202tx	Total number of “winfo” Refresh Subscription 202 Responses transmitted. Type: Counter	Int64
winfo-resubs-resp-400rx	Total number of “winfo” Refresh Subscription 400 Responses received. Type: Counter	Int64
winfo-resubs-resp-400tx	Total number of “winfo” Refresh Subscription 400 Responses transmitted. Type: Counter	Int64
winfo-resubs-resp-403rx	Total number of “winfo” Refresh Subscription 403 Responses received. Type: Counter	Int64
winfo-resubs-resp-403tx	Total number of “winfo” Refresh Subscription 403 Responses transmitted. Type: Counter	Int64
winfo-resubs-resp-481rx	Total number of “winfo” Refresh Subscription 481 Responses received. Type: Counter	Int64
winfo-resubs-resp-481tx	Total number of “winfo” Refresh Subscription 481 Responses transmitted. Type: Counter	Int64
winfo-resubs-resp-489rx	Total number of “winfo” Refresh Subscription 489 Responses received. Type: Counter	Int64
winfo-resubs-resp-489tx	Total number of “winfo” Refresh Subscription 489 Responses transmitted. Type: Counter	Int64
winfo-resubs-resp-500rx	Total number of “winfo” Refresh Subscription 500 Responses received. Type: Counter	Int64
winfo-resubs-resp-500tx	Total number of “winfo” Refresh Subscription 500 Responses transmitted. Type: Counter	Int64
winfo-resubs-resp-3xxrx	Total number of “winfo” Refresh Subscription 3XX Responses received. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
winfo-resubs-resp-3xxtx	Total number of “winfo” Refresh Subscription 3XX Responses transmitted. Type: Counter	Int64
winfo-resubs-resp-4xxrx	Total number of “winfo” Refresh Subscription 4XX Responses received. Type: Counter	Int64
winfo-resubs-resp-4xxtx	Total number of “winfo” Refresh Subscription 4XX Responses transmitted. Type: Counter	Int64

message-atrx	Total number of Message attempts received. Type: Counter	Int32

Variables	Description	Data Type
message-atttx	Total number of Message attempts transmitted. Type: Counter	Int32
message-sucrx	Total number of Message success received. Type: Counter	Int32
message-succtx	Total number of Message success transmitted. Type: Counter	Int32
message-failrx	Total number of Message failures received. Type: Counter	Int32
message-failtx	Total number of Message failures transmitted. Type: Counter	Int32
message-3xx-rx	Total number of Message 3xx Responses received. Type: Counter	Int32
message-3xx-tx	Total number of Message 3xx Responses transmitted. Type: Counter	Int32
message-400-rx	Total number of Message 400 Responses received. Type: Counter	Int32
message-400-tx	Total number of Message 400 Responses transmitted. Type: Counter	Int32
message-403-rx	Total number of Message 403 Responses received. Type: Counter	Int32
message-403-tx	Total number of Message 403 Responses transmitted. Type: Counter	Int32
message-404-rx	Total number of Message 404 Responses received. Type: Counter	Int32
message-404-tx	Total number of Message 404 Responses transmitted. Type: Counter	Int32
message-413-rx	Total number of Message 413 Responses received. Type: Counter	Int32
message-413-tx	Total number of Message 413 Responses transmitted. Type: Counter	Int32
message-415-rx	Total number of Message 415 Responses received. Type: Counter	Int32
message-415-tx	Total number of Message 415 Responses transmitted. Type: Counter	Int32
message-416-rx	Total number of Message 416 Responses received. Type: Counter	Int32
message-416-tx	Total number of Message 416 Responses transmitted. Type: Counter	Int32

Variables	Description	Data Type
message-420-rx	Total number of Message 420 Responses received. Type: Counter	Int32
message-420-tx	Total number of Message 420 Responses transmitted. Type: Counter	Int32
message-421-rx	Total number of Message 421 Response received. Type: Counter	Int32
message-421-tx	Total number of Message 421 Responses transmitted. Type: Counter	Int32
message-480-rx	Total number of Message 480 Responses received. Type: Counter	Int32
message-480-tx	Total number of Message 480 Responses transmitted. Type: Counter	Int32
message-488-rx	Total number of Message 488 Responses received. Type: Counter	Int32
message-488-tx	Total number of Message 488 Responses transmitted. Type: Counter	Int32
message-4xx-rx	Total number of Message 4xx Responses received. Type: Counter	Int32
message-4xx-tx	Total number of Message 4xx Responses transmitted. Type: Counter	Int32
message-500-rx	Total number of Message 500 Responses received. Type: Counter	Int32
message-500-tx	Total number of Message 500 Responses transmitted. Type: Counter	Int32
message-513-rx	Total number of Message 513 Responses received. Type: Counter	Int32
message-513-tx	Total number of Message 513 Responses transmitted. Type: Counter	Int32
message-5xx-rx	Total number of Message 5xx Responses received. Type: Counter	Int32
message-5xx-tx	Total number of Message 5xx Responses transmitted. Type: Counter	Int32
message-6xx-rx	Total number of Message 6xx Responses received. Type: Counter	Int32
message-6xx-tx	Total number of Total Message 6xx Responses transmitted. Type: Counter	Int32
callrejpdf	Total number of Call Rejects from PDF. Type: Counter	Int64

Variables	Description	Data Type
callrejloc	Total number of Call Rejects from Proxy (local). Type: Counter	Int64
sesstimeexp	Total number of Session Timer Expires. Type: Counter	Int64
hssacc	Total number of HSS Accesses. Type: Counter	Int64
emergcalls	Total number of Emergency Calls. Type: Counter	Int64
emerg-priv-calls	Total number of User-requested Privacy Calls. Applicable only for E-CSCF. Type: Counter	Int64
tollfreecalls	Total number of Toll Free Calls. Type: Counter	Int64
premservcalls	Total number of Premium Service Calls. Type: Counter	Int64
internationalcalls	Total number of International Calls. Type: Counter	Int64
longDistancecalls	Total number of Long Distance Calls. Type: Counter	Int64
opassistcalls	Total number of Operator Assisted Calls. Type: Counter	Int64
dirassistcalls	Total number of Directory Assisted Calls. Type: Counter	Int64
largerthansipmaxsize	Total number of Too Large SIP Messages. Type: Counter	Int64
rtp-sent	Total number of RTP packets sent. Type: Counter	Int64
rtcp-sent	Total number of RTCP packets sent. Type: Counter	Int64
rtp-recv	Total number of RTP packets received. Type: Counter	Int64
msrp-sent	Total number of MSRP TCP packets sent. Type: Counter	Int64
msrp-recv	Total number of MSRP TCP packets received. Type: Counter	Int64
callrel-from-ue	Total number of Call Releases initiated by UE. Type: Counter	Int64

Variables	Description	Data Type
callrel-from-nw	Total number of Call Releases initiated by Network. Type: Counter	Int64
callrel-from-radioloss	Total number of Call Releases initiated by Radio Loss. Type: Counter	Int64
callrel-from-local	Total number of Call Releases initiated by CSCF (Local). Type: Counter	Int64
sigcomp-req-comp	Total number of Requests Compressed. Type: Counter	Int64
sigcomp-req-decomp	Total number of Requests Decompressed. Type: Counter	Int64
sigcomp-resp-comp	Total number of Responses Compressed. Type: Counter	Int64
sigcomp-resp-decomp	Total number of Responses Decompressed. Type: Counter	Int64
sigcomp-nack-rx	Total number of NACK Packets received. Type: Counter	Int64
sigcomp-nack-tx	Total number of NACK Packets transmitted. Type: Counter	Int64
sigcomp-comp-fail	Total number of Compression Failures. Type: Counter	Int64
sigcomp-decomp-fail	Total number of Decompression Failures. Type: Counter	Int64
sigcomp-bestout-compratio	Best Outgoing Message Compression Ratio Type: Gauge	Float
sigcomp-worstout-compratio	Worst Outgoing Message Compression Ratio Type: Gauge	Float
sigcomp-bestin-compratio	Best Incoming Message Compression Ratio Type: Gauge	Float
sigcomp-worstin-compratio	Worst Incoming Message Compression Ratio Type: Gauge	Float
sigcomp-averagein-compratio	Average Incoming Message Compression Ratio Type: Gauge	Float
sigcomp-averageout-compratio	Average Outgoing Message Compression Ratio Type: Gauge	Float
min-invite-proc-time	Minimum Invite Process Time Type: Gauge	Int32
max-invite-proc-time	Maximum Invite Process Timer Type: Gauge	Int32

Variables	Description	Data Type
min-first-resp-time	Minimum First Response Time Type: Gauge	Int32
max-first-resp-time	Maximum First Response Time Type: Gauge	Int32
min-post-dial-delay	Minimum Post-Dial Delay Type: Gauge	Int32
max-post-dial-delay	Maximum Post-Dial Delay Type: Gauge	Int32
min-session-setup-delay	Minimum Session Setup Delay Type: Gauge	Int32
max-session-setup-delay	Maximum Session Setup Delay Type: Gauge	Int32
min-post-answer-delay	Minimum Post Answer Delay Type: Gauge	Int32
max-post-answer-delay	Maximum Post Answer Delay Type: Gauge	Int32
min-session-rel-delay	Minimum Session Release Delay Type: Gauge	Int32
max-session-rel-delay	Maximum Session Release Delay Type: Gauge	Int32
active-tcp-conn	Total number of Active TCP connections. Type: Gauge	Int64
closed-tcp-conn	Total number of Closed TCP connections. Type: Counter	Int64
succ-tcp-conn-out	Total number of Successful Outgoing connections. Type: Counter	Int64
fail-tcp-conn-out	Total number of Failed Outgoing connections. Type: Counter	Int64
succ-tcp-conn-in	Total number of Successful Incoming connections. Type: Counter	Int64
fail-tcp-conn-in	Total number of Failed Incoming connections. Type: Counter	Int64
migrated-tcp-conn	Total number of TCP connections migrated from Cscfmgr to Sessmgr for load balancing. Type: Counter	Int64
packet-tcp-rx	Total number of TCP/IP packets received by CSCF service. Type: Counter	Int64
packet-tcp-tx	Total number of TCP/IP packets transmitted by CSCF service. Type: Counter	Int64

Variables	Description	Data Type
bytes-tcp-rx	Total number of TCP/IP bytes received by CSCF service. Type: Counter	Int64
bytes-tcp-tx	Total number of TCP/IP bytes transmitted by CSCF service. Type: Counter	Int64
message-tcp-request-rx	Total number of TCP requests received over TCP. Type: Counter	Int64
message-tcp-request-tx	Total number of TCP requests transmitted over TCP. Type: Counter	Int64
message-tcp-response-rx	Total number of TCP responses received over TCP. Type: Counter	Int64
message-tcp-response-tx	Total number of TCP responses transmitted over TCP. Type: Counter	Int64
message-tcp-mtu-switch	Total number of times CSCF switched from UDP to TCP because of message size larger than MTU. Type: Counter	Int64
sip-tcp-subs	Total number of subscribers using TCP for SIP. Type: Gauge	Int64
msrp-active-tcp-conn	Total number of active MSRP TCP connections. Type: Counter	Int64
msrp-closed-tcp-conn	Total number of closed MSRP TCP connections. Type: Counter	Int64
msrp-succ-tcp-conn-out	Total number of outgoing MSRP TCP connections established successfully. Type: Counter	Int64
msrp-fail-tcp-conn-out	Total number of failed outgoing MSRP TCP connections. Type: Counter	Int64
msrp-succ-tcp-conn-in	Total number of incoming MSRP TCP connections established successfully. Type: Counter	Int64
msrp-fail-tcp-conn-in	Total number of failed incoming MSRP TCP connections. Type: Counter	Int64
msrp-packet-rx	Total number of MSRP packets received. Type: Counter	Int64
msrp-packet-tx	Total number of MSRP packets transmitted. Type: Counter	Int64
msrp-bytes-rx	Total number of MSRP bytes received. Type: Counter	Int64
msrp-bytes-tx	Total number of MSRP bytes transmitted. Type: Counter	Int64

Variables	Description	Data Type
msrp-tcp-subs	Total number of subscribers with TCP connection for MSRP. Type: Gauge	Int64
reg-rejdueto-secagree	Total number of Registration Rejects due to Security Agreement Type: Counter	Int64
reg-rejdueto-algomismatch	Total number of Registration Rejects due to Algorithm Mismatch Type: Counter	Int64
msg-drops-duetoerror	Total number of Message drops due to error. Type: Counter	Int64
sec-rereg	Total number of Secure re-registrations Type: Counter	Int64
sec-dereg	Total number of Secure de-registrations Type: Counter	Int64
msgs-withincorr-sec-verify	Total number of Messages with Incorrect security Verify Type: Counter	Int64
sec-assoc-rejects	Total number of Security Associations rejected. Type: Counter	Int64
sub-with-sec-conn	Total number of Subscribers with secure connections. Type: Gauge	Int32
sub-with-unsec-conn	Total number of Subscribers with unsecure connections. Type: Gauge	Int32
ipsec-pktrx	Total number of IP-Sec Packets received. Type: Counter	Int64
ipsec-pktx	Total number of IP-Sec Packets transmitted. Type: Counter	Int64
ipsec-octrx	Total number of IP-Sec Octets received. Type: Counter	Int64
ipsec-octtx	Total number of IP-Sec Octets transmitted. Type: Counter	Int64
active-ipsec-tcp-conn	Total number of Active IPSec TCP connections Type: Gauge	Int64
closed-ipsec-tcp-conn	Total number of Closed IPSec TCP connections Type: Counter	Int64
succ-ipsec-tcp-conn-out	Total number of Successful IPSec Outgoing connections Type: Counter	Int64
fail-ipsec-tcp-conn-out	Total number of Failed IPSec Outgoing connections Type: Counter	Int64
succ-ipsec-tcp-conn-in	Total number of Successful IPSec Incoming connections Type: Counter	Int64

Variables	Description	Data Type
fail-ipsec-tcp-conn-in	Total number of Failed IPSec Incoming connections Type: Counter	Int64
regreqrx	Total number of Register requests received. Type: Counter	Int64
regreqtx	Total number of Register requests transmitted. Type: Counter	Int64
invreqrx	Total number of Invite requests received. Type: Counter	Int64
invreqtx	Total number of Invite requests transmitted. Type: Counter	Int64
ackreqrx	Total number of ACK requests received. Type: Counter	Int64
ackreqtx	Total number of ACK requests transmitted. Type: Counter	Int64
byereqrx	Total number of Bye requests received. Type: Counter	Int64
byereqtx	Total number of Bye requests transmitted. Type: Counter	Int64
cancreqrx	Total number of Cancel requests received. Type: Counter	Int64
cancreqtx	Total number of Cancel requests transmitted. Type: Counter	Int64
optreqrx	Total number of Options requests received. Type: Counter	Int64
optreqtx	Total number of Options requests transmitted. Type: Counter	Int64
prackreqrx	Total number of PRACK requests received. Type: Counter	Int64
prackreqtx	Total number of PRACK requests transmitted. Type: Counter	Int64
subreqrx	Total number of Subscribe requests received. Type: Counter	Int64
subreqtx	Total number of Subscribe requests transmitted. Type: Counter	Int64
notreqrx	Total number of Notify requests received. Type: Counter	Int64
notreqtx	Total number of Notify requests transmitted. Type: Counter	Int64

Variables	Description	Data Type
refreqrx	Total number of Refer requests received. Type: Counter	Int64
refreqtx	Total number of Refer requests transmitted. Type: Counter	Int64
inforeqrx	Total number of Info requests received. Type: Counter	Int64
inforeqtx	Total number of Info requests transmitted. Type: Counter	Int64
updreqrx	Total number of Update requests received. Type: Counter	Int64
updreqtx	Total number of Update requests transmitted. Type: Counter	Int64
msgreqrx	Total number of Message requests received. Type: Counter	Int64
msgreqtx	Total number of Message requests transmitted. Type: Counter	Int64
pubreqrx	Total number of Publish requests received. Type: Counter	Int64
pubreqtx	Total number of Publish requests transmitted. Type: Counter	Int64
trysprx	Total number of Trying responses received. Type: Counter	Int64
trysptx	Total number of Trying responses transmitted. Type: Counter	Int64
rngrsprx	Total number of Ringing responses received. Type: Counter	Int64
rngrsptx	Total number of Ringing responses transmitted. Type: Counter	Int64
fwdrsprx	Total number of Forwarded responses received. Type: Counter	Int64
fwdrsptx	Total number of Forwarded responses transmitted. Type: Counter	Int64
quersprx	Total number of Queued responses received. Type: Counter	Int64
quersptx	Total number of Queued responses transmitted. Type: Counter	Int64
prgrsprx	Total number of Progress responses received. Type: Counter	Int64

Variables	Description	Data Type
prgrsptx	Total number of Progress responses transmitted. Type: Counter	Int64
200-regrsprx	Total number of 200OK Register responses received. Type: Counter	Int64
200-regrsptx	Total number of 200OK Register responses transmitted. Type: Counter	Int64
200-invrsprx	Total number of 200OK Invite responses received. Type: Counter	Int64
200-invrspix	Total number of 200OK Invite responses transmitted. Type: Counter	Int64
200-byersprx	Total number of 200OK Bye responses received. Type: Counter	Int64
200-byersptx	Total number of 200OK Bye responses transmitted. Type: Counter	Int64
200-cnlsprx	Total number of 200OK Cancel responses received. Type: Counter	Int64
200-cnlsptx	Total number of 200OK Cancel responses transmitted. Type: Counter	Int64
200-optrsprx	Total number of 200OK Options responses received. Type: Counter	Int64
200-optrsptx	Total number of 200OK Options responses transmitted. Type: Counter	Int64
200-prackrsprx	Total number of 200OK PRACK responses received. Type: Counter	Int64
200-prackrsptx	Total number of 200OK PRACK responses transmitted. Type: Counter	Int64
200-subrsprx	Total number of 200OK Subscribe responses received. Type: Counter	Int64
200-subrsptx	Total number of 200OK Subscribe responses transmitted. Type: Counter	Int64
200-notrsprx	Total number of 200OK Notify responses received. Type: Counter	Int64
200-notrsptx	Total number of 200OK Notify responses transmitted. Type: Counter	Int64
200-infrsprx	Total number of 200OK Info responses received. Type: Counter	Int64
200-infrsptx	Total number of 200OK Info responses transmitted. Type: Counter	Int64

Variables	Description	Data Type
200-updrspx	Total number of 200OK Update responses received. Type: Counter	Int64
200-updrsptx	Total number of 200OK Update responses transmitted. Type: Counter	Int64
200-pubrspx	Total number of 200OK Publish responses received. Type: Counter	Int64
200-pubrsptx	Total number of 200OK Publish responses transmitted. Type: Counter	Int64
200-refrspx	Total number of 200OK Refer responses received. Type: Counter	Int64
200-refrsptx	Total number of 200OK Refer responses transmitted. Type: Counter	Int64
200-msgrspx	Total number of 200OK Message responses received. Type: Counter	Int64
200-msgrsptx	Total number of 200OK Message responses transmitted. Type: Counter	Int64
202-refrspx	Total number of 202Accepted Refer responses received. Type: Counter	Int64
202-refrsptx	Total number of 202Accepted Refer responses transmitted. Type: Counter	Int64
202-subrspx	Total number of 202Accepted Subscribe responses received. Type: Counter	Int64
202-subrsptx	Total number of 202Accepted Subscribe responses transmitted. Type: Counter	Int64
mchrspx	Total number of Multiple Choices responses received. Type: Counter	Int64
mchrsptx	Total number of Multiple Choices responses transmitted. Type: Counter	Int64
mperspx	Total number of Moved Permanently responses received. Type: Counter	Int64
mpersptx	Total number of Moved Permanently responses transmitted. Type: Counter	Int64
mterspx	Total number of Moved Temporarily responses received. Type: Counter	Int64
mtersptx	Total number of Moved Temporarily responses transmitted. Type: Counter	Int64
upxrspx	Total number of Use Proxy responses received. Type: Counter	Int64

Variables	Description	Data Type
upxrsptx	Total number of Use Proxy responses transmitted. Type: Counter	Int64
altrsprx	Total number of Alternative Service responses received. Type: Counter	Int64
altrsptx	Total number of Alternative Service responses transmitted. Type: Counter	Int64
brqerrrx	Total number of BadRequest errors received. Type: Counter	Int64
brqerrtx	Total number of BadRequest errors transmitted. Type: Counter	Int64
uauerrrx	Total number of Unauthorized errors received. Type: Counter	Int64
uauerrtx	Total number of Unauthorized errors transmitted. Type: Counter	Int64
prerrrx	Total number of Payment Required Errors received. Type: Counter	Int64
prerrtx	Total number of Payment Required Errors transmitted. Type: Counter	Int64
forerrrx	Total number of Forbidden errors received. Type: Counter	Int64
forerrtx	Total number of Forbidden errors transmitted. Type: Counter	Int64
nfderrrx	Total number of NotFound errors received. Type: Counter	Int64
nfderrtx	Total number of NotFound errors transmitted. Type: Counter	Int64
mnaerrrx	Total number of MethodNotAllowed errors received. Type: Counter	Int64
mnaerrtx	Total number of MethodNotAllowed errors transmitted. Type: Counter	Int64
nac406errrx	Total number of NotAcceptable(406) errors received. Type: Counter	Int64
nac406errtx	Total number of NotAcceptable(406) errors transmitted. Type: Counter	Int64
parerrrx	Total number of ProxyAuthRequired errors received. Type: Counter	Int64
parerrtx	Total number of ProxyAuthRequired errors transmitted. Type: Counter	Int64

Variables	Description	Data Type
rtoerrrx	Total number of RequestTimeout errors received. Type: Counter	Int64
rtoerrtx	Total number of RequestTimeout errors transmitted. Type: Counter	Int64
conferrrx	Total number of Conflict Errors received. Type: Counter	Int64
conferrtx	Total number of Conflict Errors transmitted. Type: Counter	Int64
lrerrrx	Total number of Length Required Errors received. Type: Counter	Int64
lrerrtx	Total number of Length Required Errors transmitted. Type: Counter	Int64
gonerrrx	Total number of Gone errors received. Type: Counter	Int64
gonerrtx	Total number of Gone errors transmitted. Type: Counter	Int64
crferrrx	Total number of ConditionalRequestFail errors received. Type: Counter	Int64
crferrtx	Total number of ConditionalRequestFail errors transmitted. Type: Counter	Int64
relerrrx	Total number of RequestEntityTooLarge errors received. Type: Counter	Int64
relerrtx	Total number of RequestEntityTooLarge errors transmitted. Type: Counter	Int64
rulerrrx	Total number of RequestURITooLong errors received. Type: Counter	Int64
rulerrtx	Total number of RequestURITooLong errors transmitted. Type: Counter	Int64
umterrrx	Total number of UnsupportedMediaType errors received. Type: Counter	Int64
umterrtx	Total number of UnsupportedMediaType errors transmitted. Type: Counter	Int64
uuserrrx	Total number of Unsupported URI Scheme errors received. Type: Counter	Int64
uuserrrtx	Total number of Unsupported URI Scheme errors transmitted. Type: Counter	Int64
bexerrrx	Total number of BadExtension errors received. Type: Counter	Int64

Variables	Description	Data Type
bexerrtx	Total number of BadExtension errors transmitted. Type: Counter	Int64
exrerrrx	Total number of Extension Required errors received. Type: Counter	Int64
exrerrtx	Total number of Extension Required errors transmitted. Type: Counter	Int64
sitserrrx	Total number of Session Interval Too Small errors received Type: Counter	Int64
sitserrtx	Total number of Session Interval Too Small errors transmitted Type: Counter	Int64
fhloerrrx	Total number of First Hop Lacks Outbound Support (439) errors received. Type: Counter	Int64
fhloerrtx	Total number of First Hop Lacks Outbound Support (439) errors transmitted. Type: Counter	Int64
itberrrx	Total number of Interval Too Brief errors received. Type: Counter	Int64
itberrtx	Total number of Interval Too Brief errors transmitted. Type: Counter	Int64
blierrrx	Total number of Bad Location Information errors received. Type: Counter	Int64
blierrtx	Total number of Bad Location Information errors transmitted. Type: Counter	Int64
tnaerrrx	Total number of TempNotAvailable errors received. Type: Counter	Int64
tnaerrtx	Total number of TempNotAvailable errors transmitted. Type: Counter	Int64
tdnerrrx	Total number of Transaction Does Not Exist errors received. Type: Counter	Int64
tdnerrtx	Total number of Transaction Does Not Exist errors transmitted. Type: Counter	Int64
ldterrrx	Total number of LoopDetected errors received. Type: Counter	Int64
ldterrtx	Total number of LoopDetected errors transmitted. Type: Counter	Int64
tmherrrx	Total number of TooManyHops errors received. Type: Counter	Int64
tmherrtx	Total number of TooManyHops errors transmitted. Type: Counter	Int64

Variables	Description	Data Type
adierrrx	Total number of AddrIncomplete errors received. Type: Counter	Int64
adierrtx	Total number of AddrIncomplete errors transmitted. Type: Counter	Int64
amberrrx	Total number of Ambiguous errors received. Type: Counter	Int64
amberrtx	Total number of Ambiguous errors transmitted. Type: Counter	Int64
bhrerrrx	Total number of BusyHere errors received. Type: Counter	Int64
bhrerrtx	Total number of BusyHere errors transmitted. Type: Counter	Int64
rqcerrrx	Total number of RequestCancel errors received. Type: Counter	Int64
rqcerrtx	Total number of RequestCancel errors transmitted. Type: Counter	Int64
namerrrx	Total number of NotAcceptableMedia errors received. Type: Counter	Int64
namerrtx	Total number of NotAcceptableMedia errors transmitted. Type: Counter	Int64
beerrrx	Total number of Bad Event errors received. Type: Counter	Int64
beerrtx	Total number of Bad Event errors transmitted. Type: Counter	Int64
trperrrx	Total number of Request Pending errors received. Type: Counter	Int64
trperrtx	Total number of Request Pending errors transmitted. Type: Counter	Int64
udperrrx	Total number of Undecipherable errors received. Type: Counter	Int64
udperrtx	Total number of Undecipherable errors transmitted. Type: Counter	Int64
sarerrrx	Total number of sec-agree Required Errors received. Type: Counter	Int64
sarerrtx	Total number of Sec-agree Required Errors transmitted. Type: Counter	Int64
ineerrrx	Total number of InternalError errors received. Type: Counter	Int64

Variables	Description	Data Type
ineerrtx	Total number of InternalError errors transmitted. Type: Counter	Int64
nimerrrx	Total number of NotImplemented errors received. Type: Counter	Int64
nimerrtx	Total number of NotImplemented errors transmitted. Type: Counter	Int64
bgterrxx	Total number of BadGateway errors received. Type: Counter	Int64
bgterrxt	Total number of BadGateway errors transmitted. Type: Counter	Int64
suaerrrx	Total number of ServiceUnavailable errors received. Type: Counter	Int64
suaerrtx	Total number of ServiceUnavailable errors transmitted. Type: Counter	Int64
gtterrxx	Total number of GatewayTimeout errors received. Type: Counter	Int64
gtterrxt	Total number of GatewayTimeout errors transmitted. Type: Counter	Int64
bsverrrx	Total number of BadSipVersion errors received. Type: Counter	Int64
bsverrtx	Total number of BadSipVersion errors transmitted. Type: Counter	Int64
mtlerrxx	Total number of Message Too Large errors received. Type: Counter	Int64
mtlerrxt	Total number of Message Too Large errors transmitted. Type: Counter	Int64
pcferrxx	Total number of Precondition Failure errors received. Type: Counter	Int64
pcferrxt	Total number of Precondition Failure errors transmitted. Type: Counter	Int64
bewerrxx	Total BusyEverywhere errors received. Total number of Type: Counter	Int64
bewerrxt	Total number of BusyEverywhere errors transmitted. Type: Counter	Int64
decerrxx	Total number of Decline errors received. Type: Counter	Int64
decerrxt	Total number of Decline errors transmitted. Type: Counter	Int64

Variables	Description	Data Type
neaerrrx	Total number of NotExistAnywhere errors received. Type: Counter	Int64
neaerrtx	Total number of NotExistAnywhere errors transmitted. Type: Counter	Int64
nac606errrx	Total number of NotAcceptable(606) errors received. Type: Counter	Int64
nac606errtx	Total number of NotAcceptable(606) errors transmitted. Type: Counter	Int64
callsetuptime	Sum of setup times – For calculating average call setup time. Type: Counter	Int64
callscounted	Total number of calls, for which setup time is added in setup times. Type: Counter	Int64
tot-sip-invalid-msgs-rx	Total number of SIP Invalid Messages received. Type: Counter	Int64
tot-sip-msgs-rx	Total number of SIP Messages received. Type: Counter	Int64
tot-sip-msgs-tx	Total number of SIP Messages transmitted. Type: Counter	Int64
tot-sip-msgs-proc	Total number of SIP Messages Processed. Type: Counter	Int64
regreqretx	Total number of REGISTER Requests Re-transmitted. Type: Counter	Int64
invreqretx	Total number of INVITE Requests Re-transmitted. Type: Counter	Int64
byereqretx	Total number of BYE Requests Re-transmitted. Type: Counter	Int64
cancreqretx	Total number of CANCEL Requests Re-transmitted. Type: Counter	Int64
ackreqretx	Total number of ACK Requests Re-transmitted. Type: Counter	Int64
notifyreqretx	Total number of NOTIFY Requests Re-transmitted. Type: Counter	Int64
publishreqretx	Total number of PUBLISH Requests Re-transmitted. Type: Counter	Int64
referreqretx	Total number of REFER Requests Re-transmitted. Type: Counter	Int64
subscribereqretx	Total number of SUBSCRIBE Requests Re-transmitted. Type: Counter	Int64

Variables	Description	Data Type
req-retx	Total number of SIP Requests Re-transmitted. Type: Counter	Int64
resp-retx	Total number of SIP Responses Re-transmitted. Type: Counter	Int64
reqresp-retx	Total number of SIP messages Re-transmitted. Type: Counter	Int64
calldur-lt01sec	Total calls with duration less than 01 sec. Type: Counter	Int32
calldur-01to10sec	Total calls with duration between 01 and 10 seconds. Type: Counter	Int32
calldur-10to30sec	Total calls with duration between 10 and 30 seconds. Type: Counter	Int32
calldur-30to60sec	Total calls with duration between 30 and 60 seconds. Type: Counter	Int32
calldur-60to90sec	Total calls with duration between 60 and 90 seconds. Type: Counter	Int32
calldur-90to120sec	Total calls with duration between 90 and 120 seconds. Type: Counter	Int32
calldur-120to150sec	Total calls with duration between 120 and 150 seconds. Type: Counter	Int32
calldur-150to180sec	Total calls with duration between 150 and 180 seconds. Type: Counter	Int32
calldur-03to04min	Total calls with duration between 03 and 04 minutes. Type: Counter	Int32
calldur-04to05min	Total calls with duration between 04 and 05 minutes. Type: Counter	Int32
calldur-05to06min	Total calls with duration between 05 and 06 minutes. Type: Counter	Int32
calldur-06to07min	Total calls with duration between 06 and 07 minutes. Type: Counter	Int32
calldur-07to08min	Total calls with duration between 07 and 08 minutes. Type: Counter	Int32
calldur-08to09min	Total calls with duration between 08 and 09 minutes. Type: Counter	Int32
calldur-09to11min	Total calls with duration between 09 and 11 minutes. Type: Counter	Int32
calldur-11to13min	Total calls with duration between 11 and 13 minutes. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
calldur-13to15min	Total calls with duration between 13 and 15 minutes. Type: Counter	Int32
calldur-15to17min	Total calls with duration between 15 and 17 minutes. Type: Counter	Int32
calldur-17to19min	Total calls with duration between 17 and 19 minutes. Type: Counter	Int32
calldur-19to21min	Total calls with duration between 19 and 21 minutes. Type: Counter	Int32
calldur-21to23min	Total calls with duration between 21 and 23 minutes. Type: Counter	Int32
calldur-23to25min	Total calls with duration between 23 and 25 minutes. Type: Counter	Int32
calldur-25to27min	Total calls with duration between 25 and 27 minutes. Type: Counter	Int32
calldur-27to29min	Total calls with duration between 27 and 29 minutes. Type: Counter	Int32
calldur-29to60min	Total calls with duration between 29 and 60 minutes. Type: Counter	Int32
calldur-gt-60min	Total calls with duration more than 60 minutes. Type: Counter	Int32
subsetup<200ms	Total number of subscriptions setup in less than 200 milliseconds. Type: Counter	Int32
subsetup200-400ms	Total number of subscriptions setup in 200 to 400 milliseconds. Type: Counter	Int32
subsetup400-600ms	Total number of subscriptions setup in 400 to 600 milliseconds. Type: Counter	Int32
subsetup600-800ms	Total number of subscriptions setup in 600 to 800 milliseconds. Type: Counter	Int32
subsetup800-1000ms	Total number of subscriptions setup in 800 to 1000 milliseconds. Type: Counter	Int32
subsetup1000-1200ms	Total number of subscriptions setup in 1000 to 1200 milliseconds. Type: Counter	Int32
subsetup1200-1400ms	Total number of subscriptions setup in 1200 to 1400 milliseconds. Type: Counter	Int32
subsetup1400-1600ms	Total number of subscriptions setup in 1400 to 1600 milliseconds. Type: Counter	Int32
subsetup1600-1800ms	Total number of subscriptions setup in 1600 to 1800 milliseconds. Type: Counter	Int32

Variables	Description	Data Type
subsetup1800-2000ms	Total number of subscriptions setup in 1800 to 2000 milliseconds. Type: Counter	Int32
subsetup2000-2200ms	Total number of subscriptions setup in 2000 to 2200 milliseconds. Type: Counter	Int32
subsetup2200-2400ms	Total number of subscriptions setup in 2200 to 2400 milliseconds. Type: Counter	Int32
subsetup2400-2600ms	Total number of subscriptions setup in 2400 to 2600 milliseconds. Type: Counter	Int32
subsetup2600-2800ms	Total number of subscriptions setup in 2600 to 2800 milliseconds. Type: Counter	Int32
subsetup2800-3000ms	Total number of subscriptions setup in 2800 to 3000 milliseconds. Type: Counter	Int32
subsetup3-5sec	Total number of subscriptions setup in 3 to 5 seconds. Type: Counter	Int32
subsetup5-7sec	Total number of subscriptions setup in 5 to 7 seconds. Type: Counter	Int32
subsetup7-9sec	Total number of subscriptions setup in 7 to 9 seconds. Type: Counter	Int32
subsetup9-11sec	Total number of subscriptions setup in 9 to 11 seconds. Type: Counter	Int32
subsetup11-13sec	Total number of subscriptions setup in 11 to 13 seconds. Type: Counter	Int32
subsetup13-15sec	Total number of subscriptions setup in 13 to 15 seconds. Type: Counter	Int32
subsetup15-17sec	Total number of subscriptions setup in 15 to 17 seconds. Type: Counter	Int32
subsetup17-19sec	Total number of subscriptions setup in 17 to 19 seconds. Type: Counter	Int32
subsetup19-21sec	Total number of subscriptions setup in 19 to 21 seconds. Type: Counter	Int32
subsetup>21sec	Total number of subscriptions setup in more than 21 seconds. Type: Counter	Int32
subdur<1hr	Total number of subscription duration less than 1 hour. Type: Counter	Int32
subdur1-2hr	Total number of subscription duration 1 to 2 hours. Type: Counter	Int32
subdur2-3hr	Total number of subscription duration 2 to 3 hours. Type: Counter	Int32

Variables	Description	Data Type
subdur3-4hr	Total number of subscription duration 3 to 4 hours. Type: Counter	Int32
subdur4-5hr	Total number of subscription duration 4 to 5 hours. Type: Counter	Int32
subdur5-6hr	Total number of subscription duration 5 to 6 hours. Type: Counter	Int32
subdur6-7hr	Total number of subscription duration 6 to 7 hours. Type: Counter	Int32
subdur7-8hr	Total number of subscription duration 7 to 8 hours. Type: Counter	Int32
subdur8-9hr	Total number of subscription duration 8 to 9 hours. Type: Counter	Int32
subdur9-10hr	Total number of subscription duration 9 to 10 hours. Type: Counter	Int32
subdur>10hr	Total number of subscription duration more than 10 hours. Type: Counter	Int32
curr-reg-sub	Total number of currently registered users. Type: Gauge	Int64
active-reg-sub	Total number of active registered users. Type: Gauge	Int64
curr-sigcomp-sub	Total number of currently registered SIGCOMP users. Type: Gauge	Int64
active-sigcomp-sub	Total number of active registered SIGCOMP users. Type: Gauge	Int64
curr-ipsec-sub	Total number of currently registered IPSEC users. Type: Gauge	Int64
active-ipsec-sub	Total number of active registered IPSEC users. Type: Gauge	Int64
active-voip-sub	Active registered VOIP users. Type: Gauge	Int64
curr-presence-sub	Total number of currently registered PRESENCE users. Type: Gauge	Int64
active-presence-sub	Total number of active registered PRESENCE users. Type: Gauge	Int64
active-im-sub	Total number of active registered IM users. Type: Gauge	Int64
dpeca-curr-sessions	The total number of DPECA sessions currently active. Type: Gauge	Int32

Variables	Description	Data Type
dpeca-tot-sess-init	Total number of DPECA sessions initiated by sending AAR Initial Request message. Type: Counter	Int32
dpeca-tot-sess-terminated	Total number of terminated DPECA sessions. Type: Counter	Int32
dpeca-tot-sess-failovers	Total number of peer-switches attempted. Type: Counter	Int32
dpeca-tot-sess-failover-err	Total number of peer-switches failed. Type: Counter	Int32
dpeca-tot-msg-received	Total number of messages received. Type: Counter	Int32
dpeca-tot-msg-sent	Total number of messages sent. Type: Counter	Int32
dpeca-tot-aar-sent	Total number of AAR request messages sent from DPECA module. Type: Counter	Int32
dpeca-tot-aaa-received	Total number of AAA answer messages received. Type: Counter	Int32
dpeca-tot-uncorr-aaa	Total number of Uncorrelated AAA messages. Type: Counter	Int32
dpeca-tot-uncorr-sta	Total number of Uncorrelated STA messages. Type: Counter	Int32
dpeca-tot-aari-sent	Total number of AAR Initial requests sent. Type: Counter	Int32
dpeca-tot-aaai-received	Total number of AAA answer messages received in response to the AAR-Initial requests. Type: Counter	Int32
dpeca-tot-aaai-accepted	Total number of AAA messages accepted as successful without any errors. Type: Counter	Int32
dpeca-tot-aaai-rejected	Total number of AAA messages rejected as erroneous. Type: Counter	Int32
dpeca-tot-aaai-timeout	Total number of AAA answers to Initial request timed out. Type: Counter	Int32
dpeca-tot-aaru-sent	Total number of AAR Update messages sent Type: Counter	Int32
dpeca-tot-aaau-received	Total number of AAA answer messages received in response to the AAR-Update requests. Type: Counter	Int32
dpeca-tot-aaau-timeout	Total number of AAA answers to Update request timed out. Type: Counter	Int32

Variables	Description	Data Type
dpeca-tot-str-sent	Total number of STR messages sent. Type: Counter	Int32
dpeca-tot-sta-received	Total number of STA messages received. Type: Counter	Int32
dpeca-tot-sta-timeout	Total number of STA answers timed out. Type: Counter	Int32
dpeca-tot-asr-received	Total number of ASR messages received. Type: Counter	Int32
dpeca-tot-asa-sent	Total number of ASA messages sent. Type: Counter	Int32
dpeca-tot-rar-received	Total number of RAR messages received. Type: Counter	Int32
dpeca-tot-raa-sent	Total number of RAA messages sent. Type: Counter	Int32
dpeca-tot-protocol-err	Total number of diameter protocol errors that were received from PCRF. Type: Counter	Int32
dpeca-tot-aaa-parse-err	Total number of AAA parse-errors. Type: Counter	Int32
dpeca-tot-unk-sess-req	Total number of unknown session requests. Type: Counter	Int32
dpeca-tot-unk-cmd-codes	Total number of unknown command codes (unsupported command codes). Type: Counter	Int32
dpeca-tc-logout	Total number of sessions terminated as the user logged out. Type: Counter	Int32
dpeca-tc-service-not-prov	Total number of sessions terminated as the requested service is not provided. Type: Counter	Int32
dpeca-tc-bad-ans	Total number of sessions terminated with a bad answer. Type: Counter	Int32
dpeca-tc-administrative	Total number of sessions terminated administratively. Type: Counter	Int32
dpeca-tc-link-broken	Total number of sessions terminated due to link broken. Type: Counter	Int32
dpeca-tc-auth-expired	Total number of sessions terminated due to auth-expiry. Type: Counter	Int32
dpeca-tc-user-moved	Total number of sessions terminated as the user-moved. Type: Counter	Int32
dpeca-tc-session-timeout	Total number of sessions terminated due to session timeout. Type: Counter	Int32

Variables	Description	Data Type
dpeca-auth-rejected	Total number of authorization rejected errors. Type: Counter	Int32
dpeca-other-errors	Total number of other miscellaneous DPECA errors. Type: Counter	Int32
dpeca-exp-res-invalid-service-info	Total number of answer messages received with Experimental-Result-Code as 5061 - INVALID_SERVICE_INFORMATION. Type: Counter	Int32
dpeca-exp-res-filter-restrictions	Total number of answer messages received with Experimental-Result-Code as 5062 - FILTER_RESTRICTIONS. Type: Counter	Int32
dpeca-exp-res-req-service-not-authorized	Total number of answer messages received with Experimental-Result-Code as 5063 - REQUESTED_SERVICE_NOT_AUTHORIZED. Type: Counter	Int32
dpeca-exp-res-duplicated-af-session	Total number of answer messages received with Experimental-Result-Code as 5064 - DUPLICATED_AF_SESSION. Type: Counter	Int32
dpeca-exp-res-ipcan-session-not-avail	Total number of answer messages received with Experimental-Result-Code as 5065 - IP_CAN_SESSION_NOT_AVAILABLE Type: Counter	Int32
perf-att-init-reg	Total number of initial registrations received at CSCF. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-att-init-reg-3gpp-geran	Total number of initial registrations received at CSCF with access technology 3GPP-GERAN. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-init-reg-3gpp-utran-fdd	Total number of initial registrations received at CSCF with access technology 3GPP-UTRAN-FDD. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-init-reg-3gpp2-1x	Total number of initial registrations received at CSCF with access technology 3GPP2-1X. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-init-reg-ieee-80211a	Total number of initial registrations received at CSCF with access technology IEEE-802.11a. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-init-reg-ieee-80211b	Total number of initial registrations received at CSCF with access technology IEEE-802.11b. Applicable only for P-CSCF. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
perf-att-init-reg-other-at	Total number of initial registrations received at CSCF for any other access technology. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-init-reg	Total number of success responses sent for initial registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-succ-init-reg-3gpp-geran	Total number of success responses sent for initial registration with access technology 3GPP-GERAN. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-init-reg-3gpp-utran-fdd	Total number of success responses sent for initial registration with access technology 3GPP-UTRAN-FDD. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-init-reg-3gpp2-1x	Total number of success responses sent for initial registration with access technology 3GPP2-1X. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-init-reg-ieee-80211a	Total number of success responses sent for initial registration with access technology IEEE-802.11a. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-init-reg-ieee-80211b	Total number of success responses sent for initial registration with access technology IEEE-802.11b. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-init-reg-other	Total number of success responses sent for initial registration for any other access technologies. Applicable only for P-CSCF. Type: Counter	Int64
perf-fail-init-reg	Total number of failure responses sent for initial registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-init-reg-401	Total number of (401 Unauthorized) failure responses sent for initial registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-init-reg-403	Total number of (403 Forbidden) failure responses sent for initial registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-init-reg-404	Total number of (404 Not Found) failure responses sent for initial registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64

Variables	Description	Data Type
perf-fail-init-reg-420	Total number of (420 Bad Extension) failure responses sent for initial registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-init-reg-500	Total number of (500 Internal Error) failure responses sent for initial registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-init-reg-other	Total number of other failure responses sent for initial registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-mean-init-reg-setup	Average time (in milliseconds) between the instance REGISTER is received by P-CSCF and 200 response is sent for the REGISTER. The average is reset every 10 minutes. Applicable only for P-CSCF. Type: Gauge	Int32
perf-att-rereg	Total number of refresh registrations received at CSCF. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-att-rereg-3gpp-geran	Total number of refresh registrations received at CSCF with access technology 3GPP-GERAN. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-rereg-3gpp-utran-fdd	Total number of refresh registrations received at CSCF with access technology 3GPP-UTRAN-FDD. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-rereg-3gpp2-1x	Total number of refresh registrations received at CSCF with access technology 3GPP2-1X. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-rereg-ieee-80211a	Total number of refresh registrations received at CSCF with access technology IEEE-802.11a. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-rereg-ieee-80211b	Total number of refresh registrations received at CSCF with access technology IEEE-802.11b. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-rereg-other-at	Total number of refresh registrations received at CSCF for any other access technology. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-rereg	Total number of success responses sent for refresh registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
perf-succ-rereg-3gpp-geran	Total number of success responses sent for refresh registration with access technology 3GPP-GERAN. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-rereg-3gpp- utran- fdd	Total number of success responses sent for refresh registration with access technology 3GPP-UTRAN-FDD. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-rereg-3gpp2-1x	Total number of success responses sent for refresh registration with access technology 3GPP2-1X. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-rereg-ieee- 80211a	Total number of success responses sent for refresh registration with access technology IEEE-802.11a. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-rereg-ieee- 80211b	Total number of success responses sent for refresh registration with access technology IEEE-802.11b. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-rereg-other	Total number of success responses sent for refresh registration for any other access technology. Applicable only for P-CSCF. Type: Counter	Int64
perf-fail-rereg	Total number of failure responses sent for refresh registration. Applicable only for P-CSCF & S-CSCF Type: Counter	Int64
perf-fail-rereg-401	Total number of (401 Unauthorized) failure responses sent for refresh registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-rereg-403	Total number of (403 Forbidden) failure responses sent for refresh registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-rereg-404	Total number of (404 Not Found) failure responses sent for refresh registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-rereg-420	Total number of (420 Bad Extension) failure responses sent for refresh registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-rereg-500	Total number of (500 Internal Error) failure responses sent for refresh registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64

Variables	Description	Data Type
perf-fail-rereg-other	Total number of other failure responses sent for refresh registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-att-dereg-ue	Total number of de-registrations received from UE at CSCF. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-att-dereg-ue-3gpp-geran	Total number of de-registrations received from UE at CSCF with access technology 3GPP-GERAN. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-dereg-ue-3gpp-utran-fdd	Total number of de-registrations received from UE at CSCF with access technology 3GPP-UTRAN-FDD. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-dereg-ue-3gpp2-1x	Total number of de-registrations received from UE at CSCF with access technology 3GPP2-1X. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-dereg-ue-ieee-80211a	Total number of de-registrations received from UE at CSCF with access technology IEEE-802.11a. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-dereg-ue-ieee-80211b	Total number of de-registrations received from UE at CSCF with access technology IEEE-802.11b. Applicable only for P-CSCF. Type: Counter	Int64
perf-att-dereg-ue-other-at	Total number of de-registrations received from UE at CSCF for any other access technology. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-dereg-ue	Total number of success responses sent for de-registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-succ-dereg-ue-3gpp-geran	Total number of success responses sent for de-registration with access technology 3GPP-GERAN. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-dereg-ue-3gpp-utran-fdd	Total number of success responses sent for de-registration with access technology 3GPP-UTRAN-FDD. Applicable only for P-CSCF. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
perf-succ-dereg-ue-3gpp2-1x	Total number of success responses sent for de-registration with access technology 3GPP2-1X. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-dereg-ue-ieee-80211a	Total number of success responses sent for de-registration with access technology IEEE-802.11a. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-dereg-ue-ieee-80211b	Total number of success responses sent for de-registration with access technology IEEE-802.11b. Applicable only for P-CSCF. Type: Counter	Int64
perf-succ-dereg-ue-other	Total number of success responses sent for de-registration for any other access technology. Applicable only for P-CSCF. Type: Counter	Int64
perf-fail-dereg-ue	Total number of failure responses sent for de-registration. Applicable only for P-CSCF & S-CSCF Type: Counter	Int64
perf-fail-dereg-ue-401	Total number of (401 Unauthorized) failure responses sent for de-registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-dereg-ue-403	Total number of (403 Forbidden) failure responses sent for de-registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-dereg-ue-404	Total number of (404 Not Found) failure responses sent for de-registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-dereg-ue-420	Total number of (420 Bad Extension) failure responses sent for de-registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-dereg-ue-500	Total number of (500 Internal Error) failure responses sent for de-registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-fail-dereg-ue-other	Total number of other failure responses sent for de-registration. Applicable only for P-CSCF & S-CSCF. Type: Counter	Int64
perf-att-dereg-hss	Total number of de-registrations initiated by HSS at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-succ-dereg-hss	Total number of success responses for de-registrations initiated by HSS at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64

Variables	Description	Data Type
perf-fail-dereg-hss	Total number of failure responses for de-registrations initiated by HSS at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-hss-401	Total number of (401 Unauthorized) failure responses for de-registrations initiated by HSS at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-hss-403	Total number of (403 Forbidden) failure responses for de-registrations initiated by HSS at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-hss-404	Total number of (404 Not Found) failure responses for de-registrations initiated by HSS at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-hss-420	Total number of (420 Bad Extension) failure responses for de-registrations initiated by HSS at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-hss-500	Total number of (500 Internal Error) failure responses for de-registrations initiated by HSS at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-hss-other	Total number of other failure responses for de-registrations initiated by HSS at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-att-dereg-serv	Total number of de-registrations initiated by Service Platform at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-succ-dereg-serv	Total number of success responses for de-registrations initiated by Service Platform at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-serv	Total number of failure responses for de-registrations initiated by Service Platform at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-serv-401	Total number of (401 Unauthorized) failure responses for de-registrations initiated by Service Platform at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
perf-fail-dereg-serv-403	Total number of (403 Forbidden) failure responses for de-registrations initiated by Service Platform at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-serv-404	Total number of (404 Not Found) failure responses for de-registrations initiated by Service Platform at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-serv-420	Total number of (420 Bad Extension) failure responses for de-registrations initiated by Service Platform at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-serv-500	Total number of (500 Internal Error) failure responses for de-registrations initiated by Service Platform at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-dereg-serv-other	Total number of other failure responses for de-registrations initiated by Service Platform at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-att-3rdparty-reg	Total number of 3rd Party registrations initiated by S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-succ-3rdparty-reg	Total number of success responses for 3rd party registrations initiated by S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-3rdparty-reg	Total number of failure responses for 3rd party registrations initiated by S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-3rdparty-reg-401	Total number of (401 Unauthorized) failure responses for 3rd party registrations initiated by S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-3rdparty-reg-403	Total number of (403 Forbidden) failure responses for 3rd party registrations initiated by S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-3rdparty-reg-404	Total number of (404 Not Found) failure responses for 3rd party registrations initiated by S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64

Variables	Description	Data Type
perf-fail-3rdparty-reg-420	Total number of (420 Bad Extension) failure responses for 3rd party registrations initiated by S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-3rdparty-reg-500	Total number of (500 Internal Error) failure responses for 3rd party registrations initiated by S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-3rdparty-reg-other	Total number of other failure responses for 3rd party registrations initiated by S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-att-uar	Total number of user registration status query procedures attempted at I-CSCF. Applicable only for I-CSCF. Type: Counter	Int64
perf-succ-uaa	Total number of success response for user registration status queries attempted at I-CSCF. Applicable only for I-CSCF. Type: Counter	Int64
perf-fail-uaa	Total number of failure response for user registration status queries attempted at I-CSCF. Applicable only for I-CSCF. Type: Counter	Int64
perf-att-sar	Total number of S-CSCF registration/de-registration notification procedures. Applicable only for S-CSCF. Type: Counter	Int64
perf-succ-saa	Total number of success responses for S-CSCF registration/de-registration notification procedures. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-saa	Total number of failure responses for S-CSCF registration/de-registration notification procedures. Applicable only for S-CSCF. Type: Counter	Int64
perf-att-session	Total number of attempted session establishments at CSCF. Type: Counter	Int64
perf-succ-session-180	Total number of 180 responses for successful session establishments at CSCF. Type: Counter	Int64
perf-succ-session-200	Total number of 200 responses (without 180 response) for successful session establishments at CSCF. Type: Counter	Int64
perf-ans-session	Total number of 200 responses for session establishments at CSCF. Type: Counter	Int64

■ Common Syntax Options

Variables	Description	Data Type
perf-fail-session	Total number of failure responses for session establishments at CSCF. Type: Counter	Int64
perf-att-lir	Total number of user location query procedures attempted at I-CSCF. Applicable only for I-CSCF. Type: Counter	Int64
perf-succ-lia	Total number of success responses for user location queries attempted at I-CSCF. Applicable only for I-CSCF. Type: Counter	Int64
perf-fail-lia	Total number of failure responses for user location queries attempted at I-CSCF. Applicable only for I-CSCF. Type: Counter	Int64
perf-att-session-frm-oth-domain	Total number of session establishments from users of other domains. Applicable only for I-CSCF & S-CSCF. Type: Counter	Int64
perf-frbdn-session-frm-oth-domain	Total number of forbidden sessions for session establishments from users of other domains. Applicable only for I-CSCF & S-CSCF. Type: Counter	Int64
perf-att-session-to-oth-domain	Total number of session establishments to users of other domains. Applicable only for I-CSCF & S-CSCF. Type: Counter	Int64
perf-frbdn-session-to-oth-domain	Total number of forbidden sessions for session establishments to users of other domains. Applicable only for I-CSCF & S-CSCF. Type: Counter	Int64
perf-att-init-reg-visited	Total number of initial registrations of visiting users from other IMS network domains. Applicable only for P-CSCF. Type: Counter	Int64
perf-frbdn-init-reg-visited	Total number of forbidden messages sent for the visiting users. Applicable only for P-CSCF. Type: Counter	Int64
perf-rmg-users-out	Total number of roaming users to other network domains. Applicable only for S-CSCF. Type: Counter	Int64
perf-att-mar	Total number of Multimedia-Authentication-Requests attempted. Applicable only for S-CSCF. Type: Counter	Int64
perf-succ-maa	Total number of successful Multimedia-Authentication-Answers received. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-maa	Total number of failure Multimedia-Authentication-Answers received. Applicable only for S-CSCF. Type: Counter	Int64

Variables	Description	Data Type
perf-att-ppr	Total number of HSS-initiated user profile updates attempted. Applicable only for S-CSCF. Type: Counter	Int64
perf-succ-ppa	Total number of success responses for HSS-initiated user profile update. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-ppa	Total number of failure responses for HSS-initiated user profile update. Applicable only for S-CSCF. Type: Counter	Int64
perf-att-subscribe	Total number of subscription procedures attempted at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-succ-subscribe	Total number of success responses for subscriptions. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-subscribe	Total number of failure responses for subscriptions. Applicable only for S-CSCF. Type: Counter	Int64
perf-att-notify	Total number of notify procedures attempted at S-CSCF. Applicable only for S-CSCF. Type: Counter	Int64
perf-succ-notify	Total number of success responses for notify. Applicable only for S-CSCF. Type: Counter	Int64
perf-fail-notify	Total number of failure responses for notify. Applicable only for S-CSCF. Type: Counter	Int64
de2a-session-init	Total number of DE2A sessions initiated by sending UDR message. Type: Counter	Int32
de2a-session-active	Total number of DE2A sessions currently active. Type: Counter	Int32
de2a-udr-sent	Total number UDR messages sent. Type: Counter	Int32
de2a-uda-received	Total number of UDA messages received Type: Counter	Int32
de2a-uda-err-3xxx	Total number of messages with protocol errors. Type: Counter	Int32
de2a-uda-parse-err	Total number of bad UDA messages received. Type: Counter	Int32

Variables	Description	Data Type
de2a-udr-err	Total number of UDR send errors. Type: Counter	Int32
 IMPORTANT: For information on statistics that are common to all schema see the <i>Statistics and Counters Overview</i> chapter.		

Chapter 14

CSCFINTF Schema Statistics

The CSCFINTF schema provides operational statistics that can be used for monitoring and troubleshooting the following products: SCM

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 14. Bulk Statistic Variables in the CSCFINTF Schema

Variables	Description	Data Type
-----------	-------------	-----------

Common Syntax Options

Variables	Description	Data Type
vpnname	VPN Name This is a key variable. Type: Information	String
vpnid	VPN ID This is a key variable. Type: Information	Int32
svcname	Service Name This is a key variable. Type: Information	String
svcid	Service ID This is a key variable. Type: Information	Int32
peer-ipaddr	Peer Ip-address Type: Information	String
peer-domain	Peer Domain Name Type: Information	String
regreqrx	Total number of Register requests received. Type: Counter	Int64
regreqtx	Total number of Register requests transmitted. Type: Counter	Int64
invreqrx	Total number of Invite requests received. Type: Counter	Int64
invreqtx	Total number of Invite requests transmitted. Type: Counter	Int64
ackreqrx	Total number of ACK requests received. Type: Counter	Int64
ackreqtx	Total number of ACK requests transmitted. Type: Counter	Int64
byereqrx	Total number of Bye requests received. Type: Counter	Int64
byereqtx	Total number of Bye requests transmitted. Type: Counter	Int64
cancreqrx	Total number of Cancel requests received. Type: Counter	Int64
cancreqtx	Total number of Cancel requests transmitted. Type: Counter	Int64
optreqrx	Total number of Options requests received. Type: Counter	Int64
optreqtx	Total number of Options requests transmitted. Type: Counter	Int64

Variables	Description	Data Type
prackreqrx	Total number of PRACK requests received. Type: Counter	Int64
prackreqtx	Total number of PRACK requests transmitted. Type: Counter	Int64
subreqrx	Total number of Subscribe requests received. Type: Counter	Int64
subreqtx	Total number of Subscribe requests transmitted. Type: Counter	Int64
notreqrx	Total number of Notify requests received. Type: Counter	Int64
notreqtx	Total number of Notify requests transmitted. Type: Counter	Int64
refreqrx	Total number of Refer requests received. Type: Counter	Int64
refreqtx	Total number of Refer requests transmitted. Type: Counter	Int64
inforeqrx	Total number of Info requests received. Type: Counter	Int64
inforeqtx	Total number of Info requests transmitted. Type: Counter	Int64
updregrx	Total number of Update requests received. Type: Counter	Int64
updregrtx	Total number of Update requests transmitted. Type: Counter	Int64
msgreqrx	Total number of Message requests received. Type: Counter	Int64
msgreqtx	Total number of Message requests transmitted. Type: Counter	Int64
pubreqrx	Total number of Publish requests received. Type: Counter	Int64
pubreqtx	Total number of Publish requests transmitted. Type: Counter	Int64
trysprx	Total number of Trying responses received. Type: Counter	Int64
trysptx	Total number of Trying responses transmitted. Type: Counter	Int64
rngrsprx	Total number of Ringing responses received. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
rngrsptx	Total number of Ringing responses transmitted. Type: Counter	Int64
fwdrsprx	Total number of Forwarded responses received. Type: Counter	Int64
fwdrsptx	Total number of Forwarded responses transmitted. Type: Counter	Int64
quersprx	Total number of Queued responses received. Type: Counter	Int64
quersptx	Total number of Queued responses transmitted. Type: Counter	Int64
prgrsprx	Total number of Progress responses received. Type: Counter	Int64
prgrsptx	Total number of Progress responses transmitted. Type: Counter	Int64
200-rsprx	Total number of 200 OK responses received. Type: Counter	Int64
200-rsptx	Total number of 200 OK responses transmitted. Type: Counter	Int64
202-rsprx	Total number of 202 Accepted responses received. Type: Counter	Int64
202-rsptx	Total number of 202 Accepted responses transmitted. Type: Counter	Int64
mchrsprx	Total number of Multiple Choices responses received. Type: Counter	Int64
mchrsptx	Total number of Multiple Choices responses transmitted. Type: Counter	Int64
mpersprx	Total number of Moved Permanently responses received. Type: Counter	Int64
mpersptx	Total number of Moved Permanently responses transmitted. Type: Counter	Int64
mtersprx	Total number of Moved Temporarily responses received. Type: Counter	Int64
mtersptx	Total number of Moved Temporarily responses transmitted. Type: Counter	Int64
upxrsprx	Total number of Use Proxy responses received. Type: Counter	Int64
upxrsptx	Total number of Use Proxy responses transmitted. Type: Counter	Int64

Variables	Description	Data Type
altrsprx	Total number of Alternative Service responses received. Type: Counter	Int64
altrsptx	Total number of Alternative Service responses transmitted. Type: Counter	Int64
brqerrrx	Total number of BadRequest errors received. Type: Counter	Int64
brqerrtx	Total number of BadRequest errors transmitted. Type: Counter	Int64
uauerrrx	Total number of Unauthorized errors received. Type: Counter	Int64
uauerrtx	Total number of Unauthorized errors transmitted. Type: Counter	Int64
prerrrx	Total number of Payment Required Errors received. Type: Counter	Int64
prerrtx	Total number of Payment Required Errors transmitted. Type: Counter	Int64
forerrrx	Total number of Forbidden errors received. Type: Counter	Int64
forerrtx	Total number of Forbidden errors transmitted. Type: Counter	Int64
nfderrrx	Total number of NotFound errors received. Type: Counter	Int64
nfderrtx	Total number of NotFound errors transmitted. Type: Counter	Int64
mnaerrrx	Total number of MethodNotAllowed errors received. Type: Counter	Int64
mnaerrtx	Total number of MethodNotAllowed errors transmitted. Type: Counter	Int64
nac406errrx	Total number of NotAcceptable(406) errors received. Type: Counter	Int64
nac406errtx	Total number of NotAcceptable(406) errors transmitted. Type: Counter	Int64
parerrrx	Total number of ProxyAuthRequired errors received. Type: Counter	Int64
parerrtx	Total number of ProxyAuthRequired errors transmitted. Type: Counter	Int64
rtoerrrx	Total number of RequestTimeout errors received. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
rtoerrtx	Total number of RequestTimeout errors transmitted. Type: Counter	Int64
conferrrx	Total number of Conflict Errors received. Type: Counter	Int64
conferrtx	Total number of Conflict Errors transmitted. Type: Counter	Int64
lrerrrx	Total number of Length Required Errors received. Type: Counter	Int64
lrerrtx	Total number of Length Required Errors transmitted. Type: Counter	Int64
gonerrrx	Total number of Gone errors received. Type: Counter	Int64
gonerrtx	Total number of Gone errors transmitted. Type: Counter	Int64
crferrrx	Total number of ConditionalRequestFail errors received. Type: Counter	Int64
crferrtx	Total number of ConditionalRequestFail errors transmitted. Type: Counter	Int64
relerrrx	Total number of RequestEntityTooLarge errors received. Type: Counter	Int64
relerrtx	Total number of RequestEntityTooLarge errors transmitted. Type: Counter	Int64
rulerrrx	Total number of RequestURITooLong errors received. Type: Counter	Int64
rulerrtx	Total number of RequestURITooLong errors transmitted. Type: Counter	Int64
umterrxx	Total number of UnsupportedMediaType errors received. Type: Counter	Int64
umterrxx	Total number of UnsupportedMediaType errors transmitted. Type: Counter	Int64
uuserxx	Total number of Unsupported URI Scheme errors received. Type: Counter	Int64
uuserxx	Total number of Unsupported URI Scheme errors transmitted. Type: Counter	Int64
bexerrxx	Total number of BadExtension errors received. Type: Counter	Int64
bexerrxx	Total number of BadExtension errors transmitted. Type: Counter	Int64

Variables	Description	Data Type
exrerrrx	Total number of Extension Required errors received. Type: Counter	Int64
exrerrtx	Total number of Extension Required errors transmitted. Type: Counter	Int64
siterrrx	Total number of Session Interval Too Small errors received. Type: Counter	Int64
siterrtx	Total number of Session Interval Too Small errors transmitted. Type: Counter	Int64
itberrrx	Total number of Interval Too Brief errors received. Type: Counter	Int64
itberrtx	Total number of Interval Too Brief errors transmitted. Type: Counter	Int64
fhloerrrx	Total number of First Hop Lack Outbound errors received. Type: Counter	Int64
fhloerrtx	Total number of First Hop Lack Outbound errors transmitted. Type: Counter	Int64
blierrrx	Total number of Bad Location Information errors received. Type: Counter	Int64
blierrtx	Total number of Bad Location Information errors transmitted. Type: Counter	Int64
tnaerrrx	Total number of TempNotAvailable errors received. Type: Counter	Int64
tnaerrtx	Total number of TempNotAvailable errors transmitted. Type: Counter	Int64
tdnerrrx	Total number of Transaction Does Not Exist errors received. Type: Counter	Int64
tdnerrtx	Total number of Transaction Does Not Exist errors transmitted. Type: Counter	Int64
ldterrrx	Total number of LoopDetected errors received. Type: Counter	Int64
ldterrtx	Total number of LoopDetected errors transmitted. Type: Counter	Int64
tmherrrx	Total number of TooManyHops errors received. Type: Counter	Int64
tmherrtx	Total number of TooManyHops errors transmitted. Type: Counter	Int64
adierrrx	Total number of AddrIncomplete errors received. Type: Counter	Int64

Variables	Description	Data Type
adierrtx	Total number of AddrIncomplete errors transmitted. Type: Counter	Int64
amberrrx	Total number of Ambiguous errors received. Type: Counter	Int64
amberrtx	Total number of Ambiguous errors transmitted. Type: Counter	Int64
bhrerrrx	Total number of BusyHere errors received. Type: Counter	Int64
bhrerrtx	Total number of BusyHere errors transmitted. Type: Counter	Int64
rqcerrrx	Total number of RequestCancel errors received. Type: Counter	Int64
rqcerrtx	Total number of RequestCancel errors transmitted. Type: Counter	Int64
namerrrx	Total number of NotAcceptableMedia errors received. Type: Counter	Int64
namerrtx	Total number of NotAcceptableMedia errors transmitted. Type: Counter	Int64
beerrrx	Total number of BusyEverywhere errors received. Type: Counter	Int64
beertrtx	Total number of BusyEverywhere errors transmitted. Type: Counter	Int64
trperrrx	Total number of Request Pending errors received. Type: Counter	Int64
trperrtx	Total number of Request Pending errors transmitted. Type: Counter	Int64
udperrrx	Total number of Undecipherable errors received. Type: Counter	Int64
udperrtx	Total number of Undecipherable errors transmitted. Type: Counter	Int64
sarerrrx	Total number of Sec-agree Required errors received. Type: Counter	Int64
sarerrtx	Total number of Sec-agree Required errors transmitted. Type: Counter	Int64
ineerrrx	Total number of InternalError errors received. Type: Counter	Int64
ineerrtx	Total number of InternalError errors transmitted. Type: Counter	Int64

Variables	Description	Data Type
nimerrrx	Total number of NotImplemented errors received. Type: Counter	Int64
nimerrtx	Total number of NotImplemented errors transmitted. Type: Counter	Int64
bgterrxx	Total number of BadGateway errors received. Type: Counter	Int64
bgterrxt	Total number of BadGateway errors transmitted. Type: Counter	Int64
suaerrrx	Total number of ServiceUnavailable errors received. Type: Counter	Int64
suaerrtx	Total number of ServiceUnavailable errors transmitted. Type: Counter	Int64
gtterrxx	Total number of GatewayTimeout errors received. Type: Counter	Int64
gtterrxt	Total number of GatewayTimeout errors transmitted. Type: Counter	Int64
bsverrxx	Total number of BadSipVersion errors received. Type: Counter	Int64
bsverrxt	Total number of BadSipVersion errors transmitted. Type: Counter	Int64
mtlerrxx	Total number of Message Too Large errors received. Type: Counter	Int64
mtlerrxt	Total number of Message Too Large errors transmitted. Type: Counter	Int64
pcferrxx	Total number of Precondition Failure errors received. Type: Counter	Int64
pcferrxt	Total number of Precondition Failure errors transmitted. Type: Counter	Int64
bewerrxx	Total number of BusyEverywhere errors received. Type: Counter	Int64
bewerrxt	Total number of BusyEverywhere errors transmitted. Type: Counter	Int64
decerrxx	Total number of Decline errors received. Type: Counter	Int64
decerrxt	Total number of Decline errors transmitted. Type: Counter	Int64
neaerrxx	Total number of NotExistAnywhere errors received. Type: Counter	Int64

Common Syntax Options

Variables	Description	Data Type
neaerrtx	Total number of NotExistAnywhere errors transmitted. Type: Counter	Int64
nac606errrx	Total number of NotAcceptable(606) errors received. Type: Counter	Int64
nac606errtx	Total number of NotAcceptable(606) errors transmitted. Type: Counter	Int64
mo-call-succ-rate	Mobile Originating calls success rate. Type: Gauge	Float
mt-call-succ-rate	Mobile Terminating calls success rate. Type: Gauge	Float
mo-voice-call-succ-rate	Mobile Originating VOICE calls success rate. Type: Gauge	Float
mt-voice-call-succ-rate	Mobile Terminating VOICE calls success rate. Type: Gauge	Float
mo-video-call-succ-rate	Mobile Originating VIDEO calls success rate. Type: Gauge	Float
mt-video-call-succ-rate	Mobile Terminating VIDEO calls success rate. Type: Gauge	Float

 **IMPORTANT:** For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 15

DCCA Schema Statistics

The Diameter Credit Control Application (DCCA) schema provides operational statistics that can be used for monitoring and troubleshooting Gy interface functionality used by the following products:

- GGSN
- HA
- IPSP
- PDSN
- P-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 15. Bulk Statistic Variables in the DCCA Schema

Variables	Description	Data Type
vpnname	Description: Name of the context facilitating the DCCA configuration. This is a key variable. Availability: Per system Type: Information	String
vpnid	Description: Identifier of the context currently facilitating the DCCA configuration. This is an internal reference number. This is a key variable. Availability: Per system Type: Information	Int32
ipaddr	Description: IP address of the server for which statistics are being collected. The IP address can be specified in IPv4 or IPv6 notation. This is a key variable. Availability: Per system Type: Information	String
port	Description: The port being used for exchange of data. This is a key variable. Availability: Per system Type: Information	Int32
ccr-inisent	Description: Total number of Credit Control Request-Initial (CCR-Initial) messages sent. Triggers: Increments when the CCR-Initial message is successfully sent from the system Availability: Per Gy server	Int32
cca-inirec	Description: Total number of Credit Control Answer-Initial (CCA-Initial) messages received. Triggers: Increments when the CCA-Initial message is successfully received Availability: Per Gy server	Int32
cca-initimeout	Description: Total number of CCA-Initial message timeouts. Triggers: Increments when the CCA-Initial message response timeout occurs Availability: Per Gy server	Int32
ccr-updsent	Description: Total number of CCR-Update messages sent. Triggers: Increments when the CCR-Update message is successfully sent from the system Availability: Per Gy server	Int32
cca-updrec	Description: Total number of CCA-Update messages received. Triggers: Increments when the CCA-Update message is successfully received Availability: Per Gy server	Int32
cca-upvertimeout	Description: Total number of CCA-Update message timeouts. Triggers: Increments when the CCA-Update message response timeout occurs Availability: Per Gy server	Int32
ccr-tersent	Description: Total number of CCR-Terminate messages sent. Triggers: Increments when the CCR-Terminate message is successfully sent from the system Availability: Per Gy server	Int32

Variables	Description	Data Type
cca-terrec	Description: Total number of CCA-Terminate messages received. Triggers: Increments when the CCA-Terminate message is successfully received Availability: Per Gy server	Int32
cca-tertimeout	Description: Total number of CCA-Terminate message timeouts. Triggers: Increments when the CCA-Terminate message response timeout occurs Availability: Per Gy server	Int32
reauth-anssent	Description: Total number of Re-Authorization Answer messages sent. Triggers: Increments when the RAA message is successfully sent from the system Availability: Per Gy server	Int32
reauth-reqrec	Description: Total number of Re-Authorization Request messages received. Triggers: Increments when the RAR message is received Availability: Per Gy server	Int32
 IMPORTANT: For information on statistics that are common to all schema see the <i>Statistics and Counters Overview</i> chapter.		

Chapter 16

Diameter Accounting Schema Statistics

The Diameter Accounting schema provides operational statistics that can be used for monitoring and troubleshooting Rf interface functionality used by the following products:

- GGSN
- HSGW
- P-GW
- SCM

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 16. Bulk Statistic Variables in the Diameter Accounting Schema

Variables	Description	Data Type
vpnid	Description: The identification number of the context currently facilitating Diameter Accounting configuration. This is a key variable. Triggers: This statistics is updated whenever a new VPN is configured. Availability: Per system Type: Information	Int32
vpnname	Description: The name of the context currently facilitating Diameter Accounting configuration. This is a key variable. Triggers: This statistics is updated whenever a new VPN is configured. Availability: Per system Type: Information	String
ipaddr	Description: IP address of the server for which statistics are being collected. The IP address can be specified in IPv4 or IPv6 notation. This is a key variable. Triggers: This statistics is updated whenever a new Authentication Server is configured. Availability: Per system Type: Information	String
port	Description: The server port being used for exchange of data. This is a key variable. Triggers: This statistics is updated whenever a new Authentication Server is configured. Availability: Per system Type: Information	Int32
servertype	Description: The type of server for which statistics are being collected. Triggers: This statistics is updated whenever a new Authentication Server is configured. Availability: Per system Type: Information	String
group	Description: The name of the AAA Server Group. Triggers: This statistics is updated whenever a new AAA Server group is configured. Availability: Per system Type: Information	String
req-sent	Description: The total number of Accounting Request messages sent. Triggers: Increments when a ACR is sent Availability: Per AAAMgr instance	Int32
req-retried	Description: The total number of Accounting Requests retried. Triggers: Increments when a ACR is retried Availability: Per AAAMgr instance	Int32
rsp-rcvd	Description: The total number of Accounting Responses received. Triggers: Increments when a ACA is received Availability: Per AAAMgr instance	Int32
req-timeout	Description: The total number of Accounting Requests timed out. Triggers: Increments when a ACR is timed out Availability: Per AAAMgr instance	Int32

Variables	Description	Data Type
rsp-bad-resp	Description: The total number of bad response messages received. Triggers: Increments when a ACA is received with wrong AVPs Availability: Per AAAMgr instance	Int32
rsp-malformed	Description: The total number of malformed messages received. Triggers: Increments when a ACA is received with malformed AVPs Availability: Per AAAMgr instance	Int32
rsp-dropped	Description: The total number of dropped messages received. Triggers: Increments when a ACA is dropped Availability: Per AAAMgr instance	Int32
start-sent	Description: The total number of Accounting Start messages sent. Triggers: Increments when a ACR-START is sent Availability: Per AAAMgr instance	Int32
stop-sent	Description: The total number of Accounting Stop messages sent. Triggers: Increments when a ACR-STOP is sent Availability: Per AAAMgr instance	Int32
interim-sent	Description: The total number of Accounting Interim messages sent. Triggers: Increments when a ACR-INTERIM is sent Availability: Per AAAMgr instance	Int32
start-retries	Description: The total number of retries for Accounting Start messages. Triggers: Increments when a ACR-START is retried Availability: Per AAAMgr instance	Int32
stop-retries	Description: The total number of retries for Accounting Stop messages. Triggers: Increments when a ACR-STOP is retried Availability: Per AAAMgr instance	Int32
interim-retries	Description: The total number of retries for Accounting Interim messages. Triggers: Increments when a ACR-INTERIM is retried Availability: Per AAAMgr instance	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 17

Diameter Authentication Schema Statistics

The Diameter Authentication schema provides operational statistics that can be used for monitoring and troubleshooting Diameter authentication functionality for STa, S6b, EAP, and so on used the following products:

- GGSN
- HSGW
- P-GW
- SCM

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 17. Bulk Statistic Variables in the Diameter Authentication Schema

Variables	Description	Data Type
vpnid	Description: The identification number of the context currently facilitating Diameter Authentication configuration. This is a key variable. Triggers: This statistics is updated whenever a new VPN is configured. Availability: Per system Type: Information	Int32
vpnname	Description: The name of the context currently facilitating Diameter Authentication configuration. This is a key variable. Triggers: This statistics is updated whenever a new VPN is configured. Availability: Per system Type: Information	String
ipaddr	Description: The IP address of the server for which statistics are being collected. The IP address can be specified in IPv4 or IPv6 notation. This is a key variable. Triggers: This statistics is updated whenever a new Authentication Server is configured. Availability: Per system Type: Information	String
port	Description: The server port being used for exchange of data. This is a key variable. Triggers: This statistics is updated whenever a new Authentication Server is configured. Availability: Per system Type: Information	Int32
servertype	Description: The type of server for which statistics are being collected. Triggers: This statistics is updated whenever a new Authentication Server is configured. Availability: Per system Type: Information	String
group	Description: The name of the AAA Server Group. Triggers: This statistics is updated whenever a new AAA Server group is configured. Availability: Per system Type: Information	String
der-req-id-sent	Description: The total number of Diameter-EAP-Request (DER) messages sent. Triggers: Increments when a DER message is sent Availability: Per AAAMgr instance	Int32
der-req-aka-chal-sent	Description: The total number of DER-request-AKA-CHALLENGE messages sent. Triggers: Increments when a DER message is sent with AKA-Challenge Availability: Per AAAMgr instance	Int32
der-req-retried	Description: The total number of retries for DER messages. Triggers: Increments when a DER message is retried Availability: Per AAAMgr instance	Int32

Variables	Description	Data Type
dea-chal-rcvd	Description: The total number of DEA Challenge messages received. Triggers: Increments when a DEA message is received with EAP-Challenge Availability: Per AAAMgr instance	Int32
dea-acpt-rcvd	Description: The total number of DEA Accept messages received. Triggers: Increments when a DEA is received with Result-Code value as 2001 Availability: Per AAAMgr instance	Int32
dea-timeout	Description: The total number of DEA timeout messages. Triggers: Increments when a DEA is timed out Availability: Per AAAMgr instance	Int32
dea-badauth	Description: The total number of DEA Bad-Authentication messages. Triggers: Increments when a DEA is received with malformed or wrong AVPs Availability: Per AAAMgr instance	Int32
dea-malformed	Description: The total number of DEA Malformed messages. Triggers: Increments when a DEA is received with malformed version, length, or command-code, etc. Availability: Per AAAMgr instance	Int32
dea-malformed-avp	Description: The total number of DEA Malformed AVP messages. Triggers: Increments when a DEA is received with malformed AVP Availability: Per AAAMgr instance	Int32
dea-dropped	Description: The total number of dropped DEA messages. Triggers: Increments when a DEA is dropped Availability: Per AAAMgr instance	Int32
rar-req-rcvd	Description: The total number of Re-Auth-Request (RAR) messages received. Triggers: Increments when a RAR is received Availability: Per AAAMgr instance	Int32
raa-ans-acpt-sent	Description: The total number of Re-Auth-Answer (RAA) messages sent. Triggers: Increments when a RAA is sent Availability: Per AAAMgr instance	Int32
aar-req-sent	Description: The total number of AAR messages sent. Triggers: Increments when a AAR is sent Availability: Per AAAMgr instance	Int32
str-req-sent	Description: The total number of STR requests sent. Triggers: Increments when a STR is sent Availability: Per AAAMgr instance	Int32
str-req-retried	Description: The total number of retries for STR messages. Triggers: Increments when a STR is retried Availability: Per AAAMgr instance	Int32
sta-ans-acpt-rcvd	Description: The total number of received STA messages. Triggers: Increments when a STA is received Availability: Per AAAMgr instance	Int32

■ Common Syntax Options

Variables	Description	Data Type
asr-req-rcvd	Description: The total number of ASR requests received. Triggers: Increments when a ASR is received Availability: Per AAAMgr instance	Int32
asa-rsp-accept-sent	Description: The total number of ASA Messages sent. Triggers: Increments when a ASA is sent Availability: Per AAAMgr instance	Int32
asa-rsp-rej-sent	Description: Total number of Abort-Session-Response sent with error Result-Code. Triggers: Increments when ASA is sent with failure result-code Availability: Per AAAMgr instance	Int32
req-sock-write-err	Description: Total number of socket write failed for Diameter requests. Triggers: Increments when write failure is returned from socket for a Diameter request. Availability: Per Diameter TCP/SCTP connection	Int32
rsp-sock-write-err	Description: Total number of socket write failed for Diameter responses. Triggers: Increments when write failure is returned from socket for a Diameter response. Availability: Per Diameter TCP/SCTP connection	Int32
any-sock-read-err	Description: Total number of socket read failed for Diameter messages. Triggers: Increments when read failure is returned from socket for a Diameter message. Availability: Per Diameter TCP/SCTP connection	Int32
rem-disconnect	Description: Total number of TCP/SCTP connections disconnected from remote peer. Triggers: Increments when a connection is disconnected from a remote peer. Availability: Per Diameter TCP/SCTP connection	Int32
loc-disconnect	Description: Total number of TCP/SCTP connections disconnected locally. Triggers: Increments when a connection is disconnected locally. Availability: Per Diameter TCP/SCTP connection	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 18

DLCI-Util Schema Statistics

This schema provides DLCI (data link connection) utilization statistics that can be used for monitoring and troubleshooting the following products: SGSN with CLC-type line cards

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 18. Bulk Statistic Variables in the DLCI-Util Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
card	Description: Identifies the card for which statistics are being collected. The ID is based on the chassis slot number (17-48) where the channelized line card (CLC2) resides. This is a key variable. Triggers: N/A Availability: N/A Type: Information	Int32
port	Description: Identifies the port number (1 - 4) for which the statistics are being collected and displayed. This is a key variable. Triggers: N/A Availability: N/A Type: Information	Int32
dldci_util_path	Description: Identifies a logical Frame Relay path associated with the port. Valid range is 1 to 3. Triggers: N/A Availability: N/A Type: Gauge	Int32
dldci_util_ds1e1	Description: Identifies the type of connection, E1 or T1, associated with this path. Triggers: N/A Availability: N/A Type: Gauge	Int32
dldci_util_timeslot	Description: Identifies the timeslot configured for this E1/T1 connection. Triggers: N/A Availability: N/A Type: Gauge	Int32
dldci_util_dldci_no	Description: Indicates a specific data link connection identifier (DLCI) for which the utilization information will be displayed. Triggers: N/A Availability: N/A Type: Gauge	Int32
dldci_util_nsvc	Description: Identifies a specific network service virtual circuit (NSVC) associated with the DLCI. Triggers: N/A Availability: N/A Type: Gauge	Int32
dldci_util_nse	Description: Identifies the specific network service entity (NSE) associated with the DLCI. Triggers: N/A Availability: N/A Type: Gauge	Int32
dldci_util_dldci_curr_rx	Description: Indicates the current average number of kbps of received traffic via the DLCI. Triggers: Collects the Rx byte statistic when a message is received. Availability: per CLC2 Type: Gauge	Int64

Variables	Description	Data Type
dldci_util_dldci_curr_tx	Description: Indicates the current average number of kbps of transmitted traffic via the DLCI. Triggers: Collects the Tx byte statistic when a message is transmitted. Availability: per CLC2 Type: Gauge	Int64
dldci_util_dldci_5min_rx	Description: Indicates the average number of kbps of received traffic via the DLCI in a 5 minute period. Triggers: N/A Availability: per CLC2 Type: Gauge	Int64
dldci_util_dldci_5min_tx	Description: This gauge indicates the average number of kbps of transmitted traffic via the DLCI in a 5 minute period. Triggers: N/A Availability: per CLC2 Type: Gauge	Int64
dldci_util_dldci_15min_rx	Description: This gauge indicates the average number of kbps of received traffic via the DLCI in a 15 minute period. Triggers: N/A Availability: per CLC2 Type: Gauge	Int64
dldci_util_dldci_15min_tx	Description: This gauge indicates the average number of kbps of transmitted traffic via the DLCI in a 15 minute period. Triggers: N/A Availability: per CLC2 Type: Gauge	Int64

 **IMPORTANT:** For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 19

DPCA Schema Statistics

The Diameter Policy Control Application (DPCA) schema provides operational statistics that can be used for monitoring and troubleshooting Gx interface functionality used by the following products:

- GGSN
- HA
- HSGW
- IPSG
- PDSN
- P-GW
- S-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpname%" plus

"%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 19. Bulk Statistic Variables in the DPCA Schema

Variables	Description	Data Type
vpnname	Description: Name of the context facilitating the DPCA configuration. This is a key variable. Availability: Per system Type: Information	String
vpnid	Description: The identifier of the context currently facilitating the DPCA configuration. This is an internal reference number. This is a key variable. Availability: Per system Type: Information	Int32
ipaddr	Description: IP address of the server for which statistics are being collected. The IP address can be specified in IPv4 or IPv6 notation. This is a key variable. Availability: Per system Type: Information	String
port	Description: The port being used for exchange of data. This is a key variable. Availability: Per system Type: Information	Int32
ccr-inisent	Description: Total number of Credit Control Request-Initial (CCR-Initial) messages sent. Triggers: Increments when CCR-I message is sent Availability: Per IMS authorization service	Int32
cca-inirec	Description: Total number of Credit Control Answer-Initial (CCA-Initial) messages received. Triggers: Increments when CCA-I message is received Availability: Per IMS authorization service	Int32
ccr-initimeout	Description: Total number of CCR-Initial message timeouts. Triggers: Increments when there is a Tx timeout in CCR-I message Availability: Per IMS authorization service	Int32
ccr-updsent	Description: Total number of CCR-Update messages sent. Triggers: Increments when a CCR-U message is sent Availability: Per IMS authorization service	Int32
cca-updrec	Description: Total number of CCA-Update messages received. Triggers: Increments when a CCA-U message is received Availability: Per IMS authorization service	Int32
ccr-updtimeout	Description: Total number of CCR-Update message timeouts. Triggers: Increments when there is a Tx timeout in CCR-U message Availability: Per IMS authorization service	Int32

Variables	Description	Data Type
ccr-tersent	Description: Total number of CCR-Terminate messages sent. Triggers: Increments when a CCR-T message is sent Availability: Per IMS authorization service	Int32
cca-terrec	Description: Total number of CCA-Terminate messages received. Triggers: Increments when a CCA-T message is received Availability: Per IMS authorization service	Int32
ccr-tertimeout	Description: Total number of CCR-Terminate message timeouts. Triggers: Increments when there is a Tx timeout in CCR-T message Availability: Per IMS authorization service	Int32
reauth-anssent	Description: Total number of Re-Authorization Answer messages sent. Triggers: Increments when a RAA message is sent Availability: Per IMS authorization service	Int32
reauth-reqrec	Description: Total number of Re-authorization Request messages received. Triggers: Increments when a RAR message is received Availability: Per IMS authorization service	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 20

ECS Schema Statistics

The ECS schema provides operational statistics that can be used for monitoring and troubleshooting Enhanced Charging functionality for the following products: GGSN, HA, HSGW, MVG, PDSN, P-GW, and ADC, CF, SFW, NAT, and TPO In-line services

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 20. Bulk Statistic Variables in the ECS Schema

Variables	Description	Data Type
General ECS Statistics		

Variables	Description	Data Type
ecs-subscribers	Description: The combined total of the number of subscribers who have used the ECS service previously + other subscribers currently using the ECS service. Triggers: Increments whenever a new subscriber comes up. Availability: Per Active Charging Service.	Int32
ecs-subscribers-cur	Description: The number of subscribers currently using the ECS service. Triggers: Increments whenever a new subscriber comes up. Decrements whenever a subscriber drops. Availability: Per Active Charging Service. Type: Gauge	Int32
gcdrs-generated	Description: The total number of G-CDRs generated by ECS. Triggers: Increments whenever a G-CDR is generated. Availability: Per Active Charging Service.	Int32
edrs-generated	Description: The total number of EDRs generated by ECS. Triggers: Increments whenever an EDR is generated. Availability: Per Active Charging Service.	Int32
udrs-generated	Description: The total number of UDRs generated by ECS. Triggers: Increments whenever an UDR is generated. Availability: Per Active Charging Service.	Int32
IP Analyzer Specific Statistics		
ip-flows	Description: The combined total of the number of IP flows previously analyzed + IP flows currently being analyzed. Triggers: Increments whenever a new IP flow is created. Availability: Per Active Charging Service.	Int64
ip-flows-cur	Description: The number of IP flows currently being analyzed. Triggers: Increments whenever a new IP flow is created. Decrements whenever an IP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int64
ip-uplk-bytes	Description: The total number of IP bytes detected in uplink direction (from the MS). Triggers: Increments whenever a new packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
ip-dwnlk-bytes	Description: The total number of IP bytes detected in downlink direction (to the MS). Triggers: Increments whenever a new packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
ip-uplk-pkts	Description: The total number of IP packets detected in uplink direction. Triggers: Increments whenever a new packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
ip-dwnlk-pkts	Description: The total number of IP packets detected in downlink direction. Triggers: Increments whenever a new packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
ip-uplk-pkts-frag	Description: The total number of fragmented IP packets detected in uplink direction. Triggers: Increments whenever a new fragment packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
ip-dwnlk-pkts-frag	Description: The total number of fragmented IP packets detected in downlink direction. Triggers: Increments whenever a new fragment packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
ip-uplk-bytes-frag	Description: The total number of fragmented IP bytes detected in uplink direction. Triggers: Increments whenever a new fragment packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
ip-dwnlk-bytes-frag	Description: The total number of fragmented IP bytes detected in downlink direction. Triggers: Increments whenever a new fragment packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
UDP Analyzer Specific Statistics		
udp-flows	Description: The combined total of the number of UDP flows previously analyzed + UDP flows currently being analyzed. Triggers: Increments whenever a new UDP flow is created. Availability: Per Active Charging Service.	Int32
udp-flows-cur	Description: The number of UDP flows currently being analyzed. Triggers: Increments whenever a new UDP flow is created. Decrements whenever an UDP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
udp-uplk-bytes	Description: The total number of UDP bytes detected in uplink direction (from the MS). Triggers: Increments whenever a new UDP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
udp-dwnlk-bytes	Description: The total number of UDP bytes detected in downlink direction (to the MS). Triggers: Increments whenever a new UDP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
udp-uplk-pkts	Description: The total number of UDP packets detected in uplink direction. Triggers: Increments whenever a new UDP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
udp-dwnlk-pkts	Description: The total number of UDP packets detected in downlink direction. Triggers: Increments whenever a new UDP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
udp-inv-pkts	Description: The total number of invalid UDP packets detected. Triggers: Increments whenever an invalid UDP packet is detected. Availability: Per Active Charging Service.	Int32
TCP Analyzer Specific Statistics		
tcp-flows	Description: The combined total of the number of TCP flows previously analyzed + TCP flows currently being analyzed. Triggers: Increments whenever a new TCP flow is created. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
tcp-flows-cur	Description: The number of TCP flows currently being analyzed. Triggers: Increments whenever a new TCP flow is created. Decrements whenever a TCP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
tcp-uplk-bytes	Description: The total number of TCP bytes detected in uplink direction (from the MS). Triggers: Increments whenever a new TCP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
tcp-dwnlk-bytes	Description: The total number of TCP bytes detected in downlink direction (to the MS). Triggers: Increments whenever a new TCP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
tcp-uplk-pkts	Description: The total number of TCP packets detected in uplink direction. Triggers: Increments whenever a new TCP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
tcp-dwnlk-pkts	Description: The total number of TCP packets detected in downlink direction. Triggers: Increments whenever a new TCP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
tcp-uplk-bytes-retr	Description: The total number of TCP bytes retransmitted in uplink direction. Triggers: Increments whenever a new TCP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
tcp-dwnlk-bytes-retr	Description: The total number of TCP bytes retransmitted in downlink direction. Triggers: Increments whenever a new TCP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
tcp-uplk-pkts-retr	Description: The total number of TCP packets retransmitted in uplink direction. Triggers: Increments whenever a new TCP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
tcp-dwnlk-pkts-retr	Description: The total number of TCP packets retransmitted in downlink direction. Triggers: Increments whenever a new TCP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
tcp-uplk-pkts-ooo-analyzd	Description: The total number of out-of-order TCP packets analyzed in uplink direction. Triggers: Increments whenever a new TCP out-of-order packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
tcp-dwnlk-pkts-ooo-analyzd	Description: The total number of out-of-order TCP packets analyzed in downlink direction. Triggers: Increments whenever a new TCP out-of-order packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
tcp-uplk-pkts-ooo-fail	Description: The total number of failed out-of-order TCP packets detected in uplink direction. Triggers: Increments whenever TCP out-of-order failure occurs for uplink direction. It gets incremented by the total number of uplink out-of-order packets. Availability: Per Active Charging Service.	Int32
tcp-dwnlk-pkts-ooo-fail	Description: The total number of failed out-of-order TCP packets detected in downlink direction. Triggers: Increments whenever TCP out-of-order failure occurs for downlink direction. It gets incremented by the total number of downlink out-of-order packets. Availability: Per Active Charging Service.	Int32
tcp-uplk-pkts-ooo-retr	Description: The total number of out-of-order TCP packets retransmitted in uplink direction. Triggers: Increments whenever a new TCP retransmitted out-of-order packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
tcp-dwnlk-pkts-ooo-retr	Description: The total number of out-of-order TCP packets retransmitted in downlink direction. Triggers: Increments whenever a new TCP retransmitted out-of-order packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
ICMP Analyzer Specific Statistics		
icmp-flows	Description: The combined total of the number of ICMP flows previously analyzed + ICMP flows currently being analyzed. Triggers: Increments whenever a new ICMP flow is created. Availability: Per Active Charging Service.	Int32
icmp-flows-cur	Description: The number of ICMP flows currently being analyzed. Triggers: Increments whenever a new ICMP flow is created. Decrements whenever an ICMP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
icmp-uplk-bytes	Description: The total number of ICMP bytes detected in uplink direction (from the MS). Triggers: Increments whenever a new ICMP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
icmp-dwnlk-bytes	Description: The total number of ICMP bytes detected in downlink direction (to the MS). Triggers: Increments whenever a new ICMP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
icmp-uplk-pkts	Description: The total number of ICMP packets detected in uplink direction. Triggers: Increments whenever a new ICMP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
icmp-dwnlk-pkts	Description: The total number of ICMP packets detected in downlink direction. Triggers: Increments whenever a new ICMP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
icmp-ech-req	Description: The total number of ICMP ECHO requests detected. Triggers: Increments whenever a new ICMP ECHO request is received. Availability: Per Active Charging Service.	Int32
icmp-ech-rep	Description: The total number of ICMP ECHO replies detected. Triggers: Increments whenever a new ICMP ECHO response is received. Availability: Per Active Charging Service.	Int32
icmp-dst-unrch	Description: The total number of ICMP Destination Unreachable messages detected. Triggers: Increments whenever a new ICMP Destination Unreachable message is received. Availability: Per Active Charging Service.	Int32
icmp-redir	Description: The total number of ICMP Redirect messages detected. Triggers: Increments whenever a new ICMP Redirect message is received. Availability: Per Active Charging Service.	Int32
icmp-tm-excd	Description: The total number of ICMP Time Exceeded messages detected. Triggers: Increments whenever a new ICMP time exceeded message is received. Availability: Per Active Charging Service.	Int32
icmp-trace-route	Description: The total number of ICMP Trace Route messages detected. Triggers: Increments whenever a new ICMP Trace Route message is received. Availability: Per Active Charging Service.	Int32
icmp-oth	Description: The total number of other ICMP messages detected. Triggers: Increments whenever any other ICMP message is received. Availability: Per Active Charging Service.	Int32
icmp-inv-pkts	Description: The total number of ICMP invalid packets detected. Triggers: Increments whenever an invalid ICMP packet is detected. Availability: Per Active Charging Service.	Int32
HTTP Analyzer Specific Statistics		
http-flows	Description: The combined total of the number of HTTP flows previously analyzed + HTTP flows currently being analyzed. Triggers: Increments whenever a new HTTP flow is created. Availability: Per Active Charging Service.	Int32
http-flows-cur	Description: The number of HTTP flows currently being analyzed. Triggers: Increments whenever a new HTTP flow is created. Decrements whenever an HTTP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
http-uplk-bytes	Description: The total number of HTTP bytes detected in uplink direction (from the MS). Triggers: Increments whenever a new HTTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
http-dwnlk-bytes	Description: The total number of HTTP bytes detected in downlink direction (to the MS). Triggers: Increments whenever a new HTTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
http-uplk-pkts	Description: The total number of HTTP packets detected in uplink direction. Triggers: Increments whenever a new HTTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
http-dwnlk-pkts	Description: The total number of HTTP packets detected in downlink direction. Triggers: Increments whenever a new HTTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
http-uplk-bytes-retr	Description: The total number of HTTP bytes retransmitted in uplink direction. Triggers: Increments whenever a new HTTP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
http-dwnlk-bytes-retr	Description: The total number of HTTP bytes retransmitted in downlink direction. Triggers: Increments whenever a new HTTP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
http-uplk-pkts-retr	Description: The total number of HTTP packets retransmitted in uplink direction. Triggers: Increments whenever a new HTTP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
http-dwnlk-pkts-retr	Description: The total number of HTTP packets retransmitted in downlink direction. Triggers: Increments whenever a new HTTP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
http-req-succ	Description: The total number of successful HTTP requests detected. Triggers: Increments whenever a new HTTP request completes successfully. Availability: Per Active Charging Service.	Int32
http-req-fail	Description: The total number of failed HTTP requests detected. Triggers: Increments whenever a new HTTP request fails. Availability: Per Active Charging Service.	Int32
http-get-req	Description: The total number of HTTP GET requests detected. Triggers: Increments whenever a new HTTP GET request is received. Availability: Per Active Charging Service.	Int32
http-post-req	Description: The total number of HTTP POST requests detected. Triggers: Increments whenever a new HTTP POST request is received. Availability: Per Active Charging Service.	Int32
http-connect-req	Description: The total number of HTTP CONNECT requests detected. Triggers: Increments whenever a new HTTP CONNECT request is received. Availability: Per Active Charging Service.	Int32
http-inv-pkts	Description: The total number of invalid HTTP packets detected. Triggers: Increments whenever an invalid HTTP packet is detected. Availability: Per Active Charging Service.	Int32
HTTPS Analyzer Specific Statistics		

Variables	Description	Data Type
https-flows	Description: The combined total of the number of HTTPS flows previously analyzed + HTTPS flows currently being analyzed. Triggers: Increments whenever a new HTTPS flow is created. Availability: Per Active Charging Service.	Int32
https-flows-cur	Description: The number of HTTPS flows currently being analyzed. Triggers: Increments whenever a new HTTPS flow is created. Decrements whenever an HTTPS flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
https-uplk-bytes	Description: The total number of HTTPS bytes detected in uplink direction (from the MS). Triggers: Increments whenever a new HTTPS packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
https-dwnlk-bytes	Description: The total number of HTTPS bytes detected in downlink direction (to the MS). Triggers: Increments whenever a new HTTPS packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
https-uplk-pkts	Description: The total number of HTTPS packets detected in uplink direction. Triggers: Increments whenever a new HTTPS packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
https-dwnlk-pkts	Description: The total number of HTTPS packets detected in downlink direction. Triggers: Increments whenever a new HTTPS packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
https-uplk-bytes-retr	Description: The total number of HTTPS bytes retransmitted in uplink direction. Triggers: Increments whenever a new HTTPS retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
https-dwnlk-bytes-retr	Description: The total number of HTTPS bytes retransmitted in downlink direction. Triggers: Increments whenever a new HTTPS retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
https-uplk-pkts-retr	Description: The total number of HTTPS packets retransmitted in uplink direction. Triggers: Increments whenever a new HTTPS retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
https-dwnlk-pkts-retr	Description: The total number of HTTPS packets retransmitted in downlink direction. Triggers: Increments whenever a new HTTPS retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
WTP Analyzer Specific Statistics		
wtp-trans	Description: The total number of WTP transactions detected. Triggers: Increments whenever a new WTP transaction is created. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
wtp-cls-zero	Description: The total number of WTP Class 0 transactions detected. Triggers: Increments whenever a new WTP Class 0 transaction is created. Availability: Per Active Charging Service.	Int32
wtp-cls-one	Description: The total number of WTP Class 1 transactions detected. Triggers: Increments whenever a new WTP Class 1 transaction is created. Availability: Per Active Charging Service.	Int32
wtp-cls-two	Description: The total number of WTP Class 2 transactions detected. Triggers: Increments whenever a new WTP Class 2 transaction is created. Availability: Per Active Charging Service.	Int32
wtp-uplk-bytes	Description: The total number of WTP bytes detected in uplink direction (from the MS). Triggers: Increments whenever a new WTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
wtp-dwnlk-bytes	Description: The total number of WTP bytes detected in downlink direction (to the MS). Triggers: Increments whenever a new WTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
wtp-uplk-pkts	Description: The total number of WTP packets detected in uplink direction. Triggers: Increments whenever a new WTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
wtp-dwnlk-pkts	Description: The total number of WTP packets detected in downlink direction. Triggers: Increments whenever a new WTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
wtp-uplk-bytes-retr	Description: The total number of WTP bytes retransmitted in uplink direction. Triggers: Increments whenever an uplink WTP retransmitted packet is detected. Availability: Per Active Charging Service.	Int32
wtp-dwnlk-bytes-retr	Description: The total number of WTP bytes retransmitted in downlink direction. Triggers: Increments whenever a downlink WTP retransmitted packet is detected. Availability: Per Active Charging Service.	Int32
wtp-uplk-pkts-retr	Description: The total number of WTP packets retransmitted in uplink direction. Triggers: Increments whenever an uplink WTP retransmitted packet is detected. Availability: Per Active Charging Service.	Int32
wtp-dwnlk-pkts-retr	Description: The total number of WTP packets retransmitted in downlink direction. Triggers: Increments whenever a downlink WTP retransmitted packet is detected. Availability: Per Active Charging Service.	Int32
wtp-invk-pkts	Description: The total number of WTP INVOKE packets detected. Triggers: Increments whenever a WTP INVOKE packet is detected. Availability: Per Active Charging Service.	Int32
wtp-invk-tcl-zero	Description: The total number of WTP INVOKE TCL-0 packets detected. Triggers: Increments whenever a WTP INVOKE TCL-0 packet is detected. Availability: Per Active Charging Service.	Int32
wtp-invk-tcl-one	Description: The total number of WTP INVOKE TCL-1 packets detected. Triggers: Increments whenever a WTP INVOKE TCL-1 packet is detected. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
wtp-invk-tcl-two	Description: The total number of WTP INVOKE TCL-2 packets detected. Triggers: Increments whenever a WTP INVOKE TCL-2 packet is detected. Availability: Per Active Charging Service.	Int32
wtp-invk-tid-new	Description: The total number of WTP INVOKE with TID-new flag packets detected. Triggers: Increments whenever a WTP INVOKE packet with TID-new flag is received. Availability: Per Active Charging Service.	Int32
wtp-rslt-pkts	Description: The total number of WTP RESULT packets detected. Triggers: Increments whenever a WTP RESULT packet is detected. Availability: Per Active Charging Service.	Int32
wtp-ack-to-resp	Description: The total number of WTP ACK from Initiator to Responder detected. Triggers: Increments whenever a WTP ACK packet from Initiator to Responder is received. Availability: Per Active Charging Service.	Int32
wtp-ack-to-init	Description: The total number of WTP ACK from Responder to Initiator detected. Triggers: Increments whenever a WTP RESULT packet from Responder to Initiator is received. Availability: Per Active Charging Service.	Int32
wtp-abrt-to-resp	Description: The total number of WTP ABORT from Initiator to Responder detected. Triggers: Increments whenever a WTP ABORT packet from Initiator to Responder is received. Availability: Per Active Charging Service.	Int32
wtp-abrt-to-init	Description: The total number of WTP ABORT from Responder to Initiator detected. Triggers: Increments whenever a WTP ABORT packet from Responder to Initiator is received. Availability: Per Active Charging Service.	Int32
wtp-seg-invk	Description: The total number of WTP Segmented INVOKE packets detected. Triggers: Increments whenever a WTP Segmented INVOKE packet is detected. Availability: Per Active Charging Service.	Int32
wtp-seg-rslt	Description: The total number of WTP Segmented RESULT packets detected. Triggers: Increments whenever a WTP Segmented RESULT packet is detected. Availability: Per Active Charging Service.	Int32
wtp-neg-ack	Description: The total number of WTP Negative ACK packets detected. Triggers: Increments whenever a WTP Negative ACK packet is detected. Availability: Per Active Charging Service.	Int32
wtp-tid-vrf	Description: The total number of WTP TID Verification packets detected. Triggers: Increments whenever a WTP TID Verification packet is detected. Availability: Per Active Charging Service.	Int32
wtp-noninit-invk	Description: The total number of WTP Non-initial INVOKE packets detected. Triggers: Increments whenever a WTP Non-initial INVOKE packet is detected. Availability: Per Active Charging Service.	Int32
wtp-unk-pdu	Description: The total number of WTP unknown PDUs detected. Triggers: Increments whenever a WTP Unknown PDU packet is detected. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
WSP Analyzer Specific Statistics		
wsp-flows	Description: The combined total of the number of WSP flows previously analyzed + WSP flows currently being analyzed. Triggers: Increments whenever a new WSP flow is created. Availability: Per Active Charging Service.	Int32
wsp-flows-cur	Description: The number of WSP flows currently being analyzed. Triggers: Increments whenever a new WSP flow is created. Decrements whenever a WSP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
wsp-co-conn	Description: The total number of WSP connection-oriented connections detected. Triggers: Increments whenever a new WSP Connection-oriented flow is created. Availability: Per Active Charging Service.	Int32
wsp-cl-conn	Description: The total number of WSP connection-less connections detected. Triggers: Increments whenever a new WSP connection-less flow is created. Availability: Per Active Charging Service.	Int32
wsp-uplk-bytes	Description: The total number of WSP bytes detected in uplink direction. Triggers: Increments whenever a new WSP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
wsp-dwnlk-bytes	Description: The total number of WSP bytes detected in downlink direction. Triggers: Increments whenever a new WSP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
wsp-uplk-pkts	Description: The total number of WSP packets detected in uplink direction. Triggers: Increments whenever a new WSP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
wsp-dwnlk-pkts	Description: The total number of WSP packets detected in downlink direction. Triggers: Increments whenever a new WSP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
wsp-uplk-bytes-retr	Description: The total number of WSP bytes retransmitted in uplink direction. Triggers: Increments whenever a new WSP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
wsp-dwnlk-bytes-retr	Description: The total number of WSP bytes retransmitted in downlink direction. Triggers: Increments whenever a new WSP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
wsp-uplk-pkts-retr	Description: The total number of WSP packets retransmitted in uplink direction. Triggers: Increments whenever a new WSP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
wsp-dwnlk-pkts-retr	Description: The total number of WSP packets retransmitted in downlink direction. Triggers: Increments whenever a new WSP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
wsp-co-req-succ	Description: The total number of WSP Connection Oriented Requests succeeded. Triggers: Increments whenever a WSP connection-oriented request completes successfully. Availability: Per Active Charging Service.	Int32
wsp-co-req-fail	Description: The total number of WSP Connection Oriented Requests failed. Triggers: Increments whenever a WSP connection-oriented request fails. Availability: Per Active Charging Service.	Int32
wsp-cl-req-succ	Description: The total number of WSP Connection-less Requests succeeded. Triggers: Increments whenever a WSP connection-less request completes successfully. Availability: Per Active Charging Service.	Int32
wsp-cl-req-fail	Description: The total number of WSP Connection-less Requests failed. Triggers: Increments whenever a WSP connection-less request fails. Availability: Per Active Charging Service.	Int32
wsp-conn-pdu	Description: The total number of WSP CONNECT PDU detected. Triggers: Increments whenever a new WSP CONNECT PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-conn-rep	Description: The total number of WSP CONNECT REPLY PDU detected. Triggers: Increments whenever a new WSP CONNECT Response packet is detected. Availability: Per Active Charging Service.	Int32
wsp-redir	Description: The total number of WSP REDIRECT PDU detected. Triggers: Increments whenever a new WSP REDIRECT PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-disc	Description: The total number of WSP DISCONNECT PDU detected. Triggers: Increments whenever a new WSP DISCONNECT PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-susp	Description: The total number of WSP SUSPEND PDU detected. Triggers: Increments whenever a new WSP SUSPEND PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-resm	Description: The total number of WSP RESUME PDU detected. Triggers: Increments whenever a new WSP RESUME PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-opt	Description: The total number of WSP OPTIONS PDU detected. Triggers: Increments whenever a new WSP OPTIONS PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-head	Description: The total number of WSP HEAD PDU detected. Triggers: Increments whenever a new WSP HEAD PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-del	Description: The total number of WSP DELETE PDU detected. Triggers: Increments whenever a new WSP DELETE PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-trace	Description: The total number of WSP TRACE PDU detected. Triggers: Increments whenever a new WSP TRACE PDU packet is detected. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
wsp-reply	Description: The total number of WSP REPLY PDU detected. Triggers: Increments whenever a new WSP REPLY PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-put	Description: The total number of WSP PUT PDU detected. Triggers: Increments whenever a new WSP PUT PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-get	Description: The total number of WSP GET PDU detected. Triggers: Increments whenever a new WSP GET PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-push	Description: The total number of WSP PUSH PDU detected. Triggers: Increments whenever a new WSP PUSH PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-conf-push	Description: The total number of WSP CONFIRMED-PUSH PDU detected. Triggers: Increments whenever a new WSP CONFIRMED-PUSH PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-post	Description: The total number of WSP POST PDU detected. Triggers: Increments whenever a new WSP POST PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-data-frag	Description: The total number of WSP DATA-FRAGMENT PDU detected. Triggers: Increments whenever a new WSP DATA-FRAGMENT PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-rsrvd	Description: The total number of WSP RESERVED PDU detected. Triggers: Increments whenever a new WSP RESERVED PDU packet is detected. Availability: Per Active Charging Service.	Int32
wsp-inv-pkts	Description: The total number of invalid WSP packets detected. Triggers: Increments whenever an invalid WSP packet is detected. Availability: Per Active Charging Service.	Int32
MMS Analyzer Specific Statistics		
mms-send	Description: The total number of MMS message send transactions detected. Triggers: Increments whenever a new MMS SEND packet is detected. Availability: Per Active Charging Service.	Int32
mms-send-succ	Description: The total number of successful MMS message send transactions detected. Triggers: Increments whenever a MMS SEND transaction is successful. Availability: Per Active Charging Service.	Int32
mms-send-fail	Description: The total number of failed MMS message send transactions detected. Triggers: Increments whenever a MMS SEND transaction fails. Availability: Per Active Charging Service.	Int32
mms-retrv	Description: The total number of MMS message retrieve transactions detected. Triggers: Increments whenever a new MMS RETRIEVE packet is detected. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
mms-retrv-succ	Description: The total number of MMS message retrieve transactions succeeded. Triggers: Increments whenever a MMS RETRIEVE transaction is successful. Availability: Per Active Charging Service.	Int32
mms-retrv-fail	Description: The total number of MMS message retrieve transactions failed. Triggers: Increments whenever a MMS RETRIEVE transaction fails. Availability: Per Active Charging Service.	Int32
mms-uplk-bytes	Description: The total number of MMS bytes detected in uplink direction. Triggers: Increments whenever an uplink MMS packet is detected. Availability: Per Active Charging Service.	Int32
mms-dwnlk-bytes	Description: The total number of MMS bytes detected in downlink direction. Triggers: Increments whenever a downlink MMS packet is detected. Availability: Per Active Charging Service.	Int32
mms-uplk-pkts	Description: The total number of MMS packets detected in uplink direction. Triggers: Increments whenever an uplink MMS packet is detected. Availability: Per Active Charging Service.	Int32
mms-dwnlk-pkts	Description: The total number of MMS packets detected in downlink direction. Triggers: Increments whenever a downlink MMS packet is detected. Availability: Per Active Charging Service.	Int32
mms-uplk-bytes-retr	Description: The total number of MMS bytes retransmitted in uplink direction. Triggers: Increments whenever a new MMS retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
mms-dwnlk-bytes-retr	Description: The total number of MMS bytes retransmitted in downlink direction. Triggers: Increments whenever a new MMS retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
mms-uplk-pkts-retr	Description: The total number of MMS packets retransmitted in uplink direction. Triggers: Increments whenever a new MMS retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
mms-dwnlk-pkts-retr	Description: The total number of MMS packets retransmitted in downlink direction. Triggers: Increments whenever a new MMS retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
mms-snd-req	Description: The total number of MMS SEND Requests detected. Triggers: Increments whenever a new MMS Send-Request packet is detected. Availability: Per Active Charging Service.	Int32
mms-snd-conf	Description: The total number of MMS SEND Confirms detected. Triggers: Increments whenever a new MMS Send-Confirm packet is detected. Availability: Per Active Charging Service.	Int32
mms-ntf-ind	Description: The total number of MMS Notification Indication detected. Triggers: Increments whenever a new MMS Notify-Ind packet is detected. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
mms-ntf-ind-imm	Description: The total number of MMS Notification Indication Immediate detected. Triggers: Increments whenever a new MMS Notification Indication Immediate packet is detected. Availability: Per Active Charging Service.	Int32
mms-ntf-ind-del	Description: The total number of MMS Notification Indication Delayed detected. Triggers: Increments whenever a new MMS Notification Indication Delayed packet is detected. Availability: Per Active Charging Service.	Int32
mms-ntf-rsp	Description: The total number of MMS Notification Response detected. Triggers: Increments whenever a new MMS Notification Response packet is detected. Availability: Per Active Charging Service.	Int32
mms-retrv-conf	Description: The total number of MMS Retrieve Confirm detected. Triggers: Increments whenever a new MMS Retrieve Confirm packet is detected. Availability: Per Active Charging Service.	Int32
mms-ack-ind	Description: The total number of MMS ACK Indication detected. Triggers: Increments whenever a new MMS ACK Indication packet is detected. Availability: Per Active Charging Service.	Int32
mms-delvry-ind	Description: The total number of MMS Delivery Indication detected. Triggers: Increments whenever a new MMS Delivery Indication packet is detected. Availability: Per Active Charging Service.	Int32
mms-unk-pdu	Description: The total number of MMS Unknown PDU Type detected. Triggers: Increments whenever a new MMS Unknown PDU packet is detected. Availability: Per Active Charging Service.	Int32
mms-inv-pkts	Description: The total number of invalid MMS packets detected. Triggers: Increments whenever an invalid MMS packet is detected. Availability: Per Active Charging Service.	Int32
SIP Analyzer Specific Statistics		
sip-flows	Description: The combined total of the number of SIP flows previously analyzed + SIP flows currently being analyzed. Triggers: Increments whenever a new SIP flow is created. Availability: Per Active Charging Service.	Int32
sip-flows-cur	Description: The number of SIP flows currently being analyzed. Triggers: Increments whenever a new SIP flow is created. Decrements whenever a SIP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
sip-calls	Description: The total number of SIP calls detected. Triggers: Increments whenever a new SIP call arrives. Availability: Per Active Charging Service.	Int32
sip-uplk-bytes	Description: The total number of SIP bytes detected in uplink direction. Triggers: Increments whenever a new SIP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
sip-dwnlk-bytes	Description: The total number of SIP bytes detected in downlink direction. Triggers: Increments whenever a new SIP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
sip-uplk-pkts	Description: The total number of SIP packets detected in uplink direction. Triggers: Increments whenever a new SIP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
sip-dwnlk-pkts	Description: The total number of SIP packets detected in downlink direction. Triggers: Increments whenever a new SIP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
sip-uplk-bytes-retr	Description: The total number of SIP bytes retransmitted in uplink direction. Triggers: Increments whenever a new SIP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
sip-dwnlk-bytes-retr	Description: The total number of SIP bytes retransmitted in downlink direction. Triggers: Increments whenever a new SIP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
sip-uplk-pkts-retr	Description: The total number of SIP packets retransmitted in uplink direction. Triggers: Increments whenever a new SIP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
sip-dwnlk-pkts-retr	Description: The total number of SIP packets retransmitted in downlink direction. Triggers: Increments whenever a new SIP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
sip-invite	Description: The total number of SIP INVITE commands detected. Triggers: Increments whenever a new SIP INVITE packet is detected. Availability: Per Active Charging Service.	Int32
sip-bye	Description: The total number of SIP BYE commands detected. Triggers: Increments whenever a new SIP BYE packet is detected. Availability: Per Active Charging Service.	Int32
sip-ack	Description: The total number of SIP ACK commands detected. Triggers: Increments whenever a new SIP ACK packet is detected. Availability: Per Active Charging Service.	Int32
sip-cancel	Description: The total number of SIP CANCEL commands detected. Triggers: Increments whenever a new SIP CANCEL packet is detected. Availability: Per Active Charging Service.	Int32
sip-register	Description: The total number of SIP REGISTER commands detected. Triggers: Increments whenever a new SIP REGISTER packet is detected. Availability: Per Active Charging Service.	Int32
sip-inv-pkts	Description: The total number of invalid SIP packets detected. Triggers: Increments whenever an invalid SIP packet is detected. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
h323-calls	Description: The total number of H323 calls detected. Triggers: Increments whenever a new H323 call arrives. Availability: Per Active Charging Service.	Int32
h323-uplk-bytes	Description: The total number of H323 bytes transferred in the uplink direction. Triggers: Increments whenever a new H323 packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
h323-dwnlk-bytes	Description: The total number of H323 bytes transferred in the downlink direction. Triggers: Increments whenever a new H323 packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
h323-uplk-pkts	Description: The total number of H323 packets transferred in the uplink direction. Triggers: Increments whenever a new H323 packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
h323-dwnlk-pkts	Description: The total number of H323 packets transferred in the downlink direction. Triggers: Increments whenever a new H323 packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
h323-q931-messages	Description: The total number of Q931 messages both in uplink and downlink directions. Triggers: Increments whenever a new Q931 packet is detected. Availability: Per Active Charging Service.	Int64
h323-h245-messages	Description: The total number of H245 messages both in uplink and downlink directions. Triggers: Increments whenever a new H245 packet is detected. Availability: Per Active Charging Service.	Int64
h323-ras-messages	Description: The total number of RAS messages both in uplink and downlink directions. Triggers: Increments whenever a new RAS packet is detected. Availability: Per Active Charging Service.	Int64
sip-advanced-calls	Description: The total number of SIP calls processed by SIP ALG. Triggers: Increments whenever a SIP call is processed by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-uplk-bytes	Description: The total number of uplink bytes processed by SIP ALG. Triggers: Increments whenever an uplink packet is processed by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-dwnlk-bytes	Description: The total number of downlink bytes processed by SIP ALG. Triggers: Increments whenever a downlink packet is processed by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-uplk-pkts	Description: The total number of uplink packets processed by SIP ALG. Triggers: Increments whenever an uplink packet is processed by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-dwnlk-pkts	Description: The total number of downlink packets processed by SIP ALG. Triggers: Increments whenever a downlink packet is processed by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-register-rx	Description: The total number of REGISTER requests received by SIP ALG. Triggers: Increments whenever a REGISTER request is received by SIP ALG. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
sip-advanced-invite-rx	Description: The total number of INVITE requests received by SIP ALG. Triggers: Increments whenever an INVITE request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-ack-rx	Description: The total number of ACK requests received by SIP ALG. Triggers: Increments whenever an ACK request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-bye-rx	Description: The total number of BYE requests received by SIP ALG. Triggers: Increments whenever a BYE request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-info-rx	Description: The total number of INFO requests received by SIP ALG. Triggers: Increments whenever an INFO request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-prack-rx	Description: The total number of PRACK requests received by SIP ALG. Triggers: Increments whenever a PRACK request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-refer-rx	Description: The total number of REFER requests received by SIP ALG. Triggers: Increments whenever a REFER request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-cancel-rx	Description: The total number of CANCEL requests received by SIP ALG. Triggers: Increments whenever a CANCEL request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-update-rx	Description: The total number of UPDATE requests received by SIP ALG. Triggers: Increments whenever an UPDATE request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-message-rx	Description: The total number of MESSAGE requests received by SIP ALG. Triggers: Increments whenever a MESSAGE request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-options-rx	Description: The total number of OPTIONS requests received by SIP ALG. Triggers: Increments whenever an OPTIONS request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-publish-rx	Description: The total number of PUBLISH requests received by SIP ALG. Triggers: Increments whenever a PUBLISH request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-subscribe-rx	Description: The total number of SUBSCRIBE requests received by SIP ALG. Triggers: Increments whenever a SUBSCRIBE request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-notify-rx	Description: The total number of NOTIFY requests received by SIP ALG. Triggers: Increments whenever a NOTIFY request is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-1xx-rx	Description: The total number of 1XX responses received by SIP ALG. Triggers: Increments whenever a 1XX response is received by SIP ALG. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
sip-advanced-2xx-rx	Description: The total number of 2XX responses received by SIP ALG. Triggers: Increments whenever a 2XX response is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-3xx-rx	Description: The total number of 3XX responses received by SIP ALG. Triggers: Increments whenever a 3XX response is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-4xx-rx	Description: The total number of 4XX responses received by SIP ALG. Triggers: Increments whenever a 4XX response is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-5xx-rx	Description: The total number of 5XX responses received by SIP ALG. Triggers: Increments whenever a 5XX response is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-6xx-rx	Description: The total number of 6XX responses received by SIP ALG. Triggers: Increments whenever a 6XX response is received by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-register-tx	Description: The total number of REGISTER requests transmitted by SIP ALG. Triggers: Increments whenever a REGISTER request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-invite-tx	Description: The total number of INVITE requests transmitted by SIP ALG. Triggers: Increments whenever an INVITE request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-ack-tx	Description: The total number of ACK requests transmitted by SIP ALG. Triggers: Increments whenever an ACK request is transmitted by SIP ALG.. Availability: Per Active Charging Service.	Int64
sip-advanced-bye-tx	Description: The total number of BYE requests transmitted by SIP ALG. Triggers: Increments whenever a BYE request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-info-tx	Description: The total number of INFO requests transmitted by SIP ALG. Triggers: Increments whenever an INFO request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-prack-tx	Description: The total number of PRACK requests transmitted by SIP ALG. Triggers: Increments whenever a PRACK request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-refer-tx	Description: The total number of REFER requests transmitted by SIP ALG. Triggers: Increments whenever a REFER request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-cancel-tx	Description: The total number of CANCEL requests transmitted by SIP ALG. Triggers: Increments whenever a CANCEL request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-update-tx	Description: The total number of UPDATE requests transmitted by SIP ALG. Triggers: Increments whenever an UPDATE request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64

■ Common Syntax Options

Variables	Description	Data Type
sip-advanced-message-tx	Description: The total number of MESSAGE requests transmitted by SIP ALG. Triggers: Increments whenever a MESSAGE request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-options-tx	Description: The total number of OPTIONS requests transmitted by SIP ALG. Triggers: Increments whenever an OPTIONS request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-publish-tx	Description: The total number of PUBLISH requests transmitted by SIP ALG. Triggers: Increments whenever a PUBLISH request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-subscribe-tx	Description: The total number of SUBSCRIBE requests transmitted by SIP ALG. Triggers: Increments whenever a SUBSCRIBE request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-notify-tx	Description: The total number of NOTIFY requests transmitted by SIP ALG. Triggers: Increments whenever a NOTIFY request is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-1xx-tx	Description: The total number of 1XX responses transmitted by SIP ALG. Triggers: Increments whenever a 1XX response is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-2xx-tx	Description: The total number of 2XX responses transmitted by SIP ALG. Triggers: Increments whenever a 2XX response is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-3xx-tx	Description: The total number of 3XX responses transmitted by SIP ALG. Triggers: Increments whenever a 3XX response is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-4xx-tx	Description: The total number of 4XX responses transmitted by SIP ALG. Triggers: Increments whenever a 4XX response is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-5xx-tx	Description: The total number of 5XX responses transmitted by SIP ALG. Triggers: Increments whenever a 5XX response is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
sip-advanced-6xx-tx	Description: The total number of 6XX responses transmitted by SIP ALG. Triggers: Increments whenever a 6XX response is transmitted by SIP ALG. Availability: Per Active Charging Service.	Int64
RTSP Analyzer Specific Statistics		
rtsp-flows	Description: The combined total of the number of RTSP flows previously analyzed + RTSP flows currently being analyzed. Triggers: Increments whenever a new RTSP flow is created. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
rtsp-flows-cur	Description: The number of RTSP flows currently being analyzed. Triggers: Increments whenever a new RTSP flow is created. Decrements whenever an RTSP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
rtsp-sess	Description: The total number of RTSP sessions detected. Triggers: Increments whenever a new RTSP session is created. Availability: Per Active Charging Service.	Int32
rtsp-uplk-bytes	Description: The total number of RTSP bytes detected in uplink direction. Triggers: Increments whenever a new RTSP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
rtsp-dwnlk-bytes	Description: The total number of RTSP bytes detected in downlink direction. Triggers: Increments whenever a new RTSP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
rtsp-uplk-pkts	Description: The total number of RTSP packets detected in uplink direction. Triggers: Increments whenever a new RTSP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
rtsp-dwnlk-pkts	Description: The total number of RTSP packets detected in downlink direction. Triggers: Increments whenever a new RTSP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
rtsp-uplk-bytes-retr	Description: The total number of RTSP bytes retransmitted in uplink direction. Triggers: Increments whenever a new RTSP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
rtsp-dwnlk-bytes-retr	Description: The total number of RTSP bytes retransmitted in downlink direction. Triggers: Increments whenever a new RTSP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
rtsp-uplk-pkts-retr	Description: The total number of RTSP packets retransmitted in uplink direction. Triggers: Increments whenever a new RTSP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
rtsp-dwnlk-pkts-retr	Description: The total number of RTSP packets retransmitted in downlink direction. Triggers: Increments whenever a new RTSP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
rtsp-play	Description: The total number of RTSP PLAY commands detected. Triggers: Increments whenever a new RTSP PLAY command is detected. Availability: Per Active Charging Service.	Int32
rtsp-setup	Description: The total number of RTSP SETUP commands detected. Triggers: Increments whenever a new RTSP SETUP command is detected. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
rtsp-pause	Description: The total number of RTSP PAUSE commands detected. Triggers: Increments whenever a new RTSP PAUSE command is detected. Availability: Per Active Charging Service.	Int32
rtsp-record	Description: The total number of RTSP RECORD commands detected. Triggers: Increments whenever a new RTSP RECORD command is detected. Availability: Per Active Charging Service.	Int32
rtsp-option	Description: The total number of RTSP OPTION commands detected. Triggers: Increments whenever a new RTSP OPTION command is detected. Availability: Per Active Charging Service.	Int32
rtsp-redir	Description: The total number of RTSP REDIRECT commands detected. Triggers: Increments whenever a new RTSP REDIRECT command is detected. Availability: Per Active Charging Service.	Int32
rtsp-desc	Description: The total number of RTSP DESCRIBE commands detected. Triggers: Increments whenever a new RTSP DESCRIBE command is detected. Availability: Per Active Charging Service.	Int32
rtsp-announce	Description: The total number of RTSP ANNOUNCE commands detected. Triggers: Increments whenever a new RTSP ANNOUNCE command is detected. Availability: Per Active Charging Service.	Int32
rtsp-trdwn	Description: The total number of RTSP TEARDOWN commands detected. Triggers: Increments whenever a new RTSP TEARDOWN command is detected. Availability: Per Active Charging Service.	Int32
rtsp-get-param	Description: The total number of RTSP GET PARAMETER commands detected. Triggers: Increments whenever a new RTSP GET PARAMETER command is detected. Availability: Per Active Charging Service.	Int32
rtsp-set-param	Description: The total number of RTSP SET PARAMETER commands detected. Triggers: Increments whenever a new RTSP SET PARAMETER command is detected. Availability: Per Active Charging Service.	Int32
rtsp-inv-pkts	Description: The total number of invalid RTSP packets detected. Triggers: Increments whenever an invalid RTSP packet is detected. Availability: Per Active Charging Service.	Int32
RTP Analyzer Specific Statistics		
rtp-flows	Description: The combined total of the number of RTP flows previously analyzed + RTP flows currently being analyzed. Triggers: Increments whenever a new RTP flow is created. Availability: Per Active Charging Service.	Int32
rtp-flows-cur	Description: The number of RTP flows currently being analyzed. Triggers: Increments whenever a new RTP flow is created. Decrements whenever an RTP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32

Variables	Description	Data Type
rtp-uplk-bytes	Description: The total number of RTP bytes detected in uplink direction. Triggers: Increments whenever a new RTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
rtp-dwnlk-bytes	Description: The total number of RTP bytes detected in downlink direction. Triggers: Increments whenever a new RTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
rtp-uplk-pkts	Description: The total number of RTP packets detected in uplink direction. Triggers: Increments whenever a new RTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
rtp-dwnlk-pkts	Description: The total number of RTP packets detected in downlink direction. Triggers: Increments whenever a new RTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
FTP Analyzer Specific Statistics		
ftp-flows	Description: The combined total of the number of FTP flows previously analyzed + FTP flows currently being analyzed. Triggers: Increments whenever a new FTP flow is created. Availability: Per Active Charging Service.	Int32
ftp-flows-cur	Description: The number of FTP flows currently being analyzed. Triggers: Increments whenever a new FTP flow is created. Decrements whenever an FTP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
ftp-uplk-bytes	Description: The total number of FTP bytes detected in uplink direction. Triggers: Increments whenever a new FTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
ftp-dwnlk-bytes	Description: The total number of FTP bytes detected in downlink direction. Triggers: Increments whenever a new FTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
ftp-uplk-pkts	Description: The total number of FTP packets detected in uplink direction. Triggers: Increments whenever a new FTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
ftp-dwnlk-pkts	Description: The total number of FTP packets detected in downlink direction. Triggers: Increments whenever a new FTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
ftp-retr	Description: The total number of FTP RETR commands detected. Triggers: Increments whenever an FTP packet is retransmitted. Availability: Per Active Charging Service.	Int32
ftp-stor	Description: The total number of FTP STOR commands detected. Triggers: Increments whenever a new FTP STOR command is detected. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
ftp-inv-pkts	Description: The total number of invalid FTP packets detected. Triggers: Increments whenever an invalid FTP packet is detected. Availability: Per Active Charging Service.	Int32
pptp-flows	Description: The combined total of the number of PPTP flows previously analyzed + PPTP flows currently being analyzed. Triggers: Increments whenever a new PPTP flow is created. Availability: Per Active Charging Service.	Int32
pptp-gre-flows	Description: The combined total of the number of PPTP GRE flows previously analyzed + PPTP GRE flows currently being analyzed. Triggers: Increments whenever a new PPTP GRE flow is created. Availability: Per Active Charging Service.	Int32
pptp-uplk-bytes	Description: The total number of uplink bytes sent across all PPTP control flows. Triggers: Increments whenever a new PPTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
pptp-dwnlk-bytes	Description: The total number of downlink bytes received across all PPTP control flows. Triggers: Increments whenever a new PPTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
pptp-uplk-pkts	Description: The total number of uplink packets sent across all PPTP control flows. Triggers: Increments whenever a new PPTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
pptp-dwnlk-pkts	Description: The total number of downlink packets received across all PPTP control flows. Triggers: Increments whenever a new PPTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
pptp-inv-pkts	Description: The total number of invalid packets received across all PPTP control flows. Triggers: Increments whenever an invalid PPTP packet is detected. Availability: Per Active Charging Service.	Int32
pptp-unknown-pkts	Description: The total number of unknown packets received across all PPTP control flows. Triggers: Increments whenever an unknown PPTP packet is detected. Availability: Per Active Charging Service.	Int32
pptp-gre-uplk-bytes	Description: The total number of uplink bytes sent across all PPTP GRE flows. Triggers: Increments whenever a new PPTP GRE packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
pptp-gre-dwnlk-bytes	Description: The total number of downlink bytes received across all PPTP GRE flows. Triggers: Increments whenever a new PPTP GRE packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
pptp-gre-uplk-pkts	Description: The total number of uplink packets sent across all PPTP GRE flows. Triggers: Increments whenever a new PPTP GRE packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
pptp-gre-dwnlk-pkts	Description: The total number of downlink packets received across all PPTP GRE flows. Triggers: Increments whenever a new PPTP GRE packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
tftp-flows	Description: The total number of TFTP control and data flows established. Triggers: Increments whenever a new TFTP flow is created. Availability: Per Active Charging Service.	Int32
tftp-uplk-bytes	Description: The total number of uplink bytes sent across all the TFTP control and data flows. Triggers: Increments whenever a new TFTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
tftp-dwnlk-bytes	Description: The total number of downlink bytes received across all the TFTP control and data flows. Triggers: Increments whenever a new TFTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
tftp-uplk-pkts	Description: The total number of uplink packets sent across all the TFTP control and data flows. Triggers: Increments whenever a new TFTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
tftp-dwnlk-pkts	Description: The total number of downlink packets received across all the TFTP control and data flows. Triggers: Increments whenever a new TFTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
tftp-total-read-sessions	Description: The total number of TFTP control flow read operations. Triggers: Increments when a new TFTP control flow read operation is detected. Availability: Per Active Charging Service.	Int32
tftp-total-write-sessions	Description: The total number of TFTP control flow write operations. Triggers: Increments when a new TFTP control flow write operation is detected. Availability: Per Active Charging Service.	Int32
tftp-unsupp-req-pkts	Description: The total number of TFTP unsupported control flow requests. Triggers: Increments when a new TFTP unsupported control flow request is detected. Availability: Per Active Charging Service.	Int32
tftp-invalid-ctrl	Description: The total number of TFTP control flow invalid packets. Triggers: Increments when a new TFTP control flow invalid packet is detected. Availability: Per Active Charging Service.	Int32
tftp-invalid-data-pkts	Description: The total number of TFTP data flow invalid packets. Triggers: Increments when a new TFTP data flow invalid packet is detected. Availability: Per Active Charging Service.	Int32
tftp-data-uplk-bytes	Description: The total number of uplink bytes across all TFTP data flows. Triggers: Increments whenever a new TFTP data flow packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64

Common Syntax Options

Variables	Description	Data Type
tftp-data-dwnlk-bytes	Description: The total number of downlink bytes across all TFTP data flows. Triggers: Increments whenever a new TFTP data flow packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
tftp-data-uplk-pkts	Description: The total number of uplink packets across all TFTP data flows. Triggers: Increments whenever a new TFTP data flow packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
tftp-data-dwnlk-pkts	Description: The total number of downlink packets across all TFTP data flows. Triggers: Increments whenever a new TFTP data flow packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
SMTP Analyzer Specific Statistics		
smtp-flows	Description: The combined total of the number of SMTP flows previously analyzed + SMTP flows currently being analyzed. Triggers: Increments whenever a new SMTP flow is created. Availability: Per Active Charging Service.	Int32
smtp-flows-cur	Description: The number of SMTP flows currently being analyzed. Triggers: Increments whenever a new SMTP flow is created. Decrements whenever an SMTP flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
smtp-uplk-bytes	Description: The total number of SMTP bytes detected in uplink direction. Triggers: Increments whenever a new SMTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
smtp-dwnlk-bytes	Description: The total number of SMTP bytes detected in downlink direction. Triggers: Increments whenever a new SMTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
smtp-uplk-pkts	Description: The total number of SMTP packets detected in uplink direction. Triggers: Increments whenever a new SMTP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
smtp-dwnlk-pkts	Description: The total number of SMTP packets detected in downlink direction. Triggers: Increments whenever a new SMTP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
smtp-uplk-bytes-retr	Description: The total number of SMTP bytes retransmitted in uplink direction. Triggers: Increments whenever a new SMTP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
smtp-dwnlk-bytes-retr	Description: The total number of SMTP bytes retransmitted in downlink direction. Triggers: Increments whenever a new SMTP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
smtp-uplk-pkts-retr	Description: The total number of SMTP packets retransmitted in uplink direction. Triggers: Increments whenever a new SMTP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
smtp-dwnlk-pkts-retr	Description: The total number of SMTP packets retransmitted in downlink direction. Triggers: Increments whenever a new SMTP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
smtp-unk-cmd	Description: The total number of SMTP Unknown commands detected. Triggers: Increments whenever an SMTP unknown command is detected. Availability: Per Active Charging Service.	Int32
smtp-unk-resp	Description: The total number of SMTP Unknown responses detected. Triggers: Increments whenever an SMTP unknown response is received. Availability: Per Active Charging Service.	Int32
smtp-req-succ	Description: The total number of SMTP requests succeeded. Triggers: Increments whenever an SMTP request is successful. Availability: Per Active Charging Service.	Int32
smtp-req-fail	Description: The total number of failed SMTP requests. Triggers: Increments whenever an SMTP request fails. Availability: Per Active Charging Service.	Int32
smtp-helo	Description: The total number of SMTP HELO commands detected. Triggers: Increments whenever an SMTP HELO command is detected. Availability: Per Active Charging Service.	Int32
smtp-ehlo	Description: The total number of SMTP EHLO commands detected. Triggers: Increments whenever an SMTP EHLO command is detected. Availability: Per Active Charging Service.	Int32
smtp-mail-frm	Description: The total number of SMTP MAIL FROM commands detected. Triggers: Increments whenever an SMTP MAIL FROM command is detected. Availability: Per Active Charging Service.	Int32
smtp-rcpt-to	Description: The total number of SMTP RCPT TO commands detected. Triggers: Increments whenever an SMTP RCPT TO command is detected. Availability: Per Active Charging Service.	Int32
smtp-data	Description: The total number of SMTP DATA commands detected. Triggers: Increments whenever an SMTP DATA command is detected. Availability: Per Active Charging Service.	Int32
smtp-bdat	Description: The total number of SMTP BDAT commands detected. Triggers: Increments whenever an SMTP BDAT command is detected. Availability: Per Active Charging Service.	Int32
smtp-vrfy	Description: The total number of SMTP VERIFY commands detected. Triggers: Increments whenever an SMTP VERIFY command is detected. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
smtp-expn	Description: The total number of SMTP EXPN commands detected. Triggers: Increments whenever an SMTP EXPN command is detected. Availability: Per Active Charging Service.	Int32
smtp-noop	Description: The total number of SMTP NOOP commands detected. Triggers: Increments whenever an SMTP NOOP command is detected. Availability: Per Active Charging Service.	Int32
smtp-rset	Description: The total number of SMTP RSET commands detected. Triggers: Increments whenever an SMTP RSET command is detected. Availability: Per Active Charging Service.	Int32
smtp-quit	Description: The total number of SMTP QUIT commands detected. Triggers: Increments whenever an SMTP QUIT command is detected. Availability: Per Active Charging Service.	Int32
smtp-inv-pkts	Description: The total number of invalid SMTP packets detected. Triggers: Increments whenever an invalid SMTP packet is detected. Availability: Per Active Charging Service.	Int32
POP3 Analyzer Specific Statistics		
pop3-flows	Description: The combined total of the number of POP3 flows previously analyzed + POP3 flows currently being analyzed. Triggers: Increments whenever a new POP3 flow is created. Availability: Per Active Charging Service.	Int32
pop3-flows-cur	Description: The number of POP3 flows currently being analyzed. Triggers: Increments whenever a new POP3 flow is created. Decrements whenever a POP3 flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
pop3-uplk-bytes	Description: The total number of POP3 bytes detected in uplink direction. Triggers: Increments whenever a new POP3 packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
pop3-dwnlk-bytes	Description: The total number of POP3 bytes detected in downlink direction. Triggers: Increments whenever a new POP3 packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
pop3-uplk-pkts	Description: The total number of POP3 packets detected in uplink direction. Triggers: Increments whenever a new POP3 packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
pop3-dwnlk-pkts	Description: The total number of POP3 packets detected in downlink direction. Triggers: Increments whenever a new POP3 packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
pop3-uplk-bytes-retr	Description: The total number of POP3 bytes retransmitted in uplink direction. Triggers: Increments whenever a new POP3 retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
pop3-dwnlk-bytes-retr	Description: The total number of POP3 bytes retransmitted in downlink direction. Triggers: Increments whenever a new POP3 retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
pop3-uplk-pkts-retr	Description: The total number of POP3 packets retransmitted in uplink direction. Triggers: Increments whenever a new POP3 retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
pop3-dwnlk-pkts-retr	Description: The total number of POP3 packets retransmitted in downlink direction. Triggers: Increments whenever a new POP3 retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
pop3-retr	Description: The total number of POP3 RETR commands detected. Triggers: Increments whenever a POP3 RETR command is detected. Availability: Per Active Charging Service.	Int32
pop3-retr-succ	Description: The total number of POP3 RETR commands successful. Triggers: Increments whenever a POP3 RETR command is successful. Availability: Per Active Charging Service.	Int32
pop3-list	Description: The total number of POP3 LIST commands detected. Triggers: Increments whenever a POP3 LIST command is detected. Availability: Per Active Charging Service.	Int32
pop3-list-succ	Description: The total number of POP3 LIST commands successful. Triggers: Increments whenever a POP3 LIST command is successful. Availability: Per Active Charging Service.	Int32
pop3-inv-pkts	Description: The total number of invalid POP3 packets detected. Triggers: Increments whenever an invalid POP3 packet is detected. Availability: Per Active Charging Service.	Int32
IMAP Statistics		
imap-uplk-bytes	Description: The total number of IMAP bytes detected in uplink direction. Triggers: Increments whenever a new IMAP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
imap-dwnlk-bytes	Description: The total number of IMAP bytes detected in downlink direction. Triggers: Increments whenever a new IMAP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
imap-uplk-pkts	Description: The total number of IMAP packets detected in uplink direction. Triggers: Increments whenever a new IMAP packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
imap-dwnlk-pkts	Description: The total number of IMAP packets detected in downlink direction. Triggers: Increments whenever a new IMAP packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
imap-uplk-bytes-retr	Description: The total number of IMAP retry bytes detected in uplink direction. Triggers: Increments whenever a new IMAP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
imap-dwnlk-bytes-retr	Description: The total number of IMAP retry bytes detected in downlink direction. Triggers: Increments whenever a new IMAP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
imap-uplk-pkts-retr	Description: The total number of IMAP retry packets detected in uplink direction. Triggers: Increments whenever a new IMAP retransmitted packet is detected in uplink direction. Availability: Per Active Charging Service.	Int32
imap-dwnlk-pkts-retr	Description: The total number of IMAP retry packets detected in downlink direction. Triggers: Increments whenever a new IMAP retransmitted packet is detected in downlink direction. Availability: Per Active Charging Service.	Int32
imap-req-succ	Description: The total number of successful IMAP requests detected. Triggers: Increments whenever an IMAP request is successful. Availability: Per Active Charging Service.	Int32
imap-req-fail	Description: The total number of failed IMAP requests detected. Triggers: Increments whenever an IMAP request fails. Availability: Per Active Charging Service.	Int32
imap-reply-untag	Description: The total number of untagged IMAP replies detected. Triggers: Increments whenever an untagged IMAP reply is detected. Availability: Per Active Charging Service.	Int32
imap-reply-commcont	Description: The total number of IMAP Command Cont replies detected. Triggers: Increments whenever an IMAP command CONT reply is detected. Availability: Per Active Charging Service.	Int32
imap-unk-command	Description: The total number of unknown IMAP commands detected. Triggers: Increments whenever an IMAP unknown command is detected. Availability: Per Active Charging Service.	Int32
imap-unk-reply	Description: The total number of unknown IMAP replies detected. Triggers: Increments whenever an IMAP unknown reply is detected. Availability: Per Active Charging Service.	Int32
acf-req-created	Description: Total number of ACF requests created. Triggers: Increments whenever a new ACF request is created. Availability: Per Active Charging Service.	Int64
acf-wr-req-succ	Description: Total number of successful ACF WRITE requests. Triggers: Increments whenever an ACF write request is successful. Availability: Per Active Charging Service.	Int64
acf-wr-req-failed	Description: Total number of ACF WRITE requests failed. Triggers: Increments whenever an ACF write request fails. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
acf-rd-rsp-succ	Description: Total number of successful ACF READ responses. Triggers: Increments whenever an ACF READ response is received. Availability: Per Active Charging Service.	Int64
acf-rd-rsp-failed	Description: Total number of failed READ responses. Triggers: Increments whenever an ACF READ response fails. Availability: Per Active Charging Service.	Int64
acf-http-permit	Description: Total number of HTTP URLs permitted from ACF. Triggers: Increments whenever an HTTP URL is permitted from ACF. Availability: Per Active Charging Service.	Int64
acf-http-deny	Description: Total number of HTTP URLs denied from ACF. Triggers: Increments whenever an HTTP URL is denied from ACF. Availability: Per Active Charging Service.	Int64
acf-http-redirect	Description: Total number of HTTP URLs redirected from ACF. Triggers: Increments whenever an HTTP URL is redirected from ACF. Availability: Per Active Charging Service.	Int64
acf-wap-permit	Description: Total number of WAP URLs permitted from ACF. Triggers: Increments whenever a WAP URL is permitted from ACF. Availability: Per Active Charging Service.	Int64
acf-wap-deny	Description: Total number of WAP URLs denied from ACF. Triggers: Increments whenever a WAP URL is denied from ACF. Availability: Per Active Charging Service.	Int64
acf-wap-redirect	Description: Total number of WAP URLs redirected from ACF. Triggers: Increments whenever a WAP URL is redirected from ACF. Availability: Per Active Charging Service.	Int64
P2P Specific Statistics		
p2p-flows	Description: The total number of P2P flows detected until a given time. Triggers: Increments when a flow is marked as P2P. Availability: Per Active Charging Service	Int32
p2p-flows-cur	Description: The number of currently active P2P flows at a given instance in time. Triggers: Increments when a flow is marked as P2P. Decrements when the flow state is cleaned up. Availability: Per Active Charging Service Type: Gauge	Int32
p2p-subscribers	Description: The total number of P2P subscribers detected until a given time. Triggers: Increments when whenever the first P2P flow for a subscriber is detected. Does not increment for subsequent P2P flows in the same session. If the subscriber logs off and then returns, and has a P2P flow, this counter increments again. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
p2p-subscribers-cur	Description: The number of active P2P subscribers at a given instance in time. Triggers: Increments whenever, in the sampling time period, the first P2P flow for a subscriber is detected. Decrements whenever, in the sampling time period, all P2P flows for a P2P-marked subscriber ends. Availability: Per Active Charging Service. Type: Gauge	Int32
p2p-skype-voice-duration	Description: The total Skype voice duration for a P2P subscriber at a given instance in time. Triggers: Increments whenever a detected voice flow for Skype ends the voice conversation. Availability: Per Active Charging Service	Int32
p2p-msn-voice-duration	Description: The total MSN voice duration for a P2P subscriber at a given instance in time. Triggers: Increments whenever a detected voice flow for MSN ends the voice conversation. Availability: Per Active Charging Service	Int32
p2p-oscar-voice-duration	Description: The total Oscar voice duration for a P2P subscriber at a given instance in time. Triggers: Increments whenever a detected voice flow for Oscar ends the voice conversation. Availability: Per Active Charging Service	Int32
p2p-gtalk-voice-duration	Description: The total GTalk voice duration for a P2P subscriber at a given instance in time. Triggers: Increments whenever a detected voice flow for GTalk ends the voice conversation. Availability: Per Active Charging Service	Int32
p2p-yahoo-voice-duration	Description: The total Yahoo voice duration for a P2P subscriber at a given instance in time. Triggers: Increments whenever a detected voice flow for Yahoo ends the voice conversation. Availability: Per Active Charging Service	Int32
p2p-skype-uplnk-bytes	Description: The number of bytes of Skype traffic detected in uplink direction. Triggers: Increments when a packet of Skype traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-skype-dwlnk-bytes	Description: The number of bytes of Skype traffic sent to MS. Triggers: Increments when a packet of Skype traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-skype-uplnk-pkts	Description: The number of packets of Skype traffic received from MS. Triggers: Increments when a packet of Skype traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-skype-dwlnk-pkts	Description: The number of packets of Skype traffic sent to MS. Triggers: Increments when a packet of Skype traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-skype-voice-uplnk-bytes	<p>Description: The number of bytes of Skype voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-voice-dwlnk-bytes	<p>Description: The number of bytes of Skype voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-voice-uplnk-pkts	<p>Description: The number of packets of Skype voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-voice-dwlnk-pkts	<p>Description: The number of packets of Skype voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-skype-non-voice-uplnk-bytes	<p>Description: The number of bytes of Skype non-voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype non-voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-non-voice-dwlnk-bytes	<p>Description: The number of bytes of Skype non-voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype non-voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-non-voice-uplnk-pkts	<p>Description: The number of packets of Skype non-voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype non-voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-non-voice-dwlnk-pkts	<p>Description: The number of packets of Skype non-voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype non-voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-skype-audio-uplnk-bytes	<p>Description: The number of bytes of Skype audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-audio-dwlnk-bytes	<p>Description: The number of bytes of Skype audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-audio-uplnk-pkts	<p>Description: The number of packets of Skype audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-audio-dwlnk-pkts	<p>Description: The number of packets of Skype audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-skype-non-audio-uplnk-bytes	<p>Description: The number of bytes of Skype non-audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Skype non-audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-non-audio-dwlnk-bytes	<p>Description: The number of bytes of Skype non-audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Skype non-audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-non-audio-uplnk-pkts	<p>Description: The number of packets of Skype non-audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Skype non-audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-non-audio-dwlnk-pkts	<p>Description: The number of packets of Skype non-audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Skype non-audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-unclassified-uplnk-bytes	<p>Description: The number of bytes of Skype unclassified traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-skype-unclassified-dwlnk-bytes	<p>Description: The number of bytes of Skype unclassified traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-unclassified-uplnk-pkts	<p>Description: The number of packets of Skype unclassified traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype unclassified traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-unclassified-dwlnk-pkts	<p>Description: The number of packets of Skype unclassified traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Skype unclassified traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-bittorrent-uplnk-bytes	<p>Description: The number of bytes of BitTorrent traffic received from MS. Triggers: Increments when a packet of BitTorrent traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-bittorrent-dwlnk-bytes	<p>Description: The number of bytes of BitTorrent traffic sent to MS. Triggers: Increments when a packet of BitTorrent traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-bittorrent-uplnk-pkts	<p>Description: The number of packets of BitTorrent traffic received from MS. Triggers: Increments when a packet of BitTorrent traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-bittorrent-dwlnk-pkts	<p>Description: The number of packets of BitTorrent traffic sent to MS. Triggers: Increments when a packet of BitTorrent traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-edonkey-uplnk-bytes	Description: The number of bytes of eDonkey traffic received from MS. Triggers: Increments when a packet of eDonkey traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-edonkey-dwlnk-bytes	Description: The number of bytes of eDonkey traffic sent to MS. Triggers: Increments when a packet of eDonkey traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-edonkey-uplnk-pkts	Description: The number of packets of eDonkey traffic received from MS. Triggers: Increments when a packet of eDonkey traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-edonkey-dwlnk-pkts	Description: The number of packets of eDonkey traffic sent to MS. Triggers: Increments when a packet of eDonkey traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-msn-uplnk-bytes	Description: The number of bytes of MSN traffic received from MS. Triggers: Increments when a packet of MSN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-msn-dwlnk-bytes	Description: The number of bytes of MSN traffic sent to MS. Triggers: Increments when a packet of MSN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-msn-uplnk-pkts	Description: The number of packets of MSN traffic received from MS. Triggers: Increments when a packet of MSN traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-msn-dwlnk-pkts	Description: The number of packets of MSN traffic sent to MS. Triggers: Increments when a packet of MSN traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-msn-voice-uplnk-bytes	Description: The number of bytes of MSN voice traffic received from MS.  IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases. Triggers: Increments when a packet of MSN voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-msn-voice-dwlnk-bytes	<p>Description: The number of bytes of MSN voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-voice-uplnk-pkts	<p>Description: The number of packets of MSN voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-voice-dwlnk-pkts	<p>Description: The number of packets of MSN voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-audio-uplnk-bytes	<p>Description: The number of bytes of MSN audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-audio-dwlnk-bytes	<p>Description: The number of bytes of MSN audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-msn-audio-uplnk-pkts	<p>Description: The number of packets of MSN audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-audio-dwlnk-pkts	<p>Description: The number of packets of MSN audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-non-audio-or-video-uplnk-bytes	<p>Description: The number of bytes of MSN non-audio or non-video traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of MSN non-audio or non-video traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-non-audio-or-video-dwlnk-bytes	<p>Description: The number of bytes of MSN non-audio or non-video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of MSN non-audio or non-video traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-msn-non-audio-or-video-uplnk-pkts	<p>Description: The number of packets of MSN non-audio or non-video traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of MSN non-audio or non-video traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-non-audio-or-video-dwlnk-pkts	<p>Description: The number of packets of MSN non-audio or non-video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of MSN non-audio or non-video traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-unclassified-uplnk-bytes	<p>Description: The number of bytes of MSN unclassified traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter.</p> <p>Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-msn-video-uplnk-pkts	<p>Description: The number of packets of MSN video traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN video traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-msn-video-dwlnk-pkts	<p>Description: The number of packets of MSN video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of MSN video traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-video-uplnk-bytes	<p>Description: The number of bytes of Oscar video traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-video-dwlnk-bytes	<p>Description: The number of bytes of Oscar video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-oscar-video-uplnk-pkts	<p>Description: The number of packets of Oscar video traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-video-dwlnk-pkts	<p>Description: The number of packets of Oscar video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-video-uplnk-bytes	<p>Description: The number of bytes of GTalk video traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-video-dwlnk-bytes	<p>Description: The number of bytes of GTalk video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-gtalk-video-uplnk-pkts	<p>Description: The number of packets of GTalk video traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-video-dwlnk-pkts	<p>Description: The number of packets of GTalk video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-video-uplnk-bytes	<p>Description: The number of bytes of Skype video traffic received from MS.</p> <hr/> <p> IMPORTANT: This statistic is not supported in this release. Please contact your Cisco account representative for more information.</p> <hr/> <p>Triggers: Increments when a packet of Skype video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-video-dwlnk-bytes	<p>Description: The number of bytes of Skype video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This statistic is not supported in this release. Please contact your Cisco account representative for more information.</p> <hr/> <p>Triggers: Increments when a packet of Skype video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-skype-video-uplnk-pkts	<p>Description: The number of packets of Skype video traffic received from MS.</p> <hr/> <p> IMPORTANT: This statistic is not supported in this release. Please contact your Cisco account representative for more information.</p> <hr/> <p>Triggers: Increments when a packet of Skype video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-skype-video-dwlnk-pkts	<p>Description: The number of packets of Skype video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This statistic is not supported in this release. Please contact your Cisco account representative for more information.</p> <hr/> <p>Triggers: Increments when a packet of Skype video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-video-uplnk-bytes	<p>Description: The number of bytes of Yahoo video traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-video-dwlnk-bytes	<p>Description: The number of bytes of Yahoo video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-yahoo-video-uplnk-pkts	<p>Description: The number of packets of Yahoo video traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-video-dwlnk-pkts	<p>Description: The number of packets of Yahoo video traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo video traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-uplnk-bytes	<p>Description: The number of bytes of Yahoo traffic received from MS. Triggers: Increments when a packet of Yahoo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-dwlnk-bytes	<p>Description: The number of bytes of Yahoo traffic sent to MS. Triggers: Increments when a packet of Yahoo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-uplnk-pkts	<p>Description: The number of packets of Yahoo traffic received from MS. Triggers: Increments when a packet of Yahoo traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-dwlnk-pkts	<p>Description: The number of packets of Yahoo traffic sent to MS. Triggers: Increments when a packet of Yahoo traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-voice-uplnk-bytes	<p>Description: The number of bytes of Yahoo voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-yahoo-voice-dwlnk-bytes	<p>Description: The number of bytes of Yahoo voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-voice-uplnk-pkts	<p>Description: The number of packets of Yahoo voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-voice-dwlnk-pkts	<p>Description: The number of packets of Yahoo voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-audio-uplnk-bytes	<p>Description: The number of bytes of Yahoo audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-yahoo-audio-dwlnk-bytes	<p>Description: The number of bytes of Yahoo audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-audio-uplnk-pkts	<p>Description: The number of packets of Yahoo audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-audio-dwlnk-pkts	<p>Description: The number of packets of Yahoo audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-non-voice-uplnk-bytes	<p>Description: The number of bytes of Yahoo non-voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo non-voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-yahoo-non-voice-dwlnk-bytes	<p>Description: The number of bytes of Yahoo non-voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo non-voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-non-voice-uplnk-pkts	<p>Description: The number of packets of Yahoo non-voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo non-voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-non-voice-dwlnk-pkts	<p>Description: The number of packets of Yahoo non-voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo non-voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-non-audio-uplnk-bytes	<p>Description: The number of bytes of Yahoo non-audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo non-audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-non-audio-dwlnk-bytes	<p>Description: The number of bytes of Yahoo non-audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo non-audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-yahoo-non-audio-uplnk-pkts	<p>Description: The number of packets of Yahoo non-audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo non-audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-non-audio-dwlnk-pkts	<p>Description: The number of packets of Yahoo non-audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo non-audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-unclassified-uplnk-bytes	<p>Description: The number of bytes of Yahoo unclassified traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-unclassified-dwlnk-bytes	<p>Description: The number of bytes of Yahoo unclassified traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-yahoo-unclassified-uplnk-pkts	<p>Description: The number of packets of Yahoo unclassified traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-yahoo-unclassified-dwlnk-pkts	<p>Description: The number of packets of Yahoo unclassified traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Yahoo unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-orb-uplnk-bytes	<p>Description: The number of bytes of ORB traffic received from MS. Triggers: Increments when a packet of ORB traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-orb-dwlnk-bytes	<p>Description: The number of bytes of ORB traffic sent to MS. Triggers: Increments when a packet of ORB traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-orb-uplnk-pkts	<p>Description: The number of packets of ORB traffic received from MS. Triggers: Increments when a packet of ORB traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-orb-dwlnk-pkts	<p>Description: The number of packets of ORB traffic sent to MS. Triggers: Increments when a packet of ORB traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-winy-uplnk-bytes	<p>Description: The number of bytes of Winny traffic received from MS. Triggers: Increments when a packet of Winny traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-winy-dwlnk-bytes	<p>Description: The number of bytes of Winny traffic sent to MS. Triggers: Increments when a packet of Winny traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-winy-uplnk-pkts	<p>Description: The number of packets of Winny traffic received from MS. Triggers: Increments when a packet of Winny traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-winy-dwlnk-pkts	<p>Description: The number of packets of Winny traffic sent to MS. Triggers: Increments when a packet of Winny traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-slingbox-uplnk-bytes	<p>Description: The number of bytes of Slingbox traffic received from MS. Triggers: Increments when a packet of Slingbox traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-slingbox-dwlnk-bytes	Description: The number of bytes of Slingbox traffic sent to MS. Triggers: Increments when a packet of Slingbox traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-slingbox-uplnk-pkts	Description: The number of packets of Slingbox traffic received from MS. Triggers: Increments when a packet of Slingbox traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-slingbox-dwlnk-pkts	Description: The number of packets of Slingbox traffic sent to MS. Triggers: Increments when a packet of Slingbox traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-fasttrack-uplnk-bytes	Description: The number of bytes of FastTrack traffic received from MS. Triggers: Increments when a packet of FastTrack traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-fasttrack-dwlnk-bytes	Description: The number of bytes of FastTrack traffic sent to MS. Triggers: Increments when a packet of FastTrack traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-fasttrack-uplnk-pkts	Description: The number of packets of FastTrack traffic received from MS. Triggers: Increments when a packet of FastTrack traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-fasttrack-dwlnk-pkts	Description: The number of packets of FastTrack traffic sent to MS. Triggers: Increments when a packet of FastTrack traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-gnutella-uplnk-bytes	Description: The number of bytes of Gnutella traffic received from MS. Triggers: Increments when a packet of Gnutella traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gnutella-dwlnk-bytes	Description: The number of bytes of Gnutella traffic sent to MS. Triggers: Increments when a packet of Gnutella traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gnutella-uplnk-pkts	Description: The number of packets of Gnutella traffic received from MS. Triggers: Increments when a packet of Gnutella traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-gnutella-dwlnk-pkts	Description: The number of packets of Gnutella traffic sent to MS. Triggers: Increments when a packet of Gnutella traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-jabber-uplnk-bytes	Description: The number of bytes of Jabber traffic received from MS. Triggers: Increments when a packet of Jabber traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-jabber-dwlnk-bytes	Description: The number of bytes of Jabber traffic sent to MS. Triggers: Increments when a packet of Jabber traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-jabber-uplnk-pkts	Description: The number of packets of Jabber traffic received from MS. Triggers: Increments when a packet of Jabber traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-jabber-dwlnk-pkts	Description: The number of packets of Jabber traffic sent to MS. Triggers: Increments when a packet of Jabber traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-manolito-uplnk-bytes	Description: The number of bytes of Manolito traffic received from MS. Triggers: Increments when a packet of Manolito traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-manolito-dwlnk-bytes	Description: The number of bytes of Manolito traffic sent to MS. Triggers: Increments when a packet of Manolito traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-manolito-uplnk-pkts	Description: The number of packets of Manolito traffic received from MS. Triggers: Increments when a packet of Manolito traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-manolito-dwlnk-pkts	Description: The number of packets of Manolito traffic sent to MS. Triggers: Increments when a packet of Manolito traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-pando-uplnk-bytes	Description: The number of bytes of Pando traffic received from MS. Triggers: Increments when a packet of Pando traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-pando-dwlnk-bytes	Description: The number of bytes of Pando traffic sent to MS. Triggers: Increments when a packet of Pando traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-pando-uplnk-pkts	Description: The number of packets of Pando traffic received from MS. Triggers: Increments when a packet of Pando traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-pando-dwlnk-pkts	Description: The number of packets of Pando traffic sent to MS. Triggers: Increments when a packet of Pando traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-filetopia-uplnk-bytes	Description: The number of bytes of Filetopia traffic received from MS. Triggers: Increments when a packet of Filetopia traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-filetopia-dwlnk-bytes	Description: The number of bytes of Filetopia traffic sent to MS. Triggers: Increments when a packet of Filetopia traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-filetopia-uplnk-pkts	Description: The number of packets of Filetopia traffic received from MS. Triggers: Increments when a packet of Filetopia traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-filetopia-dwlnk-pkts	Description: The number of packets of Filetopia traffic sent to MS. Triggers: Increments when a packet of Filetopia traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-soulseek-uplnk-bytes	Description: The number of bytes of SoulSeek traffic received from MS. Triggers: Increments when a packet of SoulSeek traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-soulseek-dwlnk-bytes	Description: The number of bytes of SoulSeek traffic sent to MS. Triggers: Increments when a packet of SoulSeek traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-soulseek-uplnk-pkts	Description: The number of packets of SoulSeek traffic received from MS. Triggers: Increments when a packet of SoulSeek traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-soulseek-dwlnk-pkts	Description: The number of packets of SoulSeek traffic sent to MS. Triggers: Increments when a packet of SoulSeek traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-ppstream-uplnk-bytes	Description: The number of bytes of PPStream traffic received from MS. Triggers: Increments when a packet of PPStream traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-ppstream-dwlnk-bytes	Description: The number of bytes of PPStream traffic sent to MS. Triggers: Increments when a packet of PPStream traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-ppstream-uplnk-pkts	Description: The number of packets of PPStream traffic received from MS. Triggers: Increments when a packet of PPStream traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-ppstream-dwlnk-pkts	Description: The number of packets of PPStream traffic sent to MS. Triggers: Increments when a packet of PPStream traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-qq-uplnk-bytes	Description: The number of bytes of QQ traffic received from MS. Triggers: Increments when a packet of QQ traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-qq-dwlnk-bytes	Description: The number of bytes of QQ traffic sent to MS. Triggers: Increments when a packet of QQ traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-qq-uplnk-pkts	Description: The number of packets of QQ traffic received from MS. Triggers: Increments when a packet of QQ traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-qq-dwlnk-pkts	Description: The number of packets of QQ traffic sent to MS. Triggers: Increments when a packet of QQ traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-qqlive-uplnk-bytes	Description: The number of bytes of QQLive traffic received from MS. Triggers: Increments when a packet of QQLive traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-qqlive-dwlnk-bytes	Description: The number of bytes of QQLive traffic sent to MS. Triggers: Increments when a packet of QQLive traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-qqlive-uplnk-pkts	Description: The number of packets of QQLive traffic received from MS. Triggers: Increments when a packet of QQLive traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-qqlive-dwlnk-pkts	Description: The number of packets of QQLive traffic sent to MS. Triggers: Increments when a packet of QQLive traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-mute-uplnk-bytes	Description: The number of bytes of Mute traffic received from MS. Triggers: Increments when a packet of Mute traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-mute-dwlnk-bytes	Description: The number of bytes of Mute traffic sent to MS. Triggers: Increments when a packet of Mute traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-mute-uplnk-pkts	Description: The number of packets of Mute traffic received from MS. Triggers: Increments when a packet of Mute traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-mute-dwlnk-pkts	Description: The number of packets of Mute traffic sent to MS. Triggers: Increments when a packet of Mute traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-gadugadu-uplnk-bytes	Description: The number of bytes of Gadu-Gadu traffic received from MS. Triggers: Increments when a packet of Gadu-Gadu traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-gadugadu-dwlnk-bytes	Description: The number of bytes of Gadu-Gadu traffic sent to MS. Triggers: Increments when a packet of Gadu-Gadu traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-gadugadu-uplnk-pkts	Description: The number of packets of Gadu-Gadu traffic received from MS. Triggers: Increments when a packet of Gadu-Gadu traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-gadugadu-dwlnk-pkts	Description: The number of packets of Gadu-Gadu traffic sent to MS. Triggers: Increments when a packet of Gadu-Gadu traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-feidian-uplnk-bytes	Description: The number of bytes of Feidian traffic received from MS. Triggers: Increments when a packet of Feidian traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64

Common Syntax Options

Variables	Description	Data Type
p2p-feidian-dwlnk-bytes	Description: The number of bytes of Feidian traffic sent to MS. Triggers: Increments when a packet of Feidian traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-feidian-uplnk-pkts	Description: The number of packets of Feidian traffic received from MS. Triggers: Increments when a packet of Feidian traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-feidian-dwlnk-pkts	Description: The number of packets of Feidian traffic sent to MS. Triggers: Increments when a packet of Feidian traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-applejuice-uplnk-bytes	Description: The number of bytes of AppleJuice traffic received from MS. Triggers: Increments when a packet of AppleJuice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-applejuice-dwlnk-bytes	Description: The number of bytes of AppleJuice traffic sent to MS. Triggers: Increments when a packet of AppleJuice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-applejuice-uplnk-pkts	Description: The number of packets of AppleJuice traffic received from MS. Triggers: Increments when a packet of AppleJuice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-applejuice-dwlnk-pkts	Description: The number of packets of AppleJuice traffic sent to MS. Triggers: Increments when a packet of AppleJuice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-zattoo-uplnk-bytes	Description: The number of bytes of Zattoo traffic received from MS. Triggers: Increments when a packet of Zattoo traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-zattoo-dwlnk-bytes	Description: The number of bytes of Zattoo traffic sent to MS. Triggers: Increments when a packet of Zattoo traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-zattoo-uplnk-pkts	Description: The number of packets of Zattoo traffic received from MS. Triggers: Increments when a packet of Zattoo traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-zattoo-dwlnk-pkts	Description: The number of packets of Zattoo traffic sent to MS. Triggers: Increments when a packet of Zattoo traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-skinny-uplnk-bytes	Description: The number of bytes of Skinny traffic received from MS. Triggers: Increments when a packet of Skinny traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-skinny-dwlnk-bytes	Description: The number of bytes of Skinny traffic sent to MS. Triggers: Increments when a packet of Skinny traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-skinny-uplnk-pkts	Description: The number of packets of Skinny traffic received from MS. Triggers: Increments when a packet of Skinny traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-skinny-dwlnk-pkts	Description: The number of packets of Skinny traffic sent to MS. Triggers: Increments when a packet of Skinny traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-sopcast-uplnk-bytes	Description: The number of bytes of SopCast traffic received from MS. Triggers: Increments when a packet of SopCast traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-sopcast-dwlnk-bytes	Description: The number of bytes of SopCast traffic sent to MS. Triggers: Increments when a packet of SopCast traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-sopcast-uplnk-pkts	Description: The number of packets of SopCast traffic received from MS. Triggers: Increments when a packet of SopCast traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-sopcast-dwlnk-pkts	Description: The number of packets of SopCast traffic sent to MS. Triggers: Increments when a packet of SopCast traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-ares-uplnk-bytes	Description: The number of bytes of Ares traffic received from MS. Triggers: Increments when a packet of Ares traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-ares-dwlnk-bytes	Description: The number of bytes of Ares traffic sent to MS. Triggers: Increments when a packet of Ares traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-ares-uplnk-pkts	Description: The number of packets of Ares traffic received from MS. Triggers: Increments when a packet of Ares traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-ares-dwlnk-pkts	Description: The number of packets of Ares traffic sent to MS. Triggers: Increments when a packet of Ares traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-directconnect-uplnk-bytes	Description: The number of bytes of DirectConnect traffic received from MS. Triggers: Increments when a packet of DirectConnect traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-directconnect-dwlnk-bytes	Description: The number of bytes of DirectConnect traffic sent to MS. Triggers: Increments when a packet of DirectConnect traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-directconnect-uplnk-pkts	Description: The number of packets of DirectConnect traffic received from MS. Triggers: Increments when a packet of DirectConnect traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-directconnect-dwlnk-pkts	Description: The number of packets of DirectConnect traffic sent to MS. Triggers: Increments when a packet of DirectConnect traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64

Common Syntax Options

Variables	Description	Data Type
p2p-imesh-uplnk-bytes	Description: The number of bytes of iMesh traffic received from MS. Triggers: Increments when a packet of iMesh traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-imesh-dwlnk-bytes	Description: The number of bytes of iMesh traffic sent to MS. Triggers: Increments when a packet of iMesh traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-imesh-uplnk-pkts	Description: The number of packets of iMesh traffic received from MS. Triggers: Increments when a packet of iMesh traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-imesh-dwlnk-pkts	Description: The number of packets of iMesh traffic sent to MS. Triggers: Increments when a packet of iMesh traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-pplive-uplnk-bytes	Description: The number of bytes of PPLive traffic received from MS. Triggers: Increments when a packet of PPLive traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-pplive-dwlnk-bytes	Description: The number of bytes of PPLive traffic sent to MS. Triggers: Increments when a packet of PPLive traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-pplive-uplnk-pkts	Description: The number of packets of PPLive traffic received from MS. Triggers: Increments when a packet of PPLive traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-pplive-dwlnk-pkts	Description: The number of packets of PPLive traffic sent to MS. Triggers: Increments when a packet of PPLive traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-oscar-uplnk-bytes	Description: The number of bytes of Oscar traffic received from MS. Triggers: Increments when a packet of Oscar traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-oscar-dwlnk-bytes	Description: The number of bytes of Oscar traffic sent to MS. Triggers: Increments when a packet of Oscar traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-oscar-uplnk-pkts	Description: The number of packets of Oscar traffic received from MS. Triggers: Increments when a packet of Oscar traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64
p2p-oscar-dwlnk-pkts	Description: The number of packets of Oscar traffic sent to MS. Triggers: Increments when a packet of Oscar traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-oscar-voice-uplnk-bytes	<p>Description: The number of bytes of Oscar voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-voice-dwlnk-bytes	<p>Description: The number of bytes of Oscar voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-voice-uplnk-pkts	<p>Description: The number of packets of Oscar voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-voice-dwlnk-pkts	<p>Description: The number of packets of Oscar voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-oscar-audio-uplnk-bytes	<p>Description: The number of bytes of Oscar audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-audio-dwlnk-bytes	<p>Description: The number of bytes of Oscar audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-audio-uplnk-pkts	<p>Description: The number of packets of Oscar audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-audio-dwlnk-pkts	<p>Description: The number of packets of Oscar audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-oscar-non-voice-uplnk-bytes	<p>Description: The number of bytes of Oscar non-voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar non-voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-non-voice-dwlnk-bytes	<p>Description: The number of bytes of Oscar non-voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar non-voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-non-voice-uplnk-pkts	<p>Description: The number of packets of Oscar non-voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar non-voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-non-voice-dwlnk-pkts	<p>Description: The number of packets of Oscar non-voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar non-voice traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-oscar-non-audio-uplnk-bytes	<p>Description: The number of bytes of Oscar non-audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Oscar non-audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-non-audio-dwlnk-bytes	<p>Description: The number of bytes of Oscar non-audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Oscar non-audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-non-audio-uplnk-pkts	<p>Description: The number of packets of Oscar non-audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Oscar non-audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-non-audio-dwlnk-pkts	<p>Description: The number of packets of Oscar non-audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0.</p> <hr/> <p>Triggers: Increments when a packet of Oscar non-audio traffic is detected by the P2P analyzer. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-unclassified-uplnk-bytes	<p>Description: The number of bytes of Oscar unclassified traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-oscar-unclassified-dwlnk-bytes	<p>Description: The number of bytes of Oscar unclassified traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-unclassified-uplnk-pkts	<p>Description: The number of packets of Oscar unclassified traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-oscar-unclassified-dwlnk-pkts	<p>Description: The number of packets of Oscar unclassified traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of Oscar unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-popo-uplnk-bytes	<p>Description: The number of bytes of PoPo traffic received from MS. Triggers: Increments when a packet of PoPo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-popo-dwlnk-bytes	<p>Description: The number of bytes of PoPo traffic sent to MS. Triggers: Increments when a packet of PoPo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-popo-uplnk-pkts	<p>Description: The number of packets of PoPo traffic received from MS. Triggers: Increments when a packet of PoPo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-popo-dwlnk-pkts	<p>Description: The number of packets of PoPo traffic sent to MS. Triggers: Increments when a packet of PoPo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-irc-uplnk-bytes	Description: The number of bytes of IRC traffic received from MS. Triggers: Increments when a packet of IRC traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-irc-dwlnk-bytes	Description: The number of bytes of IRC traffic sent to MS. Triggers: Increments when a packet of IRC traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-irc-uplnk-pkts	Description: The number of packets of IRC traffic received from MS. Triggers: Increments when a packet of IRC traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-irc-dwlnk-pkts	Description: The number of packets of IRC traffic sent to MS. Triggers: Increments when a packet of IRC traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-steam-uplnk-bytes	Description: The number of bytes of Steam traffic received from MS. Triggers: Increments when a packet of Steam traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-steam-dwlnk-bytes	Description: The number of bytes of Steam traffic sent to MS. Triggers: Increments when a packet of Steam traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-steam-uplnk-pkts	Description: The number of packets of Steam traffic received from MS. Triggers: Increments when a packet of Steam traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-steam-dwlnk-pkts	Description: The number of packets of Steam traffic sent to MS. Triggers: Increments when a packet of Steam traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ddlink-uplnk-bytes	Description: The number of bytes of Ddlink traffic received from MS. Triggers: Increments when a packet of Ddlink traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ddlink-dwlnk-bytes	Description: The number of bytes of Ddlink traffic sent to MS. Triggers: Increments when a packet of Ddlink traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ddlink-uplnk-pkts	Description: The number of packets of Ddlink traffic received from MS. Triggers: Increments when a packet of Ddlink traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-ddlink-dwlnk-pkts	Description: The number of packets of Ddlink traffic sent to MS. Triggers: Increments when a packet of Ddlink traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-halflife2-uplnk-bytes	Description: The number of bytes of Half-life2 traffic received from MS. Triggers: Increments when a packet of Half-life2 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-halflife2-dwlnk-bytes	Description: The number of bytes of Half-life2 traffic sent to MS. Triggers: Increments when a packet of Half-life2 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-halflife2-uplnk-pkts	Description: The number of packets of Half-life2 traffic received from MS. Triggers: Increments when a packet of Half-life2 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-halflife2-dwlnk-pkts	Description: The number of packets of Half-life2 traffic sent to MS. Triggers: Increments when a packet of Half-life2 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-hamachivpn-uplnk-bytes	Description: The number of bytes of HamachiVPN traffic received from MS. Triggers: Increments when a packet of HamachiVPN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-hamachivpn-dwlnk-bytes	Description: The number of bytes of HamachiVPN traffic sent to MS. Triggers: Increments when a packet of HamachiVPN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-hamachivpn-uplnk-pkts	Description: The number of packets of HamachiVPN traffic received from MS. Triggers: Increments when a packet of HamachiVPN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-hamachivpn-dwlnk-pkts	Description: The number of packets of HamachiVPN traffic sent to MS. Triggers: Increments when a packet of HamachiVPN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tvants-uplnk-bytes	Description: The number of bytes of TVAnts traffic received from MS. Triggers: Increments when a packet of TVAnts traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tvants-dwlnk-bytes	Description: The number of bytes of TVAnts traffic sent to MS. Triggers: Increments when a packet of TVAnts traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-tvants-uplnk-pkts	Description: The number of packets of TVAnts traffic received from MS. Triggers: Increments when a packet of TVAnts traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tvants-dwlnk-pkts	Description: The number of packets of TVAnts traffic sent to MS. Triggers: Increments when a packet of TVAnts traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tvuplayer-uplnk-bytes	Description: The number of bytes of TVUPlayer traffic received from MS. Triggers: Increments when a packet of TVUPlayer traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tvuplayer-dwlnk-bytes	Description: The number of bytes of TVUPlayer traffic sent to MS. Triggers: Increments when a packet of TVUPlayer traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tvuplayer-uplnk-pkts	Description: The number of packets of TVUPlayer traffic received from MS. Triggers: Increments when a packet of TVUPlayer traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tvuplayer-dwlnk-pkts	Description: The number of packets of TVUPlayer traffic sent to MS. Triggers: Increments when a packet of TVUPlayer traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-uusee-uplnk-bytes	Description: The number of bytes of UUSEe traffic received from MS. Triggers: Increments when a packet of UUSEe traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-uusee-dwlnk-bytes	Description: The number of bytes of UUSEe traffic sent to MS. Triggers: Increments when a packet of UUSEe traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-uusee-uplnk-pkts	Description: The number of packets of UUSEe traffic received from MS. Triggers: Increments when a packet of UUSEe traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-uusee-dwlnk-pkts	Description: The number of packets of UUSEe traffic sent to MS. Triggers: Increments when a packet of UUSEe traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-vpnx-uplnk-bytes	Description: The number of bytes of VPN-X traffic received from MS. Triggers: Increments when a packet of VPN-X traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-vpn-dwlnk-bytes	Description: The number of bytes of VPN-X traffic sent to MS. Triggers: Increments when a packet of VPN-X traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-vpn-uplnk-pkts	Description: The number of packets of VPN-X traffic received from MS. Triggers: Increments when a packet of VPN-X traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-vpn-dwlnk-pkts	Description: The number of packets of VPN-X traffic sent to MS. Triggers: Increments when a packet of VPN-X traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-vtun-uplnk-bytes	Description: The number of bytes of VTun traffic received from MS. Triggers: Increments when a packet of VTun traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-vtun-dwlnk-bytes	Description: The number of bytes of VTun traffic sent to MS. Triggers: Increments when a packet of VTun traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-vtun-uplnk-pkts	Description: The number of packets of VTun traffic received from MS. Triggers: Increments when a packet of VTun traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-vtun-dwlnk-pkts	Description: The number of packets of VTun traffic sent to MS. Triggers: Increments when a packet of VTun traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-winmx-uplnk-bytes	Description: The number of bytes of WinMX traffic received from MS. Triggers: Increments when a packet of WinMX traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-winmx-dwlnk-bytes	Description: The number of bytes of WinMX traffic sent to MS. Triggers: Increments when a packet of WinMX traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-winmx-uplnk-pkts	Description: The number of packets of WinMX traffic received from MS. Triggers: Increments when a packet of WinMX traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-winmx-dwlnk-pkts	Description: The number of packets of WinMX traffic sent to MS. Triggers: Increments when a packet of WinMX traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-wofwarcraft-uplnk-bytes	Description: The number of bytes of WofWarcraft traffic received from MS. Triggers: Increments when a packet of WofWarcraft traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wofwarcraft-dwlnk-bytes	Description: The number of bytes of WofWarcraft traffic sent to MS. Triggers: Increments when a packet of WofWarcraft traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wofwarcraft-uplnk-pkts	Description: The number of packets of WofWarcraft traffic received from MS. Triggers: Increments when a packet of WofWarcraft traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wofwarcraft-dwlnk-pkts	Description: The number of packets of WofWarcraft traffic sent to MS. Triggers: Increments when a packet of WofWarcraft traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-xbox-uplnk-bytes	Description: The number of bytes of Xbox traffic received from MS. Triggers: Increments when a packet of Xbox traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-xbox-dwlnk-bytes	Description: The number of bytes of Xbox traffic sent to MS. Triggers: Increments when a packet of Xbox traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-xbox-uplnk-pkts	Description: The number of packets of Xbox traffic received from MS. Triggers: Increments when a packet of Xbox traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-xbox-dwlnk-pkts	Description: The number of packets of Xbox traffic sent to MS. Triggers: Increments when a packet of Xbox traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-fring-uplnk-bytes	Description: The number of bytes of Fring traffic received from MS. Triggers: Increments when a packet of Fring traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-fring-dwlnk-bytes	Description: The number of bytes of Fring traffic sent to MS. Triggers: Increments when a packet of Fring traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-fring-uplnk-pkts	Description: The number of packets of Fring traffic received from MS. Triggers: Increments when a packet of Fring traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-fring-dwlnk-pkts	Description: The number of packets of Fring traffic sent to MS. Triggers: Increments when a packet of Fring traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iskoot-uplnk-bytes	Description: The number of bytes of iSkoot traffic received from MS. Triggers: Increments when a packet of iSkoot traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iskoot-dwlnk-bytes	Description: The number of bytes of iSkoot traffic sent to MS. Triggers: Increments when a packet of iSkoot traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iskoot-uplnk-pkts	Description: The number of packets of iSkoot traffic received from MS. Triggers: Increments when a packet of iSkoot traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iskoot-dwlnk-pkts	Description: The number of packets of iSkoot traffic sent to MS. Triggers: Increments when a packet of iSkoot traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ooovoo-uplnk-bytes	Description: The number of bytes of ooVoo traffic received from MS. Triggers: Increments when a packet of ooVoo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ooovoo-dwlnk-bytes	Description: The number of bytes of ooVoo traffic sent to MS. Triggers: Increments when a packet of ooVoo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ooovoo-uplnk-pkts	Description: The number of packets of ooVoo traffic received from MS. Triggers: Increments when a packet of ooVoo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ooovoo-dwlnk-pkts	Description: The number of packets of ooVoo traffic sent to MS. Triggers: Increments when a packet of ooVoo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gtalk-uplnk-bytes	Description: The number of bytes of GTalk traffic received from MS. Triggers: Increments when a packet of GTalk traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gtalk-dwlnk-bytes	Description: The number of bytes of GTalk traffic sent to MS. Triggers: Increments when a packet of GTalk traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-gtalk-uplnk-pkts	<p>Description: The number of packets of GTalk traffic received from MS.</p> <p>Triggers: Increments when a packet of GTalk traffic is detected by the P2P analyzer. The payload length is added to the counter.</p> <p>Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-dwlnk-pkts	<p>Description: The number of packets of GTalk traffic sent to MS.</p> <p>Triggers: Increments when a packet of GTalk traffic is detected by the P2P analyzer. The payload length is added to the counter.</p> <p>Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-voice-uplnk-bytes	<p>Description: The number of bytes of GTalk voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk voice traffic is detected by the P2P analyzer. The payload length is added to the counter.</p> <p>Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-voice-dwlnk-bytes	<p>Description: The number of bytes of GTalk voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk voice traffic is detected by the P2P analyzer. The payload length is added to the counter.</p> <p>Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-voice-uplnk-pkts	<p>Description: The number of packets of GTalk voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk voice traffic is detected by the P2P analyzer. The payload length is added to the counter.</p> <p>Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-gtalk-voice-dwlnk-pkts	<p>Description: The number of packets of GTalk voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-audio-uplnk-bytes	<p>Description: The number of bytes of GTalk audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-audio-dwlnk-bytes	<p>Description: The number of bytes of GTalk audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-audio-uplnk-pkts	<p>Description: The number of packets of GTalk audio traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-gtalk-audio-dwlnk-pkts	<p>Description: The number of packets of GTalk audio traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 11.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk audio traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-non-voice-uplnk-bytes	<p>Description: The number of bytes of GTalk non-voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk non-voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-non-voice-dwlnk-bytes	<p>Description: The number of bytes of GTalk non-voice traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk non-voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-non-voice-uplnk-pkts	<p>Description: The number of packets of GTalk non-voice traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 10.0 and earlier releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk non-voice traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type

The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-gtalk-unclassified-uplnk-bytes	<p>Description: The number of bytes of GTalk unclassified traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-unclassified-dwlnk-bytes	<p>Description: The number of bytes of GTalk unclassified traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-unclassified-uplnk-pkts	<p>Description: The number of packets of GTalk unclassified traffic received from MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-gtalk-unclassified-dwlnk-pkts	<p>Description: The number of packets of GTalk unclassified traffic sent to MS.</p> <hr/> <p> IMPORTANT: This variable is supported only in StarOS 12.0 and later releases.</p> <hr/> <p>Triggers: Increments when a packet of GTalk unclassified traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64
p2p-freenet-uplnk-bytes	<p>Description: The total number of bytes of Freenet traffic received from MS. Triggers: Increments when a packet of Freenet traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.</p>	Int64

Variables	Description	Data Type
p2p-freenet-dwlnk-bytes	Description: The total number of bytes of Freenet traffic sent to MS. Triggers: Increments when a packet of Freenet traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-freenet-uplnk-pkts	Description: The total number of packets of Freenet traffic received from MS. Triggers: Increments when a packet of Freenet traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-freenet-dwlnk-pkts	Description: The total number of packets of Freenet traffic sent to MS. Triggers: Increments when a packet of Freenet traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-aimini-uplnk-bytes	Description: The total number of bytes of Aimini traffic received from MS. Triggers: Increments when a packet of Aimini traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-aimini-dwlnk-bytes	Description: The total number of bytes of Aimini traffic sent to MS. Triggers: Increments when a packet of Aimini traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-aimini-uplnk-pkts	Description: The total number of packets of Aimini traffic received from MS. Triggers: Increments when a packet of Aimini traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-aimini-dwlnk-pkts	Description: The total number of packets of Aimini traffic sent to MS. Triggers: Increments when a packet of Aimini traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-battlefld-uplnk-bytes	Description: The total number of bytes of Battlefield traffic received from MS. Triggers: Increments when a packet of Battlefield traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-battlefld-dwlnk-bytes	Description: The total number of bytes of Battlefield traffic sent to MS. Triggers: Increments when a packet of Battlefield traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-battlefld-uplnk-pkts	Description: The total number of packets of Battlefield traffic received from MS. Triggers: Increments when a packet of Battlefield traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-battlefld-dwlnk-pkts	Description: The total number of packets of Battlefield traffic sent to MS. Triggers: Increments when a packet of Battlefield traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-openft-uplnk-bytes	Description: The total number of bytes of OpenFT traffic received from MS. Triggers: Increments when a packet of OpenFT traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-openft-dwlnk-bytes	Description: The total number of bytes of OpenFT traffic sent to MS. Triggers: Increments when a packet of OpenFT traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-openft-uplnk-pkts	Description: The total number of packets of OpenFT traffic received from MS. Triggers: Increments when a packet of OpenFT traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-openft-dwlnk-pkts	Description: The total number of packets of OpenFT traffic sent to MS. Triggers: Increments when a packet of OpenFT traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-qqgame-uplnk-bytes	Description: The total number of bytes of QQGame traffic received from MS. Triggers: Increments when a packet of QQGame traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-qqgame-dwlnk-bytes	Description: The total number of bytes of QQGame traffic sent to MS. Triggers: Increments when a packet of QQGame traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-qqgame-uplnk-pkts	Description: The total number of packets of QQGame traffic received from MS. Triggers: Increments when a packet of QQGame traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-qqgame-dwlnk-pkts	Description: The total number of packets of QQGame traffic sent to MS. Triggers: Increments when a packet of QQGame traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-quake-uplnk-bytes	Description: The total number of bytes of Quake traffic received from MS. Triggers: Increments when a packet of Quake traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-quake-dwlnk-bytes	Description: The total number of bytes of Quake traffic sent to MS. Triggers: Increments when a packet of Quake traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-quake-uplnk-pkts	Description: The total number of packets of Quake traffic received from MS. Triggers: Increments when a packet of Quake traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-quake-dwlnk-pkts	Description: The total number of packets of Quake traffic sent to MS. Triggers: Increments when a packet of Quake traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-secondlife-uplnk-bytes	Description: The total number of bytes of SecondLife traffic received from MS. Triggers: Increments when a packet of SecondLife traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-secondlife-dwlnk-bytes	Description: The total number of bytes of SecondLife traffic sent to MS. Triggers: Increments when a packet of SecondLife traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-secondlife-uplnk-pkts	Description: The total number of packets of SecondLife traffic received from MS. Triggers: Increments when a packet of SecondLife traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-secondlife-dwlnk-pkts	Description: The total number of packets of SecondLife traffic sent to MS. Triggers: Increments when a packet of SecondLife traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-actsync-uplnk-bytes	Description: The total number of bytes of ActiveSync traffic received from MS. Triggers: Increments when a packet of ActiveSync traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-actsync-dwlnk-bytes	Description: The total number of bytes of ActiveSync traffic sent to MS. Triggers: Increments when a packet of ActiveSync traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-actsync-uplnk-pkts	Description: The total number of packets of ActiveSync traffic received from MS. Triggers: Increments when a packet of ActiveSync traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-actsync-dwlnk-pkts	Description: The total number of packets of ActiveSync traffic sent to MS. Triggers: Increments when a packet of ActiveSync traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-nimbuzz-uplnk-bytes	Description: The total number of bytes of Nimbuzz traffic received from MS. Triggers: Increments when a packet of Nimbuzz traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-nimbuzz-dwlnk-bytes	Description: The total number of bytes of Nimbuzz traffic sent to MS. Triggers: Increments when a packet of Nimbuzz traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-nimbuzz-uplnk-pkts	Description: The total number of packets of Nimbuzz traffic received from MS. Triggers: Increments when a packet of Nimbuzz traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-nimbuzz-dwlnk-pkts	Description: The total number of packets of Nimbuzz traffic sent to MS. Triggers: Increments when a packet of Nimbuzz traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iax-uplnk-bytes	Description: The total number of bytes of IAX traffic received from MS. Triggers: Increments when a packet of IAX traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iax-dwlnk-bytes	Description: The total number of bytes of IAX traffic sent to MS. Triggers: Increments when a packet of IAX traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iax-uplnk-pkts	Description: The total number of packets of IAX traffic received from MS. Triggers: Increments when a packet of IAX traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iax-dwlnk-pkts	Description: The total number of packets of IAX traffic sent to MS. Triggers: Increments when a packet of IAX traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-paltalk-uplnk-bytes	Description: The total number of bytes of Paltalk traffic received from MS. Triggers: Increments when a packet of Paltalk traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-paltalk-dwlnk-bytes	Description: The total number of bytes of Paltalk traffic sent to MS. Triggers: Increments when a packet of Paltalk traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-paltalk-uplnk-pkts	Description: The total number of packets of Paltalk traffic received from MS. Triggers: Increments when a packet of Paltalk traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-paltalk-dwlnk-pkts	Description: The total number of packets of Paltalk traffic sent to MS. Triggers: Increments when a packet of Paltalk traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-warcraft3-uplnk-bytes	Description: The total number of bytes of Warcraft3 traffic received from MS. Triggers: Increments when a packet of Warcraft3 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-warcft3-dwlnk-bytes	Description: The total number of bytes of Warcraft3 traffic sent to MS. Triggers: Increments when a packet of Warcraft3 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-warcft3-uplnk-pkts	Description: The total number of packets of Warcraft3 traffic received from MS. Triggers: Increments when a packet of Warcraft3 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-warcft3-dwlnk-pkts	Description: The total number of packets of Warcraft3 traffic sent to MS. Triggers: Increments when a packet of Warcraft3 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rdp-uplnk-bytes	Description: The total number of bytes of RDP traffic received from MS. Triggers: Increments when a packet of RDP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rdp-dwlnk-bytes	Description: The total number of bytes of RDP traffic sent to MS. Triggers: Increments when a packet of RDP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rdp-uplnk-pkts	Description: The total number of packets of RDP traffic received from MS. Triggers: Increments when a packet of RDP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rdp-dwlnk-pkts	Description: The total number of packets of RDP traffic sent to MS. Triggers: Increments when a packet of RDP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iptv-uplnk-bytes	Description: The total number of bytes of IPTV traffic received from MS. Triggers: Increments when a packet of IPTV traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iptv-dwlnk-bytes	Description: The total number of bytes of IPTV traffic sent to MS. Triggers: Increments when a packet of IPTV traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iptv-uplnk-pkts	Description: The total number of packets of IPTV traffic received from MS. Triggers: Increments when a packet of IPTV traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-iptv-dwlnk-pkts	Description: The total number of packets of IPTV traffic sent to MS. Triggers: Increments when a packet of IPTV traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-pandora-uplnk-bytes	Description: The total number of bytes of Pandora traffic received from MS. Triggers: Increments when a packet of Pandora traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-pandora-dwlnk-bytes	Description: The total number of bytes of Pandora traffic sent to MS. Triggers: Increments when a packet of Pandora traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-pandora-uplnk-pkts	Description: The total number of packets of Pandora traffic received from MS. Triggers: Increments when a packet of Pandora traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-pandora-dwlnk-pkts	Description: The total number of packets of Pandora traffic sent to MS. Triggers: Increments when a packet of Pandora traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-icecast-uplnk-bytes	Description: The total number of bytes of Icecast traffic received from MS. Triggers: Increments when a packet of Icecast traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-icecast-dwlnk-bytes	Description: The total number of bytes of Icecast traffic sent to MS. Triggers: Increments when a packet of Icecast traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-icecast-uplnk-pkts	Description: The total number of packets of Icecast traffic received from MS. Triggers: Increments when a packet of Icecast traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-icecast-dwlnk-pkts	Description: The total number of packets of Icecast traffic sent to MS. Triggers: Increments when a packet of Icecast traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-kontiki-uplnk-bytes	Description: The total number of bytes of Kontiki traffic received from MS. Triggers: Increments when a packet of Kontiki traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-kontiki-dwlnk-bytes	Description: The total number of bytes of Kontiki traffic sent to MS. Triggers: Increments when a packet of Kontiki traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-kontiki-uplnk-pkts	Description: The total number of packets of Kontiki traffic received from MS. Triggers: Increments when a packet of Kontiki traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-kontiki-dwlnk-pkts	Description: The total number of packets of Kontiki traffic sent to MS. Triggers: Increments when a packet of Kontiki traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-meebo-uplnk-bytes	Description: The total number of bytes of Meebo traffic received from MS. Triggers: Increments when a packet of Meebo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-meebo-dwlnk-bytes	Description: The total number of bytes of Meebo traffic sent to MS. Triggers: Increments when a packet of Meebo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-meebo-uplnk-pkts	Description: The total number of packets of Meebo traffic received from MS. Triggers: Increments when a packet of Meebo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-meebo-dwlnk-pkts	Description: The total number of packets of Meebo traffic sent to MS. Triggers: Increments when a packet of Meebo traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-shoutcast-uplnk-bytes	Description: The total number of bytes of Shoutcast traffic received from MS. Triggers: Increments when a packet of Shoutcast traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-shoutcast-dwlnk-bytes	Description: The total number of bytes of Shoutcast traffic sent to MS. Triggers: Increments when a packet of Shoutcast traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-shoutcast-uplnk-pkts	Description: The total number of packets of Shoutcast traffic received from MS. Triggers: Increments when a packet of Shoutcast traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-shoutcast-dwlnk-pkts	Description: The total number of packets of Shoutcast traffic sent to MS. Triggers: Increments when a packet of Shoutcast traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-truphone-uplnk-bytes	Description: The total number of bytes of Truphone traffic received from MS. Triggers: Increments when a packet of Truphone traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-truphone-dwlnk-bytes	Description: The total number of bytes of Truphone traffic sent to MS. Triggers: Increments when a packet of Truphone traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-truphone-uplnk-pkts	Description: The total number of packets of Truphone traffic received from MS. Triggers: Increments when a packet of Truphone traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-truphone-dwlnk-pkts	Description: The total number of packets of Truphone traffic sent to MS. Triggers: Increments when a packet of Truphone traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-thunder-uplnk-bytes	Description: The total number of bytes of Thunder traffic received from MS. Triggers: Increments when a packet of Thunder traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-thunder-dwlnk-bytes	Description: The total number of bytes of Thunder traffic sent to MS. Triggers: Increments when a packet of Thunder traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-thunder-uplnk-pkts	Description: The total number of packets of Thunder traffic received from MS. Triggers: Increments when a packet of Thunder traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-thunder-dwlnk-pkts	Description: The total number of packets of Thunder traffic sent to MS. Triggers: Increments when a packet of Thunder traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-armagettron-uplnk-bytes	Description: The total number of bytes of Armagettron traffic received from MS. Triggers: Increments when a packet of Armagettron traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-armagettron-dwlnk-bytes	Description: The total number of bytes of Armagettron traffic sent to MS. Triggers: Increments when a packet of Armagettron traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-armagettron-uplnk-pkts	Description: The total number of packets of Armagettron traffic received from MS. Triggers: Increments when a packet of Armagettron traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-armagettron-dwlnk-pkts	Description: The total number of packets of Armagettron traffic sent to MS. Triggers: Increments when a packet of Armagettron traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-blackberry-uplnk-bytes	Description: The total number of bytes of Blackberry traffic received from MS. Triggers: Increments when a packet of Blackberry traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-blackberry-dwlnk-bytes	Description: The total number of bytes of Blackberry traffic sent to MS. Triggers: Increments when a packet of Blackberry traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-blackberry-uplnk-pkts	Description: The total number of packets of Blackberry traffic received from MS. Triggers: Increments when a packet of Blackberry traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-blackberry-dwlnk-pkts	Description: The total number of packets of Blackberry traffic sent to MS. Triggers: Increments when a packet of Blackberry traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-citrix-uplnk-bytes	Description: The total number of bytes of Citrix traffic received from MS. Triggers: Increments when a packet of Citrix traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-citrix-dwlnk-bytes	Description: The total number of bytes of Citrix traffic sent to MS. Triggers: Increments when a packet of Citrix traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-citrix-uplnk-pkts	Description: The total number of packets of Citrix traffic received from MS. Triggers: Increments when a packet of Citrix traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-citrix-dwlnk-pkts	Description: The total number of packets of Citrix traffic sent to MS. Triggers: Increments when a packet of Citrix traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-clubpenguin-uplnk-bytes	Description: The total number of bytes of Clubpenguin traffic received from MS. Triggers: Increments when a packet of Clubpenguin traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-clubpenguin-dwlnk-bytes	Description: The total number of bytes of Clubpenguin traffic sent to MS. Triggers: Increments when a packet of Clubpenguin traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-clubpenguin-uplnk-pkts	Description: The total number of packets of Clubpenguin traffic received from MS. Triggers: Increments when a packet of Clubpenguin traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-clubpenguin-dwlnk-pkts	Description: The total number of packets of Clubpenguin traffic sent to MS. Triggers: Increments when a packet of Clubpenguin traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-crossfire-uplnk-bytes	Description: The total number of bytes of Crossfire traffic received from MS. Triggers: Increments when a packet of Crossfire traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-crossfire-dwlnk-bytes	Description: The total number of bytes of Crossfire traffic sent to MS. Triggers: Increments when a packet of Crossfire traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-crossfire-uplnk-pkts	Description: The total number of packets of Crossfire traffic received from MS. Triggers: Increments when a packet of Crossfire traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-crossfire-dwlnk-pkts	Description: The total number of packets of Crossfire traffic sent to MS. Triggers: Increments when a packet of Crossfire traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-dofus-uplnk-bytes	Description: The total number of bytes of Dofus traffic received from MS. Triggers: Increments when a packet of Dofus traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-dofus-dwlnk-bytes	Description: The total number of bytes of Dofus traffic sent to MS. Triggers: Increments when a packet of Dofus traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-dofus-uplnk-pkts	Description: The total number of packets of Dofus traffic received from MS. Triggers: Increments when a packet of Dofus traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-dofus-dwlnk-pkts	Description: The total number of packets of Dofus traffic sent to MS. Triggers: Increments when a packet of Dofus traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-fiesta-uplnk-bytes	Description: The total number of bytes of Fiesta traffic received from MS. Triggers: Increments when a packet of Fiesta traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-fiesta-dwlnk-bytes	Description: The total number of bytes of Fiesta traffic sent to MS. Triggers: Increments when a packet of Fiesta traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-fiesta-uplnk-pkts	Description: The total number of packets of Fiesta traffic received from MS. Triggers: Increments when a packet of Fiesta traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-fiesta-dwlnk-pkts	Description: The total number of packets of Fiesta traffic sent to MS. Triggers: Increments when a packet of Fiesta traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-florensia-uplnk-bytes	Description: The total number of bytes of Florensia traffic received from MS. Triggers: Increments when a packet of Florensia traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-florensia-dwlnk-bytes	Description: The total number of bytes of Florensia traffic sent to MS. Triggers: Increments when a packet of Florensia traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-florensia-uplnk-pkts	Description: The total number of packets of Florensia traffic received from MS. Triggers: Increments when a packet of Florensia traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-florensia-dwlnk-pkts	Description: The total number of packets of Florensia traffic sent to MS. Triggers: Increments when a packet of Florensia traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-funshion-uplnk-bytes	Description: The total number of bytes of Funshion traffic received from MS. Triggers: Increments when a packet of Funshion traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-funshion-dwlnk-bytes	Description: The total number of bytes of Funshion traffic sent to MS. Triggers: Increments when a packet of Funshion traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-funshion-uplnk-pkts	Description: The total number of packets of Funshion traffic received from MS. Triggers: Increments when a packet of Funshion traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-funshion-dwlnk-pkts	Description: The total number of packets of Funshion traffic sent to MS. Triggers: Increments when a packet of Funshion traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-guildwars-uplnk-bytes	Description: The total number of bytes of Guildwars traffic received from MS. Triggers: Increments when a packet of Guildwars traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-guildwars-dwlnk-bytes	Description: The total number of bytes of Guildwars traffic sent to MS. Triggers: Increments when a packet of Guildwars traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-guildwars-uplnk-pkts	Description: The total number of packets of Guildwars traffic received from MS. Triggers: Increments when a packet of Guildwars traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-guildwars-dwlnk-pkts	Description: The total number of packets of Guildwars traffic sent to MS. Triggers: Increments when a packet of Guildwars traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-isakmp-uplnk-bytes	Description: The total number of bytes of ISAKMP traffic received from MS. Triggers: Increments when a packet of ISAKMP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-isakmp-dwlnk-bytes	Description: The total number of bytes of ISAKMP traffic sent to MS. Triggers: Increments when a packet of ISAKMP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-isakmp-uplnk-pkts	Description: The total number of packets of ISAKMP traffic received from MS. Triggers: Increments when a packet of ISAKMP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-isakmp-dwlnk-pkts	Description: The total number of packets of ISAKMP traffic sent to MS. Triggers: Increments when a packet of ISAKMP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-maplestory-uplnk-bytes	Description: The total number of bytes of Maplestory traffic received from MS. Triggers: Increments when a packet of Maplestory traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-maplestory-dwlnk-bytes	Description: The total number of bytes of Maplestory traffic sent to MS. Triggers: Increments when a packet of Maplestory traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-maplestory-uplnk-pkts	Description: The total number of packets of Maplestory traffic received from MS. Triggers: Increments when a packet of Maplestory traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-maplestory-dwlnk-pkts	Description: The total number of packets of Maplestory traffic sent to MS. Triggers: Increments when a packet of Maplestory traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-mgcp-uplnk-bytes	Description: The total number of bytes of MGCP traffic received from MS. Triggers: Increments when a packet of MGCP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-mgcp-dwlnk-bytes	Description: The total number of bytes of MGCP traffic sent to MS. Triggers: Increments when a packet of MGCP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-mgcp-uplnk-pkts	Description: The total number of packets of MGCP traffic received from MS. Triggers: Increments when a packet of MGCP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-mgcp-dwlnk-pkts	Description: The total number of packets of MGCP traffic sent to MS. Triggers: Increments when a packet of MGCP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-octoshape-uplnk-bytes	Description: The total number of bytes of Octoshape traffic received from MS. Triggers: Increments when a packet of Octoshape traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-octoshape-dwlnk-bytes	Description: The total number of bytes of Octoshape traffic sent to MS. Triggers: Increments when a packet of Octoshape traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-octoshape-uplnk-pkts	Description: The total number of packets of Octoshape traffic received from MS. Triggers: Increments when a packet of Octoshape traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-octoshape-dwlnk-pkts	Description: The total number of packets of Octoshape traffic sent to MS. Triggers: Increments when a packet of Octoshape traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-off-uplnk-bytes	Description: The total number of bytes of Off traffic received from MS. Triggers: Increments when a packet of Off traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-off-dwlnk-bytes	Description: The total number of bytes of Off traffic sent to MS. Triggers: Increments when a packet of Off traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-off-uplnk-pkts	Description: The total number of packets of Off traffic received from MS. Triggers: Increments when a packet of Off traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-off-dwlnk-pkts	Description: The total number of packets of Off traffic sent to MS. Triggers: Increments when a packet of Off traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-ps3-uplnk-bytes	Description: The total number of bytes of PS3 traffic received from MS. Triggers: Increments when a packet of PS3 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ps3-dwlnk-bytes	Description: The total number of bytes of PS3 traffic sent to MS. Triggers: Increments when a packet of PS3 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ps3-uplnk-pkts	Description: The total number of packets of PS3 traffic received from MS. Triggers: Increments when a packet of PS3 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ps3-dwlnk-pkts	Description: The total number of packets of PS3 traffic sent to MS. Triggers: Increments when a packet of PS3 traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rmstream-uplnk-bytes	Description: The total number of bytes of Real Media Stream traffic received from MS. Triggers: Increments when a packet of Real Media Stream traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rmstream-dwlnk-bytes	Description: The total number of bytes of Real Media Stream traffic sent to MS. Triggers: Increments when a packet of Real Media Stream traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rmstream-uplnk-pkts	Description: The total number of packets of Real Media Stream traffic received from MS. Triggers: Increments when a packet of Real Media Stream traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rmstream-dwlnk-pkts	Description: The total number of packets of Real Media Stream traffic sent to MS. Triggers: Increments when a packet of Real Media Stream traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rfactor-uplnk-bytes	Description: The total number of bytes of Rfactor traffic received from MS. Triggers: Increments when a packet of Rfactor traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rfactor-dwlnk-bytes	Description: The total number of bytes of Rfactor traffic sent to MS. Triggers: Increments when a packet of Rfactor traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-rfactor-uplnk-pkts	Description: The total number of packets of Rfactor traffic received from MS. Triggers: Increments when a packet of Rfactor traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-rfactor-dwlnk-pkts	Description: The total number of packets of Rfactor traffic sent to MS. Triggers: Increments when a packet of Rfactor traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-splashfighter-uplnk-bytes	Description: The total number of bytes of Splashfighter traffic received from MS. Triggers: Increments when a packet of Splashfighter traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-splashfighter-dwlnk-bytes	Description: The total number of bytes of Splashfighter traffic sent to MS. Triggers: Increments when a packet of Splashfighter traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-splashfighter-uplnk-pkts	Description: The total number of packets of Splashfighter traffic received from MS. Triggers: Increments when a packet of Splashfighter traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-splashfighter-dwlnk-pkts	Description: The total number of packets of Splashfighter traffic sent to MS. Triggers: Increments when a packet of Splashfighter traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ssdp-uplnk-bytes	Description: The total number of bytes of SSDP traffic received from MS. Triggers: Increments when a packet of SSDP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ssdp-dwlnk-bytes	Description: The total number of bytes of SSDP traffic sent to MS. Triggers: Increments when a packet of SSDP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ssdp-uplnk-pkts	Description: The total number of packets of SSDP traffic received from MS. Triggers: Increments when a packet of SSDP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-ssdp-dwlnk-pkts	Description: The total number of packets of SSDP traffic sent to MS. Triggers: Increments when a packet of SSDP traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-stealthnet-uplnk-bytes	Description: The total number of bytes of Stealthnet traffic received from MS. Triggers: Increments when a packet of Stealthnet traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-stealthnet-dwlnk-bytes	Description: The total number of bytes of Stealthnet traffic sent to MS. Triggers: Increments when a packet of Stealthnet traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-stealthnet-uplnk-pkts	Description: The total number of packets of Stealthnet traffic received from MS. Triggers: Increments when a packet of Stealthnet traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-stealthnet-dwlnk-pkts	Description: The total number of packets of Stealthnet traffic sent to MS. Triggers: Increments when a packet of Stealthnet traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-stun-uplnk-bytes	Description: The total number of bytes of STUN traffic received from MS. Triggers: Increments when a packet of STUN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-stun-dwlnk-bytes	Description: The total number of bytes of STUN traffic sent to MS. Triggers: Increments when a packet of STUN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-stun-uplnk-pkts	Description: The total number of packets of STUN traffic received from MS. Triggers: Increments when a packet of STUN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-stun-dwlnk-pkts	Description: The total number of packets of STUN traffic sent to MS. Triggers: Increments when a packet of STUN traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-teamspeak-uplnk-bytes	Description: The total number of bytes of TeamSpeak traffic received from MS. Triggers: Increments when a packet of TeamSpeak traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-teamspeak-dwlnk-bytes	Description: The total number of bytes of TeamSpeak traffic sent to MS. Triggers: Increments when a packet of TeamSpeak traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-teamspeak-uplnk-pkts	Description: The total number of packets of TeamSpeak traffic received from MS. Triggers: Increments when a packet of TeamSpeak traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-teamspeak-dwlnk-pkts	Description: The total number of packets of TeamSpeak traffic sent to MS. Triggers: Increments when a packet of TeamSpeak traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tor-uplnk-bytes	Description: The total number of bytes of Tor traffic received from MS. Triggers: Increments when a packet of Tor traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-tor-dwlnk-bytes	Description: The total number of bytes of Tor traffic sent to MS. Triggers: Increments when a packet of Tor traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tor-uplnk-pkts	Description: The total number of packets of Tor traffic received from MS. Triggers: Increments when a packet of Tor traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-tor-dwlnk-pkts	Description: The total number of packets of Tor traffic sent to MS. Triggers: Increments when a packet of Tor traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-veohTV-uplnk-bytes	Description: The total number of bytes of VeohTV traffic received from MS. Triggers: Increments when a packet of VeohTV traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-veohTV-dwlnk-bytes	Description: The total number of bytes of VeohTV traffic sent to MS. Triggers: Increments when a packet of VeohTV traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-veohTV-uplnk-pkts	Description: The total number of packets of VeohTV traffic received from MS. Triggers: Increments when a packet of VeohTV traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-veohTV-dwlnk-pkts	Description: The total number of packets of VeohTV traffic sent to MS. Triggers: Increments when a packet of VeohTV traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wii-uplnk-bytes	Description: The total number of bytes of Wii traffic received from MS. Triggers: Increments when a packet of Wii traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wii-dwlnk-bytes	Description: The total number of bytes of Wii traffic sent to MS. Triggers: Increments when a packet of Wii traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wii-uplnk-pkts	Description: The total number of packets of Wii traffic received from MS. Triggers: Increments when a packet of Wii traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wii-dwlnk-pkts	Description: The total number of packets of Wii traffic sent to MS. Triggers: Increments when a packet of Wii traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-wmstream-uplnk-bytes	Description: The total number of bytes of Windows Media Stream traffic received from MS. Triggers: Increments when a packet of Windows Media Stream traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wmstream-dwlnk-bytes	Description: The total number of bytes of Windows Media Stream traffic sent to MS. Triggers: Increments when a packet of Windows Media Stream traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wmstream-uplnk-pkts	Description: The total number of packets of Windows Media Stream traffic received from MS. Triggers: Increments when a packet of Windows Media Stream traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wmstream-dwlnk-pkts	Description: The total number of packets of Windows Media Stream traffic sent to MS. Triggers: Increments when a packet of Windows Media Stream traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wofkungfu-uplnk-bytes	Description: The total number of bytes of WofKungfu traffic received from MS. Triggers: Increments when a packet of WofKungfu traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wofkungfu-dwlnk-bytes	Description: The total number of bytes of WofKungfu traffic sent to MS. Triggers: Increments when a packet of WofKungfu traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wofkungfu-uplnk-pkts	Description: The total number of packets of WofKungfu traffic received from MS. Triggers: Increments when a packet of WofKungfu traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-wofkungfu-dwlnk-pkts	Description: The total number of packets of WofKungfu traffic sent to MS. Triggers: Increments when a packet of WofKungfu traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-xdcc-uplnk-bytes	Description: The total number of bytes of XDCC traffic received from MS. Triggers: Increments when a packet of XDCC traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-xdcc-dwlnk-bytes	Description: The total number of bytes of XDCC traffic sent to MS. Triggers: Increments when a packet of XDCC traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-xdcc-uplnk-pkts	Description: The total number of packets of XDCC traffic received from MS. Triggers: Increments when a packet of XDCC traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-xdcc-dwlnk-pkts	Description: The total number of packets of XDCC traffic sent to MS. Triggers: Increments when a packet of XDCC traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-yourfreetunnel-uplnk-bytes	Description: The total number of bytes of YourFreedomTunnel traffic received from MS. Triggers: Increments when a packet of YourFreedomTunnel traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-yourfreetunnel-dwlnk-bytes	Description: The total number of bytes of YourFreedomTunnel traffic sent to MS. Triggers: Increments when a packet of YourFreedomTunnel traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-yourfreetunnel-uplnk-pkts	Description: The total number of packets of YourFreedomTunnel traffic received from MS. Triggers: Increments when a packet of YourFreedomTunnel traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-yourfreetunnel-dwlnk-pkts	Description: The total number of packets of YourFreedomTunnel traffic sent to MS. Triggers: Increments when a packet of YourFreedomTunnel traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-facebook-uplnk-bytes	Description: The total number of bytes of Facebook traffic received from MS. Triggers: Increments when a packet of Facebook traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-facebook-dwlnk-bytes	Description: The total number of bytes of Facebook traffic sent to MS. Triggers: Increments when a packet of Facebook traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-facebook-uplnk-pkts	Description: The total number of packets of Facebook traffic received from MS. Triggers: Increments when a packet of Facebook traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-facebook-dwlnk-pkts	Description: The total number of packets of Facebook traffic sent to MS. Triggers: Increments when a packet of Facebook traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gamekit-uplnk-bytes	Description: The total number of bytes of Gamekit traffic received from MS. Triggers: Increments when a packet of Gamekit traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-gamekit-dwlnk-bytes	Description: The total number of bytes of Gamekit traffic sent to MS. Triggers: Increments when a packet of Gamekit traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gamekit-uplnk-pkts	Description: The total number of packets of Gamekit traffic received from MS. Triggers: Increments when a packet of Gamekit traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gamekit-dwlnk-pkts	Description: The total number of packets of Gamekit traffic sent to MS. Triggers: Increments when a packet of Gamekit traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-facetime-uplnk-bytes	Description: The total number of bytes of Facetime traffic received from MS. Triggers: Increments when a packet of Facetime traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-facetime-dwlnk-bytes	Description: The total number of bytes of Facetime traffic sent to MS. Triggers: Increments when a packet of Facetime traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-facetime-uplnk-pkts	Description: The total number of packets of Facetime traffic received from MS. Triggers: Increments when a packet of Facetime traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-facetime-dwlnk-pkts	Description: The total number of packets of Facetime traffic sent to MS. Triggers: Increments when a packet of Facetime traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gmail-uplnk-bytes	Description: The total number of bytes of Gmail traffic received from MS. Triggers: Increments when a packet of Gmail traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gmail-dwlnk-bytes	Description: The total number of bytes of Gmail traffic sent to MS. Triggers: Increments when a packet of Gmail traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gmail-uplnk-pkts	Description: The total number of packets of Gmail traffic received from MS. Triggers: Increments when a packet of Gmail traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-gmail-dwlnk-pkts	Description: The total number of packets of Gmail traffic sent to MS. Triggers: Increments when a packet of Gmail traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-itunes-uplnk-bytes	Description: The total number of bytes of itunes traffic received from MS. Triggers: Increments when a packet of Gmail traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-itunes-dwlnk-bytes	Description: The total number of bytes of iTunes traffic sent to MS. Triggers: Increments when a packet of iTunes traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-itunes-uplnk-pkts	Description: The total number of packets of iTunes traffic received from MS. Triggers: Increments when a packet of iTunes traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-itunes-dwlnk-pkts	Description: The total number of packets of iTunes traffic sent to MS. Triggers: Increments when a packet of iTunes traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-myspace-uplnk-bytes	Description: The total number of bytes of MySpace traffic received from MS. Triggers: Increments when a packet of MySpace traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-myspace-dwlnk-bytes	Description: The total number of bytes of MySpace traffic sent to MS. Triggers: Increments when a packet of MySpace traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-myspace-uplnk-pkts	Description: The total number of packets of MySpace traffic received from MS. Triggers: Increments when a packet of MySpace traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-myspace-dwlnk-pkts	Description: The total number of packets of MySpace traffic sent to MS. Triggers: Increments when a packet of MySpace traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-teamviewer-uplnk-bytes	Description: The total number of bytes of TeamViewer traffic received from MS. Triggers: Increments when a packet of TeamViewer traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-teamviewer-dwlnk-bytes	Description: The total number of bytes of TeamViewer traffic sent to MS. Triggers: Increments when a packet of TeamViewer traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-teamviewer-uplnk-pkts	Description: The total number of packets of TeamViewer traffic received from MS. Triggers: Increments when a packet of TeamViewer traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-teamviewer-dwlnk-pkts	Description: The total number of packets of TeamViewer traffic sent to MS. Triggers: Increments when a packet of TeamViewer traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-twitter-uplnk-bytes	Description: The total number of bytes of Twitter traffic received from MS. Triggers: Increments when a packet of Twitter traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-twitter-dwlnk-bytes	Description: The total number of bytes of Twitter traffic sent to MS. Triggers: Increments when a packet of Twitter traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-twitter-uplnk-pkts	Description: The total number of packets of Twitter traffic received from MS. Triggers: Increments when a packet of Twitter traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-twitter-dwlnk-pkts	Description: The total number of packets of Twitter traffic sent to MS. Triggers: Increments when a packet of Twitter traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-viber-uplnk-bytes	Description: The total number of bytes of Viber traffic received from MS. Triggers: Increments when a packet of Viber traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-viber-dwlnk-bytes	Description: The total number of bytes of Viber traffic sent to MS. Triggers: Increments when a packet of Viber traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-viber-uplnk-pkts	Description: The total number of packets of Viber traffic received from MS. Triggers: Increments when a packet of Viber traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-viber-dwlnk-pkts	Description: The total number of packets of Viber traffic sent to MS. Triggers: Increments when a packet of Viber traffic is detected by the P2P analyzer. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-scydo-uplnk-bytes	Description: The total number of bytes of Scydo traffic received from MS. Triggers: Increments when a packet of Scydo traffic is detected by the P2P analyzer in the uplink direction. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-scydo-dwlnk-bytes	Description: The total number of bytes of Scydo traffic sent to MS. Triggers: Increments when a packet of Scydo traffic is detected by the P2P analyzer in the downlink direction. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
p2p-scydo-uplnk-pkts	Description: The total number of packets of Scydo traffic received from MS. Triggers: Increments when a packet of Scydo traffic is detected by the P2P analyzer in the uplink direction. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-scydo-dwlnk-pkts	Description: The total number of packets of Scydo traffic sent to MS. Triggers: Increments when a packet of Scydo traffic is detected by the P2P analyzer in the downlink direction. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-whatsapp-uplnk-bytes	Description: The total number of bytes of WhatsApp traffic received from MS. Triggers: Increments when a packet of WhatsApp traffic is detected by the P2P analyzer in the uplink direction. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-whatsapp-dwlnk-bytes	Description: The total number of bytes of WhatsApp traffic sent to MS. Triggers: Increments when a packet of WhatsApp traffic is detected by the P2P analyzer in the downlink direction. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-whatsapp-uplnk-pkts	Description: The total number of packets of WhatsApp traffic received from MS. Triggers: Increments when a packet of WhatsApp traffic is detected by the P2P analyzer in the uplink direction. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
p2p-whatsapp-dwlnk-pkts	Description: The total number of packets of WhatsApp traffic sent to MS. Triggers: Increments when a packet of WhatsApp traffic is detected by the P2P analyzer in the downlink direction. The payload length is added to the counter. Availability: Per Active Charging Service.	Int64
DNS Statistics		
dns-flows	Description: The combined total of the number of DNS flows previously analyzed + DNS flows currently being analyzed. Triggers: Increments whenever a new DNS flow is created. Availability: Per Active Charging Service.	Int32
dns-flows-cur	Description: The number of DNS flows currently being analyzed. Triggers: Increments whenever a new DNS flow is created. Decrements whenever a DNS flow ends. Availability: Per Active Charging Service. Type: Gauge	Int32
dns-uplk-bytes	Description: The total number of DNS bytes received from MS. Triggers: Increments whenever a new DNS packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64
dns-dwlnk-bytes	Description: The total number of DNS bytes sent to MS. Triggers: Increments whenever a new DNS packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
dns-uplk-pkts	Description: The total number of DNS packets received from MS. Triggers: Increments whenever a new DNS packet is detected in uplink direction. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
dns-dwnlk-pkts	Description: The total number of DNS packets sent to MS. Triggers: Increments whenever a new DNS packet is detected in downlink direction. Availability: Per Active Charging Service.	Int64
dns-unk-opcode	Description: The total number of DNS packets with an unknown operational code. Triggers: Increments whenever a DNS packet with unknown operation code is received. Availability: Per Active Charging Service.	Int32
dns-inv-pkts	Description: The total number of invalid DNS packets detected. Triggers: Increments whenever an invalid DNS packet is detected. Availability: Per Active Charging Service.	Int32
dns-over-tcp-uplk-bytes	Description: The total number of DNS uplink bytes that were detected over TCP. Triggers: Increments whenever a new DNS uplink packet arrives over TCP. Availability: Per Active Charging Service.	Int64
dns-over-tcp-dwnlk-bytes	Description: The total number of DNS downlink bytes that were detected over TCP. Triggers: Increments whenever a new DNS downlink packet arrives over TCP. Availability: Per Active Charging Service.	Int64
dns-over-tcp-uplk-pkts	Description: The total number of DNS uplink packets that were detected over TCP. Triggers: Increments whenever a new DNS uplink packet arrives over TCP. Availability: Per Active Charging Service.	Int64
dns-over-tcp-dwnlk-pkts	Description: The total number of DNS downlink packets that were detected over TCP. Triggers: Increments whenever a new DNS downlink packet arrives over TCP. Availability: Per Active Charging Service.	Int64
dns-req-a-query	Description: The total number of DNS requests received for queries. Triggers: Increments whenever a DNS packet is received for queries. Availability: Per Active Charging Service.	Int64
dns-req-cname-query	Description: The total number of DNS requests received for cname queries. Triggers: Increments whenever a DNS packet is received for cname queries. Availability: Per Active Charging Service.	Int64
dns-req-ns-query	Description: The total number of DNS requests received for ns queries. Triggers: Increments whenever a DNS packet is received for ns queries. Availability: Per Active Charging Service.	Int64
dns-req-ptr-query	Description: The total number of DNS requests received for ptr queries. Triggers: Increments whenever a DNS packet is received for ptr queries. Availability: Per Active Charging Service.	Int64
dns-req-aaaa-query	Description: The total number of DNS requests received for AAAA queries. Triggers: Increments whenever a DNS packet is received for AAAA queries. Availability: Per Active Charging Service.	Int64
dns-req-unknown-query	Description: The total number of DNS requests received for unknown queries. Triggers: Increments whenever a DNS packet is received for unknown queries. Availability: Per Active Charging Service.	Int64
dns-rsp-a-query	Description: The total number of DNS responses received for queries. Triggers: Increments whenever a DNS response packet is received for queries. Availability: Per Active Charging Service.	Int64

Variables	Description	Data Type
dns-rsp-cname-query	Description: The total number of DNS responses received for cname queries. Triggers: Increments whenever a DNS response packet is received for cname queries. Availability: Per Active Charging Service.	Int64
dns-rsp-ns-query	Description: The total number of DNS responses received for ns queries. Triggers: Increments whenever a DNS response packet is received for ns queries. Availability: Per Active Charging Service.	Int64
dns-rsp-ptr-query	Description: The total number of DNS responses received for ptr queries. Triggers: Increments whenever a DNS response packet is received for ptr queries. Availability: Per Active Charging Service.	Int64
dns-rsp-aaaa-query	Description: The total number of DNS responses received for AAAA queries. Triggers: Increments whenever a DNS response packet is received for AAAA queries. Availability: Per Active Charging Service.	Int64
dns-rsp-unknown-query	Description: The total number of DNS responses received for unknown queries. Triggers: Increments whenever a DNS response packet is received for unknown queries. Availability: Per Active Charging Service.	Int64
ECS DNS Snooping Feature Related		
Historical ECS Statistics		
ecs-ttlsuccess	Description: The total number of successful ECS sessions. Triggers: Increments whenever an ECS session is successfully created. Availability: Per Active Charging Service.	Int32
ecs-ttlfail	Description: The total number of failed ECS sessions. Triggers: Increments whenever an ECS session creation fails. Availability: Per Active Charging Service.	Int32
ecs-curactive	Description: The number of currently active ECS sessions. Triggers: Increments whenever a new ECS session is created. Decrements whenever an ECS session ends. Availability: Per Active Charging Service. Type: Gauge	Int32
ecs-15peak-curactive	Description: The peak number of active ECS sessions in 15 one-minute intervals over the last 15 minutes. ecs-15peak-curactive is computed from ecs-curactive gathered every minute over the last 15 minutes. Triggers: This is updated every 15 minutes. Availability: Per Active Charging Service. Type: Gauge	Int32
ecs-ruleshit	Description: The total number of rules hit. Triggers: Increments whenever a rule is hit. Availability: Per Active Charging Service.	v12.3 and earlier: Int32
ecs-ppruleshit	Description: The total number of post-processing rules hit. Triggers: Increments whenever a post-processing rule is hit. Availability: Per Active Charging Service.	v12.3 and earlier: Int32

Variables	Description	Data Type
ecs-tldlinkbytes	Description: The total number of downlink bytes detected for ECS sessions. Triggers: Increments whenever a downlink packet is received for the ECS session. Availability: Per Active Charging Service.	Int64
ecs-ttlulinkbytes	Description: The total number of uplink bytes detected for ECS sessions. Triggers: Increments whenever an uplink packet is received for the ECS session. Availability: Per Active Charging Service.	Int64
ecs-tldlinkpackets	Description: The total number of downlink packets detected for ECS sessions. Triggers: Increments whenever a downlink packet is received for the ECS session. Availability: Per Active Charging Service.	Int64
ecs-ttlulinkpackets	Description: The total number of uplink packets detected for ECS sessions. Triggers: Increments whenever an uplink packet is received for the ECS session. Availability: Per Active Charging Service.	Int64
ecs-ttlflowconn	Description: The total number of flows established by ECS sessions. Triggers: Increments whenever a new flow is created for the ECS session. Availability: Per Active Charging Service.	v12.3 and earlier: Int32
ecs-ttlflowdisc	Description: The total number of flows disconnected for ECS sessions. Triggers: Increments whenever a flow is disconnected for the ECS session. Availability: Per Active Charging Service.	v12.3 and earlier: Int32
ecs-curflow	Description: The number of currently active ECS flows. Triggers: Increments whenever a new ECS flow is created. Decrements whenever an ECS flow is removed. Availability: Per Active Charging Service. Type: Gauge	Int32
ecs-15peak-curflow	Description: The peak number of active ECS flows in 15 one-minute intervals over the last 15 minutes. ecs-15peak-curflow is computed from ecs-curflow gathered every minute over the last 15 minutes. Triggers: This is updated every 15 minutes. Availability: Per Active Charging Service. Type: Gauge	Int32
ecs-15min-usage-flowall	Description: The total number of active ECS flows detected in the last 15 minutes. Triggers: Increments whenever a new ECS flow is created in last 15 minutes. Decrements whenever an ECS flow is removed in last 15 minutes. Availability: Per Active Charging Service. Type: Gauge	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 21

eGTP-C Service Schema

The eGTP-C schema provides operational statistics that can be used for monitoring and troubleshooting the following products: MME, P-GW, S-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 21. Bulk Statistic Variables in the eGTP-C Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	The name of the context configured on the system that is currently facilitating the eGTP service. This is a key variable. Type: Information	String
vpnid	The identification number of the context configured on the system that is currently facilitating the eGTP service. This is an internal reference number. This is a key variable. Type: Information	Int32
servname	Displays the name of the eGTP service for which the statistics are displayed. This is a key variable. Type: Information	String
servid	The identification number of the service configured on the system that is currently facilitating the eGTP service. This is an internal reference number. This is a key variable. Type: Information	Int32
tun-sent-creseess	The total number of initial tunnel - create session request messages sent by the system. Type: Counter	Int32
tun-sent-retranscreseess	The total number of tunnel - retransmitted create session request messages sent by the system. Type: Counter	Int32
tun-recv-creseess	The total number of tunnel - create session request messages received by the system. Type: Counter	Int32
tun-recv-retranscreseess	The total number of tunnel - retransmitted create session request messages received by the system. Type: Counter	Int32
tun-sent-creseessresp	The total number of tunnel - create session response messages sent by the system. Type: Counter	Int32
tun-sent-creseessrespaccept	The total number of tunnel - create session response - accepted messages sent by the system. Type: Counter	Int32
tun-sent-creseessrespdenied	The total number of tunnel - create session response - denied messages sent by the system. Type: Counter	Int32
tun-sent-retranscreseessresp	The total number of tunnel - retransmitted create session response - messages sent by the system. Type: Counter	Int32
tun-recv-creseessresp	The total number of tunnel - create session response messages received by the system. Type: Counter	Int32

Variables	Description	Data Type
tun-recv-creseessrespaccept	The total number of tunnel - create session response - accepted messages received by the system. Type: Counter	Int32
tun-recv-creseessrespdenied	The total number of tunnel - create session response - denied messages received by the system. Type: Counter	Int32
tun-sent-crebear	The total number of tunnel - create bearer request messages sent by the system. Type: Counter	Int32
tun-sent-retranscrebear	The total number of tunnel - retransmitted create bearer request messages sent by the system. Type: Counter	Int32
tun-recv-crebear	The total number of tunnel - create bearer request messages received by the system. Type: Counter	Int32
tun-recv-retranscrebear	The total number of tunnel - retransmitted create bearer request messages received by the system. Type: Counter	Int32
tun-sent-crebearresp	The total number of tunnel - create bearer response messages sent by the system. Type: Counter	Int32
tun-sent-crebearrespaccept	The total number of tunnel - create bearer response - accepted messages sent by the system. Type: Counter	Int32
tun-sent-crebearrespdenied	The total number of tunnel - create bearer response - denied messages sent by the system. Type: Counter	Int32
tun-sent-retranscrebearresp	The total number of tunnel - retransmitted create bearer response - messages sent by the system. Type: Counter	Int32
tun-recv-crebearresp	The total number of tunnel - create bearer response messages received by the system. Type: Counter	Int32
tun-recv-crebearrespaccept	The total number of tunnel - create bearer response - accepted messages received by the system. Type: Counter	Int32
tun-recv-crebearrespdenied	The total number of tunnel - create bearer response - denied messages received by the system. Type: Counter	Int32
tun-sent-bearrescmd	The total number of tunnel - bearer resource command messages sent by the system. Type: Counter	Int32
tun-sent-retransbearrescmd	The total number of tunnel - retransmitted bearer resource command messages sent by the system. Type: Counter	Int32

Variables	Description	Data Type
tun-recv-bearrescmd	The total number of tunnel - bearer resource command messages received by the system. Type: Counter	Int32
tun-recv-retransbearrescmd	The total number of tunnel - retransmitted bearer resource command messages received by the system. Type: Counter	Int32
tun-sent-bearrescmd-fail	The total number of tunnel - bearer resource command - failure messages sent by the system. Type: Counter	Int32
tun-sent-retransbearrescmd-fail	The total number of tunnel - retransmitted bearer resource command - failure messages sent by the system. Type: Counter	Int32
tun-recv-bearrescmd-fail	The total number of tunnel - bearer resource command - failure messages received by the system. Type: Counter	Int32
tun-recv-retransbearrescmd-fail	The total number of tunnel - retransmitted bearer resource command - failure messages received by the system. Type: Counter	Int32
tun-sent-modbearreq	The total number of tunnel - modify bearer request messages sent by the system. Type: Counter	Int32
tun-sent-retransmodbearreq	The total number of tunnel - retransmitted modify bearer request messages sent by the system. Type: Counter	Int32
tun-recv-modbearreq	The total number of tunnel - modify bearer request messages received by the system. Type: Counter	Int32
tun-recv-retransmodbearreq	The total number of tunnel - retransmitted modify bearer request messages received by the system. Type: Counter	Int32
tun-sent-modbearresp	The total number of tunnel - modify bearer response - messages sent by the system. Type: Counter	Int32
tun-sent-modbearrespaccept	The total number of tunnel - modify bearer response - accepted messages sent by the system. Type: Counter	Int32
tun-sent-modbearrespdenied	The total number of tunnel - modify bearer response - denied messages sent by the system. Type: Counter	Int32
tun-sent-retransmodbearresp	The total number of tunnel - retransmitted modify bearer response - messages sent by the system. Type: Counter	Int32

Variables	Description	Data Type
tun-recv-modbearresp	The total number of tunnel - modify bearer response messages received by the system. Type: Counter	Int32
tun-recv-modbearrespaccept	The total number of tunnel - modify bearer response - accepted messages received by the system. Type: Counter	Int32
tun-recv-modbearrespdenied	The total number of tunnel - modify bearer response - denied messages received by the system. Type: Counter	Int32
tun-sent-delsessreq	The total number of tunnel - delete session request messages sent by the system. Type: Counter	Int32
tun-sent-retransdelsessreq	The total number of tunnel - retransmitted delete session request messages sent by the system. Type: Counter	Int32
tun-recv-delsessreq	The total number of tunnel - delete session request messages received by the system. Type: Counter	Int32
tun-recv-retransdelsessreq	The total number of tunnel - retransmitted delete session request messages received by the system. Type: Counter	Int32
tun-sent-delsessresp	The total number of tunnel - delete session response messages sent by the system. Type: Counter	Int32
tun-sent-delsessrespaccept	The total number of tunnel - delete session response - accepted messages sent by the system. Type: Counter	Int32
tun-sent-delsessrespdenied	The total number of tunnel - delete session response - denied messages sent by the system. Type: Counter	Int32
tun-recv-delsessresp	The total number of tunnel - delete session response messages received by the system. Type: Counter	Int32
tun-recv-delsessrespaccept	The total number of tunnel - delete session response - accepted messages received by the system. Type: Counter	Int32
tun-recv-delsessrespdenied	The total number of tunnel - delete session response - denied messages received by the system. Type: Counter	Int32
tun-sent-delbearreq	The total number of tunnel - delete bearer request messages sent by the system. Type: Counter	Int32
tun-sent-retransdelbearreq	The total number of tunnel - retransmitted delete bearer request messages sent by the system. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
tun-recv-delbearreq	The total number of tunnel - delete bearer request messages received by the system. Type: Counter	Int32
tun-recv-retransdelbearreq	The total number of tunnel - retransmitted delete bearer request messages received by the system. Type: Counter	Int32
tun-sent-delbearresp	The total number of tunnel - delete bearer response messages sent by the system. Type: Counter	Int32
tun-sent-delbearrespaccept	The total number of tunnel - delete bearer response - accepted messages sent by the system. Type: Counter	Int32
tun-sent-delbearrespdenied	The total number of tunnel - delete bearer response - denied messages sent by the system. Type: Counter	Int32
tun-recv-delbearresp	The total number of tunnel - delete bearer response messages received by the system. Type: Counter	Int32
tun-recv-delbearrespaccept	The total number of tunnel - delete bearer response - accepted messages received by the system. Type: Counter	Int32
tun-recv-delbearrespdenied	The total number of tunnel - delete bearer response - denied messages received by the system. Type: Counter	Int32
tun-sent-dlinknotif	The total number of tunnel - downlink data notification request messages sent by the system. Type: Counter	Int32
tun-sent-retransdlinknotif	The total number of tunnel - retransmitted downlink data notification request messages sent by the system. Type: Counter	Int32
tun-recv-dlinknotif	The total number of tunnel - downlink data notification request messages received by the system. Type: Counter	Int32
tun-recv-retransdlinknotif	The total number of tunnel - retransmitted downlink data notification request messages received by the system. Type: Counter	Int32
tun-recv-dlinknotifack	The total number of tunnel - downlink data notification acknowledgement messages received by the system. Type: Counter	Int32
tun-recv-dlinknotifackaccept	The total number of tunnel - downlink data notification acknowledgement accepted messages received by the system. Type: Counter	Int32

Variables	Description	Data Type
tun-recv-dlinknotifackdenied	The total number of tunnel - downlink data notification acknowledgement denied messages received by the system. Type: Counter	Int32
tun-sent-dlinkdatafail	The total number of tunnel - downlink data failure messages sent by the system. Type: Counter	Int32
tun-recv-dlinkdatafail	The total number of tunnel - downlink data failure messages received by the system. Type: Counter	Int32
tun-sent-relaccbearreq	The total number of tunnel - release access bearers request messages sent by the system. Type: Counter	Int32
tun-sent-retransrelaccbearreq	The total number of tunnel - retransmitted release access bearers request messages sent by the system. Type: Counter	Int32
tun-recv-relaccbearreq	The total number of tunnel - release access bearers request messages received by the system. Type: Counter	Int32
tun-recv-retransrelaccbearreq	The total number of tunnel - retransmitted release access bearers request messages received by the system. Type: Counter	Int32
tun-sent-relaccbearresp	The total number of tunnel - release access bearers response messages sent by the system. Type: Counter	Int32
tun-sent-relaccbearrespaccept	The total number of tunnel - release access bearers response accepted messages sent by the system. Type: Counter	Int32
tun-sent-relaccbearrespdenied	The total number of tunnel - release access bearers response denied messages sent by the system. Type: Counter	Int32
tun-sent-retransrelaccbearresp	The total number of tunnel - retransmitted release access bearers response messages sent by the system. Type: Counter	Int32
tun-recv-relaccbearresp	The total number of tunnel - release access bearers response messages received by the system. Type: Counter	Int32
tun-recv-relaccbearrespaccept	The total number of tunnel - release access bearers response accepted messages received by the system. Type: Counter	Int32
tun-recv-relaccbearrespdenied	The total number of tunnel - release access bearers response denied messages received by the system. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
tun-sent-modbearcmd	The total number of tunnel - modify bearer command messages sent by the system. Type: Counter	Int32
tun-sent-retransmodbearcmd	The total number of tunnel - retransmitted modify bearer command messages sent by the system. Type: Counter	Int32
tun-recv-modbearcmd	The total number of tunnel - modify bearer command messages received by the system. Type: Counter	Int32
tun-recv-retransmodbearcmd	The total number of tunnel - retransmitted modify bearer command messages received by the system. Type: Counter	Int32
tun-sent-modbearfail	The total number of tunnel - modify bearer command - failure indication messages sent by the system. Type: Counter	Int32
tun-sent-retransmodbearfail	The total number of tunnel - retransmitted modify bearer command - failure indication messages sent by the system. Type: Counter	Int32
tun-recv-modbearfail	The total number of tunnel - modify bearer command - failure indication messages received by the system. Type: Counter	Int32
tun-recv-retransmodbearfail	The total number of tunnel - retransmitted modify bearer command - failure indication messages received by the system. Type: Counter	Int32
tun-sent-delbearcmd	The total number of tunnel - delete bearer command messages sent by the system. Type: Counter	Int32
tun-sent-retransdelbearcmd	The total number of tunnel - retransmitted delete bearer command messages sent by the system. Type: Counter	Int32
tun-recv-delbearcmd	The total number of tunnel - delete bearer command messages received by the system. Type: Counter	Int32
tun-recv-retransdelbearcmd	The total number of tunnel - retransmitted delete bearer command messages received by the system. Type: Counter	Int32
tun-sent-delbearfail	The total number of tunnel - delete bearer command - failure indication messages sent by the system. Type: Counter	Int32
tun-sent-retransdelbearfail	The total number of tunnel - retransmitted delete bearer command - failure indication messages sent by the system. Type: Counter	Int32

Variables	Description	Data Type
tun-recv-delbearfail	The total number of tunnel - delete bearer command - failure indication messages received by the system. Type: Counter	Int32
tun-recv-retransdelbearfail	The total number of tunnel - retransmitted delete bearer command - failure indication messages received by the system. Type: Counter	Int32
tun-sent-updbearreq	The total number of tunnel - update bearer request messages sent by the system. Type: Counter	Int32
tun-sent-retransupdbearreq	The total number of tunnel - retransmitted update bearer request messages sent by the system. Type: Counter	Int32
tun-recv-updbearreq	The total number of tunnel - update bearer request messages received by the system. Type: Counter	Int32
tun-recv-retransupdbearreq	The total number of tunnel - retransmitted update bearer request messages received by the system. Type: Counter	Int32
tun-sent-updbearresp	The total number of tunnel - update bearer response messages sent by the system. Type: Counter	Int32
tun-sent-updbearrespaccept	The total number of tunnel - update bearer response - accepted messages sent by the system. Type: Counter	Int32
tun-sent-updbearrespdenied	The total number of tunnel - update bearer response - denied messages sent by the system. Type: Counter	Int32
tun-recv-updbearresp	The total number of tunnel - update bearer response messages received by the system. Type: Counter	Int32
tun-recv-updbearrespaccept	The total number of tunnel - update bearer response - accepted messages received by the system. Type: Counter	Int32
tun-recv-updbearrespdenied	The total number of tunnel - update bearer response - denied messages received by the system. Type: Counter	Int32
tun-sent-creinddatafwdngreq	The total number of tunnel - create indicators for data forwarding requests sent by the system. Type: Counter	Int32
tun-sent-retranscreinddatafwdngreq	The total number of tunnel - retransmit indicators for data forwarding requests, sent by the system. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
tun-recv-creinddatafwdngreq	The total number of tunnel - create indicators for data forwarding requests, received by the system. Type: Counter	Int32
tun-recv-retranscreinddatafwdngreq	The total number of tunnel -retransmit indicators for data forwarding requests, received by the system. Type: Counter	Int32
tun-sent-creinddatafwdngrsp	The total number of tunnel - create indicators for data forwarding responses, sent by the system. Type: Counter	Int32
tun-sent-creinddatafwdngrspacept	The total number of tunnel - create indicators for data forwarding responses accepted, sent by the system. Type: Counter	Int32
tun-sent-creinddatafwdngrspdenied	The total number of tunnel - create indicators for data forwarding responses denied, sent by the system. Type: Counter	Int32
tun-sent-retranscreinddatafwdngrsp	The total number of tunnel - retransmitted create indicators for data forwarding responses, sent by the system. Type: Counter	Int32
tun-recv-creinddatafwdngrsp	The total number of tunnel - create indicators for data forwarding responses, received by the system. Type: Counter	Int32
	Type: Counter	
tun-recv-creinddatafwdngrspdenied	The total number of tunnel - denied create indicators for data forwarding responses, received by the system. Type: Counter	Int32
tun-sent-delinddatafwdngreq	The total number of tunnel - deleted indicators for data forwarding requests, sent by the system. Type: Counter	Int32
tun-sent-retransdelinddatafwdngreq	The total number of tunnel - retransmitted delete indicators for data forwarding requests, sent by the system. Type: Counter	Int32
tun-recv-delinddatafwdngreq	The total number of tunnel - delete indicators for data forwarding requests, received by the system. Type: Counter	Int32
tun-recv-retransdelinddatafwdngreq	The total number of tunnel - retransmitted delete indicators for data forwarding requests, received by the system. Type: Counter	Int32
tun-sent-delinddatafwdngrsp	The total number of tunnel - delete indicators for data forwarding responses, sent by the system. Type: Counter	Int32

Variables	Description	Data Type
tun-sent-delinddatafwdngrspacecept	The total number of tunnel - delete indicators for data forwarding responses accepted, sent by the system. Type: Counter	Int32
tun-sent-delinddatafwdngrspdenied	The total number of tunnel - delete indicators for data forwarding responses denied, sent by the system. Type: Counter	Int32
tun-recv-delinddatafwdngrsp	The total number of tunnel - delete indicators for data forwarding responses, received by the system. Type: Counter	Int32
tun-recv-delinddatafwdngrspacecept	The total number of tunnel - delete indicators for data forwarding responses accepted, received by the system. Type: Counter	Int32
tun-recv-delinddatafwdngrspdenied	The total number of tunnel - delete indicators for data forwarding responses denied, received by the system. Type: Counter	Int32
csfb-sent-suspendnotif	Circuit-Switched Fallback - The total number of suspend notification messages sent by this service. Type: Counter	Int32
csfb-sent-retranssuspendnotif	Circuit-Switched Fallback - The total number of retransmitted suspend notification messages sent by this service. Type: Counter	Int32
csfb-recv-suspendnotif	Circuit-Switched Fallback - The total number of suspend notification messages received by this service. Type: Counter	Int32
csfb-recv-retranssuspendnotif	Circuit-Switched Fallback - The total number of retransmitted suspend notification messages received by this service. Type: Counter	Int32
csfb-sent-suspendack	Circuit-Switched Fallback - The total number of suspend acknowledgement messages sent by this service. Type: Counter	Int32
csfb-sent-suspendackaccept	Circuit-Switched Fallback - The total number of suspend acknowledgement accepted messages sent by this service. Type: Counter	Int32
csfb-sent-suspendackdenied	Circuit-Switched Fallback - The total number of suspend acknowledgement denied messages sent by this service. Type: Counter	Int32
csfb-recv-suspendack	Circuit-Switched Fallback - The total number of suspend acknowledgement messages received by this service. Type: Counter	Int32
csfb-recv-suspendackaccept	Circuit-Switched Fallback - The total number of suspend acknowledgement accepted messages received by this service. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
csfb-recv-suspenddenied	Circuit-Switched Fallback - The total number of suspend acknowledgement denied messages received by this service. Type: Counter	Int32
csfb-sent-resumenotf	Circuit-Switched Fallback - The total number of resume notification messages sent by this service. Type: Counter	Int32
csfb-sent-retransresumenotf	Circuit-Switched Fallback - The total number of retransmitted resume notification messages sent by this service. Type: Counter	Int32
csfb-recv-resumenotf	Circuit-Switched Fallback - The total number of resume notification messages received by this service. Type: Counter	Int32
csfb-recv-retransresumenotf	Circuit-Switched Fallback - The total number of retransmitted resume notification messages received by this service. Type: Counter	Int32
csfb-sent-resumeack	Circuit-Switched Fallback - The total number of resume acknowledgement message sent by this service. Type: Counter	Int32
csfb-sent-resumeackaccept	Circuit-Switched Fallback - The total number of resume acknowledgement accepted messages sent by this service. Type: Counter	Int32
csfb-sent-resumeackdenied	Circuit-Switched Fallback - The total number of resume acknowledgement denied messages sent by this service. Type: Counter	Int32
csfb-recv-resumeack	Circuit-Switched Fallback - The total number of resume acknowledgement message received by this service. Type: Counter	Int32
csfb-recv-resumeackaccept	Circuit-Switched Fallback - The total number of resume acknowledgement accepted messages received by this service. Type: Counter	Int32
csfb-recv-resumedenied	Circuit-Switched Fallback - The total number of resume acknowledgement denied messages received by this service. Type: Counter	Int32
OutSigPktS5S8PGW	The total number of outgoing signalling packets over the S5/S8 P-GW interface. Type: Counter	Int32
IncSigPktS5S8PGW	The total number of incoming signalling packets over the S5/S8 P-GW interface. Type: Counter	Int32
OutSigOctS5S8PGW	The total number of outgoing signalling octets over the S5/S8 P-GW interface. Type: Counter	Int32
IncSigOctS5S8PGW	The total number of incoming signalling octets over the S5/S8 P-GW interface. Type: Counter	Int32

Variables	Description	Data Type
OutSigPktS5S8SGW	The total number of outgoing signalling packets over the S5/S8 S-GW interface. Type: Counter	Int32
IncSigPktS5S8SGW	The total number of incoming signalling packets over the S5/S8 S-GW interface. Type: Counter	Int32
OutSigOctS5S8SGW	The total number of outgoing signalling octets over the S5/S8 S-GW interface. Type: Counter	Int32
IncSigOctS5S8SGW	The total number of incoming signalling octets over the S5/S8 S-GW interface. Type: Counter	Int32
OutSigPktS11S4SGW	The total number of outgoing signalling packets over the S11 and/or S4 S-GW interface. Type: Counter	Int32
IncSigPktS11S4SGW	The total number of incoming signalling packets over the S11 and/or S4 S-GW interface. Type: Counter	Int32
OutSigOctS11S4SGW	The total number of outgoing signalling octets over the S11 and/or S4 S-GW interface. Type: Counter	Int32
IncSigOctS11S4SGW	The total number of incoming signalling octets over the S11 and/or S4 S-GW interface. Type: Counter	Int32
OutSigPktS11S10MME	The total number of outgoing signalling packets over the S11 and/or S10 MME interface. Type: Counter	Int32
IncSigPktS11S10MME	The total number of incoming signalling packets over the S11 and/or S10 MME interface. Type: Counter	Int32
OutSigOctS11S10MME	The total number of outgoing signalling octets over the S11 and/or S10 MME interface. Type: Counter	Int32
IncSigOctS11S10MME	The total number of incoming signalling octets over the S11 and/or S10 MME interface. Type: Counter	Int32
OutSigPktS4SGSN	The total number of outgoing signalling packets over the S4 SGSN interface. Type: Counter	Int32
IncSigPktS4SGSN	The total number of incoming signalling packets over the S4 SGSN interface. Type: Counter	Int32
OutSigOctS4SGSN	The total number of outgoing signalling octets over the S4 SGSN interface. Type: Counter	Int32
IncSigOctS4SGSN	The total number of incoming signalling octets over the S4 SGSN interface. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
path-sent-echoreq	The total number of path - echo request messages sent by the system. Type: Counter	Int32
path-sent-retransechoreq	The total number of path - retransmitted echo request messages sent by the system. Type: Counter	Int32
path-recv-echoreq	The total number of path - echo request messages received by the system. Type: Counter	Int32
path-sent-echoresp	The total number of path - echo response messages sent by the system. Type: Counter	Int32
path-recv-echoresp	The total number of path - echo response messages received by the system. Type: Counter	Int32
path-sent-versnotsupp	The total number of path - version not supported indication messages sent by the system. Type: Counter	Int32
path-recv-versnotsupp	The total number of path - version not supported indication messages received by the system. Type: Counter	Int32
mobility-sent-ctxreq	The total number of mobility - context request messages sent by the system. Type: Counter	Int32
mobility-sent-retransctxreq	The total number of mobility - retransmitted context request messages sent by the system. Type: Counter	Int32
mobility-recv-ctxreq	The total number of mobility - context request messages received by the system. Type: Counter	Int32
mobility-recv-retransctxreq	The total number of mobility - retransmitted context request messages received by the system. Type: Counter	Int32
mobility-sent-ctxrsp	The total number of mobility - context response messages sent by the system. Type: Counter	Int32
mobility-sent-retransctxrsp	The total number of mobility - retransmitted context response messages sent by the system. Type: Counter	Int32
mobility-recv-ctxrsp	The total number of mobility - context response messages received by the system. Type: Counter	Int32
mobility-recv-retransctxrsp	The total number of mobility - retransmitted context response messages received by the system. Type: Counter	Int32
mobility-sent-ctxrspaccept	The total number of mobility - context response - accepted messages sent by the system. Type: Counter	Int32

Variables	Description	Data Type
mobility-sent-ctxrspdenied	The total number of mobility - context response - denied messages sent by the system. Type: Counter	Int32
mobility-recv-ctxrspaccept	The total number of mobility - context response - accepted messages received by the system. Type: Counter	Int32
mobility-recv-ctxrspdenied	The total number of mobility - context response - denied messages received by the system. Type: Counter	Int32
mobility-sent-ctxack	The total number of mobility - context acknowledge messages sent by the system. Type: Counter	Int32
mobility-sent-retransctxack	The total number of mobility - retransmitted context acknowledge messages sent by the system. Type: Counter	Int32
mobility-recv-ctxack	The total number of mobility - context acknowledge messages received by the system. Type: Counter	Int32
mobility-recv-retransctxack	The total number of mobility - retransmitted context acknowledge messages received by the system. Type: Counter	Int32
mobility-sent-ctxackaccept	The total number of mobility - context acknowledge - accepted messages sent by the system. Type: Counter	Int32
mobility-sent-ctxackdenied	The total number of mobility - context acknowledge - denied messages sent by the system. Type: Counter	Int32
mobility-recv-ctxackaccept	The total number of mobility - context acknowledge - accepted messages received by the system. Type: Counter	Int32
mobility-recv-ctxackdenied	The total number of mobility - context acknowledge - denied messages received by the system. Type: Counter	Int32
mobility-sent-idtreq	The total number of mobility - identity request messages sent by the system. Type: Counter	Int32
mobility-sent-retransidtreq	The total number of mobility - retransmitted identity request messages sent by the system. Type: Counter	Int32
mobility-recv-idtreq	The total number of mobility - identity request messages received by the system. Type: Counter	Int32

Variables	Description	Data Type
mobility-recv-retransidtrsp	The total number of mobility - retransmitted identity request messages received by the system. Type: Counter	Int32
mobility-sent-idtrsp	The total number of mobility - identity response messages sent by the system. Type: Counter	Int32
mobility-sent-retransidtrsp	The total number of mobility - retransmitted identity response messages sent by the system. Type: Counter	Int32
mobility-recv-idtrsp	The total number of mobility - identity response messages received by the system. Type: Counter	Int32
mobility-recv-retransidtrsp	The total number of mobility - retransmitted identity response messages received by the system. Type: Counter	Int32
mobility-sent-idtrspaccept	The total number of mobility - identity response - accepted messages sent by the system. Type: Counter	Int32
mobility-sent-idtrspdenied	The total number of mobility - identity response - denied messages sent by the system. Type: Counter	Int32
mobility-recv-idtrspaccept	The total number of mobility - identity response - accepted messages received by the system. Type: Counter	Int32
mobility-recv-idtrspdenied	The total number of mobility - identity response - denied messages received by the system. Type: Counter	Int32
mobility-sent-fwrelreq	The total number of mobility - forward relocation request messages sent by the system. Type: Counter	Int32
mobility-sent-retransfwrelreq	The total number of mobility - retransmitted forward relocation request messages sent by the system. Type: Counter	Int32
mobility-recv-fwrelreq	The total number of mobility - forward relocation request messages received by the system. Type: Counter	Int32
mobility-recv-retransfwrelreq	The total number of mobility - retransmitted forward relocation request messages received by the system. Type: Counter	Int32
mobility-sent-fwrelrsp	The total number of mobility - forward relocation response messages sent by the system. Type: Counter	Int32

Variables	Description	Data Type
mobility-sent-retransfwdrelrsp	The total number of mobility - retransmitted forward relocation response messages sent by the system. Type: Counter	Int32
mobility-recv-fwdrelrsp	The total number of mobility - forward relocation response messages received by the system. Type: Counter	Int32
mobility-recv-retransfwdrelrsp	The total number of mobility - retransmitted forward relocation response messages received by the system. Type: Counter	Int32
mobility-sent-fwdrelrspaccept	The total number of mobility - forward relocation response - accepted messages sent by the system. Type: Counter	Int32
mobility-sent-fwdrelrspdenied	The total number of mobility - forward relocation response - denied messages sent by the system. Type: Counter	Int32
mobility-recv-fwdrelrspaccept	The total number of mobility - forward relocation response - accepted messages received by the system. Type: Counter	Int32
mobility-recv-fwdrelrspdenied	The total number of mobility - forward relocation response - denied messages received by the system. Type: Counter	Int32
mobility-sent-fwdaccnotf	The total number of mobility - forward access context notification messages sent by the system. Type: Counter	Int32
mobility-sent-retransfwdaccnotf	The total number of mobility - retransmitted forward access context notification messages sent by the system. Type: Counter	Int32
mobility-recv-fwdaccnotf	The total number of mobility - forward access context notification messages received by the system. Type: Counter	Int32
mobility-recv-retransfwdaccnotf	The total number of mobility - retransmitted forward access context notification messages received by the system. Type: Counter	Int32
mobility-sent-fwdaccack	The total number of mobility - forward access context acknowledge messages sent by the system. Type: Counter	Int32
mobility-sent-retransfwdaccack	The total number of mobility - retransmitted forward access context acknowledge messages sent by the system. Type: Counter	Int32
mobility-recv-fwdaccack	The total number of mobility - forward access context acknowledge messages received by the system. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
mobility-recv-retransfwdaccack	The total number of mobility - retransmitted forward access context acknowledge messages received by the system. Type: Counter	Int32
mobility-sent-fwdaccackaccept	The total number of mobility - forward access context acknowledge - accepted messages sent by the system. Type: Counter	Int32
mobility-sent-fwdaccackdenied	The total number of mobility - forward access context acknowledge - denied messages sent by the system. Type: Counter	Int32
mobility-recv-fwdaccackaccept	The total number of mobility - forward access context acknowledge - accepted messages received by the system. Type: Counter	Int32
mobility-recv-fwdaccackdenied	The total number of mobility - forward access context acknowledge - denied messages received by the system. Type: Counter	Int32
mobility-sent-fwdrelcmpnotif	The total number of mobility - forward relocation complete notification messages sent by the system. Type: Counter	Int32
mobility-sent-retransfwdrelcmpnotif	The total number of mobility - retransmitted forward relocation complete notification messages sent by the system. Type: Counter	Int32
mobility-recv-fwdrelcmpnotif	The total number of mobility - forward relocation complete notification messages received by the system. Type: Counter	Int32
mobility-recv-retransfwdrelcmpnotif	The total number of mobility - retransmitted forward relocation complete notification messages received by the system. Type: Counter	Int32
mobility-sent-fwdrelcmpack	The total number of mobility - forward relocation complete acknowledge messages sent by the system. Type: Counter	Int32
mobility-sent-retransfwdrelcmpack	The total number of mobility - retransmitted forward relocation complete acknowledge messages sent by the system. Type: Counter	Int32
mobility-recv-fwdrelcmpack	The total number of mobility - forward relocation complete acknowledge messages received by the system. Type: Counter	Int32
mobility-recv-retransfwdrelcmpack	The total number of mobility - retransmitted forward relocation complete acknowledge messages received by the system. Type: Counter	Int32
mobility-sent-fwdrelcmpackaccept	The total number of mobility - forward relocation complete acknowledge - accepted messages sent by the system. Type: Counter	Int32

Variables	Description	Data Type
mobility-sent-fwdrelcpackdenied	The total number of mobility - forward relocation complete acknowledge - denied messages sent by the system. Type: Counter	Int32
mobility-recv-fwdrelcpackaccept	The total number of mobility - forward relocation complete acknowledge - accepted messages received by the system. Type: Counter	Int32
mobility-recv-fwdrelcpackdenied	The total number of mobility - forward relocation complete acknowledge - denied messages received by the system. Type: Counter	Int32
mobility-sent-relcancelreq	The total number of mobility - relocation cancel request messages sent by the system. Type: Counter	Int32
mobility-sent-retransrelcancelreq	The total number of mobility - retransmitted relocation cancel request messages sent by the system. Type: Counter	Int32
mobility-recv-relcancelreq	The total number of mobility - relocation cancel request messages received by the system. Type: Counter	Int32
mobility-recv-retransrelcancelreq	The total number of mobility - retransmitted relocation cancel request messages received by the system. Type: Counter	Int32
mobility-sent-relcancelrsp	The total number of mobility - relocation cancel response messages sent by the system. Type: Counter	Int32
mobility-sent-retransrelcancelrsp	The total number of mobility - retransmitted relocation cancel response messages sent by the system. Type: Counter	Int32
mobility-recv-relcancelrsp	The total number of mobility - relocation cancel response messages received by the system. Type: Counter	Int32
mobility-recv-retransrelcancelrsp	The total number of mobility - retransmitted relocation cancel response messages received by the system. Type: Counter	Int32
mobility-sent-relcancelrspaccept	The total number of mobility - relocation cancel response - accepted messages sent by the system. Type: Counter	Int32
mobility-sent-relcancelrspdenied	The total number of mobility - relocation cancel response - denied messages sent by the system. Type: Counter	Int32
mobility-recv-relcancelrspaccept	The total number of mobility - relocation cancel response - accepted messages received by the system. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
mobility-recv-relcancelrspdenied	The total number of mobility - relocation cancel response - denied messages received by the system. Type: Counter	Int32
trace-sent-activate	The total number of trace - activate messages sent by the system. Type: Counter	Int32
trace-recv-activate	The total number of trace - activate messages received by the system. Type: Counter	Int32
trace-sent-deactivate	The total number of trace - deactivate messages sent by the system. Type: Counter	Int32
trace-recv-deactivate	The total number of trace - deactivate messages received by the system. Type: Counter	Int32
gtpv1path-sent-echoreq	The total number of GTPv1 path - echo request messages sent by the system. Type: Counter	Int32
gtpv1path-recv-echoreq	The total number of GTPv1 path - echo request messages received by the system. Type: Counter	Int32
gtpv1path-sent-echoresp	The total number of GTPv1 path - echo response messages sent by the system. Type: Counter	Int32
gtpv1path-recv-echoresp	The total number of GTPv1 path - echo response messages received by the system. Type: Counter	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 22

FA Schema Statistics

The FA schema provides operational statistics that can be used for monitoring and troubleshooting the following products: GGSN, PDSN, P-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 22. Bulk Statistic Variables in the FA Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the FA service. This is a key variable.	String
vpnid	The identification number of the context configured on the system that is currently facilitating the FA service. This is an internal reference number. This is a key variable.	Int32
servname	The name of the FA service for which the statistics are displayed. This is a key variable.	String
advert-send	The total number of agent advertisement messages sent to the subscriber's mobile node.	Int32
disc-expiry	The total number of sessions that were disconnected due to the expiration of their lifetime setting.	Int32
disc-dereg	The total number of sessions that were disconnected due to de-registrations.	Int32
disc-admin	The total number of sessions that were disconnected due to an administrative clearing of calls (i.e. executing the clear subscriber command).	Int32
auth-attempt	The total number of AAA authentication attempts that were facilitated.	Int32
auth-success	The total number of successful AAA authentication attempts that were facilitate.	Int32
auth-failure	The total number of failed AAA authentication attempts that were facilitated.	Int32
recv-total	The total number of registration requests received.	Int32
recv-initial	The total number of initial registration requests received.	Int32
recv-renewal	The total number of renewal registration requests received.	Int32
recv-dereg	The total number of requests for de-registration received.	Int32
accept-total	The total number of registration requests accepted.	Int32
accept-initial	The total number of initial registration requests accepted.	Int32
accept-renewal	The total number of renewal registration requests accepted.	Int32
accept-dereg	The total number of requests for de-registration accepted.	Int32
denied-total	The total number of registration requests denied.	Int32
denied-initial	The total number of initial registration requests denied.	Int32
denied-renewal	The total number of renewal registration requests denied.	Int32
denied-dereg	The total number of requests for de-registration denied.	Int32
discard-total	The total number of registration requests that were discarded.	Int32
discard-initial	The total number of initial registration requests discarded.	Int32
discard-renewal	The total number of renewal registration requests discarded.	Int32
discard-dereg	The total number of requests for de-registration discarded.	Int32
relayed-total	The total number of registration requests that have been relayed.	Int32

Variables	Description	Data Type
relayed-initial	The total number of initial registration requests relayed.	Int32
relayed-renewal	The total number of renewal registration requests relayed.	Int32
relayed-dereg	The total number of requests for de-registration relayed.	Int32
authfail-total	The total number of registration requests that failed authentication.	Int32
authfail-initial	The total number of initial registration requests that failed authentication.	Int32
authfail-renewal	The total number of renewal registration requests that failed authentication.	Int32
authfail-dereg	The total number of requests for de-registration that failed authentication.	Int32
denied-pdsn-total	The total number of registration requests that have been denied by the Packet Data Service Node/Foreign Agent (PDSNFA). Reasons for a PDSN/FA denial are described later in this table.	Int32
denied-pdsn-initial	The total number of initial registration requests that were denied by the PDSN/FA. Reasons for a PDSN/FA denial are described later in this table.	Int32
denied-pdsn-renewal	The total number of renewal registration requests denied by the PDSN/FA. Reasons for a PDSN/FA denial are described later in this table.	Int32
denied-pdsn-dereg	The total number of requests for de-registration that were denied by the PDSN/FA. Reasons for a PDSN/FA denial are described later in this table.	Int32
denied-ha-total	The total number of registration requests that have been denied by the Home Agent (HA). Reasons for a HA denial are described later in this table.	Int32
denied-ha-initial	The total number of initial registration requests denied by the HA. Reasons for a HA denial are described later in this table.	Int32
denied-ha-renewal	The total number of renewal registration requests denied by the HA. Reasons for a HA denial are described later in this table.	Int32
denied-ha-dereg	The total number of requests for de-registration that were denied by the HA. Reasons for a HA denial are described later in this table.	Int32
denied-pdsn-unspec	The total number of registration requests for which an FA reply code of 40H (Registration Denied - reason unspecified) was sent.	Int32
denied-pdsn-timeout	The total number of registration requests for which a FA reply code of 4EH (Registration Denied - registration timeout) was sent.	Int32
denied-pdsn-admin	The total number of registration requests for which a FA reply code of 41H (Registration Denied- administratively prohibited) was sent.	Int32
denied-pdsn-resource	The total number of registration requests for which a FA reply code of 42H (Registration Denied - insufficient resources) was sent.	Int32
denied-pdsn-mnauth	The total number of registration requests for which a FA reply code of 43H (Registration Denied - mobile node failed authentication) was sent.	Int32
denied-pdsn-haauth	The total number of registration requests for which a FA reply code of 44H (Registration Denied - home agent authentication failure) was sent.	Int32

Variables	Description	Data Type
denied-pdsn-lifetoolong	The total number of registration requests for which a FA reply code of 45H (Registration Denied - requested lifetime too long) was sent.	Int32
denied-pdsn-badreq	The total number of registration requests for which a FA reply code of 46H (Registration Denied- administratively prohibited) was sent.	Int32
denied-pdsn-badreply	The total number of registration requests for which a FA reply code of 47H (Registration Denied - poorly formed reply) was sent.	Int32
denied-pdsn-missnai	The total number of registration requests for which a FA reply code of 61H (Registration Denied - missing NAI) was sent.	Int32
denied-pdsn-misshomeagent	The total number of registration requests for which a FA reply code of 62H (Registration Denied - missing home agent) was sent.	Int32
denied-pdsn-misshomeaddr	The total number of registration requests for which a FA reply code of 60H (Registration Denied - missing home address) was sent.	Int32
denied-pdsn-unkchallenge	The total number of registration requests for which a FA reply code of 68H (Registration Denied - unknown challenge) was sent.	Int32
denied-pdsn-misschallenge	The total number of registration requests for which a FA reply code of 69H (Registration Denied - missing challenge) was sent.	Int32
denied-pdsn-stalechallenge	The total number of registration requests for which a FA reply code of 6AH (Registration Denied - stale challenge) was sent.	Int32
denied-pdsn-mntoodistant	The total number of registration requests for which a FA reply code of 4CH (Registration Denied - reverse tunneling mobile node too distant) was sent.	Int32
denied-pdsn-styleunavail	The total number of registration requests for which a FA reply code of 4FH (Registration Denied - reverse tunneling delivery style unavailable) was sent.	Int32
denied-pdsn-hanetunreach	The total number of registration requests for which a FA reply code of 50H (Registration Denied - home network unreachable (ICMP error received)) was sent.	Int32
denied-pdsn-hahostunreach	The total number of registration requests for which a FA reply code of 51H (Registration Denied - home agent host unreachable (ICMP error received)) was sent.	Int32
denied-pdsn-haportunreach	The total number of registration requests for which a FA reply code of 52H (Registration Denied - home agent port unreachable (ICMP error received)) was sent.	Int32
denied-pdsn-haunreach	The total number of registration requests for which a FA reply code of 58H (Registration Denied - home agent unreachable (other ICMP error received)) was sent.	Int32
denied-pdsn-invcoa	The total number of registration requests for which a FA reply code of 4DH (Registration Denied - invalid care-of address) was sent.	Int32
denied-pdsn-encapunavail	The total number of registration requests for which a FA reply code of 48H (Registration Denied - requested encapsulation unavailable) was sent.	Int32
denied-pdsn-revtununavail	The total number of registration requests for which a FA reply code of 4AH (Registration Denied - requested reverse tunnel unavailable) was sent.	Int32
denied-pdsn-revtunmand	The total number of registration requests for which a FA reply code of 4BH (Registration Denied - reverse tunnel is mandatory and 'T' bit not set) was sent.	Int32

Variables	Description	Data Type
denied-pdsn-unknowncvse	The total number of registration requests for which a PDSN reply code of 8DH (Registration Denied - unsupported vendor ID or unable to interpret data in the CVSE) was received.	Int32
denied-ha-faauth	The total number of registration requests for which a HA reply code of 84H (Registration Denied - foreign agent failed authentication) was received.	Int32
denied-ha-badreq	The total number of registration requests for which a HA reply code of 86H (Registration Denied - poorly formed request) was received.	Int32
denied-ha-mismatchid	The total number of registration requests for which a HA reply code of 85H (Registration Denied - registration Identification mismatch) was received.	Int32
denied-ha-simulbind	The total number of registration requests for which a HA reply code of 87H (Registration Denied - too many simultaneous mobility bindings) was received.	Int32
denied-ha-unknownha	The total number of registration requests for which a HA reply code of 88H (Registration Denied - unknown home agent address) was received.	Int32
denied-ha-revtununavail	The total number of registration requests for which a HA reply code of 89H (Registration Denied - reverse tunneling unavailable) was received.	Int32
replyrcv-total	The total number of registration replies received. This total includes initial, renewal and de-registration registration replies.	Int32
replyrcv-totalrelayed	The total number of registration replies relayed. This total includes initial, renewal and de-registration registration replies.	Int32
replyrcv-errors	The total number of registration replies that contained errors.	Int32
replyrcv-initial	The total number of initial registration replies received.	Int32
replyrcv-initialrelayed	The total number of initial registration replies relayed.	Int32
replyrcv-renewal	The total number of renewal registration replies received.	Int32
replyrcv-renewalrelayed	The total number of renewal registration replies relayed.	Int32
replyrcv-dereg	The total number of replies for de-registration received.	Int32
replyrcv-deregrelayed	The total number of replies for de-registration relayed.	Int32
reqsent-initial	The total number of initial FA registration requests sent.	Int32
reqsent-initial-resend	The total number of initial FA registration requests re-sent.	Int32
reqsent-initial-noresend	The total number of initial FA registration requests that were not re-sent.	Int32
reqsent-renew	The total number of FA registration renewal requests that were sent.	Int32
reqsent-renew-resend	The total number of FA registration renewal requests that were re-sent.	Int32
reqsent-renew-noresend	The total number of FA registration renewal requests that were not re-sent.	Int32
reqsent-dereg	The total number of FA de-registration requests that were sent.	Int32

Common Syntax Options

Variables	Description	Data Type
reqsent-dereg-resend	The total number of FA de-registration requests that were re-sent.	Int32
reqsent-dereg-noresend	The total number of FA de-registration requests that were not re-sent.	Int32
replisent-total	The total number of registration replies sent.	Int32
replisent-acceptreg	The total number of successful registration replies sent.	Int32
replisent-acceptdereg	The total number of successful de-registration replies sent.	Int32
replisent-badreq	The total number of registration replies that were sent with a reply code of 46H (Registration Denied - poorly formed reply).	Int32
replisent-badreply	The total number of registration replies that were sent with a reply code of 47H (Registration Denied - poorly formed reply).	Int32
replisent-unspecified	The total number of registration replies that were sent with a reply code of 40H (Registration Denied - reason unspecified).	Int32
replisent-adminprohib	The total number of registration replies that were sent with a reply code of 41H (Registration Denied - administratively prohibited).	Int32
replisent-noresources	The total number of registration replies that were sent with a reply code of 42H (Registration Denied - insufficient resources).	Int32
replisent-mnauthfail	The total number of registration replies that were sent with a reply code of 43H (Registration Denied - mobile node failed authentication).	Int32
replisent-haauthfail	The total number of registration replies that were sent with a reply code of 44H (Registration Denied - home agent failed authentication).	Int32
replisent-lifetoolong	The total number of registration replies that were sent with a reply code of 45H (Registration Denied - requested lifetime too long).	Int32
replisent-revtununavail	The total number of registration replies that were sent with a reply code of 4AH (Registration Denied - reverse tunneling unavailable).	Int32
replisent-revtunmand	The total number of registration replies that were sent with a reply code of 4BH (Registration Denied - reverse tunneling mandatory).	Int32
replisent-delstyleunavail	The total number of registration replies that were sent with a reply code of 4FH (Registration Denied - reverse tunneling delivery style unavailable).	Int32
replisent-mntoodistant	The total number of registration replies sent with a reply code of 4CH (Registration Denied - reverse tunneling mobile node too distant).	Int32
replisent-invcoa	The total number of registration replies sent with a reply code of 4DH (Registration Denied - invalid care-of address).	Int32
replisent-regtimeout	The total number of registration replies sent with a reply code of 4EH (Registration Denied - registration timeout).	Int32
replisent-hanetunreach	The total number of registration requests sent with an FA reply code of 50H (Registration Denied - home network unreachable (ICMP error received)).	Int32

Variables	Description	Data Type
replysent-hahostunreach	The total number of registration requests sent with an FA reply code of 51H (Registration Denied - home agent host unreachable (ICMP error received)).	Int32
replysent-haportunreach	The total number of registration requests sent with an FA reply code of 52H (Registration Denied - home agent port unreachable (ICMP error received)).	Int32
replysent-haunreach	The total number of registration requests sent with an FA reply code of 58H (Registration Denied - home agent unreachable (other ICMP error received)).	Int32
replysent-missnai	The total number of registration replies sent with a reply code of 61H (Registration Denied - missing NAI).	Int32
replysent-misshomeagent	The total number of registration replies sent with a reply code of 62H (Registration Denied - missing home agent).	Int32
replysent-misshomeaddr	The total number of registration replies sent with a reply code of 60H (Registration Denied - missing home address).	Int32
replysent-unkchallenge	The total number of registration replies sent with a reply code of 68H (Registration Denied - unknown challenge).	Int32
replysent-misschallenge	The total number of registration replies sent with a reply code of 69H (Registration Denied - missing challenge).	Int32
replysent-stalechallenge	The total number of registration replies sent with a reply code of 6AH (Registration Denied - challenge).	Int32
replysent-senderrors	The total number of errors that occurred while sending replies.	Int32
ttlprepaid	The total number of Prepaid calls facilitated by the service.	Int32
curprepaid	The total number of Prepaid calls currently being facilitated by the service.	Int32
ttlonlineauthsucc	The total number of successful Online Authentications for the service.	Int32
ttlonlineauthfail	The total number of successful Online Authentications for the service.	Int32
revoc-sent	The total number of FA registration revocations sent.	Int32
revoc-retry-sent	The total number of FA registration revocation messages the system attempted to re-send.	Int32
revoc-ack-recv	The total number of FA registration revocation acknowledgement messages received.	Int32
revoc-timeout	The total number of timeouts that occurred during FA registration revocations.	Int32
revoc-recv	The total number of FA registration revocations received	Int32
revoc-ack-sent	The total number of The total number of FA registration revocation acknowledgement messages sent.	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 23

FNG Schema Statistics

The FNG schema provides operational statistics that can be used for monitoring and troubleshooting the Femto Network Gateway.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 23. Bulk Statistic Variables in the FNG Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	Description: The name of the context currently facilitating the service processing the subscriber session. This is a key variable.	String
vpnid	Description: The identification number of the context currently facilitating the service processing the subscriber session. This is an internal reference number. This is a key variable.	Int32
svcname	Description: Service name for which FNG statistics are being displayed. This is a key variable.	String
svcid	Description: Service ID for which FNG statistics are being displayed. This is a key variable.	Int32
bindaddress	Description: The bind IP address for this FNG service.	String
state	Description: System-wide FNG state identified by the following codes: <ul style="list-style-type: none"> unknown inservice: At least one FNG service is available. outofservice: No FNG service is currently active, but one or more FNG services are configured. 	String
sess-curinprog	Description: Number of FNG sessions in progress (including transient ones).	Int32
sess-curact	Description: Number of currently active FNG sessions.	Int32
sess-curdorm	Description: Number of currently dormant FNG sessions.	Int32
sess-curactipv4	Description: Number of currently active IPV4 sessions.	Int32
sess-ttlsetup	Description: Total number of FNG session setups.	Int32
sess-ttlattempt	Description: Total number of FNG session attempts.	Int32
sess-ttlattemptfail	Description: Total number of FNG session attempts failed.	Int32
sess-ttlrel	Description: Total number of FNG sessions released.	Int32
sess-ttlrellocal	Description: Total number of FNG sessions released locally.	Int32
sess-ttlrelremote	Description: Total number of FNG sessions released remotely.	Int32
sess-remaining	Description: Number of FNG sessions remaining.	Int32
sess-limit	Description: Session limit.	Int32
sess-discbeforeconn	Description: Number of FNG sessions disconnected by remote before being connected.	Int32
sess-discipsec	Description: Number of FNG sessions terminated because of IPsec.	Int32
sess-discadmin	Description: Number of FNG sessions terminated because of administrator release.	Int32
sess-discidletimeout	Description: Number of FNG sessions terminated because of idle timer timeout.	Int32
sess-discabstimeout	Description: Number of FNG sessions terminated because of absolute timeout.	Int32
sess-disclongdur	Description: Number of FNG sessions terminated because of long duration timer timeout.	Int32

Variables	Description	Data Type
sess-discsesssetuptimeout	Description: Number of FNG sessions terminated because of Session Manager session setup timeout.	Int32
sess-discnoresource	Description: Number of FNG sessions terminated because of no resources.	Int32
sess-discauthfail	Description: Number of FNG sessions terminated because of AAA authentication failure.	Int32
sess-discflowaddfail	Description: Number of FNG sessions terminated because of flow add failure.	Int32
sess-discinvdestctx	Description: Number of FNG sessions terminated because of invalid destination context.	Int32
sess-discsourceviol	Description: Number of FNG sessions terminated because of source IP address violation.	Int32
sess-discdupreq	Description: Number of FNG sessions terminated because of a duplicated request.	Int32
sess-discaddrfail	Description: Number of FNG sessions terminated because of an address failure.	Int32
sess-discmisc	Description: Number of FNG sessions terminated for miscellaneous reasons.	Int32
eap-rxtlsvrpssthru	Description: Total number of EAP messages received from the EAP server in pass-through mode.	Int32
eap-rxchalsvrpssthru	Description: Total number of EAP challenge messages sent to the EAP server in pass-through mode.	Int32
eap-rxsucsvrpssthru	Description: Total number of EAP success messages received from the EAP server in pass-through mode.	Int32
eap-rxfailsvrpssthru	Description: Total number of EAP failure messages received from the EAP server in pass-through mode.	Int32
eap-txtlsvrpssthru	Description: Total number of EAP messages transmitted to the EAP server in pass-through mode.	Int32
eap-txinitreqsvrpssthru	Description: Total number of EAP messages transmitted to the EAP server in pass-through mode for initial request.	Int32
eap-txfwdreqsvrpssthru	Description: Total number of EAP messages transmitted to the EAP server in pass-through mode for forward request.	Int32
ipsec-txpacket	Description: Number of IPSec packets transmitted.	Int64
ipsec-txoctet	Description: Number of IPSec bytes transmitted.	Int64
ipsec-rxpacket	Description: Number of IPSec packets received.	Int64
ipsec-rxoctet	Description: Number of IPSec bytes received.	Int64

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 24

GPRS Schema Statistics

The GPRS schema provides operational statistics that can be used for monitoring and troubleshooting the following products: 2G SGSN

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 24. Bulk Statistic Variables in the GPRS Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	Description The name of the context configured on the system that is currently facilitating the GPRS service. This is a key variable. Type: Information	String
vpnid	Description The identification number of the context configured on the system that is currently facilitating the GPRS service. This is an internal reference number. This is a key variable. Type: Information	Int32
servname	Description The name of the GPRS service configured on the system for which the statistics are displayed. This is a key variable. Type: Information	String
nse-id	Description The network service entity identifier in this GPRS service. This is a key variable. Type: Information	Int32
ns-num-bytes-rcvd	This statistic has been deprecated.	
ns-num-bytes-sent	This statistic has been deprecated.	
ns-num-nsvc-failed	This statistic has been deprecated.	
ns-num-nsvc-congest	This statistic has been deprecated.	
ns-num-unit-data-msg-rcvd	This statistic has been deprecated.	
ns-num-unit-data-msg-sent	This statistic has been deprecated.	
ns-num-alive-pdu-rcvd	This statistic has been deprecated.	
ns-num-alive-pdu-sent	This statistic has been deprecated.	
ns-num-alive-ack-pdu-rcvd	This statistic has been deprecated.	
ns-num-alive-ack-pdu-sent	This statistic has been deprecated.	
ns-num-block-pdu-rcvd	This statistic has been deprecated.	
ns-num-block-pdu-sent	This statistic has been deprecated.	
ns-num-block-ack-pdu-rcvd	This statistic has been deprecated.	

Variables	Description	Data Type
ns-num-block-ack-pdu-sent	This statistic has been deprecated.	
ns-num-unblock-pdu-rcvd	This statistic has been deprecated.	
ns-num-unblock-pdu-sent	This statistic has been deprecated.	
ns-num-unblock-ack-pdu-rcvd	This statistic has been deprecated.	
ns-num-unblock-ack-pdu-sent	This statistic has been deprecated.	
ns-num-reset-pdu-rcvd	This statistic has been deprecated.	
ns-num-reset-pdu-sent	This statistic has been deprecated.	
ns-num-reset-ack-pdu-rcvd	This statistic has been deprecated.	
ns-num-reset-ack-pdu-sent	This statistic has been deprecated.	
ns-num-status-pdu-rcvd	This statistic has been deprecated.	
ns-num-status-pdu-sent	This statistic has been deprecated.	
num-sns-size-rcvd	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) size messages received by the SGSN. Triggers: Increments upon receiving the SNS size from the BSC. Availability: per SGSN Type: Counter	Int32
num-sns-size-ack-sent	Description: This proprietary statistic indicates the total number of ACK messages sent for Sub-Network Service (SNS) messages by the network service entity. Triggers: Increments after sending a SNS size ACK to the BSC. Availability: per SGSN Type: Counter	Int32
num-sns-size-fail-rcvd-unknown-nse	Description: This proprietary statistic indicates the total number of SNS size messages failed due to unknown network service entity. Triggers: Increments upon receiving SNS size messages from an unknown NSE (such as a BSC) with the reset flag unset. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
num-sns-config-rcvd	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages received by the SGSN. Triggers: Increments upon receiving SNS configuration from the BSC. Availability: per SGSN Type: Counter	Int32
num-sns-config-sent	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages sent by the SGSN. Triggers: Increments after sending SNS configuration to the BSC. Availability: per SGSN Type: Counter	Int32
num-sns-config-ack-sent	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration ACK messages sent by the SGSN. Triggers: Increments after sending SNS configuration ACK to the BSC. Availability: per SGSN Type: Counter	Int32
num-sns-config-ack-rcvd	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration ACK messages received by the SGSN. Triggers: Increments upon receiving SNS configuration ACK from the BSC. Availability: per SGSN Type: Counter	Int32
sns-config-fail-rcv-pdu-not-compat-state	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed as received packet data unit was not compatible with the message state in the SGSN. Availability: per SGSN Type: Counter	Int32
sns-config-fail-sent-pdu-not-compat-state	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed as sent packet data unit was not compatible with the message state in the peer entity. Availability: per SGSN Type: Counter	Int32
sns-config-fail-rcv-ival-ipv4-endpt	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to invalid number of IPv4 endpoints in a received message. Triggers: Increments when the number of IPv4 endpoints received in an SNS configuration message exceeds the maximum number of endpoints (received in SNS size messages). Availability: per SGSN Type: Counter	Int32
sns-config-fail-sent-ival-ipv4-endpt	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to invalid number of IPv4 endpoints in a sent message. Triggers: Increments upon receiving SNS configuration ACK from a BSC with cause indicating an invalid number of IPv4 endpoints. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
sns-config-fail-rcv- inval-ipv6-endpt	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to invalid number of IPv6 endpoints in a received message. Triggers: Increments when the number of IPv6 endpoints received in an SNS configuration message exceeds the maximum number of endpoints (received in SNS size messages). Availability: per SGSN Type: Counter	Int32
sns-config-fail-sent- inval-ipv6-endpt	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to invalid number of IPv6 endpoints in sent message. Triggers: Increments upon receiving SNS configuration ACK from a BSC with cause indicating an invalid number of IPv6 endpoints. Availability: per SGSN Type: Counter	Int32
sns-config-fail-rcv- prot-err-unspec	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to an unspecified protocol error in a received message. Availability: per SGSN Type: Counter	Int32
sns-config-fail-sent- prot-err-unspec	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to unspecified protocol error in a sent message. Triggers: Increments upon receiving SNS configuration ACK from a BSC with cause indicating an unspecified protocol error. Availability: per SGSN Type: Counter	Int32
sns-config-fail-rcv- inval-essential-param	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to invalid mandatory parameters in a received message. Triggers: Increments upon receiving SNS configuration with an IP address of 0.0.0.0 or 255.255.255.255. Availability: per SGSN Type: Counter	Int32
sns-config-fail-sent- inval-essential-param	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to invalid mandatory parameters in a sent message. Availability: per SGSN Type: Counter	Int32
sns-config-fail-rcv- internal-err	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to internal error in a received message. Triggers: Increments upon receiving an unexpected SNS configuration or the peer NSVL configuration fails in the SGSN due to a software issue. Availability: per SGSN Type: Counter	Int32
sns-config-fail-sent- internal-err	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to internal error in a sent message. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
sns-config-fail-rcv- inval-weight	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to invalid weight bit in a received message. Triggers: Increments when the total signaling or data weight of all endpoints received in the SNS configuration is zero. Availability: per SGSN Type: Counter	Int32
sns-config-fail-sent- inval-weight	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration messages failed due to invalid weight bit in a sent message. Triggers: Increments upon receiving SNS configuration ACK from a BSC with cause indicating invalid weights. Availability: per SGSN Type: Counter	Int32
sns-config-fail-sent- no-rsp-from-peer	Description: This proprietary statistic indicates the total number of Sub-Network Service (SNS) configuration message failed due to no response from a peer. Triggers: Increments following the expiration of a TSNS provisioning (all attempts over) for a SNS configuration. Availability: per SGSN Type: Counter	Int32
num-sns-add-rcvd	Description: This proprietary statistic indicates the total number of SNS-ADD messages received. Triggers: Increments upon receiving an SNS-ADD message. Availability: per SGSN Type: Counter	Int32
num-sns-add-sent	Description: This proprietary statistic indicates the total number of SNS-ADD messages sent. Triggers: Increments after sending an SNS-ADD message. Availability: per SGSN Type: Counter	Int32
sns-add-fail-rcv-pdu- not-compat-state	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed as received packet data unit was not compatible with the message state in the SGSN. Availability: per SGSN Type: Counter	Int32
sns-add-fail-sent- pdu-not-compat-state	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed as sent packet data unit was not compatible with the message state in the peer entity. Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the PDU is not compatible with the protocol for the SNS-ADD message. Availability: per SGSN Type: Counter	Int32
sns-add-fail-rcv- inval-ipv4-endpt	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to an invalid number of IPv4 endpoints in a received message. Triggers: Increments when the number of IPv4 endpoints received in an SNS-ADD message plus the number of IPv4 endpoints received in the SNS configuration exceeds the maximum number of endpoints (as received in the SNS size message). Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
sns-add-fail-sent- inval-ipv4-endpt	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to invalid number of IPv4 endpoints in a sent message. Triggers: Increments on receiving SNS-ACK with cause “invalid number of IPv4 endpoints” for SNS-ADD. Availability: per SGSN Type: Counter	Int32
sns-add-fail-rcv- inval-ipv6-endpt	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to invalid number of IPv6 endpoints in a received message. Triggers: Increments when the number of IPv6 endpoints received in an SNS-ADD message plus the number of IPv6 endpoints received in the SNS configuration exceeds the maximum number of endpoints (as received in the SNS size message). Availability: per SGSN Type: Counter	Int32
sns-add-fail-sent- inval-ipv6-endpt	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to invalid IPv6 address of endpoint in a sent message. Triggers: Increments on receiving SNS-ACK with cause “invalid number of IPv6 endpoints” for SNS-ADD. Availability: per SGSN Type: Counter	Int32
sns-add-fail-rcv-prot- err-unspec	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to an unspecified protocol error in a received message. Triggers: Increments when an SNS-ADD is received before the SNS configuration. Availability: per SGSN Type: Counter	Int32
sns-add-fail-sent- prot-err-unspec	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to unspecified protocol error in sent message. Triggers: Increments on receiving SNS-ACK with cause “protocol error-unspecified”. Availability: per SGSN Type: Counter	Int32
sns-add-fail-rcv- inval-essential-param	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to invalid mandatory parameters in received message. Triggers: Increments upon receiving an SNS-ADD containing an IP address of 0.0.0.0 or 255.255.255.255. Availability: per SGSN Type: Counter	Int32
sns-add-fail-sent- inval-essential-param	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to invalid mandatory parameters in sent message. Availability: per SGSN Type: Counter	Int32
sns-add-fail-rcv- internal-err	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to internal error in received message. Triggers: Increments upon receiving an SNS-ADD if the SGSN is not able to create an NSVC towards the new remote endpoint due to an internal error. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
sns-add-fail-sent-internal-err	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to internal error in sent message. Triggers: Increments after sending an SNS-ACK with a cause code indicating equipment failure for the SNS-ADD. Availability: per SGSN Type: Counter	Int32
sns-add-fail-rcv-ival-weight	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to invalid weight bit in received message. Triggers: Increments upon receiving an SNS-ADD if the total sum of the signaling or data weight of all remote endpoint is 0 (zero). Availability: per SGSN Type: Counter	Int32
sns-add-fail-sent-ival-weight	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to invalid weight bit in sent message. Triggers: Increments after sending an SNS-ACK with a cause code indicating invalid weights for the SNS-ADD. Availability: per SGSN Type: Counter	Int32
sns-add-fail-sent-no-rsp-from-peer	Description: This proprietary statistic indicates the total number of SNS-ADD messages failed due to no response from peer. Triggers: Increments following the expiration of a TSNS-PROV (all attempts over) for SNS-ADD. Availability: per SGSN Type: Counter	Int32
num-sns-delete-rcvd	Description: This proprietary statistic indicates the total number of SNS-DELETE messages received. Triggers: Increments upon receiving a SNS-DELETE message. Availability: per SGSN Type: Counter	Int32
num-sns-delete-sent	Description: This proprietary statistic indicates the total number of SNS-DELETE messages sent. Triggers: Increments after sending a SNS-DELETE message. Availability: per SGSN Type: Counter	Int32
sns-delete-fail-rcv-pdu-not-compat-state	Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed as received packet data unit was not compatible with the message state in the SGSN. Availability: per SGSN Type: Counter	Int32
sns-delete-fail-sent-pdu-not-compat-state	Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed as sent packet data unit was not compatible with the message state in the remote entity. Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the PDU is not compatible with the protocol for the SNS-DELETE message. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
sns-delete-fail-rcv-unknown-ip-endpt	<p>Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to an unknown IP endpoint in a received message.</p> <p>Triggers: Increments when a SNS-DELETE is received from an unknown NSE or the SNS-DELETE contains all unknown IP endpoints.</p> <p>Availability: per SGSN</p> <p>Type: Counter</p>	Int32
sns-delete-fail-sent-unknown-ip-endpt	<p>Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to unknown endpoint in a sent message.</p> <p>Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the SNS-DELETE message contains unknown IP endpoints.</p> <p>Availability: per SGSN</p> <p>Type: Counter</p>	Int32
sns-delete-fail-rcv-unknown-ip-address	<p>Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to invalid IP address in a received message.</p> <p>Triggers: Increments when the SNS-DELETE contains an unknown IP address.</p> <p>Availability: per SGSN</p> <p>Type: Counter</p>	Int32
sns-delete-fail-sent-unknown-ip-address	<p>Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to invalid IP address in a sent message.</p> <p>Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the SNS-DELETE message contained an unknown IP address.</p> <p>Availability: per SGSN</p> <p>Type: Counter</p>	Int32
sns-delete-fail-rcv-prot-err-unspec	<p>Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to unspecified protocol error in received message.</p> <p>Availability: per SGSN</p> <p>Type: Counter</p>	Int32
sns-delete-fail-sent-prot-err-unspec	<p>Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to unspecified protocol error in sent message.</p> <p>Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the SNS-DELETE message contained an unspecified protocol error.</p> <p>Availability: per SGSN</p> <p>Type: Counter</p>	Int32
sns-delete-fail-rcv-ival-essential-param	<p>Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to invalid mandatory parameters in received message.</p> <p>Availability: per SGSN</p> <p>Type: Counter</p>	Int32
sns-delete-fail-sent-ival-essential-param	<p>Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to invalid mandatory parameters in sent message.</p> <p>Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the SNS-DELETE message contained an invalid essential information element (IE).</p> <p>Availability: per SGSN</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
sns-delete-fail-rcv-internal-err	Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to internal error in received message. Availability: per SGSN Type: Counter	Int32
sns-delete-fail-sent-internal-err	Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to internal error in sent message. Triggers: Increments after sending an SNS-ACK with a cause code indicating “internal error” for the SNS-DELETE. Availability: per SGSN Type: Counter	Int32
sns-delete-fail-sent-no-rsp-from-peer	Description: This proprietary statistic indicates the total number of SNS-DELETE messages failed due to no response from peer. Triggers: Increments following the expiration of TSNS provisioning (all attempts over) for SNS-DELETE. Availability: per SGSN Type: Counter	Int32
num-sns-cw-rcvd	Description: This proprietary statistic indicates the total number of SNS-change-weight size messages received by the SGSN. Triggers: Increments upon receiving a SNS-change-weight message. Availability: per SGSN Type: Counter	Int32
num-sns-cw-sent	Description: This proprietary statistic indicates the total number of SNS-change-weight messages sent by the SGSN. Triggers: Increments after sending a SNS-change-weight message. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-rcv-pdu-not-compat-state	Description: This proprietary statistic indicates the total number of SNS-change-weight messages that failed as the received PDU was not compatible with the message state. Triggers: Increments upon receiving an SNS-change-weight from an unknown NSE. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-sent-pdu-not-compat-state	Description: This proprietary statistic indicates the total number of SNS-change-weight messages sent by the SGSN that failed because the sent PDU was not compatible with the message state. Triggers: Increments after sending an SNS-ACK with a cause code indicating the PDU is not compatible with the protocol for the SNS-change-weight message. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-rcv-invalid-weight	Description: This proprietary statistic indicates the total number of SNS-change-weight messages that failed due to invalid weight in the received message. Triggers: Increments when applying the weights received in a SNS-change-weight message would result in the total weight equaling zero. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
sns-cw-fail-sent- inval-weight	Description: This proprietary statistic indicates the total number of SNS-change-weight messages sent by the SGSN that failed due to invalid weight in the sent message. Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the SNS-change-weight message contains invalid weights. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-rcv- unknown-ip-endpt	Description: This proprietary statistic indicates the total number of SNS-change-weight messages that failed due to unknown IP endpoint in the received message. Triggers: Increments when the SGSN receives an SNS-change-weight message containing an unknown IP endpoint. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-sent- unknown-ip-endpt	Description: This proprietary statistic indicates the total number of SNS-change-weight messages sent by the SGSN that failed due to unknown IP endpoint in the sent message. Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the SNS-change-weight message contained an unknown IP endpoint. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-rcv- unknown-ip-addr	Description: This proprietary statistic indicates the total number of SNS-change-weight messages that failed due to an unknown IP address in the received message. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-sent- unknown-ip-addr	Description: This proprietary statistic indicates the total number of SNS-change-weight messages sent by the SGSN that failed due to unknown IP address in sent message. Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the SNS-change-weight message contained an unknown IP address. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-rcv-prot- err-unspec	Description: This proprietary statistic indicates the total number of SNS-change-weight message failed due to unspecified protocol error in received message. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-sent-prot- err-unspec	Description: This proprietary statistic indicates the total number of SNS-change-weight message sent by the SGSN failed due to unspecified protocol error in sent message. Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the SNS-change-weight message contained an unspecified protocol error. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-rcv-inval- essential-param	Description: This proprietary statistic indicates the total number of SNS-change-weight message failed due to invalid mandatory parameters in received message. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
sns-cw-fail-sent- inval-essential-param	Description: This proprietary statistic indicates the total number of SNS-change-weight messages sent by the SGSN which failed due to invalid mandatory parameters in the sent messages. Triggers: Increments upon receiving an SNS-ACK with a cause code indicating the SNS-change-weight message contained an invalid essential information element (IE). Availability: per SGSN Type: Counter	Int32
sns-cw-fail-rcv- internal-err	Description: This proprietary statistic indicates the total number of SNS-change-weight messages that failed due to internal error(s) in the received message. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-sent- internal-err	Description: This proprietary statistic indicates the total number of SNS-change-weight messages sent by the SGSN that failed due to internal error(s) in the sent message. Triggers: Increments after sending an SNS-ACK with a cause code indicating equipment failure for the SNS-change-weight. Availability: per SGSN Type: Counter	Int32
sns-cw-fail-sent-no- rsp-from-peer	Description: This proprietary statistic indicates the total number of SNS-change-weight messages sent by the SGSN that failed due to no response from the peer. Triggers: Increments following the expiration of a TSNS provisioning attempt for a SNS-change-weight. Availability: per SGSN Type: Counter	Int32
sns-num-ack-rcvd	Description: This proprietary statistic indicates the total number of SNS-ACK messages received. Triggers: Increments upon receiving an SNS-ACK. Availability: per SGSN Type: Counter	Int32
sns-num-ack-sent	Description: This proprietary statistic indicates the total number of SNS-ACK messages sent. Triggers: Increments after sending an SNS-ACK. Availability: per SGSN Type: Counter	Int32
sns-num-unknown- msg	Description: This proprietary statistic indicates the total number of unknown messages received. Availability: per SGSN Type: Counter	Int32
sns-num-status-pdu- sent	Description: This proprietary statistic indicates the total number of NS-STATUS messages sent in response to SNS messages or because of NSVC going down. Availability: per SGSN Type: Counter	Int32
bssgp-total-usr-req- drop	Description: This proprietary statistic indicates the total number of LLC packets dropped at the BSSGP layer. Triggers: Increments upon dropping of an LLC packet. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
bssgp-usr-req-drop-unknown-bvci	Description: This proprietary statistic indicates the total number of LLC packets dropped at the BSSGP layer because of unknown BVC. Triggers: Increments upon dropping of an LLC packet due to unknown BVC. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-blocked-bvc	Description: This proprietary statistic indicates the total number of LLC packets dropped at the BSSGP layer because of blocked BVC. Triggers: Increments upon dropping of an LLC packet due to blocked BVC. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-encoding-fail	Description: This proprietary statistic indicates the total number of LLC packets dropped at the BSSGP layer because of encoding failure. Triggers: Increments upon dropping of an LLC packet due to encoding failure. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-bvc-flow-ctrl-rvcd	Description: This proprietary statistic indicates the total number of flow control BVC messages received from the BSC. Triggers: Increments upon receipt of a flow control BVC message. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-bvc-flow-ctrl-ack-sent	Description: This proprietary statistic indicates the total number of flow control BVC ACK messages sent to the BSC Triggers: Increments after sending a flow control BVC ACK message. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-block-rvcd	Description: This proprietary statistic indicates the total number of BVC-Block messages received from the BSC. Triggers: Increments upon receiving a BVC-Block message. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-block-ack-sent	Description: This proprietary statistic indicates the total number of BVC BLOCK ACK messages sent. Triggers: Increments after sending a BVC-Block-Ack message. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-unblock-rvcd	Description: This proprietary statistic indicates the total number of BVC UNBLOCK messages received. Triggers: Increments upon receiving a BVC-Unblock message. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-unblock-ack-sent	Description: This proprietary statistic indicates the total number of BVC UNBLOCK ACK messages sent. Triggers: Increments after sending a BVC-Unblock-Ack message. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
bssgp-usr-req-drop-bvc-reset-sent	Description: This proprietary statistic indicates the total number of BVC RESET messages sent. Triggers: Increments after sending a BVC-Reset message. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-bvc-reset-rcvd	Description: This proprietary statistic indicates the total number of BVC RESET messages received. Triggers: Increments upon receiving a BVC-Reset message. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-bvc-reset-ack-sent	Description: This proprietary statistic indicates the total number of BVC RESET ACK messages sent. Triggers: Increments after sending a BVC-Reset-Ack message. Availability: per SGSN Type: Counter	Int32
bssgp-usr-req-drop-bvc-reset-ack-rcvd	Description: This proprietary statistic indicates the total number of BVC RESET ACK messages received. Triggers: Increments upon receiving a BVC-Reset-Ack message. Availability: per SGSN Type: Counter	Int32
bssgp-bvc-status-msg-sent	Description: This proprietary statistic indicates the total number of BVC status messages sent. Triggers: Increments after sending a BVC-Status message. Availability: per SGSN Type: Counter	Int32
bssgp-bvc-status-msg-rcvd	Description: This proprietary statistic indicates the total number of BVC status messages received. Triggers: Increments upon receiving a BVC-Status message. Availability: per SGSN Type: Counter	Int32
bssgp-flush-llc-msg-sent	Description: This proprietary statistic indicates the total number of BSSGP FLUSH LL (Logical Link) messages sent. Triggers: Increments after sending a Flush-LL message. Availability: per SGSN Type: Counter	Int32
bssgp-flush-llc-ack-msg-rcvd	Description: This proprietary statistic indicates the total number of BSSGP FLUSH LL (Logical Link) ACK messages received. Triggers: Increments upon receiving a Flush-LL-Ack message. Availability: per SGSN Type: Counter	Int32
bssgp-cs-paging-msg-sent	Description: This proprietary statistic indicates the total number of BSSGP circuit switched (CS) paging messages sent. Triggers: Increments after sending a CS-Paging message. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
bssgp-ps-paging-msg-sent	Description: This proprietary statistic indicates the total number of BSSGP packet switched (PS) paging messages sent. Triggers: Increments after sending a PS-Paging message. Availability: per SGSN Type: Counter	Int32
bssgp-ra-cap-update-msg-rcvd	Description: This proprietary statistic indicates the total number of BSSGP routing area (RA) capability update messages received. Triggers: Increments upon receiving a RA-Capability-Update message. Availability: per SGSN Type: Counter	Int32
bssgp-ra-cap-update-ack-msg-sent	Description: This proprietary statistic indicates the total number of BSSGP routing area (RA) capability update messages sent. Triggers: Increments after sending a RA-Capability-Update-Ack message. Availability: per SGSN Type: Counter	Int32
bssgp-radio-status-msg-sent	This statistic has been deprecated.	
bssgp-radio-status-msg-rcvd	Description: This proprietary statistic indicates the total number of BSSGP radio status messages received. Triggers: Increments upon receiving a Radio-Status message. Availability: per SGSN Type: Counter	Int32
bssgp-suspend-msg-rcvd	Description: This proprietary statistic indicates the total number of BSSGP SUSPEND messages received. Triggers: Increments upon receiving a BSSGP-Suspend message. Availability: per SGSN Type: Counter	Int32
bssgp-suspend-ack-msg-sent	Description: This proprietary statistic indicates the total number of BSSGP SUSPEND Acks sent. Triggers: Increments after sending a BSSGP-Suspend-Ack message. Availability: per SGSN Type: Counter	Int32
bssgp-suspend-nack-msg-sent	Description: This proprietary statistic indicates the total number of BSSGP SUSPEND NACKs sent. Triggers: Increments after sending a BSSGP-Suspend-Nak message. Availability: per SGSN Type: Counter	Int32
bssgp-resume-msg-rcvd	Description: This proprietary statistic indicates the total number of BSSGP RESUME messages received. Triggers: Increments upon receiving a BSSGP-Resume message. Availability: per SGSN Type: Counter	Int32

Variables	Description	Data Type
bssgp-resume-ack-msg-sent	Description: This proprietary statistic indicates the total number of BSSGP RESUME Acks sent. Triggers: Increments after sending a BSSGP-Resume-Ack message. Availability: per SGSN Type: Counter	Int32
bssgp-resume-nack-msg-sent	Description: This proprietary statistic indicates the total number of BSSGP RESUME NACKs sent. Triggers: Increments after sending a BSSGP-Resume-Nak message. Availability: per SGSN Type: Counter	Int32
bssgp-downlink-unitdata-sent	Description: This proprietary statistic indicates the total number of BSSGP unit data sent in downlink direction (towards MS). Triggers: Increments after sending a BSSGP DL-UNITDATA message. Availability: per SGSN Type: Counter	Int32
bssgp-uplink-unitdata-rcvd	Description: This proprietary statistic indicates the total number of BSSGP unit data received in uplink direction (towards network). Triggers: Increments upon receiving a BSSGP UL-UNITDATA message. Availability: per SGSN Type: Counter	Int32
bssgp-llc-pdu-discard-msg-rcvd	Description: This proprietary statistic indicates the total number of LLC PDU discard messages received. Triggers: Increments upon receiving a LLC-Discard message. Availability: per SGSN Type: Counter	Int32
bssgp-pkt-drop-flow-ctrl-queue-full	Description: This proprietary statistic indicates the total number of BSSGP packets dropped because the flow control buffer was full. Triggers: Increments after dropping a downlink packet in the BSSGP layer due to a full flow control queue. Availability: per SGSN Type: Counter	Int32
bssgp-downlink-pkt-drop	Description: This proprietary statistic indicates the total number of BSSGP packets dropped in downlink direction. Triggers: Increments after dropping a downlink packet in the BSSGP layer. Availability: per GPRS service Type: Counter	Int32
bssgp-ms-flow-ctrl-msg-rcvd	Description: This proprietary statistic indicates the total number of MS flow control messages received. Triggers: Increments upon receiving a MS-Flow-Control message. Availability: per GPRS service Type: Counter	Int32

Variables	Description	Data Type
bssgp-ms-flow-ctrl-ack-msg-sent	<p>Description: This proprietary statistic indicates the total number of MS flow control ACK messages sent.</p> <p>Triggers: Increments after sending a MS-Flow-Control-Ack message.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
bssgp-bvc-unknown-ms-status-msg-rcvd	<p>Description: This proprietary statistic indicates the total number of BSSGP-STATUS messages received.</p> <p>Triggers: Increments upon receiving a BSSGP-STATUS message as a response for any BSSGP message which contains an MS identity that is not known at the BSS.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
bssgp-bvc-unknown-ms-status-msg-sent	<p>Description: This proprietary statistic indicates the total number of BSSGP-STATUS messages sent.</p> <p>Triggers: Increments after sending a BSSGP-STATUS message as a response for the received BSSGP message if the MS identity is not known by the SGSN.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
sndcp-xid-req-ms-init	<p>Description: This proprietary statistic indicates the total number of MS initiated eXchange Identification (XID) indicators received.</p> <p>Triggers: Increments upon receiving a XID request from a MS with Layer 3/SNDCP XID parameters.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
sndcp-xid-ind-sgsn-init	<p>Description: This proprietary statistic indicates the total number of SGSN initiated eXchange Identification (XID) indicators sent.</p> <p>Triggers: Increments after sending a XID request from the SGSN with Layer 3/SNDCP XID parameters.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
sndcp-npdus-ack-rcvd-ms	<p>Description: This proprietary statistic indicates the total number of SNDCP network PDUs in LLC Acknowledged mode received from MS.</p> <p>Triggers: Increments upon receiving SNDCP network PDUs in LLC Acknowledged mode from the MS.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
sndcp-npdus-ack-sent-ms	<p>Description: This proprietary statistic indicates the total number of SNDCP network PDUs in LLC Acknowledged mode sent to MS.</p> <p>Triggers: Increments after sending SNDCP network PDUs in LLC Acknowledged mode to the MS.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*

Variables	Description	Data Type
snhcp-npdus-uack-rcvd-ms	<p>Description: This proprietary statistic indicates the total number of SNDCP network PDUs in UnLLC Acknowledged mode received from MS.</p> <p>Triggers: Increments upon receiving SNDCP network PDUs in Un-LLC Acknowledged mode from the MS.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
snhcp-npdus-uack-sent-ms	<p>Description: This proprietary statistic indicates the total number of SNDCP network PDUs in UnLLC Acknowledged mode sent to MS.</p> <p>Triggers: Increments after sending SNDCP network PDUs in un-LLC Acknowledged mode to the MS.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
snhcp-bytes-ack-rcvd-ms	<p>Description: This proprietary statistic indicates the total number of SNDCP bytes received from MS for all subscribers at SNDCP layer using LLC Acknowledged mode of LLC operation.</p> <p>Triggers: Increments after the uplink data packet has passed SNDCP validations as mentioned in sections 6.7 and 6.9 of SNDCP TS 44.065.</p> <p>Availability: per GPRS service, per Routing Area</p> <p>Type: Counter</p>	Int64*
snhcp-bytes-ack-sent-ms	<p>Description: This proprietary statistic indicates the total number of SNDCP bytes sent to MS for all subscribers at SNDCP layer using LLC Acknowledged mode of LLC operation.</p> <p>Triggers: Increments after the uplink data packet has passed SNDCP validations as mentioned in sections 6.7 and 6.9 of SNDCP TS 44.065.</p> <p>Availability: per GPRS service, per Routing Area</p> <p>Type: Counter</p>	Int64*
snhcp-bytes-uack-rcvd-ms	<p>Description: This proprietary statistic indicates the total number of SNDCP bytes received from MS for all subscribers at SNDCP layer using LLC Un-acknowledged mode of LLC operation.</p> <p>Triggers: Increments after the uplink data packet has passed SNDCP validations as mentioned in sections 6.7 and 6.9 of SNDCP TS 44.065.</p> <p>Availability: per GPRS service, per Routing Area</p> <p>Type: Counter</p>	Int64*
snhcp-bytes-uack-sent-ms	<p>Description: This proprietary statistic indicates the total number of SNDCP bytes sent to MS for all subscribers at SNDCP layer using LLC Un-acknowledged mode of LLC operation.</p> <p>Triggers: Increments after the uplink data packet has passed SNDCP validations as mentioned in sections 6.7 and 6.9 of SNDCP TS 44.065.</p> <p>Availability: per GPRS service, per Routing Area</p> <p>Type: Counter</p>	Int64*
snhcp-pdu-drop-rcvd-from-llc	<p>Description: This proprietary statistic indicates the total number of SNDCP PDUs dropped when received from LLC due to invalid parameter or state.</p> <p>Triggers: Increments upon receiving a SNDCP PDU from LLC for a SAPI which is not in a bound state.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*

Variables	Description	Data Type
sndcp-inval-ref-num-rcvd-from-llc	Description: This proprietary statistic indicates the total number of SNDCP PDUs dropped due to invalid reference number received from LLC. Triggers: Increments upon receiving an invalid reference number from LLC for the SAPI in which the SNDCP PDU is received. Availability: per GPRS service Type: Counter	Int64*
sndcp-npdu-sent-sgsn-irau	Description: This proprietary statistic indicates the total number of SNDCP network PDUs sent/transferred to other SGSNs during inter-SGSN routing area update (RAU). Triggers: Increments after sending SNDCP network PDUs to a peer SGSN while Inter-SGSN RAU is in progress. Availability: per GPRS service Type: Counter	Int64*
sndcp-npdu-rcvd-sgsn-irau	Description: This proprietary statistic indicates the total number of SNDCP network PDUs received from other SGSNs during inter-SGSN routing area update (RAU). Triggers: Increments upon receiving SNDCP network PDUs from a peer SGSN while Inter-SGSN RAU is in progress. Availability: per GPRS service Type: Counter	Int64*
llc-data-req-rx	Description: This proprietary statistic indicates the total number of LLC data requests received from the MS. Triggers: Increments upon receiving a downlink packet from SNDCP. Availability: per GPRS service Type: Counter	Int64*
llc-data-cfm-tx	Description: This proprietary statistic indicates the total number of LLC data requests confirmation sent to the MS. Triggers: Increments after sending a confirmation to SNDCP regarding a downlink packet. Availability: per GPRS service Type: Counter	Int64*
llc-data-ind-tx	Description: This proprietary statistic indicates the total number of LLC data indications sent to SNDCP layer. Triggers: Increments after sending an uplink packet to SNDCP. Availability: per GPRS service Type: Counter	Int64*
llc-data-sent-ind-tx	This statistic no longer pegs values and should not be used.	Int64
llc-unit-data-req-rx	Description: This proprietary statistic indicates the total number of LLC unit data requests received from the MS. Triggers: Increments upon receiving an Un-LLC Acknowledged mode packet from SNDCP. Availability: per GPRS service Type: Counter	Int64*
llc-unit-data-ind-tx	Description: This proprietary statistic indicates the total number of LLC unit data indications sent to the MS. Triggers: Increments after sending an Un-LLC Acknowledged mode packet to SNDCP. Availability: per GPRS service Type: Counter	Int64*

Variables	Description	Data Type
llc-discarded-frames-rx	Description: This proprietary statistic indicates the total number of frames received from the MS that are discarded at the LLC layer. Triggers: Increments after discarding a packet received from BSSGP. Availability: per GPRS service Type: Counter	Int64*
llc-discarded-frames-tx	This statistic no longer pegs values and should not be used.	Int64
llc-error-frames-rx	Description: This proprietary statistic indicates the total number of LLC error frames received from the MS. Triggers: Increments upon receiving a packet with an error from BSSGP. Availability: per GPRS service Type: Counter	Int64*
llc-unrecog-frames-rx	Description: This proprietary statistic indicates the total number of LLC unrecognized frames received from the MS. Triggers: Increments upon receiving a LLC message which contains an Invalid Frame format or a format other than the defined frame formats. Availability: per GPRS service Type: Counter	Int64*
llc-xid-collisions	Description: This proprietary statistic indicates the total number of LLC exchange identifier (XID) request collisions. Triggers: Increments upon receiving a XID while waiting for DISC/SABME. Availability: per GPRS service Type: Counter	Int64*
llc-ciphering-errors	Description: This proprietary statistic indicates the total number of LLC ciphering errors. Triggers: Increments upon a deciphering failure on the received LLC frame or on a ciphering failure while building the LLC frame. Availability: per GPRS service Type: Counter	Int64*
llc-fcs-errors	Description: This proprietary statistic indicates the total number of LLC frame check sequence errors. Triggers: Increments upon a Frame Check Sequence failure while validating FCS on the received LLC frame or on a FCS failure while building the LLC frame. Availability: per GPRS service Type: Counter	Int64*
llc-frame-stats-octets-rcvd	Description: This proprietary statistic indicates the total number of bytes of LLC frames received from an MS. This value includes all LLC messages (data + gmm messages + other LLC messages). This stat value be compared with similar counts for other layers to check if any packets have been dropped. Triggers: Increments when the LLC layer receives a packet (can be UI frame, U frame, S frame or U frame) from lower BSSGP layer. Availability: per GRPS service Type: Counter	Int64*

Variables	Description	Data Type
llc-frame-stats-octets-sent	<p>Description: This proprietary statistic indicates the total number of bytes sent from the LLC layer to an MS from the SGSN. This value includes all LLC messages (data + gmm messages + other LLC messages). This stat value be compared with similar counts for other layers to check if any packets have been dropped.</p> <p>Triggers: Increments when the LLC layer sends a packet (can be UI frame, U frame, S frame or U frame) to the lower BSSGP layer.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-unack-frames-rcvd	<p>Description: This proprietary statistic indicates the total number of unacknowledged UI frames received at the LLC layer from an MS. This value be compared with the packet count in gmm and sndcp to check if there are any packets dropped in the LLC layer.</p> <p>Triggers: Increments when the LLC layer receives a UI frame in unacknowledged mode from the lower BSSGP layer.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-unack-frames-sent	<p>Description: This proprietary statistic indicates the total number of unacknowledged UI frames sent from the LLC to an MS. This value can be compared with the packet count in gmm and sndcp to check if there are any packets dropped in the LLC layer.</p> <p>Triggers: Increments when the LLC layer sends a UI frame in unacknowledged mode to the lower BSSGP layer.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-rx	<p>Description: This proprietary statistic indicates the total number of LLC frames with unnumbered information received from the MS.</p> <p>Triggers: Increments upon receiving a LLC message from the MS which contains an Unnumbered Information (UI Frame).</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-tx	<p>Description: This proprietary statistic indicates the total number of LLC frames with unnumbered information sent to the MS. This is a counter type of statistic.</p> <p>Triggers: Increments after sending a LLC message to the MS which contains an Unnumbered Information (UI Frame).</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-ciph-rx	<p>Description: This proprietary statistic indicates the total number of LLC frames with ciphered unnumbered information received from the MS. This is a counter type of statistic.</p> <p>Triggers: Increments upon receiving a LLC message from the MS which contains a Ciphered Unnumbered Information (UI Frame).</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int64*

Variables	Description	Data Type
llc-frame-stats-ui-ciph-tx	<p>Description: This proprietary statistic indicates the total number of LLC frames with ciphered unnumbered information sent to the MS.</p> <p>Triggers: Increments after sending a LLC message to the MS which contains a Ciphered Unnumbered Information (UI Frame).</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea1-ciph-data-frames-rx	<p>Description: Indicates the total number of GEA1 ciphered data frames received at LLC layer; where the data frames include GMM, SMS, and SNDCP SAPI i.e 1, 7, 3,5,9 or 11.</p> <p>Triggers: Increments when receiving data frame ciphered with the GPRS GEA1 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea1-ciph-data-frames-tx	<p>Description: Indicates the total number of GEA1 ciphered data frames transmitted from the LLC layer; where the data frames include GMM, SMS, and SNDCP SAPI i.e., 1, 7, 3, 5, 9 or 11.</p> <p>Triggers: Increments when transmitting data frame ciphered with the GPRS GEA1 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea1-ciph-data-octets-rx	<p>Description: Indicates the total number of GEA1 ciphered data bytes received at the LLC layer.</p> <p>Triggers: Increments when receiving a data octet ciphered with GPRS GEA1 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea1-ciph-data-octets-tx	<p>Description: Indicates the total number of GEA1 ciphered data bytes transmitted from the LLC layer.</p> <p>Triggers: Increments when transmitting a data octet ciphered with GPRS GEA1 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea2-ciph-data-frames-rx	<p>Description: Indicates the total number of GEA2 ciphered data frames received at LLC layer; where the data frames include GMM, SMS, and SNDCP SAPI i.e., 1, 7, 3, 5, 9 or 11.</p> <p>Triggers: Increments when receiving data frame ciphered with the GPRS GEA2 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea2-ciph-data-frames-tx	<p>Description: Indicates the total number of GEA2 ciphered data frames transmitted from the LLC layer; where the data frames include GMM, SMS, and SNDCP SAPI i.e., 1, 7, 3, 5, 9 or 11.</p> <p>Triggers: Increments when transmitting data frame ciphered with the GPRS GEA2 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*

Variables	Description	Data Type
llc-frame-stats-ui-gea2-ciph-data-octets-rx	<p>Description: Indicates the total number of GEA2 ciphered data bytes received at the LLC layer.</p> <p>Triggers: Increments when receiving a data octet ciphered with GPRS GEA2 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea2-ciph-data-octets-tx	<p>Description: Indicates the total number of GEA2 ciphered data bytes transmitted from the LLC layer.</p> <p>Triggers: Increments when transmitting a data octet ciphered with GPRS GEA2 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea3-ciph-data-frames-rx	<p>Description: Indicates the total number of GEA3 ciphered data frames received at LLC layer; where the data frames include GMM, SMS, and SNDCP SAPI i.e., 1, 7, 3, 5, 9 or 11.</p> <p>Triggers: Increments when receiving data frame ciphered with the GPRS GEA3 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea3-ciph-data-frames-tx	<p>Description: Indicates the total number of GEA3 ciphered data frames transmitted from the LLC layer; where the data frames include GMM, SMS, and SNDCP SAPI i.e., 1, 7, 3, 5, 9 or 11.</p> <p>Triggers: Increments when transmitting data frame ciphered with the GPRS GEA3 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea3-ciph-data-octets-rx	<p>Description: Indicates the total number of GEA3 ciphered data bytes received at the LLC layer, where the data frames include GMM, SMS, and SNDCP SAPI i.e., 1, 7, 3, 5, 9 or 11.</p> <p>Triggers: Increments when receiving a data octet ciphered with GPRS GEA3 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-gea3-ciph-data-octets-tx	<p>Description: Indicates the total number of GEA3 ciphered data bytes transmitted from the LLC layer, where the data frames include GMM, SMS, and SNDCP SAPI i.e., 1, 7, 3, 5, 9 or 11.</p> <p>Triggers: Increments when transmitting a data octet ciphered with GPRS GEA3 ciphering algorithm.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-unciph-rx	<p>Description: Total number of unciphered frames received at the LLC layer.</p> <p>Triggers: Increments when the incoming frame is unciphered.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*
llc-frame-stats-ui-unciph-tx	<p>Description: Total number of unciphered frames transmitted from the LLC layer.</p> <p>Triggers: Increments when the outgoing frame is unciphered.</p> <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int64*

Variables	Description	Data Type
llc-frame-stats-ui-unciph-data-frames-rx	Description: Total number of unciphered data frames received at the LLC layer, where the data frames include GMM, SMS, and SNDCP SAPI i.e., 1, 7, 3, 5, 9 or 11. Triggers: Increments when the incoming data frame is unciphered. Availability: per GPRS service. Type: Counter	Int64*
llc-frame-stats-ui-unciph-data-frames-tx	Description: Total number of unciphered data frames transmitted at the LLC layer, where the data frames include GMM, SMS, and SNDCP SAPI i.e., 1, 7, 3, 5, 9 or 11. Triggers: Increments when the outgoing data frame is unciphered. Availability: per GPRS service. Type: Counter	Int64*
llc-frame-stats-ui-unciph-data-octets-rx	Description: Total number of unciphered data bytes received at the LLC layer. Triggers: Increments when receiving an unciphered data octet. Availability: per GPRS service. Type: Counter	Int64*
llc-frame-stats-ui-unciph-data-octets-tx	Description: Total number of unciphered data bytes transmitted from the LLC layer. Triggers: Increments when transmitting an unciphered data octet. Availability: per GPRS service. Type: Counter	Int64*
llc-frame-stats-xid-rcvd	Description: This proprietary statistic indicates the total number of XID-reset messages received from the MS. Triggers: Increments when the LLC layer receives an XID request from the lower BSSGP layer. Availability: per GPRS service. Type: Counter	Int64*
llc-frame-stats-xid-sent	Description: This proprietary statistic indicates the total number of XID-reset messages sent to the MS. This includes responses to XIDs sent by the SGSN and XID command from the MS. This stat value can be compared with the stat value for llc-frame-stats-xid-rcvd to determine XID failures. Triggers: Increments when the LLC layer sends an XID request to the lower BSSGP layer. Availability: per GPRS service. Type: Counter	Int64*
bytes-sent-to-bsc	Description: Stat collected on the Gb interface provides the total number of bytes of data sent by a SGSN to a specific BSC (NSEI). Triggers: Increments by the number of bytes of data in the data packet whenever a data packet is sent in the downlink direction from the SGSN to a subscriber served by the particular BSC (NSEI). Availability: per NSEI Type: Counter	Int64
packets-sent-to-bsc	Description: Stat collected on the Gb interface provides the total number of data packets a SGSN sent to a specific BSC (NSEI). Triggers: Increments whenever a data packet is sent in the downlink direction from the GGSN to a subscriber served by the particular BSC. Availability: per NSEI Type: Counter	Int64

Variables	Description	Data Type
bytes-rcvd-from-bsc	<p>Description: Stat collected on the Gb interface provides the total number of bytes of data received by a SGSN from a specific BSC (NSEI).</p> <p>Triggers: Increments by the number of bytes of data in the data packet whenever a data packet is sent in the uplink direction to the SGSN from a subscriber served by the particular BSC (NSEI).</p> <p>Availability: per BSC</p> <p>Type: Counter</p>	Int64
packets-rcvd-from-bsc	<p>Description: Stat collected on the Gb interface provides the total number of data packets the SGSN received from a specific BSC (NSEI).</p> <p>Triggers: Increments whenever a data packet is sent in the uplink direction to the SGSN from a subscriber served by the particular BSC (NSEI).</p> <p>Availability: per NSEI</p> <p>Type: Counter</p>	Int64
gprs-num-sub-gea0-capable	<p>Description: This proprietary statistic indicates the total number of currently attached GPRS subscribers whose MS network capability supports GEA0 (no ciphering).</p> <p>Availability: per SGSN</p> <p>Type: Gauge</p>	Int32
gprs-num-sub-gea1-capable	<p>Description: This proprietary statistic indicates the total number of currently attached GPRS subscribers whose MS network capability supports GEA1 encryption.</p> <p>Availability: per SGSN</p> <p>Type: Gauge</p>	Int32
gprs-num-sub-gea2-capable	<p>Description: This proprietary statistic indicates the total number of currently attached GPRS subscribers whose MS network capability supports GEA2 encryption.</p> <p>Availability: per SGSN</p> <p>Type: Gauge</p>	Int32
gprs-num-sub-gea3-capable	<p>Description: This proprietary statistic indicates the total number of currently attached GPRS subscribers whose MS network capability supports GEA3 encryption.</p> <p>Availability: per SGSN</p> <p>Type: Gauge</p>	Int32
gprs-num-sub-gea0-negotiated	<p>Description: This proprietary statistic indicates the total number of currently attached GPRS subscribers who have negotiated, with the SGSN during authentication and ciphering request, to use GEA0 (no ciphering).</p> <p>Availability: per SGSN</p> <p>Type: Gauge</p>	Int32
gprs-num-sub-gea1-negotiated	<p>Description: This proprietary statistic indicates the total number of currently attached GPRS subscribers who have negotiated, with the SGSN during authentication and ciphering request, to use GEA1 encryption.</p> <p>Availability: per SGSN</p> <p>Type: Gauge</p>	Int32
gprs-num-sub-gea2-negotiated	<p>Description: This proprietary statistic indicates the total number of currently attached GPRS subscribers who have negotiated, with the SGSN during authentication and ciphering request, to use GEA2 encryption.</p> <p>Availability: per SGSN</p> <p>Type: Gauge</p>	Int32

Variables	Description	Data Type
gprs-num-sub-gea3-negotiated	<p>Description: This proprietary statistic indicates the total number of currently attached GPRS subscribers who have negotiated, with the SGSN during authentication and ciphering request, to use GEA3 encryption.</p> <p>Availability: per SGSN</p> <p>Type: Gauge</p>	Int32
<p> IMPORTANT: For information on statistics that are common to all schema see the <i>Statistics and Counters Overview</i> chapter.</p>		

Chapter 25

GTP-C Schema Statistics

The GTP-C schema provides operational statistics that can be used for monitoring and troubleshooting the following products: GGSN, P-GW, S-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 25. Bulk Statistic Variables in the GTP-C Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the service. This is a key variable. Type: Information	String
vpnid	The identification number of the context configured on the system that is currently facilitating the service. This is an internal reference number. This is a key variable. Type: Information	Int32
servname	The name of the service for which the statistics are displayed. This is a key variable. Type: Information	String
setup-current	The total number of current sessions setup Type: Gauge	Int32
current-ip	The total number of current IPv4 Sessions Type: Gauge	Int32 14.0 and later: Int64
current-ppp	The total number of current PPP sessions Type: Gauge	Int32 14.0 and later: Int64
current-ipv6	The total number of current IPv6 Sessions Type: Gauge	Int32 14.0 and later: Int64
current-ipv4v6	The total number of current IPv4v6 Sessions Type: Gauge	Int32 14.0 and later: Int64
current-ntwkinitd	The total number of current Network initiated Sessions Type: Gauge	Int32 14.0 and later: Int64
setup-total	The total number of PDP contexts setup. Type: Counter	Int32 14.0 and later: Int64
setup-ip	The total number of IP PDP contexts setup. Type: Counter	Int32 14.0 and later: Int64
setup-ppp	The total number of PPP PDP contexts setup. Type: Counter	Int32 14.0 and later: Int64
setup-ipv6	The total number of IPv6 sessions Type: Counter	Int32 14.0 and later: Int64
setup-ipv4v6	The total number of IPv4v6 sessions Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
setup-sgsn	The total number of SGSN initiated sessions Type: Counter	Int32 14.0 and later: Int64
setup-ggsn	The total number of GGSN initiated sessions Type: Counter	Int32 14.0 and later: Int64
released-total	The total number of PDP contexts released. Type: Counter	Int32 14.0 and later: Int64
dyn-ipv4-attempt	The total number of IPv4 PDP contexts requesting dynamically assigned IP addresses that were attempted. Type: Counter	Int32 14.0 and later: Int64
dyn-ipv6-attempt	The total number of IPv6 PDP contexts requesting dynamically assigned IP addresses that were attempted. Type: Counter	Int32 14.0 and later: Int64
dyn-ipv4v6-attempt	The total number of IPv4v6 PDP contexts requesting dynamically assigned IP addresses that were attempted. Type: Counter	Int32 14.0 and later: Int64
dyn-ipv4-success	The total number of IPv4 PDP contexts requesting dynamically assigned IP addresses that were successfully setup. Type: Counter	Int32 14.0 and later: Int64
dyn-ipv6-success	The total number of IPv6 PDP contexts requesting dynamically assigned IP addresses that were successfully setup. Type: Counter	Int32 14.0 and later: Int64
dyn-ipv4v6-success	The total number of IPv4v6 PDP contexts requesting dynamically assigned IP addresses that were successfully setup. Type: Counter	Int32 14.0 and later: Int64
echo-req-rx	The total number of GTPC echo requests received. Type: Counter	Int32 14.0 and later: Int64
echo-req-tx	The total number of GTPC echo requests transmitted. Type: Counter	Int32 14.0 and later: Int64
gtpu-echo-req-rx	The total number of GTPU echo requests received. Type: Counter	Int32 14.0 and later: Int64
gtpu-echo-req-tx	The total number of GTPU echo requests transmitted. Type: Counter	Int32 14.0 and later: Int64
echo-rsp-tx	The total number of GTPC echo responses transmitted. Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
echo-rsp-rx	The total number of GTPC echo responses received. Type: Counter	Int32 14.0 and later: Int64
gtpu-echo-rsp-tx	The total number of GTPU echo responses transmitted. Type: Counter	Int32 14.0 and later: Int64
gtpu-echo-rsp-rx	The total number of GTPU echo responses received. Type: Counter	Int32 14.0 and later: Int64
cpc-total	The total number of Create PDP Context Request messages received. This is the sum of GTPC v0 and GTP v1 messages. Type: Counter	Int32 14.0 and later: Int64
cpc-v0	The total number of Create PDP Context Request messages received that used GTPC version 0. Type: Counter	Int32 14.0 and later: Int64
cpc-v1	The total number of Create PDP Context Request messages received that used GTPC version 1. Type: Counter	Int32 14.0 and later: Int64
cpc-sec	The total number of Activate Secondary PDP Context Request received. Type: Counter	Int32 14.0 and later: Int64
cpc-retrans	The total number of re-transmitted Create PDP Context Request messages received from the SGSN for either the primary or secondary PDP contexts. Type: Counter	Int32 14.0 and later: Int64
cpc-accept	The total number of Create PDP Context Response messages transmitted containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32 14.0 and later: Int64
cpc-deny	The total number of “reject” Create PDP Context Response messages transmitted. Type: Counter	Int32 14.0 and later: Int64
cpc-discard	The total number of Create PDP Context Request messages received from the SGSN(s) that were discarded. Type: Counter	Int32 14.0 and later: Int64
upc-rx	The total number of Update PDP Context Request messages received from the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
upc-rx-accept	The total number of Update PDP Context Response messages transmitted to the SGSN(s) containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32 14.0 and later: Int64
upc-rx-deny	The total number of “reject” Update PDP Context Response messages transmitted to the SGSN(s). Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
upc-rx-discard	The total number of Update PDP Context Request messages received from SGSN(s) that were discarded Type: Counter	Int32 14.0 and later: Int64
upc-tx	The total number of Update PDP Context Request messages transmitted to the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
upc-tx-accept	The total number of Update PDP Context Response messages sent to the SGSN(s) containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32 14.0 and later: Int64
upc-tx-deny	The total number of “reject” Update PDP Context Response messages sent to the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
upc-tx-dt-upd	The total number of Update PDP Context Response messages sent to SGSN(s) for direct tunnel update. Type: Counter	Int32 14.0 and later: Int64
dpc-rx	The total number of Delete PDP Context Request messages received from the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
dpc-rx-accept	The total number of Delete PDP Context Response messages transmitted containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32 14.0 and later: Int64
dpc-rx-deny	The total number of “reject” Delete PDP Context Response messages transmitted. Type: Counter	Int32 14.0 and later: Int64
dpc-rx-discard	The total number of Delete PDP Context Request messages received from the SGSN(s) that were discarded Type: Counter	Int32 14.0 and later: Int64
dpc-tx	The total number of Delete PDP Context Request messages transmitted to the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
dpc-tx-accept	The total number of Delete PDP Context Response messages received from the SGSN(s) containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32 14.0 and later: Int64
dpc-tx-deny	The total number of “reject” Delete PDP Context Response messages received from the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
cpc-aa	The total number of Create AA (anonymous access) PDP Context Request messages received. Type: Counter	Int32 14.0 and later: Int64
cpc-aa-accept	The total number of Create AA PDP Context Response messages transmitted to the SGSN with a cause code of 128 (80H, Request accepted). Type: Counter	Int32 14.0 and later: Int64

Common Syntax Options

Variables	Description	Data Type
cpc-aa-deny	The total number of “reject” Create AA PDP Context Response messages transmitted to the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
cpc-aa-discard	The total number of Create AA PDP Context Request messages received that were discarded without transmitting a response to the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
dpc-aa-rx	The total number of Delete AA PDP Context Request messages received from the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
dpc-aa-rx-accept	The total number of Delete AA PDP Context Response messages transmitted containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32 14.0 and later: Int64
dpc-aa-rx-deny	The total number of “reject” Delete AA PDP Context Response messages transmitted to the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
dpc-aa-rx-discard	The total number of Delete PDP AA Context Request messages received from the SGSN(s) that were discarded Type: Counter	Int32 14.0 and later: Int64
dpc-aa-tx	The total number of Delete AA PDP Context Request messages transmitted to the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
dpc-aa-tx-accept	The total number of Delete AA PDP Context Response messages received from the SGSN(s) containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32 14.0 and later: Int64
dpc-aa-tx-deny	The total number of “reject” Delete AA PDP Context Response messages received from the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
err-ind-rx	The total number of error indication messages received from the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
err-ind-tx	The total number of error indication messages transmitted to the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
err-ind-rx-discard	The total number of error indication messages received and discarded at the SGSN(s). Type: Counter	Int32 14.0 and later: Int64
cpc-noresource	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 199 (C7H, No resources available). Type: Counter	Int32 14.0 and later: Int64
cpc-addr-occupied	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 211 (D3H, All dynamic PDP addresses are occupied). Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
cpc-nomem	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 212 (D4H, No memory is available). Type: Counter	Int32 14.0 and later: Int64
cpc-missing-apn	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 219 (DBH, Missing or unknown APN). Type: Counter	Int32 14.0 and later: Int64
cpc-unknown-pdp	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 220 (DCH, Unknown PDP address or PDP type). Type: Counter	Int32 14.0 and later: Int64
cpc-no-apn-subscription	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent because there was no apn subscription. Type: Counter	Int32 14.0 and later: Int64
cpc-auth-fail	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 201. Type: Counter	Int32 14.0 and later: Int64
cpc-sys-fail	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 204 (CCH, System failure). Type: Counter	Int32 14.0 and later: Int64
cpc-sem-tft	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 215 (D7H, Semantic error in the TFT operation). Type: Counter	Int32 14.0 and later: Int64
cpc-syn-tft	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 216 (D8H, Syntactic error in the TFT operation). Type: Counter	Int32 14.0 and later: Int64
cpc-sem-pktfilter	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 217 (D9H, Semantic error in packet filter(s)). Type: Counter	Int32 14.0 and later: Int64
cpc-syn-pktfilter	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 218 (DAH, Syntactic error in packet filter(s)). Type: Counter	Int32 14.0 and later: Int64
cpc-ie-err	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 201 (C9H, Mandatory IE incorrect). Type: Counter	Int32 14.0 and later: Int64
cpc-ie-missing	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 202 (CAH, Mandatory IE missing). Type: Counter	Int32 14.0 and later: Int64
cpc-opt-ie-err	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 203 (CBH, Optional IE incorrect). Type: Counter	Int32 14.0 and later: Int64
cpc-malformed	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 193 (C1H, Invalid message format). Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
cpc-version	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 198 (C6H, version not supported). Type: Counter	Int32 14.0 and later: Int64
cpc-srv-not-supp	The total number of “reject” Create PDP Context Response messages transmitted to the SGSN(s) sent with a cause code of 200 (C8H, service not Supported). Type: Counter	Int32 14.0 and later: Int64
disc-sgsn	The total number of sessions released by SGSN(s). Type: Counter	Int32 14.0 and later: Int64
disc-path-fail	The total number of session releases that occurred due to path failure. Type: Counter	Int32 14.0 and later: Int64
disc-smgr-dead	The total number of sessions released due to the termination of the session manager that was facilitating them. Type: Counter	Int32
disc-admin	The total number of sessions administratively released. Type: Counter	Int32
disc-other	The total number of sessions released due to other reasons. Type: Counter	Int32
disc-teardown	The total number of sessions disconnected normally. Type: Counter	Int32
disc-idle	The total number of sessions released due to the expiration of the idle timeout period as specified in the APN configuration. Type: Counter	Int32
disc-absolute	The total number of sessions released due to the expiration of the absolute timeout period as specified in the APN configuration. Type: Counter	Int32
disc-src-addr	The total number of sessions released due to source address violations. Type: Counter	Int32
disc-flow-add	The total number of sessions released reason due to flow addition failures. Type: Counter	Int32
disc-dhcp-renew-fail	The total number of sessions released due to failed DHCP lease renewal. Type: Counter	Int32
disc-long-durn	The total number of sessions released due to the expiration of the long duration timeout period. Type: Counter	Int32
disc-aborted	The total number of sessions released due to miscellaneous call abort conditions. Type: Counter	Int32
disc-apn-rmvd	The total number of sessions released due to the removal of an APN’s configuration. Type: Counter	Int32

Variables	Description	Data Type
pdu-notif	The total number of PDU Notification Request messages transmitted to the SGSN(s). Type: Counter	Int32
pdu-notif-accept	The total number of PDU Notification Response messages received from the SGSN(s) containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32
pdu-notif-deny	The total number of “deny” PDU Notification Response messages received from the SGSN(s). Type: Counter	Int32
pdu-notif-rej	The total number of PDU Notification Reject Request messages received from the SGSN(s). Type: Counter	Int32
pdu-notif-rej-accept	The total number of PDU Notification Reject Response messages transmitted to the SGSN(s) containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32
pdu-notif-rej-deny	The total number of “deny” PDU Notification Reject Response messages transmitted to the SGSN(s). Type: Counter	Int32
pdu-notif-rej-discard	The total number of PDU Notification Reject Request messages discarded by the GGSN without any response transmitted to the SGSN(s). Type: Counter	Int32
num-dt-established	The total number of direct tunnels established between RNC and GGSN. Type: Counter	Int32
num-dt-torn-by-sgsn	The total number of established direct tunnels between SGSN and GGSN torn by SGSN. Type: Counter	Int32
num-dt-recv-err-ind	The total number of direct tunnels requests received from SGSN with error indication. Type: Counter	Int32
sri-req	The total number of Send Routing Information (SRI) for GPRS messages transmitted to the HLR(s). Type: Counter	Int32
sri-accept	The total number of Send Routing Info for GPRS Ack messages received from the HLR(s) containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32
sri-deny	The total number of “deny” Send Routing Info for GPRS Ack messages received from the HLR(s). Type: Counter	Int32
fail-rep	The total number of Failure reports transmitted to the HLR(s). Type: Counter	Int32
fail-rep-accept	The total number of Failure reports received from the HLR(s) containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
fail-rep-deny	The total number of “deny” Failure reports received from the HLR(s). Type: Counter	Int32
note-ms-gprs	The total number of Note MS GPRS Present messages received from the HLR(s). Type: Counter	Int32
note-ms-gprs-accept	The total number of Note MS GPRS Present Response messages transmitted to the HLR(s) containing a cause value of 128 (80H, Request accepted). Type: Counter	Int32
note-ms-gprs-deny	The total number of “deny” Note MS GPRS Present Response messages transmitted to the HLR(s). Type: Counter	Int32
note-ms-gprs-discard	The total number of Note MS GPRS Present messages discarded with no response transmitted to the HLR(s). Type: Counter	Int32
qosconv-bytes-in	The total number of Conversational Uplink Bytes Sent Type: Counter	Int64
qosconv-pkts-in	The total number of Conversational Uplink Pkts Sent Type: Counter	Int64
qosconv-bytes-out	The total number of Conversational Downlink Bytes Rcvd Type: Counter	Int64
qosconv-pkts-out	The total number of Conversational Downlink Pkts Rcvd Type: Counter	Int64
qosstrm-bytes-in	The total number of Streaming Uplink Bytes Sent Type: Counter	Int64
qosstrm-pkts-in	The total number of Streaming Uplink Pkts Sent Type: Counter	Int64
qosstrm-bytes-out	The total number of Streaming Downlink Bytes Rcvd Type: Counter	Int64
qosstrm-pkts-out	The total number of Streaming Downlink Pkts Rcvd Type: Counter	Int64
qosint1-bytes-in	The total number of Interactive 1 Uplink Bytes Sent Type: Counter	Int64
qosint1-pkts-in	The total number of Interactive 1 Uplink Pkts Sent Type: Counter	Int64
qosint1-bytes-out	The total number of Interactive 1 Downlink Bytes Rcvd Type: Counter	Int64
qosint1-pkts-out	The total number of Interactive 1 Downlink Pkts Rcvd Type: Counter	Int64
qosint2-bytes-in	The total number of Interactive 2 Uplink Bytes Sent Type: Counter	Int64

Variables	Description	Data Type
qosint2-pkts-in	The total number of Interactive 2 Uplink Pkts Sent Type: Counter	Int64
qosint2-bytes-out	The total number of Interactive 2 Downlink Bytes Rcvd Type: Counter	Int64
qosint2-pkts-out	The total number of Interactive 2 Downlink Pkts Rcvd Type: Counter	Int64
qosint3-bytes-in	The total number of Interactive 3 Uplink Bytes Sent Type: Counter	Int64
qosint3-pkts-in	The total number of Interactive 3 Uplink Pkts Sent Type: Counter	Int64
qosint3-bytes-out	The total number of Interactive 3 Downlink Bytes Rcvd Type: Counter	Int64
qosint3-pkts-out	The total number of Interactive 3 Downlink Pkts Rcvd Type: Counter	Int64
qosint-bytes-in	The total number of Interactive 1+2=3 Uplink Bytes Sent Type: Counter	Int64
qosint-pkts-in	The total number of Interactive 1+2+3 Uplink Pkts Sent Type: Counter	Int64
qosint-bytes-out	The total number of Interactive 1+2+3 Downlink Bytes Rcvd Type: Counter	Int64
qosint-pkts-out	The total number of Interactive 1+2+3 Downlink Pkts Rcvd Type: Counter	Int64
qosback-bytes-in	The total number of Background Uplink Bytes Sent Type: Counter	Int64
qosback-pkts-in	The total number of Background Uplink Pkts Sent Type: Counter	Int64
qosback-bytes-out	The total number of Background Downlink Bytes Rcvd Type: Counter	Int64
qosback-pkts-out	The total number of Background Downlink Pkts Rcvd Type: Counter	Int64
ctrl-num-bytes-in	The total number of bytes for control packets received on the Gn and/or Gp interface. Type: Counter	Int64
ctrl-num-pkts-in	The total number of control packets received on the Gn and/or Gp interface. Type: Counter	Int64
ctrl-num-bytes-out	The total number of bytes from control packets transmitted on the Gn and/or Gp interface. Type: Counter	Int64
ctrl-num-pkts-out	The total number of control packets transmitted on the Gn and/or Gp interface. Type: Counter	Int64

Variables	Description	Data Type
num-bytes-in	The total number of bytes received on the Gn and/or Gp interface. Type: Counter	Int64
num-pkts-in	The total number of packets received on the Gn and/or Gp interface. Type: Counter	Int64
num-bytes-out	The total number of bytes transmitted on the Gn and/or Gp interface. Type: Counter	Int64
num-pkts-out	The total number of packets transmitted on the Gn and/or Gp interface. Type: Counter	Int64
current-mbms-ue	The total number of current MBMS UE sessions. Type: Gauge	Int32 14.0 and later: Int64
current-mbms-mcast	The total number of current MBMS Multicast sessions. Type: Gauge	Int32 14.0 and later: Int64
current-mbms-bcast	The total number of current MBMS Broadcast sessions. Type: Gauge	Int32 14.0 and later: Int64
setup-mbms-ue	The total number of MBMS UE Sessions setup. Type: Counter	Int32 14.0 and later: Int64
setup-mbms-mcast	The total number of MBMS Multicast Sessions setup. Type: Counter	Int32 14.0 and later: Int64
setup-mbms-bcast	The total number of MBMS Broadcast Sessions setup Type: Counter	Int32 14.0 and later: Int64
chap-auth-attempt	The total number of CHAP Auth sessions attempted. Type: Counter	Int32 14.0 and later: Int64
chap-auth-success	The total number of CHAP Auth sessions successful Type: Counter	Int32 14.0 and later: Int64
chap-auth-failure	The total number of CHAP Auth sessions failed Type: Counter	Int32 14.0 and later: Int64
pap-auth-attempt	The total number of PAP Auth sessions attempted Type: Counter	Int32 14.0 and later: Int64
pap-auth-success	The total number of PAP Auth sessions successful Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
pap-auth-failure	The total number of PAP Auth sessions failed Type: Counter	Int32 14.0 and later: Int64
no-auth	The total number of No-Auth sessions. Type: Counter	Int32 14.0 and later: Int64
err-ind	Total sessions released on Error Indication Type: Counter	Int32 14.0 and later: Int64
ctxt-replace	Total sessions released due to context replacement. Type: Counter	Int32 14.0 and later: Int64
purge-audit	Total sessions purged due to audit failure Type: Counter	Int32 14.0 and later: Int64
update-handoff-rej	Total sessions released due to handoff reject in UPC Type: Counter	Int32 14.0 and later: Int64
total-handoff-fail	Total path failure due to handoff Type: Counter	Int32 14.0 and later: Int64
sgsn-restart-cpc-req	Total path failure due to SGSN restart detected via CPC Type: Counter	Int32 14.0 and later: Int64
sgsn-restart-upc-req	Total path failure due to SGSN restart detected via UPC Type: Counter	Int32 14.0 and later: Int64
sgsn-restart-echo-rsp	Total path failure due to SGSN restart detected via Echo Rsp Type: Counter	Int32 14.0 and later: Int64
gtpc-echo-timeout	Total path failure due to SGSN restart detected via GTPC echo Type: Counter	Int32 14.0 and later: Int64
gtpu-echo-timeout	Total path failure due to SGSN restart detected via GTPU echo Type: Counter	Int32 14.0 and later: Int64
ggsn-req-timeout	Total path failure due to GGSN request timeout. Type: Counter	Int32 14.0 and later: Int64
version-not-sup-rx	Version not supported received Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
version-not-sup-tx	Version not supported transmitted Type: Counter	Int32 14.0 and later: Int64
sup-ext-header-rx	Extension header supported received Type: Counter	Int32 14.0 and later: Int64
sup-ext-header-tx	Extension header supported transmitted Type: Counter	Int32 14.0 and later: Int64
cmc-total	The total number of Create MBMS Context request messages received. Type: Counter	Int32 14.0 and later: Int64
cmc-initial	The total number of initial Create MBMS Context request messages received. Type: Counter	Int32 14.0 and later: Int64
cmc-retrans	The total number of retransmitted Create MBMS Context request messages received. Type: Counter	Int32 14.0 and later: Int64
cmc-accept	The total number of Create MBMS Context request messages accepted by the GGSN. Type: Counter	Int32 14.0 and later: Int64
cmc-deny	The total number of Create MBMS Context request messages denied by the GGSN. Type: Counter	Int32 14.0 and later: Int64
cmc-discard	The total number of Create MBMS Context request messages discarded by the GGSN. Type: Counter	Int32 14.0 and later: Int64
umc-rx	The total number of Update MBMS Context request messages received. Type: Counter	Int32 14.0 and later: Int64
umc-rx-accept	The total number of Update MBMS Context request messages accepted by the GGSN. Type: Counter	Int32 14.0 and later: Int64
umc-rx-deny	The total number of Update MBMS Context request messages denied by the GGSN. Type: Counter	Int32 14.0 and later: Int64
umc-rx-discard	The total number of Update MBMS Context request messages discarded by the GGSN. Type: Counter	Int32 14.0 and later: Int64
dmc-rx	The total number of Delete MBMS Context request messages received. Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
dmc-rx-accept	The total number of Delete MBMS Context request messages accepted by the GGSN. Type: Counter	Int32 14.0 and later: Int64
dmc-rx-deny	The total number of Delete MBMS Context request messages denied by the GGSN. Type: Counter	Int32 14.0 and later: Int64
dmc-rx-discard	The total number of Delete MBMS Context request messages discarded by the GGSN. Type: Counter	Int32 14.0 and later: Int64
dmc-tx	The total number of Delete MBMS Context request messages transmitted. Type: Counter	Int32 14.0 and later: Int64
dmc-tx-accept	The total number of Delete MBMS Context request messages accepted by the SGSN. Type: Counter	Int32 14.0 and later: Int64
dmc-tx-deny	The total number of Delete MBMS Context request messages denied by the SGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-reg-req-total	The total number of MBMS Registration Request messages received. Type: Counter	Int32 14.0 and later: Int64
mbms-reg-req-initial	The total number of initial MBMS Registration Request messages received. Type: Counter	Int32 14.0 and later: Int64
mbms-reg-req-retrans	The total number of retransmitted MBMS Registration Request messages received. Type: Counter	Int32 14.0 and later: Int64
mbms-reg-req-accept	The total number of MBMS Registration Request messages accepted by the GGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-reg-req-deny	The total number of MBMS Registration Request messages denied by the GGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-reg-req-discard	The total number of MBMS Registration Request messages discarded by the GGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-ses-start-tx	The total number of MBMS Session Start Request messages transmitted. Type: Counter	Int32 14.0 and later: Int64
mbms-ses-start-tx-accept	The total number of MBMS Session Start Request messages accepted by the SGSN. Type: Counter	Int32 14.0 and later: Int64

■ Common Syntax Options

Variables	Description	Data Type
mbms-ses-start-tx-deny	The total number of MBMS Session Start Request messages denied by the SGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-ses-stop-tx	The total number of MBMS Session Stop Request messages transmitted. Type: Counter	Int32 14.0 and later: Int64
mbms-ses-stop-tx-accept	The total number of MBMS Session Stop Request messages accepted by the SGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-ses-stop-tx-deny	The total number of MBMS Session Stop Request messages denied by the SGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-dereg-rx	The total number of MBMS De-Registration Request messages received. Type: Counter	Int32 14.0 and later: Int64
mbms-dereg-rx-accept	The total number of MBMS De-Registration Request messages accepted by the GGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-dereg-rx-deny	The total number of MBMS De-Registration Request messages denied by the GGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-dereg-rx-discard	The total number of MBMS De-Registration Request messages discarded by the GGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-dereg-tx	The total number of MBMS De-Registration Request messages transmitted. Type: Counter	Int32 14.0 and later: Int64
mbms-dereg-tx-accept	The total number of MBMS De-Registration Request messages accepted by the SGSN. Type: Counter	Int32 14.0 and later: Int64
mbms-dereg-tx-deny	The total number of MBMS De-Registration Request messages denied by the SGSN. Type: Counter	Int32 14.0 and later: Int64
sess-in-preservation-mode	The total number of sessions in Preservation-Mode. This is a customer specific support only. Type: Counter	Int32 14.0 and later: Int64
transition-to-preservation-mode	The total number of sessions in transition from Non-Preservation mode (normal mode) to Preservation-Mode. This is a customer specific support only. Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
transition-to-non-preservation-mode	The total number of sessions in transition from Preservation Mode to normal mode. This is a customer specific support only. Type: Counter	Int32 14.0 and later: Int64
sess-in-lorc	Indicates the number of GGSN session are in LORC state and subscriber is in out of radio coverage area. This counter is applicable when GGSN is enabled for overcharging protection for subscriber due to loss of radio coverage and SGSN notifies Update PDP Contexts for QOS change with GTP-C extension for LORC. Type: Counter	Int32 14.0 and later: Int64
transition-to-lorc	Indicates total number sessions in transitions state for overcharging protection support mode. This counter is applicable when GGSN is enabled for overcharging protection for subscriber due to loss of radio coverage and SGSN notifies Update PDP Contexts for QOS change with GTP-C extension for LORC. Type: Counter	Int32 14.0 and later: Int64
sess-in-focs	Total number of session Free of charge service. Type: Counter	Int32 14.0 and later: Int64
cnt-of-release-due-to-other	Total number of session release due to reasons other than listed in this table. Type: Counter	Int32 14.0 and later: Int64
cnt-of-release-due-to-violation	Total number of session release due to service violation. Type: Counter	Int32 14.0 and later: Int64
sess-in-odb	Indicates the total number of sessions with Operator Determined Barring enabled status. Type: Counter	Int32 14.0 and later: Int64
cnt-of-release-due-to-violation-odb	Indicates the statistics for sessions, with Operator Determined Barring enabled status, released due to violation of ODB conditions. Type: Counter	Int32 14.0 and later: Int64
cnt-of-release-due-to-other-odb	Indicates the total number of sessions, with Operator Determined Barring enabled status, released due to reasons not specified in this table. Type: Counter	Int32 14.0 and later: Int64
ipca-pdp-context-tx	Total number of PDP context activation requests sent for an Initiate PDP Context Activation. Type: Counter	Int32 14.0 and later: Int64
ipca-pdp-context-tx-accepted	Total number of PDP context activation requests sent and accepted for an Initiate PDP Context Activation. Type: Counter	Int32 14.0 and later: Int64
ipca-pdp-context-tx-denied	Total number of PDP context activation requests denied for an Initiate PDP Context Activation. Type: Counter	Int32 14.0 and later: Int64

Common Syntax Options

Variables	Description	Data Type
ipca-reject-rx-no-resources	Total number of Initiate PDP Context Activation reject messages received due to no resource available on remote node. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-no-mem-avail	Total number of Initiate PDP Context Activation reject messages received due to no memory available on remote node. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-sys-failure	Total number of Initiate PDP Context Activation reject messages received due to system failure on remote node. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-non-existent	Total number of Initiate PDP Context Activation reject messages received due to non-existent session/subscriber on remote node. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-unsupported-service	Total number of Initiate PDP Context Activation reject messages received as service is not supported on on remote node. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-invalid-msg-format	Total number of Initiate PDP Context Activation reject messages received due to invalid message format. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-semantic-err-in-tft	Total number of Initiate PDP Context Activation reject messages received due to semantic error in Traffic Flow Template (TFT). Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-syntactic-err-in-tft	Total number of Initiate PDP Context Activation reject messages received due to syntactic error in Traffic Flow Template (TFT) Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-man-ie-incorrect	Total number of Initiate PDP Context Activation reject messages received due to incorrect information in mandatory information elements (IEs). Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-semantic-err-in-pac-filter	Total number of Initiate PDP Context Activation reject messages received due to semantic error in PAC filter. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-man-ie-missing	Total number of Initiate PDP Context Activation reject messages received as mandatory information element (IE) is missing. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-optional-ie-incorrect	Total number of Initiate PDP Context Activation reject messages received due to incorrect information in optional information elements (IEs). Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-syntactic-err-in-pac-filter	Total number of Initiate PDP Context Activation reject messages received due to syntactic error in PAC filter. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-ue-not-gprs-rsp	Total number of Initiate PDP Context Activation reject messages received as UE is not capable or subscribed to GPRS service. Type: Counter	Int32 14.0 and later: Int64

Variables	Description	Data Type
ipca-reject-rx-ue-refuses	Total number of Initiate PDP Context Activation reject messages received due to refusal from UE. Type: Counter	Int32 14.0 and later: Int64
ipca-reject-rx-invalid-correlation-id	Total number of Initiate PDP Context Activation reject messages received due to invalid correlation identifier. Type: Counter	Int32 14.0 and later: Int64

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 26

GTPP Schema Statistics

The GTPP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: GGSN, P-GW, SGSN

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 26. Bulk Statistic Variables in the GTPP Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the GTPP configuration. This is a key variable. Type: Information	String
vpnid	The identification number of the context configured on the system that is currently facilitating the GTPP configuration. This is an internal reference number. This is a key variable. Type: Information	Int32
echo-req-rx	The total number of Echo Request messages received.	Int32
echo-req-tx	The total number of Echo Request messages transmitted.	Int32
echo-rsp-rx	The total number of Echo Response messages received.	Int32
echo-rsp-tx	The total number of Echo Response messages transmitted.	Int32
redir-rcvd	The total number of Redirection Request messages received.	Int32
redir-rsp	The total number of Redirection Response messages transmitted.	Int32
node-alive	The total number of Node Alive Request messages received.	Int32
node-alive-rsp	The total number of Node Alive Response messages transmitted.	Int32
data-rec-trans	The total number of Data Record Transfer Request messages transmitted to the CGF(s).	Int32
dup-data-rec-trans	The total number of data records transmitted marked as potential duplicates.	Int32
send-data-rec	The total number of Data Record Transfer Request messages transmitted containing a Packet Transfer Command information element of 1 (Send Data Record Packet).	Int32
rel-data-rec	The total number of Data Record Transfer Request messages transmitted containing a Packet Transfer Command information element of 4 (Release Data Record Packet).	Int32
cancel-data-rec	The total number of Data Record Transfer Request messages transmitted containing a Packet Transfer Command information element of 3 (Cancel Data Record Packet).	Int32
data-rec-trans-rsp	The total number of Data Record Transfer Response messages received from the CGF(s).	Int32
delete-node	The total number of Delete Node Address Request messages sent to the CGF(s).	Int32
node-addr	The total number of Set Node Address Request messages sent to the CGF(s).	Int32
req-accept	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 128 (80H, Request accepted).	Int32
req-not-fulfil	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 255 (FFH, Request not fulfilled).	Int32
req-malform	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 193 (C1H, Invalid message format).	Int32
version-not-sup	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 198 (C6, Version not supported).	Int32

Variables	Description	Data Type
serv-not-supp	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 200 (C8H, Service not supported).	Int32
mand-ie-err	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 201 (C9H, Mandatory IE incorrect).	Int32
mand-ie-miss	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 202 (CAH, Mandatory IE missing).	Int32
opt-ie-err	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 203 (CBH, Optional IE incorrect).	Int32
dup-already-fulfil	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 252 (FCH, Request related to possibly duplicated packets already fulfilled).	Int32
already-fulfil	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 253 (FDH, Request already fulfilled).	Int32
no-resource	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 199 (C7H, No resources available).	Int32
sys-fail	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 204 (CCH, System failure).	Int32
cdr-dec-error	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 177 (B1H, CDR Decoding Error).	Int32
seq-no-incorrect	The total number of Data Record Transfer Response messages received from the CGF(s) containing a cause information element of 254 (FEH, Incorrect Seq No).	Int32
unknown-cause	The total number of Data Record Transfer Response messages received from the CGF with Unknown Cause Code.	Int32
normal-close	The total number of CDRs sent containing a Cause for Record Closing information element of 0 (normal release).	Int32
abnormal-close	The total number of CDRs sent containing a Cause for Record Closing information element of 4 (abnormal termination).	Int32
vol-limit-close	The total number of CDRs sent containing a Cause for Record Closing information element of 16 (10H, volume limit).	Int32
time-limit-close	The total number of CDRs sent containing a Cause for Record Closing information element of 17 (11H, time limit).	Int32
open-req	The total number of Start-Accounting Request messages received.	Int32
aaa-acct-arch	The total number of requests currently archived by the system's AAA subsystem. Type: Counter	Int32
rdir-sys-fail	The total number of Redirection Request messages received from the CGF(s) containing a cause information element of 59 (3BH, System failure).	Int32
rdir-txbuf-full	The total number of Redirection Request messages received from the CGF(s) containing a cause information element of 60 (3CH, The transmit buffers are becoming full).	Int32

Variables	Description	Data Type
rdir-rxbuf-full	The total number of Redirection Request messages received from the CGF(s) containing a cause information element of 61 (3DH, The receive buffers are becoming full).	Int32
other-node-dn	The total number of Redirection Request messages received from the CGF(s) containing a cause information element of 62 (3EH, Another node is about to go down).	Int32
self-node-dn	The total number of Redirection Request messages received from the CGF(s) containing a cause information element of 63 (3FH, This node is about to go down).	Int32
rdir-no-res	The total number of Redirection Response messages transmitted to the CGF(s) containing a cause information element of 199 (C7H, No resources available).	Int32
rdir-serv-no	The total number of Redirection Response messages transmitted to the CGF(s) containing a cause information element of 200 (C8H, Service not supported).	Int32
rdir-version-not-supp	The total number of Redirection Response messages transmitted to the CGF(s) containing a cause information element of 198 (C6H, Version not supported).	Int32
rdir-mand-ie-miss	The total number of Redirection Response messages transmitted to the CGF(s) containing a cause information element of 202 (CAH, Mandatory IE missing).	Int32
rdir-mand-ie-err	The total number of Redirection Response messages transmitted to the CGF(s) containing a cause information element of 201 (C9H, Mandatory IE incorrect).	Int32
rdir-opt-ie-err	The total number of Redirection Response messages transmitted to the CGF(s) containing a cause information element of 203 (CBH, Optional IE incorrect).	Int32
rdir-malformed	The total number of Redirection Response messages transmitted to the CGF(s) containing a cause information element of 193 (C1H, Invalid message format).	Int32
rdir-rsp-sys-fail	The total number of Redirection Response messages transmitted to the CGF(s) containing a cause information element of 204 (CCH, System failure).	Int32
mgmt-int-close	indicates that the CDR is generated with cause for record closing as management intervention. e.g when the user does the "clear sub" or "gtp interm now".	Int32
sgsn-chng-close	This stat is used to indicate that the CDR is generated at the OLD sgsn with "causeForRecClosing" as SGSN change. This will happen during ISRAU (Inter SGSN Routing Area Update) scenario wherein the call in old SGSN is transferred to new SGSN and the CDR is generated at the old SGSN indicating that MM context/PDP context is released with causeForRecClosing as SGSN Change. This is applicable only for SGSN.	Int32
max-chng-close	This indicates that the CDR is released because the container changes are more than the configured value. For example, in SGSN for QOS or tariff time changes a container is added. By default, max change is set to 4. If 4 containers are added then the CDR is released with causeForRecClosing as max change condition.	Int32
rat-chng-close	This indicates that the partial CDR is released at the GGSN due to the RAT (Radio Access Technology) change. This will happen whenever the user moves from GPRS to UMTS and vice versa. This is applicable only for G-CDR.	Int32
ms-tz-chng-close	This indicates that the partial CDR is released at the GGSN due to the MS Time zone change. This is applicable only for G-CDR.	Int32

Variables	Description	Data Type
list-down-stream-chng-close	The total number of CDRs sent containing a Cause for Record Closing information element of 59 (List Of Downstream Node Change).	Int32
focs-close	Indicates the total number of FOCS enabled sessions closed due to ACL rule violation received for FOCS and/or ODB.	Int32
inactivity-close	Indicates the total number of FOCS enabled sessions closed due to inactivity timeout.	Int32
total-gcdr-xmit	This indicates the total number of G-CDRs transmitted to the mediation system.	Int32
total-scdr-xmit	This indicates the total number of S-CDRs transmitted to the mediation system.	Int32
total-mcdr-xmit	This indicates the total number of M-CDRs transmitted to the mediation system.	Int32
total-smbmscdr-xmit	The total number of S-MB-CDR transmitted between SGSN and MBMS service.	Int32
total-gmbcdr-xmit	The total number of G-MB-CDR transmitted between GGSN and MBMS service.	Int32
total-gcdr-rexmit	This indicates the total number of G-CDRs re-transmitted to the mediation system. This will happen whenever SGSN/GGSN is not getting the response from the mediation server in a stipulated period of time.	Int32
total-scdr-rexmit	This indicates the total number of S-CDRs re-transmitted to the mediation system. his will happen whenever SGSN/GGSN is not getting the response from the mediation server in a stipulated period of time.	Int32
total-mcdr-rexmit	This indicates the total number of M-CDRs re-transmitted to the mediation system. his will happen whenever SGSN/GGSN is not getting the response from the mediation server in a stipulated period of time.	Int32
total-smbmscdr-rexmit	The total number of S-MB-CDR retransmitted between SGSN and MBMS service.	Int32
total-gmbcdr-rexmit	The total number of G-MB-CDRs retransmitted between GGSN and MBMS service.	Int32
total-gcdr-accept	This indicates the total number of G-CDRs successfully sent to the mediation server for which the SGSN/GGSN received the positive response.	Int32
total-scdr-accept	This indicates the total number of S-CDRs successfully sent to the mediation server for which the SGSN/GGSN received the positive response.	Int32
total-mcdr-accept	This indicates the total number of M-CDRs successfully sent to the mediation server for which the SGSN/GGSN received the positive response.	Int32
total-gmbcdr-accept	The total number of G-MB-CDR accepted between GGSN and MBMS service.	Int32

Common Syntax Options

Variables	Description	Data Type
total-gcdr-fail	This indicates the total number of G-CDRs transmission failures.	Int32
total-scdr-fail	This indicates the total number of S-CDRs transmission failures.	Int32
total-mcdr-fail	This indicates the total number of M-CDRs transmission failures.	Int32
total-gmbcdr-fail	The total number of G-MB-CDR failed between GGSN and MBMS service.	Int32
cc-char-hot	This indicates the CDR released with charging characteristics set as Hot Billing.	Int32
cc-char-normal	This indicates the CDR released with charging characteristics set as Normal Billing.	Int32
cc-char-prepaid	This indicates the CDR released with charging characteristics set as Prepaid Billing.	Int32
cc-char-flat	This indicates the CDR released with charging characteristics set as Flat Billing.	Int32
cc-char-unknown	This indicates the CDR released with charging characteristics set as Unknow charging characteristics.	Int32
data-rec-ret-send	The total number of Data Record Transfer Request messages retried containing a Packet Transfer Command information element of 1 (Send Data Record Packet).	Int32
data-rec-ret-poss-dup	The total number of data records retried marked as potential duplicates with IE of 2. (Send Possibly Duplicate Data Record)	Int32
data-rec-ret-cancel	The total number of Data Record Transfer Request messages retried containing a Packet Transfer Command information element of 3 (Cancel Data Record Packet).	Int32
data-rec-ret-rel	The total number of Data Record Transfer Request messages retried containing a Packet Transfer Command information element of 4 (Release Data Record Packet).	Int32
data-rec-ret-emp	The total number of empty Data Record Transfer Request messages retried containing a Packet Transfer Command information element of 1 (Send Data Record Packet).	Int32
data-rec-success-send	The total number of successful Data Record Transfer Response messages for Send Data Record Packet Transfer command.	Int32
data-rec-success-poss-dup	The total number of Successful Data Record Transfer Response messages for Send Poss Dup Data Record Packet Transfer command.	Int32
data-rec-success-cancel	The total number of Successful Data Record Transfer Response messages for Cancel Data Record Packet Transfer command.	Int32
data-rec-success-rel	The total number of Successful Data Record Transfer Response messages for Release Data Record Packet Transfer command.	Int32
data-rec-success-emp	The total number of Successful Data Record Transfer Response messages for Empty Send Data Record Packet Transfer command.	Int32
invalid-msg-seq-num	The total number of requests with invalid sequence number.	Int32

Variables	Description	Data Type
invalid-msg-unknown-cgf	The total number of requests with an unknown CGF.	Int32
invalid-msg-unknown-msg	The total number of requests with an unknown message.	Int32
gss-echo-req	The total echo request from GSS.	Int32
gss-echo-rsp	The total echo request response to GSS.	Int32
gss-gtpp-req	The total GTPP request sent to GSS.	Int32
gss-gtpp-req-ret	The total GTPP request retried to GSS.	Int32
gss-gtpp-rsp	The total successful GTPP request response.	Int32
gss-gtpp-rsp-failed	The total GTPP request response failed.	Int32
gss-gcdr-req	The total GCDR request sent.	Int32
gss-gcdr-req-ret	The total GCDR request retried.	Int32
gss-gcdr-rsp	The total successful GCDR request response.	Int32
gss-gcdr-rsp-failed	The total GCDR request response failed.	Int32
gss-aaaproxy-rec-req	The total AAA proxy recover request sent.	Int32
gss-aaaproxy-rec-ret	The total AAA proxy recover request retried.	Int32
gss-aaaproxy-rec-rsp	The total successful AAA proxy recover request response.	Int32
gss-aaaproxy-rec-rsp-failed	The total AAA proxy recover request response failed.	Int32
gss-aaamgr-rec-req	The total AAA MGR recover request sent.	Int32
gss-aaamgr-rec-ret	The total AAA MGR recover request retried.	Int32
gss-aaamgr-rec-rsp	The total successful AAA MGR recover request response.	Int32
gss-aaamgr-rec-rsp-failed	The total AAA MGR recover request response failed.	Int32
gss-update-cgf-req	The total CGF update request sent.	Int32

Variables	Description	Data Type
gss-update-cgf-req-ret	The total CGF update request retried.	Int32
gss-update-cgf-rsp	The total successful CGF update request response.	Int32
gss-update-cgf-rsp-failed	The total CGF update request response failed.	Int32
gss-clear-db-req	The total database clear request sent.	Int32
gss-clear-db-req-ret	The total database clear request retried.	Int32
gss-clear-db-rsp	The total successful database clear request response.	Int32
gss-clear-db-rsp-failed	The total database clear request response failed.	Int32
gss-update-req	The total update request received.	Int32
gss-invalid-req-rcvd	The total invalid request received from.	Int32
gss-cdr-loss	The total number of CDRs lost due to failure of remote CDR file streaming.	Int32
gss-cdr-loss-traps	The total number of traps generaed for loss of CDRs due to failure of remote CDR file streaming.	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 27

GTP-U Schema Statistics

The GTP-U schema provides operational statistics that can be used for monitoring and troubleshooting the following products: GGSN, HNB-GW, P-GW, S-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 27. Bulk Statistic Variables in the GTP-U Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the service. This is a key variable. Type: Information	String
vpnid	The identification number of the context configured on the system that is currently facilitating the service. This is an internal reference number. This is a key variable. Type: Information	Int32
servname	The name of the service for which the statistics are displayed. This is a key variable. Type: Information	String
servid	The identification number of the service configured on the system that is currently facilitating the GTP-U service. This is an internal reference number. This is a key variable. Type: Information	Int32
curr-sess	The total number of current sessions. Type: Gauge	Int32
total-setup-sess	The total number of session set up using this service. Type: Counter	Int32
curr-gtpu0-sess	The total number of current GTP-0 sessions. Type: Gauge	Int32
curr-gtpu1-sess	The total number of current GTP-1 sessions. Type: Gauge	Int32
total-uplink-pkts	The total number of uplink packets. Type: Counter	Int64
total-uplink-bytes	The total number of uplink bytes. Type: Counter	Int64
total-dwlink-pkts	The total number of downlink packets. Type: Counter	Int64
total-dwlink-bytes	The total number of downlink bytes. Type: Counter	Int64
total-pkts-discard	The total number of discarded packets. Type: Counter	Int64
total-bytes-discard	The total number of discarded bytes. Type: Counter	Int64
qci#-uplink-pkts	The total number of QCI# uplink packets for the specified QCI number. Type: Counter	Int64
qci#-uplink-bytes	The total number of QCI# uplink bytes for the specified QCI number. Type: Counter	Int64
qci#-dwlink-pkts	The total number of QCI# downlink packets for the specified QCI number. Type: Counter	Int64

Variables	Description	Data Type
qci#-dwlink-byte	The total number of QCI# downlink bytes for the specified QCI number. Type: Counter	Int64
qci#-pkts-discard	The total number of discarded QCI# packets for the specified QCI number. Type: Counter	Int64
qci#-bytes-discard	The total number of discarded QCI# bytes for the specified QCI number. Type: Counter	Int64
non-std-qci-non-gbr-uplink-pkts	The total number of non-standard QCI, non-GBR uplink packets. Type: Counter	Int64
non-std-qci-non-gbr-uplink-bytes	The total number of non-standard QCI, non-GBR uplink bytes. Type: Counter	Int64
non-std-qci-non-gbr-dwlink-pkts	The total number of non-standard QCI, non-GBR downlink packets. Type: Counter	Int64
non-std-qci-non-gbr-dwlink-bytes	The total number of non-standard QCI, non-GBR downlink bytes. Type: Counter	Int64
non-std-qci-non-gbr-pkts-discard	The total number of discarded non-standard QCI, non-GBR packets. Type: Counter	Int64
non-std-qci-non-gbr-bytes-discard	The total number of discarded non-standard QCI, non-GBR bytes. Type: Counter	Int64
non-std-qci-gbr-uplink-pkts	The total number of non-standard QCI, GBR uplink packets. Type: Counter	Int64
non-std-qci-gbr-uplink-bytes	The total number of non-standard QCI, GBR uplink bytes. Type: Counter	Int64
non-std-qci-gbr-dwlink-pkts	The total number of non-standard QCI, GBR downlink packets. Type: Counter	Int64
non-std-qci-gbr-dwlink-bytes	The total number of non-standard QCI, GBR downlink bytes. Type: Counter	Int64
non-std-qci-gbr-pkts-discard	The total number of discarded non-standard QCI, GBR packets. Type: Counter	Int64
non-std-qci-gbr-bytes-discard	The total number of discarded non-standard QCI, GBR bytes. Type: Counter	Int64
total-gbr-qcis-uplink-pkts	The total number of GBR QCIS uplink packets. Type: Counter	Int64
total-gbr-qcis-uplink-bytes	The total number of GBR QCIS uplink bytes. Type: Counter	Int64
total-gbr-qcis-dwlink-pkts	The total number of GBR QCIS downlink packets. Type: Counter	Int64
total-gbr-qcis-dwlink-bytes	The total number of GBR QCIS downlink bytes. Type: Counter	Int64

Variables	Description	Data Type
total-non-gbr-qcis-uplink-pkts	The total number of non-GBR QCIS uplink packets. Type: Counter	Int64
total-non-gbr-qcis-uplink-bytes	The total number of non-GBR QCIS uplink bytes. Type: Counter	Int64
total-non-gbr-qcis-dwlink-pkts	The total number of non-GBR QCIS downlink packets. Type: Counter	Int64
total-non-gbr-qcis-dwlink-bytes	The total number of non-GBR QCIS downlink bytes. Type: Counter	Int64
echo-req-rx	The total number of echo requests received. Type: Counter	Int32
echo-rsp-tx	The total number of echo responses transmitted. Type: Counter	Int32
echo-req-tx	The total number of echo requests transmitted. Type: Counter	Int32
echo-rsp-rx	The total number of echo responses received. Type: Counter	Int32
err-ind-rx	The total number of error indications received. Type: Counter	Int32
err-ind-tx	The total number of error indications transmitted. Type: Counter	Int32
err-ind-rx-dis	The total number of discarded error indications received Type: Counter	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 28

HA Schema Statistics

The Ha schema provides operational statistics that can be used for monitoring and troubleshooting the following products: GGSN, HA, PDSN, P-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 28. Bulk Statistic Variables in the HA Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the HA service. This is a key variable.	String
vpnid	The identification number of the context configured on the system that is currently facilitating the HA service. This is an internal reference number. This is a key variable.	Int32
servname	Displays the name of the HA service for which the statistics are displayed. This is a key variable.	String
disconnects	The total number of sessions that were disconnected.	Int32
num-sessions	The current total number of Mobile IP HA sessions.	Int32
revoc-sent	The total number of HA registration revocations sent.	Int32
revoc-retry-sent	The total number of HA registration revocation messages the system attempted to re-send.	Int32
revoc-ack-recv	The total number of HA registration revocation acknowledgement messages received.	Int32
revoc-timeout	The total number of timeouts that occurred during HA registration revocations.	Int32
revoc-recv	The total number of HA registration revocations received	Int32
revoc-ack-sent	The total number of The total number of HA registration revocation acknowledgement messages sent.	Int32
expiry	The total number of sessions that were disconnected due to the expiration of their lifetime setting.	Int32
dereg	The total number of sessions that were disconnected due to de-registrations.	Int32
admindrop	The total number of sessions that were disconnected due to an administrative clearing of calls (i.e. executing the clear subscriber command).	Int32
miscerror	The total number of sessions that were disconnected due to miscellaneous errors.	Int32
farevocation	The total number of FA revocations that occurred.	Int32
auth-attempt	The total number of authentication attempts made.	Int32
auth-failure	The total number of authentication attempts that were unsuccessful.	Int32
auth-success	The total number of authentication attempts that were successful.	Int32
auth-real-failure	The total number of authentication attempts that were unsuccessful due to the receipt of an access reject message from the AAA server.	Int32
auth-misc-failure	The total number of authentication attempts that were unsuccessful due to occurrences other than the receipt of an access reject messages (i.e. AAA server timeout or internal errors).	Int32
recv-total	The total number of registration requests received.	Int32
recv-initial	The total number of initial registration requests received.	Int32
recv-renew	The total number of renewal registration requests received.	Int32
recv-dereg	The total number of requests for de-registration received.	Int32

Variables	Description	Data Type
recv-ho	The total number of handoff requests received	Int32
recv-ho-3g3g	3GPP2 to 3GPP2 Handoff Requests received	Int32
recv-ho-3gwi	3GPP2 to WiMax Handoff Requests received	Int32
recv-ho-wi3g	Wimax to 3GPP2 Handoff Requests Received	Int32
recv-ho-wiwi	Wimax to Wimax Handoff Requests Received	Int32
accept-total	The total number of registration requests accepted.	Int32
accept-reg	The total number of initial registration requests accepted.	Int32
accept-renew	The total number of renewal registration requests accepted.	Int32
accept-dereg	The total number of requests for de-registration accepted.	Int32
accept-ho	The total number of handoff registration requests accepted.	Int32
accept-ho-3g3g	3GPP2 to 3GPP2 Handoff Requests accepted	Int32
accept-ho-3gwi	3GPP2 to WiMax Handoff Requests accepted	Int32
accept-ho-wi3g	Wimax to 3GPP2 Handoff Requests accepted	Int32
accept-ho-wiwi	Wimax to Wimax Handoff Requests accepted	Int32
denied-total	The total number of registration requests that were denied.	Int32
denied-initial	The total number of initial registration requests denied.	Int32
denied-renew	The total number of renewal registration requests denied.	Int32
denied-dereg	The total number of requests for de-registration denied.	Int32
denied-ho	The total number of handoff registration requests denied.	Int32
denied-ho-3g3g	3GPP2 to 3GPP2 Handoff Requests denied	Int32
denied-ho-3gwi	3GPP2 to WiMax Handoff Requests denied	Int32
denied-ho-wi3g	Wimax to 3GPP2 Handoff Requests denied	Int32
denied-ho-wiwi	Wimax to Wimax Handoff Requests denied	Int32
discard-total	The total number of registration requests that were discarded.	Int32
reply-total	The total number of registration replies sent.	Int32
reply-acceptreg	The total number of successful registration replies sent.	Int32
reply-acceptdereg	The total number of successful de-registration replies sent.	Int32
reply-denied	The total number of denied registration replies sent.	Int32
reply-badreq	The total number of denied registration replies that were sent with a reply code of 86H (Registration Denied - poorly formed request).	Int32

Variables	Description	Data Type
reply-mismatchid	The total number of denied registration replies that were sent with a reply code of 85H (Registration Denied - registration identification mismatch).	Int32
reply-adminprohib	The total number of denied registration replies that were sent with a reply code of 81H (Registration Denied - administratively prohibited).	Int32
reply-unspecerr	The total number of denied registration replies that were sent with a reply code of 80H (Registration Denied - reason unspecified).	Int32
reply-noresource	The total number of denied registration replies that were sent with a reply code of 82H (Registration Denied - insufficient resources).	Int32
reply-mnauthfail	The total number of denied registration replies that were sent with a reply code of 83H (Registration Denied - mobile node failed authentication).	Int32
reply-faauthfail	The total number of denied registration replies that were sent with a reply code of 84H (Registration Denied - home agent failed authentication).	Int32
reply-simulbind	The total number of denied registration replies that were sent with a reply code of 87H (Registration Denied - too many simultaneous mobility bindings).	Int32
reply-unknownha	The total number of denied registration replies that were sent with a reply code of 88H (Registration Denied - unknown home agent address).	Int32
reply-revtununavail	The total number of denied registration replies that were sent with a reply code of 89H (Registration Denied - reverse tunneling unavailable).	Int32
reply-revtunmand	The total number of denied registration replies that were sent with a reply code of 8AH (Registration Denied - reverse tunneling mandatory).	Int32
reply-encapunavail	The total number of denied registration replies that were sent with a reply code of 8BH (Registration Denied - reverse tunneling encapsulation style unavailable).	Int32
reply-senderror	The total number of errors that occurred while sending replies.	Int32
reply-unknowncvse	The total number of denied registration replies that were sent with a reply code of 8DH (Registration Denied - unsupported Vendor-ID or unable to interpret Vendor-CVSE-Type.).	Int32
reply-udp-encapunavail	The total number of denied registration replies that were sent with a reply code of 8EH (Registration Denied - ERROR_HA_UDP-ENCAP_UNAVAIL).	Int32
reply-error	The total number of reply errors that occurred.	Int32
reply-cong-drop	The total number of registration replies discarded due to congestion. Refer to the Configuring Congestion Control chapter of this guide for additional information.	Int32
reply-cong-adminprohib	The total number of denied registration replies that were sent with a reply code of 81H (Registration Denied - administratively prohibited) due to congestion. Refer to the Configuring Congestion Control chapter of this guide for additional information.	Int32
reply-cong-unknownha	The total number of denied registration replies that were sent with a reply code of 88H (Registration Denied - unknown home agent address) due to congestion. Refer to the Configuring Congestion Control chapter of this guide for additional information.	Int32
ttlprepaid	The total number of Prepaid calls facilitated by the service.	Int32
curprepaid	The total number of Prepaid calls currently being facilitated by the service.	Int32

Variables	Description	Data Type
ttlonlineauthsucc	The total number of successful Online Authentications for the service.	Int32
ttlonlineauthfail	The total number of successful Online Authentications for the service.	Int32
paaa-query-total	The total number of Binding Context requests received from the proxy-AAA server.	Ctr32
paaa-query-accept	The total number of Binding Context requests received from the proxy-AAA server that were accepted.	Ctr32
paaa-query-denied	The total number of Binding Context requests from the proxy-AAA server that were denied.	Ctr32
paaa-resp-sent	The total number of Binding Context responses that were sent to the proxy-AAA server.	Ctr32
paaa-resp-found	The total number of Binding Context responses that were sent to the proxy-AAA server that indicated that the requested binding context was found.	Ctr32
paaa-resp-notfound	The total number of Binding Context responses that were sent to the proxy-AAA server that indicated that the requested binding context was not found.	Ctr32
paaa-resp-poolover	The total number of Binding Context responses that were sent to the proxy-AAA server that indicated that there is an IP Pool overflow condition for the requested binding context.	Ctr32
paaa-resp-misc	The total number of Binding Context responses that were sent to the proxy-AAA server that indicated other miscellaneous errors for the requested binding context.	Ctr32
ipsec-esp-txpackets	The total number of ESP Encode packets transmitted over IPsec.	Int64
ipsec-esp-txbytes	The total number of ESP Encode Bytes transmitted over IPsec.	Int64
ipsec-ah-txpackets	The total number of AH Encode packets transmitted over IPsec.	Int64
ipsec-ah-txbytes	The total number of AH Encode Bytes transmitted over IPsec.	Int64
ipsec-error-txpackets	The total number of Encode Error packets transmitted over IPsec.	Int64
ipsec-error-txbytes	The total number of Transmit Encode Error Bytes transmitted over IPsec.	Int64
ipsec-esp-rxpackets	The total number of ESP Decode packets received over IPsec.	Int64
ipsec-esp-rxbytes	The total number of ESP Decode Bytes received over IPsec.	Int64
ipsec-ah-rxpackets	The total number of AH Decode packets received over IPsec.	Int64
ipsec-ah-rxbytes	The total number of AH Decode Bytes received over IPsec.	Int64
ipsec-error-packets	The total number of Error packets received over IPsec.	Int64
ipsec-error-bytes	The total number of Error Bytes received over IPsec.	Int64
ipsec-replay-packets	The total number of Error Replay packets received over IPsec.	Int64
ipsec-replay-bytes	The total number of Error Replay Bytes received over IPsec.	Int64
ipsec-decode-packets	The total number of Error Decode packets received over IPsec.	Int64
ipsec-decode-bytes	The total number of Error Decode Bytes received over IPsec.	Int64
ipsec-auth-packets	The total number of Error Authentication packets received over IPsec.	Int64

Variables	Description	Data Type
ipsec-auth-bytes	The total number of Error Authentication Bytes received over IPsec.	Int64
ipsec-tooshort-packets	The total number of Error Too Short packets received over IPsec.	Int64
ipsec-tooshort-bytes	The total number of Receive Error Too Short Bytes received over IPsec.	Int64
ipsec-dpdreq-sent	The total number of DPD requests sent	Int32
ipsec-dpdreq-recv	The total number of DPD requests received	Int32
ipsec-dpdreply-sent	The total number of DPD replies sent	Int32
ipsec-dpdreply-recv	The total number of DPD replies received	Int32
ipsec-dpdtimeout	The total number of DPD timeouts (retransmissions)	Int32
ipsec-dpddisconn	The total number of DPD disconnects	Int32
ipsec-dpdrekey	The total number of DPD phase1 rekeys	Int32
ipsec-nattkeepalive-sent	The total number of NATT keepalives sent	Int32
ipsec-nattkeepalive-recv	The total number of NATT keepalives received	Int32
ipsec-ike-udpflows	The total number of current IKE UDP flows	Int32
ipsec-ike-cookieflows	The total number of current IKE cookie flows	Int32
ipsec-ike-txpackets	The total number of IKE packets transmitted	Int64
ipsec-ike-rxpackets	The total number of IKE packets received	Int64
ipsec-ike-reqrecv	The total number of IKE requests received	Int64
ipsec-ike-udpflowpackets	The total number of IKE UDP flow packets received	Int64
ipsec-ike-cookieflowpackets	The total number of IKE cookie flow packets received	Int64
ipsec-cur-tun	The total current number of IPSEC tunnels	Int32
ipsec-cur-tunestablished	The total number of currently established IPSEC tunnels	Int32
ipsec-ike-fails	The total number of IKE failures	Int32
ipsec-ttl-tun	The total number of tunnels setup	Int32
ipsec-ttl-tunestablished	The total number of tunnels that were established	Int32
ipsec-call-req-rej	The total number of call requests that were rejected	Int32

Chapter 29

HNBGW-HNBAP Schema Statistics

The HNBGW-HNBAP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 29. Bulk Statistic Variables in the HNBGW-HNBAP Schema

Variables	Description	Data Type
HNBGW-HNBAP		

Variables	Description	Data Type
vpname	Indicates the name of the context in which HNB-GW service is configured. This is a key variable.	String
vpnid	Indicates the identity number of the context in which HNB-GW service is configured. This is a key variable.	String
servname	Indicates the name of the HNB-GW service for which statistics are collected. This is a key variable.	String
registered-hnb	Indicates the total number of registered HNBs. Trigger: Changes when HNB is successfully registered with HNB-GW. Availability: Across all HNB-GW Services Type: Gauge	Unsigned Int32
registered-ue	Indicates the total number of registered UEs. Trigger: Changes when UE is successfully registered with HNB-GW. Availability: Across all HNB-GW Services Type: Gauge	Unsigned Int32
ue-with-ps-conn	Indicates the total number of UEs with PS connection. Trigger: Changes when PS connection is established with HNB-GW for a UE. Availability: Across all HNB-GW Services Type: Gauge	Unsigned Int32
ue-with-cs-conn	Indicates the total number of UEs with CS connection. Trigger: Changes when CS connection is established with HNB-GW for a UE. Availability: Across all HNB-GW Services Type: Gauge	Unsigned Int32
ue-with-ps-cs-conn	Indicates the total number of UEs with PS and CS connection. Trigger: Changes when PS and CS connections are established with HNB-GW for a UE. Availability: Across all HNB-GW Services Type: Gauge	Unsigned Int32
idle-ue	Indicates the total number of Idle UEs. Trigger: Changes when UE is registered with HNB-GW, but no CS and/or PS connection is established with HNB-GW for this UE. Availability: Across all HNB-GW Services Type: Gauge	Unsigned Int32
hnb-reg-req-rx	Indicates the total number of HNB Register Request message received. Trigger: Increases when HNB Register Request message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-reg-acc-tx	Indicates the total number of HNB Register Accept message transmitted. Trigger: Increases when HNB Register Accept message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-reg-rej-tx	Indicates the total number of HNB Register Reject message transmitted. Trigger: Increases when HNB Register Reject message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
hnb-reg-rej-unauth-loc	Indicates the total number of HNB Register Reject message transmitted with cause - Unauthorized Location. Trigger: Increases when HNB Register Reject message is transmitted by HNB-GW with cause - Unauthorized Location. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-reg-rej-unauth-hnb	Indicates the total number of HNB Register Reject message transmitted with cause - Unauthorized HNB. Trigger: Increases when HNB Register Reject message is transmitted by HNB-GW with cause - Unauthorized HNB. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-reg-rej-overload	Indicates the total number of HNB Register Reject message transmitted with cause - Overload. Trigger: Increases when HNB Register Reject message is transmitted by HNB-GW with cause - Overload. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-reg-rej-hnb-param-mismatch	Indicates the total number of HNB Register Reject message transmitted with cause - HNB Parameter Mismatch. Trigger: Increases when HNB Register Reject message is transmitted by HNB-GW with cause - HNB Parameter Mismatch. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-reg-rej-unspecified	Indicates the total number of HNB Register Reject message transmitted with cause - Unspecified. Trigger: Increases when HNB Register Reject message is transmitted by HNB-GW with cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ue-reg-req-rx	Indicates the total number of UE Register Request message received. Trigger: Increases when UE Register Request message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ue-reg-cause-emergency	Indicates the total number of UE Register Request message received with Registration cause - Emergency. Trigger: Increases when UE Register Request message is received by HNB-GW with Registration cause - Emergency. Availability: Across all HNB-GW Services	Unsigned Int32
ue-reg-cause-normal	Indicates the total number of UE Register Request message received with Registration cause - Normal. Trigger: Increases when UE Register Request message is received by HNB-GW with Registration cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
ue-reg-acc-tx	Indicates the total number of UE Register Accept message transmitted. Trigger: Increases when UE Register Accept message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ue-reg-rej-tx	Indicates the total number of UE Register Reject message transmitted. Trigger: Increases when UE Register Reject message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ue-reg-rej-invalid-ue-id	Indicates the total number of UE Register Reject message transmitted with cause - Invalid UE Identity. Trigger: Increases when UE Register Reject message is transmitted by HNB-GW with cause - Invalid UE Identity. Availability: Across all HNB-GW Services	Unsigned Int32
ue-reg-rej-ue-not-allowed-on-hnb	Indicates the total number of UE Register Reject message transmitted with cause - UE not allowed on HNB. Trigger: Increases when UE Register Reject message is transmitted by HNB-GW with cause - UE not allowed on HNB. Availability: Across all HNB-GW Services	Unsigned Int32
ue-reg-rej-hnb-not-reg	Indicates the total number of UE Register Reject message transmitted with cause - HNB not registered. Trigger: Increases when UE Register Reject message is transmitted by HNB-GW with cause - HNB not registered. Availability: Across all HNB-GW Services	Unsigned Int32
ue-reg-rej-unspecified	Indicates the total number of UE Register Reject message transmitted with cause - Unspecified. Trigger: Increases when UE Register Reject message is transmitted by HNB-GW with cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-dereg-rx	Indicates the total number of HNB De-register message received. Trigger: Increases when HNB De-register message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-dereg-rx-normal	Indicates the total number of HNB De-register message received with cause - Normal. Trigger: Increases when HNB De-register message is received by HNB-GW with cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-dereg-rx-unspecified	Indicates the total number of HNB De-register message received with cause - Unspecified. Trigger: Increases when HNB De-register message is received by HNB-GW with cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-dereg-tx	Indicates the total number of HNB De-register message transmitted. Trigger: Increases when HNB De-register message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-dereg-tx-overload	Indicates the total number of HNB De-register message transmitted with cause - Overload. Trigger: Increases when HNB De-register message is transmitted by HNB-GW with cause - Overload. Availability: Across all HNB-GW Services	Unsigned Int32
hnb-dereg-tx-unspecified	Indicates the total number of HNB De-register message transmitted with cause - Unspecified. Trigger: Increases when HNB De-register message is transmitted by HNB-GW with cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ue-dereg-rx	Indicates the total number of UE De-register message received. Trigger: Increases when UE De-register message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ue-dereg-rx-conn-with-ue-lost	Indicates the total number of UE De-register message received with cause - Connection with UE lost. Trigger: Increases when UE De-register message is received by HNB-GW with cause - Connection with UE lost. Availability: Across all HNB-GW Services	Unsigned Int32
ue-dereg-rx-ue-rrc-rel	Indicates the total number of UE De-register message received with cause - UE RRC Release. Trigger: Increases when UE De-register message is received by HNB-GW with cause - UE RRC Release. Availability: Across all HNB-GW Services	Unsigned Int32
ue-dereg-rx-undefined	Indicates the total number of UE De-register message received with cause - Undefined. Trigger: Increases when UE De-register message is received by HNB-GW with cause - Undefined. Availability: Across all HNB-GW Services	Unsigned Int32
ue-dereg-rx-ue-relocated	Indicates the total number of UE De-register message received with cause - UE Relocated. Trigger: Increases when UE De-register message is received by HNB-GW with cause - UE Relocated. Availability: Across all HNB-GW Services	Unsigned Int32
ue-dereg-tx	Indicates the total number of UE De-register message transmitted. Trigger: Increases when UE De-register message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ue-dereg-tx-ue-reg-in-another-hnb	Indicates the total number of UE De-register message transmitted with cause - UE registered in another HNB. Trigger: Increases when UE De-register message is transmitted by HNB-GW with cause - UE registered in another HNB. Availability: Across all HNB-GW Services	Unsigned Int32
ue-dereg-tx-undefined	Indicates the total number of UE De-register message transmitted with cause - Undefined. Trigger: Increases when UE De-register message is transmitted by HNB-GW with cause - Undefined. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-conn	Indicates the total number of radio access bearer connection in CS domain. Trigger: Changes when a RAB established a connection in CS domain. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-conn	Indicates the total number of radio access bearer connection in PS domain. Trigger: Changes when a RAB established a connection in PS domain. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx	Indicates the total number of Error Indication message received. Trigger: Increases when Error Indication message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
err-ind-rx-overload	Indicates the total number of Error Indication message received with Radio Network Layer cause -Overload. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause -Overload. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-unauth-loc	Indicates the total number of Error Indication message received with Radio Network Layer cause - Unauthorized Location. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - Unauthorized Location. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-unauth-hnb	Indicates the total number of Error Indication message received with Radio Network Layer cause - Unauthorized HNB. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - Unauthorized HNB. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-hnb-param-mismatch	Indicates the total number of Error Indication message received with Radio Network Layer cause - HNB Parameter mismatch. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - HNB Parameter mismatch. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-invalid-ue-id	Indicates the total number of Error Indication message received with Radio Network Layer cause - Invalid UE Identity. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - Invalid UE Identity. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-ue-not-allowed-on-this-hnb	Indicates the total number of Error Indication message received with Radio Network Layer cause - UE not allowed on this HNB. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - UE not allowed on this HNB. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-ue-unauth	Indicates the total number of Error Indication message received with Radio Network Layer cause - UE unauthorized. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - UE unauthorized. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-conn-with-ue-lost	Indicates the total number of Error Indication message received with Radio Network Layer cause - Connection with UE lost. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - Connection with UE lost. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-ue-rrc-rel	Indicates the total number of Error Indication message received with Radio Network Layer cause - UE RRC Release. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - UE RRC Release. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
err-ind-rx-hnb-not-reg	Indicates the total number of Error Indication message received with Radio Network Layer cause - HNB not registered. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - HNB not registered. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-rnl-unspecified	Indicates the total number of Error Indication message received with Radio Network Layer cause - Unspecified. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-normal	Indicates the total number of Error Indication message received with Radio Network Layer cause - Normal. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-ue-relocated	Indicates the total number of Error Indication message received with Radio Network Layer cause - UE relocated. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - UE relocated. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-ue-reg-in-another-hnb	Indicates the total number of Error Indication message received with Radio Network Layer cause - UE registered in another HNB. Trigger: Increases when Error Indication message is received by HNB-GW with Radio Network Layer cause - UE registered in another HNB. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-trans-res-unavailable	Indicates the total number of Error Indication message received with Transport Layer cause - Transport resource unavailable. Trigger: Increases when Error Indication message is received by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-trans-unspecified	Indicates the total number of Error Indication message received with Transport Layer cause - Unspecified. Trigger: Increases when Error Indication message is received by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-trans-syn-err	Indicates the total number of Error Indication message received with Protocol Layer cause - Transfer syntax error. Trigger: Increases when Error Indication message is received by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-abs-syn-err-rej	Indicates the total number of Error Indication message received with Protocol Layer cause - Abstract syntax error (Reject). Trigger: Increases when Error Indication message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
err-ind-rx-abs-syn-err-ign-notify	Indicates the total number of Error Indication message received with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: Increases when Error Indication message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-msg-not-comp-with-rcvr-state	Indicates the total number of Error Indication message received with Protocol Layer cause - Msg not compatible with receiver state. Trigger: Increases when Error Indication message is received by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-semantic-err	Indicates the total number of Error Indication message received with Protocol Layer cause - Semantic error. Trigger: Increases when Error Indication message is received by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-prot-unspecified	Indicates the total number of Error Indication message received with Protocol Layer cause - Unspecified. Trigger: Increases when Error Indication message is received by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-abs-syn-err-falsely-construct-msg	Indicates the total number of Error Indication message received with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: Increases when Error Indication message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-processing-overload	Indicates the total number of Error Indication message received with Miscellaneous cause - Processing Overload. Trigger: Increases when Error Indication message is received by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-hw-failure	Indicates the total number of Error Indication message received with Miscellaneous cause - Hardware Failure. Trigger: Increases when Error Indication message is received by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-oam-intervention	Indicates the total number of Error Indication message received with Miscellaneous cause - O&M Intervention. Trigger: Increases when Error Indication message is received by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-rx-misc-unspecified	Indicates the total number of Error Indication message received with Miscellaneous cause - Unspecified. Trigger: Increases when Error Indication message is received by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
err-ind-tx	Indicates the total number of Error Indication message transmitted. Trigger: Increases when Error Indication message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-overload	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause -Overload. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause -Overload. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-unauth-loc	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Unauthorized Location. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Unauthorized Location. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-unauth-hnb	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Unauthorized HNB. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Unauthorized HNB. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-hnb-param-mismatch	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - HNB Parameter mismatch. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - HNB Parameter mismatch. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-invalid-ue-id	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Invalid UE Identity. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Invalid UE Identity. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-ue-not-allowed-on-this-hnb	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - UE not allowed on this HNB. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - UE not allowed on this HNB. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-ue-unauth	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - UE unauthorized. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - UE unauthorized. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-conn-with-ue-lost	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Connection with UE lost. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Connection with UE lost. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
err-ind-tx-ue-rrc-rel	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - UE RRC Release. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - UE RRC Release. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-hnb-not-reg	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - HNB not registered. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - HNB not registered. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-rnl-unspecified	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Unspecified. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-normal	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Normal. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-ue-relocated	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - UE relocated. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - UE relocated. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-ue-reg-in-another-hnb	Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - UE registered in another HNB. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - UE registered in another HNB. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-trans-res-unavailable	Indicates the total number of Error Indication message transmitted with Transport Layer cause - Transport resource unavailable. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-trans-unspecified	Indicates the total number of Error Indication message transmitted with Transport Layer cause - Unspecified. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-trans-syn-err	Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Transfer syntax error. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
err-ind-tx-abs-syn-err-rej	Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Abstract syntax error (Reject). Trigger: Increases when Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-abs-syn-err-ign-notify	Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: Increases when Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-msg-not-comp-with-rcvr-state	Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Msg not compatible with receiver state. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-semantic-err	Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Semantic error. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-prot-unspecified	Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Unspecified. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-abs-syn-err-falsely-construct-msg	Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: Increases when Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-processing-overload	Indicates the total number of Error Indication message transmitted with Miscellaneous cause - Processing Overload. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-hw-failure	Indicates the total number of Error Indication message transmitted with Miscellaneous cause - Hardware Failure. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
err-ind-tx-oam-intervention	Indicates the total number of Error Indication message transmitted with Miscellaneous cause - O&M Intervention. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
err-ind-tx-misc-unspecified	Indicates the total number of Error Indication message transmitted with Miscellaneous cause - Unspecified. Trigger: Increases when Error Indication message is transmitted by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 30

HNBGW-RANAP Schema Statistics

The HNBGW-RANAP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 30. Bulk Statistic Variables in the HNBGW-RANAP Schema

Variables	Description	Data Type
vpnname	The name of the context in which HNB-GW service is configured. This is a key variable.	String

Common Syntax Options

Variables	Description	Data Type
vpnid	The identity number of the context in which HNB-GW service is configured. This is a key variable.	String
servname	The name of the HNB-GW service for which statistics are collected. This is a key variable.	String
cs-initial-ue-rx	CS Domain: Indicates the total number of Initial UE message received. Trigger: When RANAP CS Domain Initial UE message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-dir-transfer-rx	CS Domain: Indicates the total number of Direct Transfer message received. Trigger: When RANAP CS Domain Direct Transfer message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-dir-transfer-tx	CS Domain: Indicates the total number of Direct Transfer message transmitted. Trigger: When RANAP CS Domain Direct Transfer message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reset-rx	CS Domain: Indicates the total number of Reset message received. Trigger: When RANAP CS Domain Reset message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reset-tx	CS Domain: Indicates the total number of Reset message transmitted. Trigger: When RANAP CS Domain Reset message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reset-ack-rx	CS Domain: Indicates the total number of Reset Ack message received. Trigger: When RANAP CS Domain Reset Ack message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reset-ack-tx	CS Domain: Indicates the total number of Reset Ack message transmitted. Trigger: When RANAP CS Domain Reset Ack message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reset-res-rx	CS Domain: Indicates the total number of Reset Resource message received. Trigger: When RANAP CS Domain Reset Resource message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reset-res-tx	CS Domain: Indicates the total number of Reset Resource message transmitted. Trigger: When RANAP CS Domain Reset Resource message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reset-res-ack-rx	CS Domain: Indicates the total number of Reset Resource Ack message received. Trigger: When RANAP CS Domain Reset Resource Ack message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reset-res-ack-tx	CS Domain: Indicates the total number of Reset Resource Ack message transmitted. Trigger: When RANAP CS Domain Reset Resource Ack message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-iu-rel-req-rx	CS Domain: Indicates the total number of Iu Release Request message received. Trigger: When RANAP CS Domain Iu Release Request message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-iu-rel-cmd-tx	CS Domain: Indicates the total number of Iu Release Command message transmitted. Trigger: When RANAP CS Domain Iu Release Command message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-iu-rel-comp-rx	CS Domain: Indicates the total number of Iu Release Complete message received. Trigger: When RANAP CS Domain Iu Release Complete message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-paging-req-tx	CS Domain: Indicates the total number of Paging Request message transmitted. Trigger: When RANAP CS Domain Paging Request message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-req-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-req-tx-rab-setup-mod-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for RAB Setup/Mod. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-req-tx-rab-rel-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for RAB Release. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-rsp-rx	CS Domain: Indicates the total number of RAB Assignment Response message received. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-rsp-rx-rab-setup-mod-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for RAB Setup/Mod Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
cs-rab-ass-rsp-rx-rab-setup-mod-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for RAB Setup/Mod Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-rsp-rx-rab-rel-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for RAB Release Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-rsp-rx-rab-rel-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for RAB Release Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-rsp-rx-rab-queued	CS Domain: Indicates the total number of RAB Assignment Response message received for RAB Queued. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-rsp-rx-rab-setup-mod-rel-que-drop	CS Domain: Indicates the total number of RAB Assignment Response message received for RAB Set/Mod/Rel/Que Dropped. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for RAB Set/Mod/Rel/Que Dropped. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr-codec-rab-setup-mod-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for UMTS AMR Codec for RAB Setup/Mod. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for UMTS AMR Codec for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr-codec-rab-rel-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for UMTS AMR Codec for RAB Release. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for UMTS AMR Codec for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr-codec-rab-setup-mod-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR Codec for RAB Setup/Mod Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR Codec for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr-codec-rab-setup-mod-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR Codec for RAB Setup/Mod Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR Codec for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-rab-ass-amr-codec-rab-rel-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR Codec for RAB Release Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR Codec for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr-codec-rab-rel-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR Codec for RAB Release Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR Codec for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr-codec-rab-queued	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR Codec for RAB Queued. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR Codec for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr2-codec-rab-setup-mod-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for UMTS AMR2 Codec for RAB Setup/Mod. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for UMTS AMR2 Codec for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr2-codec-rab-rel-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for UMTS AMR2 Codec for RAB Release. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for UMTS AMR2 Codec for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr2-codec-rab-setup-mod-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR2 Codec for RAB Setup/Mod Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR2 Codec for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr2-codec-rab-setup-mod-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR2 Codec for RAB Setup/Mod Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR2 Codec for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr2-codec-rab-rel-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR2 Codec for RAB Release Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR2 Codec for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-amr2-codec-rab-rel-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR2 Codec for RAB Release Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR2 Codec for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
cs-rab-ass-amr2-codec-rab-queued	CS Domain: Indicates the total number of RAB Assignment Response message received for UMTS AMR2 Codec for RAB Queued. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for UMTS AMR2 Codec for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-other-codec-rab-setup-mod-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for Other Codec for RAB Setup/Mod. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for Other Codec for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-other-codec-rab-rel-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for Other Codec for RAB Release. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for Other Codec for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-other-codec-rab-setup-mod-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for Other Codec for RAB Setup/Mod Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Other Codec for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-other-codec-rab-setup-mod-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for Other Codec for RAB Setup/Mod Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Other Codec for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-other-codec-rab-rel-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for Other Codec for RAB Release Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Other Codec for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-other-codec-rab-rel-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for Other Codec for RAB Release Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Other Codec for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-other-codec-rab-queued	CS Domain: Indicates the total number of RAB Assignment Response message received for Other Codec for RAB Queued. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Other Codec for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-no-codec-rab-setup-mod-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for NO Codec for RAB Setup/Mod. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for NO Codec for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-rab-ass-no-codec-rab-rel-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for NO Codec for RAB Release. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for NO Codec for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-no-codec-rab-setup-mod-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for NO Codec for RAB Setup/Mod Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for NO Codec for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-no-codec-rab-setup-mod-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for NO Codec for RAB Setup/Mod Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for NO Codec for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-no-codec-rab-rel-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for NO Codec for RAB Release Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for NO Codec for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-no-codec-rab-rel-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for NO Codec for RAB Release Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for NO Codec for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-no-codec-rab-queued	CS Domain: Indicates the total number of RAB Assignment Response message received for NO Codec for RAB Queued. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for NO Codec for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-unknown-codec-rab-setup-mod-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for Unknown Codec for RAB Setup/Mod. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for Unknown Codec for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-unknown-codec-rab-rel-tx	CS Domain: Indicates the total number of RAB Assignment Request message transmitted for Unknown Codec for RAB Release. Trigger: When RANAP CS Domain RAB Assignment Request message is transmitted by HNB-GW for Unknown Codec for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-unknown-codec-rab-setup-mod-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for Unknown Codec for RAB Setup/Mod Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Unknown Codec for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-rab-ass-unknown-codec-rab-setup-mod-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for Unknown Codec for RAB Setup/Mod Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Unknown Codec for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-unknown-codec-rab-rel-succ-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for Unknown Codec for RAB Release Success. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Unknown Codec for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-unknown-codec-rab-rel-fail-rx	CS Domain: Indicates the total number of RAB Assignment Response message received for Unknown Codec for RAB Release Fail. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Unknown Codec for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-rab-ass-unknown-codec-rab-queued	CS Domain: Indicates the total number of RAB Assignment Response message received for Unknown Codec for RAB Queued. Trigger: When RANAP CS Domain RAB Assignment Response message is received by HNB-GW for Unknown Codec for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-tx	CS Domain: Indicates the total number of Relocation Request message transmitted. Trigger: When RANAP CS Domain Relocation Request message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-tx-rab-setup-tx	CS Domain: Indicates the total number of Relocation Request message transmitted for RAB Setup. Trigger: When RANAP CS Domain Relocation Request message is transmitted by HNB-GW for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-ack-rx	CS Domain: Indicates the total number of Relocation Request Ack message received. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-ack-rx-rab-setup-succ-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for RAB Setup Success. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-ack-rx-rab-setup-fail-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for RAB Setup Fail. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-reloc-req-ack-rx-rab-setup-dropped	CS Domain: Indicates the total number of Relocation Request Ack message received for RAB Setup Dropped. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for RAB Setup Dropped. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-amr-codec-rab-setup-tx	CS Domain: Indicates the total number of Relocation Request message transmitted for UMTS AMR Codec for RAB Setup. Trigger: When RANAP CS Domain Relocation Request message is transmitted by HNB-GW for UMTS AMR Codec for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-amr-codec-rab-setup-succ-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for UMTS AMR Codec for RAB Setup Success. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for UMTS AMR Codec for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-amr-codec-rab-setup-fail-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for UMTS AMR Codec for RAB Setup Fail. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for UMTS AMR Codec for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-amr2-codec-rab-setup-tx	CS Domain: Indicates the total number of Relocation Request message transmitted for UMTS AMR2 Codec for RAB Setup. Trigger: When RANAP CS Domain Relocation Request message is transmitted by HNB-GW for UMTS AMR2 Codec for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-amr2-codec-rab-setup-succ-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for UMTS AMR2 Codec for RAB Setup Success. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for UMTS AMR2 Codec for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-amr2-codec-rab-setup-fail-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for UMTS AMR2 Codec for RAB Setup Fail. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for UMTS AMR2 Codec for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-other-codec-rab-setup-tx	CS Domain: Indicates the total number of Relocation Request message transmitted for Other Codec for RAB Setup. Trigger: When RANAP CS Domain Relocation Request message is transmitted by HNB-GW for Other Codec for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-other-codec-rab-setup-succ-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for Other Codec for RAB Setup Success. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for Other Codec for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
cs-reloc-req-other-codec-rab-setup-fail-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for Other Codec for RAB Setup Fail. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for Other Codec for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-no-codec-rab-setup-tx	CS Domain: Indicates the total number of Relocation Request message transmitted for NO Codec for RAB Setup. Trigger: When RANAP CS Domain Relocation Request message is transmitted by HNB-GW for NO Codec for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-no-codec-rab-setup-succ-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for NO Codec for RAB Setup Success. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for NO Codec for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-no-codec-rab-setup-fail-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for NO Codec for RAB Setup Fail. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for NO Codec for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-unknown-codec-rab-setup-tx	CS Domain: Indicates the total number of Relocation Request message transmitted for Unknown Codec for RAB Setup. Trigger: When RANAP CS Domain Relocation Request message is transmitted by HNB-GW for Unknown Codec for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-unknown-codec-rab-setup-succ-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for Unknown Codec for RAB Setup Success. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for Unknown Codec for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-req-unknown-codec-rab-setup-fail-rx	CS Domain: Indicates the total number of Relocation Request Ack message received for Unknown Codec for RAB Setup Fail. Trigger: When RANAP CS Domain Relocation Request Ack message is received by HNB-GW for Unknown Codec for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-detect-rx	CS Domain: Indicates the total number of Relocation Detect message received. Trigger: When RANAP CS Domain Relocation Detect message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-comp-rx	CS Domain: Indicates the total number of Relocation Complete message received. Trigger: When RANAP CS Domain Relocation Complete message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-reloc-fail-rx	CS Domain: Indicates the total number of Relocation Failure message received. Trigger: When RANAP CS Domain Relocation Failure message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-reloc-reqd-rx	CS Domain: Indicates the total number of Relocation Required message received. Trigger: When RANAP CS Domain Relocation Required message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-fwd-srms-ctx-req-rx	CS Domain: Indicates the total number of Fwd SRNS Context Request message received. Trigger: When RANAP CS Domain Fwd SRNS Context Request message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-srms-ctx-req-tx	CS Domain: Indicates the total number of SRNS Context Request message transmitted. Trigger: When RANAP CS Domain SRNS Context Request message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-srms-ctx-rsp-rx	CS Domain: Indicates the total number of SRNS Context Response message received. Trigger: When RANAP CS Domain SRNS Context Response message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-initial-ue-rx	PS Domain: Indicates the total number of Initial UE message received. Trigger: When Initial UE message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-dir-transfer-rx	PS Domain: Indicates the total number of Direct Transfer message received. Trigger: When Direct Transfer message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-dir-transfer-tx	PS Domain: Indicates the total number of Direct Transfer message transmitted. Trigger: When Direct Transfer message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reset-rx	PS Domain: Indicates the total number of Reset message received. Trigger: When Reset message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reset-tx	PS Domain: Indicates the total number of Reset message transmitted. Trigger: When Reset message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reset-ack-rx	PS Domain: Indicates the total number of Reset Ack message received. Trigger: When Reset Ack message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reset-ack-tx	PS Domain: Indicates the total number of Reset Ack message transmitted. Trigger: When Reset Ack message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-reset-res-rx	PS Domain: Indicates the total number of Reset Resource message received. Trigger: When Reset Resource message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reset-res-tx	PS Domain: Indicates the total number of Reset Resource message transmitted. Trigger: When Reset Resource message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reset-res-ack-rx	PS Domain: Indicates the total number of Reset Resource Ack message received. Trigger: When Reset Resource Ack message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reset-res-ack-tx	PS Domain: Indicates the total number of Reset Resource Ack message transmitted. Trigger: When Reset Resource Ack message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-iu-rel-req-rx	PS Domain: Indicates the total number of Iu Release Request message received. Trigger: When Iu Release Request message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-iu-rel-cmd-tx	PS Domain: Indicates the total number of Iu Release Command message transmitted. Trigger: When Iu Release Command message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-iu-rel-comp-rx	PS Domain: Indicates the total number of Iu Release Complete message received. Trigger: When Iu Release Complete message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-paging-req-tx	PS Domain: Indicates the total number of Paging Request message transmitted. Trigger: When Paging Request message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-req-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted. Trigger: When RAB Assignment Request message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-req-tx-rab-setup-mod-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for RAB Setup/Mod. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-req-tx-rab-rel-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for RAB Release. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-rsp-rx	PS Domain: Indicates the total number of RAB Assignment Response message received. Trigger: When RAB Assignment Response message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-rab-ass-rsp-rx-rab-setup-mod-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for RAB Setup/Mod Success. Trigger: When RAB Assignment Response message is received by HNB-GW for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-rsp-rx-rab-setup-mod-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for RAB Setup/Mod Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-rsp-rx-rab-rel-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for RAB Release Success. Trigger: When RAB Assignment Response message is received by HNB-GW for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-rsp-rx-rab-rel-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for RAB Release Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-rsp-rx-rab-queued	PS Domain: Indicates the total number of RAB Assignment Response message received for RAB Queued. Trigger: When RAB Assignment Response message is received by HNB-GW for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-rsp-rx-rab-setup-mod-rel-que-drop	PS Domain: Indicates the total number of RAB Assignment Response message received for RAB Set/Mod/Rel/Que Dropped. Trigger: When RAB Assignment Response message is received by HNB-GW for RAB Set/Mod/Rel/Que Dropped. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-conv-class-rab-setup-mod-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Conversational Class for RAB Setup/Mod. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Conversational Class for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-conv-class-rab-rel-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Conversational Class for RAB Release. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Conversational Class for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-conv-class-rab-setup-mod-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Conversational Class for RAB Setup/Mod Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Conversational Class for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
ps-rab-ass-conv-class-rab-setup-mod-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Conversational Class for RAB Setup/Mod Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Conversational Class for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-conv-class-rab-rel-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Conversational Class for RAB Release Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Conversational Class for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-conv-class-rab-rel-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Conversational Class for RAB Release Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Conversational Class for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-conv-class-rab-queued	PS Domain: Indicates the total number of RAB Assignment Response message received for Conversational Class for RAB Queued. Trigger: When RAB Assignment Response message is received by HNB-GW for Conversational Class for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-stream-class-rab-setup-mod-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Streaming Class for RAB Setup/Mod. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Streaming Class for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-stream-class-rab-rel-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Streaming Class for RAB Release. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Streaming Class for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-stream-class-rab-setup-mod-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Streaming Class for RAB Setup/Mod Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Streaming Class for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-stream-class-rab-setup-mod-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Streaming Class for RAB Setup/Mod Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Streaming Class for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-stream-class-rab-rel-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Streaming Class for RAB Release Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Streaming Class for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-rab-ass-stream-class-rab-rel-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Streaming Class for RAB Release Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Streaming Class for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-stream-class-rab-queued	PS Domain: Indicates the total number of RAB Assignment Response message received for Streaming Class for RAB Queued. Trigger: When RAB Assignment Response message is received by HNB-GW for Streaming Class for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-inter-class-rab-setup-mod-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Interactive for RAB Setup/Mod. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Interactive for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-inter-class-rab-rel-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Interactive for RAB Release. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Interactive for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-inter-class-rab-setup-mod-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Interactive for RAB Setup/Mod Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Interactive for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-inter-class-rab-setup-mod-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Interactive for RAB Setup/Mod Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Interactive for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-inter-class-rab-rel-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Interactive for RAB Release Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Interactive for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-inter-class-rab-rel-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Interactive for RAB Release Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Interactive for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-inter-class-rab-queued	PS Domain: Indicates the total number of RAB Assignment Response message received for Interactive for RAB Queued. Trigger: When RAB Assignment Response message is received by HNB-GW for Interactive for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-rab-ass-back-class-rab-setup-mod-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Background for RAB Setup/Mod. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Background for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-back-class-rab-rel-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Background for RAB Release. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Background for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-back-class-rab-setup-mod-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Background for RAB Setup/Mod Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Background for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-back-class-rab-setup-mod-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Background for RAB Setup/Mod Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Background for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-back-class-rab-rel-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Background for RAB Release Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Background for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-back-class-rab-rel-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Background for RAB Release Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Background for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-back-class-rab-queued	PS Domain: Indicates the total number of RAB Assignment Response message received for Background for RAB Queued. Trigger: When RAB Assignment Response message is received by HNB-GW for Background for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-unkwn-class-rab-setup-mod-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Unknown for RAB Setup/Mod. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Unknown for RAB Setup/Mod. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-unkwn-class-rab-rel-tx	PS Domain: Indicates the total number of RAB Assignment Request message transmitted for Unknown for RAB Release. Trigger: When RAB Assignment Request message is transmitted by HNB-GW for Unknown for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-rab-ass-unkwn-class-rab-setup-mod-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Unknown for RAB Setup/Mod Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Unknown for RAB Setup/Mod Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-unkwn-class-rab-setup-mod-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Unknown for RAB Setup/Mod Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Unknown for RAB Setup/Mod Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-unkwn-class-rab-rel-succ-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Unknown for RAB Release Success. Trigger: When RAB Assignment Response message is received by HNB-GW for Unknown for RAB Release Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-unkwn-class-rab-rel-fail-rx	PS Domain: Indicates the total number of RAB Assignment Response message received for Unknown for RAB Release Fail. Trigger: When RAB Assignment Response message is received by HNB-GW for Unknown for RAB Release Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-rab-ass-unkwn-class-rab-queued	PS Domain: Indicates the total number of RAB Assignment Response message received for Unknown for RAB Queued. Trigger: When RAB Assignment Response message is received by HNB-GW for Unknown for RAB Queued. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-tx	PS Domain: Indicates the total number of Relocation Request message transmitted. Trigger: When Relocation Request message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-tx-rab-setup-tx	PS Domain: Indicates the total number of Relocation Request message transmitted for RAB Setup message transmitted. Trigger: When Relocation Request message is transmitted by HNB-GW for RAB Setup message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-ack-rx	PS Domain: Indicates the total number of Relocation Request Ack message received. Trigger: When Relocation Request Ack message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-ack-rx-rab-setup-succ-rx	PS Domain: Indicates the total number of Relocation Request Ack message received for RAB Setup Success. Trigger: When Relocation Request Ack message is received by HNB-GW for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-ack-rx-rab-setup-fail-rx	PS Domain: Indicates the total number of Relocation Request Ack message received for RAB Setup Fail. Trigger: When Relocation Request Ack message is received by HNB-GW for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-reloc-req-conv-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Request message transmitted for Conversational Class for RAB Setup. Trigger: When Relocation Request message is transmitted by HNB-GW for Conversational Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-conv-class-rab-setup-succ-rx	PS Domain: Indicates the total number of Relocation Request message received for Conversational Class for RAB Setup Success. Trigger: When Relocation Request message is received by HNB-GW for Conversational Class for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-conv-class-rab-setup-fail-rx	PS Domain: Indicates the total number of Relocation Request message received for Conversational Class for RAB Setup Fail. Trigger: When Relocation Request message is received by HNB-GW for Conversational Class for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-stream-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Request message transmitted for Streaming Class for RAB Setup. Trigger: When Relocation Request message is transmitted by HNB-GW for Streaming Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-stream-class-rab-setup-succ-rx	PS Domain: Indicates the total number of Relocation Request message received for Streaming Class for RAB Setup Success. Trigger: When Relocation Request message is received by HNB-GW for Streaming Class for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-stream-class-rab-setup-fail-rx	PS Domain: Indicates the total number of Relocation Request message received for Streaming Class for RAB Setup Fail. Trigger: When Relocation Request message is received by HNB-GW for Streaming Class for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-inter-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Request message transmitted for Interactive Class for RAB Setup. Trigger: When Relocation Request message is transmitted by HNB-GW for Interactive Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-inter-class-rab-setup-succ-rx	PS Domain: Indicates the total number of Relocation Request message received for Interactive Class for RAB Setup Success. Trigger: When Relocation Request message is received by HNB-GW for Interactive Class for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-inter-class-rab-setup-fail-rx	PS Domain: Indicates the total number of Relocation Request message received for Interactive Class for RAB Setup Fail. Trigger: When Relocation Request message is received by HNB-GW for Interactive Class for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-reloc-req-back-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Request message transmitted for Background Class for RAB Setup. Trigger: When Relocation Request message is transmitted by HNB-GW for Background Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-back-class-rab-setup-succ-rx	PS Domain: Indicates the total number of Relocation Request message received for Background Class for RAB Setup Success. Trigger: When Relocation Request message is received by HNB-GW for Background Class for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-back-class-rab-setup-fail-rx	PS Domain: Indicates the total number of Relocation Request message received for Background Class for RAB Setup Fail. Trigger: When Relocation Request message is received by HNB-GW for Background Class for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-unkwn-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Request message transmitted for Unknown Class for RAB Setup. Trigger: When Relocation Request message is transmitted by HNB-GW for Unknown Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-unkwn-class-rab-setup-succ-rx	PS Domain: Indicates the total number of Relocation Request message received for Unknown Class for RAB Setup Success. Trigger: When Relocation Request message is received by HNB-GW for Unknown Class for RAB Setup Success. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-req-unkwn-class-rab-setup-fail-rx	PS Domain: Indicates the total number of Relocation Request message received for Unknown Class for RAB Setup Fail. Trigger: When Relocation Request message is received by HNB-GW for Unknown Class for RAB Setup Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-detect-rx	PS Domain: Indicates the total number of Relocation Detect message received. Trigger: When Relocation Detect message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-comp-rx	PS Domain: Indicates the total number of Relocation Complete message received. Trigger: When Relocation Complete message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-fail-rx	PS Domain: Indicates the total number of Relocation Failure message received. Trigger: When Relocation Failure message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-reqd-rx	PS Domain: Indicates the total number of Relocation Required message received. Trigger: When Relocation Required message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-reloc-prep-failure-tx	PS Domain: Indicates the total number of Relocation Prep Failure message transmitted. Trigger: When Relocation Prep Failure message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-fwd-srns-ctx-req-rx	PS Domain: Indicates the total number of Fwd SRNS Context Request message received. Trigger: When Fwd SRNS Context Request message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-cmd-tx	PS Domain: Indicates the total number of Relocation Command message transmitted. Trigger: When Relocation Command message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-cmd-tx-rab-setup-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for RAB Setup. Trigger: When Relocation Command message is transmitted by HNB-GW for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-cmd-tx-rab-rel-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for RAB Release. Trigger: When Relocation Command message is transmitted by HNB-GW for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-cmd-tx-rab-setup-rel-local-fail	PS Domain: Indicates the total number of Relocation Command message transmitted for RAB Setup/Release Local Failure. Trigger: When Relocation Command message is transmitted by HNB-GW for RAB Setup/Release Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-invalid-rab-id	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Radio Network Layer Cause for Invalid Rab Id. Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Radio Network Layer Cause for Invalid Rab Id. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-interact-othr-proc	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Radio Network Layer Cause for Interaction With Other Proc. Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Radio Network Layer Cause for Interaction With Other Proc. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-sig-trans-res-fail	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Transport Layer Cause for Sig Transport Resource Fail. Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Transport Layer Cause for Sig Transport Resource Fail. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-reloc-local-fail-iu-conn-fail-to-estab	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Transport Layer Cause for Iu Transport Conn failed to Establish. Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Transport Layer Cause for Iu Transport Conn failed to Establish. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-trans-syn-err	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Protocol Layer Cause for Transfer syntax error. Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-abs-syn-err-ign	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Protocol Layer Cause for Abstract syntax error(Ignore). Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Abstract syntax error(Ignore). Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-semantic-err	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Protocol Layer Cause for Semantic error. Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-abs-syn-err-rej	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Protocol Layer Cause for Abstract syntax error (Reject). Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-msg-not-comp	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Protocol Layer Cause for Msg not compatible with receiver state. Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-falsely-construct-msg	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Protocol Layer Cause for Abstract syntax error (Falsely constructed msg). Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-no-res-avable	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Miscellaneous Cause for No Resource Available. Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Miscellaneous Cause for No Resource Available. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-local-fail-unspecified	PS Domain: Indicates the total number of RAB Setup/Release Local Failure message transmitted for Miscellaneous Cause for Unspecified. Trigger: When RAB Setup/Release Local Failure message is transmitted by HNB-GW for Miscellaneous Cause for Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-reloc-conv-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Conversational Class for RAB Setup. Trigger: When Relocation Command message is transmitted by HNB-GW for Conversational Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-conv-class-rab-rel-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Conversational Class for RAB Release. Trigger: When Relocation Command message is transmitted by HNB-GW for Conversational Class for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-conv-class-rab-setup-rel-local-fail	PS Domain: Indicates the total number of Relocation Command message transmitted for Conversational Class for RAB Setup/Release Local Failure. Trigger: When Relocation Command message is transmitted by HNB-GW for Conversational Class for RAB Setup/Release Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-stream-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Streaming Class for RAB Setup. Trigger: When Relocation Command message is transmitted by HNB-GW for Streaming Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-stream-class-rab-rel-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Streaming Class for RAB Release. Trigger: When Relocation Command message is transmitted by HNB-GW for Streaming Class for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-stream-class-rab-setup-rel-local-fail	PS Domain: Indicates the total number of Relocation Command message transmitted for Streaming Class for RAB Setup/Release Local Failure. Trigger: When Relocation Command message is transmitted by HNB-GW for Streaming Class for RAB Setup/Release Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-inter-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Interactive Class for RAB Setup. Trigger: When Relocation Command message is transmitted by HNB-GW for Interactive Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-inter-class-rab-rel-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Interactive Class for RAB Release. Trigger: When Relocation Command message is transmitted by HNB-GW for Interactive Class for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-inter-class-rab-setup-rel-local-fail	PS Domain: Indicates the total number of Relocation Command message transmitted for Interactive Class for RAB Setup/Release Local Failure. Trigger: When Relocation Command message is transmitted by HNB-GW for Interactive Class for RAB Setup/Release Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-reloc-back-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Background Class for RAB Setup. Trigger: When Relocation Command message is transmitted by HNB-GW for Background Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-back-class-rab-rel-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Background Class for RAB Release. Trigger: When Relocation Command message is transmitted by HNB-GW for Background Class for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-back-class-rab-setup-rel-local-fail	PS Domain: Indicates the total number of Relocation Command message transmitted for Background Class for RAB Setup/Release Local Failure. Trigger: When Relocation Command message is transmitted by HNB-GW for Background Class for RAB Setup/Release Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-unkwn-class-rab-setup-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Unknown Class for RAB Setup. Trigger: When Relocation Command message is transmitted by HNB-GW for Unknown Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-unkwn-class-rab-rel-tx	PS Domain: Indicates the total number of Relocation Command message transmitted for Unknown Class for RAB Release. Trigger: When Relocation Command message is transmitted by HNB-GW for Unknown Class for RAB Release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-reloc-unkwn-class-rab-setup-rel-lcl-fail	PS Domain: Indicates the total number of Relocation Command message transmitted for Unknown Class for RAB Setup/Release Local Failure. Trigger: When Relocation Command message is transmitted by HNB-GW for Unknown Class for RAB Setup/Release Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-ctx-req-tx	PS Domain: Indicates the total number of SRNS Context Request message transmitted. Trigger: When SRNS Context Request message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-ctx-rsp-rx	PS Domain: Indicates the total number of SRNS Context Response message received. Trigger: When SRNS Context Response message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-data-fwd-cmd-tx	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-srns-rab-setup-tx	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for RAB Setup. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-rab-setup-local-fail	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for RAB Setup Local Failure. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for RAB Setup Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-invalid-rab-id	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Radio Network Layer Cause for Invalid Rab Id. Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Radio Network Layer Cause for Invalid Rab Id. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-interact-with-othr-proc	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Radio Network Layer Cause for Interaction With Other Proc. Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Radio Network Layer Cause for Interaction With Other Proc. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-sig-trans-res-fail	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Transport Layer Cause for Sig Transport Resource Fail. Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Transport Layer Cause for Sig Transport Resource Fail. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-iu-trans-conn-fail-to-estab	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Transport Layer Cause for Iu Transport Conn failed to Establish. Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Transport Layer Cause for Iu Transport Conn failed to Establish. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-trans-syn-err	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Protocol Layer Cause for Transfer syntax error. Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-abs-syn-err-ign	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Protocol Layer Cause for Abstract syntax error(Ignore). Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Abstract syntax error(Ignore). Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-semantic-err	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Protocol Layer Cause for Semantic error. Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-srns-local-fail-abs-syn-err-rej	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Protocol Layer Cause for Abstract syntax error (Reject). Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-msg-not-comp	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Protocol Layer Cause for Msg not compatible with receiver state. Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-falsely-construct-msg	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Protocol Layer Cause for Abstract syntax error (Falsely constructed msg). Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Protocol Layer Cause for Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-no-res-avalable	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Miscellaneous Cause for No Resource Available. Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Miscellaneous Cause for No Resource Available. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-local-fail-unspecified	PS Domain: Indicates the total number of RAB Setup Local Failure message transmitted for Miscellaneous Cause for Unspecified. Trigger: When RAB Setup Local Failure message is transmitted by HNB-GW for Miscellaneous Cause for Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-conv-class-rab-setup-rx	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Conversational Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Conversational Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-conv-class-rab-setup-local-fail	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Conversational Class for RAB Setup/Local Failure. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Conversational Class for RAB Setup/Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-stream-class-rab-setup-rx	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Streaming Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Streaming Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-stream-class-rab-setup-local-fail	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Streaming Class for RAB Setup/Local Failure. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Streaming Class for RAB Setup/Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-srns-inter-class-rab-setup-rx	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Interactive Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Interactive Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-inter-class-rab-setup-local-fail	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Interactive Class for RAB Setup/Local Failure. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Interactive Class for RAB Setup/Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-back-class-rab-setup-rx	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Background Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Background Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-back-class-rab-setup-local-fail	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Background Class for RAB Setup/Local Failure. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Background Class for RAB Setup/Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-unkwn-class-rab-setup-rx	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Unknown Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Unknown Class for RAB Setup. Availability: Across all HNB-GW Services	Unsigned Int32
ps-srns-unkwn-class-rab-setup-local-fail	PS Domain: Indicates the total number of SRNS Data Fwd Command message transmitted for Unknown Class for RAB Setup/Local Failure. Trigger: When SRNS Data Fwd Command message is transmitted by HNB-GW for Unknown Class for RAB Setup/Local Failure. Availability: Across all HNB-GW Services	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 31

HNBGW-RTP Schema Statistics

The HNBGW-RTP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 31. Bulk Statistic Variables in the HNBGW-RTP Schema

Variables	Description	Data Type
vpnname	The name of the context in which HNB-GW service is configured. This is a key variable.	String

Variables	Description	Data Type
vpnid	The identity number of the context in which HNB-GW service is configured. This is a key variable.	String
servname	The name of the HNB-GW service for which statistics are collected. This is a key variable.	String
rtp-uplink-pkts-rx	Indicates the total number of RTP Uplink Packets received. Trigger: When RTP Uplink Packets are received by HNB-GW. Availability: Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-pkts-good-rx	Indicates the total number of RTP Uplink Packets (good) received. Trigger: When RTP Uplink Packets(good) are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-byts-rx	Indicates the total number of RTP Uplink Bytes received. Trigger: When RTP Uplink Bytes are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-pkts-dropped	Indicates the total number of RTP Uplink Packets dropped. Trigger: When RTP Uplink Packets are dropped by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-pkts-drop-rab_not_in_conn_state	Indicates the total number of RTP Uplink Packets dropped with cause RAB not in CONNETED state. Trigger: When RTP Uplink Packets are dropped by HNB-GW with cause RAB not in CONNETED state. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-pkts-dropped-misc	Indicates the total number of RTP Uplink Packets dropped with cause Miscellaneous. Trigger: When RTP Uplink Packets are dropped by HNB-GW with cause Miscellaneous. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-byts-dropped	Indicates the total number of RTP Uplink Bytes dropped. Trigger: When RTP Uplink Bytes are dropped by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-byts-drop-rab_not_in_conn_state	Indicates the total number of RTP Uplink Bytes dropped with cause RAB not in CONNETED state. Trigger: When RTP Uplink Bytes are dropped with cause RAB not in CONNETED state. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-byts-dropped-misc	Indicates the total number of RTP Uplink Bytes dropped with cause Miscellaneous. Trigger: When RTP Uplink Bytes are dropped by HNB-GW with cause Miscellaneous. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-downlink-pkts-tx	Indicates the total number of RTP Downlink Packets transmitted. Trigger: When RTP Downlink Packets are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
rtp-downlink-byts-tx	Indicates the total number of RTP Downlink Bytes transmitted. Trigger: When RTP Downlink Bytes are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-receiver-report-rx	Indicates the total number of RTCP Receiver Report received (From HNB). When RTCP Receiver Report are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-receiver-report-tx	Indicates the total number of RTCP Receiver Report transmitted (To HNB). When RTCP Receiver Report are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-sender-report-rx	Indicates the total number of RTCP Sender Report received (From HNB). When RTCP Sender Report are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-sender-report-tx	Indicates the total number of RTCP Sender Report transmitted (To HNB). When RTCP Sender Report are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-sdes-report-rx	Indicates the total number of RTCP SDES Report received. When RTCP SDES Report are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-sdes-report-tx	Indicates the total number of RTCP SDES Report transmitted. When RTCP SDES Report are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-bye-report-rx	Indicates the total number of RTCP BYE Report received. When RTCP BYE Report are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-app-report-rx	Indicates the total number of RTCP APP Report received. When RTCP APP Report are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-uplink-pkts-rx	Indicates the total number of RTCP Uplink Packets received. When RTCP Uplink Packets are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-uplink-byts-rx	Indicates the total number of RTCP Uplink Bytes received. When RTCP Uplink Bytes are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-uplink-pkts-dropped	Indicates the total number of RTCP Uplink Packets dropped. When RTCP Uplink Packets are dropped by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtcp-uplink-pkts-drop-rab_not-in_conn_state	Indicates the total number of RTCP Uplink Packets dropped with cause RAB not in CONNETED state. When RTCP Uplink Packets are dropped by HNB-GW with cause RAB not in CONNETED state. Availability: Across all HNB-GW Services	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
rtp-uplink-pkts-dropped-misc	Indicates the total number of RTCP Uplink Packets dropped with cause Miscellaneous. When RTCP Uplink Packets are dropped by HNB-GW with cause Miscellaneous. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-byts-dropped	Indicates the total number of RTCP Uplink Bytes dropped. When RTCP Uplink Bytes are dropped by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-byts-drop-rab_not_in_conn_state	Indicates the total number of RTCP Uplink Bytes dropped with cause RAB not in CONNETED state. When RTCP Uplink Bytes are dropped by HNB-GW with cause RAB not in CONNETED state. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-uplink-byts-dropped-misc	Indicates the total number of RTCP Uplink Bytes dropped with cause Miscellaneous. When RTCP Uplink Bytes are dropped by HNB-GW with cause Miscellaneous. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-downlink-pkts-tx	Indicates the total number of RTCP Downlink Packets transmitted. When RTCP Downlink Packets are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-downlink-byts-tx	Indicates the total number of RTCP Downlink Bytes transmitted. When RTCP Downlink Bytes are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-mux-uplink-pkts-rx	Indicates the total number of RTP-MUX Uplink Packets received. Trigger: When RTP-MUX Uplink Packets are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-mux-uplink-byts-rx	Indicates the total number of RTP-MUX Uplink Bytes received. Trigger: When RTP-MUX Uplink Bytes are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-mux-uplink-pkts-dropped	Indicates the total number of RTP-MUX Uplink Packets dropped. Trigger: When RTP-MUX Uplink Packets are dropped by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-mux-uplink-pkts-dropped-misc	Indicates the total number of RTP-MUX Uplink Packets dropped with cause Miscellaneous. Trigger: When RTP-MUX Uplink Packets are dropped by HNB-GW with cause Miscellaneous. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-mux-uplink-byts-dropped	Indicates the total number of RTP-MUX Uplink Bytes dropped. Trigger: When RTP-MUX Uplink Bytes are dropped by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
rtp-mux-uplink-byts-dropped-misc	Indicates the total number of RTP-MUX Uplink Bytes dropped with cause Miscellaneous. Trigger: When RTP-MUX Uplink Bytes are dropped by HNB-GW with cause Miscellaneous. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-mux-rtp-stream-rcvd	Indicates the total number of RTP-MUX RTP Stream received. Trigger: When RTP-MUX RTP Stream are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-mux-rtp-stream-dropped	Indicates the total number of RTP-MUX RTP Stream Dropped. Trigger: When RTP-MUX RTP Stream are Dropped by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rtp-mux-rtp-stream-dropped-misc	Indicates the total number of RTP-MUX RTP Stream Dropped with cause Miscellaneous. Trigger: When RTP-MUX RTP Stream are Dropped by HNB-GW with cause Miscellaneous. Availability: Across all HNB-GW Services	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 32

HNBGW-RUA Schema Statistics

The HNBGW-RUA schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 32. Bulk Statistic Variables in the HNBGW-RUA Schema

Variables	Description	Data Type
vpnname	Indicates the name of the context in which HNB-GW service is configured. This is a key variable.	String

Common Syntax Options

Variables	Description	Data Type
vpnid	Indicates the identity number of the context in which HNB-GW service is configured. This is a key variable.	String
servname	Indicates the name of the HNB-GW service for which statistics are collected or displayed. This is a key variable.	String
cs-connect-rx	RUA CS Domain: Indicates the total number of Connect message received. Trigger: When RUA CS Domain Connect message is received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
cs-connect-rx-est-cause-emergency	RUA CS Domain: Indicates the total number of Connect message received with Establishment cause - Emergency Call. Trigger: When RUA CS Domain Connect message is received by HNB-GW with Establishment cause - Emergency Call. Availability: Across all HNB-GW Services	Unsigned Int32
cs-connect-rx-est-cause-normal	RUA CS Domain: Indicates the total number of Connect message received with Establishment cause - Normal. Trigger: When RUA CS Domain Connect message is received by HNB-GW with Establishment cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
cs-connect-tx	RUA CS Domain: Indicates the total number of Connect message transmitted. Trigger: When RUA CS Domain Connect message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
cs-dir-transfer-rx	RUA CS Domain: Indicates the total number of Direct Transfer message received. Trigger: When RUA CS Domain Direct Transfer message received. Availability: Across all HNB-GW Services	Unsigned Int32
cs-dir-transfer-tx	RUA CS Domain: Indicates the total number of Direct Transfer message transmitted. Trigger: When RUA CS Domain Direct Transfer message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received. Trigger: When RUA CS Domain Disconnect (with payload) message received. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-normal	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Radio Network Layer cause - Normal. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-connect-failed	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Radio Network Layer cause - Connect failed. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-disc-payload-rx-nw-rel	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Radio Network Layer cause - Network release. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-rnl- unspecified	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Radio Network Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-trans- res-unavailable	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Transport Layer cause - Transport resource unavailable. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-trans- unspecified	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Transport Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-trans- syn-err	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Transfer syntax error. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-abs- syn-err-rej	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-abs- syn-err-ign-notify	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-msg- not-comp	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Msg not compatible with receiver state. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx- semantic-err	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Semantic error. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
cs-disc-payload-rx-prot- unspecified	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx- falsely-construct-msg	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Abstract syntax error (Falsely constructed message). Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed message). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx- processing-overload	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Miscellaneous cause - Processing Overload. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-hw- failure	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Miscellaneous cause - Hardware Failure. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-oam- intervention	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Miscellaneous cause - O&M Intervention. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-rx-misc- unspecified	RUA CS Domain: Indicates the total number of Disconnect (with payload) message received with Miscellaneous cause - Unspecified. Trigger: When RUA CS Domain Disconnect (with payload) message is received by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted. Trigger: When RUA CS Domain Disconnect (with payload) message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-normal	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Radio Network Layer cause - Normal. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx- connect-failed	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Radio Network Layer cause - Connect failed. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-disc-payload-tx-nw-rel	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Radio Network Layer cause - Network release. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-rrl- unspecified	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Radio Network Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-trans- res-unavailable	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Transport Layer cause - Transport resource unavailable. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-trans- unspecified	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Transport Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-trans- syn-err	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Transfer syntax error. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-abs- syn-err-rej	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-abs- syn-err-ign-notify	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-msg- not-comp	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Msg not compatible with receiver state. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx- semantic-err	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Semantic error. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
cs-disc-payload-tx-prot- unspecified	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-falsely- construct-msg	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx- processing-overload	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Miscellaneous cause - Processing Overload. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-hw- failure	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Miscellaneous cause - Hardware Failure. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-oam- intervention	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Miscellaneous cause - O&M Intervention. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-payload-tx-misc- unspecified	RUA CS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Miscellaneous cause - Unspecified. Trigger: When RUA CS Domain Disconnect (with payload) message is transmitted by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received. Trigger: When RUA CS Domain Disconnect (without payload) message received. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx- normal	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Radio Network Layer cause - Normal. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx- connect-failed	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Radio Network Layer cause - Connect failed. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-disc-wo-payload-rx-nw-rel	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Radio Network Layer cause - Network release. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-rl-unspecified	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Radio Network Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-trans-res-unavailable	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Transport Layer cause - Transport resource unavailable. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-trans-unspecified	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Transport Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-trans-syn-err	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Transfer syntax error. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-abs-syn-err-rej	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-abs-syn-err-ign-notify	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-msg-not-comp	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Msg not compatible without receiver state. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Msg not compatible without receiver state. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
cs-disc-wo-payload-rx-semantic-err	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Semantic error. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-prot-unspecified	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-falsely-construct-msg	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-processing-overload	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Miscellaneous cause - Processing Overload. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-hw-failure	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Miscellaneous cause - Hardware Failure. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-oam-intervention	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Miscellaneous cause - O&M Intervention. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-rx-misc-unspecified	RUA CS Domain: Indicates the total number of Disconnect (without payload) message received with Miscellaneous cause - Unspecified. Trigger: When RUA CS Domain Disconnect (without payload) message is received by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted. Trigger: When RUA CS Domain Disconnect (without payload) message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-normal	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Radio Network Layer cause - Normal. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-disc-wo-payload-tx-connect-failed	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Radio Network Layer cause - Connect failed. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-nw-rel	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Radio Network Layer cause - Network release. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-rnl-unspecified	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Radio Network Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-trans-res-unavailable	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Transport Layer cause - Transport resource unavailable. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-trans-unspecified	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Transport Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-trans-syn-err	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Transfer syntax error. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-abs-syn-err-rej	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-abs-syn-err-ign-notify	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
cs-disc-wo-payload-tx-msg-not-comp	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Msg not compatible without receiver state. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Msg not compatible without receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-semantic-err	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Semantic error. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-prot-undefined	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Unspecified. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-falsely-construct-msg	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-processing-overload	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Miscellaneous cause - Processing Overload. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-hw-failure	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Miscellaneous cause - Hardware Failure. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-oam-intervention	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Miscellaneous cause - O&M Intervention. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32
cs-disc-wo-payload-tx-misc-undefined	RUA CS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Miscellaneous cause - Unspecified. Trigger: When RUA CS Domain Disconnect (without payload) message is transmitted by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-conn-less-trans-rx	RUA CS Domain: Indicates the total number of Connectionless Transfer message received. Trigger: When RUA CS Domain Connectionless Transfer message received. Availability: Across all HNB-GW Services	Unsigned Int32
cs-conn-less-trans-tx	RUA CS Domain: Indicates the total number of Connectionless Transfer message transmitted. Trigger: When RUA CS Domain Connectionless Transfer message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx	RUA CS Domain: Indicates the total number of Error Indication message received. Trigger: When RUA CS Domain Error Indication message received. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-normal	RUA CS Domain: Indicates the total number of Error Indication message received with Radio Network Layer cause - Normal. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-connect-failed	RUA CS Domain: Indicates the total number of Error Indication message received with Radio Network Layer cause - Connect failed. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-nw-rel	RUA CS Domain: Indicates the total number of Error Indication message received with Radio Network Layer cause - Network release. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-rnl-unspecified	RUA CS Domain: Indicates the total number of Error Indication message received with Radio Network Layer cause - Unspecified. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-trans-res-unavailable	RUA CS Domain: Indicates the total number of Error Indication message received with Transport Layer cause - Transport resource unavailable. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-trans-unspecified	RUA CS Domain: Indicates the total number of Error Indication message received with Transport Layer cause - Unspecified. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-trans-syn-err	RUA CS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Transfer syntax error. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
cs-err-ind-rx-abs-syn-err-rej	RUA CS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-abs-syn-err-ign-notify	RUA CS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-msg-not-comp	RUA CS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Msg not compatible with receiver state. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-semantic-err	RUA CS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Semantic error. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-prot-unspecified	RUA CS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Unspecified. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-falsely-construct-msg	RUA CS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-processing-overload	RUA CS Domain: Indicates the total number of Error Indication message received with Miscellaneous cause - Processing Overload. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-hw-failure	RUA CS Domain: Indicates the total number of Error Indication message received with Miscellaneous cause - Hardware Failure. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-rx-oam-intervention	RUA CS Domain: Indicates the total number of Error Indication message received with Miscellaneous cause - O&M Intervention. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-err-ind-rx-misc-unspecified	RUA CS Domain: Indicates the total number of Error Indication message received with Miscellaneous cause - Unspecified. Trigger: When RUA CS Domain Error Indication message is received by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx	RUA CS Domain: Indicates the total number of Error Indication message transmitted. Trigger: When RUA CS Domain Error Indication message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-normal	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Normal. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-connect-failed	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Connect failed. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-nw-rel	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Network release. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-rnl-unspecified	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Unspecified. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-trans-res-unavailable	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Transport Layer cause - Transport resource unavailable. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-trans-unspecified	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Transport Layer cause - Unspecified. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-trans-syn-err	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Transfer syntax error. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
cs-err-ind-tx-abs-syn-err-rej	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-abs-syn-err-ign-notify	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-msg-not-comp	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Msg not compatible with receiver state. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-semantic-err	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Semantic error. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-prot-unspecified	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Unspecified. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-falsely-construct-msg	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-processing-overload	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Miscellaneous cause - Processing Overload. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-hw-failure	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Miscellaneous cause - Hardware Failure. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
cs-err-ind-tx-oam-intervention	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Miscellaneous cause - O&M Intervention. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
cs-err-ind-tx-misc-unspecified	RUA CS Domain: Indicates the total number of Error Indication message transmitted with Miscellaneous cause - Unspecified. Trigger: When RUA CS Domain Error Indication message is transmitted by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-connect-rx	RUA PS Domain: Indicates the total number of Connect message received. Trigger: When RUA PS Domain Connect message received. Availability: Across all HNB-GW Services	Unsigned Int32
ps-connect-rx-est-cause-emergency	RUA PS Domain: Indicates the total number of Connect message received with Establishment cause - Emergency Call. Trigger: When RUA PS Domain Connect message is received by HNB-GW with Establishment cause - Emergency Call. Availability: Across all HNB-GW Services	Unsigned Int32
ps-connect-rx-est-cause-normal	RUA PS Domain: Indicates the total number of Connect message received with Establishment cause - Normal. Trigger: When RUA PS Domain Connect message is received by HNB-GW with Establishment cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
ps-connect-tx	RUA PS Domain: Indicates the total number of Connect message transmitted. Trigger: When RUA PS Domain Connect message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
ps-dir-transfer-rx	RUA PS Domain: Indicates the total number of Direct Transfer message received. Trigger: When RUA PS Domain Direct Transfer message received. Availability: Across all HNB-GW Services	Unsigned Int32
ps-dir-transfer-tx	RUA PS Domain: Indicates the total number of Direct Transfer message transmitted. Trigger: When RUA PS Domain Direct Transfer message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received. Trigger: When RUA PS Domain Disconnect (with payload) message received. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-normal	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Radio Network Layer cause - Normal. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-connect-failed	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Radio Network Layer cause - Connect failed. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
ps-disc-payload-rx-nw-rel	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Radio Network Layer cause - Network release. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-rl- unspecified	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Radio Network Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-trans- res-unavailable	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Transport Layer cause - Transport resource unavailable. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-trans- unspecified	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Transport Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-trans- syn-err	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Transfer syntax error. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-abs- syn-err-rej	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-abs- syn-err-ign-notify	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-msg- not-comp	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Msg not compatible with receiver state. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx- semantic-err	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Semantic error. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-disc-payload-rx-prot-unspecified	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-falsely-construct-msg	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-hw-failure	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Miscellaneous cause - Hardware Failure. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-oam-intervention	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Miscellaneous cause - O&M Intervention. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-rx-misc-unspecified	RUA PS Domain: Indicates the total number of Disconnect (with payload) message received with Miscellaneous cause - Unspecified. Trigger: When RUA PS Domain Disconnect (with payload) message is received by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted. Trigger: When RUA PS Domain Disconnect (with payload) message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-normal	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Radio Network Layer cause - Normal. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-connect-failed	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Radio Network Layer cause - Connect failed. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-disc-payload-tx-nw-rel	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Radio Network Layer cause - Network release. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-rnl- unspecified	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Radio Network Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-trans- res-unavailable	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Transport Layer cause - Transport resource unavailable. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-trans- unspecified	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Transport Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-trans- syn-err	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Transfer syntax error. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-abs- syn-err-rej	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-abs- syn-err-ign-notify	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-msg- not-comp	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Msg not compatible with receiver state. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx- semantic-err	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Semantic error. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-disc-payload-tx-prot-unspecified	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-falsely-construct-msg	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-processing-overload	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Miscellaneous cause - Processing Overload. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-hw-failure	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Miscellaneous cause - Hardware Failure. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-oam-intervention	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Miscellaneous cause - O&M Intervention. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-payload-tx-misc-unspecified	RUA PS Domain: Indicates the total number of Disconnect (with payload) message transmitted with Miscellaneous cause - Unspecified. Trigger: When RUA PS Domain Disconnect (with payload) message is transmitted by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received. Trigger: When RUA PS Domain Disconnect (without payload) message received. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-normal	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Radio Network Layer cause - Normal. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-connect-failed	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Radio Network Layer cause - Connect failed. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-disc-wo-payload-rx-nw-rel	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Radio Network Layer cause - Network release. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-ml-unspecified	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Radio Network Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-trans-res-unavailable	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Transport Layer cause - Transport resource unavailable. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-trans-unspecified	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Transport Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-trans-syn-err	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Transfer syntax error. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-abs-syn-err-rej	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-abs-syn-err-ign-notify	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-msg-not-comp	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Msg not compatible without receiver state. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Msg not compatible without receiver state. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-disc-wo-payload-rx-semantic-err	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Semantic error. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-prot-unspecified	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-falsely-construct-msg	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-processing-overload	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Miscellaneous cause - Processing Overload. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-hw-failure	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Miscellaneous cause - Hardware Failure. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-oam-intervention	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Miscellaneous cause - O&M Intervention. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-rx-misc-unspecified	RUA PS Domain: Indicates the total number of Disconnect (without payload) message received with Miscellaneous cause - Unspecified. Trigger: When RUA PS Domain Disconnect (without payload) message is received by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted. Trigger: When RUA PS Domain Disconnect (without payload) message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-normal	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Radio Network Layer cause - Normal. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-disc-wo-payload-tx-connect-failed	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Radio Network Layer cause - Connect failed. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-nw-rel	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Radio Network Layer cause - Network release. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-rnl-undefined	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Radio Network Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-trans-res-unavailable	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Transport Layer cause - Transport resource unavailable. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-trans-undefined	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Transport Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-trans-syn-err	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Transfer syntax error. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-abs-syn-err-rej	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-abs-syn-err-ign-notify	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-disc-wo-payload-tx-msg-not-comp	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Msg not compatible without receiver state. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Msg not compatible without receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-semantic-err	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Semantic error. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-prot-unspecified	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Unspecified. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-falsely-construct-msg	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-processing-overload	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Miscellaneous cause - Processing Overload. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-hw-failure	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Miscellaneous cause - Hardware Failure. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-oam-intervention	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Miscellaneous cause - O&M Intervention. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32
ps-disc-wo-payload-tx-misc-unspecified	RUA PS Domain: Indicates the total number of Disconnect (without payload) message transmitted with Miscellaneous cause - Unspecified. Trigger: When RUA PS Domain Disconnect (without payload) message is transmitted by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-conn-less-trans-rx	RUA PS Domain: Indicates the total number of Connectionless Transfer message transmitted. Trigger: When RUA PS Domain Connectionless Transfer message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
ps-conn-less-trans-tx	RUA PS Domain: Indicates the total number of Connectionless Transfer message transmitted. Trigger: When RUA PS Domain Connectionless Transfer message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx	RUA PS Domain: Indicates the total number of Error Indication message received. Trigger: When RUA PS Domain Error Indication message received. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-normal	RUA PS Domain: Indicates the total number of Error Indication message received with Radio Network Layer cause - Normal. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-connect-failed	RUA PS Domain: Indicates the total number of Error Indication message received with Radio Network Layer cause - Connect failed. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-nw-rel	RUA PS Domain: Indicates the total number of Error Indication message received with Radio Network Layer cause - Network release. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-ml-unspecified	RUA PS Domain: Indicates the total number of Error Indication message received with Radio Network Layer cause - Unspecified. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-trans-res-unavailable	RUA PS Domain: Indicates the total number of Error Indication message received with Transport Layer cause - Transport resource unavailable. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-trans-unspecified	RUA PS Domain: Indicates the total number of Error Indication message received with Transport Layer cause - Unspecified. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-trans-syn-err	RUA PS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Transfer syntax error. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-err-ind-rx-abs-syn-err-rej	RUA PS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-abs-syn-err-ign-notify	RUA PS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-msg-not-comp	RUA PS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Msg not compatible with receiver state. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-semantic-err	RUA PS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Semantic error. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-prot-unspecified	RUA PS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Unspecified. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-falsely-construct-msg	RUA PS Domain: Indicates the total number of Error Indication message received with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-processing-overload	RUA PS Domain: Indicates the total number of Error Indication message received with Miscellaneous cause - Processing Overload. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-hw-failure	RUA PS Domain: Indicates the total number of Error Indication message received with Miscellaneous cause - Hardware Failure. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-rx-oam-intervention	RUA PS Domain: Indicates the total number of Error Indication message received with Miscellaneous cause - O&M Intervention. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
ps-err-ind-rx-misc- unspecified	RUA PS Domain: Indicates the total number of Error Indication message received with Miscellaneous cause - Unspecified. Trigger: When RUA PS Domain Error Indication message is received by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx	RUA PS Domain: Indicates the total number of Error Indication message transmitted. Trigger: When RUA PS Domain Error Indication message transmitted. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-normal	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Normal. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Normal. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-connect- failed	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Connect failed. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Connect failed. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-nw-rel	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Network release. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Network release. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-rl- unspecified	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Radio Network Layer cause - Unspecified. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Radio Network Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-trans-res- unavailable	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Transport Layer cause - Transport resource unavailable. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Transport Layer cause - Transport resource unavailable. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-trans- unspecified	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Transport Layer cause - Unspecified. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Transport Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-trans-syn-err	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Transfer syntax error. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Transfer syntax error. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-err-ind-tx-abs-syn-err-rej	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Abstract syntax error (Reject). Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Reject). Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-abs-syn-err-ign-notify	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Ignore and Notify). Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-msg-not-comp	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Msg not compatible with receiver state. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Msg not compatible with receiver state. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-semantic-err	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Semantic error. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Semantic error. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-prot-unspecified	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Unspecified. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-falsely-construct-msg	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Protocol Layer cause - Abstract syntax error (Falsely constructed msg). Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-processing-overload	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Miscellaneous cause - Processing Overload. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Miscellaneous cause - Processing Overload. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-hw-failure	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Miscellaneous cause - Hardware Failure. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Miscellaneous cause - Hardware Failure. Availability: Across all HNB-GW Services	Unsigned Int32
ps-err-ind-tx-oam-intervention	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Miscellaneous cause - O&M Intervention. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Miscellaneous cause - O&M Intervention. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
ps-err-ind-tx-misc- unspecified	RUA PS Domain: Indicates the total number of Error Indication message transmitted with Miscellaneous cause - Unspecified. Trigger: When RUA PS Domain Error Indication message is transmitted by HNB-GW with Miscellaneous cause - Unspecified. Availability: Across all HNB-GW Services	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 33

HNBGW-SCTP Schema Statistics

The HNBGW-SCTP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 33. Bulk Statistic Variables in the HNBGW-SCTP Schema

Variables	Description	Data Type
vpnname	Indicates the name of the context in which HNB-GW service is configured. This is a key variable.	String

■ Common Syntax Options

Variables	Description	Data Type
vpnid	Indicates the identity number of the context in which HNB-GW service is configured. This is a key variable.	String
servname	Indicates the name of the HNB-GW service for which statistics are collected. This is a key variable.	String
trans-sctp-data-init-chunks	Indicates the total number of SCTP packets transmitted for Init Chunks. Trigger: Increases when SCTP Data for Init Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-init-ack-chunks	Indicates the total number of SCTP packets transmitted for Init Ack Chunks. Trigger: Increases when SCTP Data for Init Ack Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-shutdown-chunks	Indicates the total number of SCTP packets transmitted for Shutdown Chunks. Trigger: Increases when SCTP Data for Shutdown Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-shutdown-ack-chunks	Indicates the total number of SCTP packets transmitted for Shutdown Ack Chunks. Trigger: Increases when SCTP Data for Shutdown Ack Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-cookie-chunks	Indicates the total number of SCTP packets transmitted for Cookie Chunks. Trigger: Increases when SCTP Data for Cookie Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-cookie-ack-chunks	Indicates the total number of SCTP packets transmitted for Cookie Ack Chunks. Trigger: Increases when SCTP Data for Cookie Ack Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-data-chunks	Indicates the total number of SCTP packets transmitted for Data Chunks. Trigger: Increases when SCTP Data for Data Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-data-ack-chunks	Indicates the total number of SCTP packets transmitted for Data Ack Chunks. Trigger: Increases when SCTP Data for Data Ack Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-shutdown-comp-chunks	Indicates the total number of SCTP packets transmitted for Shutdown Complete Chunks. Trigger: Increases when SCTP Data for Shutdown Complete Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
trans-sctp-data-heartbeat-chunks	Indicates the total number of SCTP packets transmitted for Heartbeat Chunks. Trigger: Increases when SCTP Data for Heartbeat Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-heartbeat-ack-chunks	Indicates the total number of SCTP packets transmitted for HeartBeat Ack Chunks. Trigger: Increases when SCTP Data for HeartBeat Ack Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-abort-chunks	Indicates the total number of SCTP packets transmitted for Abort Chunks. Trigger: Increases when SCTP Data for Abort Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
trans-sctp-data-error-chunks	Indicates the total number of SCTP packets transmitted for Error Chunks. Trigger: Increases when SCTP Data for Error Chunks are transmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-init-chunks	Indicates the total number of SCTP packets received for Init Chunks. Trigger: Increases when SCTP Data for Init Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-init-ack-chunks	Indicates the total number of SCTP packets received for Init Ack Chunks. Trigger: Increases when SCTP Data for Init Ack Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-shutdown-chunks	Indicates the total number of SCTP packets received for Shutdown Chunks. Trigger: Increases when SCTP Data for Shutdown Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-shutdown-ack-chunks	Indicates the total number of SCTP packets received for Shutdown Ack Chunks. Trigger: Increases when SCTP Data for Shutdown Ack Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-cookie-chunks	Indicates the total number of SCTP packets received for Cookie Chunks. Trigger: Increases when SCTP Data for Cookie Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-cookie-ack-chunks	Indicates the total number of SCTP packets received for Cookie Ack Chunks. Trigger: Increases when SCTP Data for Cookie Ack Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
rcvd-sctp-data-data-chunks	Indicates the total number of Sctp packets received for Data Chunks. Trigger: Increases when Sctp Data for Data Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-data-ack-chunks	Indicates the total number of Sctp packets received for Data Ack Chunks. Trigger: Increases when Sctp Data for Data Ack Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-shutdown-comp-chunks	Indicates the total number of Sctp packets received for Shutdown Complete Chunks. Trigger: Increases when Sctp Data for Shutdown Complete Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-heartbeat-chunks	Indicates the total number of Sctp packets received for Heartbeat Chunks. Trigger: Increases when Sctp Data for Heartbeat Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-heartbeat-ack-chunks	Indicates the total number of Sctp packets received for HeartBeat Ack Chunks. Trigger: Increases when Sctp Data for HeartBeat Ack Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-abort-chunks	Indicates the total number of Sctp packets received for Abort Chunks. Trigger: Increases when Sctp Data for Abort Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
rcvd-sctp-data-error-chunks	Indicates the total number of Sctp packets received for Error Chunks. Trigger: Increases when Sctp Data for Error Chunks are received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
retrans-sctp-data-init-chunks	Indicates the total number of Sctp packets retransmitted for Init Chunks. Trigger: Increases when Sctp Data for Init Chunks are retransmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
retrans-sctp-data-shutdown-chunks	Indicates the total number of Sctp packets retransmitted for Shutdown Chunks. Trigger: Increases when Sctp Data for Shutdown Chunks are retransmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
retrans-sctp-data-shutdown-ack-chunks	Indicates the total number of Sctp packets retransmitted for Shutdown Ack Chunks. Trigger: Increases when Sctp Data for Shutdown Ack Chunks are retransmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

Variables	Description	Data Type
retrans-sctp-data-data-chunks	Indicates the total number of SCTP packets retransmitted for Data Chunks. Trigger: Increases when SCTP Data for Data Chunks are retransmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
retrans-sctp-data-cookie-chunks	Indicates the total number of SCTP packets retransmitted for Cookie Chunks. Trigger: Increases when SCTP Data for Cookie Chunks are retransmitted by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
total-bytes-sent-to-lower-layer	Indicates the total number of SCTP bytes sent to the lower layer. Trigger: Increases when bytes sent to lower layer by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
total-bytes-rcvd-from-lower-layer	Indicates the total number of SCTP bytes received from lower layer. Trigger: Increases when bytes from lower layer received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
total-packets-sent-to-lower-layer	Indicates the total number of SCTP packets sent to the lower layer. Trigger: Increases when packets sent to lower layer by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32
total-packets-rcvd-from-lower-layer	Indicates the total number of SCTP packets received from lower layer. Trigger: Increases when packets from lower layer received by HNB-GW. Availability: Across all HNB-GW Services	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 34

HSGW Schema Statistics

The HSGW schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HSGW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 34. Bulk Statistic Variables in the HSGW Schema

Variables	Description	Data Type
-----------	-------------	-----------

Common Syntax Options

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the HSGW service. This is a key variable.	String
vpnid	The identification number of the context configured on the system that is currently facilitating the HSGW service. This is an internal reference number. This is a key variable. Type: Gauge	Int32
servname	Displays the name of the HSGW service for which the statistics are displayed. This is a key variable.	String
servid	The identification number of the service configured on the system that is currently facilitating the HSGW service. This is an internal reference number. This is a key variable. Type: Gauge	Int32
sessstat-totcur-ue	Session Statistics - Total Current - UE Active Type: Gauge	Int32
sessstat-totcur-pdn	Session Statistics - Total Current - PDN Type: Gauge	Int32
sessstat-totcur-bearers	Session Statistics - Total Current - Bearers Type: Gauge	Int32
sessstat-totsetup-ue	Session Statistics - Total Setup - UE	Int32
sessstat-totsetup-pdn	Session Statistics - Total Setup - PDN	Int32
sessstat-totsetup-bearers	Session Statistics - Total Setup - Bearers	Int32
sessstat-pdnsetuptype-ipv4	Session Statistics - Total PDNs Setup Per PDN-type - IPv4	Int32
sessstat-pdnsetuptype-ipv4v6	Session Statistics - Total PDNs Setup Per PDN-type - IPv4v6	Int32
sessstat-pdnrel-ipv4	Session Statistics - Total PDNs Released - IPv4Ctr32Servicesessstat	Int32
sessstat-pdnrel-ipv6	Session Statistics - Total PDNs Released - IPv6	Int32
sessstat-pdnrel-ipv4v6	Session Statistics - Total PDNs Released - IPv4v6	Int32
sessstat-pdnrelrsn-pcf	Session Statistics - Total PDNs Released Reason - PCFMME Ini	Int32
sessstat-pdnrelrsn-pgw	Session Statistics - Total PDNs Released Reason -PGW Ini	Int32
sessstat-pdnrelrsn-pcrf	Session Statistics - Total PDNs Released Reason -PCRF Ini	Int32
sessstat-pdnrelrsn-local	Session Statistics - Total PDNs Released Reason -Local	Int32
sessstat-pdnrelrsn-other	Session Statistics - Total PDNs Released Reason -Other	Int32
sessstat-pdnrej-ipv4	Session Statistics - Total PDNs Rejected - IPv4	Int32

Variables	Description	Data Type
sessstat-pdnrej-ipv6	Session Statistics - Total PDNs Rejected - IPv6	Int32
sessstat-pdnrej-ipv4v6	Session Statistics - Total PDNs Rejected - IPv4v6	Int32
sessstat-pdnrejrns-pgw	Session Statistics - Total PDNs Rejected Reason - PGW Reject	Int32
sessstat-pdnrejrns-apnauth	Session Statistics - Total PDNs Rejected Reason - APN Auth FailureLicense	Int32
sessstat-pdnrejrns-other	Session Statistics - Total PDNs Rejected Reason - OtherNewcall Policy	Int32
sessstat-pdnrejrns-pgwrej	Session Statistics - Total PDNs Rejected Reason - No PGW AvailableOverload	Int32
sessstat-pdnrejrns-pdnexists	Session Statistics - Total PDNs Rejected Reason - PDN Already ExisCongestion	Int32
sessstat-pdnrejrns-adminrej	Session Statistics - Total PDNs Rejected Reason - Admin Prohibited	Int32
sessstat-pdnrejrns-limitexceed	Session Statistics - Total PDNs Rejected Reason - PDN Limit ExceededOther	Int32
sessstat-pdnrejrns-unreach	Session Statistics - Total PDNs Rejected Reason - PDN GW Unreachable	Int32
sessstat-pdnrejrns-rscunavail	Session Statistics - Total PDNs Rejected Reason - Resource Unavailable	Int32
sessstat-pdnrejrns-sublimit	Session Statistics - Total PDNs Rejected Reason - Subscription Limitation	Int32
sessstat-totinter-ho	Session Statistics - HandOff Statistics - Total Inter HSGW HO	Int32
sessstat-totintra-ho	Session Statistics - HandOff Statistics - Total Intra HSGW HO	Int32
sessstat-active	Session Statistics - HandOff Statistics - Active	Int32
sessstat-dormant	Session Statistics - HandOff Statistics - Dormant	Int32
sessstat-a10s-totcur	Session Statistics - A10 Statistics - Total A10s Current	Int32
sessstat-a10s-maincur	Session Statistics - A10 Statistics - Main A10s Current	Int32
sessstat-a10s-auxcur	Session Statistics - A10 Statistics - Aux A10s Current	Int32
sessstat-a10s-totsetup	Session Statistics - A10 Statistics - Total A10s Setup	Int32
sessstat-a10s-mainsetup	Session Statistics - A10 Statistics - Main A10s Setup	Int32
sessstat-a10s-auxsetup	Session Statistics - A10 Statistics - Aux A10s Setup	Int32
sessstat-a10s-totrel	Session Statistics - A10 Statistics - Total A10s Released	Int32
sessstat-a10s-mainrel	Session Statistics - A10 Statistics - Main A10s Released	Int32
sessstat-a10s-auxrel	Session Statistics - A10 Statistics - Aux A10s Released	Int32
totepsbearsetup-qci1	Total EPS Bearers Setup - QCI 1	Int32

Common Syntax Options

Variables	Description	Data Type
totepsbearsetup-qci2	Total EPS Bearers Setup - QCI 2	Int32
totepsbearsetup-qci3	Total EPS Bearers Setup - QCI 3	Int32
totepsbearsetup-qci4	Total EPS Bearers Setup - QCI 4	Int32

datastat-downlink-qci7totpkt	Data Statistics - Downlink Statistics - QCI 7 Total-Packets	Int64
datastat-downlink-qci8totbyte	Data Statistics - Downlink Statistics - QCI 8 Total-Bytes	Int64

Variables	Description	Data Type
datastat-downlink-qci8totpkt	Data Statistics - Downlink Statistics - QCI 8 Total-Packets	Int64
datastat-downlink-qci9totbyte	Data Statistics - Downlink Statistics - QCI 9 Total-Bytes	Int64
datastat-downlink-qci9totpkt	Data Statistics - Downlink Statistics - QCI 9 Total-Packets	Int64
datastat-downlink-othertotbyte	Data Statistics - Downlink Statistics - Other Total-Bytes	Int64
datastat-downlink-othertotpkt	Data Statistics - Downlink Statistics - Other Total-Packets	Int64

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 35

IMSA Schema Statistics

The IMSA schema provides operational statistics that can be used for monitoring and troubleshooting Gx, Gxx, and Ty interface functionality used by the following products: GGSN, HA, HSGW, IPSG, PDSN, P-GW, S-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 35. Bulk Statistic Variables in the IMSA Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	Description: The name of the context configured on the system that is currently facilitating the IMS Authorization service. This is a key variable. Availability: Per system Type: Information	String
vpnid	Description: The identification number of the context configured on the system that is currently facilitating the IMS Authorization service. This is an internal reference number. This is a key variable. Availability: Per system Type: Information	Int32
servname	Description: The name of the IMS Authorization service for which the statistics are displayed. This is a key variable. Availability: Per system Type: Information	String
servid	Description: The identification number of the service configured on the system that is currently facilitating the IMS Authorization service. This is an internal reference number. This is a key variable. Availability: Per system Type: Information	Int32
dpca-cursess	Description: The total number of DPCA sessions currently active on this system. Triggers: Increments when DPCA session is created Decrements when DPCA session is terminated Availability: Per IMS authorization service Type: Gauge	Int32
dpca-imsaadd	Description: The total number of DPCA sessions created. Triggers: Increments when DPCA receives a create request Availability: Per IMS authorization service	Int32
dpca-start	Description: The total number of CCR Initial request messages sent. Triggers: Increments whenever CCR-I message is sent Availability: Per IMS authorization service	Int32
dpca-seccreate	Description: The total number of UE Initiated Secondary contexts created in the system. Triggers: Increments when a UE initiated secondary bearer is created Availability: Per IMS authorization service	Int32
dpca-secterm	Description: The total number of secondary contexts deleted for DPCA sessions on this system. Triggers: Increments when a UE initiated secondary bearer is terminated Availability: Per IMS authorization service	Int32
dpca-sessupd	Description: The total number of updates to DPCA sessions on this system. Triggers: Increments whenever a CCR-U message is sent Availability: Per IMS authorization service	Int32
dpca-term	Description: The total number of DPCA sessions terminated. Triggers: Increments when a IMSA session is terminated Availability: Per IMS authorization service	Int32

Variables	Description	Data Type
dpca-msg-recv	Description: The total number of DPCA messages received by IMS authorization services configured on this system. Triggers: Increments whenever any DPCA message is received Availability: Per IMS authorization service	Int32
dpca-msg-sent	Description: The total number of DPCA messages sent by IMS authorization services configured on this system. Triggers: Increments whenever any DPCA message is sent out of the chassis Availability: Per IMS authorization service	Int32
dpca-msg-ccr	Description: The total number of DPCA credit control request messages sent by IMS authorization services configured on this system. Triggers: Increments when a CCR message is sent Availability: Per IMS authorization service	Int32
dpca-msg-cca	Description: The total number of DPCA credit control answer messages received by IMS authorization services configured on this system. Triggers: Increments when a CCA message is received Availability: Per IMS authorization service	Int32
dpca-msg-ccrinit	Description: The total number of initial DPCA credit control request messages sent by IMS authorization services configured on this system. Triggers: Increments when a CCR-I message is sent Availability: Per IMS authorization service	Int32
dpca-msg-ccainit	Description: The total number of initial DPCA credit control accept messages received by IMS authorization services configured on this system. Triggers: Increments when a CCA-I message is received Availability: Per IMS authorization service	Int32
dpca-msg-ccainitacc	Description: The total number of initial DPCA credit control accept messages accepted in response to initial credit control request messages sent by IMS authorization services configured on this system. Triggers: Increments when a CCA-I message is accepted Availability: Per IMS authorization service	Int32
dpca-msg-ccainitrej	Description: The total number of initial DPCA credit control accept messages rejected in response to initial credit control request messages sent by IMS authorization services configured on this system. Triggers: Increments when a CCA-I message is rejected Availability: Per IMS authorization service	Int32
dpca-msg-ccrupd	Description: The total number of CCR Update messages sent. Triggers: Increments when a CCR-U message is sent Availability: Per IMS authorization service	Int32
dpca-msg-ccaupd	Description: The total number of CCA Update messages received. Triggers: Increments when a CCA-U message is received Availability: Per IMS authorization service	Int32

Variables	Description	Data Type
dpca-msg-ccauperror	Description: The total number of DPCA credit control accept messages received in response to credit control request update error messages sent by IMS authorization services configured on this system. Triggers: Increments when there is an error in CCA-U message Availability: Per IMS authorization service	Int32
dpca-msg-ccrfin	Description: The total number of CCR Terminate messages sent. Triggers: Increments when CCR-T message is sent Availability: Per IMS authorization service	Int32
dpca-msg-ccafin	Description: The total number of final DPCA credit control accept messages received in response to final credit control request messages sent by IMS authorization services configured on this system. Triggers: Increments when CCA-T message is received Availability: Per IMS authorization service	Int32
dpca-msg-ccafinerror	Description: The total number of final DPCA credit control accept messages received in response to final credit control request error messages sent by IMS authorization services configured on this system. Triggers: Increments when there is an error in CCA-T message Availability: Per IMS authorization service	Int32
dpca-msg-asr	Description: The total number of DPCA Abort-Session-Request messages received by IMS Authorization services configured on this system. Triggers: Increments when ASR message is sent (Not supported for 3GPP Rel. 7 standard and higher) Availability: Per IMS authorization service	Int32
dpca-msg-asa	Description: The total number of DPCA Abort-Session-Accept messages sent in response to Abort-Session-Request messages received by IMS Authorization services configured on this system. Triggers: Increments when ASA message is received Availability: Per IMS authorization service	Int32
dpca-msg-rar	Description: The total number of Re-Auth-Request messages received by IMS Authorization services configured on this system. Triggers: Increments when RAR message is received Availability: Per IMS authorization service	Int32
dpca-msg-raa	Description: The total number of DPCA Re-Auth-Accept messages sent in response to Re-Auth-Request messages received by IMS Authorization services configured on this system. Triggers: Increments when RAA message is sent Availability: Per IMS authorization service	Int32
dpca-msgerr-proto	Description: The total number of Diameter protocol error messages received by IMS Authorization services configured on this system. Triggers: Increments when result code of 3xxx is received Availability: Per IMS authorization service	Int32
dpca-msgerr-badans	Description: The total number of bad response/answer error messages received by IMS Authorization services configured on this system. Triggers: Increments when a bad answer error message is received Availability: Per IMS authorization service	Int32

Variables	Description	Data Type
dpca-msgerr-unksessreq	Description: The total number of error messages related to unknown session requests received by IMS Authorization services configured on this system. Triggers: Increments when RAR message is received for an unknown session Availability: Per IMS authorization service	Int32
dpca-msgerr-unkcomm	Description: The total number of error messages related to unknown command codes received by IMS Authorization services configured on this system. Triggers: Increments when a message with unknown command code is received Availability: Per IMS authorization service	Int32
dpca-msgerr-unsupcomm	Description: The total number of error messages related to unknown failure handling received by IMS Authorization services configured on this system. Triggers: Increments when an unsupported command is received Availability: Per IMS authorization service	Int32
dpca-term-diamlogout	Description: The total number of DPCA session terminations due to Diameter logouts. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32
dpca-term-servnotprov	Description: The total number of DPCA session terminations due to unavailability of service. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32
dpca-term-badans	Description: The total number of DPCA session terminations due to bad responses/answers. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32
dpca-term-admin	Description: The total number of DPCA session terminations due to administrative reasons. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32
dpca-term-linkbroken	Description: The total number of DPCA session terminations due to a broken link. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32
dpca-term-authexp	Description: The total number of DPCA session terminations due to expired authorization. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32
dpca-term-usermoved	Description: The total number of DPCA session terminations due to the subscriber moving to an unknown or non-serviceable area. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32
dpca-term-sesstmo	Description: The total number of DPCA session terminations due to sessions timing out. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32
dpca-term-authrej	Description: The total number of DPCA session terminations due to the authorization being rejected. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32

Variables	Description	Data Type
dpca-term-other	Description: The total number of DPCA session terminations due to unknown reasons or reasons not listed above. Triggers: Increments when a CCR-T message is sent with this term cause Availability: Per IMS authorization service	Int32
dpca-express-errinitparam	Description: The number of times DIAMETER_ERROR_INITIAL_PARAMETERS (5140) Experimental-Result-Code value was received in the Diameter CCA. Triggers: Increments when a CCA message is received with this experimental result code Availability: Per IMS authorization service	Int32
dpca-express-errtrigevt	Description: The number of times DIAMETER_ERROR_TRIGGER_EVENT (5141) Experimental-Result-Code value was received in the Diameter CCA. Triggers: Increments when a CCA message is received with this experimental result code Availability: Per IMS authorization service	Int32
dpca-express-bearnotauth	Description: The number of times DIAMETER_ERROR_BEARER_NOT_AUTHORIZED (5143) Experimental-Result-Code value was received in the Diameter CCA. Triggers: Increments when a CCA message is received with this experimental result code Availability: Per IMS authorization service	Int32
dpca-express-trafmaprej	Description: The number of times DIAMETER_ERROR_TRAFFIC_MAPPING_INFO_REJECTED (5144) Experimental-Result-Code value was received in the Diameter CCA. Triggers: Increments when a CCA message is received with this experimental result code Availability: Per IMS authorization service	Int32
dpca-express-pccruleevt	Description: The number of times DIAMETER_PCC_RULE_EVENT (5142) Experimental-Result-Code value was sent in the Diameter Re-Auth-Request (RAR). Triggers: Increments when a RAA message is sent with this experimental result code Availability: Per IMS authorization service	Int32
dpca-express-conflictingreq	Description: The number of Gx Experimental Result code. DIAMETER_ERROR_CONFLICTING_REQUEST (5147) error is used when the PCRF cannot accept the UE-initiated resource request as a network-initiated resource allocation is already in progress that covers the packet filters in the received UE-initiated resource request. The PCEF rejects the attempt for UE-initiated resource request. Triggers: Increments when a CCA message is received with this experimental result code Availability: Per IMS authorization service	Int32
dpca-express-bearerevt	Description: Tracks the number of Gx Experimental Transient Failures. DIAMETER_PCC_BEARER_EVENT (4141) error is used when for some reason a PCC rule cannot be enforced or modified successfully in a network initiated procedure. Affected PCC-Rules will be provided in the Charging-Rule-Report AVP including the reason and status. This is a Transient Failure. Triggers: Increments when a CCA message is received with this experimental result code Availability: Per IMS authorization service	Int32
dpca-express-badrescode	Description: The number of times an unknown Experimental-Result-Code value (apart from the ones recognized in CCA that are listed above PCC Rule Event) was received in the Diameter CCA. Triggers: Increments when this experimental result code is received in a CCA message Availability: Per IMS authorization service	Int32

Variables	Description	Data Type
dpca-peer-switch	Description: The total number of peer switches attempted. Triggers: Increments when performing a peer switch Availability: Per IMS authorization service	Int32
dpca-peer-switch-done	Description: The total number of peer switches successful. Triggers: Increments when a peer switch is done Availability: Per IMS authorization service	Int32
dpca-ccai-timeout	Description: The total number of CCA-I message timeouts. Triggers: Increments when Tx timer expires for CCA-I Availability: Per IMS authorization service	Int32
dpca-ccri-send-error	Description: The total number of CCR-I message send errors (DIABASE ERRORS), since the TCP connection to the peer is no longer available. Triggers: Increments when there is an error in sending CCR-I message Availability: Per IMS authorization service	Int32
dpca-ccai-unh-unk-rcode	Description: The total number of CCA-I messages received with unknown or unhandled result codes which have initiated the failure handling procedure configured for the any-error scenario. Triggers: Increments when there is an unknown result code in CCA-I message Availability: Per IMS authorization service	Int32
dpca-ccai-err-rcode	Description: The total number of CCA-I messages received with error result codes which have initiated the failure handling procedure configured for a particular or range of result codes. Triggers: Increments when there is a known error code in CCA-I message Availability: Per IMS authorization service	Int32
dpca-ccau-timeout	Description: The total number of CCA-U message timeouts. Triggers: Increments when Tx timer expires for CCA-U Availability: Per IMS authorization service	Int32
dpca-ccru-send-error	Description: The total number of CCR-U message send errors (DIABASE ERRORS), since the TCP connection to the peer is no longer available. Triggers: Increments when there is a diabase error while sending CCR-U message Availability: Per IMS authorization service	Int32
dpca-ccau-unh-unk-rcode	Description: The total number of CCA-U messages received with unknown or unhandled result codes which have initiated the failure handling procedure configured for the any-error scenario. Triggers: Increments when there is an unknown result code in CCA-U message Availability: Per IMS authorization service	Int32
dpca-ccau-err-rcode	Description: The total number of CCA-U messages received with error result codes which have initiated the failure handling procedure configured for a particular or range of result codes. Triggers: Increments when there is a known error code in CCA-U message Availability: Per IMS authorization service	Int32
dpca-ccat-timeout	Description: The total number of CCA-T message timeouts. Triggers: Increments when Tx timer expires for CCA-T Availability: Per IMS authorization service	Int32
dpca-c crt-send-error	Description: The total number of CCR-T message send errors (DIABASE ERRORS), since the TCP connection to the peer is no longer available. Triggers: Increments when there is a diabase error while sending CCR-T message Availability: Per IMS authorization service	Int32

Variables	Description	Data Type
dpca-ccat-unh-unk-rcode	Description: The total number of CCA-T messages received with unknown or unhandled result codes which have initiated the failure handling procedure configured for the any-error scenario. Triggers: Increments when there is an unknown result code in CCA-T message Availability: Per IMS authorization service	Int32
dpca-ccat-err-rcode	Description: The total number of CCA-T messages received with error result codes which have initiated the failure handling procedure configured for a particular or range of result codes. Triggers: Increments when there is a known error code in CCA-T message Availability: Per IMS authorization service	Int32
dpca-ccfh-continue	Description: The total number of times the failure handling action continue has been undertaken. Triggers: Increments when CCFH continue action is undertaken Availability: Per IMS authorization service	Int32
dpca-ccfh-retry-and-term	Description: The total number of times the failure handling action retry-and-terminate has been undertaken. Triggers: Increments when CCFH retry and terminate action is undertaken Availability: Per IMS authorization service	Int32
dpca-ccfh-terminate	Description: The total number of times the failure handling action terminate has been undertaken. Triggers: Increments when CCFH terminate action is undertaken Availability: Per IMS authorization service	Int32
dpca-unknown-reason	Description: The total number of sessions released due to unspecified reasons. Triggers: Increments when unspecified reason is received in Session Release Cause in RAR message Availability: Per IMS authorization service	Int32
dpca-ue-subscription-chngd	Description: The total number of sessions released due to a change in the UE subscription. Triggers: Increments when UE subscription reason is received in Session Release Cause in RAR message Availability: Per IMS authorization service	Int32
dpca-insuffent-srvr-resrce	Description: The total number of sessions released due to insufficient server resources. Triggers: Increments when insufficient resources are received in Session Release Cause in RAR message Availability: Per IMS authorization service	Int32
dpca-fail-connfh-totmsgtmo	Description: The total number of message timeouts. Triggers: Increments whenever Tx timeouts for CCA-I, CCA-U, and CCA-T Availability: Per IMS authorization service	Int32
dpca-fail-connfh-totmsgsenderr	Description: The total number of message send errors (DIABASE ERRORS), since the TCP connection to the peer is no longer available. Triggers: Increments when there is a diabase error while sending CCR-I, CCR-U, and CCR-T messages Availability: Per IMS authorization service	Int32
dpca-fail-rescodefh-confrescode	Description: The total number of messages received with error result codes which have initiated the failure handling procedure configured for a particular or range of result codes. Triggers: Increments when there is a known error result code in CCA-I, CCA-U, and CCA-T messages Availability: Per IMS authorization service	Int32

Variables	Description	Data Type
dpca-fail-rescodefh-unhunkrescode	<p>Description: The total number of messages received with unknown or unhandled result codes which have initiated the failure handling procedure configured for the any-error scenario.</p> <p>Triggers: Increments when there is an unknown error result code in CCA-I, CCA-U, and CCA-T messages</p> <p>Availability: Per IMS authorization service</p>	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 36

IP Pool Schema Statistics

The IP Pool schema provides operational statistics that can be used for monitoring and troubleshooting the following products: GGSN, HSGW, P-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 36. Bulk Statistic Variables in the IP Pool Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnid	The identification number of the context configured on the system where the IP pool is configured. This is a key variable. Type: Information	Int32
vpnname	The name of the context configured on the system where the IP pool is configured. This is a key variable. Type: Information	String
addr-type	The IPV6 pool address type. Type: Information	String
type	The type of IP pool. Output for this variable is one of three characters; P, R, or S: <ul style="list-style-type: none"> • P = Public • R = Private • S = Static Type: Information	String
state	The IP pool state. Output for this variable is one of three characters; G, D, or R: G = Good D = Pending Delete R = Resizing Type: Information	String
priority	The priority setting for the IP pool. Type: Information	Int32
name	The name of the IP pool. Type: Information	String
used	The number of IP addresses that have been assigned from the IP pool. Type: Gauge	Int32
hold	The number of IP addresses in the IP pool that are in a hold state. Type: Gauge	Int32
release	The number of IP addresses in the IP pool that are in a release state. Type: Gauge	Int32
free	The number of IP addresses in the IP pool that are available for use. Type: Gauge	Int32
startaddr	The starting address of the IP pool. Type: Information	String
groupname	The name of the pool group to which the IP pool belongs. Type: Information	String

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 37

IPSG Schema Statistics

The IPSG schema provides operational statistics that can be used for monitoring and troubleshooting the following products: IPSG

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 37. Bulk Statistic Variables in the IPSG Schema

Variables	Description	Data Type

Variables	Description	Data Type
vpnname	Description: Name of the VPN context in which the IPSG service is configured. This is a key variable. Triggers: Is updated when an IPSG service is configured. Availability: Per IPSG service. Type: Information.	String
vpnid	Description: Identification number of the VPN context in which the IPSG service is configured. This is a key variable. Triggers: Is updated when an IPSG service is configured. Availability: Per IPSG service. Type: Information.	Int32
servname	Description: Name of the IPSG service. This is a key variable. Triggers: Is updated when an IPSG service is configured. Availability: Per IPSG service. Type: Information.	String
servid	Description: Identification number of the service configured on the system that is currently facilitating the IPSG service. This is an internal reference number. This is a key variable. Triggers: Is updated when an IPSG service is configured. Availability: Per IPSG service. Type: Information.	Int32
total-start-req-rcv	Description: The total number of accounting start requests received by the IPSG service. Triggers: Increments when an accounting start message is sent from RADIUS client to IPSG. Availability: Per IPSG service. Type: Counter.	Int32
total-start-req-retrans-rcv	Description: The total number of accounting start request retransmissions received by the IPSG service. Triggers: Increments when a retransmitted Accounting-Start message is received. If Accounting-Start message comes again matching an established session with same IP address, Username+MSISDN, APN, NAS-IP-Address, Accounting-Session-ID, and Source-IP address of the IP packet, it is treated as retransmission. Availability: Per IPSG service. Type: Counter.	Int32
total-start-rsp-sent	Description: The total number of start responses sent by the IPSG service. Triggers: Increments when an accounting response is sent for Accounting-Start received by IPSG. Availability: Per IPSG service. Type: Counter.	Int32
total-interim-update-req-rcv	Description: The total number of interim update requests received by the IPSG service. Triggers: Increments when an interim message is received after call is up. Availability: Per IPSG service. Type: Counter.	Int32

Variables	Description	Data Type
total-stop-req-rcv	Description: The total number of stop requests received by the IPSG service. Triggers: Increments when an Accounting-Stop request is received. Availability: Per IPSG service. Type: Counter.	Int32
total-unknown-req-rcv	Description: The total number of unknown requests received by the IPSG service. Triggers: Increments when an accounting message has unknown request. Valid RADIUS requests are Accounting-Start, Accounting-Interim, Accounting-Stop, Accounting-On, Accounting-Off, Access Request. For all other RADIUS messages unknown req will be updated. Availability: Per IPSG service. Type: Counter.	Int32
total-rsp-sent	Description: The total number of responses sent by the IPSG service. Triggers: Increments with every response sent (auth response + accounting response + other messages). Availability: Per IPSG service. Type: Counter.	Int32
total-discard-msgs-unknown-clnt	Description: The total number of messages discarded by IPSG since they were received from an unknown client. Triggers: Increments if in accounting messages the IP address does not match the current RADIUS client subscriber. RADIUS client subscribers are configured in IPSG service. Availability: Per IPSG service. Type: Counter.	Int32
total-discard-msgs-ignore-interim	Description: The total number of RADIUS Accounting-Interim messages ignored by IPSG since they were received for non-existing sessions. Triggers: Increments on receiving RADIUS Accounting-Interim messages for non-existing session. If session creation based on Accounting-Interim is supported then this counter will never increment. Availability: Per IPSG service. Type: Counter.	Int32
total-discard-msgs-ignore-stop	Description: The total number of RADIUS Accounting-Stop messages ignored by IPSG since they were received for non-existing sessions. Triggers: Increments on receiving RADIUS Accounting-Stop messages for non-existing session. Availability: Per IPSG service. Type: Counter.	Int32
total-discard-msgs-incorrect-secret	Description: The total number of messages discarded by IPSG due to an incorrect secret. Triggers: Increments on mismatch of shared secrets between RADIUS client/IPSG and IPSG/RADIUS server. Availability: Per IPSG service. Type: Counter.	Int32
total-discard-msgs-attr-missing	Description: The total number of messages discarded by IPSG due to a missing attribute. Triggers: Increments if a RADIUS packet does not have the needed attributes. Availability: Per IPSG service. Type: Counter.	Int32

Variables	Description	Data Type
rad-servaddr	Description: IP address of the RADIUS server supporting the service. Triggers: Is updated when a RADIUS server is configured. Availability: Per IPSG service. Type: Information.	String
rad-servport	Description: Port number of the RADIUS server supporting the service. Triggers: Is updated when a RADIUS server is configured. Availability: Per IPSG service. Type: Information.	Int32

Chapter 38

LAC Schema Statistics

The LAC schema provides operational statistics that can be used for monitoring and troubleshooting the following products: PDSN, GGSN, HA.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 38. Bulk Statistic Variables in the LAC Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	Description: The name of the context configured on the system that is currently facilitating the LAC service. This is a key variable.	String
vpnid	Description: The identification number of the context configured on the system that is currently facilitating the LAC service. This is an internal reference number. This is a key variable.	Int32
servname	Description: Displays the name of the LAC service for which the statistics are displayed. This is a key variable.	String
tun-conn-attempt	Description: This proprietary counter indicates the total number of tunnel connection attempts. Triggers: - Incremented when a tunnel request is received or a new tunnel is started. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-conn-success	Description: This proprietary counter indicates the total number of successful tunnel connections. Triggers: - Incremented when a tunnel is established. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-conn-fail	Description: This proprietary counter indicates the total number of failed tunnel connections. Triggers: - Incremented when a tunnel connection failed. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-conn-curactive	Description: This proprietary counter indicates the total number of currently active tunnel connections. Triggers: - Incremented when a tunnel is established, decremented when a tunnel is released. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-attempts	Description: This proprietary counter indicates the total number of session connection attempts. Triggers: - Incremented when a session request is received or a new session is started. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-successful	Description: This proprietary counter indicates the total number of successful session connections. Triggers: - Incremented when a session is connected. Availability: per L2TP service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
sess-failed	Description: This proprietary counter indicates the total number of failed session connections. Triggers: - Incremented when a session connection failed. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-curactive	Description: This proprietary counter indicates the total number of currently active session connections. Triggers: - Incremented when a session is connected, decremented when a session is released. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-intrapdsnho-attempt	Description: This proprietary counter indicates the total number of Intra-PDSN Hand-Offs connection attempts. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-intrapdsnho-success	Description: This proprietary counter indicates the total number of successful Intra-PDSN Hand-Offs connections. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-intrapdsnho-failed	Description: This proprietary counter indicates the total number of failed Intra-PDSN Hand-Offs connections. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-interpdsnho-attempt	Description: This proprietary counter indicates the total number of Inter-PDSN Hand-Offs connection attempts. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-malformed	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to malformed packets . Triggers: - Incremented when a malformed packets is received. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-ctrlfield	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to control field errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-pktlen	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to packet length errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-avplen	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to AVP length errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
recv-err-protover	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to protocol version errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-md5	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to MD5 errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-invattr	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to invalid attribute errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-unkattr	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to unknown attribute errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-invsessid	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to invalid session ID errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-invstate	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to invalid state errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-unkmsg	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to unknown message errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-unmatchpktlen	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to unmatched packet length errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
recv-err-invtunid	Description: This proprietary counter indicates the total number of Tunnel Receive Control Packet errors experienced due to invalid tunnel length errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-genclear	Description: This proprietary counter indicates the total number of tunnels cleared normally. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-ctrlconnexists	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to a pre-existing control connection. Availability: per L2TP service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
tun-unauth	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to unauthorized errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-badproto	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to bad protocol errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-reqshutdown	Description: This proprietary counter indicates the total number of tunnel disconnects experienced due to requester shutdown. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-statemacherr	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to state machine errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-badlen	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to wrong length errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-oor	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to out-of-range errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-noresource	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to insufficient resources. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-vendspec	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to vendor-specific errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-tryanotherlns	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced resulting in “Try Another LNS” message generation. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-unkavp	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to unknown AVP with M-bit errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-ipsecdisc	Description: This proprietary counter indicates the total number of tunnel disconnects experienced due to IPSEC. Availability: per L2TP service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
tun-ipsecfail	Description: This proprietary counter indicates the total number of tunnel failures experienced due to IPSEC. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-license	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to license exceeded errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-newcallpoldisc	Description: This proprietary counter indicates the total number of tunnel disconnects experienced due to new call policies. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-maxretry	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to the maximum number of retries being exceeded. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-syslimit	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to reaching the system tunnel limit. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
tun-miscerr	Description: This proprietary counter indicates the total number of tunnel disconnects/failures experienced due to miscellaneous errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-nogeneral	Description: This proprietary counter indicates the total number of sessions for which there were no general errors experienced. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-admin	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to administrative reasons. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-lossofcarr	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to loss of carrier. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-remoteadmin	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to remote administrative reasons. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-nofactemp	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to temporary no facility available errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
sess-nofacperm	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to permanent no facility available errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-invdest	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to invalid destination errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-nocarrier	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due no carrier being detected. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-busysig	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to receipt of a busy signal. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-nodialtime	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to receipt of no dial tone. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-lactimeout	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to LAC timeout. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-noframing	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to no appropriate framing. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-noctrlconn	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to no control connection existing. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-badlen	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to wrong length errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-oor	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to out-of-range errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-noresource	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to insufficient resources. Availability: per L2TP service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
sess-invsessid	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to an invalid session ID. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-vendspec	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to vendor specific errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-tryanotherlms	Description: This proprietary counter indicates the total number of session disconnects/failures experienced resulting in “Try Another LNS” message generation. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-unkavp	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to unknown AVP with M-bit errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-maxtunnel	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to reaching the maximum tunnel limit. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-ipsecfail	Description: This proprietary counter indicates the total number of session failures experienced due to IPSEC. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-ipsecdisc	Description: This proprietary counter indicates the total number of session disconnects experienced due to IPSEC. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-newcallpoldisc	Description: This proprietary counter indicates the total number of session disconnects experienced due to new call policies. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-license	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to license exceeded errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-servmismatch	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to service mismatch errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32
sess-miscerr	Description: This proprietary counter indicates the total number of session disconnects/failures experienced due to miscellaneous errors. Availability: per L2TP service, per PCF, per session Type: Counter	Int32

Variables	Description	Data Type
<p data-bbox="240 373 1424 470"> IMPORTANT: For information on statistics that are common to all schema see the <i>Statistics and Counters Overview</i> chapter.</p>		

Chapter 39

LMA Schema Statistics

The LMA schema provides operational statistics that can be used for monitoring and troubleshooting the following products: P-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 39. Bulk Statistic Variables in the LMA Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	Description: The name of the context configured on the system that is currently facilitating the LMA service. This is a key variable. Type: Information	String
vpnid	Description: The identification number of the context configured on the system that is currently facilitating the LMA service. This is an internal reference number. This is a key variable. Type: Information	Int32
servname	Description: Displays the name of the LMA service for which the statistics are displayed. This is a key variable. Type: Information	String
servid	Description: The identification number of the service configured on the system that is currently facilitating the LMA service. This is an internal reference number. This is a key variable. Type: Information	Int32
sess-cur	Description: The total number of sessions currently active in the LMA service. Triggers: <ul style="list-style-type: none"> • Increments when new session is set up. • Decrement when session is torn down. Availability: per LMA service Type: Gauge	Int32
mipaaaauth-attempts	Description: The total number of mobile IP AAA Authentication attempts on receiving Binding request message by LMA service. Triggers: Increments when auth attempted on receiving Bind message. Availability: per LMA service Type: Counter	Int32
mipaaaauth-success	Description: The total number of successful mobile IP AAA Authentication attempts made by LMA service. Triggers: Increments when auth is successful when attempted. Availability: per LMA service Type: Counter	Int32
mipaaaauth-totalfailures	Description: The total number of failed mobile IP AAA authentication attempts received by LMA service. Triggers: Increments when auth failed when attempted. Availability: per LMA service Type: Counter	Int32
mipaaaauth-actualauthfailures	Description: The total number of mobile IP AAA authentication failures received by LMA service. Triggers: Increments when actual auth failed when attempted. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
mipaaaauth-miscauthfailures	Description: The total number of miscellaneous mobile IP AAA authentication failures received by LMA service. Triggers: Increments when auth failed due to other reasons when attempted. Availability: per LMA service Type: Counter	Int32
bindupd	Description: The total number of all binding updates received by LMA service. Triggers: Increments when binding updated request is received. Availability: per LMA service Type: Counter	Int32
bindupd-accept	Description: The total number of all binding updates received and accepted by LMA service. Triggers: Increments when binding update request is accepted. Availability: per LMA service Type: Counter	Int32
bindupd-denied	Description: The total number of all binding updates received and denied by LMA service. Triggers: Increments when binding update request is rejected/denied. Availability: per LMA service Type: Counter	Int32
bindupd-discard	Description: The total number of all binding updates received and discarded by LMA service. Triggers: Increments when binding update request is discarded. Availability: per LMA service Type: Counter	Int32
bindupd-initial	Description: The total number of all initial binding updates received by LMA service. Triggers: Increments when initial binding updated request is received. Availability: per LMA service Type: Counter	Int32
bindupd-initialaccept	Description: The total number of initial binding updates received and accepted by LMA service. Triggers: Increments when initial binding update request is accepted. Availability: per LMA service Type: Counter	Int32
bindupd-initialdenied	Description: The total number of initial binding updates received and denied by LMA service. Triggers: Increments when initial binding update request is rejected/denied. Availability: per LMA service Type: Counter	Int32
bindupd-refresh	Description: The total number of all refresh binding update requests received by LMA service. Triggers: Increments when renew binding updated request is received. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
bindupd-refreshaccept	Description: The total number of refresh binding update requests received and accepted by LMA service. Triggers: Increments when renew binding update request is accepted. Availability: per LMA service Type: Counter	Int32
bindupd-refreshdenied	Description: The total number of refresh binding update requests received and denied by LMA service. Triggers: Increments when renew binding update request is rejected/denied. Availability: per LMA service Type: Counter	Int32
bindupd-dereg	Description: The total number of all deregistration request binding updates received by LMA service. Triggers: Increments when dereg binding updated request is received. Availability: per LMA service Type: Counter	Int32
bindupd-deregaccept	Description: The total number of deregistration request binding updates received and accepted by LMA service. Triggers: Increments when dereg binding update request is accepted. Availability: per LMA service Type: Counter	Int32
bindupd-deregdenied	Description: The total number of deregistration request binding updates received and denied by LMA service. Triggers: Increments when dereg binding update request is rejected/denied. Availability: per LMA service Type: Counter	Int32
bindupd-handoff	Description: The total number of all handoff request binding updates received by LMA service. Triggers: Increments when handoff binding updated request is received. Availability: per LMA service Type: Counter	Int32
bindupd-handoffaccept	Description: The total number of handoff request binding updates received and accepted by LMA service. Triggers: Increments when handoff binding update request is accepted. Availability: per LMA service Type: Counter	Int32
bindupd-handoffdenied	Description: The total number of handoff request binding updates received and denied by LMA service. Triggers: Increments when handoff binding update request is rejected/denied. Availability: per LMA service Type: Counter	Int32
bindupd-ack	Description: The total number of all binding update acknowledgements sent by LMA service. Triggers: Increments when binding Ack is sent. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
bindupd-ackacceptreg	Description: The total number of accepted registration binding update acknowledgements sent by LMA service. Triggers: Increments when binding Ack is sent with success status code. Availability: per LMA service Type: Counter	Int32
bindupd-ackacceptdereg	Description: The total number of accepted deregistration binding update acknowledgements sent by LMA service. Triggers: Increments when dereg binding Ack is sent with success status code. Availability: per LMA service Type: Counter	Int32
bindupd-ackdenied	Description: The total number of denied binding update acknowledgements sent by LMA service. Triggers: Increments when binding Ack is denied and sent with error status code. Availability: per LMA service Type: Counter	Int32
bindupd-acksenderror	Description: The total number of send error binding update acknowledgements sent by LMA service. Triggers: Increments when error is encountered while sending binding Ack. Availability: per LMA service Type: Counter	Int32
bindupd-denynoresource	Description: The total number of binding update deny messages, due to insufficient resources, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Insufficient resources”. Availability: per LMA service Type: Counter	Int32
bindupd-denymisid	Description: The total number of binding update deny messages, due to mismatched IDs, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Mismatched ID”. Availability: per LMA service Type: Counter	Int32
bindupd-denymnauthfailure	Description: The total number of binding update deny messages, due to a mobile node authentication failure condition, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Mobility Auth failed”. Availability: per LMA service Type: Counter	Int32
bindupd-denyadmin	Description: The total number of binding update deny messages, due to an admin prohibited condition, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Admin Prohibited”. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
bindupd-denymsgidreq	Description: The total number of binding update deny messages, due to requiring a message ID, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Mesg ID Reqd”. Availability: per LMA service Type: Counter	Int32
bindupd-denydadfailed	Description: The total number of binding update deny messages, due to DAD failure, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “DAD failed”. Availability: per LMA service Type: Counter	Int32
bindupd-denyothomesub	Description: The total number of binding update deny messages, due to an incorrect home subnet, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Not Home Subnet”. Availability: per LMA service Type: Counter	Int32
bindupd-denyseqoow	Description: The total number of binding update deny messages, due to sequence out of window, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Sequence Number out of window”. Availability: per LMA service Type: Counter	Int32
bindupd-denytypchgis	Description: The total number of binding update deny messages, due to a disallowed registration type change, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Reg Type change Disallowed”. Availability: per LMA service Type: Counter	Int32
bindupd-denyunspec	Description: The total number of binding update deny messages, due to an unspecified reason, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Unspecified reason”. Availability: per LMA service Type: Counter	Int32
bindupd-denysevaauthfailed	Description: The total number of binding update deny messages, due to a service authorization failure, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Service authorization failed”. Availability: per LMA service Type: Counter	Int32
bindupd-denyproxyreg	Description: The total number of binding update deny messages, due to a proxy registration not enabled error, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Proxy Reg Not enabled”. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
bindupd-denytimestamp	<p>Description: The total number of binding update deny messages, due to a timestamp mismatch error, sent by LMA service.</p> <p>Triggers: Increments when Binding Ack is sent with status code “Timestamp mismatch”.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindupd-denytimestamplower	<p>Description: The total number of binding update deny messages, due to a timestamp lower than expected reason, sent by LMA service.</p> <p>Triggers: Increments when Binding Ack is sent with status code “Timestamp lower than expected”.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindupd-denymismnid	<p>Description: The total number of binding update deny messages, due to a missing MN-ID option, sent by LMA service.</p> <p>Triggers: Increments when Binding Ack is sent with status code “Missing MN-ID option”.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindupd-denymishnp	<p>Description: The total number of binding update deny messages, due to a missing HNP option, sent by LMA service.</p> <p>Triggers: Increments when Binding Ack is sent with status code “Missing HNP option”.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindupd-denymisaccesstech	<p>Description: The total number of binding update deny messages, due to a missing access technology option, sent by LMA service.</p> <p>Triggers: Increments when Binding Ack is sent with status code “Missing Access Tech option”.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindupd-denymishandoffind	<p>Description: The total number of binding update deny messages, due to a missing handoff indicator option, sent by LMA service.</p> <p>Triggers: Increments when Binding Ack is sent with status code “Missing Handoff indication option”.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindupd-denynotauthhnp	<p>Description: The total number of binding update deny messages, due to a not authorized for HNP reason, sent by LMA service.</p> <p>Triggers: Increments when Binding Ack is sent with status code “Not Authorized for HNP”.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
bindupd-denynotlmmobile	Description: The total number of binding update deny messages, due to a missing LMA for the MN, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Not LMA for mobile”/ Availability: per LMA service Type: Counter	Int32
bindupd-denynotauthproxyreg	Description: The total number of binding update deny messages, due to a not authorized for proxy registration reason, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “Not Authorized for Proxy Reg”. Availability: per LMA service Type: Counter	Int32
bindupd-denybceprefix	Description: The total number of binding update deny messages, due to a BCE prefix not matching, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “BCE prefix set do not match”. Availability: per LMA service Type: Counter	Int32
bindupd-denygrekey	Description: The total number of binding update deny messages, due to a GRE key option required, sent by LMA service. Triggers: Increments when Binding Ack is sent with status code “GRE key option required”. Availability: per LMA service Type: Counter	Int32
bindupd-denynoresourcesmgr	Description: The total number of binding update deny messages, due to insufficient resources - no session manager, sent by LMA service. Increments when Binding Update rejected due to No sessmgr. Triggers: Increments when Binding Update rejected due to No sessmgr. Availability: per LMA service Type: Counter	Int32
bindupd-denynoresourcemory	Description: The total number of binding update deny messages, due to insufficient resources - no memory, sent by LMA service. Triggers: Increments when Binding Update rejected due to memory alloc failure. Availability: per LMA service Type: Counter	Int32
bindupd-denynoresourcereject	Description: The total number of binding update deny messages, due to insufficient resources - session manager rejected, sent by LMA service. Triggers: Increments when Binding Update rejected due to sessmgr rejection. Availability: per LMA service Type: Counter	Int32
bindupd-denynoresourceinputq	Description: The total number of binding update deny messages, due to insufficient resources - input queue exceeded, sent by LMA service. Triggers: Increments when Binding Update rejected due to demux queue exceeding limit. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
bindupd-denynoresourcesimulbind	Description: The total number of binding update deny messages, due to insufficient resources - simultaneous bindings exceeded, sent by LMA service. Triggers: Increments when Binding Update rejected due to session exceeding binding limit. Availability: per LMA service Type: Counter	Int32
bindupd-denynoresourceaddallocfail	Description: The total number of binding update deny messages, due to insufficient resources - address allocation failed, sent by LMA service. Triggers: Increments when Binding Update rejected due to address alloc failure. Availability: per LMA service Type: Counter	Int32
bindupd-denyadminprohmnaaaauth	Description: The total number of binding update deny messages, due to an administrator prohibited - MN-AAA auth option missing condition, sent by LMA service. Triggers: Increments when Binding Update rejected due to missing MN-AAA auth option. Availability: per LMA service Type: Counter	Int32
bindupd-denyadminprohhbit	Description: The total number of binding update deny messages, due to an administrator prohibited - H-bit not set condition, sent by LMA service. Triggers: Increments when Binding Update rejected due to H bit not set. Availability: per LMA service Type: Counter	Int32
bindupd-denyadminprohmnaaspi	Description: The total number of binding update deny messages, due to an administrator prohibited - invalid MN-AAA option SPI condition, sent by LMA service. Triggers: Increments when Binding Update rejected due to invalid SPI in MN-AAA auth option. Availability: per LMA service Type: Counter	Int32
bindupd-denyadminprohmhaspi	Description: The total number of binding update deny messages, due to an administrator prohibited - invalid MN-HA option SPI condition, sent by LMA service. Triggers: Increments when Binding Update rejected due to invalid SPI in MN-HA auth option. Availability: per LMA service Type: Counter	Int32
bindupd-denyadmincong	Description: The total number of binding update deny messages, due to an administrator prohibited - congestion control condition, sent by LMA service. Triggers: Increments when Binding Update rejected due congestion control. Availability: per LMA service Type: Counter	Int32
bindupd-denyadminpolrej	Description: The total number of binding update deny messages, due to an administrator prohibited - policy rejected condition, sent by LMA service. Triggers: Increments when Binding Update rejected due policy. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
bindupd-denyadminhoa	Description: The total number of binding update deny messages, due to an administrator prohibited - HoA not authorized condition, sent by LMA service. Triggers: Increments when Binding Update rejected due HoA authorization failure. Availability: per LMA service Type: Counter	Int32
bindupd-denyadminperm	Description: The total number of binding update deny messages, due to an administrator prohibited - no permission condition, sent by LMA service. Triggers: Increments when Binding Update rejected due to no permission. Availability: per LMA service Type: Counter	Int32
bindupd-denyadminbadreq	Description: The total number of binding update deny messages, due to an administrator prohibited - bad request condition, sent by LMA service. Triggers: Increments when Binding Update decode fails. Availability: per LMA service Type: Counter	Int32
bindupd-discardcong	Description: The total number of binding update discarded messages, due to congestion, sent by LMA service. Triggers: Increments when Binding Update discarded due to congestion control. Availability: per LMA service Type: Counter	Int32
bindupd-discardchecksum	Description: The total number of binding update discarded messages, due to checksum error(s), sent by LMA service. Triggers: Increments when Binding Update discarded due to checksum error Availability: per LMA service Type: Counter	Int32
bindupd-discardauthpending	Description: The total number of binding update discarded messages, due to an initial authentication pending condition, sent by LMA service. Triggers: Increments when Binding Update discarded when initial registration is still being processed. Availability: per LMA service Type: Counter	Int32
bindupd-discardsessnotfound	Description: The total number of binding update discarded messages, due to a session not found condition, sent by LMA service. Triggers: Increments when Binding Update discarded due to session not found internally when expected. Availability: per LMA service Type: Counter	Int32
bindupd-discardhamgrnotready	Description: The total number of binding update discarded messages, due to an HA manager not found condition, sent by LMA service. Triggers: Increments when Binding Update discarded due to hamgr not ready. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
bindupd-discarddecodefail	Description: The total number of binding update discarded messages, due to a decode failure, sent by LMA service. Triggers: Increments when Binding Update discarded due to decode failure. Availability: per LMA service Type: Counter	Int32
bindupd-discardinbufen	Description: The total number of binding update discarded messages, due to an invalid buffer length, sent by LMA service. Triggers: Increments when Binding Update discarded due to packet buffer length. Availability: per LMA service Type: Counter	Int32
bindupd-discardrevoc	Description: The total number of binding update discarded messages, due to a revocation pending, sent by LMA service. Triggers: Increments when Binding Update discarded due to pending revocation. Availability: per LMA service Type: Counter	Int32
bindrev-sent	Description: The total number of binding revocations sent by LMA service. Triggers: Increments when initial Binding Revocation indication is sent. Availability: per LMA service Type: Counter	Int32
bindrev-retriessent	Description: The total number of binding revocation retries sent by LMA service. Triggers: Increments when Binding Revocation indication message is retried. Availability: per LMA service Type: Counter	Int32
bindrev-ackrcvd	Description: The total number of binding revocation acknowledgements received by LMA service. Triggers: Increments when Binding Revocation Acknowledgement is received. Availability: per LMA service Type: Counter	Int32
bindrev-notacked	Description: The total number of binding revocations sent, but not acknowledged, by LMA service. Triggers: Increments when session deleted without receiving ACK after max retries. Availability: per LMA service Type: Counter	Int32
bindrev-rcvd	Description: The total number of binding revocations received by LMA service. Triggers: Increments when Binding revocation indication is received. Availability: per LMA service Type: Counter	Int32
bindrev-acksent	Description: The total number of binding revocation acknowledgements sent by LMA service. Triggers: Increments when Binding revocation Acknowledgement is sent. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
sentrevtrig-reserved	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with a “Reserved” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-unspecified	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with an “Unspecified” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-admin	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with an “Administrative Reason” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-maghoffsameatt	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with an “Inter-MAG Handoff-Same ATT” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-maghoff-unknown	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with an “Inter-MAG - Unknown Handoff” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-maghoff-diffatt	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with an “Inter-MAG Handoff-Diff ATT” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-perpeer	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with a “Per-Peer Policy” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-nodelocal	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with a “Revoking Node Local Policy” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-userinitssess	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with a “User Initiated Session Term” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-accessnwsess	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with an “Access Network Session Term” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-ipv4hoabind	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with an “IPv4 HoA Binding Only” revocation trigger reason. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
sentrevtrig-syncbce	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with an “Out-of Sync BCE State” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
sentrevtrig-unknown	Description: The total number of Binding Revocation Indication (BRI) messages sent by LMA service with an “Unknown” revocation trigger reason. Availability: per LMA service Type: Counter	Int32
rcvdrevack-success	Description: The total number of Binding Revocation Acknowledgement (BRA) messages received by LMA service with a “Success” status. Availability: per LMA service Type: Counter	Int32
rcvdrevack-partialsuccess	Description: The total number of Binding Revocation Acknowledgement (BRA) messages received by LMA service with a “Partial-Success” status. Availability: per LMA service Type: Counter	Int32
rcvdrevack-nobinding	Description: The total number of Binding Revocation Acknowledgement (BRA) messages received by LMA service with a “Binding-Does-Not-Exist” status. Availability: per LMA service Type: Counter	Int32
rcvdrevack-noipv4hoabind	Description: The total number of Binding Revocation Acknowledgement (BRA) messages received by LMA service with a “No IPv4-HoA-Bind” status. Availability: per LMA service Type: Counter	Int32
rcvdrevack-revocnotauth	Description: The total number of Binding Revocation Acknowledgement (BRA) messages received by LMA service with a “Global-Revoc-Not-Authorized” status. Availability: per LMA service Type: Counter	Int32
rcvdrevack-bindingnotidentified	Description: The total number of Binding Revocation Acknowledgement (BRA) messages received by LMA service with a “Cannot-Identify-Binding” status. Availability: per LMA service Type: Counter	Int32
rcvdrevack-revocfailmnmattch	Description: The total number of Binding Revocation Acknowledgement (BRA) messages received by LMA service with a “Revoc-Failed-MN-Attached” status. Availability: per LMA service Type: Counter	Int32
rcvdrevack-unknown	Description: The total number of Binding Revocation Acknowledgement (BRA) messages received by LMA service with an “Unknown” status. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
bindrev	<p>Description: The total number of binding revocation acknowledgements received and discarded by LMA service.</p> <p>Triggers: Increments when Binding revocation Acknowledgement is discarded.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindrev-discardsessnotfound	<p>Description: The total number of binding revocation acknowledgements received and discarded, due to a session not found condition, by LMA service.</p> <p>Triggers: Increments when Binding revocation Acknowledgement discarded due to session not found.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindrev-discardbadreq	<p>Description: The total number of binding revocation acknowledgements received and discarded, due to a badly formed request condition, by LMA service.</p> <p>Triggers: Increments when Binding revocation Acknowledgement discarded due to badly formed message.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindrev-discarddecodeerror	<p>Description: The total number of binding revocation acknowledgements received and discarded, due to a decode error condition, by LMA service.</p> <p>Triggers: Increments when Binding revocation Acknowledgement discarded due to decode failure.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindrev-discardchecksumerror	<p>Description: The total number of binding revocation acknowledgements received and discarded, due to a checksum error condition, by LMA service.</p> <p>Triggers: Increments when Binding revocation Acknowledgement discarded due to checksum error.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindrev-discardinvalidmsgtype	<p>Description: The total number of binding revocation acknowledgements received and discarded, due to a invalid memory type condition, by LMA service.</p> <p>Triggers: Increments when Binding revocation Acknowledgement discarded due to invalid message type.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
bindrev-discardhamgrnotready	<p>Description: The total number of binding revocation acknowledgements received and discarded, due to a HAMGR not ready condition, by LMA service.</p> <p>Triggers: Increments when Binding revocation Acknowledgement discarded due to HAMGR not ready.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
bindrev-discardmatchreqnotfound	Description: The total number of binding revocation acknowledgements received and discarded, due to a matching request not found condition, by LMA service. Triggers: Increments when Binding revocation Acknowledgement discarded as matching request not found. Availability: per LMA service Type: Counter	Int32
bindrev-discardinvalidbuflen	Description: The total number of binding revocation acknowledgements received and discarded, due to a invalid buffer length condition, by LMA service. Triggers: Increments when Binding revocation Acknowledgement discarded due to invalid packet length. Availability: per LMA service Type: Counter	Int32
rxpackets	Description: The total number of packets received by LMA service. Triggers: Increments when tunneled data packet is received. Availability: per LMA service Type: Counter	Int32
rxpackets-6in6	Description: The total number of IPv6-in-IPv6 tunnel packets received by LMA service. Triggers: Increments when tunneled IPv6 in IPv6 encapsulated data packet is received. Availability: per LMA service Type: Counter	Int32
rxpackets-4in6	Description: The total number of IPv4-in-IPv6 tunnel packets received by LMA service. Triggers: Increments when tunneled IPv4 in IPv6 encapsulated data packet is received. Availability: per LMA service Type: Counter	Int32
rxpackets-ipv6greipv4	Description: The total number of IPv4-in-IPv6 GRE tunnel packets received by LMA service. Triggers: Increments when tunneled IPv4 in IPv6 GRE encapsulated data packet is received. Availability: per LMA service Type: Counter	Int32
rxpackets-ipv6greipv6	Description: The total number of IPv6-in-IPv6 GRE tunnel packets received by LMA service. Triggers: Increments when tunneled IPv6 in IPv6 GREEncapsulated data packet is received. Availability: per LMA service Type: Counter	Int32
rxoctets	Description: The total number of octets received by LMA service. Triggers: Increments with number of bytes received when tunneled data packet is received. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
rxoctets-6in6	<p>Description: The total number of IPv6-in-IPv6 tunnel octets received by LMA service.</p> <p>Triggers: Increments with number of IPv6 in IPv6 bytes received when tunneled data packet is received.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
rxoctets-4in6	<p>Description: The total number of IPv4-in-IPv6 tunnel octets received by LMA service.</p> <p>Triggers: Increments with number of IPv4 in IPv6 bytes received when tunneled data packet is received.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
rxoctets-ipv6greipv4	<p>Description: The total number of IPv4-in-IPv6 GRE tunnel octets received by LMA service.</p> <p>Triggers: Increments with number of IPv4 in IPv6 GRE bytes received when tunneled data packet is received.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
rxoctets-ipv6greipv6	<p>Description: The total number of IPv6-in-IPv6 GRE tunnel octets received by LMA service.</p> <p>Triggers: Increments with number of IPv6 in IPv6 GRE bytes received when tunneled data packet is received.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
dataerror	<p>Description: The total number of data errors received by LMA service.</p> <p>Triggers: Increments when error is encountered on processing data packet received from the tunnel.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
dataerror-prot	<p>Description: The total number of protocol type data errors received by LMA service.</p> <p>Triggers: Increments when packet received with invalid protocol type.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
dataerror-InvPktLen	<p>Description: The total number of invalid packet length data errors received by LMA service.</p> <p>Triggers: Increments when packet received with invalid length.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
dataerror-noSession	<p>Description: The total number of no session found data errors received by LMA service.</p> <p>Triggers: Increments when packet received with session not found.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
txpackets	Description: The total number of packets sent by LMA service. Triggers: Increments when tunneled data packet is sent. Availability: per LMA service Type: Counter	Int32
txpackets-6in6	Description: The total number of IPv6-in-IPv6 tunnel packets sent by LMA service. Triggers: Increments when tunneled IPv6 in IPv6 encapsulated data packet is sent. Availability: per LMA service Type: Counter	Int32
txpackets-4in6	Description: The total number of IPv4-in-IPv6 tunnel packets sent by LMA service. Triggers: Increments when tunneled IPv4 in IPv6 encapsulated data packet is sent. Availability: per LMA service Type: Counter	Int32
txpackets-ipv6greipv4	Description: The total number of IPv4-in-IPv6 GRE tunnel packets sent by LMA service. Triggers: Increments when tunneled IPv4 in IPv6 GRE encapsulated data packet is sent. Availability: per LMA service Type: Counter	Int32
txpackets-ipv6greipv6	Description: The total number of IPv6-in-IPv6 GRE tunnel packets sent by LMA service. Triggers: Increments when tunneled IPv6 in IPv6 GRE encapsulated data packet is sent. Availability: per LMA service Type: Counter	Int32
txoctets	Description: The total number of octets sent by LMA service. Triggers: Increments with number of bytes sent when tunneled data packet is sent. Availability: per LMA service Type: Counter	Int32
txoctets-6in6	Description: The total number of IPv6-in-IPv6 tunnel octets sent by LMA service. Triggers: Increments with number of IPv6 in IPv6 bytes sent when tunneled data packet is sent. Availability: per LMA service Type: Counter	Int32
txoctets-4in6	Description: The total number of IPv4-in-IPv6 tunnel octets sent by LMA service. Triggers: Increments with number of IPv4 in IPv6 bytes sent when tunneled data packet is sent. Availability: per LMA service Type: Counter	Int32
txoctets-ipv6greipv4	Description: The total number of IPv4-in-IPv6 GRE tunnel octets sent by LMA service. Triggers: Increments with number of IPv4 in IPv6 GRE bytes sent when tunneled data packet is sent. Availability: per LMA service Type: Counter	Int32

Variables	Description	Data Type
txoctets-ipv6greipv6	<p>Description: The total number of IPv6-in-IPv6 GRE tunnel octets sent by LMA service.</p> <p>Triggers: Increments with number of IPv6 in IPv6 GRE bytes sent when tunneled data packet is sent.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
icmpv6-pktoobigrecv	<p>Description: The total number of tunnel ICMP packets - too big received by LMA service.</p> <p>Triggers: Increments when packet too big received with tunnel.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
icmpv6-pktoobigdrop	<p>Description: The total number of tunnel ICMP packets - too big dropped by LMA service.</p> <p>Triggers: Increments when packet too big received with tunnel is dropped.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
icmpv6-pktoobigrelay	<p>Description: The total number of tunnel ICMP packets - too big relayed by LMA service.</p> <p>Triggers: Increments when packet too big received with tunnel is relayed.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
disc	<p>Description: The total number of disconnects initiated by LMA service.</p> <p>Triggers: Increments when LMA session disconnects.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
disclifetime	<p>Description: The total number of disconnects due to lifetime expiry initiated by LMA service.</p> <p>Triggers: Increments when LMA session is disconnected due to lifetime expiry.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
discdereg	<p>Description: The total number sessions disconnected in the LMA service due to peer deregistration.</p> <p>Triggers: Increments when LMA session is disconnected due to deregistration.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
discadmin	<p>Description: The total number of disconnects due to admin drops initiated by LMA service.</p> <p>Triggers: Increments when LMA session disconnects due to Admin reasons.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32
discother	<p>Description: The total number of disconnects due to “other reasons” initiated by LMA service.</p> <p>Triggers: Increments when LMA session is disconnected due to misc reasons.</p> <p>Availability: per LMA service</p> <p>Type: Counter</p>	Int32

Chapter 40

LNS Schema Statistics

The LNS schema provides operational statistics that can be used for monitoring and troubleshooting the following products: L2TP Network Server (LNS).

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 40. Bulk Statistic Variables in the LNS Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the LNS service. This is a key variable.	String
vpnid	The identification number of the context configured on the system that is currently facilitating the LNS service. This is an internal reference number. This is a key variable.	Int32
servname	Displays the name of the LNS service for which the statistics are displayed. This is a key variable.	String
tun-conn-attempt	The total number of tunnel connection attempts.	Int32
tun-conn-success	The total number of successful tunnel connections.	Int32
tun-conn-fail	The total number of failed tunnel connections.	Int32
tun-conn-curactive	The total number of currently active tunnel connections.	Int32
sess-attempts	The total number of session connection attempts.	Int32
sess-successful	The total number of successful session connections.	Int32
sess-failed	The total number of failed session connections.	Int32
sess-curactive	The total number of currently active session connections.	Int32
sess-intrapdsnho-attempt	The total number of Intra-PDSN Hand-Offs connection attempts.	Int32
sess-intrapdsnho-success	The total number of successful Intra-PDSN Hand-Offs connections.	Int32
sess-intrapdsnho-failed	The total number of failed Intra-PDSN Hand-Offs connections.	Int32
sess-interpdsnho-attempt	The total number of Inter-PDSN Hand-Offs connection attempts.	Int32
recv-err-malformed	The total number of Tunnel Receive Control Packet errors experienced due to malformed packets .	Int32
recv-err-ctrlfield	The total number of Tunnel Receive Control Packet errors experienced due to control field errors.	Int32
recv-err-pkflen	The total number of Tunnel Receive Control Packet errors experienced due to packet length errors.	Int32
recv-err-avplen	The total number of Tunnel Receive Control Packet errors experienced due to AVP length errors.	Int32
recv-err-protover	The total number of Tunnel Receive Control Packet errors experienced due to protocol version errors.	Int32
recv-err-md5	The total number of Tunnel Receive Control Packet errors experienced due to MD5 errors.	Int32
recv-err-invattr	The total number of Tunnel Receive Control Packet errors experienced due to invalid attribute errors.	Int32

Variables	Description	Data Type
recv-err-unkattr	The total number of Tunnel Receive Control Packet errors experienced due to unknown attribute errors.	Int32
recv-err-invsessid	The total number of Tunnel Receive Control Packet errors experienced due to invalid session ID errors.	Int32
recv-err-invstate	The total number of Tunnel Receive Control Packet errors experienced due to invalid state errors.	Int32
recv-err-unkmsg	The total number of Tunnel Receive Control Packet errors experienced due to unknown message errors.	Int32
recv-err-unmatchpktlen	The total number of Tunnel Receive Control Packet errors experienced due to unmatched packet length errors.	Int32
recv-err-invtunid	The total number of Tunnel Receive Control Packet errors experienced due to invalid tunnel length errors.	Int32
tun-genclear	The total number of tunnels cleared normally.	Int32
tun-ctrlconnexists	The total number of tunnel disconnects/failures experienced due to a pre-existing control connection.	Int32
tun-unauth	The total number of tunnel disconnects/failures experienced due to unauthorized errors.	Int32
tun-badproto	The total number of tunnel disconnects/failures experienced due to bad protocol errors.	Int32
tun-reqshutdown	The total number of tunnel disconnects experienced due to requester shutdown.	Int32
tun-statemacherr	The total number of tunnel disconnects/failures experienced due to state machine errors.	Int32
tun-badlen	The total number of tunnel disconnects/failures experienced due to wrong length errors.	Int32
tun-oor	The total number of tunnel disconnects/failures experienced due to out-of-range errors.	Int32
tun-noresource	The total number of tunnel disconnects/failures experienced due to insufficient resources.	Int32
tun-vendspec	The total number of tunnel disconnects/failures experienced due to vendor-specific errors.	Int32
tun-tryanotherlns	The total number of tunnel disconnects/failures experienced resulting in "Try Another LNS" message generation.	Int32
tun-unkavp	The total number of tunnel disconnects/failures experienced due to unknown AVP with M-bit errors.	Int32
tun-ipsecdisc	The total number of tunnel disconnects experienced due to IPSEC.	Int32
tun-ipsecfail	The total number of tunnel failures experienced due to IPSEC.	Int32
tun-license	The total number of tunnel disconnects/failures experienced due to license exceeded errors.	Int32
tun-newcallpoldisc	The total number of tunnel disconnects experienced due to new call policies.	Int32
tun-maxretry	The total number of tunnel disconnects/failures experienced due to the maximum number of retries being exceeded.	Int32
tun-syslimit	The total number of tunnel disconnects/failures experienced due to reaching the system tunnel limit.	Int32

Common Syntax Options

Variables	Description	Data Type
tun-miscerr	The total number of tunnel disconnects/failures experienced due to miscellaneous errors.	Int32
sess-nogeneral	The total number of sessions for which there were no general errors experienced.	Int32
sess-admin	The total number of session disconnects/failures experienced due to administrative reasons.	Int32
sess-lossofcarr	The total number of session disconnects/failures experienced due to loss of carrier.	Int32
sess-remoteadmin	The total number of session disconnects/failures experienced due to remote administrative reasons.	Int32
sess-nofactemp	The total number of session disconnects/failures experienced due to temporary no facility available errors.	Int32
sess-nofacperm	The total number of session disconnects/failures experienced due to permanent no facility available errors.	Int32
sess-invdest	The total number of session disconnects/failures experienced due to invalid destination errors.	Int32
sess-nocarrier	The total number of session disconnects/failures experienced due no carrier being detected.	Int32
sess-busysig	The total number of session disconnects/failures experienced due to receipt of a busy signal.	Int32
sess-nodialtime	The total number of session disconnects/failures experienced due to receipt of no dial tone.	Int32
sess-lactimeout	The total number of session disconnects/failures experienced due to LAC timeout.	Int32
sess-noframing	The total number of session disconnects/failures experienced due to no appropriate framing.	Int32
sess-noctrlconn	The total number of session disconnects/failures experienced due to no control connection existing.	Int32
sess-badlen	The total number of session disconnects/failures experienced due to wrong length errors.	Int32
sess-oor	The total number of session disconnects/failures experienced due to out-of-range errors.	Int32
sess-noresource	The total number of session disconnects/failures experienced due to insufficient resources.	Int32
sess-invsessid	The total number of session disconnects/failures experienced due to an invalid session ID.	Int32
sess-vendspec	The total number of session disconnects/failures experienced due to vendor specific errors.	Int32
sess-tryanotherlns	The total number of session disconnects/failures experienced resulting in "Try Another LNS" message generation.	Int32
sess-unkavp	The total number of session disconnects/failures experienced due to unknown AVP with M-bit errors.	Int32
sess-maxtunnel	The total number of session disconnects/failures experienced due to reaching the maximum tunnel limit.	Int32
sess-ipsecfail	The total number of session failures experienced due to IPSEC.	Int32
sess-ipsecdisc	The total number of session disconnects experienced due to IPSEC.	Int32
sess-newcallpoldisc	The total number of session disconnects experienced due to new call policies.	Int32
sess-license	The total number of session disconnects/failures experienced due to license exceeded errors.	Int32

Variables	Description	Data Type
sess-servmismatch	The total number of session disconnects/failures experienced due to service mismatch errors.	Int32
sess-miscerr	The total number of session disconnects/failures experienced due to miscellaneous errors.	Int32

 **IMPORTANT:** For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 41

MAG Schema Statistics

The MAG schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HSGW, S-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 41. Bulk Statistic Variables in the MAG Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	Description: The name of the context configured on the system that is currently facilitating the MAG service. This is a key variable.	String
vpnid	Description: The identification number of the context configured on the system that is currently facilitating the MAG service. This is an internal reference number. This is a key variable.	Int32
servname	Description: Displays the name of the MAG service for which the statistics are displayed. This is a key variable.	String
servid	Description: The identification number of the service configured on the system that is currently facilitating the MAG service. This is an internal reference number. This is a key variable.	Int32
sess-cur	Description: The total number of sessions currently established on this system. Triggers: 1 . Incremented when new PDN is setup 2 . Decrementd when PDN is torn down Availability: per MAG service Type: Gauge	Int32
bindupd	Description: The total number of all binding updates sent by this system. Triggers: Incremented when PBU is sent Availability: per MAG service	Int32
bindupd-init	Description: The total number of initial request transmit binding updates sent by this system. Triggers: Incremented when initial PBU is sent Availability: per MAG service	Int32
bindupd-initretrans	Description: The total number of initial request retransmit binding updates sent by this system. Triggers: Incremented when initial PBU is retransmitted Availability: per MAG service	Int32
bindupd-renew	Description: The total number of renew request transmit binding updates sent by this system. Triggers: Incremented when renew PBU is sent Availability: per MAG service	Int32
bindupd-renewretrans	Description: The total number of renew request retransmit binding updates sent by this system. Triggers: Incremented when renew PBU is retransmitted Availability: per MAG service	Int32
bindupd-dereg	Description: The total number of deregistration request transmit binding updates sent by this system. Triggers: Incremented when dereg PBU is sent Availability: per MAG service	Int32

Variables	Description	Data Type
bindupd-deregretrans	Description: The total number of deregistration request retransmit binding updates sent by this system. Triggers: Incremented when dereg PBU is retransmitted Availability: per MAG service	Int32
bindack	Description: The total number of all binding acknowledgements received by this system. Triggers: Incremented when PBA is received Availability: per MAG service	Int32
bindack-error	Description: The total number of all binding acknowledgements, with errors, received by this system. Triggers: Incremented when PBA received has some error Availability: per MAG service	Int32
bindack-accept	Description: The total number of all binding acknowledgements received, and accepted by this system or the specified service. Triggers: Incremented when PBA has Accept status code Availability: per MAG service	Int32
bindack-denied	Description: The total number of all binding acknowledgements received, but denied by this system or the specified service. Triggers: Incremented when PBA has deny status code Availability: per MAG service	Int32
bindack-init	Description: The total number of all binding acknowledgements - initial reply received by this system. Triggers: Incremented when initial PBA is received Availability: per MAG service	Int32
bindack-renew	Description: The total number of all binding acknowledgements - renew reply received by this system. Triggers: Incremented when renew PBA is received Availability: per MAG service	Int32
bindack-dereg	Description: The total number of all binding acknowledgements - deregistration reply received by this system. Triggers: Incremented when dereg PBA is received Availability: per MAG service	Int32
deniedlma-noresource	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to insufficient resources. Triggers: Incremented when PBA received with code Insufficient Resources Availability: per MAG service	Int32
deniedlma-mismatchid	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to mismatched IDs. Triggers: Incremented when PBA received with code Mismatched ID Availability: per MAG service	Int32
deniedlma-mnauthfail	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to mobile node authorization failures. Triggers: Incremented when PBA received with code MN-Auth failure Availability: per MAG service	Int32

Variables	Description	Data Type
deniedlma-adminproh	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to admin prohibited conditions. Triggers: Incremented when PBA received with code Admin Prohibited Availability: per MAG service	Int32
deniedlma-msgidrqd	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to missing message IDs. Triggers: Incremented when PBA received with code Mesg ID Required Availability: per MAG service	Int32
deniedlma-dadfailed	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to DAD failures. Triggers: Incremented when PBA received with code DAD failed Availability: per MAG service	Int32
deniedlma-homesubnet	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to incorrect home subnet. Triggers: Incremented when PBA received with code Not Home Subnet Availability: per MAG service	Int32
deniedlma-seqoow	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to sequence out of window conditions. Triggers: Incremented when PBA received with code Sequence out of window Availability: per MAG service	Int32
deniedlma-typchgis	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to registration type change disallowed. Triggers: Incremented when PBA received with code Reg Type change disallowed Availability: per MAG service	Int32
deniedlma-unspec	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to unspecified reasons. Triggers: Incremented when PBA received with code Unspecified reason Availability: per MAG service	Int32
deniedlma-servauthfailed	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to failed service authorizations. Triggers: Incremented when PBA received with code Service Authorisation failed Availability: per MAG service	Int32
deniedlma-proxyreg	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to proxy registration not being enabled. Triggers: Incremented when PBA received with code Proxy Reg not enabled Availability: per MAG service	Int32
deniedlma-timestamp	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to timestamp mismatches. Triggers: Incremented when PBA received with code Time mismatch Availability: per MAG service	Int32
deniedlma-timestamplower	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to lower than expected timestamps. Triggers: Incremented when PBA received with code Timestamp lower than expected Availability: per MAG service	Int32

Variables	Description	Data Type
deniedlma-mismnid	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to missing mobile node ID options. Triggers: Incremented when PBA received with code Missing MN-ID option Availability: per MAG service	Int32
deniedlma-mishnp	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to missing HNP options. Triggers: Incremented when PBA received with code Missing HNP option Availability: per MAG service	Int32
deniedlma-misacesstech	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to missing access technology options. Triggers: Incremented when PBA received with code MissingAccess Tech option Availability: per MAG service	Int32
deniedlma-mishandoffind	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to missing handoff indication options. Triggers: Incremented when PBA received with code Missing Handoff indicator option Availability: per MAG service	Int32
deniedlma-notauthhnp	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to not being authorized for HNP. Triggers: Incremented when PBA received with code Not Authorized for HNP Availability: per MAG service	Int32
deniedlma-notlmamobile	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due incorrect LMA for mobility. Triggers: Incremented when PBA received with code Not LMA for Mobile Availability: per MAG service	Int32
deniedlma-notauthproxyreg	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to not being authorized for proxy registration. Triggers: Incremented when PBA received with code Not Authorized for Proxy Reg Availability: per MAG service	Int32
deniedlma-bceprefix	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to BCE prefix mismatches. Triggers: Incremented when PBA received with code BCE prefix set do not Match Availability: per MAG service	Int32
deniedlma-grekey	Description: The total number of binding updates sent by this system or the specified service but denied by the LMA due to GRE key option required. Triggers: Incremented when PBA received with code GRE key option required Availability: per MAG service	Int32
bindack-errormishnp	Description: The total number of binding acknowledgements with missing HNP errors received by this system or the specified service. Triggers: Incremented when PBA received that is discarded due to missing HNP option Availability: per MAG service	Int32

Variables	Description	Data Type
bindack-errornai	Description: The total number of binding acknowledgements with missing NAI errors received by this system or the specified service. Triggers: Incremented when PBA received that is discarded due to missing MN-ID option Availability: per MAG service	Int32
bindack-errorhomeaddconf	Description: The total number of binding acknowledgements with home address conflict errors received by this system or the specified service. Triggers: Incremented when PBA received that is discarded due to Home Address Conflict Availability: per MAG service	Int32
bindack-errormatchreq	Description: The total number of binding acknowledgements with matching requests not found errors received by this system or the specified service. Triggers: Incremented when PBA received that is discarded due to Matching Request not found Availability: per MAG service	Int32
bindack-errorbadlyformed	Description: The total number of binding acknowledgements with badly formed message errors received by this system or the specified service. Triggers: Incremented when PBA received that is discarded due to decode failure Availability: per MAG service	Int32
bindack-errorchecksum	Description: The total number of binding acknowledgements with checksum errors received by this system or the specified service. Triggers: Incremented when PBA received that is discarded due to Checksum error Availability: per MAG service	Int32
bindack-errorsessnotfound	Description: The total number of binding acknowledgements with session not found errors received by this system or the specified service. Triggers: Incremented when PBA received that is discarded due to session not found Availability: per MAG service	Int32
bindrev-sent	Description: The total number of binding revocations sent by this system or the specified service. Triggers: Incremented when BRI is sent by MAG service Availability: per MAG service	Int32
bindrev-retriessent	Description: The total number of binding revocation retries sent by this system or the specified service. Triggers: Incremented when BRI is retransmitted by MAG service Availability: per MAG service	Int32
bindrev-ackrcvd	Description: The total number of binding revocation acknowledgements received by this system or the specified service. Triggers: Incremented when BRA is received by MAG service Availability: per MAG service	Int32
bindrev-notacked	Description: The total number of binding revocations sent, but not acknowledged, by this system or the specified service. Triggers: Incremented when session is deleted after max BRI retries without receiving ACK Availability: per MAG service	Int32

Variables	Description	Data Type
bindrev-rcvd	Description: The total number of binding revocations received by this system or the specified service. Triggers: Incremented when BRI is received by MAG service Availability: per MAG service	Int32
bindrev-acksent	Description: The total number of binding revocation acknowledgements sent by this system or the specified service. Triggers: Incremented when BRA is sent by MAG service Availability: per MAG service	Int32
rcvdbindrevtrig-reserved	Description: The total number of binding revocation trigger reasons received - reserved. Triggers: Incremented when BRI is received with trigger reason - Reserved Availability: per MAG service	Int32
rcvdbindrevtrig- unspecified	Description: The total number of binding revocation trigger reasons received - unspecified. Triggers: Incremented when BRI is received with trigger reason - Unspecified Availability: per MAG service	Int32
rcvdbindrevtrig-admin	Description: The total number of binding revocation trigger reasons received - administrative reason. Triggers: Incremented when BRI is received with trigger reason - Administrative reason Availability: per MAG service	Int32
rcvdbindrevtrig- maghoffsameatt	Description: The total number of binding revocation trigger reasons received - inter-MAG handoff-same ATT. Triggers: Incremented when BRI is received with trigger reason - Inter MAG Handoff - same Access Type Availability: per MAG service	Int32
rcvdbindrevtrig-maghoff- unknown	Description: The total number of binding revocation trigger reasons received - inter-MAG - unknown handoff. Triggers: Incremented when BRI is received with trigger reason - Inter MAG - unknown handoff Availability: per MAG service	Int32
rcvdbindrevtrig-maghoff- diffatt	Description: The total number of binding revocation trigger reasons received - inter-MAG handoff-diff ATT. Triggers: Incremented when BRI is received with trigger reason - Inter MAG Handoff - diff Access type Availability: per MAG service	Int32
rcvdbindrevtrig-perpeer	Description: The total number of binding revocation trigger reasons received - per-peer policy. Triggers: Incremented when BRI is received with trigger reason - Per peer policy Availability: per MAG service	Int32
rcvdbindrevtrig-nodelocal	Description: The total number of binding revocation trigger reasons received - revoking node local policy. Triggers: Incremented when BRI is received with trigger reason - Node local policy Availability: per MAG service	Int32

Variables	Description	Data Type
rcvdbindrevtrig-userinitssess	Description: The total number of binding revocation trigger reasons received - user initiated session term. Triggers: Incremented when BRI is received with trigger reason - User Initiated Sess Termination Availability: per MAG service	Int32
rcvdbindrevtrig-accessnwssess	Description: The total number of binding revocation trigger reasons received - access network session term. Triggers: Incremented when BRI is received with trigger reason - Access network initiated Term Availability: per MAG service	Int32
rcvdbindrevtrig-ipv4hoabind	Description: The total number of binding revocation trigger reasons received - IPv4 HoA binding only. Triggers: Incremented when BRI is received with trigger reason - IPv4 HoA binding only Availability: per MAG service	Int32
rcvdbindrevtrig-syncbce	Description: The total number of binding revocation trigger reasons received - out-of sync BCE state. Triggers: Incremented when BRI is received with trigger reason - BCE Out of Sync Availability: per MAG service	Int32
rcvdbindrevtrig-unknown	Description: The total number of binding revocation trigger reasons received - unknown. Triggers: Incremented when BRI is received with trigger reason - Unknown Availability: per MAG service	Int32
sentrevack-success	Description: The total number of revocation ACK status sent - success. Triggers: Incremented when BRA is sent with status Success Availability: per MAG service	Int32
sentrevack-partialsuccess	Description: The total number of revocation ACK status sent - partial-success. Triggers: Incremented when BRA is sent with status Partial Success Availability: per MAG service	Int32
sentrevack-nobinding	Description: The total number of revocation ACK status sent - binding-does-not-exist. Triggers: Incremented when BRA is sent with status Binding Does Not exist Availability: per MAG service	Int32
sentrevack-noipv4hoabind	Description: The total number of revocation ACK status sent - no IPv4-HoA-bind. Triggers: Incremented when BRA is sent with status No IPv4 HoA Binding Availability: per MAG service	Int32
sentrevack-revocnotauth	Description: The total number of revocation ACK status sent - global-revoc-not-authorized. Triggers: Incremented when BRA is sent with status Global Revoc Not Authorized Availability: per MAG service	Int32
sentrevack-bindingnotidentified	Description: The total number of revocation ACK status sent - cannot-identify-binding. Triggers: Incremented when BRA is sent with status Cannot Identify binding Availability: per MAG service	Int32
sentrevack-revocfailmnattach	Description: The total number of revocation ACK status sent - revoc-failed-MN-attached. Triggers: Incremented when BRA is sent with status Revoc Failed MN Attached Availability: per MAG service	Int32

Variables	Description	Data Type
sentrevack-unknown	Description: The total number of revocation ACK status sent - unknown. Triggers: Incremented when BRA is sent with status unknown Availability: per MAG service	Int32
bindrev-discardtotal	Description: The total number of binding revocation acknowledgements received and discarded by this system or the specified service. Triggers: Incremented when BRI is discarded Availability: per MAG service	Int32
bindrev-discardsessnotfound	Description: The total number of binding revocation acknowledgements received and discarded, due to a session not found condition, by this system or the specified service. Triggers: Incremented when BRI is discarded due to session not found Availability: per MAG service	Int32
bindrev-discardbadreq	Description: The total number of binding revocation acknowledgements received and discarded, due to a badly formed request condition, by this system or the specified service. Triggers: Incremented when BRI is discarded due to malformed request Availability: per MAG service	Int32
bindrev-discarddecode	Description: The total number of binding revocation acknowledgements received and discarded, due to a decode error condition, by this system or the specified service. Triggers: Incremented when BRI is discarded due to decode failure Availability: per MAG service	Int32
bindrev-discardchecksum	Description: The total number of binding revocation acknowledgements received and discarded, due to a checksum error condition, by this system or the specified service. Triggers: Incremented when BRI is discarded due to checksum error Availability: per MAG service	Int32
bindrev-discardmsgtype	Description: The total number of binding revocation acknowledgements received and discarded, due to an invalid memory type condition, by this system or the specified service. Triggers: Incremented when BRI is discarded due to invalid message type Availability: per MAG service	Int32
bindrev-discardnomemory	Description: The total number of binding revocation acknowledgements received and discarded, due to insufficient memory, by this system or the specified service. Triggers: Incremented when BRI is discarded due to memory alloc failure Availability: per MAG service	Int32
rxpackets	Description: The total number of packets received by this system. Triggers: Incremented when tunneled data packet is received Availability: per MAG service	Int32
rxpackets-6in6	Description: The total number of IPv6-in-IPv6 tunnel packets received by this system. Triggers: Incremented when tunneled IPv6 in IPv6 encapsulated data packet is received Availability: per MAG service	Int32
rxpackets-4in6	Description: The total number of IPv4-in-IPv6 tunnel packets received by this system or the specified service. Triggers: Incremented when tunneled IPv4 in IPv6 encapsulated data packet is received Availability: per MAG service	Int32

Variables	Description	Data Type
rxpackets-ipv6greipv4	Description: The total number of IPv4-in-IPv6 GRE tunnel packets received by this system or the specified service. Triggers: Incremented when tunneled IPv4 in IPv6 GRE encapsulated data packet is received Availability: per MAG service	Int32
rxpackets-ipv6greipv6	Description: The total number of IPv6-in-IPv6 GRE tunnel packets received by this system or the specified service. Triggers: Incremented when tunneled IPv6 in IPv6 GREEncapsulated data packet is received Availability: per MAG service	Int32
rxoctets	Description: The total number of octets received by this system. Triggers: Incremented with number of bytes received when tunneled data packet is received Availability: per MAG service	Int32
rxoctets-6in6	Description: The total number of IPv6-in-IPv6 tunnel octets received by this system. Triggers: Incremented with number of IPv6 in IPv6 bytes received when tunneled data packet is received Availability: per MAG service	Int32
rxoctets-4in6	Description: The total number of IPv4-in-IPv6 tunnel octets received by this system or the specified service. Triggers: Incremented with number of IPv4 in IPv6 bytes received when tunneled data packet is received Availability: per MAG service	Int32
rxoctets-ipv6greipv4	Description: The total number of IPv4-in-IPv6 GRE tunnel octets received by this system or the specified service. Triggers: Incremented with number of IPv4 in IPv6 GRE bytes received when tunneled data packet is received Availability: per MAG service	Int32
rxoctets-ipv6greipv6	Description: The total number of IPv6-in-IPv6 GRE tunnel octets received by this system or the specified service. Triggers: Incremented with number of IPv6 in IPv6 GRE bytes received when tunneled data packet is received Availability: per MAG service	Int32
dataerror	Description: The total number of data errors received by this system. Triggers: Incremented when error is encountered on processing data packet received from the tunnel Availability: per MAG service	Int32
dataerror-proto	Description: The total number of protocol type data errors received by this system. Triggers: Incremented when packet received with invalid protocol type Availability: per MAG service	Int32
dataerror-invpktn	Description: The total number of invalid packet length data errors received by this system. Triggers: Incremented when packet received with invalid length Availability: per MAG service	Int32

Variables	Description	Data Type
dataerror-nosess	Description: The total number of no session found data errors received by this system. Triggers: Incremented when packet received with session not found Availability: per MAG service	Int32
txpackets	Description: The total number of packets sent by this system. Triggers: Incremented when tunneled data packet is sent Availability: per MAG service	Int32
txpackets-6in6	Description: The total number of IPv6-in-IPv6 tunnel packets sent by this system. Triggers: Incremented when tunneled IPv6 in IPv6 encapsulated data packet is sent Availability: per MAG service	Int32
txpackets-4in6	Description: The total number of IPv4-in-IPv6 tunnel packets sent by this system or the specified service. Triggers: Incremented when tunneled IPv4 in IPv6 encapsulated data packet is sent Availability: per MAG service	Int32
txpackets-ipv6greipv4	Description: The total number of IPv4-in-IPv6 GRE tunnel packets sent by this system or the specified service. Triggers: Incremented when tunneled IPv4 in IPv6 GRE encapsulated data packet is sent Availability: per MAG service	Int32
txpackets-ipv6greipv6	Description: The total number of IPv6-in-IPv6 GRE tunnel packets sent by this system or the specified service. Triggers: Incremented when tunneled IPv6 in IPv6 GREEncapsulated data packet is sent Availability: per MAG service	Int32
txoctets	Description: The total number of octets sent by this system. Triggers: Incremented with number of bytes sent when tunneled data packet is sent Availability: per MAG service	Int32
txoctets-6in6	Description: The total number of IPv6-in-IPv6 tunnel octets sent by this system. Triggers: Incremented with number of IPv6 in IPv6 bytes sent when tunneled data packet is sent Availability: per MAG service	Int32
txoctets-4in6	Description: The total number of IPv4-in-IPv6 tunnel octets sent by this system or the specified service. Triggers: Incremented with number of IPv4 in IPv6 bytes sent when tunneled data packet is sent Availability: per MAG service	Int32
txoctets-ipv6greipv4	Description: The total number of IPv4-in-IPv6 GRE tunnel octets sent by this system or the specified service. Triggers: Incremented with number of IPv4 in IPv6 GRE bytes sent when tunneled data packet is sent Availability: per MAG service	Int32
txoctets-ipv6greipv6	Description: The total number of IPv6-in-IPv6 GRE tunnel octets sent by this system or the specified service. Triggers: Incremented with number of IPv6 in IPv6 GRE bytes sent when tunneled data packet is sent Availability: per MAG service	Int32

Variables	Description	Data Type
disc	Description: The total number of disconnects initiated by this system. Triggers: Incremented when MAG session disconnects Availability: per MAG service	Int32
disclifetime	Description: The total number of disconnects due to lifetime expiry initiated by this system. Triggers: Incremented when MAG session is disconnected due to lifetime expiry Availability: per MAG service	Int32
discaccessinit	Description: The total number of disconnects due to de-registrations initiated by this system or the specified service. Triggers: Incremented when MAG session is disconnected due to access initiated term Availability: per MAG service	Int32
discadmin	Description: The total number of disconnects due to admin drops initiated by this system. Triggers: Incremented when MAG session disconnects due to Admin reasons Availability: per MAG service	Int32
discother	Description: The total number of disconnects due to “other reasons” initiated by this system. Triggers: Incremented when MAG session is disconnected due to misc reasons Availability: per MAG service	Int32
disclmarevoc	Description: The total number of disconnects due to LMA revocations received by this system or the specified service. Triggers: Incremented when MAG session disconnects due to revocation from LMA Availability: per MAG service	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 42

MAP Schema Statistics

The MAP (Mobile Application Part [SS7]) schema provides operational statistics that can be used for monitoring and troubleshooting the following products: SCM (E-CSCF)

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 42. Bulk Statistic Variables in the MAP Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	Indicates the name of VPN context in which the MAP service is configured. This is a stat key variable.	String
vpnid	Indicates the identifier of the VPN context in which the MAP service is configured. This is a stat key variable.	Int32
servname	Indicates the name of the MAP service for which these statistics are collected. This is a stat key variable.	String
map-open-req-tx	Total number of mobile application part (MAP) open requests sent.	Int32
map-open-req-rx	Total number of mobile application part (MAP) open requests received.	Int32
map-open-rsp-tx	Total number of MAP open response sent.	Int32
map-open-rsp-rx	Total number of MAP open response received.	Int32
map-close-tx	Total number of MAP close response sent.	Int32
map-close-rx	Total number of MAP close response received.	Int32
map-abort-tx	Total number of MAP abort request sent.	Int32
map-abort-rx	Total number of MAP abort request received.	Int32
map-auth-req-tx	Description: Total number of Send Authentication Request messages transmitted to HLR. Triggers: Counter increments when a MAP Send Authentication Request is initiated from SGSN. Availability: per MAP service	Int32
map-auth-succes	Total number of MAP authentication successful.	Int32
map-auth-fail	Description: Total number of User Error / Provider Error received in response to SAI request. Triggers: Counter increments when User Error / Provider Error is received from HLR. Availability: per MAP service	Int32
map-auth-timeouts-rcvd	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments when there is no response from the HLR for map-auth-fail-req-tx message initiated from SGSN. Availability: per MAP service	Int32
map-imei-req-tx	Description: Total number of MAP Check IMEI requests initiated towards EIR. Triggers: Counter increments when MAP CHECK IMEI Request is sent. Availability: per MAP service	Int32
map-imei-succes	Description: Total number of successful responses for MAP Check IMEI requests. Triggers: Counter increments when MAP CHECK IMEI Request is sent. Availability: per MAP service	Int32
map-imei-fail	Description: Total number of failure responses for MAP Check IMEI requests received from EIR. Triggers: Counter increments when MAP Return Error / Provider Error is received in response. Availability: per MAP service	Int32

Variables	Description	Data Type
map-imei-timeout	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments when there is no response from HLR. Availability: per MAP service	Int32
map-gprs-update-loc-req-tx	Description: Total number of UGL (GPRS Update Location) request initiated towards HLR. Triggers: Counter increments when UGL request is sent to HLR. Availability: per MAP service	Int32
map-gprs-update-loc-rsp-tx	Description: Total number of UGL (GPRS Update Location) request initiated towards HLR. Triggers: Counter increments when UGL request is sent to HLR. Availability: per MAP service	Int32
map-gprs-update-loc-err-tx	Description: Total number of Failure response (User Error/Provider Error) messages received in response to UGL request. Triggers: Counter increments when MAP Return Error / Provider Error is received to UGL request. Availability: per MAP service	Int32
map-gprs-update-loc-timeouts-rx	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments if there is no response from HLR. Availability: per MAP service	Int32
map-sub-loc-rpt-req-tx	Description: Total Number of SLR (Subscriber Location Report) request initiated towards GMLC. Triggers: Counter increments when SLR request is sent to GMLC. Availability: per MAP service	Int32
map-sub-loc-rpt-rsp-tx	Description: Total Number of successful response messages sent in response to SLR request. Triggers: Counter increments when successful response is received from GMLC. Availability: per MAP service	Int32
map-sub-loc-rpt-err-tx	Description: Total Number of Failure response (User Error/Provider Error) messages received in response to SLR request. Triggers: Counter increments when MAP Return Error/Provider Error is received to SLR request. Availability: per MAP service	Int32
map-sub-loc-rpt-timeouts-rx	Description: Total Number of timeouts that occurred while waiting for response to SLR request from GMLC. Triggers: Counter increments if there is no response to SLR request from GMLC. Availability: per MAP service	Int32
map-prov-sub-loc-req-rx	Description: Total Number of PSL (Provide Subscriber Location) request received from GMLC. Triggers: Counter increments when MAP PSL request is received from GMLC. Availability: per MAP service	Int32
map-prov-sub-loc-rsp-tx	Description: Total Number of successful PSL response messages sent to GMLC. Triggers: Counter increments when successful response is sent to GMLC. Availability: per MAP service	Int32
map-prov-sub-loc-err-tx	Description: Total Number of error response messages sent to GMLC. Triggers: Counter increments when MAP Return Error is sent to GMLC. Availability: per MAP service	Int32

Variables	Description	Data Type
map-cancel-loc-req-rx	Description: Total number of Cancel Location Request received from HLR. Triggers: Counter increments when MAP Cancel Location Request is received. Availability: per MAP service	Int32
map-cancel-loc-rsp-tx	Description: Total number of successful Cancel Location Response messages sent to HLR. Triggers: Counter increments when successful response is sent to HLR. Availability: per MAP service	Int32
map-cancel-loc-err-tx	Description: Total number of Error response messages sent to HLR. Triggers: Counter increments when MAP Return Error is sent to HLR. Availability: per MAP service	Int32
map-del-sub-req-rx	Description: Total number of Delete Subscription Data Request received from HLR. Triggers: Counter increments when MAP Delete Subscription Data (DSD) message is received. Availability: per MAP service	Int32
map-del-sub-rsp-tx	Description: Total number of successful responses for Delete Subscription Data request sent to HLR. Triggers: Counter increments when MAP Delete Subscription Data (DSD) message is received. Availability: per MAP service	Int32
map-del-sub-ret-tx	Description: Total number of Error responses sent for Delete Subscription Data (DSD) request received. Triggers: Counter increments when failure response is sent to HLR. Availability: per MAP service	Int32
map-insert-sub-rcvd	Total number of insert subscriber data requests received by MAP.	Int32
map-standalone-isd-rcvd	Total number of standalone insert subscriber data requests received by MAP.	Int32
map-isd-rsp-tx	Total number of insert subscriber data requests sent by MAP.	Int32
map-isd-err-tx	Total number of insert subscriber data failure response sent by MAP.	Int32
map-auth-fail-rept-req-tx	Description: Total number of Authentication Failure Report Request messages transmitted by MAP. Triggers: Counter increments when a message is initiated to inform HLR that certain vectors had problem in authenticating with the MS. Availability: per MAP service	Int32
map-auth-fail-rept-rsp-rx	Description: Total number of Authentication Failure Report Request messages received by MAP. Triggers: Counter increments when successful response is received in response to map-auth-fail-rep-req-tx. Availability: per MAP service	Int32
map-auth-fail-rept-err-rx	Description: Total number of User Error and Provider Error received for the Authentication Failure Report Request sent to HLR. Triggers: Counter increments when MAP Return Error/Provider Error is received in response to map-auth-fail-rep-req-tx message. There will be no effect on the call due to this. Availability: per MAP service	Int32

Variables	Description	Data Type
map-auth-fail-rept-timeouts-rcvd	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments when MAP Return Error / Provider Error is received in response to map-auth-fail-rep-req-tx. There will be no effect on the call due to this. Availability: per MAP service	Int32
map-purge-req-tx	Description: Total number of MAP Purge Request messages initiated towards HLR. Triggers: Counter increments when MAP Purge Request is transmitted. Availability: per MAP service	Int32
map-purge-success	Description: Total number of successful MAP Purge Request messages sent to HLR. Triggers: Counter increments when successful response is received from HLR. Availability: per MAP service	Int32
map-purge-fail	Description: Total number of Failure response received from HLR. Triggers: Counter increments when MAP Return Error / Provider Error is received in response. Availability: per MAP service	Int32
map-purge-timeouts-rcvd	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments when there is no response from HLR. Availability: per MAP service	Int32
map-hlr-reset-rcvd	Total number of HLR reset indicator received by MAP.	Int32
map-mo-fwd-req-sent	Total number of mobile originated forward request messages sent to MAP.	Int32
map-mo-fwd-rsp-rcvd	Total number of mobile originated forward response messages received from MAP.	Int32
map-mo-fwd-rsp-failed	Total number of mobile originated forward response messages failed at MAP.	Int32
map-mo-fwd-rsp-time-out	Total number of mobile originated forward response messages timed-out at MAP.	Int32
map-mt-fwd-req-sent	Total number of mobile terminated forward request messages sent to MAP.	Int32
map-mt-fwd-rsp-rcvd	Total number of mobile terminated forward request messages received from MAP.	Int32
map-mt-fwd-rsp-failed	Total number of mobile terminated forward response messages failed at MAP.	Int32
map-ready-for-sm-req	Total number of MAP ready for session management request received.	Int32
map-ready-for-sm-rsp	Total number of MAP ready for session management request response received.	Int32
map-ready-for-sm-rsp-failed	Total number of MAP ready for session management requests failed.	Int32
map-ready-for-sm-rsp-time-out	Total number of MAP ready for session management requests timed-out.	Int32

Chapter 43

MIPv6HA Schema Statistics

The MIPv6HA schema provides operational statistics that can be used for monitoring and troubleshooting the following products: All

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 43. Bulk Statistic Variables in the MIPv6 HA Schema

Variables	Description	Data Type
-----------	-------------	-----------

Common Syntax Options

Variables	Description	Data Type
vpnname	The name of the context configured on the system that is currently facilitating the LAC service. This is a key variable.	String
vpnid	The identification number of the context configured on the system that is currently facilitating the LAC service. This is an internal reference number. This is a key variable.	Int32
servname	Displays the name of the LAC service for which the statistics are displayed. This is a key variable.	String
servid	The identification number of the MIPv6 HA service for which the statistics are displayed. This is a key variable.	Int32
num-subscriber	The current total number of MIPv6 HA sessions.	Int32
aaa-attempt	The number of authentication requests attempted on receiving a bind update request.	Ctr32
aaa-success	The number of successful authorization attempts.	Ctr32
aaa-totfail	The number of failed authorization attempts.	Ctr32
aaa-actauthfail	The authorization attempt failure count due to access rejects from AAA.	Ctr32
aaa-misauthfail	The authorization attempt failure s due to other reasons like internal error or AAA response timeout.	Ctr32
bindupdrec-totrec	The total number of MIPv6 bind update requests received.	Ctr32
bindupdrec-totacc	The total number of MIPv6 bind update requests accepted.	Ctr32
bindupdrec-totdeny	The total number of MIPv6 bind update requests denied.	Ctr32
bindupdrec-totdisc	The total number of MIPv6 bind update requests discarded.	Ctr32
bindupdrec-totcongdiscreq	The total number of MIPv6 bind update requests discarded because of congestion.	Ctr32
ibindupdreq-receive	The total number of initial bind update requests received.	Ctr32
ibindupdreq-accept	The total number of initial bind update requests accepted.	Ctr32
ibindupdreq-deny	The total number of initial bind update requests denied.	Ctr32
rbindupdreq-receive	The total number of renew bind update requests received.	Ctr32
rbindupdreq-accept	The total number of renew bind update requests accepted.	Ctr32
rbindupdreq-deny	The total number of renew bind update requests denied.	Ctr32
deregreq-receive	The total number of dereg bind update requests received.	Ctr32
deregreq-accept	The total number of dereg bind update requests accepted.	Ctr32
deregreq-deny	The total number of dereg bind update requests denied.	Ctr32
horeq-receive	The total number of handoff bind update requests received. A handoff bind update request is a bind update request received for the same session (NAI/HA/HoA) with a new CoA.	Ctr32

Variables	Description	Data Type
horeq-accept	The total number of handoff requests accepted.	Ctr32
horeq-deny	The total number of handoff requests denied.	Ctr32
bindacksent-total	The total number of MIPv6 binding acknowledgement messages sent.	Ctr32
bindacksent-acceptreg	The total number of MIPv6 binding acknowledgement replies sent.	Ctr32
bindacksent-acceptdereg	The total number of MIPv6 dereg replies sent (bind acknowledgement with a lifetime of zero).	Ctr32
bindacksent-deny	The total number of denied bind acknowledgement replies sent.	Ctr32
denyreason -badreq	The total number of bind updates denied with status code 81H due to poorly formed bind update request.	Ctr32
denyreason -mismatchid	The total number of bind update denied with status code 90H (mismatched id).	Ctr32
denyreason-mnauthfail	The total number of bind update denied with status code 92H (mobile auth failure).	Ctr32
denyreason-admprohibit	The total number of bind update denied with status code 81H (Admin prohibited).	Ctr32
denyreason-noresource	The total number of bind update denied with status code 82H (Insufficient resources).	Ctr32
denyreason-simbindexceed	The total number of bind update denied with status code 82H because simultaneous binding limit is exceeded.	Ctr32
denyreason-unspereason	The total number of bind update denied with status code 80H (Reason Unspecified).	Ctr32
denyreason-msgidrequire	The total number of bind update denied with status code 91H (Msg-Id-Required).	Ctr32
denyreason-dadfail	The total number of bind update denied with status code 86H (Duplicate Address Detection failed).	Ctr32
denyreason-nothomesubnet	The total number of bind update denied with status code 84H (Not Home Subnet).	Ctr32
denyreason-seqoutwindow	The total number of bind update denied with status code 87H (Sequence number Out of Window).	Ctr32
denyreason-regchadisallow	The total number of bind update denied with status code 8BH (Registration Type change disallowed).	Ctr32
datareceive-totpkt	The total number of tunneled data packets received.	Ctr32
datareceive-totpkt6in6	The total number of ipv6-ipv6 tunneled data packets received.	Ctr32
datareceive-totbyte	The total byte count of the tunnel data received	Ctr32
datareceive-totbyte6in6	The total byte count of ipv6-ipv6 tunneled data received	Ctr32
datareceive-errorprotocol	The total number of packets received with protocol type error.	Ctr32

Common Syntax Options

Variables	Description	Data Type
datareceive-errorinvpkt	The total number of invalid data packets received	Ctr32
datareceive-errornosess	The total number of data packets received for which session was not found.	Ctr32
datasent- totpkt	The total number of tunnel data packet sent	Ctr32
datasent- totpkt6in6	The total number of ipv6-ipv6 tunneled data packets sent	Ctr32
datasent-totbyte	The total byte count of tunneled data sent	Ctr32
datasent- totbyte6in6	The total byte count for ipv6-ipv6 tunneled data sent	Ctr32
disconnect-lifetimeexp	The total number of session disconnected due to lifetime expiry	Ctr32
disconnect-deregistration	The total number of disconnects due to deregistration from MN.	Ctr32
disconnect-admdrop	The total number of sessions disconnected administratively.	Ctr32
disconnect-othreason	The total number of sessions disconnects due to other reasons.	Ctr32
icmpv6-toobigreceive	The total number of ICMPv6 Packet too big received for tunneled packets originating within tunnel.	Ctr32
icmpv6-toobigforward	The total number of ICMPv6 packet too big forwarded messages	Ctr32
total-subscriber		Ctr32
admprohreason-badreq	Number of updates denied for an Admin prohibited reason: bad request	Ctr32
insufresource-badreq	Number of binding updates denied	Ctr32
bindacksent-senderror	The total number of binding acknowledgements sent with a send error	Ctr32
admprohreason-congcondenied	Number of updates denied for an Admin prohibited reason: congestion control denied	Ctr32
icmpv6-toobigdrop	Number of ICMPv6 packets dropped because they are too big and need to be fragmented.	Ctr32
bindupddiscard-congdisc	Number of binding updates discarded because HAMGR is configured to drop packets on congestion	Ctr32
bindupddiscard-chkerror	Number of bind updates discarded because of a checksum error on binding update.	Ctr32
bindupddiscard-inauthpend	Number of bind updates discarded because initialization authorization is pending when retry binding updates are received	Ctr32
bindupddiscard-sessnotfound	Number of bind updates discarded because hamgr forwards RRQ for existing session but session not found in Sessmgr	Ctr32
bindupddiscard-hamgrnotrea	Number of bind updates discarded because HAMGR is not yet ready and packet buffering limit is exceeded	Ctr32
bindupddiscard-decfail	Number of binding updates discarded because the binding update packet decoding has failed in HAMGR.	Ctr32

Variables	Description	Data Type
bindupddiscard- invbuflen	Number of bind updates discarded because there is mismatch in the binding update packet buffer length and expected length.	Ctr32
admprohreason- authoptmiss	Number of bind updates denied because there are Admin Prohibited Reasons-MN-AAA Auth Option Missing.	String
admprohreason- hbitnotset	Number of bind updates denied because there are Admin Prohibited Reasons-H-bit Not Set.	String
admprohreason- invaaaspi	Number of bind updates denied because there are Admin Prohibited Reasons-Invalid MN-AAA Option SPI.	String
admprohreason- invhaspi	Number of bind updates denied because there are Admin Prohibited Reasons-Invalid MN-HA Option SPI.	String
admprohreason-polrej	Number of bind updates denied because there are Admin Prohibited Reasons-Policy Rejected.	String
admprohreason- notauth	Number of bind updates denied because there are Admin Prohibited Reasons-HoA Not Authorized.	String
admprohreason- noperm	Number of bind updates denied because there are Admin Prohibited Reasons-No Permission.	String
insufresource- nosessmgr	Number of bind updates denied because there are Insufficient Resource Reasons-No Session Manager.	String
insufresource-nomem	Number of bind updates denied because there are Insufficient Resource Reasons-No Memory.	String
insufresource- sessmgrrej	Number of bind updates denied because there are Insufficient Resource Reasons-Session Manager Rejected.	String
insufresource- ipqexc	Number of bind updates denied because there are Insufficient Resource Reasons-Input-Q Exceeded.	String
insufresource- simbindexc	Number of bind updates denied because there are Insufficient Resource Reasons-Simul Bindings Exceeded.	String
tun-conn-attempt	The total number of tunnel connection attempts.	Int32
tun-conn-success	The total number of successful tunnel connections.	Int32
tun-conn-fail	The total number of failed tunnel connections.	Int32
tun-conn-curactive	The total number of currently active tunnel connections.	Int32
sess-attempts	The total number of session connection attempts.	Int32
sess-successful	The total number of successful session connections.	Int32
sess-failed	The total number of failed session connections.	Int32
sess-curactive	The total number of currently active session connections.	Int32
sess-intrapdsnho- attempt	The total number of Intra-PDSN Hand-Offs connection attempts.	Int32

Common Syntax Options

Variables	Description	Data Type
sess-intrapdsnho-success	The total number of successful Intra-PDSN Hand-Offs connections.	Int32
sess-intrapdsnho-failed	The total number of failed Intra-PDSN Hand-Offs connections.	Int32
sess-interpdsnho-attempt	The total number of Inter-PDSN Hand-Offs connection attempts.	Int32
recv-err-malformed	The total number of Tunnel Receive Control Packet errors experienced due to malformed packets .	Int32
recv-err-ctrlfield	The total number of Tunnel Receive Control Packet errors experienced due to control field errors.	Int32
recv-err-pkflen	The total number of Tunnel Receive Control Packet errors experienced due to packet length errors.	Int32
recv-err-avplen	The total number of Tunnel Receive Control Packet errors experienced due to AVP length errors.	Int32
recv-err-protover	The total number of Tunnel Receive Control Packet errors experienced due to protocol version errors.	Int32
recv-err-md5	The total number of Tunnel Receive Control Packet errors experienced due to MD5 errors.	Int32
recv-err-invattr	The total number of Tunnel Receive Control Packet errors experienced due to invalid attribute errors.	Int32
recv-err-unkattr	The total number of Tunnel Receive Control Packet errors experienced due to unknown attribute errors.	Int32
recv-err-invsessid	The total number of Tunnel Receive Control Packet errors experienced due to invalid session ID errors.	Int32
recv-err-invstate	The total number of Tunnel Receive Control Packet errors experienced due to invalid state errors.	Int32
recv-err-unkmsg	The total number of Tunnel Receive Control Packet errors experienced due to unknown message errors.	Int32
recv-err-unmatchpktlen	The total number of Tunnel Receive Control Packet errors experienced due to unmatched packet length errors.	Int32
recv-err-InvTunID	The total number of Tunnel Receive Control Packet errors experienced due to invalid tunnel length errors.	Int32
tun-genclear	The total number of tunnels cleared normally.	Int32
tun-ctrlconnexists	The total number of tunnel disconnects/failures experienced due to a pre-existing control connection.	Int32
tun-unauth	The total number of tunnel disconnects/failures experienced due to unauthorized errors.	Int32
tun-badproto	The total number of tunnel disconnects/failures experienced due to bad protocol errors.	Int32
tun-reqshutdown	The total number of tunnel disconnects experienced due to requester shutdown.	Int32

Variables	Description	Data Type
tun-statemacherr	The total number of tunnel disconnects/failures experienced due to state machine errors.	Int32
tun-badlen	The total number of tunnel disconnects/failures experienced due to wrong length errors.	Int32
tun-oor	The total number of tunnel disconnects/failures experienced due to out-of-range errors.	Int32
tun-noresource	The total number of tunnel disconnects/failures experienced due to insufficient resources.	Int32
tun-vendspec	The total number of tunnel disconnects/failures experienced due to vendor-specific errors.	Int32
tun-tryanotherlns	The total number of tunnel disconnects/failures experienced resulting in “Try Another LNS” message generation.	Int32
tun-unkavp	The total number of tunnel disconnects/failures experienced due to unknown AVP with M-bit errors.	Int32
tun-ipsecdisc	The total number of tunnel disconnects experienced due to IPSEC.	Int32
tun-ipsecfail	The total number of tunnel failures experienced due to IPSEC.	Int32
tun-license	The total number of tunnel disconnects/failures experienced due to license exceeded errors.	Int32
tun-newcallpoldisc	The total number of tunnel disconnects experienced due to new call policies.	Int32
tun-maxretry	The total number of tunnel disconnects/failures experienced due to the maximum number of retries being exceeded.	Int32
tun-syslimit	The total number of tunnel disconnects/failures experienced due to reaching the system tunnel limit.	Int32
tun-miscerr	The total number of tunnel disconnects/failures experienced due to miscellaneous errors.	Int32
sess-nogeneral	The total number of sessions for which there were no general errors experienced.	Int32
sess-admin	The total number of session disconnects/failures experienced due to administrative reasons.	Int32
sess-lossofcarr	The total number of session disconnects/failures experienced due to loss of carrier.	Int32
sess-remoteadmin	The total number of session disconnects/failures experienced due to remote administrative reasons.	Int32
sess-nofactemp	The total number of session disconnects/failures experienced due to temporary no facility available errors.	Int32
sess-nofacperm	The total number of session disconnects/failures experienced due to permanent no facility available errors.	Int32
sess-invdest	The total number of session disconnects/failures experienced due to invalid destination errors.	Int32
sess-nocarrier	The total number of session disconnects/failures experienced due no carrier being detected.	Int32
sess-busysig	The total number of session disconnects/failures experienced due to receipt of a busy signal.	Int32
sess-nodialtime	The total number of session disconnects/failures experienced due to receipt of no dial tone.	Int32
sess-lactimeout	The total number of session disconnects/failures experienced due to LAC timeout.	Int32
sess-noframing	The total number of session disconnects/failures experienced due to no appropriate framing.	Int32

■ Common Syntax Options

Variables	Description	Data Type
sess-noctrlconn	The total number of session disconnects/failures experienced due to no control connection existing.	Int32
sess-badlen	The total number of session disconnects/failures experienced due to wrong length errors.	Int32
sess-oor	The total number of session disconnects/failures experienced due to out-of-range errors.	Int32
sess-noresource	The total number of session disconnects/failures experienced due to insufficient resources.	Int32
sess-invsessid	The total number of session disconnects/failures experienced due to an invalid session ID.	Int32
sess-vendspec	The total number of session disconnects/failures experienced due to vendor specific errors.	Int32
sess-tryanotherlms	The total number of session disconnects/failures experienced resulting in “Try Another LNS” message generation.	Int32
sess-unkavp	The total number of session disconnects/failures experienced due to unknown AVP with M-bit errors.	Int32
sess-maxtunnel	The total number of session disconnects/failures experienced due to reaching the maximum tunnel limit.	Int32
sess-ipsecfail	The total number of session failures experienced due to IPSEC.	Int32
sess-ipsecdisc	The total number of session disconnects experienced due to IPSEC.	Int32
sess-newcallpoldisc	The total number of session disconnects experienced due to new call policies.	Int32
sess-license	The total number of session disconnects/failures experienced due to license exceeded errors.	Int32
sess-servmismatch	The total number of session disconnects/failures experienced due to service mismatch errors.	Int32
sess-miscerr	The total number of session disconnects/failures experienced due to miscellaneous errors.	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 44

MME Schema Statistics

The MME schema provides operational statistics that can be used for monitoring and troubleshooting the following products: MME

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 44. Bulk Statistic Variables in the MME Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	The name of the context configured on the system that is currently facilitating the MME service processing the subscriber's session. This is a key variable. Type: Information	String
vpnid	The identification number of the context configured on the system that is currently facilitating the MME service processing subscriber's session. This is an internal reference number. This is a key variable. Type: Information	Int32
servname	The name of the service for which MME statistics are being displayed. This is a key variable. Type: Information	String
servid	The identification number of the service configured on the system that is currently facilitating MME subscriber sessions. This is an internal reference number. This is a key variable. Type: Information	Int32
sess-cur	The current total number of sessions on the system. Type: Gauge	Int32
 IMPORTANT: The following EMM event association statistics are only available in 12.0 and earlier releases.		
emmevent-assoc-attempt	The total number of EPS Mobility Management events - associations (attach) - attempted. Type: Counter	Int32
emmevent-assoc-success	The total number of EPS Mobility Management events - associations (attach) - successes. Type: Counter	Int32
emmevent-assoc-failure	The total number of EPS Mobility Management events - associations (attach) - failures. Type: Counter	Int32
emmevent-associmsi-attempt	The total number of EPS Mobility Management events - associations (attach) IMSI - attempted. Type: Counter	Int32
emmevent-associmsi-success	The total number of EPS Mobility Management events - associations (attach) IMSI - successes. Type: Counter	Int32
emmevent-associmsi-failure	The total number of EPS Mobility Management events - associations (attach) IMSI - failures. Type: Counter	Int32

Variables	Description	Data Type
emmevent-assocloguti-attempt	The total number of EPS Mobility Management events - associations (attach) local GUTI - attempted Type: Counter	Int32
emmevent-assocloguti-success	The total number of EPS Mobility Management events - associations (attach) local GUTI - successes. Type: Counter	Int32
emmevent-assocloguti-failure	The total number of EPS Mobility Management events - associations (attach) local GUTI - failures. Type: Counter	Int32
emmevent-assocnonloguti-attempt	The total number of EPS Mobility Management events - associations (attach) non-local GUTI - attempted. Type: Counter	Int32
emmevent-assocnonloguti-success	The total number of EPS Mobility Management events - associations (attach) non-local GUTI - successes. Type: Counter	Int32
emmevent-assocnonloguti-failure	The total number of EPS Mobility Management events - associations (attach) non-local GUTI - failures. Type: Counter	Int32
 IMPORTANT: The previous EMM event association statistics are only available in 12.0 and earlier releases.		
emmevent-auth-attempt	The total number of EPS Mobility Management events - S1 NAS authentications - attempted. Type: Counter	Int32
emmevent-auth-success	The total number of EPS Mobility Management events - S1 NAS authentications - successes. Type: Counter	Int32
emmevent-auth-failure	The total number of EPS Mobility Management events - S1 NAS authentications - failures. Type: Counter	Int32
emmevent-iden-attempt	The total number of EPS Mobility Management events - S1 NAS identity - attempted. Type: Counter	Int32
emmevent-iden-success	The total number of EPS Mobility Management events - S1 NAS identity - successes. Type: Counter	Int32
emmevent-iden-failure	The total number of EPS Mobility Management events - S1 NAS identity - failures. Type: Counter	Int32
emmevent-sec-attempt	The total number of EPS Mobility Management events - security - attempted. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
emmevent-sec-success	The total number of EPS Mobility Management events - security - successes. Type: Counter	Int32
emmevent-sec-failure	The total number of EPS Mobility Management events - security - failures. Type: Counter	Int32
emmevent-x2ho-attempt	The total number of EPS Mobility Management events - X2-based handovers - attempted. Type: Counter	Int32
emmevent-x2ho-success	The total number of EPS Mobility Management events - X2-based handovers - successes. Type: Counter	Int32
emmevent-x2ho-failure	The total number of EPS Mobility Management events - X2-based handovers - failures. Type: Counter	Int32
emmevent-s1ho-attempt	The total number of EPS Mobility Management events - S1-based handovers - attempted. Type: Counter	Int32
emmevent-s1ho-success	The total number of EPS Mobility Management events - S1-based handovers - successes. Type: Counter	Int32
emmevent-s1ho-failure	The total number of EPS Mobility Management events - S1-based handovers - failures. Type: Counter	Int32
 IMPORTANT: The following EMM event TAU and detach statistics are only available in 12.0 and earlier releases.		
emmevent-tau-attempt	The total number of EPS Mobility Management events - all tracking area update events - attempted. Type: Counter	Int32
emmevent-tau-success	The total number of EPS Mobility Management events - all tracking area update events - successes. Type: Counter	Int32
emmevent-tau-failure	The total number of EPS Mobility Management events - all tracking area update events - failures. Type: Counter	Int32
emmevent-detach-attempt	The total number of EPS Mobility Management events - detach - attempts. Type: Counter	Int32
emmevent-detach-success	The total number of EPS Mobility Management events - detach - successes. Type: Counter	Int32

Variables	Description	Data Type
emmevent-detach-failure	The total number of EPS Mobility Management events - detach - failures. Type: Counter	Int32
 IMPORTANT: The previous EMM event TAU and detach statistics are only available in 12.0 and earlier releases.		
emmevent-detachueinit-attempt	The total number of EPS Mobility Management events - user equipment initiated detach - attempts. Type: Counter	Int32
emmevent-detachueinit-success	The total number of EPS Mobility Management events - user equipment initiated detach - successes. Type: Counter	Int32
emmevent-detachueinit-failure	The total number of EPS Mobility Management events - user equipment initiated detach - failures. Type: Counter	Int32
emmevent-detachnwinit-attempt	The total number of EPS Mobility Management events - network initiated detach - attempts. Type: Counter	Int32
emmevent-detachnwinit-success	The total number of EPS Mobility Management events - network initiated detach - successes. Type: Counter	Int32
emmevent-detachnwinit-failure	The total number of EPS Mobility Management events - network initiated detach - failures. Type: Counter	Int32
emmevent-detachhssinit-attempt	The total number of EPS Mobility Management events - home subscriber service initiated detach - attempts. Type: Counter	Int32
emmevent-detachhssinit-success	The total number of EPS Mobility Management events - home subscriber service initiated detach - successes. Type: Counter	Int32
emmevent-detachhssinit-failure	The total number of EPS Mobility Management events - home subscriber service initiated detach - failures. Type: Counter	Int32
ecmevent-idlemode-attempt	The total number of EPS Connection Management events - idle mode entry events - attempted. Type: Counter	Int32
ecmevent-idlemode-success	The total number of EPS Connection Management events - idle mode entry events - successes. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
ecmevent-idlemode-failure	The total number of EPS Connection Management events - idle mode entry events - failures. Type: Counter	Int32
ecmevent-ue-srvcreq-attempt	The total number of EPS Connection Management events - service request events - attempted. Type: Counter	Int32
ecmevent-ue-srvcreq-success	The total number of EPS Connection Management events - service request events - successes. Type: Counter	Int32
ecmevent-ue-srvcreq-failure	The total number of EPS Connection Management events - service request events - failures. Type: Counter	Int32
 IMPORTANT: The following ECM event service request and paging statistics are only available in 12.0 and earlier releases.		
ecmevent-paging-attempt	The total number of EPS Connection Management events - paging initiation events - attempted. Type: Counter	Int32
ecmevent-paging-success	The total number of EPS Connection Management events - paging initiation events - successes. Type: Counter	Int32
ecmevent-paging-failure	The total number of EPS Connection Management events - paging initiation events - failures. Type: Counter	Int32
 IMPORTANT: The previous ECM event service request and paging statistics are only available in 12.0 and earlier releases.		
emmctrlmsg-sent-cleartext	The total number of EPS Mobility Management control messages - sent - clear text messages. Type: Counter	Int32
emmctrlmsg-sent-integrity	The total number of EPS Mobility Management control messages - sent - integrity-check enabled. Type: Counter	Int32
emmctrlmsg-sent-cipher	The total number of EPS Mobility Management control messages - sent - ciphered messages. Type: Counter	Int32

Variables	Description	Data Type
emmctrlmsg-sent-retrans	The total number of EPS Mobility Management control messages - sent - retransmissions sent. Type: Counter	Int32
emmctrlmsg-sent-failure	The total number of EPS Mobility Management control messages - sent - failures. Type: Counter	Int32
emmctrlmsg-recv-cleartext	The total number of EPS Mobility Management control messages - received - clear-text messages. Type: Counter	Int32
emmctrlmsg-recv-integrity	The total number of EPS Mobility Management control messages - received - integrity-check enabled. Type: Counter	Int32
emmctrlmsg-recv-cipher	The total number of EPS Mobility Management control messages - received - ciphered messages. Type: Counter	Int32
emmctrlmsg-recv-accept	The total number of EPS Mobility Management control messages - received - accepted. Type: Counter	Int32
emmctrlmsg-recv-discard	The total number of EPS Mobility Management control messages - received - discarded. Type: Counter	Int32
emmctrlmsg-recv-denied	The total number of EPS Mobility Management control messages - received - denied. Type: Counter	Int32
emmctrlmsg-recv-deocdefail	The total number of EPS Mobility Management control messages - received - decode failures. Type: Counter	Int32
emmcalls-attach-currcall	The total number of EPS Mobility Management callline statistics - attached calls - current calls. Type: Gauge	Int32
emmcalls-attach-maxcall	The total number of EPS Mobility Management callline statistics - attached calls - maximum calls. Type: Gauge	Int32
emmcalls-connect-currcall	The total number of EPS Mobility Management callline statistics - connected calls - current calls. Type: Gauge	Int32
emmcalls-connect-maxcall	The total number of EPS Mobility Management callline statistics - connected calls - maximum calls. Type: Gauge	Int32
emmcalls-idle-currcall	The total number of EPS Mobility Management callline statistics - idle calls - current calls. Type: Gauge	Int32

Variables	Description	Data Type
emmcalls-idle-maxcalls	The total number of EPS Mobility Management callline statistics - idle calls - maximum calls. Type: Gauge	Int32
emmdisc-uedetach	The total number of EPS Mobility Management disconnect statistics - UE detached. Type: Counter	Int32
emmdisc-pgwdetach	The total number of EPS Mobility Management disconnect statistics - P-GW detached. Type: Counter	Int32
emmdisc-hssdetach	The total number of EPS Mobility Management disconnect statistics - HSS detached. Type: Counter	Int32
emmdisc-mmedetach	The total number of EPS Mobility Management disconnect statistics - MME detached. Type: Counter	Int32
emmdisc-implicitdetach	The total number of EPS Mobility Management disconnect statistics - implicit detach. Type: Counter	Int32
emmdisc-localabort	The total number of EPS Mobility Management disconnect statistics - local abort. Type: Counter	Int32
emmdisc-authfail	The total number of EPS Mobility Management disconnect statistics - authentication failures. Type: Counter	Int32
emmdisc-subparamfail	The total number of EPS Mobility Management disconnect statistics - subscription parameter failures. Type: Counter	Int32
emmdisc-otherreasons	The total number of EPS Mobility Management disconnect statistics - other reasons. Type: Counter	Int32
esmevent-pdncon-attempt	The total number of EPS Session Management events - PDN connections - attempted. Type: Counter	Int32
esmevent-pdncon-success	The total number of EPS Session Management events - PDN connections - successes. Type: Counter	Int32
esmevent-pdncon-failure	The total number of EPS Session Management events - PDN connections - failures. Type: Counter	Int32
esmevent-pdncon-ipv4-attempt	The total number of EPS Session Management events - PDN connections of PDN type IPv4 - attempted. Type: Counter	Int32
esmevent-pdncon-ipv4-success	The total number of EPS Session Management events - PDN connections of PDN type IPv4 - successes. Type: Counter	Int32

Variables	Description	Data Type
esmevent-pdncon-ipv4-failure	The total number of EPS Session Management events - PDN connections of PDN type IPv4 - failures. Type: Counter	Int32
esmevent-pdncon-ipv6-attempt	The total number of EPS Session Management events - PDN connections of PDN type IPv6 - attempted. Type: Counter	Int32
esmevent-pdncon-ipv6-success	The total number of EPS Session Management events - PDN connections of PDN type IPv6 - successes. Type: Counter	Int32
esmevent-pdncon-ipv6-failure	The total number of EPS Session Management events - PDN connections of PDN type IPv6 - failures. Type: Counter	Int32
 IMPORTANT: The following ESM event PDN disconnect statistics are only available in 12.0 and earlier releases.		
esmevent-pdncon-ipv6-attempt	The total number of EPS Session Management events - PDN disconnections - attempted. Type: Counter	Int32
esmevent-pdncon-ipv6-success	The total number of EPS Session Management events - PDN disconnections - successes. Type: Counter	Int32
esmevent-pdncon-ipv6-failure	The total number of EPS Session Management events - PDN disconnections - failures. Type: Counter	Int32
 IMPORTANT: The previous ESM event PDN disconnect statistics are only available in 12.0 and earlier releases.		
esmevent-defbearact-attempt	The total number of EPS Session Management events - default bearer activations - attempted. Type: Counter	Int32
esmevent-defbearact-success	The total number of EPS Session Management events - default bearer activations - successes. Type: Counter	Int32
esmevent-defbearact-failure	The total number of EPS Session Management events - default bearer activations - failures. Type: Counter	Int32

Variables	Description	Data Type
 IMPORTANT: The following ESM event dedicated bearer and bearer deactivation statistics are only available in 12.0 and earlier releases.		
esmevent-dedbearact-attempt	The total number of EPS Session Management events - dedicated bearer activations - attempted. Type: Counter	Int32
esmevent-dedbearact-success	The total number of EPS Session Management events - dedicated bearer activations - successes. Type: Counter	Int32
esmevent-dedbearact-failure	The total number of EPS Session Management events - dedicated bearer activations - failures. Type: Counter	Int32
esmevent-beardeact-attempt	The total number of EPS Session Management events - bearer deactivations - attempted. Type: Counter	Int32
esmevent-beardeact-success	The total number of EPS Session Management events - bearer deactivations - successes. Type: Counter	Int32
esmevent-beardeact-failure	The total number of EPS Session Management events - bearer deactivations - failures. Type: Counter	Int32
 IMPORTANT: The previous ESM event dedicated bearer and bearer deactivation statistics are only available in 12.0 and earlier releases.		
esmctrlmsg-sent-cleartext	The total number of EPS Session Management control messages - sent - clear-text messages. Type: Counter	Int32
esmctrlmsg-sent-integrity	The total number of EPS Session Management control messages - sent - integrity-check enabled. Type: Counter	Int32
esmctrlmsg-sent-cipher	The total number of EPS Session Management control messages - sent - ciphered messages. Type: Counter	Int32
esmctrlmsg-sent-retrans	The total number of EPS Session Management control messages - sent - retransmissions sent. Type: Counter	Int32

Variables	Description	Data Type
esmctrlmsg-sent-failure	The total number of EPS Session Management control messages - sent - failures. Type: Counter	Int32
 IMPORTANT: The following ESM control message statistics are only available in 12.0 and earlier releases.		
esmctrlmsg-recv-cleartext	The total number of EPS Session Management control messages - received - clear-text messages. Type: Counter	Int32
esmctrlmsg-recv-integrity	The total number of EPS Session Management control messages - received - integrity-check enabled. Type: Counter	Int32
esmctrlmsg-recv-cipher	The total number of EPS Session Management control messages - received - ciphered messages. Type: Counter	Int32
esmctrlmsg-recv-accept	The total number of EPS Session Management control messages - received - accepted. Type: Counter	Int32
esmctrlmsg-recv-discard	The total number of EPS Session Management control messages - received - discarded. Type: Counter	Int32
esmctrlmsg-recv-denied	The total number of EPS Session Management control messages - received - denied. Type: Counter	Int32
esmctrlmsg-recv-deocdefail	The total number of EPS Session Management control messages - received - decode failures. Type: Counter	Int32
 IMPORTANT: The previous ESM control message statistics are only available in 12.0 and earlier releases.		
sctp-transdata-init	The total number of Stream Control Transmission Protocol - transmit data - init chunks. Type: Counter	Int32
sctp-transdata-initack	The total number of Stream Control Transmission Protocol - transmit data - init acknowledge chunks. Type: Counter	Int32
sctp-transdata-shut	The total number of Stream Control Transmission Protocol - transmit data - shutdown chunks. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
sctp-transdata-shutack	The total number of Stream Control Transmission Protocol - transmit data - shutdown acknowledge chunks. Type: Counter	Int32
sctp-transdata-cookie	The total number of Stream Control Transmission Protocol - transmit data - cookie chunks. Type: Counter	Int32
sctp-transdata-cookieack	The total number of Stream Control Transmission Protocol - transmit data - cookie acknowledge chunks. Type: Counter	Int32
sctp-transdata-data	The total number of Stream Control Transmission Protocol - transmit data - data chunks. Type: Counter	Int32
sctp-transdata-dataack	The total number of Stream Control Transmission Protocol - transmit data - data acknowledge chunks. Type: Counter	Int32
sctp-transdata-shutcomp	The total number of Stream Control Transmission Protocol - transmit data - shutdown complete chunks. Type: Counter	Int32
sctp-transdata-hb	The total number of Stream Control Transmission Protocol - transmit data - heartbeat chunks. Type: Counter	Int32
sctp-transdata-hback	The total number of Stream Control Transmission Protocol - transmit data - heartbeat acknowledge chunks. Type: Counter	Int32
sctp-transdata-abort	The total number of Stream Control Transmission Protocol - transmit data - abort chunks. Type: Counter	Int32
sctp-transdata-error	The total number of Stream Control Transmission Protocol - transmit data - error chunks. Type: Counter	Int32
sctp-recdata-init	The total number of Stream Control Transmission Protocol - receive data - init chunks. Type: Counter	Int32
sctp-recdata-initack	The total number of Stream Control Transmission Protocol - receive data - init acknowledge chunks. Type: Counter	Int32
sctp-recdata-shut	The total number of Stream Control Transmission Protocol - receive data - shutdown chunks. Type: Counter	Int32
sctp-recdata-shutack	The total number of Stream Control Transmission Protocol - receive data - shutdown acknowledge chunks. Type: Counter	Int32

Variables	Description	Data Type
sctp-recdata-cookie	The total number of Stream Control Transmission Protocol - receive data - cookie chunks. Type: Counter	Int32
sctp-recdata-cookieack	The total number of Stream Control Transmission Protocol - receive data - cookie acknowledge chunks. Type: Counter	Int32
sctp-recdata-data	The total number of Stream Control Transmission Protocol - receive data - data chunks. Type: Counter	Int32
sctp-recdata-dataack	The total number of Stream Control Transmission Protocol - receive data - data acknowledge chunks. Type: Counter	Int32
sctp-recdata-shutcomp	The total number of Stream Control Transmission Protocol - receive data - shutdown complete chunks. Type: Counter	Int32
sctp-recdata-hb	The total number of Stream Control Transmission Protocol - receive data - heartbeat chunks. Type: Counter	Int32
sctp-recdata-hback	The total number of Stream Control Transmission Protocol - receive data - heartbeat acknowledge chunks. Type: Counter	Int32
sctp-recdata-abort	The total number of Stream Control Transmission Protocol - receive data - abort chunks. Type: Counter	Int32
sctp-recdata-error	The total number of Stream Control Transmission Protocol - receive data - error chunks. Type: Counter	Int32
sctp-retransdata-init	The total number of Stream Control Transmission Protocol - retransmit data - init chunks. Type: Counter	Int32
sctp-retransdata-shut	The total number of Stream Control Transmission Protocol - retransmit data - shutdown chunks. Type: Counter	Int32
sctp-retransdata-shutack	The total number of Stream Control Transmission Protocol - retransmit data - shutdown acknowledge chunks. Type: Counter	Int32
sctp-retransdata-cookie	The total number of Stream Control Transmission Protocol - retransmit data - cookie chunks. Type: Counter	Int32
sctp-retransdata-cookieack	The total number of Stream Control Transmission Protocol - retransmit data - cookie acknowledge chunks. Type: Counter	Int32

Variables	Description	Data Type
sctp-totsent-bytes	The total number of Stream Control Transmission Protocol - total bytes sent to lower layer. Type: Counter	Int32
sctp-totrec-bytes	The total number of Stream Control Transmission Protocol - total bytes received from lower layer. Type: Counter	Int32
sctp-totsent-pkts	The total number of Stream Control Transmission Protocol - total packets sent to lower layer. Type: Counter	Int32
sctp-totrec-pkts	The total number of Stream Control Transmission Protocol - total packets received from lower layer. Type: Counter	Int32
s1ap-transdata-setupres	The total number of S1 Application Protocol - transmit data - S1 setup responses. Type: Counter	Int32
s1ap-transdata-setupresfail	The total number of S1 Application Protocol - transmit data - S1 setup response failures.	Int32
s1ap-transdata-reset	The total number of S1 Application Protocol - transmit data - reset messages. Type: Counter	Int32
s1ap-transdata-resetack	The total number of S1 Application Protocol - transmit data - reset acknowledgements. Type: Counter	Int32
s1ap-transdata-olstart	The total number of S1 Application Protocol - transmit data - overload start messages. Type: Counter	Int32
s1ap-transdata-olstop	The total number of S1 Application Protocol - transmit data - overload stop messages. Type: Counter	Int32
s1ap-transdata-mmedirinfra	The total number of S1 Application Protocol - transmit data - MME direct information transfers. Type: Counter	Int32
s1ap-transdata-paging	The total number of S1 Application Protocol - transmit data - paging messages. Type: Counter	Int32
s1ap-transdata-enbcfgupdock	The total number of S1 Application Protocol - transmit data - EnodeB configuration update acknowledgements. Type: Counter	Int32
s1ap-transdata-enbcfgupdfail	The total number of S1 Application Protocol - transmit data - EnodeB configuration update failures. Type: Counter	Int32
s1ap-transdata-ctrlmsgencfail	The total number of S1 Application Protocol - transmit data - S1AP control message failures. Type: Counter	Int32

Variables	Description	Data Type
slap-transdata-erabsetupreq	The total number of S1 Application Protocol - transmit data - E-RAB setup requests. Type: Counter	Int32
slap-transdata-erabmodreq	The total number of S1 Application Protocol - transmit data - E-RAB modify requests. Type: Counter	Int32
slap-transdata-erabrelcmd	The total number of S1 Application Protocol - transmit data - E-RAB release commands. Type: Counter	Int32
slap-transdata-ctxtsetupreq	The total number of S1 Application Protocol - transmit data - initial context setup requests. Type: Counter	Int32
slap-transdata-uectxrel	The total number of S1 Application Protocol - transmit data - UE context release commands. Type: Counter	Int32
slap-transdata-uectxmod	The total number of S1 Application Protocol - transmit data - UE context modify requests. Type: Counter	Int32
slap-transdata-dlnastrans	The total number of S1 Application Protocol - transmit data - downlink NAS transports. Type: Counter	Int32
slap-transdata-errorind	The total number of S1 Application Protocol - transmit data - error indications. Type: Counter	Int32
slap-transdata-hocmd	The total number of S1 Application Protocol - transmit data - handover commands. Type: Counter	Int32
slap-transdata-hoprepfail	The total number of S1 Application Protocol - transmit data - handover preparation failures. Type: Counter	Int32
slap-transdata-horeq	The total number of S1 Application Protocol - transmit data - handover requests. Type: Counter	Int32
slap-transdata-hocanack	The total number of S1 Application Protocol - transmit data - handover cancel acknowledgements. Type: Counter	Int32
slap-transdata-pathswreqack	The total number of S1 Application Protocol - transmit data - path switch request acknowledgements. Type: Counter	Int32
slap-transdata-pathswreqfail	The total number of S1 Application Protocol - transmit data - path switch request failures. Type: Counter	Int32
slap-transdata-dlinktunnel	The total number of S1 Application Protocol - transmit data - downlink S1 CDMA2000 tunneling. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
slap-transdata-tracestart	The total number of S1 Application Protocol - transmit data - trace starts. Type: Counter	Int32
slap-transdata-deactivtrace	The total number of S1 Application Protocol - transmit data - deactivation trace messages. Type: Counter	Int32
slap-transdata-mmetrans	The total number of S1 Application Protocol - transmit data - MME status transfers. Type: Counter	Int32
slap-transdata-locrepctrl	The total number of S1 Application Protocol - transmit data - location report control messages. Type: Counter	Int32
slap-transdata-encfail	The total number of S1 Application Protocol - transmit data - S1AP encode failures. Type: Counter	Int32
slap-recdata-setupreq	The total number of S1 Application Protocol - receive data - S1 setup requests. Type: Counter	Int32
slap-recdata-reset	The total number of S1 Application Protocol - receive data - resets. Type: Counter	Int32
slap-recdata-resetack	The total number of S1 Application Protocol - receive data - reset acknowledgements. Type: Counter	Int32
slap-recdata-enbdirinftrans	The total number of S1 Application Protocol - receive data - EnodeB direct information transfers. Type: Counter	Int32
slap-recdata-enbcfgupd	The total number of S1 Application Protocol - receive data - EnodeB configuration updates. Type: Counter	Int32
slap-recdata-ctrlmsgdecfail	The total number of S1 Application Protocol - receive data - S1AP control message decode failures. Type: Counter	Int32
slap-recdata-ctrlmsgunexpevt	The total number of S1 Application Protocol - receive data - S1AP control message unexpected events. Type: Counter	Int32
slap-recdata-erabsetupres	The total number of S1 Application Protocol - receive data - E-RA setup responses. Type: Counter	Int32
slap-recdata-erabmodres	The total number of S1 Application Protocol - receive data - E-RAB modify responses. Type: Counter	Int32
slap-recdata-erabrelres	The total number of S1 Application Protocol - receive data - E-RAB release responses. Type: Counter	Int32

Variables	Description	Data Type
slap-recdata-erabrelind	The total number of S1 Application Protocol - receive data - E-RAB release indications. Type: Counter	Int32
slap-recdata-ctxtsetupres	The total number of S1 Application Protocol - receive data - initial context setup responses. Type: Counter	Int32
slap-recdata-ctxtsetupfail	The total number of S1 Application Protocol - receive data - initial context setup failures. Type: Counter	Int32
slap-recdata-uectxtrelreq	The total number of S1 Application Protocol - receive data - UE context release requests. Type: Counter	Int32
slap-recdata-uectxtrelcomp	The total number of S1 Application Protocol - receive data - UE context release completions. Type: Counter	Int32
slap-recdata-uectxtmodres	The total number of S1 Application Protocol - receive data - UE context modify responses. Type: Counter	Int32
slap-recdata-uectxtmodfail	The total number of S1 Application Protocol - receive data - UE context modify failures. Type: Counter	Int32
slap-recdata-inituemsg	The total number of S1 Application Protocol - receive data - initial UE messages. Type: Counter	Int32
slap-recdata-ulinknastp	The total number of S1 Application Protocol - receive data - uplink NAS transports. Type: Counter	Int32
slap-recdata-nasnondelind	The total number of S1 Application Protocol - receive data - NAS non-delivery indications. Type: Counter	Int32
slap-recdata-errorind	The total number of S1 Application Protocol - receive data - error indications. Type: Counter	Int32
slap-recdata-horeqack	The total number of S1 Application Protocol - receive data - handover request acknowledgements. Type: Counter	Int32
slap-recdata-hocancel	The total number of S1 Application Protocol - receive data - handover cancellations. Type: Counter	Int32
slap-recdata-horequire	The total number of S1 Application Protocol - receive data - handover required messages. Type: Counter	Int32
slap-recdata-hofail	The total number of S1 Application Protocol - receive data - handover failures. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
slap-recdata-honotify	The total number of S1 Application Protocol - receive data - handover notify messages. Type: Counter	Int32
slap-recdata-pathswreq	The total number of S1 Application Protocol - receive data - path switch requests. Type: Counter	Int32
slap-recdata-enbstatustrans	The total number of S1 Application Protocol - receive data - EnodeB status transfers. Type: Counter	Int32
slap-recdata-uecap	The total number of S1 Application Protocol - receive data - UE capability information indications. Type: Counter	Int32
slap-recdata-ulinktunnel	The total number of S1 Application Protocol - receive data - uplink S1 CDMA 2000 tunneling. Type: Counter	Int32
slap-recdata-tracefailind	The total number of S1 Application Protocol - receive data - trace failure indications. Type: Counter	Int32
slap-recdata-locrep	The total number of S1 Application Protocol - receive data - location reports. Type: Counter	Int32
slap-recdata-locrepfailind	The total number of S1 Application Protocol - receive data - location report failure indications. Type: Counter	Int32
slap-recdata-decfail	The total number of S1 Application Protocol - receive data - S1AP decode failures. Type: Counter	Int32
slap-recdata-unexpevt	The total number of S1 Application Protocol - receive data - S1AP unexpected events. Type: Counter	Int32
 IMPORTANT: The following EMM event TAU, outbound RAU, outbound S1, inbound TAU, and inbound S1 statistics are only available in 12.0 and earlier releases.		
emmevent-tauattach-success	The total number of EPS Mobility Management events - tracking area update attach successes. Type: Counter	Int32
emmevent-tauattach-failure	The total number of EPS Mobility Management events - tracking area update attach failures. Type: Counter	Int32
emmevent-outrauh04g3g-success	The total number of EPS Mobility Management events - outbound RAU E-UTRAN to UTRAN handovers - successes. Type: Counter	Int32

Variables	Description	Data Type
emmevent-outrauho4g3g-failure	The total number of EPS Mobility Management events - outbound RAU E-UTRAN to UTRAN handovers - failures. Type: Counter	Int32
emmevent-outs1ho4g3g-success	The total number of EPS Mobility Management events - outbound S1 E-UTRAN to UTRAN handovers - successes. Type: Counter	Int32
emmevent-outs1ho4g3g-failure	The total number of EPS Mobility Management events - outbound S1 E-UTRAN to UTRAN handovers - failures. Type: Counter	Int32
emmevent-intauho3g4g-success	The total number of EPS Mobility Management events - inbound TAU UTRAN to E-UTRAN handovers - successes. Type: Counter	Int32
emmevent-intauho3g4g-failure	The total number of EPS Mobility Management events - inbound TAU UTRAN to E-UTRAN handovers - failures. Type: Counter	Int32
emmevent-ins1ho3g4g-success	The total number of EPS Mobility Management events - inbound S1 UTRAN to E-UTRAN handovers - successes. Type: Counter	Int32
emmevent-ins1ho3g4g-failure	The total number of EPS Mobility Management events - inbound S1 UTRAN to E-UTRAN handovers - failures. Type: Counter	Int32
 IMPORTANT: The previous EMM event TAU, outbound RAU, outbound S1, inbound TAU, and inbound S1 statistics are only available in 12.0 and earlier releases.		
epsattach-imsi-attempted	The total number of EPS associations by attach using IMSI - attempts. Type: Counter	Int32
epsattach-imsi-success	The total number of EPS associations by attach using IMSI - successes. Type: Counter	Int32
epsattach-imsi-failures	The total number of EPS associations by attach using IMSI - failures. Type: Counter	Int32
epsattach-guti-local-attempted	The total number of EPS associations by attach using local GUTI - attempts. Type: Counter	Int32
epsattach-guti-local-success	The total number of EPS associations by attach using local GUTI - successes. Type: Counter	Int32
epsattach-guti-local-failures	The total number of EPS associations by attach using local GUTI - failures. Type: Counter	Int32
epsattach-guti-foreign-attempted	The total number of EPS associations by attach using foreign GUTI - attempts. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
epsattach-guti-foreign-success	The total number of EPS associations by attach using foreign GUTI - successes. Type: Counter	Int32
epsattach-guti-foreign-failures	The total number of EPS associations by attach using foreign GUTI - failures. Type: Counter	Int32
epsattach-ptmsi-attempted	The total number of EPS associations by attach using P-TMSI - attempts. Type: Counter	Int32
epsattach-ptmsi-success	The total number of EPS associations by attach using P-TMSI - successes. Type: Counter	Int32
epsattach-ptmsi-failures	The total number of EPS associations by attach using P-TMSI - failures. Type: Counter	Int32
epstauattach-guti-foreign-attempted	The total number of EPS associations by TAU attach using foreign GUTI - attempts. Type: Counter	Int32
epstauattach-guti-foreign-success	The total number of EPS associations by TAU attach using foreign GUTI - successes. Type: Counter	Int32
epstauattach-guti-foreign-failures	The total number of EPS associations by TAU attach using foreign GUTI - failures. Type: Counter	Int32
epstauattach-ptmsi-attempted	The total number of EPS associations by TAU attach using P-TMSI - attempts. Type: Counter	Int32
epstauattach-ptmsi-success	The total number of EPS associations by TAU attach using P-TMSI - successes. Type: Counter	Int32
epstauattach-ptmsi-failures	The total number of EPS associations by TAU attach using P-TMSI - failures. Type: Counter	Int32
combinedattach-imsi-attempted	The total number of EPS associations by combined attach using IMSI - attempts. Type: Counter	Int32
combinedattach-imsi-success	The total number of EPS associations by combined attach using IMSI - successes. Type: Counter	Int32
combinedattach-imsi-success-eps	The total number of EPS associations by combined attach using IMSI - EPS successes only. Type: Counter	Int32
combinedattach-imsi-failure	The total number of EPS associations by combined attach using IMSI - failures. Type: Counter	Int32
combinedattach-guti-local-attached	The total number of EPS associations by combined attach using local GUTI - attempts. Type: Counter	Int32
combinedattach-guti-local-success	The total number of EPS associations by combined attach using local GUTI - successes. Type: Counter	Int32

Variables	Description	Data Type
combinedattach-guti-local-success-eps	The total number of EPS associations by combined attach using local GUTI - EPS successes only. Type: Counter	Int32
combinedattach-guti-local-failure	The total number of EPS associations by combined attach using local GUTI - failures. Type: Counter	Int32
combinedattach-guti-foreign-attempted	The total number of EPS associations by combined attach using foreign GUTI - attempts. Type: Counter	Int32
combinedattach-guti-foreign-success	The total number of EPS associations by combined attach using foreign GUTI - successes. Type: Counter	Int32
combinedattach-guti-foreign-success-eps	The total number of EPS associations by combined attach using foreign GUTI - EPS successes only. Type: Counter	Int32
combinedattach-guti-foreign-failure	The total number of EPS associations by combined attach using foreign GUTI - failures. Type: Counter	Int32
combinedattach-ptmsi-attempted	The total number of EPS associations by combined attach using P-TMSI - attempts. Type: Counter	Int32
combinedattach-ptmsi-success	The total number of EPS associations by combined attach using P-TMSI - successes. Type: Counter	Int32
combinedattach-ptmsi-success-eps	The total number of EPS associations by combined attach using P-TMSI - EPS successes only. Type: Counter	Int32
combinedattach-ptmsi-failure	The total number of EPS associations by combined attach using P-TMSI - failures. Type: Counter	Int32
combined-tauattach-guti-foreign-attempted	The total number of EPS associations by combined TAU attach using foreign GUTI - attempts. Type: Counter	Int32
combined-tauattach-guti-foreign-success	The total number of EPS associations by combined TAU attach using foreign GUTI - successes. Type: Counter	Int32
combined-tauattach-guti-foreign-success-eps	The total number of EPS associations by combined TAU attach using foreign GUTI - EPS successes only. Type: Counter	Int32
combined-tauattach-guti-foreign-failure	The total number of EPS associations by combined TAU attach using foreign GUTI - failures. Type: Counter	Int32

Variables	Description	Data Type
combined-tauattach-ptmsi-attempted	The total number of EPS associations by combined TAU attach using P-TMSI - attempts. Type: Counter	Int32
combined-tauattach-ptmsi-success	The total number of EPS associations by combined TAU attach using P-TMSI - successes. Type: Counter	Int32
combined-tauattach-ptmsi-success-eps	The total number of EPS associations by combined TAU attach using P-TMSI - EPS successes only. Type: Counter	Int32
combined-tauattach-ptmsi-failure	The total number of EPS associations by combined TAU attach using P-TMSI - failures. Type: Counter	Int32
tau-periodic-attempted	The total number of EMM periodic TAU request attempts where the update type was set to periodic. Type: Counter	Int32
tau-periodic-success	The total number of EMM periodic TAU request successes where the update type was set to periodic. Type: Counter	Int32
tau-periodic-failures	The total number of EMM periodic TAU request failures where the update type was set to periodic. Type: Counter	Int32
tau-normal-attempted	The total number of EMM normal TAU request attempts where the update type was set to periodic (without S-GW relocation). Type: Counter	Int32
tau-normal-success	The total number of EMM normal TAU request successes where the update type was set to periodic (without S-GW relocation). Type: Counter	Int32
tau-normal-failures	The total number of EMM normal TAU request failures where the update type was set to periodic (without S-GW relocation). Type: Counter	Int32
tau-active-attempted	The total number of EMM TAU with bearer activation attempts (activate bearer flag set to "true" in the TAU procedure). Type: Counter	Int32
tau-active-success	The total number of EMM TAU with bearer activation successes (activate bearer flag set to "true" in the TAU procedure). Type: Counter	Int32
tau-active-failures	The total number of EMM TAU with bearer activation failures (activate bearer flag set to "true" in the TAU procedure). Type: Counter	Int32
tau-sgw-change-attempted	The total number of EMM TAU with S-GW relocation attempts (new TAI triggered S-GW relocation for the UE). Type: Counter	Int32

Variables	Description	Data Type
tau-sgw-change-success	The total number of EMM TAU with S-GW relocation successes (new TAI triggered S-GW relocation for the UE). Type: Counter	Int32
tau-sgw-change-failures	The total number of EMM TAU with S-GW relocation failures (new TAI triggered S-GW relocation for the UE). Type: Counter	Int32
paging-init-events-attempted	The total number of EMM paging initiation events - attempts. Type: Counter	Int32
paging-init-events-success	The total number of EMM paging initiation events - successes. Type: Counter	Int32
paging-init-events-failures	The total number of EMM paging initiation events - failures Type: Counter	Int32
paging-last-enb-success	The total number of EMM paging initiation events - success at last ENodeB. Type: Counter	Int32
paging-last-tai-success	The total number of EMM paging initiation events - success at last TAI. Type: Counter	Int32
paging-tai-list-success	The total number of EMM paging initiation events - success at TAI list. Type: Counter	Int32
emm-msgtx-attach-accept	The total number of EMM control messages sent - accepted attaches. Type: Counter	Int32
emm-msgtx-attach-accept-retx	The total number of EMM control messages sent - retransmitted attaches. Type: Counter	Int32
emm-msgtx-attach-accept-imsi-unknown	The total number of EMM Control messages sent – Attach Accept with a cause code of IMSI unknown. Type: Counter	Int32
emm-msgtx-attach-accept-no-msc	The total number of EMM Control messages sent – Attach Accept with a cause code of MSC not available. Type: Counter	Int32
emm-msgtx-attach-accept-nw-fail	The total number of EMM Control messages sent – Attach Accept with a cause code of Network Failure. Type: Counter	Int32
emm-msgtx-attach-accept-congestion	The total number of EMM Control messages sent – Attach Accept with a cause code of Congestion. Type: Counter	Int32
emm-msgtx-attach-accept-no-cs	The total number of EMM Control messages sent – Attach Accept with a cause code of CS domain not available. Type: Counter	Int32
emm-msgtx-attach-reject	The total number of EMM control messages sent - rejected attaches. Type: Counter	Int32

Variables	Description	Data Type
emm-msgtx-imsi-unknown-hss	The total number of EMM control messages sent - IMSI unknown in HSS. Type: Counter	Int32
emm-msgtx-illegal-ue	The total number of EMM control messages sent - illegal UE. Type: Counter	Int32
emm-msgtx-illegal-me	The total number of EMM control messages sent - illegal ME. Type: Counter	Int32
emm-msgtx-eps-not-allowed	The total number of EMM control messages sent - EPS not allowed. Type: Counter	Int32
emm-msgtx-network-failure	The total number of EMM control messages sent - network failures. Type: Counter	Int32
emm-msgtx-esm-failure	The total number of EMM control messages sent - ESM failures. Type: Counter	Int32
emm-msgtx-decode-failure	The total number of EMM control messages sent - decode failures. Type: Counter	Int32
emm-msgtx-auth-reject	The total number of EMM control messages sent - authentication rejects. Type: Counter	Int32
emm-msgtx-auth-req	The total number of EMM control messages sent - authentication requests. Type: Counter	Int32
emm-msgtx-auth-req-retx	The total number of EMM control messages sent - retransmitted authentication requests. Type: Counter	Int32
emm-msgtx-detach-request	The total number of EMM control messages sent - detach requests. Type: Counter	Int32
emm-msgtx-detach-req-retx	The total number of EMM control messages sent - retransmitted detach requests. Type: Counter	Int32
emm-msgtx-reattach-req	The total number of EMM control messages sent - reattach required. Type: Counter	Int32
emm-msgtx-reattach-not-req	The total number of EMM control messages sent - reattach not required. Type: Counter	Int32
emm-msgtx-imsi-detach	The total number of EMM control messages sent - IMSI detach. Type: Counter  IMPORTANT: This statistic is only available in 12.0 and earlier releases.	Int32
emm-msgtx-detach-accept	The total number of EMM control messages sent - detach accepts. Type: Counter	Int32

Variables	Description	Data Type
emm-msgtx-downlink-transport	The total number of EMM control messages sent - downlink NAS transports. Type: Counter	Int32
emm-msgtx-emm-info	The total number of EMM control messages sent - EMM information. Type: Counter	Int32
emm-msgtx-emm-status	The total number of EMM control messages sent - EMM status. Type: Counter	Int32
emm-msgtx-guti-reloc	The total number of EMM control messages sent - GUTI relocations. Type: Counter	Int32
emm-msgtx-guti-reloc-retx	The total number of EMM control messages sent - retransmitted GUTI relocations. Type: Counter	Int32
emm-msgtx-identity-req	The total number of EMM control messages sent - identity requests. Type: Counter	Int32
emm-msgtx-identity-req-retx	The total number of EMM control messages sent - retransmitted identity requests. Type: Counter	Int32
emm-msgtx-sm-cmd	The total number of EMM control messages sent - security mode commands. Type: Counter	Int32
emm-msgtx-sm-cmd-retx	The total number of EMM control messages sent - retransmitted security mode commands. Type: Counter	Int32
emm-msgtx-service-reject	The total number of EMM control messages sent - service rejects. Type: Counter	Int32
emm-msgtx-ue-identity-unk	The total number of EMM control messages sent - UE identity unknown. Type: Counter	Int32
emm-msgtx-impl-detached	The total number of EMM control messages sent - implicitly detached. Type: Counter	Int32
emm-msgtx-tau-accept	The total number of EMM control messages sent - TAU accepts. Type: Counter	Int32
emm-msgtx-tau-accept-retx	The total number of EMM control messages sent - retransmitted TAU accepts. Type: Counter	Int32
emm-msgtx-tau-reject	The total number of EMM control messages sent - TAU rejects. Type: Counter	Int32
emm-msgtx-tau-accept-imsi-unknown	The total number of EMM Control messages sent – TAU Accept with a cause code of IMSI unknown. Type: Counter	Int32
emm-msgtx-tau-accept-no-msc	The total number of EMM Control messages sent – TAU Accept with a cause code of MSC not available. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
emm-msgtx-tau-accept-nw-fail	The total number of EMM Control messages sent – TAU Accept with a cause code of Network Failure. Type: Counter	Int32
emm-msgtx-tau-accept-congestion	The total number of EMM Control messages sent – TAU Accept with a cause code of Congestion. Type: Counter	Int32
emm-msgtx-tau-accept-no-cs	The total number of EMM Control messages sent – TAU Accept with a cause code of CS domain not available. Type: Counter	Int32
emm-msgtx-tau-imsi-unknown-hss	The total number of EMM control messages sent - TAU IMSI unknown in HSS. Type: Counter	Int32
emm-msgtx-tau-illegal-ue	The total number of EMM control messages sent - TAU illegal UE. Type: Counter	Int32
emm-msgtx-tau-illegal-me	The total number of EMM control messages - sent - TAU illegal ME. Type: Counter	Int32
emm-msgtx-tau-eps-not-allowed	The total number of EMM control messages sent - TAU EPA not allowed. Type: Counter	Int32
emm-msgtx-tau-network-fail	The total number of EMM control messages sent - TAU network failures. Type: Counter	Int32
emm-msgtx-tau-esm-failure	The total number of EMM control messages sent - TAU ESM failures.  IMPORTANT: This statistic is only available in 12.0 and earlier releases.	Int32
emm-msgtx-tau-decode-failure	The total number of EMM control messages sent - TAU decode failures. Type: Counter	Int32
emm-msgtx-tau-no-bearer-active	The total number of EMM control messages sent - TAU no bearer active. Type: Counter	Int32
emm-msgtx-tau-ue-identity-unk	The total number of EMM control messages sent - TAU UE identity unknown. Type: Counter	Int32
emm-msgtx-tau-implicit-detached	The total number of EMM control messages sent - TAU implicitly detached. Type: Counter	Int32
emm-msgrx-plain-nas	The total number of EMM control messages received - clear-text messages. Type: Counter	Int32
emm-msgrx-integrity	The total number of EMM control messages received - integrity-check enabled. Type: Counter	Int32
emm-msgrx-ciphered	The total number of EMM control messages received - ciphered messages. Type: Counter	Int32

Variables	Description	Data Type
emm-msgrx-accepted	The total number of EMM control messages received - accepted. Type: Counter	Int32
emm-msgrx-discarded	The total number of EMM control messages received - discarded. Type: Counter	Int32
emm-msgrx-denied	The total number of EMM control messages received - denied. Type: Counter	Int32
emm-msgrx-decode-failure	The total number of EMM control messages received - decode failures. Type: Counter	Int32
emm-msgrx-attach-complete	The total number of EMM control messages received - attach complete. Type: Counter	Int32
emm-msgrx-attach-req	The total number of EMM control messages received - attach requests. Type: Counter	Int32
emm-msgrx-attach-retx	The total number of EMM control messages received - retransmitted attach requests. Type: Counter  IMPORTANT: This statistic is only available in 12.2 and earlier releases.	Int32
emm-msgrx-auth-failure	The total number of EMM control messages received - authentication failures. Type: Counter	Int32
emm-msgrx-auth-resp	The total number of EMM control messages received - authentication responses. Type: Counter	Int32
emm-msgrx-detach-req	The total number of EMM control messages received - detach requests. Type: Counter	Int32
emm-msgrx-detach-req-switchoff	The total number of EMM control messages received - detach requests - switch off. Type: Counter	Int32
emm-msgrx-detach-req-not-switchoff	The total number of EMM control messages received - detach requests - not switch off. Type: Counter	Int32
emm-msgrx-imsi-detach	The total number of EMM control messages received - IMSI detach. Type: Counter	Int32
emm-msgrx-emm-status	The total number of EMM control messages received - EMM status. Type: Counter	Int32
emm-msgrx-guti-reloc-complete	The total number of EMM control messages received - GUTI relocation complete. Type: Counter	Int32
emm-msgrx-sm-complete	The total number of EMM control messages received - security mode complete. Type: Counter	Int32

Variables	Description	Data Type
emm-msgrx-sm-reject	The total number of EMM control messages received - security mode reject. Type: Counter	Int32
emm-msgrx-service-req	The total number of EMM control messages received - service requests. Type: Counter	Int32
emm-msgrx-tau-req	The total number of EMM control messages received - TAU requests. Type: Counter	Int32
emm-msgrx-tau-retx	The total number of EMM control messages received - retransmitted TAU. Type: Counter	Int32
emm-msgrx-tau-complete	The total number of EMM control messages received - TAU complete. Type: Counter	Int32
pdn-disconnect-ue-attempted	The total number of ESM UE-initiated PDN disconnections - attempted. Type: Counter	Int32
pdn-disconnect-ue-success	The total number of ESM UE-initiated PDN disconnections - successes. Type: Counter	Int32
pdn-disconnect-ue-failures	The total number of ESM UE-initiated PDN disconnections - failures. Type: Counter	Int32
pdn-disconnect-mme-attempted	The total number of ESM MME-initiated PDN disconnections - attempted. Type: Counter	Int32
pdn-disconnect-mme-success	The total number of ESM MME-initiated PDN disconnections - successes. Type: Counter	Int32
pdn-disconnect-mme-failures	The total number of ESM MME-initiated PDN disconnections - failures. Type: Counter	Int32
pdn-disconnect-pgw-attempted	The total number of ESM P-GW/S-GW-initiated PDN disconnections - attempted. Type: Counter	Int32
pdn-disconnect-pgw-success	The total number of ESM P-GW/S-GW-initiated PDN disconnections - successes. Type: Counter	Int32
pdn-disconnect-pgw-failures	The total number of ESM P-GW/S-GW-initiated PDN disconnections - failures. Type: Counter	Int32
pdn-disconnect-hss-attempted	The total number of ESM HSS-initiated PDN disconnections - attempted. Type: Counter	Int32
pdn-disconnect-hss-success	The total number of ESM HSS-initiated PDN disconnections - successes. Type: Counter	Int32
pdn-disconnect-hss-failures	The total number of ESM HSS-initiated PDN disconnections - failures. Type: Counter	Int32
dedi-brr-activation-ue-attempted	The total number of ESM UE-initiated dedicated bearer activations - attempted. Type: Counter	Int32
dedi-brr-activation-ue-success	The total number of ESM UE-initiated dedicated bearer activations - successes. Type: Counter	Int32

Variables	Description	Data Type
dedi-brr-activation-ue-failures	The total number of ESM UE-initiated dedicated bearer activations - failures. Type: Counter	Int32
brr-deactivation-mme-attempted	The total number of ESM MME-initiated bearer deactivations - attempted. Type: Counter	Int32
brr-deactivation-mme-success	The total number of ESM MME-initiated bearer deactivations - successes. Type: Counter	Int32
brr-deactivation-mme-failures	The total number of ESM MME-initiated bearer deactivations - failures. Type: Counter	Int32
brr-deactivation-pgw-attempted	The total number of ESM P-GW/S-GW-initiated bearer deactivations - attempted. Type: Counter	Int32
brr-deactivation-pgw-success	The total number of ESM P-GW/S-GW-initiated bearer deactivations - successes. Type: Counter	Int32
brr-deactivation-pgw-failures	The total number of ESM P-GW/S-GW-initiated bearer deactivations - failures. Type: Counter	Int32
brr-deactivation-ue-attempted	The total number of ESM UE-initiated bearer deactivations - attempted. Type: Counter	Int32
brr-deactivation-ue-success	The total number of ESM UE-initiated bearer deactivations - successes. Type: Counter	Int32
brr-deactivation-ue-failures	The total number of ESM UE-initiated bearer deactivations - failures. Type: Counter	Int32
brr-modification-hss-attempted	The total number of ESM HSS-initiated bearer modifications - attempted. Type: Counter	Int32
brr-modification-hss-success	The total number of ESM HSS-initiated bearer modifications - successes. Type: Counter	Int32
brr-modification-hss-failures	The total number of ESM HSS-initiated bearer modifications - failures. Type: Counter	Int32
brr-modification-pgw-attempted	The total number of ESM P-GW/S-GW-initiated bearer modifications - attempted. Type: Counter	Int32
brr-modification-pgw-success	The total number of ESM P-GW/S-GW-initiated bearer modifications - successes. Type: Counter	Int32
brr-modification-pgw-failures	The total number of ESM P-GW/S-GW-initiated bearer modifications - failures. Type: Counter	Int32
brr-modification-ue-attempted	The total number of ESM UE-initiated bearer modifications - attempted. Type: Counter	Int32
brr-modification-ue-success	The total number of ESM UE-initiated bearer modifications - successes. Type: Counter	Int32
brr-modification-ue-failures	The total number of ESM UE-initiated bearer modifications - failures. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
esm-msgtx-act-ded-brr	The total number of ESM control messages sent - activate dedicated bearer. Type: Counter	Int32
esm-msgtx-act-ded-brr-retx	The total number of ESM control messages sent - retransmitted activate dedicated bearer. Type: Counter	Int32
esm-msgtx-act-dflt-brr	The total number of ESM control messages sent - activate default bearer. Type: Counter	Int32
esm-msgtx-act-dflt_bee-retx	The total number of ESM control messages sent - retransmitted activate default bearer. Type: Counter	Int32
esm-msgtx-brralloc-rej	The total number of ESM control messages sent - bearer allocation reject. Type: Counter	Int32
esm-msgtx-brralloc-rej-pt1-inuse	The total number of ESM control messages sent - bearer allocation reject - PTI already in use. Type: Counter	Int32
esm-msgtx-brralloc-rej-semantic-errft	The total number of ESM control messages sent - bearer allocation reject - semantic error TFT. Type: Counter	Int32
esm-msgtx-brralloc-rej-syntactic-errft	The total number of ESM control messages sent - bearer allocation reject - syntactic error TFT. Type: Counter	Int32
esm-msgtx-brralloc-rej-invalid-brrid	The total number of ESM control messages sent - bearer allocation reject - invalid bearer ID. Type: Counter	Int32
esm-msgtx-brralloc-rej-collision-nwop	The total number of ESM control messages sent - bearer allocation reject - collision with network op. Type: Counter	Int32
esm-msgtx-brralloc-rej-pgw-rej	The total number of ESM control messages sent - bearer allocation reject - rejected by P-GW/S-GW. Type: Counter  IMPORTANT: This statistic is only available in 12.0 and earlier releases.	Int32
esm-msgtx-brralloc-rej-invalid-pti	The total number of ESM control messages sent - bearer allocation reject - invalid PTI. Type: Counter	Int32
esm-msgtx-brrmod-rej	The total number of ESM control messages sent - bearer modification reject. Type: Counter	Int32

Variables	Description	Data Type
esm-msgtx-brrmod-rej-pti-inuse	The total number of ESM control messages sent - bearer modification reject - PTI already in use. Type: Counter	Int32
esm-msgtx-brrmod-rej-semantic-errtft	The total number of ESM control messages sent - bearer modification reject - semantic error TFT. Type: Counter	Int32
esm-msgtx-brrmod-rej-syntactic-errtft	The total number of ESM control messages sent - bearer modification reject - syntactic error TFT. Type: Counter	Int32
esm-msgtx-brrmod-rej-invalid-brrid	The total number of ESM control messages sent - bearer modification reject - invalid bearer ID. Type: Counter	Int32
esm-msgtx-brrmod-rej-collision-nwop	The total number of ESM control messages sent - bearer modification reject - collision with network op. Type: Counter	Int32
esm-msgtx-brrmod-rej-pgw-rej	The total number of ESM control messages sent - bearer modification reject - rejected by P-GW/S-GW. Type: Counter	Int32
esm-msgtx-brrmod-rej-invalid-pti	The total number of ESM control messages sent - bearer modification reject - invalid PTI. Type: Counter	Int32
esm-msgtx-deactbrr	The total number of ESM control messages sent - deactivate bearer. Type: Counter	Int32
esm-msgtx-deactbrr-retx	The total number of ESM control messages sent - retransmitted deactivate bearer. Type: Counter	Int32
esm-msgtx-deactbrr-esm-info-req	The total number of ESM control messages sent - deactivate bearer - ESM information request. Type: Counter	Int32
esm-msgtx-deactbrr-esm-info-req-retx	The total number of ESM control messages sent - deactivate bearer - retransmitted ESM information request. Type: Counter	Int32
esm-msgtx-deactbrr-modbrr	The total number of ESM control messages sent - deactivate bearer - modify bearer. Type: Counter	Int32
esm-msgtx-deactbrr-moderr-retx	The total number of ESM control messages sent - deactivate bearer - retransmitted modify bearer. Type: Counter	Int32
esm-msgtx-pdncon-rej	The total number of ESM control messages sent - PDN connectivity reject. Type: Counter	Int32
esm-msgtx-pdncon-rej-pti-inuse	The total number of ESM control messages sent - PDN connectivity reject - PTI already in use. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
esm-msgtx-pdncon-rej-apn-unk	The total number of ESM control messages sent - PDN connectivity reject - unknown or missing APN. Type: Counter	Int32
esm-msgtx-pdncon-rej-pdntype-unk	The total number of ESM control messages sent - PDN connectivity reject - unknown PDN type. Type: Counter	Int32
esm-msgtx-pdncon-rej-inv-brrid	The total number of ESM control messages sent - PDN connectivity reject - invalid bearer ID. Type: Counter	Int32
esm-msgtx-pdncon-rej-inv-pti	The total number of ESM control messages sent - PDN connectivity reject - invalid PTI. Type: Counter	Int32
esm-msgtx-pdncon-rej-auth-failed	The total number of ESM control messages sent - PDN connectivity reject - authentication failed. Type: Counter	Int32
esm-msgtx-pdncon-rej-svc-not-supported	The total number of ESM control messages sent - PDN connectivity reject - service not supported. Type: Counter	Int32
esm-msgtx-pdncon-rej-svc-not-subscribed	The total number of ESM control messages sent - PDN connectivity reject - service not subscribed. Type: Counter	Int32
esm-msgtx-pdncon-rej-pgw-rej	The total number of ESM control messages sent - PDN connectivity reject - rejected by P-GW/S-GW. Type: Counter	Int32
esm-msgtx-pdncon-rej	The total number of ESM control messages sent - PDN disconnect reject. Type: Counter	Int32
esm-msgtx-pdncon-rej-pti-inuse	The total number of ESM control messages sent - PDN disconnect reject - PTI already in use. Type: Counter	Int32
esm-msgtx-pdncon-rej-lastpdn	The total number of ESM control messages sent - PDN disconnect reject - last PDN disconnection. Type: Counter	Int32
esm-msgtx-pdncon-rej-inv-pti	The total number of ESM control messages sent - PDN disconnect reject - invalid PTI. Type: Counter	Int32
esm-msgtx-pdncon-rej-inv-brrid	The total number of ESM control messages sent - PDN disconnect reject - invalid bearer ID. Type: Counter	Int32
esm-msgtx-pdncon-rej-pgw-rej	The total number of ESM control messages sent - PDN disconnect reject - rejected by P-GW/S-GW. Type: Counter	Int32

Variables	Description	Data Type
esm-msgrx-plain-nas	The total number of ESM control messages received - clear text messages. Type: Counter	Int32
esm-msgrx-integrity	The total number of ESM control messages received - integrity-check enabled. Type: Counter	Int32
esm-msgrx-ciphered	The total number of ESM control messages received - ciphered messages. Type: Counter	Int32
esm-msgrx-accepted	The total number of ESM control messages received - accepted. Type: Counter	Int32
esm-msgrx-discarded	The total number of ESM control messages received - discarded. Type: Counter  IMPORTANT: This statistic is only available in 12.0 and earlier releases.	Int32
esm-msgrx-denied	The total number of ESM control messages received - denied. Type: Counter	Int32
esm-msgrx-decode-failures	The total number of ESM control messages received - decode failures. Type: Counter  IMPORTANT: This statistic is only available in 12.0 and earlier releases.	Int32
esm-msgrx-ded-brr-accept	The total number of ESM control messages received - activate dedicated bearer accept. Type: Counter	Int32
esm-msgrx-ded-brr-reject	The total number of ESM control messages received - activate dedicated bearer reject. Type: Counter	Int32
esm-msgrx-dflt-brr-accept	The total number of ESM control messages received - activate default bearer accept. Type: Counter	Int32
esm-msgrx-dflt-brr-reject	The total number of ESM control messages received - activate default bearer reject. Type: Counter	Int32
esm-msgrx-brr-rsrc-alloc-req	The total number of ESM control messages received - bearer resource allocation request. Type: Counter	Int32
esm-msgrx-brr-rsrc-modify-req	The total number of ESM control messages received - bearer resource modification request. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
esm-msgrx-esm-info-resp	The total number of ESM control messages received - ESM information response. Type: Counter	Int32
esm-msgrx-em-status	The total number of ESM control messages received - ESM status. Type: Counter	Int32
esm-msgrx-mod-brr-accept	The total number of ESM control messages received - modify bearer context accept. Type: Counter	Int32
esm-msgrx-mod-brr-reject	The total number of ESM control messages received - modify bearer context reject. Type: Counter	Int32
esm-msgrx-pdn-con-req	The total number of ESM control messages received - PDN connectivity request. Type: Counter	Int32
esm-msgrx-pdn-discon-req	The total number of ESM control messages received - PDN disconnect request. Type: Counter	Int32
out-tau-ho-4gto4g-s10-attempted	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - outbound relocation using TAU procedure - attempted. Type: Counter	Int32
out-tau-ho-4gto4g-s10-success	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - outbound relocation using TAU procedure - successes. Type: Counter	Int32
out-tau-ho-4gto4g-s10-failures	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - outbound relocation using TAU procedure - failures. Type: Counter	Int32
out-s1-ho-4gto4g-s10-attempted	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - outbound relocation using S1 handover procedure - attempted. Type: Counter	Int32
out-s1-ho-4gto4g-s10-success	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - outbound relocation using S1 handover procedure - successes. Type: Counter	Int32
out-s1-ho-4gto4g-s10-failures	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - outbound relocation using S1 handover procedure - failures. Type: Counter	Int32
in-tau-ho-4gto4g-s10-attempted	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - inbound relocation using TAU procedure - attempted. Type: Counter	Int32
in-tau-ho-4gto4g-s10-success	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - inbound relocation using TAU procedure - successes. Type: Counter	Int32
in-tau-ho-4gto4g-s10-failures	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - inbound relocation using TAU procedure - failures. Type: Counter	Int32

Variables	Description	Data Type
in-s1-ho-4gto4g-s10-attempted	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - inbound relocation using S1 handover procedure - attempted. Type: Counter	Int32
in-s1-ho-4gto4g-s10-success	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - inbound relocation using S1 handover procedure - successes. Type: Counter	Int32
in-s1-ho-4gto4g-s10-failures	The total number of handovers - E-UTRAN to E-UTRAN using S10 interface - inbound relocation using S1 handover procedure - failures. Type: Counter	Int32
out-s1-ho-4gto3g-gngp-attempted	The total number of handovers - E-UTRAN to UTRAN using Gn/Gp interface - outbound relocation using S1 handover procedure - attempted. Type: Counter	Int32
out-s1-ho-4gto3g-gngp-success	The total number of handovers - E-UTRAN to UTRAN using Gn/Gp interface - outbound relocation using S1 handover procedure - successes. Type: Counter	Int32
out-s1-ho-4gto3g-gngp-failures	The total number of handovers - E-UTRAN to UTRAN using Gn/Gp interface - outbound relocation using S1 handover procedure - failures. Type: Counter	Int32
in-s1-ho-3gto4g-gngp-attempted	The total number of handovers - UTRAN to E-UTRAN using Gn/Gp interface - inbound relocation using S1 handover procedure - attempted. Type: Counter	Int32
in-s1-ho-3gto4g-gngp-success	The total number of handovers - UTRAN to E-UTRAN using Gn/Gp interface - inbound relocation using S1 handover procedure - successes. Type: Counter	Int32
in-s1-ho-3gto4g-gngp-failures	The total number of handovers - UTRAN to E-UTRAN using Gn/Gp interface - inbound relocation using S1 handover procedure - failures. Type: Counter	Int32
out-s1-ho-4gto2g-gngp-attempted	The total number of handovers - E-UTRAN to GERAN using Gn/Gp interface - outbound relocation using S1 handover procedure - attempted. Type: Counter	Int32
out-s1-ho-4gto2g-gngp-success	The total number of handovers - E-UTRAN to GERAN using Gn/Gp interface - outbound relocation using S1 handover procedure - successes. Type: Counter	Int32
out-s1-ho-4gto2g-gngp-failures	The total number of handovers - E-UTRAN to GERAN using Gn/Gp interface - outbound relocation using S1 handover procedure - failures. Type: Counter	Int32
in-s1-ho-2gto4g-gngp-attempted	The total number of handovers - GERAN to E-UTRAN using Gn/Gp interface - inbound relocation using S1 handover procedure - attempted. Type: Counter	Int32
in-s1-ho-2gto4g-gngp-success	The total number of handovers - GERAN to E-UTRAN using Gn/Gp interface - inbound relocation using S1 handover procedure - successes. Type: Counter	Int32

Variables	Description	Data Type
in-s1-ho-2gto4g-gngp-failures	The total number of handovers - GERAN to E-UTRAN using Gn/Gp interface - inbound relocation using S1 handover procedure - failures. Type: Counter	Int32
 IMPORTANT: The following PDN and bearer statistics are only available in 12.0 and earlier releases.		
tot-pdn-current	The total number of all current PDNs. Type: Counter	Int32
tot-pdn-max	The total number of maximum PDNs. Type: Counter	Int32
connected-pdn-current	The total number of connected PDNs - current. Type: Counter	Int32
connected-pdn-max	The total number of connected PDNs - maximum. Type: Counter	Int32
idle-pdn-current	The total number of idle PDNs - current. Type: Counter	Int32
idle-pdn-max	The total number of idle PDNs - maximum. Type: Counter	Int32
tot-brr-current	The total number of all bearers - current. Type: Counter	Int32
tot-brr-max	The total number of all bearers - maximum. Type: Counter	Int32
connected-brr-current	The total number of connected bearers - current. Type: Counter	Int32
connected-brr-max	The total number of connected bearers - maximum. Type: Counter	Int32
idle-brr-current	The total number of idle bearers - current. Type: Counter	Int32
idle-brr-max	The total number of idle bearers - maximum. Type: Counter	Int32
 IMPORTANT: The previous PDN and bearer statistics are only available in 12.0 and earlier releases.

Chapter 45

MVS Schema Statistics

The MVS (Mobile Videoscape) schema provides operational statistics that can be used for monitoring and troubleshooting the Mobile Video Gateway.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 45. Bulk Statistic Variables in the MVS Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
currflows-paced	<p>Description: The number of current video flows paced. For video pacing. This variable is proprietary.</p> <p>Trigger: The charging action event increments this statistic.</p> <p>Availability: Video pacing, which is part of ECS (Enhanced Charging Services), generates this statistic.</p> <p>Type: Gauge</p>	Int32
ttl-flows-paced	<p>Description: The total number of video flows paced. For video pacing. This variable is proprietary.</p> <p>Trigger: The charging action event increments this statistic.</p> <p>Availability: Video pacing, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
ttl-flows-optimized	<p>Description: The total number of TCP flows optimized. For TPO. This variable is proprietary.</p> <p>Trigger: This variable gets triggered when TPO is enabled on the flow.</p> <p>Availability: TPO, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
avrg-goodput	<p>Description: The average goodput of optimized TCP flows in kbps. For TPO. This variable is proprietary.</p> <p>Trigger: This variable gets triggered when TPO is enabled on the flow.</p> <p>Availability: TPO, which is part of ECS (Enhanced Charging Services), generates this statistic.</p> <p>Type: Gauge</p>	Int32
avrg-conn-setup-time-ms	<p>Description: The average connection setup time of Optimized TCP flows in milliseconds. For TPO. This variable is proprietary.</p> <p>Trigger: This variable gets triggered when TPO is enabled on the flow.</p> <p>Availability: TPO, which is part of ECS (Enhanced Charging Services), generates this statistic.</p> <p>Type: Gauge</p>	Int32
avrg-goodput-cong-avoid	<p>Description: The average goodput of optimized TCP flows during congestion avoidance in kbps. For TPO. This variable is proprietary.</p> <p>Trigger: This variable gets triggered when TPO is enabled on the flow.</p> <p>Availability: TPO, which is part of ECS (Enhanced Charging Services), generates this statistic.</p> <p>Type: Gauge</p>	Int32

Variables	Description	Data Type
tcplm-video-avrg-rtt-ms	<p>Description: The average video round trip time in milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-avrg-rtt-ms	<p>Description: The average non-video round trip time in milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-avrg-rate	<p>Description: The average video bit rate in kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-avrg-rate	<p>Description: The average non-video bit rate in kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-lt-50ms	<p>Description: The number of average video round trip times less than 50 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-50-69ms	<p>Description: The number of average video round trip times between 50 and 69 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rtt-70-89ms	<p>Description: The number of average video round trip times between 70 and 89 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-90-109ms	<p>Description: The number of average video round trip times between 90 and 109 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-110-129ms	<p>Description: The number of average video round trip times between 110 and 129 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-130-149ms	<p>Description: The number of average video round trip times between 130 and 149 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-150-169ms	<p>Description: The number of average video round trip times between 150 and 169 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rtt-170-189ms	<p>Description: The number of average video round trip times between 170 and 189 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-190-209ms	<p>Description: The number of average video round trip times between 190 and 209 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-210-229ms	<p>Description: The number of average video round trip times between 210 and 229 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-230-249ms	<p>Description: The number of average video round trip times between 230 and 249 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-gteq-250ms	<p>Description: The number of average video round trip times greater than or equal to 250 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rtt-lt-250ms	<p>Description: The number of average video round trip times less than 250 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-250-289ms	<p>Description: The number of average video round trip times between 250 and 289 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-290-329ms	<p>Description: The number of average video round trip times between 290 and 329 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-330-369ms	<p>Description: The number of average video round trip times between 330 and 369 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-370-409ms	<p>Description: The number of average video round trip times between 370 and 409 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rtt-410-449ms	<p>Description: The number of average video round trip times between 410 and 449 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-450-489ms	<p>Description: The number of average video round trip times between 450 and 489 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-490-529ms	<p>Description: The number of average video round trip times between 490 and 529 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-530-569ms	<p>Description: The number of average video round trip times between 530 and 569 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-570-609ms	<p>Description: The number of average video round trip times between 570 and 609 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rtt-610-649ms	<p>Description: The number of average video round trip times between 610 and 649 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-gteq-650ms	<p>Description: The number of average video round trip times greater than or equal to 650 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-lt-650ms	<p>Description: The number of average video round trip times less than 650 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-650-749ms	<p>Description: The number of average video round trip times between 650 and 749 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-750-849ms	<p>Description: The number of average video round trip times between 750 and 849 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rtt-850-949ms	<p>Description: The number of average video round trip times between 850 and 949 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-950-1049ms	<p>Description: The number of average video round trip times between 950 and 1049 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-1050-1149ms	<p>Description: The number of average video round trip times between 1050 and 1149 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-1150-1249ms	<p>Description: The number of average video round trip times between 1150 and 1249 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-1250-1349ms	<p>Description: The number of average video round trip times between 1250 and 1349 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rtt-1350-1449ms	<p>Description: The number of average video round trip times between 1350 and 1449 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-1450-1549ms	<p>Description: The number of average video round trip times between 1450 and 1549 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-1550-1649ms	<p>Description: The number of average video round trip times between 1550 and 1649 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rtt-gteq-1650ms	<p>Description: The number of average video round trip times greater than or equal to 1650 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-lt-50ms	<p>Description: The number of average non-video round trip times less than 50 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rtt-50-69ms	<p>Description: The number of average non-video round trip times between 50 and 69 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-70-89ms	<p>Description: The number of average non-video round trip times between 70 and 89 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-90-109ms	<p>Description: The number of average non-video round trip times between 90 and 109 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-110-129ms	<p>Description: The number of average non-video round trip times between 110 and 129 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-130-149ms	<p>Description: The number of average non-video round trip times between 130 and 149 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rtt-150-169ms	<p>Description: The number of average non-video round trip times between 150 and 169 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-170-189ms	<p>Description: The number of average non-video round trip times between 170 and 189 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-190-209ms	<p>Description: The number of average non-video round trip times between 190 and 209 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-210-229ms	<p>Description: The number of average non-video round trip times between 210 and 229 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-230-249ms	<p>Description: The number of average non-video round trip times between 230 and 249 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rtt-gteq-250ms	<p>Description: The number of average non-video round trip times greater than or equal to 250 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-lt-250ms	<p>Description: The number of average non-video round trip times less than 250 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-250-289ms	<p>Description: The number of average non-video round trip times between 250 and 289 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-290-329ms	<p>Description: The number of average non-video round trip times between 290 and 329 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-330-369ms	<p>Description: The number of average non-video round trip times between 330 and 369 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rtt-370-409ms	<p>Description: The number of average non-video round trip times between 370 and 409 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-410-449ms	<p>Description: The number of average non-video round trip times between 410 and 449 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-450-489ms	<p>Description: The number of average non-video round trip times between 450 and 489 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-490-529ms	<p>Description: The number of average non-video round trip times between 490 and 529 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-530-569ms	<p>Description: The number of average non-video round trip times between 530 and 569 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rtt-570-609ms	<p>Description: The number of average non-video round trip times between 570 and 609 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-610-649ms	<p>Description: The number of average non-video round trip times between 610 and 649 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-gteq-650ms	<p>Description: The number of average non-video round trip times greater than or equal to 650 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-lt-650ms	<p>Description: The number of average non-video round trip times less than 650 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-650-749ms	<p>Description: The number of average non-video round trip times between 650 and 749 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rtt-750-849ms	<p>Description: The number of average non-video round trip times between 750 and 849 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-850-949ms	<p>Description: The number of average non-video round trip times between 850 and 949 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-950-1049ms	<p>Description: The number of average non-video round trip times between 950 and 1049 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-1050-1149ms	<p>Description: The number of average non-video round trip times between 1050 and 1149 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-1150-1249ms	<p>Description: The number of average non-video round trip times between 1150 and 1249 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rtt-1250-1349ms	<p>Description: The number of average non-video round trip times between 1250 and 1349 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-1350-1449ms	<p>Description: The number of average non-video round trip times between 1350 and 1449 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-1450-1549ms	<p>Description: The number of average non-video round trip times between 1450 and 1549 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-1550-1649ms	<p>Description: The number of average non-video round trip times between 1550 and 1649 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rtt-gteq-1650ms	<p>Description: The number of average non-video round trip times greater than or equal to 1650 milliseconds. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-lt-20kbps	<p>Description: The number of average video bit rates less than 20 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rate-20-39kbps	<p>Description: The number of average video bit rates between 20 and 39 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-40-59kbps	<p>Description: The number of average video bit rates between 40 and 59 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-60-79kbps	<p>Description: The number of average video bit rates between 60 and 79 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-80-99kbps	<p>Description: The number of average video bit rates between 80 and 99 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-100-119kbps	<p>Description: The number of average video bit rates between 100 and 119 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-120-139kbps	<p>Description: The number of average video bit rates between 120 and 139 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rate-140-159kbps	<p>Description: The number of average video bit rates between 140 and 159 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-160-179kbps	<p>Description: The number of average video bit rates between 160 and 179 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-180-199kbps	<p>Description: The number of average video bit rates between 180 and 199 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-200-219kbps	<p>Description: The number of average video bit rates between 200 and 219 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-gteq-220kbps	<p>Description: The number of average video bit rates between greater than or equal to 220 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rate-lt-220kbps	<p>Description: The number of average video bit rates between less than 220 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-220-259kbps	<p>Description: The number of average video bit rates between 220 and 259 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-260-299kbps	<p>Description: The number of average video bit rates between 260 and 299 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-300-339kbps	<p>Description: The number of average video bit rates between 300 and 339 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-340-379kbps	<p>Description: The number of average video bit rates between 340 and 379 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rate-380-419kbps	<p>Description: The number of average video bit rates between 380 and 419 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-420-459kbps	<p>Description: The number of average video bit rates between 420 and 459 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-460-499kbps	<p>Description: The number of average video bit rates between 460 and 499 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-500-539kbps	<p>Description: The number of average video bit rates between 500 and 539 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-540-579kbps	<p>Description: The number of average video bit rates between 540 and 579 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rate-580-619kbps	<p>Description: The number of average video bit rates between 580 and 619 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-gteq-620kbps	<p>Description: The number of average video bit rates greater than or equal to 620 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-lt-620kbps	<p>Description: The number of average video bit rates less than 620 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-620-719kbps	<p>Description: The number of average video bit rates between 620 and 719 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-720-819kbps	<p>Description: The number of average video bit rates between 720 and 819 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-820-919kbps	<p>Description: The number of average video bit rates between 820 and 919 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rate-920-1019kbps	<p>Description: The number of average video bit rates between 920 and 1019 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-1020-1119kbps	<p>Description: The number of average video bit rates between 1020 and 1119 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-1120-1219kbps	<p>Description: The number of average video bit rates between 1120 and 1219 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-1220-1319kbps	<p>Description: The number of average video bit rates between 1220 and 1319 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-1320-1419kbps	<p>Description: The number of average video bit rates between 1320 and 1419 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-video-rate-1420-1519kbps	<p>Description: The number of average video bit rates between 1420 and 1519 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-1520-1619kbps	<p>Description: The number of average video bit rates between 1520 and 1619 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-video-rate-gteq-1620kbps	<p>Description: The number of average video bit rates greater than or equal to 1620 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-lt-20kbps	<p>Description: The number of average non-video bit rates less than 20 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-20-39kbps	<p>Description: The number of average non-video bit rates between 20 and 39 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-40-59kbps	<p>Description: The number of average non-video bit rates between 40 and 59 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rate-60-79kbps	<p>Description: The number of average non-video bit rates between 60 and 79 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-80-99kbps	<p>Description: The number of average non-video bit rates between 80 and 99 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-100-119kbps	<p>Description: The number of average non-video bit rates between 100 and 119 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-120-139kbps	<p>Description: The number of average non-video bit rates between 120 and 139 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-140-159kbps	<p>Description: The number of average non-video bit rates between 140 and 159 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rate-160-179kbps	<p>Description: The number of average non-video bit rates between 160 and 179 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-180-199kbps	<p>Description: The number of average non-video bit rates between 180 and 199 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-200-219kbps	<p>Description: The number of average non-video bit rates between 200 and 219 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-gteq-220kbps	<p>Description: The number of average non-video bit rates between greater than or equal to 220 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-lt-220kbps	<p>Description: The number of average non-video bit rates between less than 220 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rate-220-259kbps	<p>Description: The number of average non-video bit rates between 220 and 259 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-260-299kbps	<p>Description: The number of average non-video bit rates between 260 and 299 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-300-339kbps	<p>Description: The number of average non-video bit rates between 300 and 339 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-340-379kbps	<p>Description: The number of average non-video bit rates between 340 and 379 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-380-419kbps	<p>Description: The number of average non-video bit rates between 380 and 419 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rate-420-459kbps	<p>Description: The number of average non-video bit rates between 420 and 459 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-460-499kbps	<p>Description: The number of average non-video bit rates between 460 and 499 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-500-539kbps	<p>Description: The number of average non-video bit rates between 500 and 539 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-540-579kbps	<p>Description: The number of average non-video bit rates between 540 and 579 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-580-619kbps	<p>Description: The number of average non-video bit rates between 580 and 619 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rate-gteq-620kbps	<p>Description: The number of average non-video bit rates greater than or equal to 620 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-lt-620kbps	<p>Description: The number of average non-video bit rates less than 620 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-620-719kbps	<p>Description: The number of average non-video bit rates between 620 and 719 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-720-819kbps	<p>Description: The number of average non-video bit rates between 720 and 819 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-820-919kbps	<p>Description: The number of average non-video bit rates between 820 and 919 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rate-920-1019kbps	<p>Description: The number of average non-video bit rates between 920 and 1019 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-1020-1119kbps	<p>Description: The number of average non-video bit rates between 1020 and 1119 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-1120-1219kbps	<p>Description: The number of average non-video bit rates between 1120 and 1219 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-1220-1319kbps	<p>Description: The number of average non-video bit rates between 1220 and 1319 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-1320-1419kbps	<p>Description: The number of average non-video bit rates between 1320 and 1419 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32

Variables	Description	Data Type
tcplm-nonvideo-rate-1420-1519kbps	<p>Description: The number of average non-video bit rates between 1420 and 1519 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-1520-1619kbps	<p>Description: The number of average non-video bit rates between 1520 and 1619 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
tcplm-nonvideo-rate-gteq-1620kbps	<p>Description: The number of average non-video bit rates greater than or equal to 1620 kbps. For TCP link monitoring. This variable is proprietary.</p> <p>Trigger: This variable get triggered when TCP link monitoring is enabled and the flow is identified as a non-video flow.</p> <p>Availability: TCP link monitoring, which is part of ECS (Enhanced Charging Services), generates this statistic.</p>	Int32
ttl_vbytes_mp4_ios	<p>Description: The total video bytes for MP4 containers for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_mp4_android	<p>Description: The total video bytes for MP4 containers for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_mp4_laptop	<p>Description: The total video bytes for MP4 containers for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64

Variables	Description	Data Type
ttl_vbytes_mp4_unk_ue	<p>Description: The total video bytes for MP4 containers for other devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_flv_ios	<p>Description: The total video bytes for FLV (Flash Video) containers for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_flv_android	<p>Description: The total video bytes for FLV (Flash Video) containers for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_flv_laptop	<p>Description: The total video bytes for FLV (Flash Video) containers for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_flv_unk_ue	<p>Description: The total video bytes for FLV (Flash Video) containers for other devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_unk_cntnr_ios	<p>Description: The total video bytes for other containers for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64

Variables	Description	Data Type
ttl_vbytes_unk_cntnr_android	<p>Description: The total video bytes for other containers for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_unk_cntnr_laptop	<p>Description: The total video bytes for other containers for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_unk_cntnr_unk_ue	<p>Description: The total video bytes for other containers for other devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_mp4_ios	<p>Description: The total video duration for MP4 containers for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_mp4_android	<p>Description: The total video duration for MP4 containers for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_mp4_laptop	<p>Description: The total video duration for MP4 containers for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_mp4_unk_ue	<p>Description: The total video duration for MP4 containers for other devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64

Variables	Description	Data Type
tll_vduration_flv_ios	<p>Description: The total video duration for FLV (Flash Video) containers for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64

This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_cdma_ios	<p>Description: The total video bytes for CDMA Radio Access Type for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64

Variables	Description	Data Type
ttl_vbytes_cdma_android	<p>Description: The total video bytes for CDMA Radio Access Type for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_cdma_laptop	<p>Description: The total video bytes for CDMA Radio Access Type for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_cdma_unk_ue	<p>Description: The total video bytes for CDMA Radio Access Type for other devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_unk_rat_ios	<p>Description: The total video bytes for other Radio Access Type for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_unk_rat_android	<p>Description: The total video bytes for other Radio Access Type for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vbytes_unk_rat_laptop	<p>Description: The total video bytes for other Radio Access Type for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64

Variables	Description	Data Type
ttl_vbytes_unk_rat_unk_ue	<p>Description: The total video bytes for other Radio Access Type for other devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_gprs_ios	<p>Description: The total video duration for GPRS Radio Access Type for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_gprs_android	<p>Description: The total video duration for GPRS Radio Access Type for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_gprs_laptop	<p>Description: The total video duration for GPRS Radio Access Type for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_gprs_unk_ue	<p>Description: The total video duration for GPRS Radio Access Type for other devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_umts_ios	<p>Description: The total video duration for UMTS Radio Access Type for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64

Variables	Description	Data Type
ttl_vduration_ums_android	<p>Description: The total video duration for UMTS Radio Access Type for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_ums_laptop	<p>Description: The total video duration for UMTS Radio Access Type for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_ums_unk_ue	<p>Description: The total video duration for UMTS Radio Access Type for other devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_lte_ios	<p>Description: The total video duration for LTE Radio Access Type for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_lte_android	<p>Description: The total video duration for LTE Radio Access Type for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_lte_laptop	<p>Description: The total video duration for LTE Radio Access Type for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64

Variables	Description	Data Type
ttl_vduration_lte_unk_ue	<p>Description: The total video duration for LTE Radio Access Type for other devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_hspa_ios	<p>Description: The total video duration for HSPA Radio Access Type for iPhone/iPad/iPod (iOS) devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_hspa_android	<p>Description: The total video duration for HSPA Radio Access Type for Android devices. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64
ttl_vduration_hspa_laptop	<p>Description: The total video duration for HSPA Radio Access Type for laptops. For video analytics. This variable is proprietary.</p> <p>Trigger: This variable get triggered for each downloaded video when the video information is timed out from the MVG cache.</p> <p>Availability: Video analytics generates this statistic.</p>	Int64

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 46

NAT Realm Schema Statistics

The NAT Realm schema provides operational statistics that can be used for monitoring and troubleshooting the following products: NAT in-line service, SCM

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 46. Bulk Statistic Variables in the NAT Realm Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	Name of the VPN context. This is a key variable. Type: Information	String
realmname	Name of the realm. Collected per context per realm. This is a key variable. Type: Information	String
nat-bind-updates	Description: Total binding updates sent to AAA. Collected per context per realm. Triggers: Increments when the port chunk allocates or deallocates, and an update is sent to AAA. Availability: Per Active Charging Service.	Int32
nat-rlm-bytes-tx	Description: Total number of bytes transferred by realm. Collected per context per realm. Triggers: Increments when the packets are transmitted using this NAT realm. Availability: Per Active Charging Service.	Int32
nat-rlm-flows	Description: Total number of flows used by realm. Collected per context per realm. Triggers: Increments when the new flows use this NAT realm. Availability: Per Active Charging Service.	Int32
nat-rlm-ip-denied	Description: Total number of flows denied IP. Collected per context per realm. Triggers: Increments when the new NAT IP is not available for translation to new flows. Availability: Per Active Charging Service.	Int32
nat-rlm-port-denied	Description: Total number of flows denied ports. Collected per context per realm. Triggers: Increments when the new NAT port is not available for translation to new flows. Availability: Per Active Charging Service.	Int32
nat-rlm-ttl-ips	Description: Total number of NAT public IP addresses. Collected per context per realm. Availability: Per Active Charging Service. Type: Gauge	Int32
nat-rlm-ips-in-use	Description: Total number of NAT public IP addresses currently in use. Collected per context. Triggers: Increments when a new NAT IP address is used by any subscriber. Availability: Per Active Charging Service. Type: Gauge	Int32
nat-rlm-current-users	Description: Total number of current users using a NAT realm. Collected per context per realm. Triggers: Increments when a new subscriber uses the NAT IP from this realm and decrements on releasing the NAT IP address. Availability: Per Active Charging Service. Type: Gauge	Int32
nat-rlm-ttl-port-chunks	Description: Total number of port chunks. Collected per context per realm. Availability: Per Active Charging Service. Type: Gauge	Int32

Variables	Description	Data Type
nat-rlm-chunks-in-use	Description: Total number of port chunks currently in use. Collected per context per realm. Triggers: Increments when a new flow takes new port chunk and decrements on releasing the chunk. Availability: Per Active Charging Service. Type: Gauge	Int32
nat-rlm-port-chunk-size	Description: The size of the port chunk in the NAT realm. This is a snapshot statistic. Availability: Per Active Charging Service. Type: Gauge	Int32
nat-rlm-port-chunk-average-usage-tcp	Description: The average TCP port usage in the allocated TCP ports, i.e out of allocated TCP ports how many got used. This is not a percentage value. This is a snapshot statistic. Triggers: Increments during TCP flows creation and existing network conditions. Availability: Per Active Charging Service. Type: Gauge	Int32
nat-rlm-port-chunk-average-usage-udp	Description: The average UDP port usage in the allocated UDP ports, i.e out of allocated UDP ports how many got used. This is not a percentage value. This is a snapshot statistic. Triggers: Increments during UDP flows creation and existing network conditions. Availability: Per Active Charging Service. Type: Gauge	Int32
nat-rlm-port-chunk-average-usage-others	Description: The average Others (ICMP or GRE) port usage in the allocated others ports, i.e out of allocated 'Others' ports how many got used. This is not a percentage value. This is a snapshot statistic. Triggers: Increments during ICMP or GRE flows creation and existing network conditions. Availability: Per Active Charging Service. Type: Gauge	Int32
nat-rlm-max-port-chunk-subscribers	Description: Total number of subscribers who have used maximum number of port chunks. This is a cumulative statistic. Triggers: Increments when any subscriber uses maximum number of port chunks. Availability: Per Active Charging Service.	Int64
nat-rlm-max-port-chunk-used	Description: The maximum number of port chunks used by any subscriber. This is a cumulative statistic. Triggers: Increments when any subscriber uses new maximum number of port chunks. Availability: Per Active Charging Service.	Int32
nat-rlm-max-cur-port-chunk-subscribers	Description: Total number of current subscribers using maximum number of port chunks. This is a snapshot statistic. Triggers: Increments when the active subscriber uses maximum number of port chunks. Availability: Per Active Charging Service. Type: Gauge	Int64
nat-rlm-max-cur-port-chunk-used	Description: The maximum number of port chunks currently used by any subscriber. This is a snapshot statistic. Triggers: Increments when the active subscriber uses new maximum number of port chunks. Availability: Per Active Charging Service. Type: Gauge	Int32

Chapter 47

PCC-AF Schema Statistics

The PCC-AF schema provides operational statistics that can be used for monitoring and troubleshooting the following products from StarOS Release 12.1 onward: IPCF.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 47. Bulk Statistic Variables in the PCC-AF Schema

Variables	Description	Data Type
vpnname	The name of the context in which PCC-AF service is configured. This is a key variable.	String

Variables	Description	Data Type
vpnid	The identity number of the context in which PCC-AF service is configured. This is a key variable.	String
servname	The name of the PCC-AF service for which statistics are collected or displayed. This is a key variable.	String
servid	The identity number of the PCC-AF service for which statistics are collected or displayed. This is a key variable.	String
total-rx-inbound-msgs	Indicates the total number of Rx messages received. Trigger: When a Rx message arrives at IPCF. Trigger: When a Rx message arrives at IPCF. Availability: Across all PCC App Services.	Unsigned Int32
total-rx-outbound-msgs	Indicates the total number of Rx messages sent. Trigger: When a Rx message is sent by IPCF to peer. Availability: Across all PCC App Services.	Unsigned Int32
total-rx-aar-rcvd	Indicates the total number of Rx AAR messages received. Trigger: When Rx AAR received. Availability: Across all PCC App Services.	Unsigned Int32
total-rx-aar-accept-sent	Indicates the total number of Rx AAR messages accepted. Trigger: When Rx AAR accepted with AAA with success code. Availability: Across all PCC App Services.	Unsigned Int32
total-rx-ccri-rcvd	Indicates the total number of Rx STR messages received. Trigger: When IPCF received a Rx STR. Availability: Across all PCC App Services.	Unsigned Int32
total-rx-ccai-accept-sent	Indicates the total number of Rx STR messages received. Trigger: When IPCF accepts a STR with STA with success code. Availability: Across all PCC App Services.	Unsigned Int32
total-rx-rar-sent	Indicates the total number of Rx RAR request sent. Trigger: When IPCF sends a RAR on Rx. Availability: Across all PCC App Services.	Unsigned Int32
total-rx-raa-rcvd	Indicates the total number of Rx RAA responses received. Trigger: When IPCF received a RAR response. Availability: Across all PCC App Services.	Unsigned Int32
total-rx-asr-sent	Indicates the total number of Rx ASR request sent. Trigger: When IPCF sends a ASR on Rx. Availability: Across all PCC App Services.	Unsigned Int32
total-rx-asa-rcvd	Indicates the total number of Rx ASA responses received. Trigger: When IPCF received a ASA response. Availability: Across all PCC App Services.	Unsigned Int32

Chapter 48

PCC-Policy Schema Statistics

The PCC-Policy schema provides operational statistics that can be used for monitoring and troubleshooting the following products from StarOS Release 12.1 onward: IPCF.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.
