 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 48. Bulk Statistic Variables in the PCC-Policy Schema

Variables	Description	Data Type
vpnname	The name of the context in which PCC-Policy service is configured. This is a key variable.	String

■ Common Syntax Options

Variables	Description	Data Type
vpnid	The identity number of the context in which PCC- Policy service is configured. This is a key variable.	Unsigned Int32
servname	The name of the PCC- Policy service for which statistics are collected or displayed. This is a key variable.	String
servid	The identity number of the PCC- Policy service for which statistics are collected or displayed. This is a key variable.	Unsigned Int32
total-gx-inbound-msgs	Indicates the total number of Gx messages received. Trigger: When a Gx message arrives at IPCF. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-outbound-msgs	Indicates the total number of Gx messages sent. Trigger: When a Gx message is sent by IPCF to peer. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccr-rcvd	Indicates the total number of Gx CCR messages received. Trigger: When GxCCR I/U/T received. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccr-rej-sent	Indicates the total number of Gx CCR messages rejected. Trigger: When Gx CCR rejected with CCA with respective error code. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-cca-accept-sent	Indicates the total number of Gx CCA messages scepted successfully. Trigger: When Gx CCR accepted with CCA with success code. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccri-rcvd	Indicates the total number of Gx CCR-I messages received. Trigger: When IPCF received a Gx CCR-I. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccai-rej-sent	Indicates the total number of Gx CCA-I messages sent with error response. Trigger: When IPCF rejects a CCR-I with CCA with respective error code. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccai-accept-sent	Indicates the total number of Gx CCA-I messages sent with success response. Trigger: When IPCF accepts a CCR-I with CCA with success code. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccru-rcvd	Indicates the total number of Gx CCR-U messages received. Trigger: When IPCF received a Gx CCR-U. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccru-rej-sent	Indicates the total number of Gx CCA-U messages sent with error response. Trigger: When IPCF rejects a CCR-U with CCA with respective error code. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccru-accept-sent	Indicates the total number of Gx CCA-U messages sent with success response. Trigger: When IPCF accepts a CCR-U with CCA with success code. Availability: Across all PCC Policy Services.	Unsigned Int32

Variables	Description	Data Type
total-gx-ccrt-rcvd	Indicates the total number of Gx CCR-T messages received. Trigger: When IPCF received a Gx CCR-T. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccrt-rej-sent	Indicates the total number of Gx CCA-T messages sent with error response. Trigger: When IPCF rejects a CCR-T with CCA with respective error code. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccrt-accept-sent	Indicates the total number of Gx CCA-T messages sent with success response. Trigger: When IPCF accepts a CCR-T with CCA with success code. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-unknown-ccr-rcvd	Indicates the total number of Gx Unknown CCR messages received. Trigger: When Unknown CCR sent to IPCF. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-unknown-ccr-rej	Indicates the total number of Gx unknown CCR messages rejected. Trigger: When IPCF rejects the unknown CCR with CCA with respective error code. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-rar-sent	Indicates the total number of Gx RAR request sent. Trigger: When IPCF sends a RAR on Gx. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-raa-rcvd	Indicates the total number of Gx RAA responses received. Trigger: When IPCF received a RAR response. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-rar-timeouts	Indicates the total number of Gx RAR timeouts. Trigger: When RAR times out. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-raa-parse-success	Indicates the total number of Gx RAA parse success messages. Trigger: When RAA AVP parsing is successful. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-raa-parse-fail	Indicates the total number of Gx RAA parse fail. Trigger: When RAA AVP parsing fails. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-cca-sent	Indicates the total number of Gx-CCA messages sent in response to CCR. Trigger: When IPCF sends a CCA message. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccai-sent	Indicates the total number of Gx-CCA-I messages sent in response to CCR-I. Trigger: When IPCF sends a CCA-I message. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccau-sent	Indicates the total number of Gx-CCA-U messages sent in response to CCR-U. Trigger: When IPCF sends a CCA-U message. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-ccat-sent	Indicates the total number of Gx-CCA-T messages sent in response to CCR-T. Trigger: When IPCF sends a CCA-T message. Availability: Across all PCC Policy Services.	Unsigned Int32

Variables	Description	Data Type
total-gx-rar-sess-release	Indicates the total number of Gx RAR messages sent for Session Release. Trigger: When IPCF sends RAR message to PCEF with Session-Release Cause AVP to request a session release. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-raa-success-code	Indicates the total number of Gx RAA messages sent with Result-Code as SUCCESS. Trigger: When IPCF receives RAA message with Result-Code as SUCCESS in response to an RAR. Availability: Across all PCC Policy Services.	Unsigned Int32
total-gx-raa-faluir-code	Indicates the total number of Gx RAA messages sent with Result-Code other than SUCCESS. Trigger: When IPCF receives RAA message with Result-Code other than SUCCESS in response to an RAR. Availability: Across all PCC Policy Services.	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 49

PCC-Sp-Endpoint Schema Statistics

The PCC-Sp-Endpoint schema provides operational statistics that can be used for monitoring and troubleshooting the following products from StarOS Release 12.1 onward: IPCF.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 49. Bulk Statistic Variables in the PCC-Sp-Endpoint Schema

Variables	Description	Data Type
vpnname	The name of the context in which PCC-Sp-Endpoint is configured. This is a key variable.	String

Common Syntax Options

Variables	Description	Data Type
vpnid	The identity number of the context in which PCC-Sp-Endpoint is configured. This is a key variable.	String
endpt-name	The name of the PCC-Sp-Endpoint instance for which statistics are collected or displayed. This is a key variable.	String
req-open	Indicates total number of SPRMgr Sh session Create requests received from PCCMgr. Trigger: When SPRMgr receives a first GET profile request for a session. Availability: Across all PCC SP Endpoints.	Unsigned Int32
req-close	Indicates total number of SPRMgr Sh session Close requests received from PCCMgr. Trigger: When SPRMgr receives the last notification de-registration request or session close request. Availability: Across all PCC SP Endpoints.	Unsigned Int32
req-update-profile	Indicates total number of requests received from PCCMgr to send PUR to SSC. Trigger: When SPRMgr gets a request from PCCMgr to send PUR to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
req-update-profile-answer	Indicates total number of PUA received from SSC. Trigger: When SPRMgr receives a PUA message from SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
req-user-data-req	Indicates total number of requests received from PCCMgr to send UDR to SSC. Trigger: When SPRMgr gets a request from PCCMgr to send UDR to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
req-user-data-answer	Indicates total number of UDA received from SSC. Trigger: When SPRMgr receives a UDA message from SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
req-push-notif-req	Indicates total number of PNRs received. Trigger: When IPCF receives a PNR message from SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
req-push-notif-answer	Indicates total number of PNA received from PCCMgr. Trigger: After successful parsing of PNR message and before sending the PNA message out. Availability: Across all PCC SP Endpoints.	Unsigned Int32
req-subscr-notif-req	Indicates total number of requests received from PCCMgr to send PNR to SSC. Trigger: When IPCF receives a SNR message from SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
req-subscr-notif-answer	Indicates total number of SNAs sent. Trigger: When SPRMgr receives a SNA message from SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
success-open	Indicates total number of SPRMgr Sh sessions successfully created. Trigger: When SPRMgr has successfully created a Sh session. Availability: Across all PCC SP Endpoints.	Unsigned Int32

Variables	Description	Data Type
success-close	Indicates total number of SPRMgr Sh sessions successfully closed. Trigger: When SPRMgr has successfully closed a Sh session. Availability: Across all PCC SP Endpoints.	Unsigned Int32
success-update-profile	Indicates total number of PUR successfully sent to SSC. Trigger: When a PUR message is successfully sent from IPCF to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
success-update-profile-answer	Indicates total number of PUA successfully parsed and their data sent to PCCMgr. Trigger: When the PUA message received from SSC is successfully parsed. Availability: Across all PCC SP Endpoints.	Unsigned Int32
success-user-data-req	Indicates total number of UDR successfully sent to SSC. Trigger: When a UDR message is successfully sent from IPCF to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
success-user-data-answer	Indicates total number of UDA successfully parsed and their data sent to PCCMgr. Trigger: When the UDA message received from SSC is successfully parsed. Availability: Across all PCC SP Endpoints.	Unsigned Int32
success-push-notif-req	Indicates total number of PNR successfully sent to SSC. Trigger: When the PNR message received from SSC is successfully parsed. Availability: Across all PCC SP Endpoints.	Unsigned Int32
success-push-notif-answer	Indicates total number of PNA successfully parsed and their data sent to PCCMgr. Trigger: When a PNA message is successfully sent from IPCF to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
success-subscr-notif-req	Indicates total number of SNR successfully sent to SSC. Trigger: When a SNR message is successfully sent from IPCF to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
success-subscr-notif-answer	Indicates total number of SNA successfully parsed and their data sent to PCCMgr. Trigger: When the SNA message received from SSC is successfully parsed. Availability: Across all PCC SP Endpoints.	Unsigned Int32
error-open	Indicates total number of SPRMgr Sh session create failures. Trigger: When SPRMgr session creation fails. Availability: Across all PCC SP Endpoints.	Unsigned Int32
error-close	Indicates total number of SPRMgr Sh session close failures. Trigger: When SPRMgr session close fails. Availability: Across all PCC SP Endpoints.	Unsigned Int32
error-update-profile	Indicates total number of errors occurred while sending PUR. Trigger: When an error occurs while sending PUR message to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
error-update-profile-answer	Indicates total number of errors occurred while processing PUA. Trigger: When an error occurs while processing PUA message received from SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
error-user-data-req	Indicates total number of errors occurred while sending UDR. Trigger: When an error occurs while sending UDR message to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32

Variables	Description	Data Type
error-user-data-answer	Indicates total number of errors occurred while processing UDA. Trigger: When an error occurs while processing UDA message received from SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
error-push-notif-req	Indicates total number of errors occurred while processing PNR. Trigger: When an error occurs while processing PNR message received from SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
error-push-notif-answer	Indicates total number of errors occurred while sending PNA. Trigger: When an error occurs while sending PNA message to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
error-subscr-notif-req	Indicates total number of errors occurred while sending SNR. Trigger: When an error occurs while sending SNR message to SSC. Availability: Across all PCC SP Endpoints.	Unsigned Int32
error-subscr-notif-answer	Indicates total number of errors occurred while processing SNA. Trigger: When an error occurs while processing SNA message received from SSC. Availability: Across all PCC SP Endpoints	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 50

PCC Service Schema Statistics

The PCC Service schema provides operational statistics that can be used for monitoring and troubleshooting the following products from StarOS Release 12.1 onward: IPCF.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 50. Bulk Statistic Variables in the PCC Service Schema

Variables	Description	Data Type
vpnname	The name of the context in which PCC service is configured. This is a key variable.	String

Variables	Description	Data Type
vpnid	The identity number of the context in which PCC service is configured. This is a key variable.	String
servname	The name of the PCC service for which statistics are collected or displayed. This is a key variable.	String
servid	The identity number of the PCC service for which statistics are collected or displayed. This is a key variable.	String
total-gx-processed	Indicates the total number of Gx request processed by PCC. Trigger: When Gx request is processed by PCC. Availability: Availability: Across all PCC Services.	Unsigned Int32
total-gy-processed	Indicates the total number of Gy request processed by PCC. Trigger: When Gy request is processed by PCC. Availability: Availability: Across all PCC Services.	Unsigned Int32
total-spr-processed	Indicates the total number of SSC request processed by PCC. Trigger: When SPR responded is processed by PCC. Availability: Availability: Across all PCC Services.	Unsigned Int32
total-unknown-req	Indicates the total number of unknown request received at PCC. Trigger: When sent to PCC is unknown. Availability: Availability: Across all PCC Services.	Unsigned Int32
total-pur-updates	Indicates the total number of profile update request sent by PCC. Trigger: When IPCF wants to update quota on SSC. Availability: Availability: Across all PCC Services.	Unsigned Int32
total-snr-requests	Indicates the total number of subscriber notification request processed by PCC. Trigger: When IPCF wants to ask for Subscriber information from SSC. Availability: Across all PCC Services.	Unsigned Int32
total-pnr-requests	Indicates the total number of profile notification request processed by PCC. Trigger: When subscriber profile is updated at SSC. Availability: Across all PCC Services.	Unsigned Int32
total-profile-match-hits	Indicates the total number profiles matched. Trigger: When profile requested by interfaces is matched. Availability: Across all PCC Services.	Unsigned Int32
total-profile-match-miss	Indicates the total number of profiles that did not match. Trigger: When profile requested by interfaces does not match. Availability: Across all PCC Services.	Unsigned Int32
total-quota-reports	Indicates the total number of quote reports generated by PCC. Trigger: When IPCF processes quota request on Gy interface. Availability: Across all PCC Services.	Unsigned Int32
total-unknown-rt-req	Indicates the total number of unknown rating group requested. Trigger: When an unknown rating group is reported by Gy. Availability: Across all PCC Services.	Unsigned Int32

Chapter 51

PDG Schema Statistics

The PDG schema provides operational statistics that can be used for monitoring and troubleshooting the following products: PDG/TTG

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 51. Bulk Statistic Variables in the PDG Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	Description: The name of the context currently facilitating the service processing the subscriber session. This is a key variable. This variable is proprietary. Availability: IPSec/SSL.	String
vpnid	Description: The identification number of the context currently facilitating the service processing the subscriber session. This is an internal reference number. This is a key variable. This variable is proprietary. Availability: IPSec/SSL.	Int32
svcname	Description: The service name for which PDG statistics are being displayed. This is a key variable. This variable is proprietary. Availability: IPSec/SSL.	String
svcid	Description: The service ID for which PDG statistics are being displayed. This is a key variable. This variable is proprietary. Availability: IPSec/SSL.	Int32
bindaddress	Description: The bind IP address for this PDG service. This variable is proprietary. Availability: IPSec/SSL.	String
state	Description: System-wide PDG state identified by the following codes: <ul style="list-style-type: none"> inservice(1): The PDG service is started (active). outofservice(2): The PDG service is not started. It is in the initial state (inactive). This variable is proprietary. Availability: IPSec/SSL.	String
sess-ttlcursess	Description: Number of total current sessions. This variable is proprietary. Availability: IPSec/SSL. Type: Gauge	Int32
sess-curact	Description: Number of currently active PDG sessions. This variable is proprietary. Trigger: Increments on receiving a new call request from the UE. For IPSec, it increments after receiving an IKE_INIT message from the UE. For SSL, it increments after the SSL tunnel is established. Availability: IPSec/SSL. Type: Gauge	Int32
sess-curdorm	Description: Number of currently dormant PDG sessions. This variable is proprietary. Trigger: For SSL, it represents those subscribers wherein the TCP connection is up but the SSL tunnel is not yet up. Availability: SSL. Type: Gauge	Int32

Variables	Description	Data Type
sess-curactipv4	Description: Number of currently active IPv4 sessions. This variable is proprietary. Availability: IPsec/SSL. Type: Gauge	Int32
sess-curdormipv4	Description: Number of currently dormant IPv4 sessions. This variable is proprietary. Availability: IPsec/SSL. Type: Gauge	Int32
sess-curactipv6	Description: Number of currently active IPv6 sessions. This variable is proprietary. Availability: IPsec/SSL. Type: Gauge	Int32
sess-curdormipv6	Description: Number of currently dormant IPv6 sessions. This variable is proprietary. Availability: IPsec/SSL. Type: Gauge	Int32
sess-curdiripv4	Description: Number of current direct IP IPv4 sessions. This variable is proprietary. Availability: IPsec/SSL. Type: Gauge	Int32
sess-curttgipv4	Description: Number of current TTG IPv4 sessions. This variable is proprietary. Availability: IPsec/SSL. Type: Gauge	Int32
sess-tldiripv4	Description: Total number of direct IP IPv4 sessions. This variable is proprietary. Trigger: Increments upon successful IPv4 PDG mode call setup. Availability: IPsec/SSL. Type: Gauge	Int32
sess-tlittgipv4	Description: Total number of TTG IPv4 sessions. This variable is proprietary. Trigger: Increments upon successful IPv4 TTG mode call setup. Availability: IPsec/SSL.	Int32
sess-diripv4succ	Description: Number of direct IP IPv4 successful sessions. This variable is proprietary. Trigger: Increments upon successful IPv4 PDG mode call setup. Availability: IPsec/SSL.	Int32
sess-diripv4attempt	Description: Number of direct IP IPv4 attempted sessions. This variable is proprietary. Trigger: Increments upon receiving an IKE_INIT message from the UE in IPsec and a TCP SYN message from the UE in SSL. Availability: IPsec/SSL.	Int32

Variables	Description	Data Type
sess-diripipv4attemptfail	<p>Description: Number of direct IP IPv4 attempted sessions that failed. This variable is proprietary.</p> <p>Trigger: Increments upon a session setup timeout and authentication failure scenario in PDG mode IPv4 call setup.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-ttgipv4succ	<p>Description: Number of direct TTG IPv4 successful sessions. This variable is proprietary.</p> <p>Trigger: Increments upon a successful IPv4 TTG mode call setup.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-ttgipv4attempt	<p>Description: Number of direct TTG IPv4 attempted sessions. This variable is proprietary.</p> <p>Trigger: Increments upon receiving an IKE_INIT message from the UE in IPsec and a TCP SYN message from the UE in SSL TTG mode.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-ttgipv4attemptfail	<p>Description: Number of direct TTG IPv4 attempted sessions that failed. This variable is proprietary.</p> <p>Trigger: Increments upon a session setup timeout and authentication failure scenario in PDG mode IPv4 call setup.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-ttlsetup	<p>Description: Total number of sessions set up. This variable is proprietary.</p> <p>Trigger: Increments upon sending a successful IKE_AUTH CFG response to the UE in IPSec, and upon a successful call setup with an MT_CLOSE message sent to the UE in SSL.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-ttlattempt	<p>Description: Total number of session attempted. This variable is proprietary.</p> <p>Trigger: Increments upon receiving an IKE_INIT message from the UE in IPsec and a TCP SYN message in SSL TTG mode.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-ttlattemptfail	<p>Description: Total number of session attempts failed. This variable is proprietary.</p> <p>Trigger: Increments upon session setup timeout and authentication failure scenario or a resource unavailable scenario where the subscriber allocation fails.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-tlldisc	<p>Description: Total number of sessions disconnected. This variable is proprietary.</p> <p>Trigger: Increments after call is up during re-authentication failure (IPSec only) and the SSL or IPSec tunnel goes down.</p> <p>This variable is proprietary.</p>	Int32
sess-tlldisclocal	<p>Description: Total number of sessions disconnected locally. This variable is proprietary.</p> <p>Trigger: Increments by unavailable resources and session setup timeout.</p> <p>Availability: IPSec/SSL.</p>	Int32

Variables	Description	Data Type
sess-ttliscremote	Description: Total number of sessions disconnected remotely. This variable is proprietary. Trigger: Increments on UE-initiated call tear down after call setup. Availability: IPsec/SSL.	Int32
sess-discbeforeconn	Description: Sessions remotely disconnected before connected. This variable is proprietary. Trigger: Increments on UE-initiated call tear down before call setup. Availability: IPsec/SSL.	Int32
sess-ttlfastreauthsucc	Description: Total fast re-authentication successes. This variable is proprietary. Trigger: Increments upon re-authentication success scenario. Includes both fast re-authentication and pseudoname re-authentication. Availability: IPsec.	Int32
sess-ttlfastreauthattempt	Description: Total fast re-authentication attempts. This variable is proprietary. Trigger: Increments upon receiving the re-auth ID in the IKE-AUTH message from the UE. Includes both fast re-authentication and pseudoname re-authentication. Availability: IPsec.	Int32
sess-ttlfastreauthattemptfail	Description: Total fast re-authentication attempts that failed. This variable is proprietary. Trigger: Increments upon a re-authentication success scenario from the AAA server. Includes both fast re-authentication and pseudoname re-authentication. Availability: IPsec.	Int32
sess-ttlreauthorizesucc	Description: Total reauthorization attempts that succeeded. This variable is proprietary. Trigger: Increments upon receiving an authorize success message from the AAA server. Availability: IPsec.	Int32
sess-ttlreauthorizeattempt	Description: Total reauthorization attempts. This variable is proprietary. Trigger: Increments upon sending an authorize request message to the AAA server. Availability: IPsec.	Int32
sess-ttlreauthorizeattemptfail	Description: Total reauthorization attempts that failed. This variable is proprietary. Trigger: Increments upon an authorization failure with the AAA server or if the IPsec tunnel goes down during authorization. Availability: IPsec.	Int32
sess-ttlprimaryaaasucc	Description: Total primary AAA sessions that succeeded. This variable is proprietary. Trigger: Increments upon receiving an access accept message from the AAA server. (Increments only during primary authentication if multiple authentication is supported in IPsec). Availability: IPsec/SSL.	Int32

Variables	Description	Data Type
sess-ttlprimaryaaaattempt	Description: Total primary AAA sessions attempted. This variable is proprietary. Trigger: Increments upon receiving an IKE -AUTH message from the UE in IPsec and an MT-AUTH message from the UE in SSL. Availability: IPsec/SSL.	Int32
sess-ttlprimaryaaaattemptfail	Description: Total primary AAA sessions that failed. This variable is proprietary. Trigger: Increments on an authentication failure and if the SSL or IPsec tunnel goes down during authentication. Availability: IPsec/SSL.	Int32
sess-ttlexternalaaaasucc	Description: Total external AAA sessions that succeeded. This variable is proprietary. Trigger: Increments upon receiving an authentication success message from the AAA server in a multiple authentication scenario. Availability: IPsec.	Int32
sess-ttlexternalaaaattempt	Description: Total external AAA sessions that attempted. This variable is proprietary. Trigger: Increments upon receiving an IKE-AUTH (ANOTHER-AUTH-FOLLOWS) message from the UE in a multiple authentication scenario. Availability: IPsec.	Int32
sess-ttlexternalaaaattemptfail	Description: Total external AAA sessions that failed. This variable is proprietary. Trigger: Increments upon receiving an authentication failure from the AAA server or an IPsec tunnel tear down in a multiple authentication scenario. Availability: IPsec.	Int32
sess-ttleapauthsucc	Description: Total of successful EAP authorizations. This variable is proprietary. Trigger: Increments upon receiving an authentication success message from the AAA server for the second phase authentication using EAP. (Applicable only in a multiple authentication scenario.) Availability: IPsec.	Int32
sess-ttleapauthfail	Description: Total of failed EAP authorizations. This variable is proprietary. Trigger: Increments upon receiving an authentication failure message from the AAA server for the second phase authentication using EAP. (Applicable only in a multiple authentication scenario.) Availability: IPsec.	Int32
sess-ttlpapauthsucc	Description: Total of successful PAP authorizations. This variable is proprietary. Trigger: Increments upon receiving an authentication success message from the AAA server for the second phase authentication using PAP. (Applicable only in a multiple authentication scenario.) Availability: IPsec.	Int32

Variables	Description	Data Type
sess-ttlpapauthfail	<p>Description: Total of failed PAP authorizations. This variable is proprietary.</p> <p>Trigger: Increments upon receiving an authentication failure message from the AAA server for the second phase authentication using PAP. (Applicable only in a multiple authentication scenario.)</p> <p>Availability: IPSec.</p>	Int32
sess-ttlchapauthsucc	<p>Description: Total of successful CHAP authorizations. This variable is proprietary.</p> <p>Trigger: Increments upon receiving an authentication success message from the AAA server for the second phase authentication using CHAP. (Applicable only in a multiple authentication scenario.)</p> <p>Availability: IPSec.</p>	Int32
sess-ttlchapauthfail	<p>Description: Total of failed CHAP authorizations. This variable is proprietary.</p> <p>Trigger: Increments upon receiving an authentication failure message from the AAA server for the second phase authentication using CHAP. (Applicable only in a multiple authentication scenario.)</p> <p>Availability: IPSec.</p>	Int32
sess-discremote	<p>Description: Number of sessions terminated by a remote disconnect. This variable is proprietary.</p> <p>Trigger: A TCP failure scenario in SSL PDG and SSL TTG after the call is in the CONNECTED state. A UE-initiated session disconnect in IPSec PDG and IPSec TTG after the call is in the CONNECTED state.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-attemptfaildiscremote	<p>Description: Number of sessions terminated by a Session Attempt Failed disconnect reason due to a remote disconnect.</p> <p>Trigger: A TCP failure scenario in SSL PDG and SSL TTG before the call is in the CONNECTED state. A UE-initiated session disconnect in IPSec PDG and IPSec TTG before the call is in the CONNECTED state.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-discadmin	<p>Description: Number of sessions terminated because of an admin release. This variable is proprietary.</p> <p>Trigger: Incremented for all sessions in a CONNECTED state that are cleared due to an Admin Disconnect disconnect reason.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-attemptfaildiscadmin	<p>Description: Number of sessions terminated by a Session Attempt Failed disconnect reason due to an admin disconnect. This variable is proprietary.</p> <p>Trigger: Incremented for all session setups that failed due to an admin disconnect before the session is in a CONNECTED state.</p> <p>Availability: IPSec/SSL.</p>	Int32
sess-discidletimeout	<p>Description: Number of sessions terminated because of idle timer timeout. This variable is proprietary.</p> <p>Availability: IPSec/SSL.</p>	Int32

Variables	Description	Data Type
sess-discabstimeout	Description: Number of sessions terminated because of absolute timeout. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-disclongdur	Description: Number of sessions terminated because of long duration timer timeout. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-discsesssetuptimeout	Description: Number of sessions terminated because of Session Manager session setup timeout. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-discnonexistperf	Description: Number of sessions terminated because of non-existence of PCRF. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-discnoresource	Description: Number of sessions terminated because of no resources. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-discauthfail	Description: Number of sessions terminated because of AAA authentication failure. This variable is proprietary. Trigger: Incremented on receiving an Access-Reject message, an invalid AAA attribute in an Access-Accept message, an AAA timeout message, a missing AAA attribute in an Access-Accept message, an invalid W-APN format, or an invalid NAI format. Also incremented in PDG mode if W-APN is not configured. Availability: IPsec/SSL.	Int32
sess-discreauthfail	Description: Number of sessions terminated because of a session re-authentication failure. This variable is proprietary. Trigger: Incremented for all AAA failures during fast re-authentication or pseudonym re-authentication. Availability: IPsec.	Int32
sess-discflowaddfail	Description: Number of sessions terminated because of flow add failure. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-discinvdestctx	Description: Number of sessions terminated because of invalid destination context. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-discsourceviol	Description: Number of sessions terminated because of source IP address violation. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-discgtp	Description: Number of sessions terminated because of a GTP failure. This variable is proprietary. Trigger: Incremented for all GTP path failures or DPC requests from the GGSN. Availability: IPsec/SSL (TTG only).	Int32

Variables	Description	Data Type
sess-attemptfaildiscgtp	Description: Number of session attempts failed because of GTP failure. This variable is proprietary. Trigger: Incremented for all session setups failed due to CPC failure/timeout. Availability: IPsec/SSL (TTG only).	Int32
sess-discdupreq	Description: Number of sessions terminated because of duplicate requests. This variable is proprietary. Trigger: Incremented on receiving a new call when a previous call exists in the CONNECTED state with the same IMSI and APN on the same Session Manager. When this occurs, the original call is cleared. Availability: IPsec/SSL (TTG only).	Int32
sess-attemptfaildiscdupreq	Description: Number of session attempts failed because of duplicate requests. This variable is proprietary. Trigger: Incremented on receiving a new call when a previous call exists in the CONNECTED state with the same IMSI and APN on the same Session Manager. When this occurs, the original call is cleared. Availability: IPsec/SSL (TTG only).	Int32
sess-discaddrfail	Description: Number of sessions terminated because of an address assignment failure. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-discmisc	Description: Number of sessions terminated because of miscellaneous reasons. This variable is proprietary. Trigger: Incremented for all SSL failures and all remaining disconnect reasons (for example, for IPsec, no-response or remote-error-notification). Availability: IPsec/SSL.	Int32
sess-attemptfaildiscmisc	Description: Number of session attempts failed because of miscellaneous reasons. This variable is proprietary. Trigger: Incremented for all session setup failures due to SSL failures (for example, handshake failures, ssl-alert, ssl-bad-message), or an unknown APN case in which the TTG is unable to resolve the APN and all remaining disconnect reasons before the call is in the CONNECTED state. Availability: IPsec/SSL.	Int32
sess-ttlbytesent	Description: Total number of bytes sent. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-ttlbytesrcvd	Description: Total number of bytes received. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-ttlpktsent	Description: Total number of packets sent. This variable is proprietary. Availability: IPsec/SSL.	Int32
sess-ttlpktrcvd	Description: Total number of packets received. This variable is proprietary. Availability: IPsec/SSL.	Int32

Variables	Description	Data Type
sess-ttlpktviolations	Description: Total number of packet violations. This variable is proprietary. Availability: IPsec/SSL.	Int32
eap-rttlsvrpssthru	Description: Total number of EAP messages received from the EAP server in pass-through mode. This variable is proprietary. Availability: IPsec/SSL.	Int32
eap-rxsucsvrpssthru	Description: Total number of EAP-Success messages received from the EAP server in pass-through mode. This variable is proprietary. Availability: IPsec/SSL.	Int32
eap-rxfailsvrpssthru	Description: Total number of EAP-Failure messages received from the EAP server in pass-through mode. This variable is proprietary. Availability: IPsec/SSL.	Int32
eap-rxchalsvrpssthru	Description: Total number of EAP challenge messages sent to the EAP server in pass-through mode. This variable is proprietary. Availability: IPsec/SSL.	Int32
eap-txttlsvr	Description: Total number of EAP messages transmitted to the EAP server. This variable is proprietary. Availability: IPsec/SSL.	Int32
eap-txinitrequest	Description: Total number of EAP request messages forwarded to the EAP server for initial request. This variable is proprietary. Availability: IPsec/SSL.	Int32
eap-txreqfwd	Description: Total number of EAP messages transmitted to the EAP server for forward request. This variable is proprietary. Availability: IPsec/SSL.	Int32
eap-rxmobilepassthru	Description: Total number of EAP messages transmitted to the EAP server in pass-through mode for mobile node. This variable is proprietary. Availability: IPsec/SSL.	Int32
eap-rxmobilisediscarded	Description: Total number of EAP messages transmitted to the EAP server that were discarded. This variable is proprietary. Availability: IPsec/SSL.	Int32
mt-txdatabyteuplink	Description: SSL micro-tunneling: Uplink data bytes sent. This variable is proprietary. Availability: SSL.	Int64

Variables	Description	Data Type
mt-databyteuplinkdropped	Description: SSL micro-tunneling: Uplink data bytes dropped. This variable is proprietary. Availability: SSL.	Int64
mt-ulddroppedd-nonconnectedstate	Description: SSL micro-tunneling: Uplink data bytes dropped due to non-connected state. This variable is proprietary. Availability: SSL.	Int64
mt-ulddroppedd-transstackbufferoverflow	Description: SSL micro-tunneling: Uplink data bytes dropped due to transport stack buffer over flow. This variable is proprietary. Availability: SSL.	Int64
mt-ulddroppedd-incorrectdestip	Description: SSL micro-tunneling: Uplink data bytes dropped due to incorrect destination IP address. This variable is proprietary. Availability: SSL.	Int64
mt-ulddroppedd-transtackfailed	Description: SSL micro-tunneling: Uplink data bytes dropped due to transport stack failed to send. This variable is proprietary. Availability: SSL.	Int64
mt-ulddroppedd-sessnotfoundforsockid	Description: SSL micro-tunneling: Uplink data bytes dropped due to session not found for sock-id. This variable is proprietary. Availability: SSL.	Int64
mt-txdatabytedownlink	Description: SSL micro-tunneling: Downlink data bytes sent. This variable is proprietary. Availability: SSL.	Int64
mt-rxttlopenreq	Description: SSL micro-tunneling: Total OPEN requests received. This variable is proprietary. Availability: SSL.	Int32
mt-rxopenreqprocessed	Description: SSL micro-tunneling: OPEN requests processed. This variable is proprietary. Availability: SSL.	Int32
mt-rxopenreqdropped	Description: SSL micro-tunneling: OPEN requests dropped. This variable is proprietary. Availability: SSL.	Int32
mt-txttlopenresp	Description: SSL micro-tunneling: Total OPEN responses sent. This variable is proprietary. Availability: SSL.	Int32
mt-txopenrespaccept	Description: SSL micro-tunneling: OPEN responses accepted. This variable is proprietary. Availability: SSL.	Int32

Variables	Description	Data Type
mt-txopenresprej	Description: SSL micro-tunneling: OPEN responses rejected. This variable is proprietary. Availability: SSL.	Int32
mt-rxopenresp	Description: SSL micro-tunneling: OPEN responses received. This variable is proprietary. Availability: SSL.	Int32
mt-rxttlnamreq	Description: SSL micro-tunneling: Total NAM requests received. This variable is proprietary. Availability: SSL.	Int32
mt-rxnamreqprocessed	Description: SSL micro-tunneling: NAM requests processed. This variable is proprietary. Availability: SSL.	Int32
mt-rxnamreqdropped	Description: SSL micro-tunneling: NAM requests dropped. This variable is proprietary. Availability: SSL.	Int32
mt-txttlnamresp	Description: SSL micro-tunneling: Total NAM responses sent. This variable is proprietary. Availability: SSL.	Int32
mt-txnamrespacept	Description: SSL micro-tunneling: NAM responses accepted. This variable is proprietary. Availability: SSL.	Int32
mt-txnamresprej	Description: SSL micro-tunneling: NAM responses rejected. This variable is proprietary. Availability: SSL.	Int32
mt-rxnamresp	Description: SSL micro-tunneling: NAM responses received. This variable is proprietary. Availability: SSL.	Int32
mt-rxttlauthreq	Description: SSL micro-tunneling: Total AUTH requests received. This variable is proprietary. Availability: SSL.	Int32
mt-rxauthreqprocessed	Description: SSL micro-tunneling: AUTH requests processed. This variable is proprietary. Availability: SSL.	Int32
mt-rxauthreqdropped	Description: SSL micro-tunneling: AUTH requests dropped. This variable is proprietary. Availability: SSL.	Int32
mt-txttlauthresp	Description: SSL micro-tunneling: Total AUTH responses sent. This variable is proprietary. Availability: SSL.	Int32
mt-txauthrespacept	Description: SSL micro-tunneling: AUTH responses accepted. This variable is proprietary. Availability: SSL.	Int32

Variables	Description	Data Type
mt-txauthrespj	Description: SSL micro-tunneling: AUTH responses rejected. This variable is proprietary. Availability: SSL.	Int32
mt-rxauthresp	Description: SSL micro-tunneling: AUTH responses received. This variable is proprietary. Availability: SSL.	Int32
mt-rxttlrecvreq	Description: SSL micro-tunneling: Total RECV requests received. This variable is proprietary. Availability: SSL.	Int32
mt-rxrecvreqprocessed	Description: SSL micro-tunneling: RECV requests processed. This variable is proprietary. Availability: SSL.	Int32
mt-rxrecvreqdropped	Description: SSL micro-tunneling: RECV requests dropped. This variable is proprietary. Availability: SSL.	Int32
mt-txttlrecvresp	Description: SSL micro-tunneling: Total RECV responses sent. This variable is proprietary. Availability: SSL.	Int32
mt-txrecvrespaccept	Description: SSL micro-tunneling: RECV responses accepted. This variable is proprietary. Availability: SSL.	Int32
mt-txrecvrespj	Description: SSL micro-tunneling: RECV responses rejected. This variable is proprietary. Availability: SSL.	Int32
mt-rxrecvresp	Description: SSL micro-tunneling: RECV responses received. This variable is proprietary. Availability: SSL.	Int32
mt-rxttlclosereq	Description: SSL micro-tunneling: Total CLOSE requests received. This variable is proprietary. Availability: SSL.	Int32
mt-rxclosereqprocessed	Description: SSL micro-tunneling: CLOSE requests processed. This variable is proprietary. Availability: SSL.	Int32
mt-rxclosereqdropped	Description: SSL micro-tunneling: CLOSE requests dropped. This variable is proprietary. Availability: SSL.	Int32
mt-txttlclosereq	Description: SSL micro-tunneling: Total CLOSE requests sent. This variable is proprietary. Availability: SSL.	Int32
mt-txclosereqdispatch	Description: SSL micro-tunneling: CLOSE requests dispatched. This variable is proprietary. Availability: SSL.	Int32

Variables	Description	Data Type
mt-rxttlcloseresp	Description: SSL micro-tunneling: Total CLOSE responses received. This variable is proprietary. Availability: SSL.	Int32
mt-rxcloserespaccept	Description: SSL micro-tunneling: CLOSE responses accepted. This variable is proprietary. Availability: SSL.	Int32
mt-rxcloseresprej	Description: SSL micro-tunneling: CLOSE responses rejected. This variable is proprietary. Availability: SSL.	Int32
mt-rxcloserespdropped	Description: SSL micro-tunneling: CLOSE responses dropped. This variable is proprietary. Availability: SSL.	Int32
mt-txttlcloseresp	Description: SSL micro-tunneling: Total CLOSE responses sent. This variable is proprietary. Availability: SSL.	Int32
mt-txcloserespaccept	Description: SSL micro-tunneling: CLOSE responses accepted. This variable is proprietary. Availability: SSL.	Int32
mt-txcloseresprej	Description: SSL micro-tunneling: CLOSE responses rejected. This variable is proprietary. Availability: SSL.	Int32
mt-rxttlsendreq	Description: SSL micro-tunneling: Total SEND requests received. This variable is proprietary. Availability: SSL.	Int32
mt-rxsendreqprocessed	Description: SSL micro-tunneling: SEND requests processed. This variable is proprietary. Availability: SSL.	Int32
mt-rxsendreqdropped	Description: SSL micro-tunneling: SEND requests dropped. This variable is proprietary. Availability: SSL.	Int32
mt-txttlsendreq	Description: SSL micro-tunneling: Total SEND requests sent. This variable is proprietary. Availability: SSL.	Int32
mt-txsendreqdispatch	Description: SSL micro-tunneling: SEND requests dispatched. This variable is proprietary. Availability: SSL.	Int32
mt-rxttlsendresp	Description: SSL micro-tunneling: Total SEND responses received. This variable is proprietary. Availability: SSL.	Int32
mt-rxsendrespaccept	Description: SSL micro-tunneling: SEND responses accepted. This variable is proprietary. Availability: SSL.	Int32

Variables	Description	Data Type
mt-rxsendresprej	Description: SSL micro-tunneling: SEND responses rejected. This variable is proprietary. Availability: SSL.	Int32
mt-rxsendrespdropped	Description: SSL micro-tunneling: SEND responses dropped. This variable is proprietary. Availability: SSL.	Int32
mt-txttlsendresp	Description: SSL micro-tunneling: Total SEND responses sent. This variable is proprietary. Availability: SSL.	Int32
mt-txsendrespaccept	Description: SSL micro-tunneling: SEND responses accepted. This variable is proprietary. Availability: SSL.	Int32
mt-txsendresprej	Description: SSL micro-tunneling: SEND responses rejected. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-cannotcreatconn	Description: SSL micro-tunneling: OPEN Reject sent: cannot create connection. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-protonotsupported	Description: SSL micro-tunneling: OPEN Reject sent: protocol not supported. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-permdenied	Description: SSL micro-tunneling: OPEN Reject sent: permission denied. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-cannotcreatesockid	Description: SSL micro-tunneling: OPEN Reject sent: cannot create sock-id. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-badparam	Description: SSL micro-tunneling: OPEN Reject sent: bad parameters. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-addrport-alreadyused	Description: SSL micro-tunneling: OPEN Reject sent: address or port already used. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-cannotconnectserver	Description: SSL micro-tunneling: OPEN Reject sent: cannot connect the server. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-hostnameunknown	Description: SSL micro-tunneling: OPEN Reject sent: hostname is unknown. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-authrequired	Description: SSL micro-tunneling: OPEN Reject sent: authentication required. This variable is proprietary. Availability: SSL.	Int32

■ Common Syntax Options

Variables	Description	Data Type
mt-openrejtx-undefined	Description: SSL micro-tunneling: OPEN Reject sent: undefined. This variable is proprietary. Availability: SSL.	Int32
mt-openrejtx-reserved	Description: SSL micro-tunneling: OPEN Reject sent: reserved. This variable is proprietary. Availability: SSL.	Int32
mt-namrejtx-versionnotsupported	Description: SSL micro-tunneling: OPEN Reject sent: version not supported. This variable is proprietary. Availability: SSL.	Int32
mt-namrejtx-servercannotcreateauth	Description: SSL micro-tunneling: OPEN Reject sent: server cannot create an authentication process. This variable is proprietary. Availability: SSL.	Int32
mt-namrejtx-badparameters	Description: SSL micro-tunneling: OPEN Reject sent: bad parameters. This variable is proprietary. Availability: SSL.	Int32
mt-namrejtx-undefined	Description: SSL micro-tunneling: NAM Reject sent: undefined. This variable is proprietary. Availability: SSL.	Int32
mt-namrejtx-reserved	Description: SSL micro-tunneling: NAM Reject sent: reserved. This variable is proprietary. Availability: SSL.	Int32
mt-authrejtx-authidunknown	Description: SSL micro-tunneling: AUTH Reject sent: the auth-id is unknown. This variable is proprietary. Availability: SSL.	Int32
mt-authrejtx-cannotconntoauthserver	Description: SSL micro-tunneling: AUTH Reject sent: cannot connect to authentication server. This variable is proprietary. Availability: SSL.	Int32
mt-authrejtx-badparam	Description: SSL micro-tunneling: AUTH Reject sent: bad parameters. This variable is proprietary. Availability: SSL.	Int32
mt-authrejtx-undefined	Description: SSL micro-tunneling: AUTH Reject sent: undefined. This variable is proprietary. Availability: SSL.	Int32
mt-authrejtx-reserved	Description: SSL micro-tunneling: AUTH Reject sent: reserved. This variable is proprietary. Availability: SSL.	Int32
mt-recvrejtx-sockidunknown	Description: SSL micro-tunneling: RECV Reject sent: the sock-id is unknown. This variable is proprietary. Availability: SSL.	Int32

Variables	Description	Data Type
mt-recvrejectx-connlost	Description: SSL micro-tunneling: RECV Reject sent: the connection is lost. This variable is proprietary. Availability: SSL.	Int32
mt-recvrejectx-permissiondenied	Description: SSL micro-tunneling: RECV Reject sent: permission denied. This variable is proprietary. Availability: SSL.	Int32
mt-recvrejectx-badparameters	Description: SSL micro-tunneling: RECV Reject sent: bad parameters. This variable is proprietary. Availability: SSL.	Int32
mt-recvrejectx-undefined	Description: SSL micro-tunneling: RECV Reject sent: undefined. This variable is proprietary. Availability: SSL.	Int32
mt-recvrejectx-unreserved	Description: SSL micro-tunneling: RECV Reject sent: reserved. This variable is proprietary. Availability: SSL.	Int32
mt-closerejectx-sockidunknown	Description: SSL micro-tunneling: RECV Reject sent: the sock-id is unknown. This variable is proprietary. Availability: SSL.	Int32
mt-closerejectx-connlost	Description: SSL micro-tunneling: CLOSE Reject sent: the connection is lost. This variable is proprietary. Availability: SSL.	Int32
mt-closerejectx-badparameters	Description: SSL micro-tunneling: CLOSE Reject sent: the bad parameters. This variable is proprietary. Availability: SSL.	Int32
mt-closerejectx-undefined	Description: SSL micro-tunneling: CLOSE Reject sent: undefined. This variable is proprietary. Availability: SSL.	Int32
mt-closerejectx-unreserved	Description: SSL micro-tunneling: CLOSE Reject sent: reserved. This variable is proprietary. Availability: SSL.	Int32
mt-closerejrx-sockidunknown	Description: SSL micro-tunneling: CLOSE Reject received: sock-id unknown. This variable is proprietary. Availability: SSL.	Int32
mt-closerejrx-connlost	Description: SSL micro-tunneling: CLOSE Reject received: the connection is lost. This variable is proprietary. Availability: SSL.	Int32
mt-closerejrx-badparameters	Description: SSL micro-tunneling: CLOSE Reject received: bad parameters. This variable is proprietary. Availability: SSL.	Int32
mt-closerejrx-undefined	Description: SSL micro-tunneling: CLOSE Reject received: undefined. This variable is proprietary. Availability: SSL.	Int32

Variables	Description	Data Type
mt-closerejrx-unreserved	Description: SSL micro-tunneling: CLOSE Reject received: reserved. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejtx-sockidunknown	Description: SSL micro-tunneling: SEND Reject sent: sock-id unknown. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejtx-connlost	Description: SSL micro-tunneling: SEND Reject sent: the connection is lost. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejtx-permissiondenied	Description: SSL micro-tunneling: SEND Reject sent: permission denied. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejtx-badparam	Description: SSL micro-tunneling: SEND Reject sent: bad parameters. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejtx-undefined	Description: SSL micro-tunneling: SEND Reject sent: undefined. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejtx-reserved	Description: SSL micro-tunneling: SEND Reject sent: reserved. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejrx-sockidunknown	Description: SSL micro-tunneling: SEND Reject received: sock-id unknown. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejrx-connlost	Description: SSL micro-tunneling: SEND Reject received: connection is lost. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejrx-permissiondenied	Description: SSL micro-tunneling: SEND Reject received: permission denied. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejrx-badparam	Description: SSL micro-tunneling: SEND Reject received: bad parameters. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejrx-undefined	Description: SSL micro-tunneling: SEND Reject received: undefined. This variable is proprietary. Availability: SSL.	Int32
mt-sendrejrx-reserved	Description: SSL micro-tunneling: SEND Reject received: reserved. This variable is proprietary. Availability: SSL.	Int32
mt-pktdiscardstat-unknownversion	Description: SSL micro-tunneling: Packets discarded statistics: unknown version. This variable is proprietary. Availability: SSL.	Int32

Variables	Description	Data Type
mt-pktdiscardstat-unknownmsgtype	Description: SSL micro-tunneling: Packets discarded statistics: unknown message type. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-open-decodefaildropped	Description: SSL micro-tunneling: Packets discarded statistics: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-open-decodefailrej	Description: SSL micro-tunneling: Packets discarded statistics: decoding failed, rejected. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-open-unknownctxtdropped	Description: SSL micro-tunneling: Messages denied statistics: OPEN: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-open-unknownctxrej	Description: SSL micro-tunneling: Messages denied statistics: OPEN: decoding failed, rejected. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-respopen-decodefaildropped	Description: SSL micro-tunneling: Messages denied statistics: RESP OPEN: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-respopen-unknownctxtdropped	Description: SSL micro-tunneling: Messages denied statistics: RESP OPEN: unknown context, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-close-decodefaildropped	Description: SSL micro-tunneling: Messages denied statistics: CLOSE: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-close-decodefailrej	Description: SSL micro-tunneling: Messages denied statistics: CLOSE: decoding failed, rejected. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-close-unknownctxtdropped	Description: SSL micro-tunneling: Messages denied statistics: CLOSE: unknown context, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-close-unknownctxrej	Description: SSL micro-tunneling: Messages denied statistics: CLOSE: unknown context, rejected. This variable is proprietary. Availability: SSL.	Int32

Common Syntax Options

Variables	Description	Data Type
mt-msgdenied-respclose-decodefaildropped	Description: SSL micro-tunneling: Messages denied statistics: RESP CLOSE: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-respclose-unknownctxdropped	Description: SSL micro-tunneling: Messages denied statistics: RESP CLOSE: unknown context, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-nam-decodefaildropped	Description: SSL micro-tunneling: Messages denied statistics: NAM: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-nam-decodefailrej	Description: SSL micro-tunneling: Messages denied statistics: NAM: decoding failed, rejected. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-nam-unknownctxdropped	Description: SSL micro-tunneling: Messages denied statistics: NAM: unknown context, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-nam-unknownctxrej	Description: SSL micro-tunneling: Messages denied statistics: NAM: unknown context, rejected. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-respnam-decodefaildropped	Description: SSL micro-tunneling: Messages denied statistics: RESP NAM: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-respnam-unknownctxdropped	Description: SSL micro-tunneling: Messages denied statistics: RESP NAM: unknown context, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-auth-decodefaildropped	Description: SSL micro-tunneling: Messages denied statistics: AUTH: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-auth-decodefailrej	Description: SSL micro-tunneling: Messages denied statistics: AUTH: decoding failed, rejected. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-auth-unknownctxdropped	Description: SSL micro-tunneling: Messages denied statistics: AUTH: unknown context, dropped. This variable is proprietary. Availability: SSL.	Int32

Variables	Description	Data Type
mt-msgdenied-auth-unknownctxrej	Description: SSL micro-tunneling: Messages denied statistics: AUTH: unknown context, rejected. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-respauth-decodefaildropped	Description: SSL micro-tunneling: Messages denied statistics: RESP AUTH: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-respauth-unknownctxdropped	Description: SSL micro-tunneling: Messages denied statistics: RESP AUTH: unknown context, dropped. This variable is proprietary. Availability: SSL.	Int32
mt-msgdenied-recv-decodefaildropped	Description: SSL micro-tunneling: Messages denied statistics: RECV: decoding failed, dropped. This variable is proprietary. Availability: SSL.	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 52

PDIF Schema Statistics

The PDIF schema provides operational statistics that can be used for monitoring and troubleshooting the following products: PDIF

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 52. Bulk Statistic Variables in the PDIF Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	Description: The name of the context currently facilitating the service processing the subscriber session. This is a key variable.	String
vpnid	Description: The identification number of the context currently facilitating the service processing the subscriber session. This is an internal reference number. This is a key variable.	Int32
svcname	Description: The service name for which PDIF statistics are being displayed. This is a key variable.	String
svcid	Description: The service ID for which PDIF statistics are being displayed. This is a key variable.	Int32
bindaddress	Description: The bind IP address for this PDIF service.	String
state	Description: System-wide PDIF state identified by the following codes: <ul style="list-style-type: none"> unknown(0) inservice(1): At least one PDIF service is available. outofservice(2): No PDIF service is currently active, but one or more PDIF services are configured. 	Int32
sess-curinprog	Description: Number of PDIF service sessions in progress (including transient ones).	Int32
sess-curact	Description: Number of currently active PDIF sessions.	Int32
sess-curdorm	Description: Number of currently dormant PDIF sessions.	Int32
sess-curactipv4	Description: Number of currently active IPV4 sessions.	Int32
sess-cursip	Description: Number of current simple IP sessions.	Int32
sess-curmip	Description: Number of current mobile IP sessions.	Int32
sess-curpmip	Description: Number of current proxy mobile IP sessions.	Int32
sess-sipattempt	Description: Number of attempted simple IP sessions.	Int32
sess-sipsuccess	Description: Number of successful simple IP sessions.	Int32
sess-sipfail	Description: Number of failed simple IP sessions.	Int32
sess-mipattempt	Description: Number of attempted mobile IP sessions.	Int32
sess-mipsuccess	Description: Number of successful mobile IP sessions.	Int32
sess-mipfail	Description: Number of failed mobile IP sessions.	Int32
sess-pmipattempt	Description: Number of attempted proxy mobile IP sessions.	Int32
sess-pmipsuccess	Description: Number of successful proxy mobile IP sessions completed.	Int32
sess-pmipfail	Description: Number of failed proxy mobile IP sessions.	Int32
sess-sipfbksucc	Description: Number of successful sImple IP fallback sessions.	Int32
sess-sipfbknotdone	Description: Number of sessions where simple IP fallback was not done.	Int32

Variables	Description	Data Type
sess-sipfallbacknorrq	Description: Number of simple IP fallback sessions with no rrq request.	Int32
sess-sipfallbacknotallw	Description: Number of simple IP fallback sessions that were not allowed.	Int32
sess-sipfallbacktagaddr	Description: Number of simple IP fallback sessions that failed because of no tagged pool address.	Int32
sess-sipfallbackmisc	Description: Number of simple IP fallback sessions that failed because of miscellaneous reasons.	Int32
sess-ttlsetup	Description: Total number of session setups.	Int32
sess-ttlattempt	Description: Total number of session attempts.	Int32
sess-ttlattemptfail	Description: Total number of session attempts that failed.	Int32
sess-ttlrel	Description: Total number of sessions released.	Int32
sess-ttlrellocal	Description: Total number of sessions released locally.	Int32
sess-ttlrelremote	Description: Total number of sessions released remotely.	Int32
sess-ttlsip	Description: Total Number of simple IP sessions.	Int32
sess-ttlmip	Description: Total number of mobile IP sessions.	Int32
sess-ttl-pmip	Description: Total number of proxy mobile IP sessions.	Int32
sess-discbeforeconn	Description: Number of sessions disconnected by remote node before being connected.	Int32
sess-discipsec	Description: Number of sessions terminated via IPsec, either by the remote node or an error in the IKE tunnel set up process.	Int32
discadmin	Description: Number of sessions terminated because of admin release.	Int32
sess-discidletimeout	Description: Number of sessions terminated because of idle timer timeout. Idle means that there is no activity from the user side.	Int32
sess-discabstimeout	Description: Number of sessions terminated because of absolute timeout, which is the maximum time allowed for the session.	Int32
sess-disclongdur	Description: Number of sessions terminated because of long duration timer timeout, which is the maximum time a session can be up, if the absolute timeout is not configured.	Int32
sess-discmmdtimeout	Description: Number of sessions terminated because of multimedia domain service timer expiry.	Int32
sess-distysetuptimeout	Description: Number of sessions terminated because of TY interface setup timeout.	Int32
sess-discsesssetuptimeout	Description: Number of sessions terminated because of Session Manager session setup timeout.	Int32
sess-discnonexistpcrf	Description: Number of sessions terminated because of non-existence of PCRF.	Int32
sess-discnoresource	Description: Number of sessions terminated because of no resources. Number of sessions terminated because of no resources. This can be from lack of memory or CPU resources, NPU-based flows, a session limit based on the license, etc.	Int32

Variables	Description	Data Type
sess-discauthfail	Description: Number of sessions terminated because of AAA authentication failure.	Int32
sess-discflowaddfail	Description: Number of sessions terminated because of flow add failure.	Int32
sess-discinvdestctx	Description: Number of sessions terminated because of an invalid destination context, when the destination context for the subscriber is not found or is not defined.	Int32
sess-discsourceviol	Description: Number of sessions terminated because of source IP address violation.	Int32
sess-discmipremote	Description: Number of sessions terminated because of remote mobile IP.	Int32
sess-discmiplocal	Description: Number of sessions terminated because of local mobile IP.	Int32
sess-discdupreq	Description: Number of sessions terminated because of a duplicated request.	Int32
sess-discmacfail	Description: Number of sessions terminated because of a MAC address authentication failure.	Int32
sess-discaddrfail	Description: Number of sessions terminated because of an address allocation failure.	Int32
sess-discmisc	Description: Number of sessions terminated for miscellaneous reasons, which is disconnection for any reason other than the reasons defined above.	Int32
sess-remaining	Description: Number of available sessions remaining, based on the configured maximum sessions.	Int32
sess-limit	Description: The maximum sessions allowed. This is the value configured along with the bind command or it can be the system default.	Int32
mac-authreq	Description: Number of MAC address authentication requests.	Int32
mac-authreqvalid	Description: Number of valid MAC address authentication requests.	Int32
mac-authreqinv	Description: Number of invalid MAC address authentication requests.	Int32
mac-authsucc	Description: Number of MAC address validation successes.	Int32
mac-authsuccmatch	Description: Number of successful MAC address matches.	Int32
mac-authsucchssfail	Description: Number of HSS server authentication failures.	Int32
mac-authfail	Description: Number of MAC address authentication failures because of an unauthorized MAC address.	Int32
mac-authfaildiam	Description: Number of MAC address authentication failures because of a Diameter error.	Int32
mac-authfailuserunk	Description: Number of MAC address authentication failures because of an unknown user.	Int32
mac-authfailmacnotfound	Description: Number of MAC address authentication failures because the MAC address was not found. The MAC address is received as part of the NAI.	Int32
mac-authfailmacmissing	Description: Number of MAC address authentication failures because the MAC address was missing. The MAC address is received as part of the NAI.	Int32
mac-authfailmacmalformed	Description: Number of MAC address authentication failures because the MAC address was malformed. The MAC address is received as part of the NAI.	Int32

Variables	Description	Data Type
mac-authfailnosh	Description: Number of MAC address authentication failures because the Sh interface is down.	Int32
mac-authfailtimeout	Description: Number of MAC address authentication failures because of a timeout, which is a session setup time out with a required MAC validation, but MAC validation not complete.	Int32
mac-authfailother	Description: Number of MAC address authentication failures because of any reason other than mentioned above.	Int32
eap-rxtlsvrpssthru	Description: Total number of EAP messages received from the EAP server in pass-through mode.	Int32
eap-rxchalsvrpssthru	Description: Total number of EAP challenge messages sent to the EAP server in pass-through mode.	Int32
eap-rxsucsvrpssthru	Description: Total number of EAP-Success messages received from the EAP server in pass-through mode.	Int32
eap-rxfailsvrpssthru	Description: Total number of EAP-Failure messages received from the EAP server in pass-through mode.	Int32
eap-rxmobilepassthru	Description: Total number of EAP messages received from mobile clients in pass-through mode.	Int32
eap-txtlsvrpssthru	Description: Total number of EAP messages transmitted to the EAP server in pass-through mode.	Int32
eap-txinitreqsvrpssthru	Description: Total number of EAP messages transmitted to the EAP server in pass-through mode for initial request.	Int32
eap-txfwdreqsvrpssthru	Description: Total number of EAP messages transmitted to the EAP server in pass-through mode for forward request.	Int32
ipsec-tpacket	Description: Number of IPsec packets transmitted.	Int64
ipsec-txoctet	Description: Number of IPsec bytes transmitted.	Int64
ipsec-rxpacket	Description: Number of IPsec packets received.	Int64
ipsec-rxoctet	Description: Number of IPsec bytes received.	Int64
ipsec-violpacket	Description: Number of data packets that do not match any of the configured traffic selectors.	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 53

P-GW Node Level Schema Statistics

The P-GW schema provides operational statistics that can be used for monitoring and troubleshooting the following products: P-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 53. Bulk Statistic Variables in the P-GW Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

■ Common Syntax Options

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the P-GW service. This is a key variable. Type: Information	String
vpnid	The identification number of the context configured on the system that is currently facilitating the P-GW service. This is an internal reference number. This is a key variable. Type: Information	Int32
servname	Displays the name of the P-GW service for which the statistics are displayed. This is a key variable. Type: Information	String
servid	The identification number of the service configured on the system that is currently facilitating the P-GW service. This is an internal reference number. This is a key variable. Type: Information	Int32
sess-cur	The total number of sessions currently established on this system. Type: Gauge	Int32
sessstat-bearact-def	Session Statistics - Total default bearers active Type: Gauge	Int32
sessstat-bearact-ded	Session Statistics - Total dedicated bearers active Type: Gauge	Int32
sessstat-bearact-ue-init-ded	Session Statistics - Total bearers active - UE-initiated Type: Gauge	Int32
sessstat-bearact-nw-init-ded	Session Statistics - Total bearers active - Network-initiated Type: Gauge	Int32
sessstat-bearact-nw-init-ded-att	Session Statistics - Total bearers active - Network-initiated dedicated bearers Type: Gauge	Int32
sessstat-bearsetup-def	Session Statistics - Total default bearers setup Type: Counter	Int32
sessstat-bearsetup-ded	Session Statistics - Total dedicated bearers setup Type: Counter	Int32
sessstat-bearsetup-ue-init-ded	Session Statistics - Total bearers rejected - Network-req reject - No Resource Type: Counter	Int32
sessstat-bearsetup-nw-init-ded	Session Statistics - Total bearers setup - Dedicated bearers - Network-initiated Type: Counter	Int32
sessstat-bearrel-def	Session Statistics - Total default bearers released Type: Counter	Int32
sessstat-bearrel-ded	Session Statistics - Total dedicated bearers released Type: Counter	Int32

Variables	Description	Data Type
sessstat-bearrel-nwdefadmin	Session Statistics - Total bearers released - Network Default Admin disconnect Type: Counter	Int32
sessstat-bearrel-nwdefgtp	Session Statistics - Total bearers released - Network Default GTP-U error ind Type: Counter	Int32
sessstat-bearrel-nwdefsgw	Session Statistics - Total bearers released - Network Default S-GW Path failure Type: Counter	Int32
sessstat-bearrel-nwdefmme	Session Statistics - Total bearers released - Network Default MME initiated release Type: Counter	Int32
sessstat-bearrel-nwdedadmin	Session Statistics - Total bearers released - Network Dedicated Admin disconnect Type: Counter	Int32
sessstat-bearrel-nwdedgtp	Session Statistics - Total bearers released - Network Dedicated GTP-U error ind Type: Counter	Int32
sessstat-bearrel-nwdedmme	Session Statistics - Total bearers released - Network Dedicated MME initiated release Type: Counter	Int32
sessstat-bearrel-nwdeddefbear	Session Statistics - Total bearers released - Network Dedicated Default bearer release Type: Counter	Int32
sessstat-bearrel-nwdedgxdisc	Session Statistics - Total bearers released - Network Dedicated GX Disconnect Type: Counter	Int32
sessstat-bearrelfail-def	Session Statistics - Total bearers release failure - Default bearers Type: Counter	Int32
sessstat-bearrelfail-ded	Session Statistics - Total bearers release failure - Dedicated bearers Type: Counter	Int32
sessstat-bearrej-def	Session Statistics - Total bearers rejected - Default bearers Type: Counter	Int32
sessstat-bearrej-ded	Session Statistics - Total bearers rejected - Dedicated bearers Type: Counter	Int32
sessstat-bearrej-nores	Session Statistics - Total bearers rejected - No Resource Type: Counter	Int32
sessstat-bearrej-uereq	Session Statistics - Total bearers rejected - UE-req reject Type: Counter	Int32
sessstat-bearrej-uereq-nores	Session Statistics - Total bearers rejected - UE-req reject - No Resource Type: Counter	Int32
sessstat-bearrej-misapn	Session Statistics - Total bearers rejected - Missing or unknown APN Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
sessstat-bearrej-nwreq	Session Statistics - Total bearers rejected - Network-req reject Type: Counter	Int32
sessstat-bearrej-nwreq-nores	Session Statistics - Total bearers rejected - Network-req reject - No Resource Type: Counter	Int32
sessstat-bearrej-nwreq-nomem	Session Statistics - Total bearers rejected - Network-req reject - No memory available Type: Counter	Int32
sessstat-bearrej-nwreq-sysfail	Session Statistics - Total bearers rejected - Network-req reject - System failure Type: Counter	Int32
sessstat-bearrej-apnmode	Session Statistics - Total bearers rejected - APN selection -Mode mismatch Type: Counter	Int32
sessstat-bearrej-pdn	Session Statistics - Total bearers rejected - Pref PDN -Type not supported Type: Counter	Int32
sessstat-bearrej-apnrestr	Session Statistics - Total bearers rejected - APN restr violation Type: Counter	Int32
sessstat-bearrej-subsauth	Session Statistics - Total bearers rejected - Subs auth failed Type: Counter	Int32
sessstat-bearrej-subsaddrnotallow	Session Statistics - Total bearers rejected - Subscriber's static address not allowed Type: Counter	Int32
sessstat-bearrej-subsaddrnotalloc	Session Statistics - Total bearers rejected - Subscriber's static address not allocated Type: Counter	Int32
sessstat-bearrej-dynaddrnotalloc	Session Statistics - Total bearers rejected - Dynamic address not allocated Type: Counter	Int32
sessstat-bearrej-subsaddrnotpres	Session Statistics - Total bearers rejected - Subscriber's static address not present Type: Counter	Int32
sessstat-bearmod-ueinit	Session Statistics - Total bearers modified - UE-initiated modification Type: Counter	Int32
sessstat-bearmod-nwinit	Session Statistics - Total bearers modified - Network-initiated modification Type: Counter	Int32
sessstat-bearmod-ueqos	Session Statistics - Total bearers modified - UE-initiated quality of service (QoS) modification Type: Counter	Int32
sessstat-bearmod-uetft	Session Statistics - Total bearers modified - UE-initiated TFT modification Type: Counter	Int32
sessstat-bearmod-nwqos	Session Statistics - Total bearers modified - Network-initiated QoS modification Type: Counter	Int32

Variables	Description	Data Type
sessstat-bearmod-nwtft	Session Statistics - Total bearers modified - Network-initiated TFT modification Type: Counter	Int32
sessstat-bearmodfail-ueinit	Session Statistics - Total bearers modification failure - UE-initiated modification failed Type: Counter	Int32
sessstat-bearmodfail-nwinit	Session Statistics - Total bearers modification failure - Network-initiated modification failed Type: Counter	Int32
sessstat-bearmodfail-uenores	Session Statistics - Total bearers modification failure - UE-initiated No res available Type: Counter	Int32
sessstat-bearmodfail-uesemtft	Session Statistics - Total bearers modification failure - UE-initiated Semantic error in TFT oper Type: Counter	Int32
sessstat-bearmodfail-uesyntft	Session Statistics - Total bearers modification failure - UE-initiated Syntax error in TFT oper Type: Counter	Int32
sessstat-bearmodfail-uesempkt	Session Statistics - Total bearers modification failure - UE-initiated Semantic error in packet filter Type: Counter	Int32
sessstat-bearmodfail-uesynpkt	Session Statistics - Total bearers modification failure - UE-initiated syntax error in packet filter Type: Counter	Int32
sessstat-bearmodfail-nwnores	Session Statistics - Total bearers modification failure - Network-initiated - No res available Type: Counter	Int32
sessstat-bearmodfail-nwnomem	Session Statistics - Total bearers modification failure - Network-initiated - No memory available Type: Counter	Int32
sessstat-bearmodfail-nwsysfail	Session Statistics - Total bearers modification failure - Network-initiated - System failure Type: Counter	Int32
sessstat-bearmodfail-nwsemftft	Session Statistics - Total bearers modification failure - Network-initiated Semantic error in TFT oper Type: Counter	Int32
sessstat-bearmodfail-nwsyntft	Session Statistics - Total bearers modification failure - Network-initiated syntax error in TFT oper Type: Counter	Int32
sessstat-bearmodfail-nwsempkt	Session Statistics - Total bearers modification failure - Network-initiated Semantic error in packet filter Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
sessstat-bearmodfail-nwsynpkt	Session Statistics - Total bearers modification failure - Network-initiated syntax error in packet filter Type: Counter	Int32
sessstat-bearmodfail-qos-uenores	Session Statistics - Total bearer modification failures - User equipment quality of service no response errors Type: Counter	Int32
sessstat-bearmodfail-qos-uesemtft	Session Statistics - Total bearer modification failures - User equipment quality of service TFT semantics errors Type: Counter	Int32
sessstat-bearmodfail-qos-uesyntft	Session Statistics - Total bearer modification failures - User equipment quality of service TFT syntax errors Type: Counter	Int32
sessstat-bearmodfail-qos-uesempkt	Session Statistics - Total bearer modification failures - User equipment quality of service packet semantics errors Type: Counter	Int32
sessstat-bearmodfail-qos-uesynpkt	Session Statistics - Total bearer modification failures - User equipment quality of service packet syntax errors Type: Counter	Int32
sessstat-bearmodfail-qos-nwnores	Session Statistics - Total bearer modification failures - Network-initiated quality of service no response Type: Counter	Int32
sessstat-bearmodfail-qos-nwnomem	Session Statistics - Total bearer modification failures - Network-initiated quality of service no memory Type: Counter	Int32
sessstat-bearmodfail-qos-nwsysfail	Session Statistics - Total bearer modification failures - Network-initiated quality of service system failures Type: Counter	Int32
sessstat-bearmodfail-qos-nwsemftft	Session Statistics - Total bearer modification failures - Network-initiated quality of service semantics of TFT Type: Counter	Int32
sessstat-bearmodfail-qos-nwsyntft	Session Statistics - Total modified bearer failures - Network-initiated TFT syntax Type: Counter	Int32
sessstat-bearmodfail-qos-nwsempkt	Session Statistics - Total modified bearer failures - Network quality of service semantics packets Type: Counter	Int32
sessstat-bearmodfail-qos-nwsynpkt	Session Statistics - Total modified bearer failures - Network quality of service syntax of packets Type: Counter	Int32
sessstat-beardel-ded	Session Statistics - Total deleted dedicated bearers Type: Counter	Int32

Variables	Description	Data Type
sessstat-nw-init-qos-update-att	Session Statistics - Total bearers modified - Network initiated - quality of service (QoS) modifications attempted Type: Counter	Int32
sessstat-nw-init-no-qos-update-att	Session Statistics - Total bearers modified - Network initiated - no quality of service (QoS) modifications attempted Type: Counter	Int32
sessstat-nw-init-bearer-fail-cause	Session Statistics - Total bearers modification failure - Network-initiated Syntax error in packet filter Type: Counter	Int32
sessstat-pdn-ipv4active	Session Statistics - Total PDN-Type Statistics - IPv4 Active Type: Gauge	Int32
sessstat-pdn-ipv4setup	Session Statistics - Total PDN-Type Statistics - IPv4 Setup Type: Counter	Int32
sessstat-pdn-ipv4rel	Session Statistics - Total PDN-Type Statistics - IPv4 Released Type: Counter	Int32
sessstat-pdn-ipv6active	Session Statistics - Total PDN-Type Statistics - IPv6 Active Type: Gauge	Int32
sessstat-pdn-ipv6setup	Session Statistics - Total PDN-Type Statistics - IPv6 Setup Type: Counter	Int32
sessstat-pdn-ipv6rel	Session Statistics - Total PDN-Type Statistics - IPv6 Released Type: Counter	Int32
sessstat-pdn-ipv4v6active	Session Statistics - Total PDN-Type Statistics - IPv4v6 Active Type: Gauge	Int32
sessstat-pdn-ipv4v6setup	Session Statistics - Total PDN-Type Statistics - IPv4v6 Setup Type: Counter	Int32
sessstat-pdn-ipv4v6rel	Session Statistics - Total PDN-Type Statistics - IPv4v6 Released Type: Counter	Int32
sessstat-ipv4addaloc	Session Statistics - IPv4 address allocation Type: Counter	Int32
sessstat-ipaddaloc-ipv4localpool	Session Statistics - IP address allocation Statistics - IPv4 Local pool address assign Type: Counter	Int32
sessstat-ipaddaloc-ipv4staticaddr	Session Statistics - IP address allocation Statistics - IPv4 Static address assign Type: Counter	Int32
sessstat-ipaddaloc-ipv4radaddr	Session Statistics - IP address allocation Statistics - IPv4 Radius provided address assign Type: Counter	Int32
sessstat-ipv6addaloc	Session Statistics - IPv6 address allocation Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
sessstat-ipaddalloc-ipv6auto	Session Statistics - IP address allocation Statistics - IPv6 Stateless auto config Type: Counter	Int32
subplmnstat-homesubact	Subscriber PLMN Statistics - Home subscribers sessions active Type: Gauge	Int32
subplmnstat-homesubsetup	Subscriber PLMN Statistics - Home subscribers sessions setup Type: Counter	Int32
subplmnstat-homesubrel	Subscriber PLMN Statistics - Home subscribers sessions released Type: Counter	Int32
subplmnstat-roamsubact	Subscriber PLMN Statistics - Roaming subscribers sessions active Type: Gauge	Int32
subplmnstat-roamsubsetup	Subscriber PLMN Statistics - Roaming subscribers sessions setup Type: Counter	Int32
subplmnstat-roamsubrel	Subscriber PLMN Statistics - Roaming subscribers sessions released Type: Counter	Int32
subplmnstat-visitsubact	Subscriber PLMN Statistics - Visiting subscribers sessions active Type: Gauge	Int32
subplmnstat-visitsubsetup	Subscriber PLMN Statistics - Visiting subscribers sessions setup Type: Counter	Int32
subplmnstat-visitsubrel	Subscriber PLMN Statistics - Visiting subscribers sessions released Type: Counter	Int32
sgitunstat-ipv4sessact	SGi tunneling Statistics - IPv4 IP-in-IP tunnel sessions active Type: Gauge	Int32
sgitunstat-ipv4sesssetup	SGi tunneling Statistics - IPv4 IP-in-IP tunnel sessions setup Type: Counter	Int32
sgitunstat-ipv4sessrel	SGi tunneling Statistics - IPv4 IP-in-IP tunnel sessions released Type: Counter	Int32
sgitunstat-ipv4gresessact	SGi tunneling Statistics - IPv4 GRE tunnel sessions active Type: Gauge	Int32
sgitunstat-ipv4gresesssetup	SGi tunneling Statistics - IPv4 GRE tunnel sessions setup Type: Counter	Int32
sgitunstat-ipv4gresessrel	SGi tunneling Statistics - IPv4 GRE tunnel sessions released Type: Counter	Int32
sgitunstat-ipv6sessact	SGi tunneling Statistics - IPv6 6to4 tunnel sessions active Type: Gauge	Int32
sgitunstat-ipv6sesssetup	SGi tunneling Statistics - IPv6 6to4 tunnel sessions setup Type: Counter	Int32
sgitunstat-ipv6sessrel	SGi tunneling Statistics - IPv6 6to4 tunnel sessions released Type: Counter	Int32

Variables	Description	Data Type
handoverstat-intersgsnatt	Handover Statistics - Total number of inter-SGSN handover attempts Type: Counter	Int32
handoverstat-intersgsnsucc	Handover Statistics - Total number of successful inter-SGSN handovers Type: Counter	Int32
handoverstat-intersgsnfail	Handover Statistics - Total number of failed inter-SGSN handovers Type: Counter	Int32
handoverstat-intersgwatt	Handover Statistics - Total number of inter-SGW handover attempts Type: Counter	Int32
handoverstat-intersgwsucc	Handover Statistics - Total number of successful inter-SGW handovers Type: Counter	Int32
handoverstat-intersgwfail	Handover Statistics - Total number of failed inter-SGW handovers Type: Counter	Int32
handoverstat-interhsgwatt	Handover Statistics - Total number of inter-HSGW handover attempts Type: Counter	Int32
handoverstat-interhsgwsucc	Handover Statistics - Total number of successful inter-HSGW handovers Type: Counter	Int32
handoverstat-interhsgwfail	Handover Statistics - Total number of failed inter-HSGW handovers Type: Counter	Int32
handoverstat-gngptolteatt	Handover Statistics - Number of Gn/Gp to LTE attempted handovers Type: Counter	Int32
handoverstat-gngptoltesucc	Handover Statistics - Number of Gn/Gp to LTE successful handovers Type: Counter	Int32
handoverstat-gngptoltefail	Handover Statistics - Number of Gn/Gp to LTE failed handovers Type: Counter	Int32
handoverstat-ltetogngpatt	Handover Statistics - Number of LTE to Gn/Gp attempted handovers Type: Counter	Int32
handoverstat-ltetogngpsucc	Handover Statistics - Number of LTE to Gn/Gp successful handovers Type: Counter	Int32
handoverstat-ltetogngpfail	Handover Statistics - Number of LTE to Gn/Gp failed handovers Type: Counter	Int32
handoverstat-ltetoehrpatt	Handover Statistics -Number of LTE to eHRPD attempted handovers Type: Counter	Int32
handoverstat-ltetoehrpsucc	Handover Statistics - Number of LTE to eHRPD successful handovers Type: Counter	Int32
handoverstat-ltetoehrpdfail	Handover Statistics - Number of LTE to eHRPD failed handovers Type: Counter	Int32
handoverstat-ehrpdtolteatt	Handover Statistics - Number of eHRPD to LTE attempted handovers Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
handoverstat-ehrpdtoltesucc	Handover Statistics - Number of eHPRD to LTE successful handovers Type: Counter	Int32
handoverstat-ehrpdtoltefail	Handover Statistics - Number of eHPRD to LTE failed handovers Type: Counter	Int32
subqosstat-bearact-qci1	Subscriber QoS Statistics - Total bearers active - QCI 1 Type: Gauge	Int32
subqosstat-bearact-qci2	Subscriber QoS Statistics - Total bearers active - QCI 2 Type: Gauge	Int32
subqosstat-bearact-qci3	Subscriber QoS Statistics - Total bearers active - QCI 3 Type: Gauge	Int32
subqosstat-bearact-qci4	Subscriber QoS Statistics - Total bearers active - QCI 4 Type: Gauge	Int32
subqosstat-bearact-qci5	Subscriber QoS Statistics - Total bearers active - QCI 5 Type: Gauge	Int32
subqosstat-bearact-qci6	Subscriber QoS Statistics - Total bearers active - QCI 6 Type: Gauge	Int32
subqosstat-bearact-qci7	Subscriber QoS Statistics - Total bearers active - QCI 7 Type: Gauge	Int32
subqosstat-bearact-qci8	Subscriber QoS Statistics - Total bearers active - QCI 8 Type: Gauge	Int32
subqosstat-bearact-qci9	Subscriber QoS Statistics - Total bearers active - QCI 9 Type: Gauge	Int32
subqosstat-bearact-qcinongbr	Subscriber QoS Statistics - Total bearers active - Non-Standard QCI (Non-GBR) Type: Gauge	Int32
subqosstat-bearact-qcigbr	Subscriber QoS Statistics - Total bearers active - Non-Standard QCI (GBR) Type: Gauge	Int32
subqosstat-bearsetup-qci1	Subscriber QoS Statistics - Total bearers setup - QCI 1 Type: Counter	Int32
subqosstat-bearsetup-qci2	Subscriber QoS Statistics - Total bearers setup - QCI 2 Type: Counter	Int32
subqosstat-bearsetup-qci3	Subscriber QoS Statistics - Total bearers setup - QCI 3 Type: Counter	Int32
subqosstat-bearsetup-qci4	Subscriber QoS Statistics - Total bearers setup - QCI 4 Type: Counter	Int32
subqosstat-bearsetup-qci5	Subscriber QoS Statistics - Total bearers setup - QCI 5 Type: Counter	Int32

Variables	Description	Data Type
subqosstat-bearsetup-qci6	Subscriber QoS Statistics - Total bearers setup - QCI 6 Type: Counter	Int32
subqosstat-bearsetup-qci7	Subscriber QoS Statistics - Total bearers setup - QCI 7 Type: Counter	Int32
subqosstat-bearsetup-qci8	Subscriber QoS Statistics - Total bearers setup - QCI 8 Type: Counter	Int32
subqosstat-bearsetup-qci9	Subscriber QoS Statistics - Total bearers setup - QCI 9 Type: Counter	Int32
subqosstat-bearsetup-qcinongbr	Subscriber QoS Statistics - Total bearers setup - Non-Standard QCI (Non-GBR) Type: Counter	Int32
subqosstat-bearsetup-qcigbr	Subscriber QoS Statistics - Total bearers setup - Non-Standard QCI (GBR) Type: Counter	Int32
subqosstat-bearrel-qci1	Subscriber QoS Statistics - Total bearers released - QCI 1 Type: Counter	Int32
subqosstat-bearrel-qci2	Subscriber QoS Statistics - Total bearers released - QCI 2 Type: Counter	Int32
subqosstat-bearrel-qci3	Subscriber QoS Statistics - Total bearers released - QCI 3 Type: Counter	Int32
subqosstat-bearrel-qci4	Subscriber QoS Statistics - Total bearers released - QCI 4 Type: Counter	Int32
subqosstat-bearrel-qci5	Subscriber QoS Statistics - Total bearers released - QCI 5 Type: Counter	Int32
subqosstat-bearrel-qci6	Subscriber QoS Statistics - Total bearers released - QCI 6 Type: Counter	Int32
subqosstat-bearrel-qci7	Subscriber QoS Statistics - Total bearers released - QCI 7 Type: Counter	Int32
subqosstat-bearrel-qci8	Subscriber QoS Statistics - Total bearers released - QCI 8 Type: Counter	Int32
subqosstat-bearrel-qci9	Subscriber QoS Statistics - Total bearers released - QCI 9 Type: Counter	Int32
subqosstat-bearrel-qcinongbr	Subscriber QoS Statistics - Total bearers released - Non-Standard QCI (Non-GBR) Type: Counter	Int32
subqosstat-bearrel-qcigbr	Subscriber QoS Statistics - Total bearers released - Non-Standard QCI (GBR) Type: Counter	Int32
subdatastat-totuppktfwd	Subscriber Data Statistics - Total Uplink packets forwarded Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
subdatastat-uppkfwd-qci1	Subscriber Data Statistics -Uplink packets forwarded - QCI 1 Type: Counter	Int32
subdatastat-uppkfwd-qci2	Subscriber Data Statistics -Uplink packets forwarded - QCI 2 Type: Counter	Int32
subdatastat-uppkfwd-qci3	Subscriber Data Statistics -Uplink packets forwarded - QCI 3 Type: Counter	Int32
subdatastat-uppkfwd-qci4	Subscriber Data Statistics -Uplink packets forwarded - QCI 4 Type: Counter	Int32
subdatastat-uppkfwd-qci5	Subscriber Data Statistics -Uplink packets forwarded - QCI 5 Type: Counter	Int32
subdatastat-uppkfwd-qci6	Subscriber Data Statistics -Uplink packets forwarded - QCI 6 Type: Counter	Int32
subdatastat-uppkfwd-qci7	Subscriber Data Statistics -Uplink packets forwarded - QCI 7 Type: Counter	Int32
subdatastat-uppkfwd-qci8	Subscriber Data Statistics -Uplink packets forwarded - QCI 8 Type: Counter	Int32
subdatastat-uppkfwd-qci9	Subscriber Data Statistics -Uplink packets forwarded - QCI 9 Type: Counter	Int32
subdatastat-uppkfwd-stdqcinongbr	Subscriber Data Statistics - Uplink packets forwarded - Standard QCI (Non-GBR) Type: Counter	Int32
subdatastat-uppkfwd-stdqcigbr	Subscriber Data Statistics - Uplink packets forwarded - Standard QCI (GBR) Type: Counter	Int32
subdatastat-uppkfwd-qcinongbr	Subscriber Data Statistics - Uplink packets forwarded - Non-Standard QCI (Non-GBR) Type: Counter	Int32
subdatastat-uppkfwd-qcigbr	Subscriber Data Statistics - Uplink packets forwarded - Non-Standard QCI (GBR) Type: Counter	Int32
subdatastat-uppkfwd-totgbr	Subscriber Data Statistics - Uplink packets forwarded - Total GBR Type: Counter	Int32
subdatastat-uppkfwd-totnongbr	Subscriber Data Statistics - Uplink packets forwarded - Total Non-GBR Type: Counter	Int32
subdatastat-totupbytefwd	Subscriber Data Statistics - Total Uplink bytes forwarded Type: Counter	Int64
subdatastat-upbytefwd-qci1	Subscriber Data Statistics - Uplink bytes forwarded - QCI 1 Type: Counter	Int64
subdatastat-upbytefwd-qci2	Subscriber Data Statistics - Uplink bytes forwarded - QCI 2 Type: Counter	Int64

Variables	Description	Data Type
subdatastat-upbytefwd-qci3	Subscriber Data Statistics - Uplink bytes forwarded - QCI 3 Type: Counter	Int64
subdatastat-upbytefwd-qci4	Subscriber Data Statistics - Uplink bytes forwarded - QCI 4 Type: Counter	Int64
subdatastat-upbytefwd-qci5	Subscriber Data Statistics - Uplink bytes forwarded - QCI 5 Type: Counter	Int64
subdatastat-upbytefwd-qci6	Subscriber Data Statistics - Uplink bytes forwarded - QCI 6 Type: Counter	Int64
subdatastat-upbytefwd-qci7	Subscriber Data Statistics - Uplink bytes forwarded - QCI 7 Type: Counter	Int64
subdatastat-upbytefwd-qci8	Subscriber Data Statistics - Uplink bytes forwarded - QCI 8 Type: Counter	Int64
subdatastat-upbytefwd-qci9	Subscriber Data Statistics - Uplink bytes forwarded - QCI 9 Type: Counter	Int64
subdatastat-upbytefwd-stdqcinongbr	Subscriber Data Statistics - Uplink bytes forwarded - Standard QCI (Non-GBR) Type: Counter	Int64
subdatastat-upbytefwd-stdqcigr	Subscriber Data Statistics - Uplink bytes forwarded - Standard QCI (GBR) Type: Counter	Int64
subdatastat-upbytefwd-qcinongbr	Subscriber Data Statistics - Uplink bytes forwarded - Non-Standard QCI (Non-GBR) Type: Counter	Int64
subdatastat-upbytefwd-qcigr	Subscriber Data Statistics - Uplink bytes forwarded - Non-Standard QCI (GBR) Type: Counter	Int64
subdatastat-upbytefwd-totgbr	Subscriber Data Statistics - Uplink bytes forwarded - Total GBR Type: Counter	Int64
subdatastat-upbytefwd-totnongbr	Subscriber Data Statistics - Uplink bytes forwarded - Total NON-GBR Type: Counter	Int64
subdatastat-totdownpktfwd	Subscriber Data Statistics - Total Downlink packets forwarded Type: Counter	Int32
subdatastat-downpktfwd-qci1	Subscriber Data Statistics - Downlink packets forwarded - QCI 1 Type: Counter	Int32
subdatastat-downpktfwd-qci2	Subscriber Data Statistics - Downlink packets forwarded - QCI 2 Type: Counter	Int32
subdatastat-downpktfwd-qci3	Subscriber Data Statistics - Downlink packets forwarded - QCI 3 Type: Counter	Int32
subdatastat-downpktfwd-qci4	Subscriber Data Statistics - Downlink packets forwarded - QCI 4 Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
subdatastat-downpktfwd-qci5	Subscriber Data Statistics - Downlink packets forwarded - QCI 5 Type: Counter	Int32
subdatastat-downpktfwd-qci6	Subscriber Data Statistics - Downlink packets forwarded - QCI 6 Type: Counter	Int32
subdatastat-downpktfwd-qci7	Subscriber Data Statistics - Downlink packets forwarded - QCI 7 Type: Counter	Int32
subdatastat-downpktfwd-qci8	Subscriber Data Statistics - Downlink packets forwarded - QCI 8 Type: Counter	Int32
subdatastat-downpktfwd-qci9	Subscriber Data Statistics - Downlink packets forwarded - QCI 9 Type: Counter	Int32
subdatastat-downpktfwd-stdqcinongbr	Subscriber Data Statistics - Downlink packets forwarded - Standard QCI (Non-GBR) Type: Counter	Int32
subdatastat-downpktfwd-stdqcigbr	Subscriber Data Statistics - Downlink packets forwarded - Standard QCI (GBR) Type: Counter	Int32
subdatastat-downpktfwd-qcinongbr	Subscriber Data Statistics - Downlink packets forwarded - Non-Standard QCI (Non-GBR) Type: Counter	Int32
subdatastat-downpktfwd-qcigbr	Subscriber Data Statistics - Downlink packets forwarded - Non-Standard QCI (GBR) Type: Counter	Int32
subdatastat-downpktfwd-totgbr	Subscriber Data Statistics - Downlink packets forwarded - Total GBR Type: Counter	Int32
subdatastat-downpktfwd-totnongbr	Subscriber Data Statistics - Downlink packets forwarded - Total Non-GBR Type: Counter	Int32
subdatastat-totdownbytefwd	Subscriber Data Statistics - Total Downlink bytes forwarded Type: Counter	Int64
subdatastat-downbytefwd-qci1	Subscriber Data Statistics - Downlink bytes forwarded - QCI 1 Type: Counter	Int64
subdatastat-downbytefwd-qci2	Subscriber Data Statistics - Downlink bytes forwarded - QCI 2 Type: Counter	Int64
subdatastat-downbytefwd-qci3	Subscriber Data Statistics - Downlink bytes forwarded - QCI 3 Type: Counter	Int64
subdatastat-downbytefwd-qci4	Subscriber Data Statistics - Downlink bytes forwarded - QCI 4 Type: Counter	Int64
subdatastat-downbytefwd-qci5	Subscriber Data Statistics - Downlink bytes forwarded - QCI 5 Type: Counter	Int64
subdatastat-downbytefwd-qci6	Subscriber Data Statistics - Downlink bytes forwarded - QCI 6 Type: Counter	Int64

Variables	Description	Data Type
subdatastat-downbytefwd-qci7	Subscriber Data Statistics - Downlink bytes forwarded - QCI 7 Type: Counter	Int64
subdatastat-downbytefwd-qci8	Subscriber Data Statistics - Downlink bytes forwarded - QCI 8 Type: Counter	Int64
subdatastat-downbytefwd-qci9	Subscriber Data Statistics - Downlink bytes forwarded - QCI 9 Type: Counter	Int64
subdatastat-downbytefwd-stdqcinongbr	Subscriber Data Statistics - Downlink bytes forwarded - Standard QCI (Non-GBR) Type: Counter	Int64
subdatastat-downbytefwd-stdqcigr	Subscriber Data Statistics - Downlink bytes forwarded - Standard QCI (GBR) Type: Counter	Int64
subdatastat-downbytefwd-qcinongbr	Subscriber Data Statistics - Downlink bytes forwarded - Non-Standard QCI (Non-GBR) Type: Counter	Int64
subdatastat-downbytefwd-qcigr	Subscriber Data Statistics - Downlink bytes forwarded - Non-Standard QCI (GBR) Type: Counter	Int64
subdatastat-downbytefwd-totgbr	Subscriber Data Statistics - Downlink bytes forwarded - Total GBR Type: Counter	Int64
subdatastat-downbytefwd-totnongbr	Subscriber Data Statistics - Downlink bytes forwarded - Total Non-GBR Type: Counter	Int64
subdatastat-totuppktdrop	Subscriber Data Statistics - Total Uplink packets dropped Type: Counter	Int32
subdatastat-uppktdrop-qci1	Subscriber Data Statistics -Uplink packets dropped - QCI 1 Type: Counter	Int32
subdatastat-uppktdrop-qci2	Subscriber Data Statistics -Uplink packets dropped - QCI 2 Type: Counter	Int32
subdatastat-uppktdrop-qci3	Subscriber Data Statistics -Uplink packets dropped - QCI 3 Type: Counter	Int32
subdatastat-uppktdrop-qci4	Subscriber Data Statistics -Uplink packets dropped - QCI 4 Type: Counter	Int32
subdatastat-uppktdrop-qci5	Subscriber Data Statistics -Uplink packets dropped - QCI 5 Type: Counter	Int32
subdatastat-uppktdrop-qci6	Subscriber Data Statistics -Uplink packets dropped - QCI 6 Type: Counter	Int32
subdatastat-uppktdrop-qci7	Subscriber Data Statistics -Uplink packets dropped - QCI 7 Type: Counter	Int32
subdatastat-uppktdrop-qci8	Subscriber Data Statistics -Uplink packets dropped - QCI 8 Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
subdatastat-uppktdrop-qci9	Subscriber Data Statistics -Uplink packets dropped - QCI 9 Type: Counter	Int32
subdatastat-uppktdrop-stdqcinongbr	Subscriber Data Statistics - Uplink packets dropped - Standard QCI (Non-GBR) Type: Counter	Int32
subdatastat-uppktdrop-stdqcigbr	Subscriber Data Statistics - Uplink packets dropped - Standard QCI (GBR) Type: Counter	Int32
subdatastat-uppktdrop-qcinongbr	Subscriber Data Statistics - Uplink packets dropped - Non-Standard QCI (Non-GBR) Type: Counter	Int32
subdatastat-uppktdrop-qcigbr	Subscriber Data Statistics - Uplink packets dropped - Non-Standard QCI (GBR) Type: Counter	Int32
subdatastat-uppktdrop-totgbr	Subscriber Data Statistics - Uplink packets dropped - Total GBR Type: Counter	Int32
subdatastat-uppktdrop-totnongbr	Subscriber Data Statistics - Uplink packets dropped - Total Non-GBR Type: Counter	Int32
subdatastat-totupbytedrop	Subscriber Data Statistics - Total Uplink bytes dropped Type: Counter	Int64
subdatastat-upbytedrop-qci1	Subscriber Data Statistics - Uplink bytes dropped - QCI 1 Type: Counter	Int64
subdatastat-upbytedrop-qci2	Subscriber Data Statistics - Uplink bytes dropped - QCI 2 Type: Counter	Int64
subdatastat-upbytedrop-qci3	Subscriber Data Statistics - Uplink bytes dropped - QCI 3 Type: Counter	Int64
subdatastat-upbytedrop-qci4	Subscriber Data Statistics - Uplink bytes dropped - QCI 4 Type: Counter	Int64
subdatastat-upbytedrop-qci5	Subscriber Data Statistics - Uplink bytes dropped - QCI 5 Type: Counter	Int64
subdatastat-upbytedrop-qci6	Subscriber Data Statistics - Uplink bytes dropped - QCI 6 Type: Counter	Int64
subdatastat-upbytedrop-qci7	Subscriber Data Statistics - Uplink bytes dropped - QCI 7 Type: Counter	Int64
subdatastat-upbytedrop-qci8	Subscriber Data Statistics - Uplink bytes dropped - QCI 8 Type: Counter	Int64
subdatastat-upbytedrop-qci9	Subscriber Data Statistics - Uplink bytes dropped - QCI 9 Type: Counter	Int64
subdatastat-upbytedrop-stdqcinongbr	Subscriber Data Statistics - Uplink bytes dropped - Standard QCI (Non-GBR) Type: Counter	Int64

Variables	Description	Data Type
subdatastat-upbytedrop-stdqciubr	Subscriber Data Statistics - Uplink bytes dropped - Standard QCI (GBR) Type: Counter	Int64
subdatastat-upbytedrop-qcinongbr	Subscriber Data Statistics - Uplink bytes dropped - Non-Standard QCI (Non-GBR) Type: Counter	Int64
subdatastat-upbytedrop-qciubr	Subscriber Data Statistics - Uplink bytes dropped - Non-Standard QCI (GBR) Type: Counter	Int64
subdatastat-upbytedrop-totubr	Subscriber Data Statistics - Uplink bytes dropped - Total GBR Type: Counter	Int64
subdatastat-upbytedrop-totnongbr	Subscriber Data Statistics - Uplink bytes dropped - Total Non-GBR Type: Counter	Int64
subdatastat-totdownpktdrop	Subscriber Data Statistics - Total Downlink packets dropped Type: Counter	Int32
subdatastat-downpktdrop-qci1	Subscriber Data Statistics - Downlink packets dropped - QCI 1 Type: Counter	Int32
subdatastat-downpktdrop-qci2	Subscriber Data Statistics - Downlink packets dropped - QCI 2 Type: Counter	Int32
subdatastat-downpktdrop-qci3	Subscriber Data Statistics - Downlink packets dropped - QCI 3 Type: Counter	Int32
subdatastat-downpktdrop-qci4	Subscriber Data Statistics - Downlink packets dropped - QCI 4 Type: Counter	Int32
subdatastat-downpktdrop-qci5	Subscriber Data Statistics - Downlink packets dropped - QCI 5 Type: Counter	Int32
subdatastat-downpktdrop-qci6	Subscriber Data Statistics - Downlink packets dropped - QCI 6 Type: Counter	Int32
subdatastat-downpktdrop-qci7	Subscriber Data Statistics - Downlink packets dropped - QCI 7 Type: Counter	Int32
subdatastat-downpktdrop-qci8	Subscriber Data Statistics - Downlink packets dropped - QCI 8 Type: Counter	Int32
subdatastat-downpktdrop-qci9	Subscriber Data Statistics - Downlink packets dropped - QCI 9 Type: Counter	Int32
subdatastat-downpktdrop-stdqcinongbr	Subscriber Data Statistics - Downlink packets dropped - Standard QCI (Non-GBR) Type: Counter	Int32
subdatastat-downpktdrop-stdqciubr	Subscriber Data Statistics - Downlink packets dropped - Standard QCI (GBR) Type: Counter	Int32
subdatastat-downpktdrop-qcinongbr	Subscriber Data Statistics - Downlink packets dropped - Non-Standard QCI (Non-GBR) Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
subdatastat-downpktdrop-qcigr	Subscriber Data Statistics - Downlink packets dropped - Non-Standard QCI (GBR) Type: Counter	Int32
subdatastat-downpktdrop-totgbr	Subscriber Data Statistics - Downlink packets dropped - Total GBR Type: Counter	Int32
subdatastat-downpktdrop-totnongbr	Subscriber Data Statistics - Downlink packets dropped - Total Non-GBR Type: Counter	Int32
subdatastat-totdownbytedrop	Subscriber Data Statistics - Total Downlink bytes dropped Type: Counter	Int64
subdatastat-downbytedrop-qci1	Subscriber Data Statistics - Downlink bytes dropped - QCI 1 Type: Counter	Int64
subdatastat-downbytedrop-qci2	Subscriber Data Statistics - Downlink bytes dropped - QCI 2 Type: Counter	Int64
subdatastat-downbytedrop-qci3	Subscriber Data Statistics - Downlink bytes dropped - QCI 3 Type: Counter	Int64
subdatastat-downbytedrop-qci4	Subscriber Data Statistics - Downlink bytes dropped - QCI 4 Type: Counter	Int64
subdatastat-downbytedrop-qci5	Subscriber Data Statistics - Downlink bytes dropped - QCI 5 Type: Counter	Int64
subdatastat-downbytedrop-qci6	Subscriber Data Statistics - Downlink bytes dropped - QCI 6 Type: Counter	Int64
subdatastat-downbytedrop-qci7	Subscriber Data Statistics - Downlink bytes dropped - QCI 7 Type: Counter	Int64
subdatastat-downbytedrop-qci8	Subscriber Data Statistics - Downlink bytes dropped - QCI 8 Type: Counter	Int64
subdatastat-downbytedrop-qci9	Subscriber Data Statistics - Downlink bytes dropped - QCI 9 Type: Counter	Int64
subdatastat-downbytedrop-stdqcinongbr	Subscriber Data Statistics - Downlink bytes dropped - Standard QCI (Non-GBR) Type: Counter	Int64
subdatastat-downbytedrop-stdqcigr	Subscriber Data Statistics - Downlink bytes dropped - Standard QCI (GBR) Type: Counter	Int64
subdatastat-downbytedrop-qcinongbr	Subscriber Data Statistics - Downlink bytes dropped - Non-Standard QCI (Non-GBR) Type: Counter	Int64
subdatastat-downbytedrop-qcigr	Subscriber Data Statistics - Downlink bytes dropped - Non-Standard QCI (GBR) Type: Counter	Int64

Variables	Description	Data Type
subdatastat-downbytedrop-totgbr	Subscriber Data Statistics - Downlink bytes dropped - Total GBR Type: Counter	Int64
subdatastat-downbytedrop-totnongbr	Subscriber Data Statistics - Downlink bytes dropped - Total Non-GBR Type: Counter	Int64
subdatastat-totuppktdropmbrexc	Subscriber Data Statistics - Total Uplink packets Drop mbr exceed Type: Counter	Int32
subdatastat-uppktdropmbrexc-qci1	Subscriber Data Statistics - Uplink packets Drop mbr exceed - QCI 1 Type: Counter	Int32
subdatastat-uppktdropmbrexc-qci2	Subscriber Data Statistics - Uplink packets Drop mbr exceed - QCI 2 Type: Counter	Int32
subdatastat-uppktdropmbrexc-qci3	Subscriber Data Statistics - Uplink packets Drop mbr exceed- QCI 3 Type: Counter	Int32
subdatastat-uppktdropmbrexc-qci4	Subscriber Data Statistics - Uplink packets Drop mbr exceed - QCI 4 Type: Counter	Int32
subdatastat-uppktdropmbrexc-qci5	Subscriber Data Statistics - Uplink packets Drop mbr exceed- QCI 5 Type: Counter	Int32
subdatastat-uppktdropmbrexc-qci6	Subscriber Data Statistics - Uplink packets Drop mbr exceed - QCI 6 Type: Counter	Int32
subdatastat-uppktdropmbrexc-qci7	Subscriber Data Statistics - Uplink packets Drop mbr exceed - QCI 7 Type: Counter	Int32
subdatastat-uppktdropmbrexc-qci8	Subscriber Data Statistics - Uplink packets Drop mbr exceed - QCI 8 Type: Counter	Int32
subdatastat-uppktdropmbrexc-qci9	Subscriber Data Statistics - Uplink packets Drop mbr exceed - QCI 9 Type: Counter	Int32
subdatastat-uppktdropmbrexc-stdqcinongbr	Subscriber Data Statistics - Uplink packets Drop mbr exceed - Standard QCI (Non-GBR) Type: Counter	Int32
subdatastat-uppktdropmbrexc-stdqciubr	Subscriber Data Statistics - Uplink packets Drop mbr exceed - Standard QCI (GBR) Type: Counter	Int32
subdatastat-uppktdropmbrexc-qcinongbr	Subscriber Data Statistics - Uplink packets Drop mbr exceed - Non-Standard QCI (Non-GBR) Type: Counter	Int32
subdatastat-uppktdropmbrexc-qciubr	Subscriber Data Statistics - Uplink packets Drop mbr exceed - Non-Standard QCI (GBR) Type: Counter	Int32
subdatastat-uppktdropmbrexc-totgbr	Subscriber Data Statistics - Uplink packets Drop mbr exceed - Total GBR Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
subdatastat-uppktdropmbrexc-totnongbr	Subscriber Data Statistics - Uplink packets Drop mbr exceed - Total Non-GBR Type: Counter	Int32
subdatastat-totupbytedropmbrexc	Subscriber Data Statistics - Total Uplink bytes Drop mbr exceed Type: Counter	Int64
subdatastat-upbytedropmbrexc-qci1	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - QCI 1 Type: Counter	Int64
subdatastat-upbytedropmbrexc-qci2	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - QCI 2 Type: Counter	Int64
subdatastat-upbytedropmbrexc-qci3	Subscriber Data Statistics - Uplink bytes Drop mbr exceed- QCI 3 Type: Counter	Int64
subdatastat-upbytedropmbrexc-qci4	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - QCI 4 Type: Counter	Int64
subdatastat-upbytedropmbrexc-qci5	Subscriber Data Statistics - Uplink bytes Drop mbr exceed- QCI 5 Type: Counter	Int64
subdatastat-upbytedropmbrexc-qci6	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - QCI 6 Type: Counter	Int64
subdatastat-upbytedropmbrexc-qci7	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - QCI 7 Type: Counter	Int64
subdatastat-upbytedropmbrexc-qci8	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - QCI 8 Type: Counter	Int64
subdatastat-upbytedropmbrexc-qci9	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - QCI 9 Type: Counter	Int64
subdatastat-upbytedropmbrexc-stdqcinongbr	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - Standard QCI (Non-GBR) Type: Counter	Int64
subdatastat-upbytedropmbrexc-stdqcigr	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - Standard QCI (GBR) Type: Counter	Int64
subdatastat-upbytedropmbrexc-qcinongbr	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - Non-Standard QCI (Non-GBR) Type: Counter	Int64
subdatastat-upbytedropmbrexc-qcigr	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - Non-Standard QCI (GBR) Type: Counter	Int64
subdatastat-upbytedropmbrexc-totgbr	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - Total GBR Type: Counter	Int64
subdatastat-upbytedropmbrexc-totnongbr	Subscriber Data Statistics - Uplink bytes Drop mbr exceed - Total NON-GBR Type: Counter	Int64

Variables	Description	Data Type
subdatastat-totdownpktdropmbrexc	Subscriber Data Statistics - Total Downlink packets Drop mbr exceed Type: Counter	Int32
subdatastat-downpktdropmbrexc-qci1	Subscriber Data Statistics - Downlink packets Drop mbr exceed - QCI 1 Type: Counter	Int32
subdatastat-downpktdropmbrexc-qci2	Subscriber Data Statistics - Downlink packets Drop mbr exceed - QCI 2 Type: Counter	Int32
subdatastat-downpktdropmbrexc-qci3	Subscriber Data Statistics - Downlink packets Drop mbr exceed- QCI 3 Type: Counter	Int32
subdatastat-downpktdropmbrexc-qci4	Subscriber Data Statistics - Downlink packets Drop mbr exceed - QCI 4 Type: Counter	Int32
subdatastat-downpktdropmbrexc-qci5	Subscriber Data Statistics - Downlink packets Drop mbr exceed- QCI 5 Type: Counter	Int32
subdatastat-downpktdropmbrexc-qci6	Subscriber Data Statistics - Downlink packets Drop mbr exceed - QCI 6 Type: Counter	Int32
subdatastat-downpktdropmbrexc-qci7	Subscriber Data Statistics - Downlink packets Drop mbr exceed - QCI 7 Type: Counter	Int32

apnambratelimit-downbytedrop	APN AMBR Rate Limiting Statistics - Downlink bytes dropped Type: Counter	Int64

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 54

Port Schema Statistics

The Port schema provides operational statistics that can be used for monitoring and troubleshooting the following products: All

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 54. Bulk Statistic Variables in the Port-level Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
card	Description: Chassis slot numbers. This is a key variable. Type: Information	Int32
port	Description: Port number on the card. This is a key variable. Type: Information	Int32
maxrate	Description: The maximum physical data rate for the port. Type: Information	Int64
rxbytes	Description: The number of bytes received over the port. Type: Counter	Int64
txbytes	Description: The number of bytes transmitted over the port. Type: Counter	Int64
ucast_inpackets	Description: The number of unicast packets received over the port. Type: Counter This statistic is not supported for SPIO ports.	Int64
ucast_outpackets	Description: The number of unicast packets sent over the port. Type: Counter This statistic is not supported for SPIO ports.	Int64
mcast_inpackets	Description: The number of multicast packets received over the port. Type: Counter This statistic is not supported for SPIO ports.	Int64
mcast_outpackets	Description: The number of multicast packets sent over the port. Type: Counter This statistic is not supported for SPIO ports.	Int64
bcast_inpackets	Description: The number of broadcast packets received over the port. Type: Counter This statistic is not supported for SPIO ports.	Int64
bcast_outpackets	Description: The number of broadcast packets sent over the port. Type: Counter This statistic is not supported for SPIO ports.	Int64
rxpackets	Description: The number of packets received over the port. Type: Counter	Int64
txpackets	Description: The number of packets transmitted over the port. Type: Counter	Int64
rxdiscbytes	Description: The number of bytes received over the port that were discarded. Type: Counter	Int64
rxdiscpackets	Description: The number of packets received over the port that were discarded. Type: Counter	Int64
txdiscbytes	Description: The number of bytes transmitted over the port that were discarded. Type: Counter	Int64
txdiscpackets	Description: The number of packets transmitted over the port that were discarded. Type: Counter	Int64

Variables	Description	Data Type
rxerrorbytes	Description: The number of error bytes received over the port. Type: Counter	Int64
rxerrorpackets	Description: The number of error packets received over the port. Type: Counter	Int64
txerrorbytes	Description: The number of error bytes transmitted over the port. Type: Counter	Int64
txerrorpackets	Description: The number of error packets transmitted over the port. Type: Counter	Int64
frag-rcvd	Description: The number of fragments received on this port. Type: Counter	Int64
pkt-reassembled	Description: The number of packets re-assembled from fragments received on this port. Type: Counter	Int64
frag-tokernel	Description: The number of fragments received on this port and sent to the kernel. Type: Counter	Int64
util-rx-curr	Description: The current average port utilization for received data in Mbps. Type: Gauge	Int64
util-tx-curr	Description: The current average port utilization for transmitted data in Mbps. Type: Gauge	Int64
util-rx-5min	Description: The average port utilization for received data over the last five minutes in Mbps. Type: Gauge	Int64
util-tx-5min	Description: The current average port utilization for transmitted data over the last five minutes in Mbps. Type: Gauge	Int64
util-rx-15min	Description: The average port utilization for received data over the last 15 minutes in Mbps. Type: Gauge	Int64
util-tx-15min	Description: The current average port utilization for transmitted data over the last 15 minutes in Mbps. Type: Gauge	Int64
port-5peak-rx-util	Description: This is the peak Rx port utilization for a 1-minute average over the last 5 minutes. Type: Gauge	Int64
port-5peak-tx-util	Description: This is the peak Tx port utilization for a 1-minute average over the last 5 minutes. Type: Gauge	Int64
port-15peak-rx-util	Description: This is the peak Rx port utilization for a 1-minute average over the last 15 minutes. Type: Gauge	Int64
port-15peak-tx-util	Description: This is the peak Tx port utilization for a 1-minute average over the last 15 minutes. Type: Gauge	Int64

Chapter 55

PPP Schema Statistics

The PPP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: GGSN, HSGW, MME, P-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 55. Bulk Statistic Variables in the PPP Schema

Variables	Description	Type
-----------	-------------	------

Variables	Description	Type
vpname	The name of the context configured on the system that is currently facilitating the service processing the subscriber's session. This is a key variable.	String
vpnid	The identification number of the context configured on the system that is currently facilitating the service processing the subscriber's session. This is an internal reference number. This is a key variable. Type: Gauge	Int32
servname	The name of the service for which PPP statistics are being displayed. This is a key variable.	String
svctype	The type of the service for which PPP statistics are being displayed. This is a key variable.	String
init	The total number of subscriber sessions that have been received by the system for processing.	Int32
reneg	The total number of subscriber sessions that have been re-negotiated by the system.	Int32
fail-reneg	The total number of subscriber sessions that have failed to be re-negotiated by the system	Int32
success	The total number of subscriber sessions that have been successfully connected by the system.	Int32
failed	The total number of subscriber sessions that the system has/have failed to process.	Int32
released	The total number of subscriber sessions that have been disconnected.	Int32
released-local	The total number of subscriber sessions that have been dropped by the system.	Int32
released-remote	The total number of subscriber sessions that have been dropped by the mobile nodes.	Int32
altppp-connected	The total number of Alt PPP subscriber sessions that have been connected by the system.	Int32
lcp-fail-maxretry	The number of sessions that were released during setup due to the system not receiving a response prior to the expiration of the maximum number of Link Control Protocol (LCP) retries.	Int32
lcp-fail-option	The number of sessions that were released during setup due to failed negotiations between the system and the mobile nodes over Link Control Protocol (LCP) options.	Int32
lcp-fail-unknown	The number of sessions that were released during setup due to failed LCP negotiations for unknown reasons.	Int32
ipcp-fail-maxretry	The number of sessions that were released during setup due to the system not receiving a response prior to the expiration of the maximum number of Internet Protocol Control Protocol (IPCP) retries.	Int32
ipcp-fail-option	The number of sessions that were released during setup due to failed negotiations between the system and the mobile nodes over Internet Protocol Control Protocol (IPCP) options.	Int32
ipcp-fail-unknown	The number of sessions that were released during setup due to failed IPCP negotiations for unknown reasons.	Int32
ipv6cp-fail-maxretry	The number of sessions that were released during setup due to the system not receiving a response prior to the expiration of the maximum number of Internet Protocol version 6 Control Protocol (IPv6CP) retries.	Int32
ipv6cp-fail-optiss	The number of sessions that were released during setup due to failed negotiations between the system and the mobile nodes over Internet Protocol version 6 Control Protocol (IPv6CP) options.	Int32

Variables	Description	Type
ipv6cp-fail-unknown	The number of sessions that were released during setup due to failed IPv6CP negotiations for unknown reasons.	Int32
fail-ccp	The number Compression Control Protocol negotiation failures.	Int32
fail-auth	The number of sessions that were released during setup due to subscriber authentication failures.	Int32
abort-auth	The number of sessions that were released during setup due to aborted authentication processes.	Int32
rp-disc	The number of sessions that were released during setup due to lower-layer disconnects.	Int32
entered-lcp	The number of sessions entering or re-entering the Link Control Protocol (LCP) phase of call setup.	Int32
entered-auth	The number of sessions entering or re-entering the authentication phase of call setup.	Int32
entered-ipcp	The number of sessions entering or re-entering the Internet Protocol Control Protocol (IPCP) phase of call setup.	Int32
entered-ipv6cp	The number of sessions entering or re-entering the Internet Protocol version 6 Control Protocol (IPv6CP) phase of call setup.	Int32
success-lcp	The number of sessions for which LCP was successfully negotiated.	Int32
success-auth	The number of sessions for which authentication was successful.	Int32
reneg-pdsn	The number of session re-negotiations initiated by the system.	Int32
reneg-mobile	The number of session re-negotiations initiated by the mobile nodes.	Int32
reneg-addrmis	The number of session re-negotiations that occurred due to mis-matched IP addresses.	Int32
reneg-rp-handoff	The number of session re-negotiations that occurred due to lower-layer handoffs.	Int32
reneg-update	The number of session re-negotiations that occurred due to parameter updates.	Int32
reneg-other	The number of session re-negotiations that occurred due to other reasons.	Int32
conn-sess-reneg	Indicates the number of PPP renegotiation happened for sessions which are already in connected/established state.	Int32
auth-attempt-chap	The number of sessions that attempted to authenticate using the Challenge Handshake Authentication Protocol (CHAP).	Int32
auth-attempt-pap	The number of sessions that attempted to authenticate using the Password Authentication Protocol (PAP).	Int32
auth-attempt-mschap	The number of sessions that attempted to authenticate using MicroSoft CHAP (MS CHAP).	Int32
auth-success-chap	The number of sessions that successfully authenticated using the Challenge Handshake Authentication Protocol (CHAP).	Int32
auth-success-pap	The number of sessions that successfully authenticated using the Password Authentication Protocol (PAP).	Int32
auth-success-mschap	The number of sessions that successfully authenticated using MicroSoft CHAP (MS CHAP).	Int32
auth-fail-chap	The number of sessions that failed authentication using the Challenge Handshake Authentication Protocol (CHAP).	Int32

Variables	Description	Type
auth-fail-pap	The number of sessions that failed authentication using the Password Authentication Protocol (PAP).	Int32
auth-fail-mschap	The number of sessions that failed authentication using MicroSoft CHAP (MS CHAP).	Int32
auth-abort-chap	The number of sessions that aborted authentication while using the Challenge Handshake Authentication Protocol (CHAP).	Int32
auth-abort-pap	The number of sessions that aborted authentication while using the Password Authentication Protocol (PAP).	Int32
auth-abort-mschap	The number of sessions that aborted authentication while using MicroSoft CHAP (MS CHAP).	Int32
sess-skip-auth	The number of sessions that skipped the authentication process.	Int32
comp-stac	The total number of sessions that negotiated the use data compression using the STAC protocol.	Int32
comp-mppc	The total number of sessions that negotiated the use data compression using the MPPC protocol.	Int32
comp-defl	The total number of sessions that negotiated the use data compression using the DEFLATE protocol.	Int32
comp-sess-neg	The total number of sessions that negotiated the use of data compression.	Int32
comp-sess-neg-fail	The total number of sessions for which data compression negotiation failed.	Int32
rcverr-basfcs	The number of packets received with an invalid Frame Check Sequence (FCS).	Int32
timeout-toplus	The total number of PPP authentication requests and NCP configuration requests that timed out.	Int32
rcverr-unknproto	The number of packets received with an invalid protocol type.	Int32
rcverr-badaddr	The number of packets received with a bad address field.	Int32
rcverr-badctrl	The number of packets received with a bad control field.	Int32
comp-vjhdr	The total number of sessions that negotiated the use Van Jacobson header compression.	Int32
comp-rohchdr	The total number of sessions that negotiated the use of RObust Header Compression (ROHC).	Int32
disc-lcp-remote	The number of sessions for which the mobile node initiated the disconnection.	Int32
disc-rp-remote	The number of sessions in which the mobile node disconnected the lower layers of the protocol stack.	Int32
disc-admin	The number of sessions for which the system initiated the disconnection.	Int32
disc-idle-timeout	The number of sessions disconnected due to exceeding their idle timeout limit.	Int32
disc-abs-timeout	The number of sessions disconnected due to exceeding their absolute timeout limit.	Int32
disc-ppp-keepalive	The number of sessions disconnected due to keep alive failures.	Int32
disc-no-resource	The number of sessions disconnected due to lack of resources on the local side (CPU and memory).	Int32
disc-misc	The number of sessions that were disconnected for reasons other than those listed here.	Int32
disc-rp-local	The number of sessions that experienced a local disconnect at the lower-layers.	Int32

Variables	Description	Type
disc-add-flow-fail	The number of sessions that experienced a disconnect due to a flow addition failure.	Int32
disc-maxretry-lcp	The number of sessions that experienced a disconnect due to exceeding the maximum number of LCP retries.	Int32
disc-maxretry-ipcp	The number of sessions that experienced a disconnect due to exceeding the maximum number of IPCP retries.	Int32
disc-max-setup-time	The number of sessions that experienced a disconnect due to exceeding the maximum setup timer.	Int32
disc-bad-dest-vpn	The number of sessions that experienced a disconnect due to the specification of invalid destination context.	Int32
disc-opt-neg-lcp	The number of sessions that experienced a disconnect due to the failed negotiation of an LCP option.	Int32
disc-opt-neg-ipcp	The number of sessions that experienced a disconnect due to the failed negotiation of an IPCP option.	Int32
disc-no-remoteaddr	The number of sessions that experienced a disconnect because no remote IP address was specified.	Int32
disc-typedetect-fail	The number of sessions that experienced a disconnect because the system could not identify the call type.	Int32
disc-bad-src-addr	The number of sessions that experienced a disconnect due to a source address violation.	Int32
disc-ipv6cp-excretry	The number of sessions that experienced a disconnect due to exceeding the maximum number of IPv6CP retries.	Int32
disc-ipv6cp-optnegfail	The number of sessions that experienced a disconnect due to the failed negotiation of an IPv6CP option.	Int32
disc-remote	The number of sessions that experienced a remote disconnect at the upper-layers.	Int32
disc-long-timeout	The number of sessions that experienced a disconnect due to the expiration of the long-duration timer.	Int32
disc-auth-fail	The number of sessions that experienced a disconnect due to PPP authentication failures.	Int32
lcpecho-req-total	The total number of LCP echo request messages sent.	Int32
lcpecho-req-resent	The total number of LCP echo request messages that were re-sent.	Int32
lcpecho-req-recvd	The total number of LCP echo reply messages received.	Int32
lcpecho-timeout	The total number of LCP echo request messages that timed-out prior to the system's receiving a response.	Int32
recverr-ctrl-field	The total number of bad control field errors experienced in received packets.	Int32
recverr-bad-length	The total number of bad packet length errors experienced in received packets.	Int32
remote-term	The number of sessions for which termination was initiated from the remote (mobile) side.	Int32
misc-fail	The number of session failures that occurred due to reasons other than those listed by the other variables.	Int32

Variables	Description	Type
in-oct	The number of inbound octets received.	Int64
in-ucast	The number of inbound unicast packets received.	Int32
in-nucast	The number of inbound non-unicast (multicast or broadcast) packets received.	Int32
in-pkt	The number of inbound packets that were received.	Int32
in-discard	The number of inbound packets that were discarded.	Int32
in-discard-oct	The number of inbound octets that were discarded.	Int32
out-oct	The number of outbound octets transmitted.	Int64
out-ucast	The number of outbound unicast packets transmitted.	Int32
out-nucast	The number of outbound non-unicast (multicast or broadcast) packets transmitted.	Int32
out-pkt	The number of outbound packets that were transmitted.	Int32
out-discard	The number of outbound packets that were discarded.	Int32
out-discard-oct	The number of outbound octets that were discarded.	Int32
num-sessions	The current total number of PPP sessions.	Int32
eap-authattempt	The total number of EAP authentication attempt done on the HSGW. This is collected at the HSGW service level.	Int32
eap-authsuccess	The total number of EAP authentication attempt done on the HSGW and was successful. This is collected at the HSGW service level.	Int32
eap-authfail	The total number of EAP authentication attempt done on the HSGW and was unsuccessful. This is collected at the HSGW service level.	Int32
eap-authabort	The total number of EAP authentication procedures attempted on the HSGW but aborted due to any reason. This is collected at the HSGW service level.	Int32
vsncp-attempt	The total number of Vendor Specific Network Control Protocol (VSNCNP) connection attempted on the HSGW. This is collected at the HSGW service level.	Int32
vsncp-conn	The total number of vendor Specific Network Control Protocol (VSNCNP) connected to the HSGW. This is collected at the HSGW service level.	Int32
vsncp-fail	The total number of Vendor Specific Network Control Protocol (VSNCNP) connections attempted but failed to the HSGW. This is collected at HSGW service level.	Int32
vsncp-rellocal	The total number of Vendor Specific Network Control Protocol (VSNCNP) connections released locally by the HSGW. This is collected at HSGW service level.	Int32
vsncp-relremote	The total number of Vendor Specific Network Control Protocol (VSNCNP) connections released remotely by peer. This is collected at the HSGW service level.	Int32

Variables	Description	Type
vsncp-err-gen	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors - general. This is collected at the HSGW service level.	Int32
vsncp-err-unauthapn	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to an unauthorized APN. This is collected at the HSGW service level.	Int32
vsncp-err-pdnlimit	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to a PDN limitation. This is collected at the HSGW service level.	Int32
vsncp-err-nopdngw	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to not locating the P-GW. This is collected at the HSGW service level.	Int32
vsncp-err-pdngwunreach	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to an unreachable P-GW. This is collected at the HSGW service level.	Int32
vsncp-err-pdngwrej	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to a P-GW rejection. This is collected at the HSGW service level.	Int32
vsncp-err-insufparam	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to insufficient parameters. This is collected at the HSGW service level.	Int32
vsncp-err-resunava	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to unavailable resources. This is collected at the HSGW service level.	Int32
vsncp-err-admpro	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to administrator prohibited. This is collected at the HSGW service level.	Int32
vsncp-err-pdniduse	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due the PDN being already in use. This is collected at the HSGW service level.	Int32
vsncp-err-sublimit	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to a subscriber limit. This is collected at the HSGW service level.	Int32
vsncp-err-pdnexist	The total number of Vendor Specific Network Control Protocol (VSNCNP) errors due to the PDN not existing. This is collected at the HSGW service level.	Int32
vsncp-fail-maxretry	Total number of Vendor Specific Network Control Protocol (VSNCNP) connection failed as maximum retry limit for connection setup exhausted. This is collected at the HSGW service level.	Int32
vsncp-fail-optiss	Total number of Vendor Specific Network Control Protocol (VSNCNP) connection failed due to failure option as ISS. This is collected at the HSGW service level.	Int32

Variables	Description	Type
vsncp-fail-unk	Total number of Vendor Specific Network Control Protocol (VSNCNP) connection failed due to unknown failure option. This is collected at the HSGW service level.	Int32
lcpvse-req-total	The total number of LCP vendor specific extension request messages sent to mobile stations to update the inactivity timer in conjunction with the always on feature.	Int32
lcpvse-req-resent	The total number of LCP vendor specific extension request messages retransmitted to mobile stations to update the inactivity timer in conjunction with the always on feature.	Int32
lcpvse-rep-recved	The total number of responses to LCP vendor specific extension replies received from mobile stations as part of the inactivity timer update process in conjunction with the always on feature.	Int32
lcpvse-proto-reject	The total number protocol reject responses received for LCP vendor specific extension request messages sent to mobile stations to update the inactivity timer in conjunction with the always on feature.	Int32
lcpvse-req-maxreach	The total number of max retransmissions reached for LCP vendor specific extension request messages sent to mobile stations to update the inactivity timer in conjunction with the always on feature.	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 56

PS-Network-RANAP Schema Statistics

The PS-Network schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HNB-GW.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 56. Bulk Statistic Variables in the PS-Network-RANAP Schema

Variables	Description	Data Type
-----------	-------------	-----------

Common Syntax Options

Variables	Description	Data Type
nwnname	Indicates the name of the Packet Switch (PS) Network connected with specific HNB-GW on which statistics are collected or displayed. This is a key variable.	String
dest-pt-code	Indicates the destination point code in SS7 notation of SGSN in core network connected with specific HNB-GW of which statistics are collected or displayed. This is a key variable.	String
initial-ue-tx	Indicates the total number of Initial UE message transmitted. Trigger: When Initial UE message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
dir-transfer-rx	Indicates the total number of Direct Transfer message received. Trigger: When Direct Transfer message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
dir-transfer-tx	Indicates the total number of Direct Transfer message transmitted. Trigger: When Direct Transfer message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
reset-rx	Indicates the total number of Reset message received. Trigger: When Reset message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
reset-tx	Indicates the total number of Reset message transmitted. Trigger: When Reset message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
reset-ack-rx	Indicates the total number of Reset Ack message received. Trigger: When Reset Ack message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
reset-ack-tx	Indicates the total number of Reset Ack message transmitted. Trigger: When Reset Ack message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
reset-res-rx	Indicates the total number of Reset Resource message received. Trigger: When Reset Resource message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
reset-res-tx	Indicates the total number of Reset Resource message transmitted. Trigger: When Reset Resource message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
reset-res-ack-rx	Indicates the total number of Reset Resource Ack message received. Trigger: When Reset Resource Ack message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
reset-res-ack-tx	Indicates the total number of Reset Resource Ack message transmitted. Trigger: When Reset Resource Ack message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
iu-rel-req-tx	Indicates the total number of Iu Release Request message transmitted. Trigger: When Iu Release Request message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32

Variables	Description	Data Type
iu-rel-cmd-rx	Indicates the total number of Iu Release Command message received. Trigger: When Iu Release Command message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
iu-rel-comp-tx	Indicates the total number of Iu Release Complete message transmitted. Trigger: When Iu Release Complete message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
paging-req-rx	Indicates the total number of Paging Request message received. Trigger: When Paging Request message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rsp-tx	Indicates the total number of RAB Assignment Response message transmitted. Trigger: When RAB Assignment Response message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rsp-tx-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rsp-tx-total-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rsp-tx-rab-fail-local-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-rsp-tx-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Release Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rsp-tx-total-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Release Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rsp-tx-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Release Fail (Local). Availability: Across all PS Networks	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
rab-ass-rsp-tx-rab-que-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Queued. Availability: Across all PS Networks	Unsigned Int32
rab-ass-req-rx	Indicates the total number of RAB Assignment Request message received by PS Network. Trigger: When RAB Assignment Request message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
rab-ass-req-rx-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message received by PS Network for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by PS Network for RAB Setup/Modify. Availability: Across all PS Networks	Unsigned Int32
rab-ass-req-rx-rab-rel-rx	Indicates the total number of RAB Assignment Request message received by PS Network for RAB Release. Trigger: When RAB Assignment Request message is received by PS Network for RAB Release. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rab-setup-mod-timer-exp	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify Timer Expire. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify Timer Expire. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rab-rel-timer-exp	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Release Timer Expire. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Release Timer Expire. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rab-setup-mod-rel-local-failure	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure. Availability: Across all PS Networks	Unsigned Int32
rab-ass-local-fail-invalid-rab-id	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Radio Network Layer Cause - Invalid RAB Id. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Radio Network Layer Cause - Invalid Rab Id. Availability: Across all PS Networks	Unsigned Int32

Variables	Description	Data Type
rab-ass-local-fail-interact-with-othr-proc	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Radio Network Layer Cause - Interaction With Other Proc. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Radio Network Layer Cause - Interaction With Other Proc. Availability: Across all PS Networks	Unsigned Int32
rab-ass-local-fail-sig-trans-res-fail	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Transport Layer Cause - Signal Transport Resource Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Transport Layer Cause - Signal Transport Resource Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-local-fail-iu-conn-fail-to-estab	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Transport Layer Cause - Iu Transport Conn failed to Establish. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Transport Layer Cause - Iu Transport Conn failed to Establish. Availability: Across all PS Networks	Unsigned Int32
rab-ass-local-fail-trans-syn-err	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Transfer syntax error. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Transfer syntax error. Availability: Across all PS Networks	Unsigned Int32
rab-ass-local-fail-abs-syn-err-ign	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Abstract syntax error (Ignore). Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Abstract syntax error(Ignore). Availability: Across all PS Networks	Unsigned Int32
rab-ass-local-fail-semantic-err	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Semantic error. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Semantic error. Availability: Across all PS Networks	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
rab-ass-local-fail-abs-syn-err-rej	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Abstract syntax error (Reject). Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Abstract syntax error (Reject). Availability: Across all PS Networks	Unsigned Int32
rab-ass-local-fail-msg-not-comp	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Message not compatible with receiver state. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Message not compatible with receiver state. Availability: Across all PS Networks	Unsigned Int32
rab-ass-local-fail-falsely-construct-msg	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Abstract syntax error (Falsely constructed message). Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Protocol Layer Cause - Abstract syntax error (Falsely constructed msg). Availability: Across all PS Networks	Unsigned Int32
rab-ass-local-fail-no-res-avalable	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Miscellaneous Cause - No Resource Available. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Miscellaneous Cause - No Resource Available. Availability: Across all PS Networks	Unsigned Int32
rab-ass-rep-rx-local-fail-unspecified	Indicates the total number of RAB Assignment Response message transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Miscellaneous Cause - Unspecified. Trigger: When RAB Assignment Response message is transmitted by PS Network for RAB Setup/Modify/Release Local Failure with Miscellaneous Cause - Unspecified. Availability: Across all PS Networks	Unsigned Int32
rab-ass-conv-class-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Conversational Class for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by PS Network with Conversational Class for RAB Setup/Modify. Availability: Across all PS Networks	Unsigned Int32
rab-ass-conv-class-rab-rel-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Conversational Class for RAB Release. Trigger: When RAB Assignment Request message is received by PS Network with Conversational Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32

Variables	Description	Data Type
rab-ass-conv-class-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Conversational Class for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Conversational Class for RAB Setup/Modify Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-conv-class-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Conversational Class for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Conversational Class for RAB Setup/Modify Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-conv-class-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Conversational Class for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Conversational Class for RAB Setup/Modify Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-conv-class-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Conversational Class for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Conversational Class for RAB Release Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-conv-class-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Conversational Class for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Conversational Class for RAB Release Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-conv-class-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Conversational Class for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Conversational Class for RAB Release Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-conv-class-rab-que-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Conversational Class for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by PS Network with Conversational Class for RAB Queued. Availability: Across all PS Networks	Unsigned Int32
rab-ass-stream-class-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Streaming Class for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by PS Network with Streaming Class for RAB Setup/Modify. Availability: Across all PS Networks	Unsigned Int32
rab-ass-stream-class-rab-rel-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Streaming Class for RAB Release. Trigger: When RAB Assignment Request message is received by PS Network with Streaming Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
rab-ass-stream-class-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Streaming Class for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Streaming Class for RAB Setup/Modify Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-stream-class-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Streaming Class for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Streaming Class for RAB Setup/Modify Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-stream-class-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Streaming Class for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Streaming Class for RAB Setup/Modify Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-stream-class-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Streaming Class for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Streaming Class for RAB Release Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-stream-class-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Streaming Class for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Streaming Class for RAB Release Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-stream-class-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Streaming Class for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Streaming Class for RAB Release Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-stream-class-rab-que-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Streaming Class for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by PS Network with Streaming Class for RAB Queued. Availability: Across all PS Networks	Unsigned Int32
rab-ass-inter-class-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Interactive Class for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by PS Network with Interactive Class for RAB Setup/Modify. Availability: Across all PS Networks	Unsigned Int32
rab-ass-inter-class-rab-rel-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Interactive Class for RAB Release. Trigger: When RAB Assignment Request message is received by PS Network with Interactive Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32

Variables	Description	Data Type
rab-ass-inter-class-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Interactive Class for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Interactive Class for RAB Setup/Modify Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-inter-class-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Interactive Class for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Interactive Class for RAB Setup/Modify Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-inter-class-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Interactive Class for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Interactive Class for RAB Setup/Modify Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-inter-class-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Interactive Class for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Interactive Class for RAB Release Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-inter-class-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Interactive Class for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Interactive Class for RAB Release Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-inter-class-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Interactive Class for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Interactive Class for RAB Release Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-inter-class-rab-que-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Interactive Class for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by PS Network with Interactive Class for RAB Queued. Availability: Across all PS Networks	Unsigned Int32
rab-ass-back-class-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Background Class for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by PS Network with Background Class for RAB Setup/Modify. Availability: Across all PS Networks	Unsigned Int32
rab-ass-back-class-rab-rel-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Background Class for RAB Release. Trigger: When RAB Assignment Request message is received by PS Network with Background Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
rab-ass-back-class-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Background Class for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Background Class for RAB Setup/Modify Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-back-class-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Background Class for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Background Class for RAB Setup/Modify Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-back-class-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Background Class for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Background Class for RAB Setup/Modify Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-back-class-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Background Class for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Background Class for RAB Release Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-back-class-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Background Class for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Background Class for RAB Release Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-back-class-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Background Class for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Background Class for RAB Release Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-back-class-rab-que-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Background Class for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by PS Network with Background Class for RAB Queued. Availability: Across all PS Networks	Unsigned Int32
rab-ass-unkwn-class-rab-setup-mod-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Unknown Class for RAB Setup/Modify. Trigger: When RAB Assignment Request message is received by PS Network with Unknown Class for RAB Setup/Modify. Availability: Across all PS Networks	Unsigned Int32
rab-ass-unkwn-class-rab-rel-rx	Indicates the total number of RAB Assignment Request message received by PS Network with Unknown Class for RAB Release. Trigger: When RAB Assignment Request message is received by PS Network with Unknown Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32

Variables	Description	Data Type
rab-ass-unkwn-class-rab-setup-mod-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Unknown Class for RAB Setup/Modify Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Unknown Class for RAB Setup/Modify Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-unkwn-class-tot-rab-setup-mod-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Unknown Class for RAB Setup/Modify Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Unknown Class for RAB Setup/Modify Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-unkwn-class-rab-setup-mod-fail-lcl-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Unknown Class for RAB Setup/Modify Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Unknown Class for RAB Setup/Modify Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-unkwn-class-rab-rel-succ-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Unknown Class for RAB Release Success. Trigger: When RAB Assignment Response message is transmitted by PS Network with Unknown Class for RAB Release Success. Availability: Across all PS Networks	Unsigned Int32
rab-ass-unkwn-class-tot-rab-rel-fail-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Unknown Class for RAB Release Fail. Trigger: When RAB Assignment Response message is transmitted by PS Network with Unknown Class for RAB Release Fail. Availability: Across all PS Networks	Unsigned Int32
rab-ass-unkwn-class-rab-rel-fail-local-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Unknown Class for RAB Release Fail (Local). Trigger: When RAB Assignment Response message is transmitted by PS Network with Unknown Class for RAB Release Fail (Local). Availability: Across all PS Networks	Unsigned Int32
rab-ass-unkwn-class-rab-que-tx	Indicates the total number of RAB Assignment Response message transmitted by PS Network with Unknown Class for RAB Queued. Trigger: When RAB Assignment Response message is transmitted by PS Network with Unknown Class for RAB Queued. Availability: Across all PS Networks	Unsigned Int32
reloc-req-rx	Indicates the total number of Relocation Request message received by PS Network. Trigger: When Relocation Request message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
reloc-req-rx-rab-setup-rx	Indicates the total number of Relocation Request message received by PS Network for RAB Setup. Trigger: When Relocation Request message is received by PS Network for RAB Setup. Availability: Across all PS Networks	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
reloc-req-ack-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network. Trigger: When Relocation Request Ack message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-tx-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by PS Network for RAB Setup Success. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-tx-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by PS Network for RAB Setup Fail. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-tx-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network for RAB Setup Fail for RAB Setup Fail(Local). Trigger: When Relocation Request Ack message is transmitted by PS Network for RAB Setup Fail for RAB Setup Fail(Local). Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-invalid-rab-id	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Radio Network Layer Cause - Invalid Rab Id. Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Radio Network Layer Cause - Invalid Rab Id. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-interact-othr-proc	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Radio Network Layer Cause - Interaction With Other Proc. Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Radio Network Layer Cause - Interaction With Other Proc. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-sig-trans-res-fail	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Transport Layer Cause - Signal Transport Resource Fail. Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Transport Layer Cause - Signal Transport Resource Fail. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-iu-conn-fail-to-estab	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Transport Layer Cause - Iu Transport Conn failed to Establish. Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Transport Layer Cause - Iu Transport Conn failed to Establish. Availability: Across all PS Networks	Unsigned Int32

Variables	Description	Data Type
reloc-req-ack-local-fail-trans-syn-err	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Transfer syntax error. Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Transfer syntax error. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-abs-syn-err-ign	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Abstract syntax error(Ignore). Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Abstract syntax error(Ignore). Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-semantic-err	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Semantic error. Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Semantic error. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-abs-syn-err-rej	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Abstract syntax error (Reject). Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Abstract syntax error (Reject). Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-msg-not-comp	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Message not compatible with receiver state. Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Message not compatible with receiver state. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-falsely-construct-msg	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Abstract syntax error (Falsely constructed msg). Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Protocol Layer Cause - Abstract syntax error (Falsely constructed msg). Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-no-res-avalable	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Miscellaneous Cause - No Resource Available. Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Miscellaneous Cause - No Resource Available. Availability: Across all PS Networks	Unsigned Int32
reloc-req-ack-local-fail-unspecified	Indicates the total number of Relocation Request Ack message transmitted by PS Network for Local RAB Setup Failure with Miscellaneous Cause - Unspecified. Trigger: When Relocation Request Ack message is transmitted by PS Network for Local RAB Setup Failure with Miscellaneous Cause - Unspecified. Availability: Across all PS Networks	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
reloc-req-conv-class-rab-setup-rx	Indicates the total number of Relocation Request message received by PS Network with Conversational Class for RAB Setup. Trigger: When Relocation Request message is received by PS Network with Conversational Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
reloc-req-conv-class-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Conversational Class for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by PS Network with Conversational Class for RAB Setup Success. Availability: Across all PS Networks	Unsigned Int32
reloc-req-conv-class-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Conversational Class for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by PS Network with Conversational Class for RAB Setup Fail. Availability: Across all PS Networks	Unsigned Int32
reloc-req-conv-class-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Conversational Class for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by PS Network with Conversational Class for RAB Setup Fail (Local). Availability: Across all PS Networks	Unsigned Int32
reloc-req-stream-class-rab-setup-rx	Indicates the total number of Relocation Request message received by PS Network with Streaming Class for RAB Setup. Trigger: When Relocation Request message is received by PS Network with Streaming Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
reloc-req-stream-class-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Streaming Class for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by PS Network with Streaming Class for RAB Setup Success. Availability: Across all PS Networks	Unsigned Int32
reloc-req-stream-class-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Streaming Class for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by PS Network with Streaming Class for RAB Setup Fail. Availability: Across all PS Networks	Unsigned Int32
reloc-req-stream-class-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Streaming Class for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by PS Network with Streaming Class for RAB Setup Fail (Local). Availability: Across all PS Networks	Unsigned Int32
reloc-req-inter-class-rab-setup-rx	Indicates the total number of Relocation Request message received by PS Network with Interactive Class for RAB Setup. Trigger: When Relocation Request message is received by PS Network with Interactive Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32

Variables	Description	Data Type
reloc-req-inter-class-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Interactive Class for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by PS Network with Interactive Class for RAB Setup Success. Availability: Across all PS Networks	Unsigned Int32
reloc-req-inter-class-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Interactive Class for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by PS Network with Interactive Class for RAB Setup Fail. Availability: Across all PS Networks	Unsigned Int32
reloc-req-inter-class-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Interactive Class for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by PS Network with Interactive Class for RAB Setup Fail (Local). Availability: Across all PS Networks	Unsigned Int32
reloc-req-back-class-rab-setup-rx	Indicates the total number of Relocation Request message received by PS Network with Background Class for RAB Setup. Trigger: When Relocation Request message is received by PS Network with Background Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
reloc-req-back-class-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Background Class for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by PS Network with Background Class for RAB Setup Success. Availability: Across all PS Networks	Unsigned Int32
reloc-req-back-class-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Background Class for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by PS Network with Background Class for RAB Setup Fail. Availability: Across all PS Networks	Unsigned Int32
reloc-req-back-class-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Background Class for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by PS Network with Background Class for RAB Setup Fail (Local). Availability: Across all PS Networks	Unsigned Int32
reloc-req-unkwn-class-rab-setup-rx	Indicates the total number of Relocation Request message received by PS Network with Unknown Class for RAB Setup. Trigger: When Relocation Request message is received by PS Network with Unknown Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
reloc-req-unkwn-class-rab-setup-succ-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Unknown Class for RAB Setup Success. Trigger: When Relocation Request Ack message is transmitted by PS Network with Unknown Class for RAB Setup Success. Availability: Across all PS Networks	Unsigned Int32

■ Common Syntax Options

Variables	Description	Data Type
reloc-req-unkwn-class-tot-rab-setup-fail-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Unknown Class for RAB Setup Fail. Trigger: When Relocation Request Ack message is transmitted by PS Network with Unknown Class for RAB Setup Fail. Availability: Across all PS Networks	Unsigned Int32
reloc-req-unkwn-class-rab-setup-fail-local-tx	Indicates the total number of Relocation Request Ack message transmitted by PS Network with Unknown Class for RAB Setup Fail (Local). Trigger: When Relocation Request Ack message is transmitted by PS Network with Unknown Class for RAB Setup Fail (Local). Availability: Across all PS Networks	Unsigned Int32
reloc-detect-tx	Indicates the total number of Relocation Detect message transmitted by PS Network. Trigger: When Relocation Detect message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
reloc-comp-tx	Indicates the total number of Relocation Complete message transmitted by PS Network. Trigger: When Relocation Complete message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
total-reloc-fail-tx	Indicates the total number of Relocation Failure message transmitted by PS Network. Trigger: When Relocation Failure message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
reloc-fail-local-tx	Indicates the total number of Relocation Failure message transmitted by PS Network for Relocation Failure (Local). Trigger: When Relocation Failure message is transmitted by PS Network for Relocation Failure (Local). Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-invalid-rab-id	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Radio Network Layer Cause - Invalid RAB Id. Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Radio Network Layer Cause - Invalid RAB Id. Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-interact-otr-proc	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Radio Network Layer Cause - Interaction with other procedure.. Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Radio Network Layer Cause - Interaction with other procedure.. Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-sig-trans-res-fail	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Transport Layer Cause - Signal Transport Resource Fail. Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Transport Layer Cause - Signal Transport Resource Fail. Availability: Across all PS Networks	Unsigned Int32

Variables	Description	Data Type
reloc-fail-tx-local-fail-iu-conn-fail-to-estab	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Transport Layer Cause - Iu Transport Conn failed to Establish. Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Transport Layer Cause - Iu Transport Conn failed to Establish. Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-trans-syn-err	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Protocol Layer Cause Transfer syntax error. Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Protocol Layer Cause Transfer syntax error. Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-abs-syn-err-ign	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Protocol Layer Cause - Abstract syntax error(Ignore). Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Protocol Layer Cause - Abstract syntax error(Ignore). Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-semantic-err	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Protocol Layer Cause - Semantic error. Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Protocol Layer Cause - Semantic error. Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-abs-syn-err-rej	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Protocol Layer Cause - Abstract syntax error (Reject). Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Protocol Layer Cause - Abstract syntax error (Reject). Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-msg-not-comp	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Protocol Layer Cause - Message not compatible with receiver state. Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Protocol Layer Cause - Message not compatible with receiver state. Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-falsely-construct-msg	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Protocol Layer Cause - Abstract syntax error (Falsely constructed msg). Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Protocol Layer Cause - Abstract syntax error (Falsely constructed msg). Availability: Across all PS Networks	Unsigned Int32
reloc-fail-tx-local-fail-no-res-avable	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Miscellaneous Cause - No Resource Available. Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Miscellaneous Cause - No Resource Available. Availability: Across all PS Networks	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
reloc-fail-tx-local-fail- unspecified	Indicates the total number of Relocation Failure message received by PS Network for Local Relocation Failure with Miscellaneous Cause - Unspecified. Trigger: When Relocation Failure message is received by PS Network for Local Relocation Failure with Miscellaneous Cause - Unspecified. Availability: Across all PS Networks	Unsigned Int32
reloc-reqd-tx	Indicates the total number of Relocation Required message transmitted by PS Network. Trigger: When Relocation Required message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
reloc-prep-failure-rx	Indicates the total number of Relocation Prep Failure message received by PS Network. Trigger: When Relocation Prep Failure message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
fwd-srns-ctx-req-tx	Indicates the total number of Fwd SRNS Context Request message transmitted by PS Network. Trigger: When Fwd SRNS Context Request message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-rx	Indicates the total number of Relocation Command message received by PS Network. Trigger: When Relocation Command message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-rx-rab- setup-rx	Indicates the total number of Relocation Command message received by PS Network for RAB Setup. Trigger: When Relocation Command message is received by PS Network for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-rx-rab-rel- rx	Indicates the total number of Relocation Command message received by PS Network for RAB Release. Trigger: When Relocation Command message is received by PS Network for RAB Release. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-conv-class- rab-setup-rx	Indicates the total number of Relocation Command message received by PS Network with Conversational Class for RAB Setup. Trigger: When Relocation Command message is received by PS Network with Conversational Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-conv-class- rab-rel-rx	Indicates the total number of Relocation Command message received by PS Network with Conversational Class for RAB Release. Trigger: When Relocation Command message is received by PS Network with Conversational Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-stream- class-rab-setup-rx	Indicates the total number of Relocation Command message received by PS Network with Streaming Class for RAB Setup. Trigger: When Relocation Command message is received by PS Network with Streaming Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32

Variables	Description	Data Type
reloc-cmd-stream-class-rab-rel-rx	Indicates the total number of Relocation Command message received by PS Network with Streaming Class for RAB Release. Trigger: When Relocation Command message is received by PS Network with Streaming Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-inter-class-rab-setup-rx	Indicates the total number of Relocation Command message received by PS Network with Interactive Class for RAB Setup. Trigger: When Relocation Command message is received by PS Network with Interactive Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-inter-class-rab-rel-rx	Indicates the total number of Relocation Command message received by PS Network with Interactive Class for RAB Release. Trigger: When Relocation Command message is received by PS Network with Interactive Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-back-class-rab-setup-rx	Indicates the total number of Relocation Command message received by PS Network with Background Class for RAB Setup. Trigger: When Relocation Command message is received by PS Network with Background Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-back-class-rab-rel-rx	Indicates the total number of Relocation Command message received by PS Network with Background Class for RAB Release. Trigger: When Relocation Command message is received by PS Network with Background Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-unkwn-class-rab-setup-rx	Indicates the total number of Relocation Command message received by PS Network with Unknown Class for RAB Setup. Trigger: When Relocation Command message is received by PS Network with Unknown Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
reloc-cmd-unkwn-class-rab-rel-rx	Indicates the total number of Relocation Command message received by PS Network with Unknown Class for RAB Release. Trigger: When Relocation Command message is received by PS Network with Unknown Class for RAB Release. Availability: Across all PS Networks	Unsigned Int32
srns-ctx-req-rx	Indicates the total number of SRNS Context Request message received by PS Network. Trigger: When SRNS Context Request message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
srns-ctx-rsp-tx	Indicates the total number of SRNS Context Response message transmitted by PS Network. Trigger: When SRNS Context Response message is transmitted by PS Network. Availability: Across all PS Networks	Unsigned Int32

Common Syntax Options

Variables	Description	Data Type
sns-data-fwd-cmd-rx	Indicates the total number of SRNS Data Fwd Command message received by PS Network. Trigger: When SRNS Data Fwd Command message is received by PS Network. Availability: Across all PS Networks	Unsigned Int32
sns-data-fwd-cmd-rx-rab-setup-rx	Indicates the total number of SRNS Data Fwd Command message received by PS Network for RAB Setup. Trigger: When SRNS Data Fwd Command message is received by PS Network for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
sns-conv-class-rab-setup-rx	Indicates the total number of SRNS Data Fwd Command message received by PS Network with Conversational Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is received by PS Network with Conversational Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
sns-stream-class-rab-setup-rx	Indicates the total number of SRNS Data Fwd Command message received by PS Network with Streaming Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is received by PS Network with Streaming Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
sns-inter-class-rab-setup-rx	Indicates the total number of SRNS Data Fwd Command message received by PS Network with Interactive Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is received by PS Network with Interactive Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
sns-back-class-rab-setup-rx	Indicates the total number of SRNS Data Fwd Command message received by PS Network with Background Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is received by PS Network with Background Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32
sns-unkwn-class-rab-setup-rx	Indicates the total number of SRNS Data Fwd Command message received by PS Network with Unknown Class for RAB Setup. Trigger: When SRNS Data Fwd Command message is received by PS Network with Unknown Class for RAB Setup. Availability: Across all PS Networks	Unsigned Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 57

RADIUS Schema Statistics

The RADIUS schema provides operational statistics that can be used for monitoring and troubleshooting RADIUS AAA functionality used by the following products: ASN-GW, GGSN, HA, HSGW, IPSG, P-GW, PDSN

This schema displays information pertaining to RADIUS bulk statistics per server.

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 57. Bulk Statistic Variables in the RADIUS Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
ipaddr	Description: The IP address of the RADIUS server for which statistics are being collected. The IP address can be specified in IPv4 or IPv6 notation. This is a key variable. Availability: Per AAA group Type: Information	String
port	Description: The UDP port being used for the exchange of RADIUS data. This is a key variable. Availability: Per AAA group Type: Information	Int32
servertype	Description: The type of RADIUS server (authentication or accounting) for which statistics are being collected. This is a key variable. Availability: Per AAA group Type: Information	String
vpnname	Description: The name of the context configured on the system that is currently facilitating the RADIUS server configuration. This is a key variable. Availability: Per system Type: Information	String
vpnid	Description: The identification number of the context configured on the system that is currently facilitating the RADIUS server configuration. This is an internal reference number. This is a key variable. Availability: Per system Type: Information	Int32
group	Description: The RADIUS group name on a per-radius-server basis. This is a key variable. Availability: Per system Type: Information	String
nasipaddr	Description: The RADIUS network access server address. This is a key variable. Availability: Per AAA group Type: Information	String
auth-req-sent	Description: The total number of authentication requests sent to this server. Triggers: Increments when an authentication request is sent to RADIUS server Availability: Per RADIUS server	Int32
auth-req-sentwdmu	Description: The total number of authentication requests sent to this server with a Dynamic Mobile IP Key Update. Triggers: Increments when an authentication request is sent to RADIUS server with DMU attribute Availability: Per RADIUS server	Int32

Variables	Description	Data Type
auth-req-pending	<p>Description: The total number of authentication requests pending for this server.</p> <p>Triggers: Increments whenever a response to the authentication request is pending from the RADIUS server Decrements when an acknowledgement is received for the authentication request from the RADIUS server</p> <p>Availability: Per RADIUS server Type: Gauge</p>	Int32
auth-req-queued	<p>Description: The total number of authentication requests queued for this server.</p> <p>Triggers: Increments when an authentication request is queued for the server Decrements when the authentication request is dequeued and sent to the RADIUS server</p> <p>Availability: Per RADIUS server Type: Gauge</p>	Int32
auth-req-retried	<p>Description: The total number of authentication requests that were re-sent to this server.</p> <p>Triggers: Increments when an authentication request is retried</p> <p>Availability: Per RADIUS server</p>	Int32
auth-req-retriedwdmu	<p>Description: The total number of authentication requests that were re-sent to this server with a Dynamic Mobile IP Key Update.</p> <p>Triggers: Increments when an authentication request with DMU attribute is retried</p> <p>Availability: Per RADIUS server</p>	Int32
auth-chal-rcvd	<p>Description: The total number of authentication access challenges received from this server.</p> <p>Triggers: Increments when an authentication access challenge request is received from RADIUS server</p> <p>Availability: Per RADIUS server</p>	Int32
auth-acc-rcvd	<p>Description: The total number of authentication accept messages received from this server.</p> <p>Triggers: Increments when an authentication accept message is received from RADIUS server</p> <p>Availability: Per RADIUS server</p>	Int32
auth-rej-rcvd	<p>Description: The total number of authentication reject messages received from this server.</p> <p>Triggers: Increments when an authentication reject message is received from RADIUS server</p> <p>Availability: Per RADIUS server</p>	Int32
auth-rej-rcvdwdmu	<p>Description: The total number of authentication reject messages received from this server with a Dynamic Mobile IP Key Update.</p> <p>Triggers: Increments when an authentication reject message is received with DMU attribute</p> <p>Availability: Per RADIUS server</p>	Int32
auth-timeout	<p>Description: The total number of authentication requests for this server that timed-out.</p> <p>Triggers: Increments when an authentication request is timed out for the RADIUS server</p> <p>Availability: Per RADIUS server</p>	Int32
cons-fail	<p>Description: The total number of consecutive authentication/accounting failures that occurred with this server.</p> <p>Triggers: Increments whenever two or more consecutive authentication/accounting requests fail</p> <p>Availability: Per RADIUS server</p>	Int32

Variables	Description	Data Type
auth-cons-fail	<p>Description: The total number of consecutive authentication failures that occurred with this server.</p> <hr/> <p> IMPORTANT: This statistic is obsolete and has been replaced with “cons-fail” statistic.</p> <hr/>	Int32
auth-rsp-badauth	<p>Description: The total number of Accept Request responses received by the system from the server that contains an incorrect Authenticator field, thereby failing message authentication.</p> <p>Triggers: Increments whenever a message authentication fails due to the presence of incorrect Authenticator field in Accept Request response received from the server.</p> <p>Availability: Per RADIUS server</p>	Int32
auth-rsp-malformed	<p>Description: The total number of Accept Request responses received by the system from the server that were malformed.</p> <p>Triggers: Increments whenever an Accept Request response from the server is detected to be malformed.</p> <p>Availability: Per RADIUS server</p>	Int32
auth-rsp-malformedattr	<p>Description: The total number of malformed or invalid attributes received in Access-Request response messages.</p> <p>Triggers: Increments whenever a malformed or invalid attribute is received in Access-Request response message.</p> <p>Availability: Per RADIUS server</p>	Int32
auth-rsp-unktype	<p>Description: The total number of Accept Request responses received by the system from the server that contained an unknown message type.</p> <p>Triggers: Increments whenever an unknown message type is included in Access-Request response message received from the server.</p> <p>Availability: Per RADIUS server</p>	Int32
auth-rsp-dropped	<p>Description: The total number of authentication responses from this server that were discarded. The message discard can happen due to any of the following reasons - the request being timed out, response arriving late, or request being cancelled due to call disconnection, etc.</p> <p>Triggers: Increments whenever an authentication response message is discarded</p> <p>Availability: Per RADIUS server</p>	Int32
auth-rsp-roundtripusec	<p>Description: Indicates the amount of time it took for the system to receive a valid response from the server for the last authentication request. This is used as a measure to determine how fast the server responds to the authentication request.</p> <p>Triggers: This statistics is updated whenever the system receives a valid response to the last authentication request.</p> <p>Availability: Per RADIUS server</p> <p>Type: Information</p>	Int32
probe-issued	<p>Description: The total number of probe transactions issued to the RADIUS server. Probe is a type of RADIUS test authentication message.</p> <p>Triggers: Increments whenever a probe request is sent to the RADIUS server.</p> <p>Availability: Per RADIUS server</p>	Int32

Variables	Description	Data Type
probe-success	Description: The total number of complete successful probe transactions to the RADIUS server. Triggers: Increments whenever a response is received from the RADIUS server for the probe request sent. Availability: Per RADIUS server	Int32
probe-failed	Description: The total number of failed probe transactions to the RADIUS server. Triggers: Increments whenever a response is not received from the RADIUS server for the probe request sent. Availability: Per RADIUS server	Int32
probe-roundtriptimeusec	Description: The amount of time, in milliseconds, that it took from when a request was sent to and acknowledgement was received from the RADIUS server. Triggers: This statistics is updated when a request was sent to and acknowledgement was received from the RADIUS server. Availability: Per RADIUS server Type: Information	Int32
keepalive-auth-req-sent	Description: The total number of keepalive authentication requests sent. Triggers: Increments whenever a keepalive authentication request is sent to the RADIUS server. Availability: Per RADIUS server	Int32
keepalive-auth-retried	Description: The total number of keepalive authentication requests retried. Triggers: Increments whenever a keepalive authentication request is retried. Availability: Per RADIUS server	Int32
keepalive-auth-timeout	Description: The total number of keepalive authentication requests that timed out. Triggers: Increments whenever a keepalive authentication request is timed out. Availability: Per RADIUS server	Int32
keepalive-auth-acc-rcvd	Description: The total number of keepalive authentication accept requests that were received. Triggers: Increments whenever a keepalive authentication accept request is received. Availability: Per RADIUS server	Int32
keepalive-auth-rej-rcvd	Description: The total number of keepalive authentication rejections that were received. Triggers: Increments whenever a keepalive authentication rejection is received. Availability: Per RADIUS server	Int32
keepalive-auth-rsp-badauth	Description: The total number of keepalive authentication request response messages that failed with a bad authenticator. Triggers: Increments when a keepalive authentication request response message failed with a bad authenticator. Availability: Per RADIUS server	Int32
keepalive-auth-rsp-malformed	Description: The total number of keepalive authentication request response messages that were malformed. Triggers: Increments when a keepalive authentication request response message is detected to be malformed. Availability: Per RADIUS server	Int32

Variables	Description	Data Type
keepalive-auth-rsp-malformedattr	Description: The total number of keepalive authentication request response messages that contained malformed attributes. Triggers: Increments when a malformed attribute is included in the keepalive authentication request response message. Availability: Per RADIUS server	Int32
keepalive-auth-rsp-unktype	Description: The total number of keepalive authentication request response messages that failed with an unknown message type. Triggers: Increments when a keepalive authentication request response message failed with an unknown message type. Availability: Per RADIUS server	Int32
keepalive-auth-rsp-dropped	Description: The total number of keepalive authentication request response messages that were dropped. Triggers: Increments when a keepalive authentication request response message is dropped. Availability: Per RADIUS server	Int32
acc-req-sent	Description: The total number of accounting requests sent to this server. Triggers: Increments when an accounting request is sent to the RADIUS server. Availability: Per RADIUS server	Int32
acc-req-pending	Description: The total number of accounting requests pending for this server. Triggers: Increments when an accounting request is pending for the RADIUS server. Availability: Per RADIUS server	Int32
acc-req-queued	Description: The total number of accounting requests queued for this server. Triggers: Increments when an accounting request is queued for the RADIUS server. Availability: Per RADIUS server	Int32
acc-req-retried	Description: The total number of accounting requests that were re-sent to this server. Triggers: Increments when an accounting request is re-sent to the RADIUS server. Availability: Per RADIUS server	Int32
acc-rsp-rcvd	Description: The total number of accounting responses received from this server. Triggers: Increments when an accounting response is received from the RADIUS server. Availability: Per RADIUS server	Int32
acc-req-timeout	Description: The total number of accounting requests for this server that timed-out. Triggers: Increments when an accounting request is timed out. Availability: Per RADIUS server	Int32
acc-req-cons-fail	Description: The total number of consecutive accounting failures that occurred with this server.  IMPORTANT: This statistic is obsolete and has been replaced with “cons-fail” statistic.	Int32

Variables	Description	Data Type
acc-rsp-badresp	Description: The total number of Accounting Responses received by the system from the server that contained an incorrect Authenticator field, thereby failing message. Triggers: Increments whenever a message accounting fails due to the presence of incorrect Authenticator field in Accounting response received from the server. Availability: Per RADIUS server	Int32
acc-rsp-malformed	Description: The total number of Accounting Responses received by the system from the server that were malformed. Triggers: Increments whenever an Accounting Response from the server is detected to be malformed. Availability: Per RADIUS server	Int32
acc-rsp-unktype	Description: The total number of Accounting Responses received by the system from the server that contained an unknown message type. Triggers: Increments whenever an unknown message type is included in Accounting Response message received from the server. Availability: Per RADIUS server	Int32
acc-rsp-dropped	Description: The total number of Accounting Responses from the server that were discarded. Triggers: Increments whenever an Accounting Response message is discarded Availability: Per RADIUS server	Int32
acc-rsp-roundtripusec	Description: Indicates the amount of time it took for the system to receive a valid response from the server for the last accounting request. Triggers: This statistics is updated whenever the system receives a valid response to the last accounting request. Availability: Per RADIUS server Type: Information	Int32
acc-start-sent	Description: The total number of accounting start messages sent. Triggers: Increments whenever an accounting start message is sent Availability: Per RADIUS server	Int32
acc-stop-sent	Description: The total number of accounting stop messages sent. Triggers: Increments whenever an accounting stop message is sent Availability: Per RADIUS server	Int32
acc-interim-sent	Description: The total number of interim accounting messages sent. Triggers: Increments whenever an interim accounting message is sent Availability: Per RADIUS server	Int32
acc-on-sent	Description: The total number of accounting ON messages sent. Triggers: Increments whenever an accounting ON message is sent Availability: Per RADIUS server	Int32
acc-off-sent	Description: The total number of accounting OFF messages sent. Triggers: Increments whenever an accounting OFF message is sent Availability: Per RADIUS server	Int32
acc-start-retries	Description: The total number of accounting start retry messages sent. Triggers: Increments whenever an accounting start message is retried Availability: Per RADIUS server	Int32

Variables	Description	Data Type
acc-stop-retries	Description: The total number of accounting stop retry messages sent. Triggers: Increments whenever an accounting stop message is retried Availability: Per RADIUS server	Int32
acc-interim-retries	Description: The total number of interim accounting retry messages sent. Triggers: Increments whenever an interim accounting message is retried Availability: Per RADIUS server	Int32
acc-on-retries	Description: The total number of accounting ON retry messages sent. Triggers: Increments whenever an accounting ON message is retried Availability: Per RADIUS server	Int32
acc-off-retries	Description: The total number of accounting OFF retry messages sent. Triggers: Increments whenever an accounting OFF message is retried Availability: Per RADIUS server	Int32
acc-ttl-g1	Description: The total number of accounted bytes as user input. Triggers: Increments based on the input byte value of accounting messages Availability: Per RADIUS server	Int64
acc-ttl-g2	Description: The total number of accounted bytes outputted to user. Triggers: Increments based on the output byte value of accounting messages Availability: Per RADIUS server	Int64
keepalive-acct-req-sent	Description: The total number of keepalive accounting request messages sent. Triggers: Increments whenever a keepalive accounting request message is sent Availability: Per RADIUS server	Int32
keepalive-acct-retried	Description: The total number of keepalive accounting messages retried. Triggers: Increments whenever a keepalive accounting request message is retried Availability: Per RADIUS server	Int32
keepalive-acct-success	Description: The total number of successful keepalive accounting messages. Triggers: Increments whenever a keepalive accounting request message is successful. Availability: Per RADIUS server	Int32
keepalive-acct-timeout	Description: The total number of keepalive accounting timeout messages. Triggers: Increments whenever a keepalive accounting request message is timed out. Availability: Per RADIUS server	Int32
keepalive-acct-rsp-badauth	Description: The total number of keepalive accounting request response messages that failed with a bad authenticator. Triggers: Increments whenever a message accounting fails due to the presence of incorrect Authenticator field in keepalive accounting request response message received from the server. Availability: Per RADIUS server	Int32
keepalive-acct-rsp-malformed	Description: The total number of keepalive accounting request response messages that were malformed. Triggers: Increments whenever a keepalive accounting request response message is detected to be malformed. Availability: Per RADIUS server	Int32

Variables	Description	Data Type
keepalive-acct-rsp-unktype	Description: The total number of keepalive accounting request response messages that failed with an unknown type. Triggers: Increments whenever an unknown message type is included in keepalive accounting request response message received from the server. Availability: Per RADIUS server	Int32
keepalive-acct-rsp-dropped	Description: The total number of keepalive accounting request response messages that were dropped. Triggers: Increments whenever a keepalive accounting request response message is discarded Availability: Per RADIUS server	Int32
online-acc-req-sent	Description: The total number of Online Access Request messages sent. Triggers: Increments whenever an Online Access Request message is sent. Availability: Per RADIUS server	Int32
online-acc-req-pending	Description: The total number of Online Access Request messages pending. Triggers: Increments whenever an Online Access Request message is pending for the RADIUS server. Availability: Per RADIUS server	Int32
online-acc-req-retried	Description: The total number of Online Access Request messages retried. Triggers: Increments whenever an Online Access Request message is retried. Availability: Per RADIUS server	Int32
online-acc-rsp-rcvd	Description: The total number of Online Access Accept messages received. Triggers: Increments whenever an Online Access Accept message is received. Availability: Per RADIUS server	Int32
online-acc-rej-rcvd	Description: The total number of Online Access Reject messages received. Triggers: Increments whenever an Online Access Reject message is received. Availability: Per RADIUS server	Int32
online-acc-req-timeout	Description: The total number of Online Access Request message timeouts. Triggers: Increments whenever an Online Access Request message is timed out. Availability: Per RADIUS server	Int32
online-acc-rsp-badauth	Description: The total number of Online Access Request messages that failed with a bad authenticator. Triggers: Increments whenever a message accounting fails due to the presence of incorrect Authenticator field in Online Access Request message. Availability: Per RADIUS server	Int32
online-acc-rsp-malformed	Description: The total number of Online Access Request Response messages that were malformed. Triggers: Increments whenever an Online Access Request Response message from the server is detected to be malformed. Availability: Per RADIUS server	Int32
online-acc-rsp-malformedattr	Description: The total number of Online Access Request Response messages that contained a malformed attribute. Triggers: Increments whenever a malformed or invalid attribute is received in Online Access Request Response message. Availability: Per RADIUS server	Int32

Variables	Description	Data Type
online-acc-rsp-unktype	<p>Description: The total number of Online Access Request Response messages that are of an unknown type.</p> <p>Triggers: Increments whenever an unknown message type is included in Online Access Request Response message received from the server.</p> <p>Availability: Per RADIUS server</p>	Int32
online-acc-badmsgauth	<p>Description: The total number of Online Access Request Response messages that contained a bad message authenticator.</p> <p>Triggers: Increments whenever an Online Access Request Response message contains a bad message authenticator.</p> <p>Availability: Per RADIUS server</p>	Int32
online-acc-nomsgauth	<p>Description: The total number of Online Access Request Response messages that contained no message authenticator.</p> <p>Triggers: Increments whenever an Online Access Request Response message does not contain any message authenticator.</p> <p>Availability: Per RADIUS server</p>	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 58

RP Schema Statistics

The RP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: HSGW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 58. Bulk Statistic Variables in the RP Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the PDSN service. This is a key variable.	String
vpnid	The identification number of the context configured on the system that is currently facilitating the PDSN service. This is an internal reference number. This is a key variable.	Int32
servname	Displays the name of the PDSN service for which the statistics are displayed. This is a key variable.	String
num-sessions	The current total number of RP sessions	Int32
sess-cursetup	The total number of current sessions per service.	Int32
sess-currevasetup	The total number of current EVDO-Rev A sessions per service.	Int32
sess-ttlsetup	The total sessions setup per service.	Int32
sess-ttlrevasetup	The total EVDO-Rev A sessions setup per service.	Int32
sess-ttlrevarereleased	The total EVDO-Rev A sessions released per service.	Int32
sess-ttlrevadowngrade	The total EVDO-Rev A sessions that were downgraded per service.	Int32
sess-ttlreleased	The total number of sessions released per service.	Int32
svctype	Indicates the type of services running for this schema. It is collected at the per service level.	String
a10-cursetup	The total number of current A10s per service.	Int32
a10aux-cursetup	The total number of current aux A10s per service.	Int32
a10main-cursetup	The total number of current main A10s per service.	Int32
a10-ttlsetup	The total number of A10s setup per service.	Int32
a10aux-ttlsetup	The total number of aux A10s setup per service.	Int32
a10main-ttlsetup	The total number of main a10s setup per service.	Int32
a10-ttlreleased	The total number of a10s released per service.	Int32
a10aux-ttlreleased	The total number of aux A10s released per service.	Int32
a10main-ttlreleased	The total number of main A10s released per service.	Int32
sess-release-dereg	The total number of sessions de-registered per service.	Int32
sess-release-expiry	The total number of sessions released due to lifetime expiry per service.	Int32
sess-release-ppplayer	The total number of sessions released due to a PPP Layer command reported per service.	Int32
sess-release-pcfmonfail	The total number of sessions released due to a PCF Monitor failure reported per service.	Int32
sess-release-grekey	The total number of sessions released due to a GRE Key Mismatch reported per service.	Int32

Variables	Description	Data Type
sess-release-purged	The total number of sessions released due to inconsistencies found during audits between the A11 Manager task and the Session Manager task. When an inconsistency is identified, the session is released and accounting stops are issued.	Int32
sess-release-other	The total number of sessions released due to other reasons reported per service.	Int32
recv-total	The total number of registration requests, renewals, and de-registrations received.	Int32
accept-total	The total number of registration requests that have been accepted.	Int32
denied-total	The total number of registration requests that have been rejected.	Int32
reply -total	The total number of registration replies sent.	Int32
discard-total	The total number of registration requests that have been discarded.	Int32
accept-initial	The total number of initial registration requests received and accepted.	Int32
recv-initial	The total number of initial registration requests received.	Int32
accept-intrapdsn	The total number of registration requests received for sessions going through an intra-PDSN handoff.  IMPORTANT: This statistic is provided for compatibility only. Please use the accept-active-intrapdsn statistic.	Int32
accept-active-intrapdsn	The total number of registration requests received with ACTIVE START for an intra-PDSN handoff.	Int32
accept-dormant-intrapdsn	The total number of registration requests received with ACTIVE STOP for an intra-PDSN handoff.	Int32
accept-interpdsn	The total number of registration requests received for sessions going through an inter-PDSN handoff.	Int32
reva-rrq-recv	The total number of Rev-A RRQs received per service.	Int32
reva-rrq-accept	The total number of Rev-A RRQs accepted per service.	Int32
reva-rrq-denied	The total number of Rev-A RRQs denied per service.	Int32
reva-rrq-reply	The total number of Rev-A RRQs per service that were replied to.	Int32
denied-initial	The total number of initial registration requests received and rejected.	Int32
discard-initial	The total number of Initial RRQ discarded.	Int32
recv-initial-setupstart	The total number of Initial Setup/Start RRQ received.	Int32
accept-initial-setupstart	The total number of Initial Setup/Start RRQ received and accepted.	Int32
denied-initial-setupstart	The total number of Initial Setup/Start RRQ received and denied.	Int32

Variables	Description	Data Type
discard-initial-setupstart	The total number of initial start or setup registration requests that have been received and discarded.	Int32
accept-renew	The total number of registration request renewals received and accepted.	Int32
denied-renew	The total number of registration request renewals received and rejected.	Int32
recv-renew	The total number of registration request renewals received.	Int32
discard-renew	The total number of registration request renewals received and discarded.	Int32
recv-renew-noairlink	The total number of registration request renewals received due to “No airlink”.	Int32
accept-renew-noairlink	The total number of registration request renewals received due to “No airlink” and accepted.	Int32
denied-renew-noairlink	The total number of registration request renewals received due to “No airlink” and denied.	Int32
discard-renew-noairlink	The total number of registration request renewals received due to “No airlink” and discarded.	Int32
active-start-renew	<p>The total number of ACTIVE START registration request renewals received.</p> <hr/> <p> IMPORTANT: This statistic is provided for compatibility only. Please use the accept-renew-activestart statistic.</p>	Int32
recv-renew-activestart	The total number of RRQ renewals with an Active Start record received.	Int32
accept-renew-activestart	The total number of RRQ renewals with an Active Start record received and accepted.	Int32
denied-renew-activestart	The total number of RRQ renewals with an Active Start record received and denied.	Int32
discard-renew-activestart	The total number of RRQ renewals with an Active Start record received and discarded.	Int32
active-stop-renew	<p>The total number of ACTIVE STOP registration request renewals received.</p> <hr/> <p> IMPORTANT: This statistic is provided for compatibility only. Please use the accept-renew-activestop statistic.</p>	Int32
recv-renew-activestop	The total number of RRQ renewals with an Active Stop record received.	Int32
accept-renew-activestop	The total number of RRQ renewals with an Active Stop record received and accepted.	Int32
denied-renew-activestop	The total number of RRQ renewals with an Active Stop record received and denied.	Int32
discard-renew-activestop	The total number of RRQ renewals with an Active Stop record received and discarded.	Int32
accept-dereg	The total number of de-registration requests received and accepted.	Int32
denied-dereg	The total number of de-registration request renewals received and rejected.	Int32

Variables	Description	Data Type
recv-dereg	The total number of de-registration request renewals received.	Int32
discard-dereg	The the total number of de-registration requests received and discarded.	Int32
recv-dereg-noactivestop	The total number of de-registration requests with a No Active Stop record received.	Int32
accept-dereg-noactivestop	The total number of de-registration requests with a No Active Stop record received and accepted.	Int32
denied-dereg-noactivestop	The total number of de-registration requests with a No Active Stop record received and denied	Int32
discard-dereg-noactivestop	The total number of de-registration requests with a No Active Stop record received and discarded.	Int32
active-stop-dereg	The total number of ACTIVE STOP de-registration request renewals received and accepted.  IMPORTANT: This statistic is provided for compatibility only. Please use the accept-dereg-activestop statistic.	Int32
recv-dereg-activestop	The the total number of de-registration request with an Active Stop record received.	Int32
accept-dereg-activestop	The the total number of de-registration request with an Active Stop record received and accepted.	Int32
denied-dereg-activestop	The the total number of de-registration request with an Active Stop record received and denied.	Int32
discard-dereg-activestop	The the total number of de-registration request with an Active Stop record received and discarded.	Int32
recv-intrapdsn-activeanidhandoff	The total number of intra PDSN handoff RRQs with active Access Network Identifier (ANID) received.	Int32
accept-intrapdsn-activeanidhandoff	The total number of intra PDSN handoff RRQs with active ANID received and accepted.	Int32
denied-intrapdsn-activeanidhandoff	The total number of intra PDSN handoff RRQs with active ANID received and denied.	Int32
discard-intrapdsn-activeanidhandoff	The total number of intra PDSN handoff RRQs with active ANID received and discarded.	Int32
recv-intrapdsn-dormantanidhandoff	The total number of intra PDSN handoff RRQs with dormant ANID received.	Int32
accept-intrapdsn-dormantanidhandoff	The total number of intra PDSN handoff RRQs with dormant ANID received and accepted.	Int32
denied-intrapdsn-dormantanidhandoff	The total number of intra PDSN handoff RRQs with dormant ANID received and denied.	Int32

Variables	Description	Data Type
discard-intrapdsn-dormantanidhandoff	The total number of intra PDSN handoff RRQs with dormant ANID received and discarded.	Int32
recv-interpdsn-activemeianidhandoff	The total number of inter PDSN handoff RRQs with active Mobility Event Indicator (MEI) and ANID received.	Int32
accept-interpdsn-activemeianidhandoff	The total number of inter PDSN handoff RRQs with active MEI and ANID received and accepted.	Int32
denied-interpdsn-activemeianidhandoff	The total number of inter PDSN handoff RRQs with active MEI and ANID received and denied.	Int32
discard-interpdsn-activemeianidhandoff	The total number of inter PDSN handoff RRQs with active MEI and ANID received and discarded.	Int32
send-error	The total number of registration replies for which errors were experienced during transmission.	Int32
hash-error	The total number of registration requests that had internal hash lookup errors.	Int32
decode-error	The total number of registration requests that had decode errors.	Int32
unhandled	The total number of registration requests that had unhandled errors.	Int32
seqerror	The total number of registration requests that had sequence numbers that were not acceptable.	Int32
deny-unspec	The total number of registration requests that were denied using reply code of 80H (Registration Denied - reason unspecified)	Int32
deny-adminprohib	The total number of registration requests that were denied using reply code of 81H (Registration Denied - administratively prohibited).	Int32
deny-noresource	The total number of registration requests that were denied using reply code of 82H (Registration Denied - insufficient resources).	Int32
deny-auth	The total number of registration requests that were denied using reply code of 83H (Registration Denied - mobile node failed authentication).	Int32
deny-idmismatch	The total number of registration requests that were denied using reply code of 85H (Registration Denied - identification mismatch).	Int32
deny-badrequest	The total number of registration requests that were denied using reply code of 86H (Registration Denied - poorly formed request).	Int32
deny-unknownpdsn	The total number of registration requests that were denied using reply code of 88H (Registration Denied - unknown PDSN address)	Int32
deny-revtununavail	The total number of registration requests that were denied using reply code of 89H (Registration Denied - requested reverse tunnel unavailable).	Int32
deny-revtunreq	The total number of registration requests that were denied using reply code of 8AH (Registration Denied - reverse tunnel is mandatory and "T"-bit not set).	Int32
deny-unrecogvend	The total number of registration requests that were denied using reply code of 8DH (Registration Denied - unsupported vendor ID or unable to interpret data in the CVSE).	Int32

Variables	Description	Data Type
deny-sessclosed	The total number of registration requests that were denied using an error code 0x8E for absent RP sessions. Refer to the session-already-closed keyword for the registration-deny command in the PDSN Configuration Mode chapter of the Command Line Interface Reference for additional information.	Int32
deny-bsninfo	The total number of registration requests that were denied because BSN information was unavailable.	Int32
deny-noresource-nosessmgr	The total number of RRQ denied due to Insufficient resource, no session manager reported per service.	Int32
deny-noresource-nomem	The total number of RRQ denied due to Insufficient resource, no memory reported per service.	Int32
deny-noresource-sessmgrretried	The total number of RRQ denied due to Insufficient resource, session managers retried reported per service.	Int32
deny-noresource-inputq	The total number of RRQ denied due to Insufficient resource, input queue exceeded reported per service.	Int32
deny-noresource-policy	The total number of RRQ denied due to Insufficient resource, policy rejected reported per service.	Int32
deny-noresource-sessmgrrej	The total number of RRQ denied due to Insufficient resource, session manager rejected reported per service.	Int32
deny-noresource-allmgrrej	The total number of RRQ denied due to Insufficient resource, A11 manager rejected reported per service.	Int32
deny-badrequest-alrdorm	The total number of RRQ denied due to poorly formed request, session already dormant reported per service.	Int32
deny-badrequest-alractive	The total number of RRQ denied due to poorly formed request, already active reported per service.	Int32
deny-badrequest-setupabsent	The total number of RRQ denied due to poorly formed request, airlink setup absent reported per service.	Int32
deny-badrequest-miscoaaddr	The total number of RRQ denied due to poorly formed request, mismatched CoA/Source address reported per service.	Int32
deny-badrequest-pktttooshort	The total number of RRQ denied due to poorly formed request, packet too short reported per service.	Int32
deny-badrequest-pktttoolong	The total number of RRQ denied due to poorly formed request, packet too long reported per service.	Int32
deny-badrequest-fieldlen	The total number of RRQ denied due to poorly formed request, invalid field length reported per service.	Int32
deny-badrequest-flags	The total number of RRQ denied due to poorly formed request, invalid flags reported per service.	Int32
deny-badrequest-hoanonzero	The total number of RRQ denied due to poorly formed request, HOA non-zero reported per service.	Int32

Variables	Description	Data Type
deny-badrequest-sse	The total number of RRQ denied due to poorly formed request, invalid SSE reported per service.	Int32
deny-badrequest-vse	The total number of RRQ denied due to poorly formed request, invalid VSE reported per service.	Int32
deny-badrequest-authextn	The total number of RRQ denied due to poorly formed request, invalid authorization extension reported per service.	Int32
deny-badrequest-unkextn	The total number of RRQ denied due to poorly formed request, invalid unknown extension reported per service.	Int32
deny-badrequest-other	The total number of RRQ denied due to poorly formed request, other reason reported per service.	Int32
deny-unspec-nullpkt	The total number of RRQ denied due to unspecified reason, null packet received reported per service.	Int32
deny-unspec-lifzero	The total number of RRQ denied due to unspecified reason, lifetime zero in initial RRQ reported per service.	Int32
deny-unspec-notready	The total number of RRQ denied due to unspecified reason, session manager not ready reported per service.	Int32
deny-unspec-crphandoff	The total number of RRQ denied due to unspecified reason, Closed RP handoff in progress reported per service.	Int32
deny-unspec-noairlink	The total number of RRQ denied due to unspecified reason, no airlink setup reported per service.	Int32
deny-unspec-intrahandoff	The total number of RRQ Denied due to unspecified reason, intra PDSN handoff triggered reported per service.	Int32
deny-cong-drop	The total number of denied registration replies discarded due to congestion. Refer to the Configuring Congestion Control chapter of this guide for additional information.	Int32
deny-cong-adminprohib	The total number of denied registration replies that were sent with a reply code of 81H (Registration Denied - administratively prohibited) due to congestion. Refer to the Configuring Congestion Control chapter of this guide for additional information.	Int32
deny-cong-unknownpdsn	The total number of denied registration replies that were sent with a reply code of 88H (Registration Denied - unknown PDSN address) due to congestion. Refer to the Configuring Congestion Control chapter of this guide for additional information.	Int32
upd-total	The total number of registration updates that were transmitted.	Int32
upd-accept	The total number of registration updates that were accepted by the PCF.	Int32
upd-denied	The total number of registration updates that were denied.	Int32
upd-unack	The total number of registration updates that were not acknowledged.	Int32
upd-trans	The total number of initial registration updates that were transmitted.	Int32
upd-ttlnoetrans	The total number of registration updates that were not re-transmitted due to TTL expiration.	Int32
upd-retrans	The total number of registration updates that were re-transmitted.	Int32

Variables	Description	Data Type
upd-received	The total number of registration acknowledgements that were received.	Int32
upd-ack-received	The total number of registration acknowledgements that were received.	Int32
upd-discard	The total number of registration acknowledgements that were discarded.	Int32
upd-senderror	The total number of registration updates for which errors were experienced during transmission.	Int32
upd-upltrinit	The total number of registration updates that were initiated by upper processing layers.  IMPORTANT: This statistic is obsolete.	Int32
upd-uplyrinit	The total number of registration updates that were initiated by upper processing layers.  IMPORTANT: This statistic is obsolete.	Int32
upd-other	The total number of registration updates that were sent due to reasons other than those listed here.	Int32
upd-handoff	The number of registration updates that were sent due to handoff releases.	Int32
upd-lifetime	The total number of registration updates that the send reason was Lifetime Expiry reported per service.	Int32
upd-smgrexit	The total number of registration updates that the send reason was that the session manager exited reported per service.	Int32
upddeny-unspec	The total number of denied registration updates that were sent with a reply code of 80H (Registration Denied - reason unspecified).	Int32
upddeny-adminprohib	The total number of denied registration updates that were sent with a reply code of 81H (Registration Denied - administratively prohibited).	Int32
upddeny-auth	The total number of denied registration updates that were sent with a reply code of 83H (Registration Denied - mobile node failed authentication).	Int32
upddeny-idmismatch	The total number of denied registration updates that were sent with a reply code of 85H (Registration Denied - identification mismatch).	Int32
upddeny-badrequest	The total number of denied registration updates that were sent with a reply code of 86H (Registration Denied - poorly formed request).	Int32
upd-discard-absent	The total number of registration acknowledgements that were discarded due to the session having been already ended because the acknowledgement was late.	Int32
upd-discard-nomem	The total number of registration acknowledgements that were discarded due to insufficient memory.	Int32

Variables	Description	Data Type
upd-discard-malform	The total number of registration acknowledgements that were discarded due to being poorly formed.	Int32
upd-discard-authfail	The total number of registration acknowledgements that were discarded due to the mobile node failing authentication.	Int32
upd-discard-bounce	The total number of internal communication messages between an A11 Manager task and a Session Manager task that bounced (were not successfully sent).	Int32
upd-discard-inputq	The number of times that the queue in which incoming calls are kept prior to being processed exceeded its capacity.	Int32
upd-discard-mismatchid	The total number of discarded registration acknowledgements due to reply code 85H (Registration Denied - identification mismatch).	Int32
upd-discard-invpktlen	The total number of registration acknowledgements that were discarded due to having an invalid packet length.	Int32
upd-discard-unkpcf	The total number of registration acknowledgements that were discarded due to Unknown PCF.	Int32
upd-discard-unhpkt	The total number of registration acknowledgements that were discarded due to Unhandled Packet.	Int32
upd-discard-misc	The number of registration acknowledgements that were discarded due to reasons other than those listed above.	Int32
disc-absent	 IMPORTANT: This statistic has been renamed to upd-discard-absent. However, this statistic name is still provided for compatibility only.	Int32
disc-nomem	 IMPORTANT: This statistic has been renamed to upd-discard-nomem. However, this statistic name is still provided for compatibility only.	Int32
disc-malform	 IMPORTANT: This statistic has been renamed to upd-discard-malform. However, this statistic name is still provided for compatibility only.	Int32

Variables	Description	Data Type
disc-authfail	 IMPORTANT: This statistic has been renamed to upd-discard-authfail. However, this statistic name is still provided for compatibility only.	Int32
disc-bounce	 IMPORTANT: This statistic has been renamed to upd-discard-bounce. However, this statistic name is still provided for compatibility only.	Int32
disc-inputq	 IMPORTANT: This statistic has been renamed to upd-discard-inputq. However, this statistic name is still provided for compatibility only.	Int32
disc-mismatchid	 IMPORTANT: This statistic has been renamed to upd-discard-mismatchid. However, this statistic name is still provided for compatibility only.	Int32
disc-invpktn	 IMPORTANT: This statistic has been renamed to upd-discard-invpktn. However, this statistic name is still provided for compatibility only.	Int32
disc-misc	 IMPORTANT: This statistic has been renamed to upd-discard-misc. However, this statistic name is still provided for compatibility only.	Int32
sec-violations	The total number of security violations that occurred.	Int32
sec-badauth	The total number of security violations that occurred due to a mis-computed authentication field.	Int32
sec-badid	The total number of security violations that occurred due to the receipt of a Security Parameter Index (SPI) that is not configured on the PDSN.	Int32
sec-badspi	The total number of security violations that occurred due to the receipt of a Security Parameter Index (SPI) that was in the reserved range (0 through 255).	Int32

Variables	Description	Data Type
sec-mnhaauth	The total number of security violations that occurred due to missing mobile node-home agent authentication extensions.	Int32
sec-regupdate	The total number of security violations that occurred due to missing registration update authentication extensions	Int32
rrqdiscard-nosessmgr	The total number of registration requests discarded due to no session manager, reported per service.	Int32
rrqdiscard-nomem	The total number of registration requests discarded due to no memory, reported per service.	Int32
rrqdiscard-authfail	The total number of registration requests discarded due to auth failure, reported per service.	Int32
rrqdiscard-smgrdead	The total number of registration requests discarded due to session manager dead, reported per service.	Int32
rrqdiscard-adminprohib	The total number of registration requests discarded due to admin prohibited, reported per service.	Int32
rrqdiscard-smgrnotready	The total number of registration requests discarded due to session manager not ready, reported per service.	Int32
rrqdiscard-unkpdsn	The total number of registration requests discarded due to unknown pdsn, reported per service.	Int32
rrqdiscard-bounce	The total number of registration requests discarded due to internal bounce error, reported per service.	Int32
rrqdiscard-inputq	The total number of registration requests discarded due to input queue exceeded, reported per service.	Int32
rrqdiscard-maxsess	The total number of registration requests discarded due to max sessions reached, reported per service.	Int32
rrqdiscard-invlen	The total number of registration requests discarded due to invalid packet length, reported per service.	Int32
rrqdiscard-grekey	The total number of registration requests discarded due to GRE key changed, reported per service.	Int32
rrqdiscard-overload	The total number of registration requests discarded due to overload/congestion, reported per service.	Int32
rrqdiscard-misc	The total number of registration requests discarded due to miscellaneous errors reported per service.	Int32
ttlprepaid	The total number of Prepaid calls facilitated by the service.	Int32
curprepaid	The total number of Prepaid calls currently being facilitated by the service.	Int32
ttlonlineauthsucc	The total number of successful Online Authentications for the service.	Int32
ttlonlineauthfail	The total number of successful Online Authentications for the service.	Int32
rx-pkt-xoff	The total number of packets Received with XOFF per service.	Int32
rx-pkt-xon	The total number of packets Received with XON per Service.	Int32

Variables	Description	Data Type
xontoxoff	The total number of XON->XOFF transitions per service.	Int32
pkt-dropped-xoff	The total number of output packets dropped to XOFF per service.	Int32
bytes-dropped-xoff	The total number of output bytes dropped on XOFF per Service.	Int32
sess-num-transmitted	The total number of RP session update messages transmitted.	Int32
sess-accepted	The total number of RP session update ack messages accepted.	Int32
sess-denied	The total number of RP session update messages denied.	Int32
sess-not-acknowledged	The total number of RP session update messages not acknowledged.	Int32
sess-initial-update	The total number of RP session update messages initially transmitted.	Int32
sess-update-retransmitted	The total number of RP session update messages re-transmitted.	Int32
sess-update-ack-received	The total number of RP session update acknowledgement messages received.	Int32
sess-update-ack-discarded	The total number of RP session update acknowledgement messages discarded.	Int32
sess-update-send-error	The total number of RP session update send errors that occurred.	Int32
sess-updreason-alwayson	The total number of session updates sent due to Always On, reported per service. This is a Rev-A specific statistic.	Int32
sess-updreason-qosinfo	The total number of session updates sent due to QoS Info, reported per service.	Int32
sess-updreason-qostftviol	The total number of session updates sent due to TFT Violation, reported per service.	Int32
sess-updreason-qostrafviol	The total number of session updates sent due to Traffic Violation, reported per service.	Int32
sess-updreason-qostrafpol	The total number of session updates sent due to Traffic Policing, reported per service.	Int32
sess-updreason-qosoptrig	The total number of session updates sent due to Operator Triggered, reported per service.	Int32
sess-always-on-indication	The total number of RP session updates supporting Always-on functionality.	Int32
sess-reason-unspecified	The total number of RP session update messages denied with status code reason-unspecified.	Int32
sess-PDSN-auth-fail	<p>The total number of RP session update messages denied due to message authentication failure at the PCF.</p> <hr/> <p> IMPORTANT: This statistic is provided for compatibility only. Please use the sess-pdsn-auth-fail statistic.</p> <hr/>	Int32
sess-pdsn-auth-fail	The total number of RP session update messages denied due to message authentication failure at the PCF.	Int32

Variables	Description	Data Type
sess-ID-mismatch	<p>The total number of RP session update messages denied due to having an ID mismatch at the PCF.</p> <hr/> <p> IMPORTANT: This statistic is provided for compatibility only. Please use the sess-id-mismatch statistic.</p> <hr/>	Int32
sess-id-mismatch	The total number of RP session update messages denied due to having an ID mismatch at the PCF.	Int32
sess-poorly-formed-update	The total number of session update messages denied by the PCF due to poorly formed message error.	Int32
sess-para-not-update	The total number of update ack messages received with status code indicating that parameters were not updated.	Int32
sess-upddenied-noresource	The total number of session updates sent due to Insufficient Resources, reported per service.	Int32
sess-upddenied-adminprohib	The total number of session updates denied due to Admin Prohibited, reported per service.	Int32
sess-upddenied-idnotsupp	The total number of session updates denied due to Profile ID Not Supported, reported per service.	Int32
sess-upddenied-handoff	The total number of session updates denied due to handoffs in progress per service.	Int32
sess-absent	The total number of update ack messages that were discarded by the PDSN due to no session being present at the PDSN.	Int32
sess-no-memory	The total number of update ack messages that were discarded by the PDSN due to no memory available.	Int32
sess-malformed	The total number of update ack messages that were discarded by the PDSN due to being malformed.	Int32
sess-auth-fail	The total number of update ack messages that were discarded by the PDSN due to message authentication failure.	Int32
sess-ID-bounce-error	The total number of update ack messages that were discarded by the PDSN due to internal communication error within the PDSN.	Int32
sess-input-Q-exceeded	The total number of update ack messages that were discarded by the PDSN due to exceeding input pacing queues at the PDSN.	Int32
sess-mismatched-ID	The total number of update ack messages that were discarded by the PDSN due to mismatched id in the message.	Int32
sess-invalid-packet-length	The total number of update ack messages that were discarded by the PDSN due to bad packet length.	Int32
sess-misc-reasons	The total number of update ack messages that were discarded by the PDSN due to other reasons.	Int32

Variables	Description	Data Type
sess-updackdisc-sessdisc	Session Update Ack Discard Reasons – Session Disconnecting per service.	Int32
sess-updackdisc-pktnothand	Session Update Ack Discard Reasons – Packet Not Handled per service.	Int32
sess-gre-packet-sent-sdb	The total number of GRE packets transmitted in short data burst (SDB).	Int32
sess-gre-byte-sent-sdb	The total number of GRE bytes transmitted in short data burst (SDB).	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 59

SCCP Schema Statistics

The SCCP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: SGSN

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 59. Bulk Statistic Variables in the SCCP Service Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
ssa-txed	<p>Description: Total number of Subsystem Allowed (SSA) messages sent by Signalling Connection Control Part (SCCP) function to the peer destination</p> <p>Triggers: Increments when the SCCP subsystem becomes available (SCCP function is not prohibited or unavailable) and SCCP function sends an SSA message to inform the peer destination.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
ss-oos-grant-txed	<p>Description: Total number of Subsystem-Out-of-Service-Grant (SOG) messages sent by the SCCP function. SOG is sent as a reply by the SCCP when it receives and accepts a Subsystem-Out-of-Service-Request (SOR) message from the peer SCCP.</p> <p>Triggers: Increments when a SOG message is sent, in reply to a SOR message, to the requesting SCCP.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
ss-oos-req-txed	<p>Description: Total number of Subsystem-Out-of-Service-Request (SOR) messages sent by the SCCP function, to the peer SCCP, to inform the peer that the requesting SCCP wishes to go out-of-service.</p> <p>Triggers: Increments when the SCCP wishes to go out-of-service and sends a SOR.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
ssp-txed	<p>Description: Total number of Subsystem-Prohibited (SSP) messages sent by the SCCP function, to the peer SCCP subsystem, to inform the peer SCCP that the originating SCCP is not available.</p> <p>Triggers: Increments when the local SCCP is unavailable and sends an SSP message.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
ss-status-test-txed	<p>Description: Total number of Subsystem-Status-Test messages (SST) sent by the local SCCP, to the peer SCCP subsystem, to verify the status of the marked peer.</p> <p>Triggers: Increments when the local SCCP sends SST to verify the peer's availability</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
ssa-rcvd	<p>Description: Total number of Subsystem-Allowed (SSA) messages received, by the local Signalling Connection Control Part (SCCP) function, from the peer SCCP.</p> <p>Triggers: Increments when the local SCCP receives SSA to verify the peer's availability</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
ss-oos-grant-rcvd	<p>Description: Total number of Subsystem-Out-of-Service-Grant (SOG) messages received by the SCCP.</p> <p>Triggers: Increments when the local SCCP accepts a Subsystem-Out-of-Service-Request (SOR).</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
ss-oos-req-rcvd	Description: Total number of Subsystem-Out-of-Service-Request (SOR) messages received by the local SCCP. Triggers: Increments when the local SCCP receives a Subsystem-Out-of-Service-Request (SOR) message. Availability: per VPN context Type: Counter	Int32
ss-prohibit-rcvd	Description: Total number of Subsystem-Prohibited (SSP) messages received by the local SCCP. Triggers: Increments when the local SCCP receives an SSP message. Availability: per VPN context Type: Counter	Int32
ss-status-test-rcvd	Description: Total number of Subsystem Status Test (SST) messages received by the local SCCP Triggers: Increments when the local SCCP receives an SST message. Availability: per VPN context Type: Counter	Int32
ss-congested-txed	Description: Total number of Subsystem Congested (SSC) messages sent by the local SCCP. Triggers: Increments when the local SCCP sends an SSC message. Availability: per VPN context Type: Counter	Int32
ss-congested-rcvd	Description: Total number of Subsystem Congested (SSC) messages received by the local SCCP. Triggers: Increments when the local SCCP receives an SSC message. Availability: per VPN context Type: Counter	Int32
sccp-rtf-notrans-addr-nature	Description: Total number of SCCP routing failures due to unavailable translation for a bad address. Triggers: Increments when the local SCCP routing failures is due to unavailable translation for a bad address. Availability: per VPN context Type: Counter	Int32
sccp-rtf-notrans-addr-specific	Description: Total number of SCCP routing failures due to unavailable translation for a specific address. Triggers: Increments when the local SCCP routing failures is due to unavailable translation for a specific address. Availability: per VPN context Type: Counter	Int32
sccp-rtf-netwfail-pc-unavail	Description: Total number of SCCP routing failures due to a network failure or the point code is unavailable. Triggers: Increments when the SCCP routing failure is due to a network failure or the point code being unavailable. Availability: per VPN context Type: Counter	Int32

Variables	Description	Data Type
sccp-rtf-netw-conges	<p>Description: Total number of SCCP routing failures due to a network failure result from congestion.</p> <p>Triggers: Increments when the SCCP routing failure is due to a network failure resulting from congestion.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-rtf-ssn-fail	<p>Description: Total number of SCCP routing failures due to a subsystem failure of a specific subsystem number (SSN).</p> <p>Triggers: Increments when the SCCP routing failure is due to a subsystem failure of a specific subsystem number (SSN).</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-rtf-ssn-conges	<p>Description: Total number of SCCP routing failures due to subsystem congestion of a specific subsystem number (SSN).</p> <p>Triggers: Increments when the SCCP routing failure is due to subsystem congestion of a specific subsystem number (SSN).</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-syntax-error	<p>Description: Total number of SCCP functions that have failed due to a syntax error in a message.</p> <p>Triggers: Increments when the SCCP function fails due to a syntax error in a message.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-reassem-err-timer	<p>Description: Total number of SCCP functions that failed due to the expiration of the reassembly timer for a message.</p> <p>Triggers: Increments when the SCCP function fails due to the expiration of the reassembly timer for a message.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-reassem-err-sequence	<p>Description: Total number of SCCP functions that failed because segments arrived out of sequence during reassembly.</p> <p>Triggers: Increments when the SCCP function fails because segments arrived out of sequence during reassembly.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-reassem-err-space	<p>Description: Total number of SCCP functions that failed due to out of memory or space errors occurred during reassembly.</p> <p>Triggers: Increments when the SCCP function fails because out of memory or space errors occurred during reassembly.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
sccp-hop-counter-violation	<p>Description: Total number of SCCP functions that have failed due to hop counter violations in messages.</p> <p>Triggers: Increments when the SCCP function fails due to hop counter violations in a message.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-provider-ini-reset	<p>Description: Total number of SCCP functions that have failed because the service provider initiated a reset.</p> <p>Triggers: Increments when the SCCP function fails due to a reset initiated by the service provider.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-provider-ini-rel	<p>Description: Total number of SCCP functions that have failed because the service provider initiated a release.</p> <p>Triggers: Increments when the SCCP function fails due to a release initiated by the service provider.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-msg-toolarge-segment	<p>Description: Total number of SCCP functions that have failed because the message was too large for segmentation.</p> <p>Triggers: Increments when the SCCP function fails because the message was too large for segmentation.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-segmentation-fail	<p>Description: Total number of SCCP functions that have failed due to failure of the segmentation procedure.</p> <p>Triggers: Increments when the SCCP function fails due to failure of the segmentation procedure.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-total-msgs-handled	<p>Description: Total number of SCCP messages that have been handled by the subsystem.</p> <p>Triggers: Increments when a new SCCP message is received by the system and the message is intended for the local SCCP.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-total-msgs-handl-local-ss	<p>Description: Total number of SCCP messages that have been handled by the subsystem but were intended for local subsystems.</p> <p>Triggers: Increments when a new SCCP message is received by the system.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32
sccp-total-msgs-req-gtt	<p>Description: Total number of SCCP messages that require global title translation (GTT).</p> <p>Triggers: Increments when an SCCP message is received, by the system, which requires GTT.</p> <p>Availability: per VPN context</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
sccp-udt-sent	Description: Total number of Unit Data (UDT) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new UDT message. Availability: per VPN context Type: Counter	Int32
sccp-udt-rcvd	Description: Total number of Unit Data (UDT) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new UDT message. Availability: per VPN context Type: Counter	Int32
sccp-udts-sent	Description: Total number of Unit Data Service (UDTS) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new UDTS message. Availability: per VPN context Type: Counter	Int32
sccp-udts-rcvd	Description: Total number of Unit Data Service (UDTS) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new UDTS message. Availability: per VPN context Type: Counter	Int32
sccp-xudt-sent	Description: Total number of Extended Unit Data (XUDT) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new XUDT message. Availability: per VPN context Type: Counter	Int32
sccp-xudt-rcvd	Description: Total number of Extended Unit Data (XUDT) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new XUDT message. Availability: per VPN context Type: Counter	Int32
sccp-xudts-sent	Description: Total number of Extended Unit Data Service (XUDTS) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new XUDTS message. Availability: per VPN context Type: Counter	Int32
sccp-xudts-rcvd	Description: Total number of Extended Unit Data Service (XUDTS) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new XUDTS message. Availability: per VPN context Type: Counter	Int32
sccp-ludt-sent	Description: Total number of Long Unit Data (LUDT) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new LUDT message. Availability: per VPN context Type: Counter	Int32

Variables	Description	Data Type
sccp-ludt-rcvd	Description: Total number of Long Unit Data (LUDT) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new LUDT message. Availability: per VPN context Type: Counter	Int32
sccp-ludts-sent	Description: Total number of Long Unit Data Service (LUDTS) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new LUDTS message. Availability: per VPN context Type: Counter	Int32
sccp-ludts-rcvd	Description: Total number of Long Unit Data Service (LUDTS) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new LUDTS message. Availability: per VPN context Type: Counter	Int32
sccp-cr-sent	Description: Total number of Connection Request (CR) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new CR message. Availability: per VPN context Type: Counter	Int32
sccp-cr-rcvd	Description: Total number of Connection Request (CR) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new CR message. Availability: per VPN context Type: Counter	Int32
sccp-cc-sent	Description: Total number of Connection Confirm (CC) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new CC message. Availability: per VPN context Type: Counter	Int32
sccp-cc-rcvd	Description: Total number of Connection Confirm (CC) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new CC message. Availability: per VPN context Type: Counter	Int32
sccp-cref-sent	Description: Total number of Connection Refuse (CREF) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new CREF message. Availability: per VPN context Type: Counter	Int32
sccp-cref-rcvd	Description: Total number of Connection Refuse (CREF) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new CREF message. Availability: per VPN context Type: Counter	Int32

Variables	Description	Data Type
sccp-rsr-msg-sent	Description: Total number of Reset Request (RSR) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new RSR message. Availability: per VPN context Type: Counter	Int32
sccp-rsr-msg-rcvd	Description: Total number of Reset Request (RSR) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new RSR message. Availability: per VPN context Type: Counter	Int32
sccp-err-msg-sent	Description: Total number of Protocol Data Unit Error (ERR) messages sent by the SCCP layer. Triggers: Increments when the SCCP layer sends a new ERR message. Availability: per VPN context Type: Counter	Int32
sccp-err-msg-rcvd	Description: Total number of Protocol Data Unit Error (ERR) messages received by the SCCP layer. Triggers: Increments when the SCCP layer receives a new ERR message. Availability: per VPN context Type: Counter	Int32
sccp-unequipped-user	Description: Total number of routing failures that occur when the upper SAP of the SCCP layer is unequipped. Triggers: Increments when routing failures occur because the upper SAP of the SCCP layer is unequipped. Availability: per VPN context Type: Counter	Int32
sccp-reason-unknown	Description: Total number of failures at the SCCP layer that are due to unknown reasons or reasons not specified in this table. Triggers: Increments when SCCP failure occurs due to unknown reason(s). Availability: per VPN context Type: Counter	Int32
sccp-congested-msg-rcvd	Description: Total number of SCCP/Subsystem Congested (SSC) messages received by the local SCCP. Triggers: Increments when a new SSC message is received by the SCCP. Availability: per VPN context Type: Counter	Int32
sccp-prohibit-msg-rcvd	Description: Total number of SCCP/Subsystem Prohibited (SSP) messages received by the local SCCP. Triggers: Increments when a new SSP message is received by the SCCP. Availability: per VPN context Type: Counter	Int32
sccp-class-0-sent	Description: Total number of SCCP class -0 (basic connectionless) messages are sent by SCCP function. Triggers: Increments when the SCCP layer sends a new class-0 message. Availability: per VPN context Type: Counter	Int32

Variables	Description	Data Type
sccp-class-0-rcvd	Description: Total number of SCCP class -0 (basic connectionless) messages are received by SCCP function. Triggers: Increments when the SCCP layer receives a new class-0 message. Availability: per VPN context Type: Counter	Int32
sccp-class-1-sent	Description: Total number of SCCP class -1 (basic connectionless) messages are sent by SCCP function. Triggers: Increments when the SCCP layer sends a new class-1 message. Availability: per VPN context Type: Counter	Int32
sccp-class-1-rcvd	Description: Total number of SCCP class -1 (basic connectionless) messages are received by SCCP function. Triggers: Increments when the SCCP layer receives a new class-1 message. Availability: per VPN context Type: Counter	Int32
sccp-DT1-sent	Description: Total number of Data Form 1 (DT1) messages that have been sent by the SCCP function. Triggers: Increments when the SCCP layer sends a new DT1 message. Availability: per VPN context Type: Counter	Int32
sccp-DT1-rcvd	Description: Total number of Data Form 1 (DT1) messages that have been received by the SCCP function. Triggers: Increments when the SCCP layer receives a new DT1 message. Availability: per VPN context Type: Counter	Int32
sccp-rel-compl-supv-fail	Description: Total number of SCCP functions released due to supervision failure in the SCCP release complete procedure. Triggers: Increments when the SCCP function is released due to supervision failure of the SCCP release complete procedure. Availability: per VPN context Type: Counter	Int32
sccp-rel-disconn-req-rx	Description: Total number of SCCP functions released due to received Disconnect Request messages. Triggers: Increments when the SCCP function is released because a DR is received. Availability: per VPN context Type: Counter	Int32
sccp-routing-fail-invalid-ins-routing-req	Description: Total number of routing failures due to invalid INS in the routing requested by the SCCP function. Triggers: Increments when the routing fails due to invalid INS in the routing requested by the SCCP function. Availability: per VPN context Type: Counter	Int32

Variables	Description	Data Type
sccp-routing-fail-invalid-isni-routing-req	Description: Total number of routing failures due to invalid intermediate signaling network identification (ISNI) information in the routing requested by the SCCP function. Triggers: Increments when the routing fails due to invalid ISNI information in the routing requested by the SCCP function. Availability: per VPN context Type: Counter	Int32
sccp-routing-fail-isni-constrained-routing	Description: Total number of routing failures due to constraints by the intermediate signaling network identification (ISNI) information in the routing requested by the SCCP function. Triggers: Increments when the routing fails due to constraints in the ISNI information in the routing requested by the SCCP function. Availability: per VPN context Type: Counter	Int32
sccp-routing-fail-redundant-isni-routing-req	Description: Total number of routing failures due to redundant intermediate signaling network identification (ISNI) information in the routing requested by the SCCP function. Triggers: Increments when the routing fails due to redundant ISNI information in the routing requested by the SCCP function. Availability: per VPN context Type: Counter	Int32
sccp-routing-fail-isni-identify-network	Description: Total number of routing failures due to missing intermediate signaling network identification (ISNI) information in the routing requested by the SCCP function. Triggers: Increments when the routing fails due to missing ISNI information in the routing requested by the SCCP function. Availability: per VPN context Type: Counter	Int32
sccp-inactivity-rcv-tmr-expired	Description: Total number of times the SCCP inactivity receive timer expired. Triggers: Increments when the SCCP inactivity receive timer expires. Availability: per VPN context Type: Counter	Int32
sccp-inactivity-test-sent	Description: Total number of SCCP Inactivity Test messages that were sent. Triggers: Increments when an SCCP Inactivity Test message is sent. Availability: per VPN context Type: Counter	Int32
sccp-inactivity-test-received	Description: Total number of SCCP Inactivity Test messages that were received. Triggers: Increments when an SCCP Inactivity Test message is received. Availability: per VPN context Type: Counter	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 60

SGs Schema Statistics

The SGs schema provides operational statistics that can be used for monitoring and troubleshooting the following products: MME

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 60. Bulk Statistic Variables in the SGs Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the S-GW service. This is a key variable. Type: Information	String
vpnid	The identification number of the context configured on the system that is currently facilitating the S-GW service. This is an internal reference number. This is a key variable. Type: Information	Int32
servname	Displays the name of the S-GW service for which the statistics are displayed. This is a key variable. Type: Information	String
servid	The identification number of the service configured on the system that is currently facilitating the S-GW service. This is an internal reference number. This is a key variable. Type: Information	Int32
pag-req-tx	SGS-AP Statistics - The total number of paging requests transmitted by this service. Type: Counter	Int32
pag-req-retx	SGS-AP Statistics - The total number of paging requests retransmitted by this service. Type: Counter	Int32
pag-req-rx	SGS-AP Statistics - The total number of paging requests received by this service. Type: Counter	Int32
pag-rej-tx	SGS-AP Statistics - The total number of paging reject messages transmitted by this service. Type: Counter	Int32
pag-rej-retx	SGS-AP Statistics - The total number of paging reject messages retransmitted by this service. Type: Counter	Int32
pag-rej-rx	SGS-AP Statistics - The total number of paging reject messages received by this service. Type: Counter	Int32
service-req-tx	SGS-AP Statistics - The total number of service request messages transmitted by this service. Type: Counter	Int32
service-req-retx	SGS-AP Statistics - The total number of service request messages retransmitted by this service. Type: Counter	Int32
service-req-rx	SGS-AP Statistics - The total number of service request messages received by this service. Type: Counter	Int32
dl-ud-tx	SGS-AP Statistics - The total number of downlink unit data messages transmitted by this service. Type: Counter	Int32
dl-ud-retx	SGS-AP Statistics - The total number of downlink unit data messages retransmitted by this service. Type: Counter	Int32
dl-ud-rx	SGS-AP Statistics - The total number of downlink unit data messages received by this service. Type: Counter	Int32

Variables	Description	Data Type
ul-ud-tx	SGS-AP Statistics - The total number of uplink unit data messages transmitted by this service. Type: Counter	Int32
ul-ud-retx	SGS-AP Statistics - The total number of uplink unit data messages retransmitted by this service. Type: Counter	Int32
ul-ud-rx	SGS-AP Statistics - The total number of uplink unit data messages received by this service. Type: Counter	Int32
localupd-req-tx	SGS-AP Statistics - The total number of location update request messages transmitted by this service. Type: Counter	Int32
localupd-req-retx	SGS-AP Statistics - The total number of location update request messages retransmitted by this service. Type: Counter	Int32
localupd-req-rx	SGS-AP Statistics - The total number of location update request messages received by this service. Type: Counter	Int32
localupd-accept-tx	SGS-AP Statistics - The total number of location update accept messages transmitted by this service. Type: Counter	Int32
localupd-accept-retx	SGS-AP Statistics - The total number of location update accept messages retransmitted by this service. Type: Counter	Int32
localupd-accept-rx	SGS-AP Statistics - The total number of location update accept messages received by this service. Type: Counter	Int32
localupd-rej-tx	SGS-AP Statistics - The total number of location update reject messages transmitted by this service. Type: Counter	Int32
localupd-rej-retx	SGS-AP Statistics - The total number of location update reject messages retransmitted by this service. Type: Counter	Int32
localupd-rej-rx	SGS-AP Statistics - The total number of location update reject messages received by this service. Type: Counter	Int32
tmsi-reloc-tx	SGS-AP Statistics - The total number of TMSI reallocation complete messages transmitted by this service. Type: Counter	Int32
tmsi-reloc-retx	SGS-AP Statistics - The total number of TMSI reallocation complete messages retransmitted by this service. Type: Counter	Int32
tmsi-reloc-rx	SGS-AP Statistics - The total number of TMSI reallocation complete messages received by this service. Type: Counter	Int32

Variables	Description	Data Type
alert-req-tx	SGS-AP Statistics - The total number of alert request messages transmitted by this service. Type: Counter	Int32
alert-req-retx	SGS-AP Statistics - The total number of alert request messages retransmitted by this service. Type: Counter	Int32
alert-req-rx	SGS-AP Statistics - The total number of alert request messages received by this service. Type: Counter	Int32
alert-ack-tx	SGS-AP Statistics - The total number of alert ack messages transmitted by this service. Type: Counter	Int32
alert-ack-retx	SGS-AP Statistics - The total number of alert ack messages retransmitted by this service. Type: Counter	Int32
alert-ack-rx	SGS-AP Statistics - The total number of alert ack messages received by this service. Type: Counter	Int32
alert-rej-tx	SGS-AP Statistics - The total number of alert reject messages transmitted by this service. Type: Counter	Int32
alert-rej-retx	SGS-AP Statistics - The total number of alert reject messages retransmitted by this service. Type: Counter	Int32
alert-rej-rx	SGS-AP Statistics - The total number of alert reject messages received by this service. Type: Counter	Int32
ue-actind-tx	SGS-AP Statistics - The total number of UE activity indication messages transmitted by this service. Type: Counter	Int32
ue-actind-retx	SGS-AP Statistics - The total number of UE activity indication messages retransmitted by this service. Type: Counter	Int32
ue-actind-rx	SGS-AP Statistics - The total number of UE activity indication messages received by this service. Type: Counter	Int32
eps-detind-tx	SGS-AP Statistics - The total number of EPS detach indication messages transmitted by this service. Type: Counter	Int32
eps-detind-retx	SGS-AP Statistics - The total number of EPS detach indication messages retransmitted by this service. Type: Counter	Int32
eps-detind-rx	SGS-AP Statistics - The total number of EPS detach indication messages received by this service. Type: Counter	Int32
eps-detack-tx	SGS-AP Statistics - The total number of EPS detach ack messages transmitted by this service. Type: Counter	Int32
eps-detack-retx	SGS-AP Statistics - The total number of EPS detach ack messages retransmitted by this service. Type: Counter	Int32

Variables	Description	Data Type
eps-detack-rx	SGS-AP Statistics - The total number of EPS detach ack messages received by this service. Type: Counter	Int32
imsi-detind-tx	SGS-AP Statistics - The total number of IMSI detach indication messages transmitted by this service. Type: Counter	Int32
imsi-detind-retx	SGS-AP Statistics - The total number of IMSI detach indication messages retransmitted by this service. Type: Counter	Int32
imsi-detind-rx	SGS-AP Statistics - The total number of IMSI detach indication messages received by this service. Type: Counter	Int32
imsi-detack-tx	SGS-AP Statistics - The total number of IMSI detach ack messages transmitted by this service. Type: Counter	Int32
imsi-detack-retx	SGS-AP Statistics - The total number of IMSI detach ack messages retransmitted by this service. Type: Counter	Int32
imsi-detack-rx	SGS-AP Statistics - The total number of IMSI detach ack messages received by this service. Type: Counter	Int32
reset-ind-tx	SGS-AP Statistics - The total number of reset indication messages transmitted by this service. Type: Counter	Int32
reset-ind-retx	SGS-AP Statistics - The total number of reset indication messages retransmitted by this service. Type: Counter	Int32
reset-ind-rx	SGS-AP Statistics - The total number of reset indication messages received by this service. Type: Counter	Int32
reset-ack-tx	SGS-AP Statistics - The total number of reset ack messages transmitted by this service. Type: Counter	Int32
reset-ack-retx	SGS-AP Statistics - The total number of reset ack messages retransmitted by this service. Type: Counter	Int32
reset-ack-rx	SGS-AP Statistics - The total number of reset ack messages received by this service. Type: Counter	Int32
mm-inforeq-tx	SGS-AP Statistics - The total number of MM information request messages transmitted by this service. Type: Counter	Int32
mm-inforeq-retx	SGS-AP Statistics - The total number of MM information request messages retransmitted by this service. Type: Counter	Int32
mm-inforeq-rx	SGS-AP Statistics - The total number of MM information request messages received by this service. Type: Counter	Int32
rel-req-tx	SGS-AP Statistics - The total number of release request messages transmitted by this service. Type: Counter	Int32

Variables	Description	Data Type
rel-req-retx	SGS-AP Statistics - The total number of release request messages retransmitted by this service. Type: Counter	Int32
rel-req-rx	SGS-AP Statistics - The total number of release request messages received by this service. Type: Counter	Int32
status-tx	SGS-AP Statistics - The total number of status messages transmitted by this service. Type: Counter	Int32
status-retx	SGS-AP Statistics - The total number of status messages retransmitted by this service. Type: Counter	Int32
status-rx	SGS-AP Statistics - The total number of status messages received by this service. Type: Counter	Int32
ue-unreach-tx	SGS-AP Statistics - The total number of UE unreachable messages transmitted by this service. Type: Counter	Int32
ue-unreach-retx	SGS-AP Statistics - The total number of UE unreachable messages retransmitted by this service. Type: Counter	Int32
ue-unreach-rx	SGS-AP Statistics - The total number of UE unreachable messages received by this service. Type: Counter	Int32
unk-msg-tx	SGS-AP Statistics - The total number of unknown messages transmitted by this service. Type: Counter	Int32
unk-msg-retx	SGS-AP Statistics - The total number of unknown messages retransmitted by this service. Type: Counter	Int32
unk-msg-rx	SGS-AP Statistics - The total number of unknown messages received by this service. Type: Counter	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 61

SGSN Schema Statistics

The SGSN Schema provides operational statistics that can be used for monitoring and troubleshooting the following products: 2.5G SGSN, 3G SGSN

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 61. Bulk Statistic Variables in the SGSN Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
vpnname	Description: Indicates the name of VPN context in which SGSN service is configured. This is a key variable. Type: Counter	String
vpnid	Description: Indicates the identifier of VPN context in which SGSN service is configured. This is a key variable. Type: Counter	Int32
servname	Description: Indicates the name of SGSN service for which these statistics are collected. This is a key variable. Type: Counter	String
mcc	Description: Indicates the mobile country code (MCC) of SGSN service for which these statistics are collected. This is a key variable. Type: Counter	Int32
mnc	Description: Indicates the mobile network code (MNC) of SGSN service for which these statistics are collected. This is a key variable. Type: Counter	Int32
lac	Description: Indicates the location area code (LAC) of SGSN service for which these statistics are collected. This is a key variable. Type: Counter	Int32
rac	Description: Indicates the routing area code (RAC) of SGSN service for which these statistics are collected. This is a key variable. Type: Counter	Int32
3G-attached	Description: Total number of subscribers, including home and visiting, attached for 3G service. Triggers: 1) Increments when a subscriber attaches to the SGSN. 2) Decrements when a subscriber detaches from the SGSN. Availability: per SGSN service, per RA Type: Gauge	Int32
2G-attached	Description: Total number of subscribers, including home and visiting, attached for 2G service. Triggers: 1) Increments when a subscriber attaches to the SGSN. 2) Decrements when a subscriber detaches from the SGSN. Availability: per GPRS service; per RA Type: Gauge	Int32
3G-home-subscribers	Description: Indicates the total number of home subscribers attached for 3G service; where 'home' means the MCC and MNC of the IMSI are equal to the SGSN PLMN ID. Type: Gauge.	Int32
2G-home-subscribers	Description: Indicates the total number of home subscribers attached for 2G service; where 'home' means the MCC and MNC of the IMSI are equal to the SGSN PLMN ID. Type: Gauge.	Int32

Variables	Description	Data Type
3G-visiting-national	<p>Description: This proprietary gauge indicates the total number of attached subscribers (active and standby) whose MCC (from IMSI) matches with SGSN service's MCC, but MNC is different from the SGSN service's MNC for 3G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) Increments when a national subscriber attaches to the SGSN. 2) Decrements when a national subscriber detaches from the SGSN. <p>Availability: per SGSN service, per RA</p> <p>Type: Gauge</p>	Int32
2G-visiting-national	<p>Description: This proprietary gauge indicates the total number of attached subscribers (active and standby) whose MCC (from IMSI) matches with GPRS service's MCC, but MNC is different from the GPRS service's MNC for 2G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) Increments when a national subscriber attaches to the SGSN. 2) Decrements when a national subscriber detaches from the SGSN. <p>Availability: per GPRS service; per RA</p> <p>Type: Gauge</p>	Int32
3G-visiting-foreign	<p>Description: This proprietary gauge indicates the total number of attached subscribers (active and standby) whose MCC/MNC (from IMSI) does not match with the PLMN of the 3G SGSN service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) Increments when a foreign subscriber attaches to the SGSN. 2) Decrements when a foreign subscriber detaches from the SGSN. <p>Availability: per SGSN service, per RA</p> <p>Type: Gauge</p>	Int32
2G-visiting-foreign	<p>Description: This proprietary gauge indicates the total number of attached subscribers (active and standby) whose MCC/MNC (from IMSI) does not match with the PLMN of the 2G SGSN service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) Increments when a subscriber establishes an Iu and completes the security procedure in it. 2) Decrements when a connected subscriber releases the Iu. <p>Availability: per GPRS service; per RA</p> <p>Type: Gauge</p>	Int32
3G-network-sharing-supp-ue	<p>Description: This proprietary gauge indicates the total number of 3G Network Sharing Supporting User Equipment currently in the system. This statistics is specific to releases 8.1 and higher.</p> <p>Triggers: Increments when a network sharing supporting UE connects with the 3G SGSN.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Gauge</p>	Int32
3G-network-sharing-non-supp-ue	<p>Description: This proprietary gauge indicates the total number of 3G Network Sharing Non-supporting User Equipment currently in the system. This statistics is specific to releases 8.1 and higher.</p> <p>Triggers: Increments when a network sharing non-supporting UE connects with the 3G SGSN.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Gauge</p>	Int32

Variables	Description	Data Type
pmm-connected	Description: Total number of subscribers in packet mobility management-connected (PMM-CONNECTED) state. Triggers: 1) Increments when a subscriber attaches to the SGSN. 2) Decrements when a subscriber detaches from the SGSN. Availability: per SGSN service, per RA Type: Gauge	Int32
pmm-idle	Description: Total number of subscribers in packet mobility management-idle (PMM-IDLE) mode. Type: Gauge	Int32
gprs-standby	Description: Total number of GPRS subscribers in standby mode. Type: Gauge	Int32
gprs-ready	Description: Total number of GPRS subscribers in ready mode. Type: Gauge	Int32
3G-attached-with-pdp	Description: Total number of 3G visiting and home subscribers in attached state with at least one active PDP context. Triggers: This gauge changes after successful activation of the first PDP context for a subscriber. Availability: per SGSN service, per RA Type: Gauge	Int32
2G-attached-with-pdp	Description: Total number of 2G visiting and home subscribers in attached state with at least one active PDP context per GPRS service. Triggers: This gauge changes after successful activation of the first PDP context for a subscriber. Availability: per GPRS service Type: Gauge	Int32
3G-attached-no-pdp	This statistic has been deprecated.	Int32
2G-attached-no-pdp	This statistic has been deprecated.	Int32
3G-detached	Description: Total number of subscribers in detached state with PDP context for 3G service. Type: Gauge	Int32
3G-total-attach-req-all	Description: Total number of all types of 3G Attach Request messages on the SGSN service, including SGSN-only and combined attaches. Type: Counter	Int32
3G-total-attach-req	Description: Total number of IMSI and P-TMSI 3G Attach Request messages for GPRS and IMSI (PS and CS). Type: Counter	Int32
3G-total-comb-attach-req	Description: Total number of combined 3G Attach Request messages. Type: Counter	Int32
2G-total-attach-req-all	Description: Total number of all types of 2G Attach Request messages on the GPRS service, including GPRS-only and combined attaches. Type: Counter	Int32
2G-total-attach-req	Description: Total number of GPRS-only IMSI and P-TMSI Attach Request messages for GPRS and IMSI (PS and CS). Type: Counter	Int32

Variables	Description	Data Type
2G-total-comb-attach-req	Description: Total number of combined 2G Attach Request messages. Type: Counter	Int32
3G-IMSI-Attch	Description: Total number of International Mobile Subscriber Identifier (IMSI) Attach Request messages for CS attach in 3G service. Type: Counter	Int32
3G-IMSI-Attch-Combined	Description: Total number of IMSI and P-TMSI Attach Request messages for GPRS and IMSI (PS and CS) attach in 3G service. Type: Counter	Int32
2G-IMSI-Attch	Description: Total number of IMSI Attach Request messages for CS in 2G service. Type: Counter	Int32
2G-IMSI-Attch-Combined	Description: Total number of IMSI and P-TMSI Attach Request messages for GPRS and IMSI (PS and CS) attach in 2G service. Type: Counter	Int32
3G-ptmsi-Attch	Description: Total number of Packet-Temporary Mobile Subscriber Identifier (P-TMSI) Attach Request messages for CS attach in 3G service. Type: Counter	Int32
3G-ptmsi-Attch-Combined	Description: Total number of P-TMSI Attach Request messages for combined GPRS and IMSI (PS and CS) in 3G service. Type: Counter	Int32
3G-local-ptmsi-Attch	Description: Total number of local P-TMSI Attach Request messages for CS attach in 3G service. Type: Counter	Int32
3G-local-ptmsi-Attch-comb	Description: Total number of local P-TMSI Attach Request messages for combined PS and CS attach in 3G service. Type: Counter	Int32
3G-remote-ptmsi-Attch	Description: Total number of remote P-TMSI Attach Request messages for CS in 3G service. Type: Counter	Int32
3G-remote-ptmsi-Attch-comb	Description: Total number of remote P-TMSI Attach Request messages for combined PS and CS attach in 3G service. Type: Counter	Int32
2G-ptmsi-Attch	Description: Total number of P-TMSI Attach Request messages for CS attach in 2G service. Type: Counter	Int32
2G-ptmsi-Attch-Combined	Description: Total number of P-TMSI Attach Request messages for combined GPRS and IMSI (PS and CS) in 2G service. Type: Counter	Int32
2G-local-ptmsi-Attch	Description: Total number of remote P-TMSI Attach Request messages for CS in 2G service. Type: Counter	Int32
2G-local-ptmsi-Attch-comb	Description: Total number of local P-TMSI Attach Request messages for combined GPRS and IMSI (PS and CS) in 2G service. Type: Counter	Int32

Variables	Description	Data Type
2G-remote-ptmsi-Attach	Description: Total number of remote P-TMSI Attach Request messages for CS in 2G service. Type: Counter	Int32
2G-remote-ptmsi-Attach-comb	Description: Total number of remote P-TMSI Attach Request messages for combined GPRS and IMSI (PS and CS) in 2G service. Type: Counter	Int32
3G-ret-imsi-attach	Description: Total number of IMSI Attach Request messages retransmitted for 3G service. Type: Counter	Int32
3G-ret-imsi-attach-comb	Description: Total number of IMSI Attach Request messages retransmitted for combined GPRS and IMSI (PS and CS) in 3G service. Type: Counter	Int32
2G-ret-imsi-attach	Description: Total number of IMSI Attach Request messages retransmitted for 2G service. Type: Counter	Int32
2G-ret-imsi-attach-comb	Description: Total number of IMSI Attach Request messages retransmitted for combined GPRS and IMSI (PS and CS) in 2G service. Type: Counter	Int32
3G-ret-local-ptmsi-attach	Description: Total number of local-P-TMSI Attach Request messages retransmitted for 3G service. Type: Counter	Int32
3G-ret-local-ptmsi-attach-comb	Description: Total number of local P-TMSI Attach Request messages retransmitted for combined GPRS and IMSI (PS and CS) in 3G service. Type: Counter	Int32
2G-ret-local-ptmsi-attach	Description: Total number of local-P-TMSI Attach Request messages retransmitted for 2G service. Type: Counter	Int32
2G-ret-local-ptmsi-attach-comb	Description: Total number of local P-TMSI Attach Request messages retransmitted for combined GPRS and IMSI (PS and CS) in 2G service. Type: Counter	Int32
3G-ret-remote-ptmsi-attach	Description: Total number of remote P-TMSI Attach Request messages retransmitted for 3G service. Type: Counter	Int32
3G-ret-remote-ptmsi-attach-comb	Description: Total number of remote P-TMSI Attach Request messages retransmitted for combined GPRS and IMSI (PS and CS) in 3G service. Type: Counter	Int32
2G-ret-remote-ptmsi-attach	Description: Total number of remote P-TMSI Attach Request messages retransmitted for 2G service. Type: Counter	Int32
2G-ret-remote-ptmsi-attach-comb	Description: Total number of remote P-TMSI Attach Request messages retransmitted for combined GPRS and IMSI (PS and CS) in 2G service. Type: Counter	Int32

Variables	Description	Data Type
3G-attach-accept	Description: Total number of Attach Request messages accepted for 3G service. Triggers: On sending a successful attach-accept with attach-result “GPRS-only Attached”. Availability: per SGSN service, per RA Type: Counter	Int32
3G-comb-attach-accept	Description: Total number of Attach Accept messages sent with attach result “Combined GPRS/IMSI Attached” in 3G service. Triggers: On sending a successful attach-accept with attach-result “Combined attached”. Availability: per SGSN service, per RA Type: Counter	Int32
3G-ret-attach-accept	Description: Total number of Attach Request accept messages retransmitted for 3G service. Type: Counter	Int32
3G-ret-attach-accept-comb	Description: Total number of combined (GPRS and IMSI) Attach Request accept messages retransmitted for 3G service. Type: Counter	Int32
2G-attach-accept	Description: Total number of Attach Request messages accepted for 2G service. Triggers: On sending a successful attach-accept with attach-result “GPRS-only Attached”. Availability: per GPRS service Type: Counter	Int32
2G-comb-attach-accept	Description: Total number of Attach Accepts sends with attach-result “Combined GPRS/IMSI Attached” in 2G service. Triggers: On sending a successful attach-accept with attach-result “Combined attached”. Availability: per GPRS service Type: Counter	Int32
2G-ret-attach-accept	Description: Total number of Attach Request accepted messages retransmitted for 2G service. Type: Counter	Int32
2G-ret-attach-accept-comb	Description: Total number of combined (GPRS and IMSI) Attach Request accept messages retransmitted for 2G service. Type: Counter	Int32
3G-attach-complete	Description: Total number of attach procedures completed for 3G service. Type: Counter	Int32
2G-attach-complete	Description: Total number of attach procedures completed for 2G service. Type: Counter	Int32
3G-attach-reject-all	Description: Total number of Attach Request messages rejected for for 3G service. Type: Counter	Int32
3G-attach-reject	Description: Total number of Attach Rejects sent with individual causes against Attach Request of type “GPRS Attach” in 3G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per SGSN service, per RA Type: Counter	Int32

Variables	Description	Data Type
3G-attach-reject-comb	Description: Sum of all Attach-Reject counters with individual causes sent against Attach Requests of type "Combined GPRS/IMSI Attach" in 3G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per SGSN service, per RA Type: Counter	Int32
2G-attach-reject-all	Description: Total number of Attach Request messages rejected for for 2G service. Type: Counter	Int32
2G-attach-reject	Description: Total number of Attach Rejects sent with individual causes against Attach Requests of type "GPRS Attach" in 2G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per GPRS service Type: Counter	Int32
2G-attach-reject-comb	Description: Sum of all Attach-Reject counters with individual causes sent against Attach requests of type "Combined GPRS/IMSI Attach" in 2G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per GPRS service Type: Counter	Int32
3G-attach-rej-imsi-unknown-at-hlr	Description: Total number of Attach Rejects sent with cause "imsi unknown at hlr" against Attach requests of type "GPRS Attach" in 3G service. Triggers: Counter increments when - the HLR sends a bad response to an SAI-Req or a GLU-Req, or - the SGSN gets zero authentication vectors from the HLR for a SAI-Req, or - when an operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per SGSN service, per RA Type: Counter	Int32
2G-attach-rej-imsi-unknown-at-hlr	Description: Total number of Attach Rejects sent with cause "imsi unknown at hlr" against Attach requests of type "GPRS Attach" in 2G service. Triggers: - the HLR sends a bad response to an SAI-Req or a GLU-Req, or - the SGSN gets zero authentication vectors from the HLR for a SAI-Req, or - when an operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per GPRS service Type: Counter	Int32
3G-attach-rej-illegal-ms	Description: Total number of Attach Requests rejected for 3G service due to illegal mobile subscriber. Type: Counter	Int32
2G-attach-rej-illegal-ms	Description: Total number of Attach Requests rejected for 2G service due to illegal mobile subscriber. Type: Counter	Int32
3G-attach-rej-illegal-me	Description: Total number of Attach Requests rejected for 3G service due to illegal mobile equipment. Type: Counter	Int32
2G-attach-rej-illegal-me	Description: Total number of Attach Requests rejected for 2G service due to illegal mobile equipment. Type: Counter	Int32

Variables	Description	Data Type
3G-gprs-service-not-allowed	<p>Description: Total number of Attach Rejects sent with cause "GPRS Services not allowed" against Attach requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting a cl (subs-with) while a RAU/attach is in progress. - on getting "Subscriber Unknown" failure from HLR for SAI-Req/GLU-Req. - for rejecting attaches due to subscriber control inactivity. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-gprs-service-not-allowed	<p>Description: Total number of Attach Rejects sent with cause "GPRS Services not allowed" against Attach requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting a cl (subs-with) while a RAU/attach is in progress. - on getting "Subscriber Unknown" failure from HLR for SAI-Req/GLU-Req. - for rejecting attaches due to subscriber control inactivity. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service.</p> <p>Type: Counter</p>	Int32
3G-gprs-and-non-gprs-service-not-allowed	<p>Description: Total number of Attach Rejects sent with cause "GPRS and non-GPRS Services not allowed" against Attach requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting "IMSI unknown" from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-gprs-and-non-gprs-service-not-allowed	<p>Description: Total number of Attach Rejects sent with cause "GPRS and non-GPRS Services not allowed" against Attach requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Counter increments</p> <ul style="list-style-type: none"> - on getting "IMSI unknown" from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-msid-not-derived-by-nwt	<p>Description: Total number of Attach Rejects sent with cause "msid not derived by nwt" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Counter increments</p> <ul style="list-style-type: none"> - on getting periodic RAU with old RAI as a non-local RAI. - when PTMSI-IE is missing in RAU. - when old RAI has invalid location area values (0x0000 or 0xffff) for PTMSI-attaches/RAUs. - when getting a RAU with old RAI in 2G and PTMSI is unknown. - when getting PTMSI-SIG-MISMATCH SGSN Context Request sent with IMSI Validated. - when getting a RAU Request while an attach with the same peer-SGSN-PTMSI is in progress. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-attach-rej-msid-not-derived-by-nwt	<p>Description: Total number of Attach Rejects sent with cause "msid not derived by nwt" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increment</p> <ul style="list-style-type: none"> - when SGSN-Context-Resp arrives with any cause other than "accepted". - when GMM-Identity-Req with MS fails. - when GTP-Identity-Req with MS fails. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-implicitly-detach	<p>Description: Total number of Attach Requests rejected with cause "implicitly detached" against Attach requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increment</p> <ul style="list-style-type: none"> - if RAU at 3G when subscriber was detached from 2G. - when we get a different IMSI in SGSN Context Response for an SGSN Context Request sent with IMSI validated. - when we get RAU while awaiting a Detach Accept. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-implicitly-detach	<p>Description: Total number of Attach Requests rejected with cause "implicitly detached" against Attach requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when we get an RAU from an unknown MS. - on T3350 expiry for the attach-accept - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-plmn-not-allowed	<p>Description: Total number of Attach Rejects sent with cause "plmn not allowed" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-plmn-not-allowed	<p>Description: Total number of Attach Rejects sent with cause "plmn not allowed" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-la-not-allowed	<p>Description: Total number of GPRS Attach Rejected for 3G service due to specific location area not allowed.</p> <p>Type: Counter</p>	Int32
2G-attach-rej-la-not-allowed	<p>Description: Total number of GPRS Attach Rejected for 2G service due to specific location area not allowed.</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-roaming-not-allowed-in-this-location-area	<p>Description: Total number of Attach Rejects sent with cause “Roaming not allowed in this Location Area” against Attach Requests of type “GPRS Attach” in 3G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) When rejecting as a shared SGSN as operator not accepting the given IMSI. 2) When operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-roaming-not-allowed-in-this-location-area	<p>Description: Total number of Attach Rejects sent with cause “Roaming not allowed in this Location Area” against Attach Requests of type “GPRS Attach” in 2G service.</p> <p>Triggers: When operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-gprs-service-not-allowed-in-this-plmn	<p>Description: Total number of Attach Rejects sent with cause “GPRS services not allowed in this PLMN” against Attach Requests of type “GPRS Attach” in 3G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) On getting "Roaming Not allowed" from HLR for SAI-Req/GLU-Req. 2) When operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-gprs-service-not-allowed-in-this-plmn	<p>Description: Total number of Attach Rejects sent with cause “GPRS services not allowed in this PLMN” against Attach Requests of type “GPRS Attach” in 2G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) On getting "Roaming not allowed" from HLR for SAI-Req/GLU-Req. 2) When operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-no-suitable-cells-in-location-area	<p>Description: Total number of Attach Rejects sent with cause "No suitable cell in location area" against Attach requests of type "GPRS Attach" in 3G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) On getting "UMTS Access Control" from HLR for SAI-Req/GLU-Req. 2) When operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-no-suitable-cells-in-location-area	<p>Description: Total number of Attach Rejects sent with cause "No suitable cell in location area" against Attach requests of type "GPRS Attach" in 2G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) On getting "UMTS Access Control" from HLR for SAI-Req/GLU-Req. 2) When operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-msc-not-reachable	<p>Description: Total number of GPRS Attach Rejected for 3G service as MSC not reachable.</p> <p>Type: Counter</p>	Int32
2G-attach-rej-msc-not-reachable	<p>Description: Total number of GPRS Attach Rejected for 2G service as MSC not reachable.</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-attach-rej-network-failure	<p>Description: Total number of Attach Rejects sent with cause "Network Failure" against Attach requests of type "GPRS Attach" in 3G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) RNC is overloaded. 2) Not enough credits at session manager. 3) On getting cause "data missing from HLR" in SAI-Req/GLU-Req. 4) Too many IU's for the same IMSI. 5. On congestion, if configured for attach-throttling. 6. When operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-network-failure	<p>Description: Total number of Attach Rejects sent with cause "Network Failure" against Attach requests of type "GPRS Attach" in 3G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) Not enough credits at session manager. 2) On getting cause "data missing from HLR" in SAI-Req/GLU-Req. 3) Too many IU's for the same IMSI. 4) On congestion, if configured for attach-throttling. 5) When operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-mac-failure	<p>Description: Total number of GPRS Attach Rejected for 3G service due to message authenticate code (MAC) failure.</p> <p>Type: Counter</p>	Int32
2G-attach-rej-mac-failure	<p>Description: Total number of GPRS Attach Rejected for 2G service due to MAC failure.</p> <p>Type: Counter</p>	Int32
3G-attach-rej-sync-failure	<p>Description: Total number of Attach Rejects sent with cause "sync failure" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-sync-failure	<p>Description: Total number of Attach Rejects sent with cause "sync failure" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-congestion	<p>Description: Total number of Attach Rejects sent with cause "Congestion" against Attach Request of type "GPRS Attach" in a 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on congestion, if configured for attach-throttling. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-attach-rej-congestion	<p>Description: Total number of GPRS Attach Rejected for 2G service due to network congestion.</p> <p>Triggers: Increments - on congestion, if configured for attach-throttling. - when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-gsm-auth-unacceptable	<p>Description: Total number of Attach Rejects sent with cause "gsm auth unacceptable" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-gsm-auth-unacceptable	<p>Description: Total number of Attach Rejects sent with cause "gsm auth unacceptable" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-no-pdp-ctx-activated	<p>Description: Total number of Attach Rejects sent with cause "no pdp ctx activated" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-no-pdp-ctx-activated	<p>Description: Total number of Attach Rejects sent with cause "no pdp ctx activated" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-retry-from-new-cell	<p>Description: Total number of Attach Rejects sent with cause "retry from new cell" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-retry-from-new-cell	<p>Description: Total number of Attach Rejects sent with cause "retry from new cell" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-attach-rej-sem-wrong-msg	<p>Description: Total number of Attach Rejects sent with cause "sem wrong msg" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when getting an appropriate decode error. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-sem-wrong-msg	<p>Description: Total number of Attach Rejects sent with cause "sem wrong msg" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when getting an appropriate decode error. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-invalid-mand-info	<p>Description: Total number of Attach Rejects sent with cause "invalid mand info" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when getting an appropriate decode error. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-attach-rej-msg-type-not-comp-prot-state	<p>Description: Total number of Attach Rejects sent with cause "msg type not comp prot state" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-msg-type-not-comp-prot-state	<p>Description: Total number of Attach Rejects sent with cause "msg type not comp prot state" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-ie-non-existent	<p>Description: Total number of Attach Rejects sent with cause "ie non existent" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when getting an appropriate decode error. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-ie-non-existent	<p>Description: Total number of Attach Rejects sent with cause "ie non existent" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when getting an appropriate decode error. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-conditional-ie-err	<p>Description: Total number of Attach Rejects sent with cause "conditional ie err" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when getting an appropriate decode error. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-conditional-ie-err	<p>Description: Total number of Attach Rejects sent with cause "conditional ie err" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when getting an appropriate decode error. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-attach-rej-msg-not-comp-prot-state	<p>Description: Total number of Attach Rejects sent with cause "msg not comp prot state" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when getting an Attach Request before getting Relocation-complete during SRNS. - when getting periodic RAU in a direct transfer message. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-msg-not-comp-prot-state	<p>Description: Total number of Attach Rejects sent with cause "msg not comp prot state" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-protocol-error	<p>Description: Total number of Attach Rejects sent with cause "protocol error" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments</p> <p>When getting an appropriate decode error.</p> <p>When operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-protocol-error	<p>Description: Total number of Attach Rejects sent with cause "protocol error" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when the PLMN-id in BSSGP message does not match the configured PLMN at GPRS-service. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-attach-rej-unknown-cause	<p>Description: Total number of Attach Rejects sent with cause "unknown cause" against Attach Requests of type "GPRS Attach" in 3G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-attach-rej-unknown-cause	<p>Description: Total number of Attach Rejects sent with cause "unknown cause" against Attach Requests of type "GPRS Attach" in 2G service.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-imsi-unknown-at-hlr	<p>Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 3G service due to IMSI not known at HLR.</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-imsi-unknown-at-hlr	<p>Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 3G service due to IMSI not known at HLR.</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-comb-attach-rej-illegal-ms	Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 3G service due to illegal mobile subscriber. Type: Counter	Int32
2G-comb-attach-rej-illegal-ms	Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 2G service due to illegal mobile subscriber. Type: Counter	Int32
3G-comb-attach-rej-illegal-me	Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 3G service due to illegal mobile equipment. Type: Counter	Int32
2G-comb-attach-rej-illegal-me	Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 2G service due to illegal mobile equipment. Type: Counter	Int32
3G-comb-gprs-service-not-allowed	Description: Total number of Attach Rejects sent with cause "GPRS services not allowed" against Attach Requests of type "Combined GPRS/IMSI Attach" in 3G service. Triggers: 1) On getting a cl (subs-with) while a RAU/attach is in progress. 2) On getting "Subscriber Unknown" failure from hlr for glu/sai-req. 3) For rejecting attaches due to subscriber-control-inactivity. 4) When operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per SGSN service, per RA Type: Counter	Int32
2G-comb-gprs-service-not-allowed	Description: Total number of Attach Rejects sent with cause "GPRS services not allowed" against Attach Requests of type "Combined GPRS/IMSI Attach" in 2G service. Triggers: Increments - on getting a cl (subs-with) while a RAU/attach is in progress. - on getting "Subscriber Unknown" failure from hlr for glu/sai-req. - for rejecting attaches due to subscriber-control-inactivity. - when operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per GPRS service Type: Counter	Int32
3G-comb-gprs-and-non-gprs-svc-not-allow	Description: Total number of Attach Rejects sent with cause "GPRS and non-GPRS services not allowed" against Attach Requests of type "Combined GPRS/IMSI Attach" in 3G service. Triggers: - on getting "Imsi unknown" from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per SGSN service, per RA Type: Counter	Int32
2G-comb-gprs-and-non-gprs-svc-not-allow	Description: Total number of Attach Rejects sent with cause "GPRS and non-GPRS services not allowed" against Attach Requests of type "Combined GPRS/IMSI Attach" in 3G service. Triggers: Increments - on getting "Imsi unknown" from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per GPRS service Type: Counter	Int32

Variables	Description	Data Type
3G-comb-attach-rej-msid-not-derived-by-nwt	Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 3G service as network failed to derive MSID from request message. Type: Counter	Int32
2G-comb-attach-rej-msid-not-derived-by-nwt	Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 2G service as network failed to derive MSID from request message. Type: Counter	Int32
3G-comb-attach-rej-implicitly-detach	Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 3G service as subscriber implicitly detached from network. Type: Counter	Int32
2G-comb-attach-rej-implicitly-detach	Description: Total number of combined (GPRS and IMSI) Attach Requests rejected for 3G service as subscriber implicitly detached from network. Type: Counter	Int32
3G-comb-attach-rej-plmn-not-allowed	Description: Total number of combined (GPRS and IMSI) Attach Rejected for 3G service due to specific PLMN not allowed. Type: Counter	Int32
2G-comb-attach-rej-plmn-not-allowed	Description: Total number of combined (GPRS and IMSI) Attach Rejected for 2G service due to specific PLMN not allowed. Type: Counter	Int32
3G-comb-attach-rej-la-not-allowed	Description: Total number of combined (GPRS and IMSI) Attach Rejected for 3G service due to specific location area not allowed. Type: Counter	Int32
2G-comb-attach-rej-la-not-allowed	Description: Total number of combined (GPRS and IMSI) Attach Rejected for 2G service due to specific location area not allowed. Type: Counter	Int32
3G-comb-roam-not-allow-in-loc-area	Description: Total number of Attach Rejects sent with cause "Roaming not allowed in LA" against attached request of type "Combined GPRS/IMSI Attach" in 3G service. Triggers: Increments - when rejecting as a shared SGSN due to no operator accepting the given IMSI. - when operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per SGSN service, per RA Type: Counter	Int32
2G-comb-roam-not-allow-in-loc-area	Description: Total number of Attach Rejects sent with cause "Roaming not allowed in LA" against attached request of type "Combined GPRS/IMSI Attach" in 2G service. Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per GPRS service Type: Counter	Int32
3G-comb-gprs-svc-not-allow-in-plmn	Description: Total number of Attach Rejects sent with cause "GPRS Service Not Allowed in PLMN" against Attach Requests of type "Combined GPRS/IMSI Attach" in 3G service. Triggers: Increments - on getting "Roaming not allowed" from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per SGSN service, per RA Type: Counter	Int32

Variables	Description	Data Type
2G-comb-gprs-svc-not-allow-in-plmn	<p>Description: Total number of Attach Rejects sent with cause "GPRS Service Not Allowed in PLMN" against Attach Requests of type "Combined GPRS/IMSI Attach" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting "Roaming not allowed" from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-no-suitable-cells-in-loc-area	<p>Description: Total number of Attach Rejects sent with cause "No suitable cells in LA" against Attach requests of type "Combined GPRS/IMSI Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting "UMTS access control" from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-no-suitable-cells-in-loc-area	<p>Description: Total number of Attach Rejects sent with cause "No suitable cells in LA" against Attach requests of type "Combined GPRS/IMSI Attach" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting "UMTS access control" from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-msc-not-reachable	<p>Description: Total number of combined (GPRS and IMSI) Attach Rejected for 3G service as MSC not reachable.</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-msc-not-reachable	<p>Description: Total number of combined (GPRS and IMSI) Attach Rejected for 2G service as MSC not reachable.</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-network-failure	<p>Description: Total number of Attach Rejects sent with cause "Network Failure" against Attach requests of type "Combined GPRS/IMSI Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting cause "data missing from HLR" in SAI-Req/GLU-Req. - on XID failure for RAU. - inability to send an SGSN-CTX-Req out for an RAU. - inability to send a Check-IMEI Request out. - on congestion, if configured for attach-throttling. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-comb-attach-rej-network-failure	<p>Description: Total number of Attach Rejects sent with cause "Network Failure" against Attach requests of type "Combined GPRS/IMSI Attach" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting cause "data missing from HLR" in SAI-Req/GLU-Req. - on XID failure for RAU. - inability to send an SGSN-CTX-Req out for an RAU. - inability to send a Check-IMEI Request out. - on congestion, if configured for attach-throttling. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-mac-failure	<p>Description: Total number of combined (GPRS and IMSI) Attach Rejected for 3G service due to message authenticate code (MAC) failure.</p>	Int32
2G-comb-attach-rej-mac-failure	<p>Description: Total number of combined (GPRS and IMSI) Attach Rejected for 2G service due to MAC failure.</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-sync-failure	<p>Description: Total number of combined (GPRS and IMSI) Attach Rejected for 3G service due to context synchronization failure.</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-sync-failure	<p>Description: Total number of combined (GPRS and IMSI) Attach Rejected for 2G service due to context synchronization failure.</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-congestion	<p>Description: Total number of Attach Rejects sent with cause "Congestion" against Attach requests of type "Combined GPRS/IMSI Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on congestion, if configured for attach-throttling. - when operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-congestion	<p>Description: Total number of Attach Rejects sent with cause "Congestion" against Attach requests of type "Combined GPRS/IMSI Attach" in the 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on congestion, if configured for attach-throttling. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-gsm-auth-unacceptable	<p>Description: Total number of Attach Rejects sent with cause "gsm-auth-unacceptable" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-comb-attach-rej-gsm-auth-unacceptable	<p>Description: Total number of Attach Rejects sent with cause "gsm-auth-unacceptable" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-no-pdp-ctx-activated	<p>Description: Total number of Attach Rejects sent with cause "no-pdp-ctx-activated" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-no-pdp-ctx-activated	<p>Description: Total number of Attach Rejects sent with cause "no-pdp-ctx-activated" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-retry-from-new-cell	<p>Description: Total number of Attach Rejects sent with cause "retry-from-new-cell" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-retry-from-new-cell	<p>Description: Total number of Attach Rejects sent with cause "retry-from-new-cell" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-sem-wrong-msg	<p>Description: Total number of Attach Rejects sent with cause "sem-wrong-msg" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-sem-wrong-msg	<p>Description: Total number of Attach Rejects sent with cause "sem-wrong-msg" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-comb-attach-rej-invalid-mand-info	<p>Description: Total number of Attach Rejects sent with cause "invalid-mand-info" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-invalid-mand-info	<p>Description: Total number of Attach Rejects sent with cause "invalid-mand-info" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-msg-type-not-exist	<p>Description: Total number of Attach Rejects sent with cause "msg-type-not-exist" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-msg-type-not-exist	<p>Description: Total number of Attach Rejects sent with cause "msg-type-not-exist" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-msg-type-not-comp-pstate	<p>Description: Total number of Attach Rejects sent with cause "msg-type-not-comp-pstate" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-msg-type-not-comp-pstate	<p>Description: Total number of Attach Rejects sent with cause "msg-type-not-comp-pstate" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-comb-attach-rej-ie-non-existent	<p>Description: Total number of Attach Rejects sent with cause "ie-non-existent" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-ie-non-existent	<p>Description: Total number of Attach Rejects sent with cause "ie-non-existent" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-conditional-ie-err	<p>Description: Total number of Attach Rejects sent with cause "conditional-ie-err" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-conditional-ie-err	<p>Description: Total number of Attach Rejects sent with cause "conditional-ie-err" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on decode failure of messages. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-msg-not-comp-prot-state	<p>Description: Total number of Attach Rejects sent with cause "msg-not-comp-prot-state" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when SGSN receives an Attach Request before getting Relocation-Complete during SRNS. - when SGSN receives periodic RAU in a Dir-Transfer message. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-msg-not-comp-prot-state	<p>Description: Total number of Attach Rejects sent with cause "msg-not-comp-prot-state" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-comb-attach-rej-protocol-error	<p>Description: Total number of Attach Rejects sent with cause "protocol-error" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-protocol-error	<p>Description: Total number of Attach Rejects sent with cause "protocol-error" against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when the PLMN ID in the MSSGP message does not match the configured PLMN in the GPRS Service. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-attach-rej-unknown-cause	<p>Description: Total number of Attach Rejects sent with any cause other than those captured in stats already listed against Attach Requests of type "Combined GPRS/IMSI Attach" in the 3G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-attach-rej-unknown-cause	<p>Description: Total number of Attach Rejects sent with any cause other than those captured in stats already listed against Attach Requests of type "Combined GPRS/IMSI Attach" in the 2G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-total-attach-fail	<p>Description: Total number of Attach Requests of type "GPRS Attach" that were dropped from processing in 3G service.</p> <p>Triggers: Increments when</p> <ul style="list-style-type: none"> - another Attach, differing from this Attach, was received and pre-empted existing Attach procedure. - Iu released while the Attach procedure was in progress. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
3G-total-attach-fail-comb	<p>Description: Total number of Attach Requests of type "Combined GPRS/IMSI Attach" that were dropped from processing in 3G service.</p> <p>Triggers: Increments when</p> <ul style="list-style-type: none"> - another Attach, differing from this Attach, was received and pre-empted existing Attach procedure. - Iu released while the Attach procedure was in progress. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-total-attach-fail-all	Description: Sum of 3G-total-attach-fail + 3G-total-attach-fail-comb. Triggers: n/a Availability: per SGSN service, per RA Type: Counter	Int32
2G-total-attach-fail	Description: Total number of Attach Requests of type “GPRS Attach” that were dropped from processing in 2G service. Triggers: Increments when another Attach, differing from current Attach, was received and pre-empted existing Attach procedure. Availability: per GPRS service, per RA Type: Counter	Int32
2G-total-attach-fail-comb	Description: Total number of Attach Requests of type “Combined GPRS/IMSI Attach” that were dropped from processing in 2G service. Triggers: Increments when another Attach, differing from current Attach, was received and pre-empted existing Attach procedure. Availability: per GPRS service, per RA Type: Counter	Int32
2G-total-attach-fail-all	Description: Sum of the stats for 2G-total-attach-fail + 2G-total-attach-fail-comb. Triggers: n/a Availability: per GPRS service, per RA Type: Counter	Int32
3G-attach-fail-iu_release	Description: Total number of attach procedures failed for 3G service due to Iu interface release. Type: Counter	Int32
3G-attach-fail-ongoing-proc	Description: This proprietary counter indicates the total number of attach procedures failed for 3G service due to a new attach received. Triggers: Increments when we abort an ongoing attach due to another new attach in 3G. Availability: per SGSN service, per RA Type: Counter	Int32
2G-attach-fail-ongoing-proc	Description: This proprietary counter indicates the total number of Attach procedures failed for 2G service due to a new attach received. Triggers: Increments when - Suspend occurs during Attach procedure - Radio-status is lost during Attach procedure - BVC-block occurs during Attach procedure - T3350 timer expires during Attach procedure - T3360 timer expires during Attach procedure - XID timer expires during Attach procedure Availability: per GPRS service Type: Counter	Int32
3G-attach-fail-iu_release-comb	Description: Total number of combined (GPRS and IMSI) attach procedures failed due to Iu released for 3G service. Type: Counter	Int32
3G-attach-fail-ongoing-proc-comb	Description: Total number of combined (GPRS and IMSI) attach procedures failed due to ongoing attach procedures for 3G service. Type: Counter	Int32

Variables	Description	Data Type
2G-attach-fail-ongoing-proc-comb	Description: Total number of combined (GPRS and IMSI) attach procedures failed due to ongoing attach procedures for 2G service. Type: Counter	Int32
3G-intra-rau	Description: Total number of intra SGSN routing area updates received for 3G service. Type: Counter	Int32
2G-intra-rau	Description: Total number of intra SGSN routing area updates received for 2G service. Type: Counter	Int32
3G-periodic-rau	Description: Total number of periodic routing area updates received for 3G service. Type: Counter	Int32
2G-periodic-rau	Description: Total number of periodic routing area updates received for 2G service. Type: Counter	Int32
3G-intra-comb-rau	Description: Total number of intra SGSN combined (GPRS and IMSI) routing area updates received for 3G service. Type: Counter	Int32
2G-intra-comb-rau	Description: Total number of intra SGSN combined (GPRS and IMSI) routing area updates received for 2G service. Type: Counter Type: Counter	Int32
3G-inter-sgsn-rau	Description: Total packet switched inter-SGSN-RA update request messages for 3G service. Type: Counter	Int32
2G-inter-sgsn-rau	Description: Total packet switched inter-SGSN-RA update request messages for 2G service. Type: Counter	Int32
3G-inter-sgsn-comb-rau	Description: Total combined (GPRS and IMSI) inter-SGSN-RA update request messages for 3G service. Type: Counter	Int32
2G-inter-sgsn-comb-rau	Description: Total combined (GPRS and IMSI) inter-SGSN-RA update request messages for 2G service. Type: Counter	Int32
3G-ret-intra-rau	Description: Total routing area update request messages retransmitted for intra-SGSN RA updates for 3G. Type: Counter	Int32
2G-ret-intra-rau	Description: Total routing area update request messages retransmitted for intra-SGSN RA updates for 2G. Type: Counter	Int32
3G-ret-periodic-rau	Description: Total periodic intra-RA update messages retransmitted for 3G. Type: Counter	Int32
2G-ret-periodic-rau	Description: Total periodic intra-RA update messages retransmitted for 2G. Type: Counter	Int32

Variables	Description	Data Type
3G-ret-inter-sgsn-rau	Description: Total packet switched inter-SGSN-RA update request messages retransmitted for 3G service. Type: Counter	Int32
2G-ret-inter-sgsn-rau	Description: Total packet switched inter-SGSN-RA update request messages retransmitted for 2G service. Type: Counter	Int32
3G-rau-accept-intra	Description: Sum of all RAU-Accepts sent against intra-SGSN-RAU requests with update type “RA Updating” in 3G service. Triggers: Increments on sending a successful RAU-Accept with update-result “RA Updating”. Availability: per SGSN service, per RA Type: Counter	Int32
3G-comb-upd-rau-accept-intra	Description: Total number of RAU-Accepts sent against intra-SGSN-RAU requests with update type “Combined RA/LA update” in 3G service. Triggers: Increments on sending a successful rau-accept with update-result "Combined RA/LA updated". Type: Counter	Int32
3G-rau-accept-inter	Description: Sum of all RAU-Accepts sent against inter-SGSN-RAU requests with update type “RA Updating” in 3G service. Triggers: Increments on sending a successful RAU-Accept with update-result “RA Updating”. Availability: per SGSN service, per RA Type: Counter	Int32
3G-comb-upd-rau-accept-inter	Description: Total number of RAU-Accepts sent against inter-SGSN-RAU requests with update type “Combined RA/LA Update” in 3G service. Triggers: Increments on sending a successful rau-accept with update-result "Combined RA/LA Updated". Availability: per SGSN service, per RA Type: Counter	Int32
2G-rau-accept-intra	Description: Sum of all RAU-Accepts sent against intra-SGSN-RAU requests with update type “RA Updated” in 2G service. Triggers: Increments on sending a successful RAU-Accept with update-result “RA Updated”. Availability: per GPRS service Type: Counter	Int32
2G-comb-upd-rau-accept-intra	Description: Total number of RAU-Accepts sent against intra-SGSN-RAU requests with update type “Combined RA/LA Update” in 2G service. Triggers: Increments on sending a successful RAU-accept with update-result "Combined RA/LA Updated". Availability: per GPRS service Type: Counter	Int32
2G-rau-accept-inter	Description: Sum of all RAU-Accepts sent against inter-SGSN-RAU requests with update type “RA Updated” in 2G service. Triggers: Increments on sending a successful RAU-Accept with update-result “RA Updated”. Availability: per GPRS service Type: Counter	Int32

Variables	Description	Data Type
2G-comb-upd-rau-accept-inter	Description: Total number of RAU-Accepts sent against inter-SGSN-RAU requests with update type "Combined RA/LA update" in 2G service. Triggers: Increments on sending a successful rau-accept with update-result "Combined RA/LA updated". Availability: per GPRS service Type: Counter	Int32
3G-rau-accept-periodic	Description: Sum of all RAU-Accepts sent against intra-SGSN-RAU requests of type "Periodic Updating" with update type "RA updating" in 3G service. Triggers: Increments on sending a successful RAU-Accept with update-result "Periodic Updating". Availability: per SGSN service, per RA Type: Counter	Int32
2G-rau-accept-periodic	Description: Sum of all RAU-Accepts sent against intra-SGSN-RAU requests of type "Periodic Updating" with update type "RA updated" in 2G service. Triggers: Increments on sending a successful RAU-Accept with update-result "Periodic Updated". Availability: per GPRS service Type: Counter	Int32
3G-ret-rau-accept-intra	Description: Total number of intra-SGSN routing area update accept messages retransmitted for 3G service. Type: Counter	Int32
2G-ret-rau-accept-intra	Description: Total number of intra-SGSN routing area update accept messages retransmitted for 2G service. Type: Counter	Int32
3G-ret-rau-accept-inter	Description: Total number of inter-SGSN routing area update accept messages retransmitted for 3G service. Type: Counter	Int32
2G-ret-rau-accept-inter	Description: Total number of inter-SGSN routing area update accept messages retransmitted for 2G service. Type: Counter	Int32
3G-ret-rau-accept-periodic	Description: Total number of periodic routing area update accept messages retransmitted for 3G service. Type: Counter	Int32
2G-ret-rau-accept-periodic	Description: Total number of periodic routing area update accept messages retransmitted for 2G service. Type: Counter	Int32
3G-rau-complete	Description: Total number of routing area update complete messages for 3G service. Type: Counter	Int32
2G-rau-complete	Description: Total number of routing area update complete messages for 2G service. Type: Counter	Int32
3G-rau-reject	Description: Total number of routing area update reject messages for 3G service. Type: Counter	Int32

Variables	Description	Data Type
3G-intra-rau-reject	Description: Sum of all RAU-reject counters with individual causes against intra-SGSN-RAU requests of type “RA Updating” in 3G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per SGSN service, per RA Type: Counter	Int32
3G-periodic-rau-reject	Description: Sum of all RAU-reject counters with individual causes against intra-SGSN-RAU requests of type “Periodic RA Updating” in 3G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per SGSN service, per RA Type: Counter	Int32
3G-inter-rau-reject	Description: Sum of all RAU-reject counters with individual causes against inter-SGSN-RAU requests of type “RA Updating” in 3G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per SGSN service, per RA Type: Counter	Int32
3G-comb-rau-reject	Description: Sum of all RAU-reject counters with individual causes against intra-SGSN-RAU requests of type “Combined RA/LA update” or “Combined RA/LA update with IMSI Attach” in 3G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per SGSN service, per RA Type: Counter	Int32
3G-comb-inter-rau-reject	Description: Sum of all RAU-reject counters with individual causes against inter-SGSN-RAU requests of type “Combined RA/LA update” or “Combined RA/LA update with IMSI Attach” in 3G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per SGSN service, per RA Type: Counter	Int32
2G-rau-reject	Description: Total number of routing area update messages rejected for 2G service. Type: Counter	Int32
2G-intra-rau-reject	Description: Sum of all RAU-reject counters with individual causes against intra-SGSN-RAU requests of type “RAU Updating” in 2G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per GPRS service Type: Counter	Int32
2G-periodic-rau-reject	Description: Sum of all RAU-reject counters with individual causes against intra-SGSN-RAU requests of type “Periodic RA Updating” in 2G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per GPRS service Type: Counter	Int32
2G-inter-rau-reject	Description: Sum of all RAU-reject counters with individual causes against inter-SGSN-RAU requests of type “RAU Updating” in 2G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per GPRS service Type: Counter	Int32

Variables	Description	Data Type
2G-comb-rau-reject	Description: Sum of all RAU-reject counters with individual causes against intra-SGSN-RAU requests of type “Combined RA/LA update” or “Combined RA/LA update with IMSI Attach” in 2G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per GPRS service Type: Counter	Int32
2G-comb-inter-rau-reject	Description: Sum of all RAU-reject counters with individual causes against inter-SGSN-RAU requests of type “Combined RA/LA update” or “Combined RA/LA update with IMSI Attach” in 2G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per GPRS service Type: Counter	Int32

2G-rau-rej-unknown-error	This statistic has been deprecated.	Int32
3G-intra-rau-rej-imsi-unknown-hlr	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to unknown IMSI in HLR. Type: Counter	Int32
2G-intra-rau-rej-imsi-unknown-hlr	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to unknown IMSI in HLR. Type: Counter	Int32
3G-intra-rau-rej-illegal-ms	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to illegal mobile subscriber. Type: Counter	Int32
2G-intra-rau-rej-illegal-ms	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to illegal mobile subscriber. Type: Counter	Int32
3G-intra-rau-rej-illegal-me	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to illegal mobile equipment. Type: Counter	Int32
2G-intra-rau-rej-illegal-me	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to illegal mobile equipment. Type: Counter	Int32

Variables	Description	Data Type
3G-intra-rau-rej-gprs-svc-not-allw	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to GPRS service not allowed for subscriber. Type: Counter	Int32
2G-intra-rau-rej-gprs-svc-not-allw	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to GPRS service not allowed for subscriber. Type: Counter	Int32
3G-intra-rau-rej-nongprs-svc-not-allow	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to GPRS and non-GPRS service not allowed for subscriber. Type: Counter	Int32
2G-intra-rau-rej-nongprs-svc-not-allow	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to GPRS and non-GPRS service not allowed for subscriber. Type: Counter	Int32
3G-intra-rau-rej-msid-not-derived-by-nw	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to network failed to derive MSID from attach message. Type: Counter	Int32
2G-intra-rau-rej-msid-not-derived-by-nw	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to network failed to derive MSID from attach message. Type: Counter	Int32
3G-intra-rau-rej-implicitly-detach	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to implicitly detach. Type: Counter	Int32
2G-intra-rau-rej-implicitly-detach	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to implicitly detach. Type: Counter	Int32
3G-intra-rau-rej-plmn-not-allowed	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to specific PLMN not allowed. Type: Counter	Int32
2G-intra-rau-rej-plmn-not-allowed	Description: The total intra-SGSN routing area update message rejected in intra-2G roaming due to specific PLMN not allowed. Type: Counter	Int32
3G-intra-rau-rej-loc-area-not-allow	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to specific location area not allowed. Type: Counter	Int32
2G-intra-rau-rej-loc-area-not-allow	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to specific location area not allowed. Type: Counter	Int32
3G-intra-rau-rej-roam-not-allow-larea	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to roaming not allowed in specific location area. Type: Counter	Int32
2G-intra-rau-rej-roam-not-allow-larea	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to roaming not allowed in specific location area. Type: Counter	Int32

Variables	Description	Data Type
3G-intra-rau-rej-gprs-svc-not-allow-plmn	<p>Description: Total number of RAU rejects sent with cause “GPRS service not allowed in this PLMN” against intra-SGSN-RAU requests of type “RA Updating” in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting “Roaming not allowed” from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-intra-rau-rej-gprs-svc-not-allow-plmn	<p>Description: Total number of RAU rejects sent with cause “GPRS service not allowed in this PLMN” against intra-SGSN-RAU requests of type “RA Updating” in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting “Roaming not allowed” from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-intra-rau-rej-no-cells-in-loc-area	<p>Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to non availability of suitable cell in specific location area.</p> <p>Type: Counter</p>	Int32
2G-intra-rau-rej-no-cells-in-loc-area	<p>Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to non availability of suitable cell in specific location area.</p> <p>Type: Counter</p>	Int32
3G-intra-rau-rej-msc-not-reachable	<p>Description: Total number of intra-SGSN routing area update requests rejected for 3G service as MSC not reachable.</p> <p>Type: Counter</p>	Int32
2G-intra-rau-rej-msc-not-reachable	<p>Description: Total number of intra-SGSN routing area update requests rejected for 2G service as MSC not reachable.</p> <p>Type: Counter</p>	Int32
3G-intra-rau-rej-network-failure	<p>Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to network failure.</p> <p>Type: Counter</p>	Int32
2G-intra-rau-rej-network-failure	<p>Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to network failure.</p> <p>Type: Counter</p>	Int32
3G-intra-rau-rej-mac-failure	<p>Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to message authenticate code (MAC) failure.</p> <p>Type: Counter</p>	Int32
2G-intra-rau-rej-mac-failure	<p>Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to MAC failure.</p> <p>Type: Counter</p>	Int32
3G-intra-rau-rej-syn-failure	<p>Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to context synchronization failure.</p> <p>Type: Counter</p>	Int32

Common Syntax Options

Variables	Description	Data Type
2G-intra-rau-rej-syn-failure	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to context synchronization failure. Type: Counter	Int32
3G-intra-rau-rej-congestion	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to network congestion. Type: Counter	Int32
2G-intra-rau-rej-congestion	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to network congestion. Type: Counter	Int32
3G-intra-rau-rej-gsm-auth-unacceptable	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to unacceptable authentication from GSM network. Type: Counter	Int32
2G-intra-rau-rej-gsm-auth-unacceptable	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to unacceptable authentication from GSM network. Type: Counter	Int32
3G-intra-rau-rej-no-pdp-ctx-actv	Description: Total number of intra-SGSN routing area update requests rejected for 3G service as PDP context is not activated. Type: Counter	Int32
2G-intra-rau-rej-no-pdp-ctx-actv	Description: Total number of intra-SGSN routing area update requests rejected for 2G service as PDP context is not activated. Type: Counter	Int32
3G-intra-rau-rej-retry-from-new-cell	Description: Total number of intra-SGSN routing area update requests rejected for 3G service as subscriber retried for update from new cell. Type: Counter	Int32
2G-intra-rau-rej-retry-from-new-cell	Description: Total number of intra-SGSN routing area update requests rejected for 2G service as subscriber retried for update from new cell. Type: Counter	Int32
3G-intra-rau-rej-inval-mand-info	Description: Total number of intra-SGSN routing area update requests rejected for 3G service as mandatory information in message is invalid. Type: Counter	Int32
2G-intra-rau-rej-inval-mand-info	Description: Total number of intra-SGSN routing area update requests rejected for 2G service as mandatory information in message is invalid. Type: Counter	Int32
3G-intra-rau-rej-msg-type-non-exist	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to non-existent type of message. Type: Counter	Int32
2G-intra-rau-rej-msg-type-non-exist	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to non-existent type of message. Type: Counter	Int32
3G-intra-rau-rej-mtype-incompat-pstate	Description: Total number of intra-SGSN routing area update requests rejected for 3G service as message type is not compatible with protocol state. Type: Counter	Int32

Variables	Description	Data Type
2G-intra-rau-rej-mtype-incompat-pstate	Description: Total number of intra-SGSN routing area update requests rejected for 2G service as message type is not compatible with protocol state. Type: Counter	Int32
3G-intra-rau-rej-ie-non-existent	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to non-existence of information element. Type: Counter	Int32
2G-intra-rau-rej-ie-non-existent	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to non-existence of information element. Type: Counter	Int32
3G-intra-rau-rej-cond-ie-error	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to error in conditional information element. Type: Counter	Int32
2G-intra-rau-rej-cond-ie-error	Description: Total number of intra-SGSN routing area update requests rejected for 2G service due to error in conditional information element. Type: Counter	Int32
3G-intra-rau-rej-msg-incompat-prot-state	Description: Total number of intra-SGSN routing area update requests rejected for 3G service as message type is not compatible with protocol state. Type: Counter	Int32
2G-intra-rau-rej-msg-incompat-prot-state	Description: Total number of intra-SGSN routing area update requests rejected for 2G service as message type is not compatible with protocol state. Type: Counter	Int32
3G-intra-rau-rej-prot-error	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to protocol error in message. Type: Counter	Int32
2G-intra-rau-rej-prot-error	Description: Total number of intra-SGSN routing area update requests rejected for 3G service due to protocol error in message. Type: Counter	Int32
3G-intra-rau-rej-unknown-error	Description: Total number of intra-SGSN routing area update requests rejected for 3G service where cause is unknown or not specified here. Type: Counter	Int32
2G-intra-rau-rej-unknown-error	Description: Total number of intra-SGSN routing area update requests rejected for 2G service where cause is unknown or not specified here. Type: Counter	Int32
3G-intra-prau-rej-imsi-unknown-hlr	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to unknown IMSI in HLR. Type: Counter	Int32
2G-intra-prau-rej-imsi-unknown-hlr	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to unknown IMSI in HLR. Type: Counter	Int32
3G-intra-prau-rej-illegal-ms	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to illegal mobile subscriber. Type: Counter	Int32

Variables	Description	Data Type
2G-intra-prau-rej-illegal-ms	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to illegal mobile subscriber. Type: Counter	Int32
3G-intra-prau-rej-illegal-me	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to illegal mobile equipment. Type: Counter	Int32
2G-intra-prau-rej-illegal-me	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to illegal mobile equipment. Type: Counter	Int32
3G-intra-prau-rej-gprs-svc-not-allow	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to GPRS service not allowed for subscriber. Type: Counter	Int32
2G-intra-prau-rej-gprs-svc-not-allow	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to GPRS service not allowed for subscriber. Type: Counter	Int32
3G-intra-prau-rej-nongprs-svc-not-allow	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to GPRS and non-GPRS service not allowed for subscriber. Type: Counter	Int32
2G-intra-prau-rej-nongprs-svc-not-allow	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to GPRS and non-GPRS service not allowed for subscriber. Type: Counter	Int32
3G-intra-prau-rej-msid-not-derived-by-nw	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to network failed to derive MSID from attach message. Type: Counter	Int32
2G-intra-prau-rej-msid-not-derived-by-nw	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to network failed to derive MSID from attach message. Type: Counter	Int32
3G-intra-prau-rej-implicitly-detach	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to implicitly detach. Type: Counter	Int32
2G-intra-prau-rej-implicitly-detach	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to implicitly detach. Type: Counter	Int32
3G-intra-prau-rej-plmn-not-allowed	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to specific PLMN not allowed. Type: Counter	Int32
2G-intra-prau-rej-plmn-not-allowed	Description: The total periodic intra-SGSN routing area update message rejected in intra-2G roaming due to specific PLMN not allowed. Type: Counter	Int32
3G-intra-prau-rej-loc-area-not-allowed	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to specific location area not allowed. Type: Counter	Int32

Variables	Description	Data Type
2G-intra-prau-rej-loc-area-not-allowed	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to specific location area not allowed. Type: Counter	Int32
3G-intra-prau-rej-roam-not-allowed-larea	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to roaming not allowed in specific location area. Type: Counter	Int32
2G-intra-prau-rej-roam-not-allowed-larea	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to roaming not allowed in specific location area. Type: Counter	Int32
3G-intra-prau-rej-gprs-svc-not-allowed-plmn	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to GPRS service not allowed in specific PLMN. Type: Counter	Int32
2G-intra-prau-rej-gprs-svc-not-allowed-plmn	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to GPRS service not allowed in specific PLMN. Type: Counter	Int32
3G-intra-prau-rej-no-cells-in-loc-area	Description: Total number of intra-SGSN RAU requests, of type “periodic updating”, for 3G service that were rejected with reject messages sent with a cause of "No Suitable Cells In Location Area". Triggers: Increments: - upon receiving a "UMTS access control" message from a Siemens HLR for a sai-req (service area identify request). - when an operator policy is configured with this value as the reject cause for RAUs. Availability: per SGSN service, per RA Type: Counter	Int32
2G-intra-prau-rej-no-cells-in-loc-area	Description: Total number of intra-SGSN RAU requests, of type “periodic updating”, for 2G service that were rejected where “rau-reject” messages were sent with a cause of "No Suitable Cells In Location Area". Triggers: Increments: - upon receiving a "UMTS access control" message from a Siemens HLR for a sai-req (service area identify request). - when an operator policy is configured with this value as the reject cause for RAUs. Availability: per GPRS service Type: Counter	Int32
3G-intra-prau-rej-msc-not-reachable	Description: Total number of intra-SGSN RAU requests, of type “periodic updating”, for 3G service that were rejected where “rau-reject” messages were sent with a cause of "MSC temporarily not reachable". Triggers: Increments when the operator policy is configured with this value as the reject cause for RAUs. Availability: per SGSN service, per RA Type: Counter	Int32

Variables	Description	Data Type
2G-intra-prau-rej-msc-not-reachable	<p>Description: Total number of intra-SGSN RAU requests, of type “periodic updating”, for 2G service that were rejected where “rau-reject” messages were sent with a cause of "MSC temporarily not reachable".</p> <p>Triggers: Increments when the operator policy is configured with this value as the reject cause for RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-intra-prau-rej-network-failure	<p>Description: Total number of intra-SGSN RAU requests, of type “period updating”, for 3G service that were rejected where the “rau-reject” message was sent with a cause "Network Failure"</p> <p>Triggers: Increments :</p> <ul style="list-style-type: none"> - if RNC is overloaded. - if not enough credits at session manager. - upon receiving sai-request with cause of "data missing from hlr" . - if there are too many IU's for the same subscriber. - upon receiving RAU with a peer-sgsn P-TMSI when another attach is ongoing with the same P-TMSI. - when the operator policy is configured with this value as the reject cause for RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-intra-prau-rej-network-failure	<p>Description: Total number of intra-SGSN RAU requests, of type “period updating”, for 2G service that were rejected where the “rau-reject” message was sent with a cause "Network Failure"</p> <p>Triggers: Increments :</p> <ul style="list-style-type: none"> - upon receiving a sai-req with cause "data missing from hlr". - on XID failure for RAU. - if unable to send a “check-imei” request out. - when the operator policy is configured with this value as the reject cause for RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-intra-prau-rej-mac-failure	<p>Description: Total number of intra-SGSN RAU requests, of type “period updating”, for 3G service that were rejected where the “rau-reject” message was sent with a cause "MAC Failure".</p> <p>Triggers: Increments when the operator policy is configured with this value as the reject cause for RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-intra-prau-rej-mac-failure	<p>Description: Total number of intra-SGSN RAU requests, of type “period updating”, for 2G service that were rejected where the “rau-reject” message was sent with a cause "MAC Failure".</p> <p>Triggers: Increments when the operator policy is configured with this value as the reject cause for RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-intra-prau-rej-syn-failure	Description: Total number of intra-SGSN RAU requests, of type “period updating”, for 3G service that were rejected where the “rau-reject” message was sent with a cause "SYNC Failure". Triggers: Increments when the operator policy is configured with this value as the reject cause for RAUs. Availability: per SGSN service, per RA Type: Counter	Int32
2G-intra-prau-rej-syn-failure	Description: Total number of intra-SGSN RAU requests, of type “period updating”, for 2G service that were rejected where the “rau-reject” message was sent with a cause "SYNC Failure". Triggers: Increments when the operator policy is configured with this value as the reject cause for RAUs. Availability: per GPRS service Type: Counter	Int32
3G-intra-prau-rej-congestion	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to network congestion. Type: Counter	Int32
2G-intra-prau-rej-congestion	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to network congestion. Type: Counter	Int32
3G-intra-prau-rej-gsm-auth-unacceptable	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to unacceptable authentication from GSM network. Type: Counter	Int32
2G-intra-prau-rej-gsm-auth-unacceptable	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to unacceptable authentication from GSM network. Type: Counter	Int32
3G-intra-prau-rej-no-pdp-ctx-actv	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service as PDP context is not activated. Type: Counter	Int32
2G-intra-prau-rej-no-pdp-ctx-actv	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service as PDP context is not activated. Type: Counter	Int32
3G-intra-prau-rej-retry-from-new-cell	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service as subscriber retried for update from new cell. Type: Counter	Int32
2G-intra-prau-rej-retry-from-new-cell	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service as subscriber retried for update from new cell. Type: Counter	Int32
3G-intra-prau-rej-sem-wrong-msg	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service as Attach Request message is semantically wrong. Type: Counter	Int32
2G-intra-prau-rej-sem-wrong-msg	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service as Attach Request message is semantically wrong. Type: Counter	Int32

Variables	Description	Data Type
3G-intra-prau-rej- inval-mand-info	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service as mandatory information in message is invalid. Type: Counter	Int32
2G-intra-prau-rej- inval-mand-info	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service as mandatory information in message is invalid. Type: Counter	Int32
3G-intra-prau-rej- msg-type-non-exist	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to non-existent type of message. Type: Counter	Int32
2G-intra-prau-rej- msg-type-non-exist	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to non-existent type of message. Type: Counter	Int32
3G-intra-prau-rej- mtype-incompat- pstate	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service as message type is not compatible with protocol state. Type: Counter	Int32
2G-intra-prau-rej- mtype-incompat- pstate	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service as message type is not compatible with protocol state. Type: Counter	Int32
3G-intra-prau-rej- ie-non-existent	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to non-existence of information element. Type: Counter	Int32
2G-intra-prau-rej- ie-non-existent	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to non-existence of information element. Type: Counter	Int32
3G-intra-prau-rej- cond-ie-error	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to error in conditional information element. Type: Counter	Int32
2G-intra-prau-rej- cond-ie-error	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to error in conditional information element. Type: Counter	Int32
3G-intra-prau-rej- msg-incompat- pstate	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service as message type is not compatible with protocol state. Type: Counter	Int32
2G-intra-prau-rej- msg-incompat- pstate	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service as message type is not compatible with protocol state. Type: Counter	Int32
3G-intra-prau-rej- prot-error	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service due to protocol error in message. Type: Counter	Int32
2G-intra-prau-rej- prot-error	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service due to protocol error in message. Type: Counter	Int32

Variables	Description	Data Type
3G-intra-prau-rej-unknown-error	Description: Total number of periodic intra-SGSN routing area update requests rejected for 3G service where cause is unknown or not specified here. Type: Counter	Int32
2G-intra-prau-rej-unknown-error	Description: Total number of periodic intra-SGSN routing area update requests rejected for 2G service where cause is unknown or not specified here. Type: Counter	Int32
3G-comb-rau-rej-imsi-unknown-hlr	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to unknown IMSI in HLR. Type: Counter	Int32
2G-comb-rau-rej-imsi-unknown-hlr	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to unknown IMSI in HLR. Type: Counter	Int32
3G-comb-rau-rej-illegal-ms	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to illegal mobile subscriber. Type: Counter	Int32
2G-comb-rau-rej-illegal-ms	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to illegal mobile subscriber. Type: Counter	Int32
3G-comb-rau-rej-illegal-me	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to illegal mobile equipment. Type: Counter	Int32
2G-comb-rau-rej-illegal-me	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to illegal mobile equipment. Type: Counter	Int32
3G-comb-rau-rej-gprs-svc-not-allow	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to GPRS service not allowed for subscriber. Type: Counter	Int32
2G-comb-rau-rej-gprs-svc-not-allow	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to GPRS service not allowed for subscriber. Type: Counter	Int32
3G-comb-rau-rej-nongprs-svc-not-allow	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to GPRS and non-GPRS service not allowed for subscriber. Type: Counter	Int32
2G-comb-rau-rej-nongprs-svc-not-allow	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to GPRS and non-GPRS service not allowed for subscriber. Type: Counter	Int32
3G-comb-rau-rej-msid-not-derived-by-nw	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to network failed to derive MSID from attach message. Type: Counter	Int32
2G-comb-rau-rej-msid-not-derived-by-nw	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to network failed to derive MSID from attach message. Type: Counter	Int32

Variables	Description	Data Type
3G-comb-rau-rej-implicitly-detach	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to implicitly detach. Type: Counter	Int32
2G-comb-rau-rej-implicitly-detach	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to implicitly detach. Type: Counter	Int32
3G-comb-rau-rej-plmn-not-allowed	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to specific PLMN not allowed. Type: Counter	Int32
2G-comb-rau-rej-plmn-not-allowed	Description: The total intra-SGSN routing area update message rejected in intra-2G roaming due to specific PLMN not allowed. Type: Counter	Int32
3G-comb-rau-rej-loc-area-not-allowed	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to specific location area not allowed. Type: Counter	Int32
2G-comb-rau-rej-loc-area-not-allowed	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to specific location area not allowed. Type: Counter	Int32
3G-comb-rau-rej-roam-not-allowed-larea	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to roaming not allowed in specific location area. Type: Counter	Int32
2G-comb-rau-rej-roam-not-allowed-larea	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to roaming not allowed in specific location area. Type: Counter	Int32
3G-comb-rau-rej-gprs-svc-not-allowed-plmn	Description: Total number of RAU rejects sent with cause “GPRS service not allowed in this PLMN” against intra-SGSN-RAU requests of type “Combined RA/LA update” or “Combined RA/LA update with IMSI Attach” in 3G service. Triggers: Increment - on getting “Roaming not allowed” from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per SGSN service, per RA Type: Counter	Int32
2G-comb-rau-rej-gprs-svc-not-allowed-plmn	Description: Total number of RAU reject messages sent with cause “GPRS service not allowed in this PLMN” against intra-SGSN-RAU requests of type “Combined RA/LA update” or “Combined RA/LA update with IMSI Attach” in 2G service. Triggers: Increments - on getting “Roaming not allowed” from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. Availability: per GPRS service Type: Counter	Int32

Variables	Description	Data Type
3G-comb-rau-rej-no-cells-in-loc-area	<p>Description: Total number of intra-SGSN RAU requests for 3G service, of type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach", sent with cause "No Suitable Cells In Location Area".</p> <p>Triggers: Increments:</p> <ul style="list-style-type: none"> - upon receiving "UMTS access control" for the SAI-Request from the Siemens HLR. - when the operator policy is configured with this value as the reject cause for RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-rau-rej-no-cells-in-loc-area	<p>Description: Total number of intra-SGSN RAU requests for 2G service, of type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach", sent with cause "No Suitable Cells In Location Area".</p> <p>Triggers: Increments:</p> <ul style="list-style-type: none"> - upon receiving "UMTS access control" for the SAI-Request from the Siemens HLR. - when the operator policy is configured with this value as the reject cause for RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-rau-rej-msc-not-reachable	<p>Description: Total number of intra-SGSN RAU requests for 3G service, of type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach", sent with cause "MSC temporarily not reachable".</p> <p>Triggers: Increments when the operator policy is configured with this value as the reject cause for RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-rau-rej-msc-not-reachable	<p>Description: Total number of intra-SGSN RAU requests for 2G service, of type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach", sent with cause "MSC temporarily not reachable".</p> <p>Triggers: Increments when the operator policy is configured with this value as the reject cause for RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-rau-rej-network-failure	<p>Description: Total number of intra-SGSN RAU requests for 3G service, of type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach", sent with cause "MSC temporarily not reachable".</p> <p>Triggers: Increments:</p> <ul style="list-style-type: none"> - if the RNC is overloaded. - if there is not enough credits at session manager. - upon receiving cause "data missing from hlr" in the SAI-request. - if there are too many IU's for the same subscriber. - upon receiving an RAU with a peer-sgsn P-TMSI when another attach is ongoing with the same P-TMSI. - when the operator policy is configured with this value as the reject cause for RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-comb-rau-rej-network-failure	<p>Description: Total number of intra-SGSN RAU requests for 2G service, of type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach", sent with cause "MSC temporarily not reachable".</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - if there is not enough credits at session manager. - upon receiving cause "data missing from hlr" in the SAI-request. - if there are too many IU's for the same subscriber. - upon receiving an RAU with a peer-sgsn P-TMSI when another attach is ongoing with the same P-TMSI. - when the operator policy is configured with this value as the reject cause for RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-rau-rej-mac-failure	<p>Description: Total number of intra-SGSN RAU requests for 3G service, of type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach", sent with cause "MAC Failure".</p> <p>Triggers: Increments when the operator policy is configured with this value as the reject cause for RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

3G-comb-rau-rej-congestion	<p>Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to network congestion.</p> <p>Type: Counter</p>	Int32
2G-comb-rau-rej-congestion	<p>Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to network congestion.</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-comb-rau-rej-gsm-auth-unacceptable	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to unacceptable authentication from GSM network. Type: Counter	Int32
2G-comb-rau-rej-gsm-auth-unacceptable	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to unacceptable authentication from GSM network. Type: Counter	Int32
3G-comb-rau-rej-no-pdp-ctx-actv	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service as PDP context is not activated. Type: Counter	Int32
2G-comb-rau-rej-no-pdp-ctx-actv	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service as PDP context is not activated. Type: Counter	Int32
3G-comb-rau-rej-retry-from-new-cell	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service as subscriber retried for update from new cell. Type: Counter	Int32
2G-comb-rau-rej-retry-from-new-cell	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service as subscriber retried for update from new cell. Type: Counter	Int32
3G-comb-rau-rej-sem-wrong-msg	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service as Attach Request message is semantically wrong. Type: Counter	Int32
2G-comb-rau-rej-sem-wrong-msg	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service as Attach Request message is semantically wrong. Type: Counter	Int32
3G-comb-rau-rej-inval-mand-info	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service as mandatory information in message is invalid. Type: Counter	Int32
2G-comb-rau-rej-inval-mand-info	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service as mandatory information in message is invalid. Type: Counter	Int32
3G-comb-rau-rej-msg-type-non-exist	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to non-existence of information element. Type: Counter	Int32
2G-comb-rau-rej-msg-type-non-exist	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to non-existence of information element. Type: Counter	Int32
3G-comb-rau-rej-mtype-incompat-pstate	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service as message type is not compatible with protocol state. Type: Counter	Int32
2G-comb-rau-rej-mtype-incompat-pstate	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service as message type is not compatible with protocol state. Type: Counter	Int32

Variables	Description	Data Type
3G-comb-rau-rej- ie-non-existent	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to non-existent type of message. Type: Counter	Int32
2G-comb-rau-rej- ie-non-existent	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to non-existent type of message. Type: Counter	Int32
3G-comb-rau-rej- cond-ie-error	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to error in conditional information element. Type: Counter	Int32
2G-comb-rau-rej- cond-ie-error	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to error in conditional information element. Type: Counter	Int32
3G-comb-rau-rej- msg-incompat- pstate	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service as message type is not compatible with protocol state. Type: Counter	Int32
2G-comb-rau-rej- msg-incompat- pstate	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service as message type is not compatible with protocol state. Type: Counter	Int32
3G-comb-rau-rej- prot-error	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service due to protocol error in message. Type: Counter	Int32
2G-comb-rau-rej- prot-error	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service due to protocol error in message. Type: Counter	Int32
3G-comb-rau-rej- unknown-error	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 3G service where cause is unknown or not specified here. Type: Counter	Int32
2G-comb-rau-rej- unknown-error	Description: Total number of combined (GPRS and IMSI) routing area update requests rejected for 2G service where cause is unknown or not specified here. Type: Counter	Int32
3G-inter-rau-rej- imsi-unknown-hlr	Description: Total number of RAU rejects sent with cause "imsi-unknown-in-hlr" against inter-SGSN-RAU requests of type "RA Updating in 3G service." Triggers: Increments - on HLR sending a bad response to an SAI-Req or a GLU-Req. - on receiving zero (0) authorization vectors for HLR for SAI-Req. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. Availability: per SGSN service Type: Counter	Int32

Variables	Description	Data Type
2G-inter-rau-rej-imsi-unknown-hlr	<p>Description: Total number of RAU rejects sent with cause "imsi-unknown-in-hlr" against inter-SGSN-RAU requests of type "RA Updating in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on HLR sending a bad response to an SAI-Req or a GLU-Req. - on receiving zero (0) authorization vectors for HLR for SAI-Req. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-inter-rau-rej-illegal-ms	<p>Description: Total number of RAU rejects sent with cause "illegal-ms" against inter-SGSN-RAU requests of type "RA Updating in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when an Xres mismatch, followed by identity procedure, results in same IMSI. - upon receiving a bad identity-type for an Identity Request (type IMSI) that was initiated after an Xres mismatch. - after a security command failure. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service</p> <p>Type: Counter</p>	Int32
2G-inter-rau-rej-illegal-ms	<p>Description: Total number of RAU rejects sent with cause "illegal-ms" against inter-SGSN-RAU requests of type "RA Updating in 2G service.</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-inter-rau-rej-illegal-me	<p>Description: Total number of RAU rejects sent with cause "illegal-me" against inter-SGSN-RAU requests of type "RA Updating in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when unable to retrieve IMEI/IMEISV from the ms. - upon failure of IMEI verification with the EIR. - upon getting unknown equipment failure from EIR/HLR. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service</p> <p>Type: Counter</p>	Int32
2G-inter-rau-rej-illegal-me	<p>Description: Total number of RAU rejects sent with cause "illegal-me" against inter-SGSN-RAU requests of type "RA Updating in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - upon failure of IMEI verification with the EIR. - upon getting unknown equipment failure from EIR/HLR. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-inter-rau-rej-gprs-svc-not-allow	<p>Description: Total number of RAU rejects sent with cause "gprs-svc-not-allowed" against inter-SGSN-RAU requests of type "RA Updating in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - upon receiving a cl(subs-with) while a RAU/Attach is in progress. - upon receiving Subscriber Unknown failure from the HLR for GLU/SAI-Req. - after rejecting attaches due to subscriber-control-inactivity. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service</p> <p>Type: Counter</p>	Int32
2G-inter-rau-rej-gprs-svc-not-allow	<p>Description: Total number of RAU rejects sent with cause "gprs-svc-not-allowed" against inter-SGSN-RAU requests of type "RA Updating in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - upon receiving a cl(subs-with) while a RAU/Attach is in progress. - upon receiving Subscriber Unknown failure from the HLR for GLU/SAI-Req. - after rejecting attaches due to subscriber-control-inactivity. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-inter-rau-rej-nongprs-svc-not-allow	<p>Description: Total number of RAU rejects sent with cause "nongprs-svc-not-allowed" against inter-SGSN-RAU requests of type "RA Updating in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - upon receiving IMSI-Unknown from HLR in response to SAI-Req/GLU-Req. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service</p> <p>Type: Counter</p>	Int32
2G-inter-rau-rej-nongprs-svc-not-allow	<p>Description: Total number of RAU rejects sent with cause "nongprs-svc-not-allowed" against inter-SGSN-RAU requests of type "RA Updating in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - upon receiving IMSI-Unknown from HLR in response to SAI-Req/GLU-Req. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-inter-rau-rej-msid-not-derived-by-nw	<p>Description: Total number of inter-SGSN routing area update request rejects sent with cause "MSID not derived by network" against inter-SGSN-RAU requests of type "RA Updating" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when PTMSI IE is missing in RAU. - when old RAI has invalid location area values (0x0000 or 0xFFFF) for P-TMSI-attaches/RAU. - when getting a RAU with old RAI in 2G, and P-TMSI is unknown. - when getting P-TMSI-SIG-MISMATCH for an SGSN Context Request sent with IMSI Validated. - when getting a RAU Request while an attach with the same peer-SGSN-P-TMSI is in progress. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-inter-rau-rej-msid-not-derived-by-nw	<p>Description: Total number of inter-SGSN routing area update request rejects sent with cause "MSID not derived by network" against inter-SGSN-RAU requests of type "RA Updating" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when SGSN-Context-resp arrives with any cause other than "accepted". - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-inter-rau-rej-implicitly-detach	<p>Description: Total number of RAU rejects sent with cause "implicitly-detach" against inter-SGSN-RAU requests of type "RA Updating in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - upon RAU at 3G when subscriber was detached from 2G. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. - when SGSN receives a different IMSI in an SGSN-Ctx-Rsp for an SGSN-Ctx-Req sent with IMSI-validated. - when SGSN gets RAU while awaiting Detach-Accept. <p>Availability: per SGSN service</p> <p>Type: Counter</p>	Int32
2G-inter-rau-rej-implicitly-detach	<p>Description: Total number of RAU rejects sent with cause "implicitly-detach" against inter-SGSN-RAU requests of type "RA Updating in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. - when SGSN receives RAU from an unknown MS. - on t3350 expiry for the Attach-Accept. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-inter-rau-rej-plmn-not-allowed	<p>Description: Total number of RAU rejects sent with cause "plmn-not-allowed" against inter-SGSN-RAU requests of type "RA Updating in 3G service.</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per SGSN service</p> <p>Type: Counter</p>	Int32

2G-comb-irau-rej-gprs-svc-not-allow	<p>Description: Total number of inter-SGSN routing area update request rejects sent with cause “GPRS services not allowed in this PLMN” against inter-SGSN-RAU requests of type “Combined RA/LA update” or “Combined RA/LA update with IMSI Attach” in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting "Roaming not allowed" from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-irau-rej-nongprs-svc-not-allow	<p>Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to GPRS and non-GPRS service not allowed for subscriber.</p> <p>Type: Counter</p>	Int32
2G-comb-irau-rej-nongprs-svc-not-allow	<p>Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to GPRS and non-GPRS service not allowed for subscriber.</p> <p>Type: Counter</p>	Int32
3G-comb-irau-rej-msid-not-derived-by-nw	<p>Description: Total number of inter-SGSN routing area update request rejects sent with cause “MSID not derived by network” against inter-SGSN-RAU requests of type “Combined RA/LA update” or “Combined RA/LA update with IMSI Attach” in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when PTMSI IE is missing in RAU. - when old RAI has invalid location area values (0x0000 or 0xFFFFE) for P-TMSI-attaches/RAU. - when getting a RAU with old RAI in 2G, and P-TMSI is unknown. - when getting P-TMSI-SIG-MISMATCH for an SGSN Context Request sent with IMSI Validated. - when getting a RAU Request while an attach with the same peer-SGSN-P-TMSI is in progress. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-irau-rej-msid-not-derived-by-nw	<p>Description: Total number of inter-SGSN routing area update request rejects sent with cause “MSID not derived by network” against inter-SGSN-RAU requests of type “Combined RA/LA update” or “Combined RA/LA update with IMSI Attach” in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when SGSN-Context-resp arrives with any cause other than “accepted”. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-comb-irau-rej-implicitly-detach	<p>Description: Total number of RAU Rejects sent with cause “implicitly-detach” against inter-SGSN-RAU Requests of type "Combined RA/LA update" or “Combined RA/LA update with IMSI Attach” in the 3G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when RAU at 3G subscriber was detached from 2G. - when the SGSN receives a different IMSI in an SGSN-CTX-RSP for an SGSN-CTX-REQ sent with IMSI-validated. - when the SGSN receives RAU while awaiting Detach-Accept. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-irau-rej-implicitly-detach	<p>Description: Total number of RAU Rejects sent with cause “implicitly-detach” against inter-SGSN-RAU Requests of type "Combined RA/LA update" or “Combined RA/LA update with IMSI Attach” in the 2G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when the SGSN receives RAU from an unknown MS. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-irau-rej-plmn-not-allowed	<p>Description: Total number of RAU Rejects sent with cause “plmn-not-allowed” against inter-SGSN-RAU Requests of type "Combined RA/LA update" or “Combined RA/LA update with IMSI Attach” in the 3G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-irau-rej-plmn-not-allowed	<p>Description: Total number of RAU Rejects sent with cause “plmn-not-allowed” against inter-SGSN-RAU Requests of type "Combined RA/LA update" or “Combined RA/LA update with IMSI Attach” in the 2G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-irau-rej-loc-area-not-allowed	<p>Description: Total number of RAU Rejects sent with cause “loc-area-not-allowed” against inter-SGSN-RAU Requests of type "Combined RA/LA update" or “Combined RA/LA update with IMSI Attach” in the 3G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-irau-rej-loc-area-not-allowed	<p>Description: Total number of RAU Rejects sent with cause “loc-area-not-allowed” against inter-SGSN-RAU Requests of type "Combined RA/LA update" or “Combined RA/LA update with IMSI Attach” in the 2G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-comb-irau-rej-roam-not-allowed-larea	<p>Description: Total number of RAU Rejects sent with cause “roaming-not-allowed-in-location-area” against inter-SGSN-RAU Requests of type "Combined RA/LA update" or “Combined RA/LA update with IMSI Attach” in the 3G service</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when rejecting as a shared SGSN because no operator is accepting the provided IMSI. - when an operator policy is configured with this value as the reject cause for Attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-irau-rej-roam-not-allowed-larea	<p>Description: Total number of RAU Rejects sent with cause “roaming-not-allowed-in-location-area” against inter-SGSN-RAU Requests of type "Combined RA/LA update" or “Combined RA/LA update with IMSI Attach” in the 2G service</p> <p>Triggers: Increments when an operator policy is configured with this value as the reject cause for Attaches/RAUs.</p> <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-comb-irau-rej-gprs-svc-not-allowed-plmn	<p>Description: Total number of RAU rejects sent with cause "GPRS service not allowed in PLMN" against inter-SGSN-RAU requests of type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach" in 3G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting “Roaming not allowed” from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-comb-irau-rej-gprs-svc-not-allowed-plmn	<p>Description: Total number of RAU rejects sent with cause "GPRS service not allowed in PLMN" against inter-SGSN-RAU requests of type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach" in 2G service.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - on getting “Roaming not allowed” from HLR for SAI-Req/GLU-Req. - when operator policy is configured with this value as the reject cause for attaches/RAUs. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-comb-irau-rej-no-cells-in-location-area	<p>Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to non availability of suitable cell in specific location area.</p> <p>Type: Counter</p>	Int32
2G-comb-irau-rej-no-cells-in-location-area	<p>Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to non availability of suitable cell in specific location area.</p> <p>Type: Counter</p>	Int32
3G-comb-irau-rej-msc-not-reachable	<p>Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service as MSC not reachable.</p> <p>Type: Counter</p>	Int32
2G-comb-irau-rej-msc-not-reachable	<p>Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service as MSC not reachable.</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-comb-irau-rej-network-failure	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to network failure. Type: Counter	Int32
2G-comb-irau-rej-network-failure	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to network failure. Type: Counter	Int32
3G-comb-irau-rej-mac-failure	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to message authenticate code (MAC) failure. Type: Counter	Int32
2G-comb-irau-rej-mac-failure	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to MAC failure. Type: Counter	Int32
3G-comb-irau-rej-syn-failure	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to context synchronization failure. Type: Counter	Int32
2G-comb-irau-rej-syn-failure	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to context synchronization failure. Type: Counter	Int32
3G-comb-irau-rej-congestion	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to network congestion. Type: Counter	Int32
2G-comb-irau-rej-congestion	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to network congestion. Type: Counter	Int32
3G-comb-irau-rej-gsm-auth-unacceptable	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to unacceptable authentication from GSM network. Type: Counter	Int32
2G-comb-irau-rej-gsm-auth-unacceptable	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to unacceptable authentication from GSM network. Type: Counter	Int32
3G-comb-irau-rej-no-pdp-ctx-actv	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service as PDP context is not activated. Type: Counter	Int32
2G-comb-irau-rej-no-pdp-ctx-actv	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service as PDP context is not activated. Type: Counter	Int32
3G-comb-irau-rej-retry-from-new-cell	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service as subscriber retried for update from new cell. Type: Counter	Int32
2G-comb-irau-rej-retry-from-new-cell	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service as subscriber retried for update from new cell. Type: Counter	Int32

Variables	Description	Data Type
3G-comb-irau-rej-sem-wrong-msg	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service as Attach Request message is semantically wrong. Type: Counter	Int32
2G-comb-irau-rej-sem-wrong-msg	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service as Attach Request message is semantically wrong. Type: Counter	Int32
3G-comb-irau-rej-inval-mand-info	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service as mandatory information in message is invalid. Type: Counter	Int32
2G-comb-irau-rej-inval-mand-info	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service as mandatory information in message is invalid. Type: Counter	Int32
3G-comb-irau-rej-msg-type-non-exist	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to non-existent type of message. Type: Counter	Int32
2G-comb-irau-rej-msg-type-non-exist	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to non-existent type of message. Type: Counter	Int32
3G-comb-irau-rej-mtype-incompat-pstate	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service as message type is not compatible with protocol state. Type: Counter	Int32
2G-comb-irau-rej-mtype-incompat-pstate	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service as message type is not compatible with protocol state. Type: Counter	Int32
3G-comb-irau-rej-ie-non-existent	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to non-existence of information element. Type: Counter	Int32
2G-comb-irau-rej-ie-non-existent	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to non-existence of information element. Type: Counter	Int32
3G-comb-irau-rej-cond-ie-error	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to error in conditional information element. Type: Counter	Int32
2G-comb-irau-rej-cond-ie-error	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to error in conditional information element. Type: Counter	Int32
3G-comb-irau-rej-msg-not-compat-pstate	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service as message type is not compatible with protocol state. Type: Counter	Int32
2G-comb-irau-rej-msg-not-compat-pstate	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service as message type is not compatible with protocol state. Type: Counter	Int32

Variables	Description	Data Type
3G-comb-irau-rej-prot-error	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service due to protocol error in message. Type: Counter	Int32
2G-comb-irau-rej-prot-error	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service due to protocol error in message. Type: Counter	Int32
3G-comb-irau-rej-unknown-error	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 3G service where cause is unknown or not specified here. Type: Counter	Int32
2G-comb-irau-rej-unknown-error	Description: Total number of combined (GPRS and IMSI) inter-SGSN routing area update requests rejected for 2G service where cause is unknown or not specified here. Type: Counter	Int32
3G-total-rau-failure	Description: Total number of routing area updates failed for 3G service. Type: Counter	Int32
2G-total-rau-failure	Description: Total number of routing area updates failed for 2G service. Type: Counter	Int32
3G-total-intra-rau-failure	Description: This proprietary counter indicates the total number of intra-SGSN-RAU requests of type "RA Updating" that were dropped from processing in 3G service. "Dropped" indicates that the requests were silently discarded and no reject was sent for such requests. Triggers: Increments when - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this Attach, was received and pre-empted existing Attach procedure. Availability: per SGSN service, per RA Type: Counter	Int32
2G-total-intra-rau-failure	Description: This proprietary counter indicates the total number of intra-SGSN-RAU requests of type "RA Updating" that were dropped from processing in 2G service. "Dropped" indicates that the requests were silently discarded and no reject was sent for such requests. Triggers: Increments when - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this Attach, was received and pre-empted existing Attach procedure. Availability: per GPRS service Type: Counter	Int32
3G-total-periodic-rau-failure	Description: This proprietary counter indicates the total number of intra-SGSN-RAU requests of type "Periodic Updating" that were dropped from processing in 3G service. "Dropped" indicates that the requests were silently discarded and no reject was sent for such requests. Triggers: Increments when - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this attach, was received and pre-empted existing Attach procedure. - Iu released while attach procedure in progress. Availability: per SGSN service, per RA Type: Counter	Int32

Variables	Description	Data Type
2G-total-periodic-rau-failure	<p>Description: This proprietary counter indicates the total number of intra-SGSN RAU requests, of type “Periodic Updating”, that were dropped from processing in 2G service. “Dropped” indicates that the requests were silently discarded and no reject was sent for such requests.</p> <p>Triggers: Increments when</p> <ul style="list-style-type: none"> - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this attach, was received and pre-empted existing Attach procedure. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-total-intra-rau-failure-comb	<p>Description: This proprietary counter indicates the total number of inter-SGSN RAU requests, of type “Combined RA/LA Update or “Combined RA/LA Update with IMSI Attach”, that were failed in 3G service. “Dropped” indicates that the requests were silently discarded and no reject was sent for such requests.</p> <p>Triggers: Increments when</p> <ul style="list-style-type: none"> - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this attach, was received and pre-empted existing Attach procedure. <p>3) Iu released while attach procedure in progress.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-total-intra-rau-failure-comb	<p>Description: This proprietary counter indicates the total number of inter-SGSN-RAU requests of type “Combined RA/LA Update or “Combined RA/LA Update with IMSI Attach” that were failed in 3G service. “Dropped” indicates that the requests were silently discarded and no reject was sent for such requests.</p> <p>Triggers: Increments when</p> <ul style="list-style-type: none"> - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this attach, was received and pre-empted existing Attach procedure. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-total-inter-rau-failure	<p>Description: This proprietary counter indicates the total number of inter-SGSN-RAU requests of type “RA Updating” that were failed in 3G service. “Dropped” indicates that the requests were silently discarded and no reject was sent for such requests.</p> <p>Triggers: Increments when</p> <ul style="list-style-type: none"> - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this attach, was received and pre-empted existing Attach procedure. - Iu released while attach procedure in progress. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-total-inter-rau-failure	<p>Description: This proprietary counter indicates the total number of inter-SGSN-RAU requests of type “RA Updating” that were failed in 2G service. “Dropped” indicates that the requests were silently discarded and no reject was sent for such requests.</p> <p>Triggers: Increments when</p> <ul style="list-style-type: none"> - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this attach, was received and pre-empted existing Attach procedure. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-total-comb-inter-rau-failure	<p>Description: This proprietary counter indicates the total number of inter-SGSN-RAU requests of type “Combined RA/LA Update or “Combined RA/LA Iupdate with IMSI Attach” that were failed in 3G service. “Dropped” indicates that the requests were silently discarded and no reject was sent for such requests.</p> <p>Triggers: Increments when</p> <ul style="list-style-type: none"> - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this attach, was received and pre-empted existing Attach procedure. - Iu released while attach procedure was in progress. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-total-comb-inter-rau-failure	<p>Description: This proprietary counter indicates the total number of inter-SGSN-RAU requests of type “Combined RA/LA Update or “Combined RA/LA Iupdate with IMSI Attach” that were failed in 2G service. “Dropped” indicates that the requests were silently discarded and no reject was sent for such requests.</p> <p>Triggers: Increments when</p> <ul style="list-style-type: none"> - another RAU, differing from this RAU, was received and pre-empted existing RAU procedure. - another Attach, differing from this attach, was received and pre-empted existing Attach procedure. <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-intra-ra-upd-rau-fail-iu_release	<p>Description: Total number of intra-SGSN routing area updates failed for 3G service due to Iu released.</p> <p>Type: Counter</p>	Int32
3G-intra-ra-upd-rau-fail-ongoing-proc	<p>Description: Total number of intra-SGSN routing area updates failed for 3G service due ongoing procedures.</p> <p>Type: Counter</p>	Int32
2G-intra-ra-upd-rau-fail-ongoing-proc	<p>Description: Total number of intra-SGSN routing area updates failed for 2G service due ongoing procedures.</p> <p>Type: Counter</p>	Int32
3G-intra-perio-rau-fail-iu_release	<p>Description: Total number of intra-SGSN periodic routing area updates failed for 3G service due Iu released.</p> <p>Type: Counter</p>	Int32
3G-intra-perio-rau-fail-ongoing-proc	<p>Description: Total number of intra-SGSN periodic routing area updates failed for 3G service due ongoing procedures.</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-intra-perio-rau-fail-ongoing-proc	Description: Total number of intra-SGSN periodic routing area updates failed for 2G service due ongoing procedures. Type: Counter	Int32
3G-inter-rau-fail-iu_release	Description: Total number of inter-SGSN periodic routing area updates failed for 3G service due Iu released. Type: Counter	Int32
3G-inter-rau-fail-ongoing-proc	Description: Total number of inter-SGSN periodic routing area updates failed for 3G service due ongoing procedures. Type: Counter	Int32
2G-inter-rau-fail-ongoing-proc	Description: Total number of inter-SGSN periodic routing area updates failed for 2G service due ongoing procedures. Type: Counter	Int32
3G-intra-comb-rau-fail-iu_release	Description: Total number of combined RAUs dropped from processing as the Iu (in which the RAU came) was released. This counter is new in release 9.0. Triggers: Increments when the Iu releases during an ongoing RAU. Availability: per SGSN service, per RA Type: Counter	Int32
3G-intra-comb-rau-fail-ongoing-proc	Description: Total number of combined RAUs dropped from processing as another RAU/Attach/Detach was received. This counter is new in release 9.0. Triggers: Increments when another Attach/RAU/Detach is received. Availability: per SGSN service, per RA Type: Counter	Int32
2G-intra-comb-rau-fail-ongoing-proc	Description: Total number of combined RAUs dropped from processing as another RAU/Attach/Detach was received. This counter is new in release 9.0. Triggers: Increments when another Attach/RAU/Detach is received. Availability: per GPRS service Type: Counter	Int32
3G-inter-comb-rau-fail-iu_release	Description: Total number of combined inter-SGSN RAUs dropped from processing as the Iu (in which the RAU came) was released. This counter is new in release 9.0. Triggers: Increments when the Iu releases during an ongoing RAU. Availability: per SGSN service, per RA Type: Counter	Int32
3G-inter-comb-rau-fail-ongoing-proc	Description: Total number of combined inter-SGSN RAUs dropped from processing as another RAU/Attach/Detach was received. This counter is new in release 9.0. Triggers: Increments when another Attach/RAU/Detach is received. Availability: per SGSN service, per RA Type: Counter	Int32
2G-inter-comb-rau-fail-ongoing-proc	Description: Total number of combined inter-SGSN RAUs dropped from processing as another RAU/Attach/Detach was received. This counter is new in release 9.0. Triggers: Increments when another Attach/RAU/Detach is received. Availability: per GPRS service Type: Counter	Int32

Variables	Description	Data Type
intra-sgsn-inter-system-gsm-to-wcdma-success	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of Attach and RAU Requests received at 3G from 2G mobile stations (MS) attached in the same SGSN.</p> <p>Triggers: Increments when a Mobile Station (MS) performs an intra-SGSN inter-RAT Attach/RAU from 2G to 3G.</p> <p>Availability: Across all SGSN services</p> <p>Type: Counter</p>	Int32
intra-sgsn-inter-system-gsm-to-wcdma-rej	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of Attach/RAU Rejects sent against Attach/RAU Requests received at 3G from 2G mobile stations (MS) attached in the same SGSN.</p> <p>Triggers: Increments when an Attach/RAU procedure is rejected on an intra-SGSN inter-RAT Attach/RAU Request from 2G to 3G.</p> <p>Availability: Across all SGSN services</p> <p>Type: Counter</p>	Int32
intra-sgsn-inter-system-gsm-to-wcdma-fail	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of failed Attach/RAU Procedures initiated at 3G from 2G mobile stations (MS) attached in the same SGSN.</p> <p>Triggers: Increments when an Attach/RAU procedure is dropped without an Attach/RAU Reject on an intra-SGSN inter-RAT from 2G to 3G.</p> <p>Availability: Across all SGSN services</p> <p>Type: Counter</p>	Int32
intra-sgsn-inter-system-wcdma-to-gsm-success	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of RAU and Attach Requests received at 2G from 3G mobile stations (MS) attached in the same SGSN.</p> <p>Triggers: Increments when a Mobile Station (MS) performs an intra-SGSN inter-RAT Attach/RAU from 3G to 2G.</p> <p>Availability: Across all GPRS services</p> <p>Type: Counter</p>	Int32
intra-sgsn-inter-system-wcdma-to-gsm-rej	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of Attach/RAU Rejects sent against Attach/RAU Requests received at 2G from 3G mobile stations (MS) attached in the same SGSN.</p> <p>Triggers: Increments when an Attach/RAU procedure is rejected on an intra-SGSN inter-RAT Attach/RAU Request from 3G to 2G.</p> <p>Availability: Across all GPRS services</p> <p>Type: Counter</p>	Int32
intra-sgsn-inter-system-wcdma-to-gsm-fail	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of failed Attach/RAU Procedures initiated at 2G from 3G mobile stations (MS) attached in the same SGSN.</p> <p>Triggers: Increments when an Attach/RAU procedure is dropped without an Attach/RAU Reject on an intra-SGSN inter-RAT from 3G to 2G.</p> <p>Availability: Across all GPRS services</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
inter-system-2G-to-3G-rau-requests	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of RAU-requests of type "RA Updating" received from subscribers who attached previously to the same SGSN under 2G.</p> <p>Triggers: Increments upon reception of a RAU-request at the 3G SGSN.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
inter-system-2G-to-3G-rau-accepts	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of RAU-accepts with update-result - "RA updated" issued against RAU-requests from subscribers who attached previously to the same SGSN under 2G.</p> <p>Triggers: Increments upon issue of such a RAU-accept message at the 3G SGSN.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
inter-system-2G-to-3G-rau-rejects	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of RAU-rejects issued against RAU-requests of the type "RA Updating" which were received from subscribers who attached previously to the same SGSN under 2G.</p> <p>Triggers: Increments upon issue of such a RAU-reject message by the 3G SGSN.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
inter-system-2G-to-3G-comb-rau-requests	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of RAU-requests, of type "Combined RA/LA update" or "Combined RA/LA update, with IMSI Attach" received from subscribers who attached previously to the same SGSN under 2G.</p> <p>Triggers: Increments upon reception of such a RAU-request message at the 3G SGSN.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
inter-system-2G-to-3G-comb-rau-accepts	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of RAU-accepts, with update-result - "Combined RA/LA updated", issued against RAU-requests from subscribers who attached previously to the same SGSN under 2G.</p> <p>Triggers: Increments upon issue of such RAU-accept message at the 3G SGSN.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
inter-system-2G-to-3G-comb-rau-rejects	<p>NOTE: This statistic was deprecated for Release 11.0 and higher.</p> <p>Description: Total number of RAU-rejects, issued against RAU-requests of the type "Combined RA/LA update" or "Combined RA/LA update with IMSI Attach", received from subscribers who attached previously to the same SGSN under 2G.</p> <p>Triggers: Increments upon issue of such a RAU-reject message at the 3G SGSN.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
inter-system-2G-to-3G-attach-requests	<p>Description: Total number of attach-request messages, of the type "GPRS Attach", received from subscribers who attached previously to the same SGSN under 2G.</p> <p>Triggers: Increments upon reception of such an attach-request message at the 3G SGSN.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
inter-system-2G-to-3G-attach-accepts	Description: Total number of attach-accepts of type "GPRS only attached" issued against attach-requests from subscribers who attached previously to the same SGSN under 2G. Triggers: Increments upon issue of such an attach-accept message at the 3G SGSN. Availability: per SGSN service, per RA Type: Counter	Int32
inter-system-2G-to-3G-attach-rejects	Description: Total number of attach-reject messages, issued against attach-requests of type "GPRS Attach", received from subscribers who attached previously to the same SGSN under 2G. Triggers: Increments upon issue of such an attach-reject message from the 3G SGSN. Availability: per SGSN service, per RA Type: Counter	Int32
inter-system-2G-to-3G-comb-attach-requests	Description: Total number of attach-request messages, of type "Combined GPRS/IMSI Attach", received from subscribers who attached previously to the same SGSN under 2G. Triggers: Increments upon reception of such attach-request messages at the 3G SGSN. Availability: per SGSN service, per RA Type: Counter	Int32
inter-system-2G-to-3G-comb-attach-accepts	Description: Total number of attach-accept messages, of the type "Combined GPRS/IMSI attached", issued against attach-requests from subscribers who attached previously to the same SGSN under 2G. Triggers: Increments upon issue of such an attach-accept message by the 3G SGSN. Availability: per SGSN service, per RA Type: Counter	Int32
inter-system-2G-to-3G-comb-attach-rejects	Description: Total number of attach-reject messages, issued against attach-requests of type "Combined GPRS/IMSI Attach", received from subscribers who attached previously to the same SGSN under 2G. Triggers: Increments upon issue of such an attach-reject message by the 3G SGSN. Availability: per SGSN service, per RA Type: Counter	Int32
inter-system-3G-to-2G-rau-requests	NOTE: This statistic was deprecated for Release 11.0 and higher. Description: Total number of RAU-request messages, of type "RA Updating", received from subscribers who attached previously to the same SGSN under 3G. Triggers: Increments upon reception of such a RAU-request message at the 2G SGSN. Availability: across all GPRS services Type: Counter	Int32
inter-system-3G-to-2G-rau-accepts	NOTE: This statistic was deprecated for Release 11.0 and higher. Description: Total number of RAU-accept messages, with update-result - "RA updated", issued against RAU-requests from subscribers who previously attached to the same SGSN under 3G. Triggers: Increments upon issue of such a RAU-accept message by the 2G SGSN. Availability: across all GPRS services Type: Counter	Int32
inter-system-3G-to-2G-rau-rejects	NOTE: This statistic was deprecated for Release 11.0 and higher. Description: Total number of RAU-reject messages, issued against RAU-requests of type "Ra Updating", received from subscribers who attached previously to the same SGSN under 3G. Triggers: Increments upon issue of such a RAU-reject message by the 2G SGSN. Availability: across all GPRS services Type: Counter	Int32

Variables	Description	Data Type
3G-irat-comb-rej-prot-error	<p>Description: Total number of Combined Inter RAT RAU Rejects in 3G service with cause “protocol error”.</p> <p>Triggers: Increments when operator policy is configured with this value as the reject cause for attaches/RAUs.</p> <p>Availability: per RA, per SGSN service</p> <p>Type: Counter</p>	Int32
2G-irat-comb-rej-prot-error	<p>Description: Total number of Combined Inter RAT RAU Rejects in 2G service with cause “protocol error”.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when the PLMN ID in BSSGP message does not match the configured PLMN at GPRS service - when operator policy is configured with this value as the reject cause for attaches/RAUs <p>Availability: per RA, per GPRS service</p> <p>Type: Counter</p>	Int32
3G-irat-comb-rej-unknown-error	<p>Description: Total number of Combined Inter RAT RAU Rejects in 3G service with cause “unknown error”.</p> <p>Availability: per RA, per SGSN service</p> <p>Type: Counter</p>	Int32
2G-irat-comb-rej-unknown-error	<p>Description: Total number of Combined Inter RAT RAU Rejects in 2G service with cause “unknown error”.</p> <p>Availability: per RA, per GPRS service</p> <p>Type: Counter</p>	Int32
redir-attach-rej-gprs-pna	<p>Description: Total number of GPRS Attach Rejects sent with a redirection indication cause of “PLMN Not Allowed”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32
redir-attach-rej-comb-pna	<p>Description: Total number of combined Attach Rejects sent with a redirection indication using any cause other than “PLMN Not Allowed”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32
redir-rau-gprs-intra-sgsn-rej-pna	<p>Description: Total number of intra-SGSN GPRS RAU Rejects sent with a redirection indication cause of “PLMN Not Allowed”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
redir-rau-comb-intra-sgsn-rej-pna	<p>Description: Total number of intra-SGSN combined-RAU Rejects sent with a redirection indication cause of “PLMN Not Allowed”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32
redir-rau-gprs-inter-sgsn-rej-pna	<p>Description: Total number of inter-SGSN GPRS RAU Rejects sent with a redirection indication cause of “PLMN Not Allowed”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32
redir-rau-comb-inter-sgsn-rej-pna	<p>Description: Total number of inter-SGSN combined-RAU Rejects sent with a redirection indication cause of “PLMN Not Allowed”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32
redir-rau-gprs-inter-rat-pna	<p>Description: Total number of inter-RAT GPRS-RAU Rejects sent with a redirection indication cause of “PLMN Not Allowed”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32
redir-rau-comb-inter-rat-pna	<p>Description: Total number of inter-RAT combined-RAU Rejects sent with a redirection indication cause of “PLMN Not Allowed”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32
redir-rau-gprs-inter-serv-pna	<p>Description: Total number of inter-service GPRS-RAU Rejects sent with a redirection indication cause of “PLMN Not Allowed”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32

redir-rau-gprs-inter-serv-ur	<p>Description: Total number of inter-service GPRS-RAU Rejects sent with a redirection indication cause of “xxx”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32
redir-rau-comb-inter-serv-ur	<p>Description: Total number of inter-service combined-RAU Rejects sent with a redirection indication cause of “xxx”, which has been configured as the reject cause for network sharing failure cause.</p> <p>Triggers: Increments when network sharing is enabled and the SGSN is not configured to accept this subscriber under any of its PLMN.</p> <p>Availability: per SGSN, per RA</p> <p>Type: Counter</p>	Int32
3G-ms-init-detach	<p>Description: Total number of MS initiated Detach Requests of type 'GPRS Detach' received for 3G service.</p> <p>Triggers: Increments when the MS initiates a Detach Request.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-ms-init-detach	<p>Description: Total number of MS initiated Detach Requests of type 'GPRS Detach' received for 2G service.</p> <p>Triggers: Increments when the MS initiates a Detach Request.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-ms-init-imsi-detach	<p>Description: Total number of MS initiated Detach Requests of type 'Imsi Detach' received for 3G service.</p> <p>Triggers: Increments when the MS initiates a Detach Request.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-ms-init-imsi-detach	<p>Description: Total number of MS initiated Detach Requests of type 'Imsi Detach' received for 2G service.</p> <p>Triggers: Increments when the MS initiates a Detach Request.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-ms-init-comb-detach	<p>Description: Total number of MS initiated GPRS and IMSI (PS and CS) Detach Requests of type 'Combined Gprs/Imsi Detach' received for 3G service.</p> <p>Triggers: Increments when the MS initiates a Detach Request.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-ms-init-comb-detach	<p>Description: Total number of MS initiated GPRS and IMSI (PS and CS) Detach Requests of type 'Combined Gprs/Imsi Detach' received for 2G service.</p> <p>Triggers: Increments when the MS initiates a Detach Request.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-nw-init-detach	<p>Description: Total number of network initiated Detach Request procedures sent for 3G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) When a subscriber cleared by Administrator/operator. 2) When "Cancel Location" received from HLR. 3) When stand-alone "Delete Subscriber Data" is received with "All GPRS Subscription withdrawn". 4) When subscriber-control-inactivity timer expires and action is to detach immediately. <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-nw-init-detach	<p>Description: Total number of network initiated Detach Request procedures received for 2G service.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1) When a subscriber cleared by Administrator/operator. 2) When "Cancel Location" received from HLR. 3) When stand-alone "Delete Subscriber Data" is received with "All GPRS Subscription withdrawn". 4) When subscriber-control-inactivity timer expires and action is to detach immediately. <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-ms-init-detach-accept	<p>Description: Total number of 3G service MS-initiated Detach Accept messages received by the SGSN and sent by the mobile station (MS) in response to network-initiated Detach Request messages.</p> <p>Triggers: Increments when a Detach Accept is received from an MS.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-ms-init-detach-accept	<p>Description: Total number of 2G service MS-initiated Detach Accept messages received by the SGSN and sent by the mobile station (MS) in response to network-initiated Detach Request messages.</p> <p>Triggers: Increments when a Detach Accept is received from an MS.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
3G-nw-init-detach-accept	<p>Description: Total number of Network initiated Detach Accept messages in response to requests of type 'Gprs Detach' in 3G service.</p> <p>Triggers: Increments when the network accepts a detach initiated by the MS.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
3G-nw-init-imsi-detach-accept	<p>Description: Total number of Network initiated IMSI (CS) Detach Accept messages in response to requests of type 'Imsi Detach' in 3G service.</p> <p>Triggers: Increments when the network accepts a detach initiated by the MS.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
3G-nw-init-comb-detach-accept	<p>Description: Total number of Network initiated combined (GPRS and IMSI) Detach Accept messages in response to requests of type 'Combined Gprs/Imsi Detach' in 3G service.</p> <p>Triggers: Increments when the network accepts a detach initiated by the MS.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-nw-init-detach-accept	Description: Total number of Network initiated Detach Accept messages in response to requests of type 'Gprs Detach' in 2G service. Triggers: Increments when the network accepts a detach initiated by the MS. Availability: per GPRS service Type: Counter	Int32
2G-nw-init-imsi-detach-accept	Description: Total number of Network initiated IMSI (CS) Detach Accept messages in response to requests of type 'Imsi Detach' in 2G service. Triggers: Increments when the network accepts a detach initiated by the MS. Availability: per GPRS service Type: Counter	Int32
2G-nw-init-comb-detach-accept	Description: Total number of Network initiated combined (GPRS and IMSI) Detach Accept messages in response to requests of type 'Combined Gprs/Imsi Detach' in 2G service. Triggers: Increments when the network accepts a detach initiated by the MS. Availability: per GPRS service Type: Counter	Int32
3G-signalling-service-request	Description: Total number of Service Request messages received for type "Signalling" in 3G service. Triggers: Increments when the MS initiates a Serving Request message. Availability: per SGSN service, per RA Type: Counter	Int32
2G-signalling-service-request	This statistic has been deprecated.	Int32
3G-data-service-request	Description: Total number of Service Request messages received for type "Data" in 3G service. Triggers: Increments when the MS initiates a Serving Request message. Availability: per SGSN service, per RA Type: Counter	Int32
2G-data-service-request	This statistic has been deprecated.	Int32
3G-service-response	Description: Total number of Service Accept messages sent by the network in 3G service. Triggers: Increments when the SGSN receives and accepts a Serving Request message in connected state. Availability: per SGSN service, per RA Type: Counter	Int32
2G-service-response	This statistic has been deprecated.	Int32
3G-service-reject	Description: Total number of Service Reject messages sent by the network in 3G service. Triggers: A derived counter. See individual counters for trigger points. Availability: per SGSN service, per RA Type: Counter	Int32
2G-service-reject	This statistic has been deprecated.	Int32

Variables	Description	Data Type
3G-service-rej-netwk-fail	<p>Description: Total number of Service Request messages rejected for 3G service due to network failure.</p> <p>Triggers: Increments</p> <ul style="list-style-type: none"> - when the SGSN initiates SAI towards HLR but the SGSN does not receive an SAI response - when there are too many Ius to the same MM context - if RNC is overloaded <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-service-rej-netwk-fail	This statistic has been deprecated.	Int32
3G-service-rej-imsi-unknown-at-hlr	<p>Description: Total number of Service Request messages rejected for 3G service due to unknown IMSI in HLR.</p> <p>Triggers: Increments when we initiate SAI towards HLR but we get an 'imsi not known' from HLR.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-service-rej-imsi-unknown-at-hlr	This statistic has been deprecated.	Int32
3G-service-rej-msid-not-derived-by-nwtk	<p>Description: Total number of Service Request messages rejected for 3G service as MSID can not derived by network from message.</p> <p>Triggers: Increments when we get an unknown PTMSI service request from an MS.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-service-rej-msid-not-derived-by-nwtk	This statistic has been deprecated.	Int32
3G-service-rej-implicity-detach	<p>Description: Total number of Service Request messages rejected for 3G service due to implicitly detach.</p> <p>Triggers: Increments when we get a service request from an MS that is already detached.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-service-rej-implicity-detach	This statistic has been deprecated.	Int32
3G-service-rej-illegal-ms	<p>Description: Total number of Service Request messages rejected for 3G service due to illegal mobile subscriber.</p> <p>Triggers: Increments when authentication fails on a service request.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
2G-service-rej-illegal-ms	This statistic has been deprecated.	Int32

Variables	Description	Data Type
3G-service-rej-msg-not-compat-prot-state	Description: Total number of Service Request messages rejected for 3G service as message is not compatible with protocol state. Triggers: Increments when we get a service request for ongoing authentication or attach. Availability: per SGSN service, per RA Type: Counter	Int32
2G-service-rej-msg-not-compat-prot-state	This statistic has been deprecated.	Int32
3G-service-rej-no-pdp-ctx-actv	Description: Total number of Service Request messages rejected for 3G service as no PDP context is activated. Triggers: Increments when we get a service request of type 'data' and we have no PDP contexts activated. Availability: per SGSN service, per RA	Int32
2G-service-rej-no-pdp-ctx-actv	This statistic has been deprecated.	Int32
3G-service-rej-sem-wrong-msg	Description: Total number of Service Request messages rejected for 3G service as request message is semantically wrong. Triggers: Increments when a decode failure happens on a service request. Availability: per SGSN service, per RA	Int32
3G-service-rej-unknown-cause	Description: Total number of 3G Service Request messages rejected for unknown causes. Any number other than zero (0) indicates a software problem. This counter is new in release 9.0. Triggers: Increments when a 3G Service Request is rejected. Availability: per SGSN service, per RA	Int32
2G-service-rej-sem-wrong-msg	This statistic has been obsoleted in release 9.0. Description: Total number of Service Request messages rejected for 2G service as request message is semantically wrong. Triggers: Increments when a decode failure happens on a service request. Availability: per GPRS service, per RA	Int32
3G-paging-request	Description: Total number of 3G service Paging Request messages originated by SGSN and sent to the Radio Network Controller (RNC) to contact mobile stations (MS). Triggers: 1) Subscriber is in standby state and SGSN has some downlink signalling activity to do for network initiated detach procedure or downlink SM-messages (like modify-PDP-Request) to be sent. 2) Downlink data is to be sent to a standby subscriber Availability: per SGSN service	Int32
2G-paging-request	Description: Total number of 2G service Paging Request messages originated by SGSN and sent to the Radio Network Controller (RNC) to contact mobile stations (MS). Triggers: 1) Subscriber is in standby state and SGSN has some downlink signalling activity to do for network initiated detach procedure or downlink SM-messages (like modify-PDP-Request) to be sent. 2) Downlink data is to be sent to a standby subscriber. Availability: per GPRS service	Int32

Variables	Description	Data Type
3G-ret-paging-request	Total paging request messages retransmitted in packet switching (PS) domain for 3G service.	Int32
2G-ret-paging-request	Total paging request messages retransmitted in packet switching (PS) domain for 2G service.	Int32
3G-paging-success	Description: Total number of successful paging responses in 3G service. Triggers: Any successful Iu passing security started after Paging is started. Availability: per SGSN service, per RA	Int32
2G-paging-success	Description: Total number of successful paging responses in 2G service. Triggers: Any LLC uplink frame received after a Page-Request is sent to MS. Availability: per GPRS service	Int32
3G-cs-page-request	Total paging request messages in circuit switching (CS) domain for 3G service.	Int32
2G-cs-page-request	Total paging request messages in circuit switching (CS) domain for 2G service.	Int32
3G-cs-page-response	NOTE: This statistic was deprecated for Release 11.0 and higher. Total paging request response messages sent in circuit switching (CS) domain for 3G service.	Int32
2G-cs-page-response	NOTE: This statistic was deprecated for Release 11.0 and higher. Total paging request response messages sent in circuit switching (CS) domain for 2G service.	Int32
3G-gmm-status-sent	Total GPRS mobility management procedure status messages sent for 3G service.	Int32
2G-gmm-status-sent	Total GPRS mobility management procedure status messages sent for 2G service.	Int32
3G-gmm-status-rcvd	Total GPRS mobility management procedure status messages received for 3G service.	Int32
2G-gmm-status-rcvd	Total GPRS mobility management procedure status messages received for 2G service.	Int32
3G-gmm-info-sent	Total messages sent with GPRS mobility management information for 3G service.	Int32
2G-gmm-info-sent	Total messages sent with GPRS mobility management information for 2G service.	Int32
3G-auth-cipher-request	Description: Total authentication and ciphering request messages for 3G service. Triggers: Whenever authentication procedure is initiated. Availability: per SGSN service, per RA	Int32
2G-auth-cipher-request	Description: Total authentication and ciphering request messages for 2G service. Triggers: Whenever authentication procedure is initiated. Availability: per GPRS service	Int32
3G-ret-auth-cipher-request	Description: Indicates the total number of authorization and cipher requests that were retransmitted in 3G. Triggers: On expiry of T3360 and a retransmission of auth and cipher request. Availability: per SGSN service, per RA	Int32

Variables	Description	Data Type
2G-ret-auth-cipher-request	Description: Indicates the total number of authorization and cipher requests that were retransmitted in 2G. Triggers: On expiry of T3360 and a retransmission of auth and cipher request. Availability: per GPRS service, per RA	Int32
3G-auth-cipher-response	Description: Total authentication and ciphering request response messages for 3G service. Triggers: Whenever the MS sends a authentication and cipher response message. Availability: per SGSN service, per RA	Int32
2G-auth-cipher-response	Description: Total authentication and ciphering request response messages for 2G service. Triggers: Whenever the MS sends a authentication and cipher response message. Availability: per GPRS service	Int32
3G-auth-cipher-rsp-sres-mismatch	Description: Indicates the number of authentication and cipher responses received, in 3G service, with mismatching xres/sres values. Triggers: When a mismatching Xres is received in auth-response. Availability: per SGSN service, per RA	Int32
2G-auth-cipher-rsp-sres-mismatch	Description: Indicates the number of authentication and cipher responses received, in 2G service, with mismatching xres/sres values. Triggers: When a mismatching Xres is received in auth-response. Availability: per GPRS service, per RA	Int32
3G-auth-cipher-reject	Total authentication and ciphering request reject messages for 3G service.	Int32
2G-auth-cipher-reject	Total authentication and ciphering request reject messages for 2G service.	Int32
3G-auth-cipher-rej-xres-mismatch	Description: Indicates the number of auth and cipher rejects sent by the SGSN due to xres not matching in 3G. Triggers: When auth-response has an xres mismatch and the SGSN proceeds to reject the MS because of it. Availability: per SGSN service, per RA	Int32
2G-auth-cipher-rej-xres-mismatch	Description: Indicates the number of auth and cipher rejects sent by the SGSN due to xres not matching in 2G. Triggers: When auth-response has an xres mismatch and the SGSN proceeds to reject the MS because of it. Availability: per GPRS service, per RA	Int32
3G-auth-cipher-rej-sync-not-have-auts	Description: Indicates the number of auth and cipher rejects sent by the SGSN in 3G when a SYNC failure is received without the AUTS parameter. Triggers: When an auth-failure message, with cause SYNC failure, is received but there is no AUTS (authentication token for re-synchronization) parameter. Availability: per SGSN service, per RA	Int32
2G-auth-cipher-rej-sync-not-have-auts	Description: Indicates the number of auth and cipher rejects sent by the SGSN in 2G when a SYNC failure is received without the AUTS parameter. Triggers: When an auth-failure message, with cause SYNC failure, is received but there is no AUTS (authentication token for re-synchronization) parameter. Availability: per GPRS service, per RA	Int32

Variables	Description	Data Type
3G-auth-cipher-rej-many-sync-fail	Description: Indicates the number of auth and cipher rejects sent by the SGSN in 3G when there was more than one SYNC failure. Triggers: When SGSN receives an auth-failure message with SYNC failure more than once in the same authentication procedure. Availability: per SGSN service, per RA	Int32
2G-auth-cipher-rej-many-sync-fail	Description: Indicates the number of auth and cipher rejects sent by the SGSN in 2G when there was more than one SYNC failure. Triggers: When SGSN receives an auth-failure message with SYNC failure more than once in the same authentication procedure. Availability: per GPRS service, per RA	Int32
3G-auth-cipher-rej-many-mac-fail	Description: Indicates the number of auth and cipher rejects sent by the SGSN in 3G when there was more than one MAC failure. Triggers: When SGSN receives an auth-failure message with MAC failure more than once in the same authentication procedure. Availability: per SGSN service, per RA	Int32
2G-auth-cipher-rej-many-mac-fail	Description: Indicates the number of auth and cipher rejects sent by the SGSN in 2G when there was more than one MAC failure. Triggers: When SGSN receives an auth-failure message with MAC failure more than once in the same authentication procedure. Availability: per GPRS service, per RA	Int32
3G-auth-cipher-mac-fail	Description: Total authentication and ciphering failed due to message authentication code (MAC) failure in 3G service. Triggers: When a authorization and cipher failure message is received with this cause. Availability: per SGSN service, per RA	Int32
2G-auth-cipher-mac-fail	Description: Total authentication and ciphering failed due to message authentication code (MAC) failure for 2G service. Triggers: When a authorization and cipher failure message is received with this cause. Availability: per GPRS service	Int32
3G-auth-cipher-syn-fail	Description: Total number of authentication and cipher procedure failures messages received with cause "SYNC failure" in 3G service. Triggers: When a authorization and cipher failure message is received with this cause. Availability: per SGSN service, per RA	Int32
2G-auth-cipher-syn-fail	Description: Total number of authentication and cipher procedure failures messages received with cause "SYNC failure" in 2G service. Triggers: When a authorization and cipher failure message is received with this cause. Availability: per GPRS service	Int32
3G-auth-unacceptable	Description: Total number of authentication and cipher procedure fail messages received with cause "authentication unacceptable" in 3G service. Triggers: When a authorization and cipher failure message is received with this cause. Availability: per SGSN service, per RA	Int32
2G-auth-unacceptable	Indicates the number of authentication and cipher procedure fail messages received with cause "authentication unacceptable" in 2G service. Triggers: When a authorization and cipher failure message is received with this cause. Availability: per GPRS service	Int32

Variables	Description	Data Type
3G-ptmsi-realloc	Description: Total Packet-Temporary Mobile Subscriber Identity reallocation procedure for 3G service.	Int32
2G-ptmsi-realloc	Description: Total Packet-Temporary Mobile Subscriber Identity reallocation procedure for 2G service.	Int32
3G-ret-ptmsi-realloc	Description: Total number of PTMSI-Reallocation commands retransmitted in the 3G service. Triggers: Increments on expiry of T3350 timer and a retransmission of the PTMSI-Reallocation command. Availability: per SGSN service, per RA	Int32
2G-ret-ptmsi-realloc	Description: Total number of PTMSI-Reallocation commands retransmitted in the 2G service. Triggers: Increments on expiry of T3350 timer and a retransmission of the PTMSI-Reallocation command. Availability: per GPRS service, per RA	Int32
3G-ptmsi-realloc-complete	Description: Total number of PTMSI-Reallocation Complete messages received at 3G. Triggers: Increments when we receive a PTMSI Realloc Complete from MS in 3G. Availability: per SGSN service, per RA	Int32
2G-ptmsi-realloc-complete	Description: Total number of PTMSI-Reallocation Complete messages received at 2G. Triggers: Increments when we receive a PTMSI Realloc Complete from MS in 2G. Availability: per GPRS service	Int32
3G-imsi-identity-request	Description: Total number of identity request messages sent with identity type as “IMSI” in 3G service. Triggers: When the SGSN initiates a Identity request to know the IMSI of the subscriber. This is done when: - Unknown local P-TMSI attach is received. - GTP-Identity with peer SGSN failed on a peer SGSN P-TMSI attach. - Authenticate response X-RES mismatch and the IMSI was not ascertained from the MS itself. - On a MAC failure and the IMSI was not ascertained from the MS itself. Availability: per SGSN service, per RA	Int32
2G-imsi-identity-request	Description: Total number of identity request messages sent with identity type as “IMSI” in 2G service. Triggers: When the SGSN initiates an identity request to know the IMSI of the subscriber due to unknown local-PTMSI attach is received or GTP identity with Peer SGSN failed on a Peer SGSN PTMSI attach. Availability: per GPRS service	Int32
3G-imei-identity-request	Description: Total number of identity request messages sent with identity type as “IMEI” for 3G service. Triggers: When the SGSN initiates an identity request to know the IMEI of the UE due to unknown local-PTMSI attach is received or GTP identity with Peer SGSN failed on a Peer SGSN PTMSI attach. Availability: per SGSN service	Int32
2G-imei-identity-request	Description: Total number of identity request messages sent with identity type as “IMEI” for 2G service. Triggers: When the SGSN initiates an identity request to know the IMEI of the subscriber due to unknown local-PTMSI attach is received or GTP identity with Peer SGSN failed on a Peer SGSN PTMSI attach. Availability: per GPRS service	Int32

Variables	Description	Data Type
3G-imeisv-identity-request	<p>Description: Total number of identity request messages sent with identity type as “IMEI-SV” for 3G service.</p> <p>Triggers: When the SGSN initiates an identity request to know the IMEI-SV of the UE due to unknown local-PTMSI attach is received or GTP identity with Peer SGSN failed on a Peer SGSN PTMSI attach.</p> <p>Availability: per SGSN service, per RA</p>	Int32
2G-imeisv-identity-request	<p>Description: Total number of identity request messages sent with identity type as “IMEI-SV” for 2G service.</p> <p>Triggers: When the SGSN initiates an identity request to know the IMEI-SV of the subscriber due to unknown local-PTMSI attach is received or GTP identity with Peer SGSN failed on a Peer SGSN PTMSI attach.</p> <p>Availability: per GPRS service</p>	Int32
3G-tmsi-identity-request	<p>Description: Total number of identity request messages sent with identity type as “T-IMSI” for 3G service.</p> <p>Triggers: When the SGSN initiates an identity request to know the temporary IMSI of the subscriber due to unknown local-PTMSI attach is received or GTP identity with Peer SGSN failed on a Peer SGSN PTMSI attach.</p> <p>Availability: per SGSN service, per RA</p>	Int32
2G-tmsi-identity-request	<p>Description: Total number of identity request messages sent with identity type as “IMSI” for 2G service.</p> <p>Triggers: When the SGSN initiates an identity request to know the IMSI of the subscriber due to unknown local-PTMSI attach is received or GTP identity with Peer SGSN failed on a Peer SGSN PTMSI attach.</p> <p>Availability: per GPRS service</p>	Int32
3G-ret-imsi-identity-request	Total number of IMSI identity request messages retransmitted for 3G service.	Int32
2G-ret-imsi-identity-request	Total number of IMSI identity request messages retransmitted for 2G service.	Int32
3G-ret-imei-identity-request	Total number of IMEI identity request messages retransmitted for 3G service.	Int32
2G-ret-imei-identity-request	Total number of IMEI identity request messages retransmitted for 2G service.	Int32
3G-ret-imeisv-identity-request	Total number of IMEI-SV identity request messages retransmitted for 3G service.	Int32
2G-ret-imeisv-identity-request	Total number of IMEI-SV identity request messages retransmitted for 2G service.	Int32
3G-ret-tmsi-identity-request	Total number of temporary IMS identity request messages retransmitted for 3G service.	Int32
2G-ret-tmsi-identity-request	Total number of temporary IMSI identity request messages retransmitted for 2G service.	Int32

Variables	Description	Data Type
3G-imsi-identity-response	<p>Description: Total number of identity response messages received with MS identity of type “IMSI” for 3G service.</p> <p>Triggers: When the SGSN receives an Identity response initiated to an identity request initiated of identity type IMSI.</p> <p>Availability: per SGSN service, per RA</p>	Int32
2G-imsi-identity-response	<p>Description: Total number of identity response messages received with MS identity of type “IMSI” for 2G service.</p> <p>Triggers: When the SGSN receives an Identity response initiated to an identity request initiated of identity type IMSI.</p> <p>Availability: per GPRS service</p>	Int32
3G-imei-identity-response	<p>Description: Total number of identity response messages received with MS identity of type “IMEI” for 3G service.</p> <p>Triggers: When the SGSN receives an Identity response initiated to an identity request initiated of identity type IMEI.</p> <p>Availability: per SGSN service, per RA</p>	Int32
2G-imei-identity-response	<p>Description: Total number of identity response messages received with MS identity of type “IMEI” for 2G service.</p> <p>Triggers: When the SGSN receives an Identity response initiated to an identity request initiated of identity type IMEI.</p> <p>Availability: per GPRS service</p>	Int32
3G-imeisv-identity-response	<p>Description: Total number of identity response messages received with MS identity of type “IMEI-SV” for 3G service.</p> <p>Triggers: When the SGSN receives an Identity response initiated to an identity request initiated of identity type IMEI-SV.</p> <p>Availability: per SGSN service, per RA</p>	Int32
2G-imeisv-identity-response	<p>Description: Total number of identity response messages received with MS identity of type “IMEI-SV” for 2G service.</p> <p>Triggers: When the SGSN receives an Identity response initiated to an identity request initiated of identity type IMEI-SV.</p> <p>Availability: per GPRS service</p>	Int32
3G-unknown-identity-response	Total number of unknown identity response sent for 3G service.	Int32
2G-unknown-identity-response	Total number of unknown identity response sent for 2G service.	Int32
3G-tmsi-identity-response	Total number of temporary IMSI identity response messages sent for 3G service.	Int32
2G-tmsi-identity-response	Total number of temporary IMSI identity response messages sent for 2G service.	Int32

Variables	Description	Data Type
new-connection-rejected-overload	<p>Description: This proprietary counter indicates the total number of new connection (inter-SGSN RAU and/or Attach) requests that were rejected due to an overload situation.</p> <p>Triggers:</p> <p>1) A congestion control mechanism is configured so that any new connection request received, that goes beyond the set threshold, will be rejected.</p> <p>2) A network overload control feature is enabled and configured to accept new connections only at a defined rate. Incoming requests are buffered in a queue. When the queue is full additional requests can be rejected.</p> <p>Availability: per SGSN Service</p>	Int32
3G-T3350-expiry	Total number of times the T3350 timer timed-out for 3G service.	Int32
2G-T3350-expiry	Total number of times the T3350 timer timed-out for 2G service.	Int32
3G-T3360-expiry	Total number of times the T3360 timer timed-out for 3G service.	Int32
2G-T3360-expiry	Total number of times the T3360 timer timed-out for 2G service.	Int32
3G-T3370-expiry	Total number of times the T3370 timer timed-out for 3G service.	Int32
2G-T3370-expiry	Total number of times the T3370 timer timed-out for 2G service.	Int32
3G-T3322-expiry	Total number of times the T3322 timer timed-out for 3G service.	Int32
2G-T3322-expiry	Total number of times the T3322 timer timed-out for 2G service.	Int32
3G-T3313-expiry	Total number of times the T3313 timer timed-out for 3G service.	Int32
2G-T3313-expiry	Total number of times the T3313 timer timed-out for 2G service.	Int32
2G-ready-timer-expiry	Total number of times the 2G service ready timer timed-out.	Int32
exist-conn-proc-rej-overload	<p>Description: This proprietary counter indicates the total number of ongoing procedures rejected or skipped due to an overload indication received from the RNCs. When an overload indication is received from an RNC, the SGSN can reduce the signaling load on the RNC by doing one or more of the following:</p> <ul style="list-style-type: none"> - dropping attaches, - dropping service requests for data, - skipping PTMSI reallocation, - skipping authentication <p>The preferred action is configurable.</p> <p>Triggers: Counter increments when connection is dropped due to overload.</p> <p>Availability: per SGSN</p>	Int32
Rnc-overload-attach-dropped	Total number of Attach Requests dropped due to overload at RNC.	Int32
Rnc-overload-service-req-dropped	Total number of service requests dropped due to overload at RNC.	Int32
Rnc-overload-skip-ptmsi-realloc	Total number of P-TMSI reallocation procedure skipped due to overload at RNC.	Int32
Rnc-overload-skip-auth	Total number of authentication procedure skipped due to overload at RNC.	Int32

Variables	Description	Data Type
Initial-UE-Rcvd	Total number of initial user equipment (UE) messages received.	Int32
Direct-Trans-Rcvd	Total number of common identifier messages sent.	Int32
Direct-Trans-Sent	Total number of direct transfer messages sent.	Int32
common-id-sent	Total number of direct transfer messages received.	Int32
sec-mode-command	Total number of security mode commands received.	Int32
sec-mode-complete	Total number of security mode completed.	Int32
sec-mode-reject	Total number of security mode commands rejected.	Int32
Iu-release-request	Total number of Iu interface release request received.	Int32
Iu-release-command	Total number of Iu interface release commands received.	Int32
Iu-release-complete	Total number of Iu interface release completed.	Int32
Reset-received	Total number of reset requests received.	Int32
Retransmitted-reset-received	Total number of retransmitted reset requests received.	Int32
Reset-Ack-sent	Total number of reset request acknowledgement sent.	Int32
Reset-sent	Total number of reset requests sent.	Int32
Retransmitted-reset-sent	Total number of reset requests retransmitted.	Int32
Reset-Ack-received	Total number of reset request acknowledgement received.	Int32
Resource-reset-received	Total number of resource reset requests received.	Int32
Resource-reset-ack-sent	Total number of resource reset request acknowledgement sent.	Int32
Resource-reset-sent	Total number of resource reset request sent.	Int32
Resource-reset-ack-received	Total number of resource reset request acknowledgement received.	Int32
Overload-control-rcvd	Total number of resource overload control message received.	Int32
Pc-congested-rcvd	Total number of point code (PC) congested message received.	Int32
Error-indication-rcvd	Total number of error indication message received.	Int32
Error-indication-sent	Total number of error indication message sent.	Int32

Variables	Description	Data Type
Relocation-required	Total number of message received for Serving Radio Network Subsystem (SRNS) relocation required.	Int32
Relocation-command	Total number of message received with SRNS relocation command.	Int32
Relocation-request	Total number of SRNS relocation requests received.	Int32
Relocation-request-ack	Total number of SRNS relocation requests Ack sent.	Int32
Relocation-failure	Total number of SRNS relocation failure messages received.	Int32
Relocation-prep-failure	Total number of SRNS relocation preparation failure messages received.	Int32
Relocation-cancel	Total number of SRNS relocation cancel messages received.	Int32
Relocation-cancel-ack	Total number of SRNS relocation cancel acknowledge messages sent.	Int32
Relocation-detect	Total number of SRNS relocation detected.	Int32
Relocation-complete	Total number of SRNS relocation completed.	Int32
Forward-srns-context	Total number of SRNS contexts forwarded.	Int32
GMM-received-nas-pdu	Total protocol data units received by GPRS mobility management (GMM) service through NAS interface.	Int32
GMM-sent-nas-pdu	Total protocol data units sent by GMM service through NAS interface.	Int32
SM-received-nas-pdu	Total protocol data units received by Service Management (SM) service through NAS interface.	Int32
SM-sent-nas-pdu	Total protocol data units sent by SM service through NAS interface.	Int32
SMS-received-nas-pdu	Total protocol data units received by short message service (SMS) through NAS interface.	Int32
SMS-sent-nas-pdu	Total protocol data units sent by short message service (SMS) through NAS interface.	Int32
SMS-unexpected-nas-pdu	Total unexpected type of protocol data units received by short message service (SMS) through NAS interface.	Int32
Unidentified-nas-pdu	Total number of unknown type PDUs received through NAS interface.	Int32
exist-conn-proc-rej-overload	Total number of existing procedures rejected due to overload.	
3G-ptmsi-signature-mismatch-attach	Total number of NAS PDU dropped due to mismatch in P-TMSI signatures in attach procedures for 3G service.	Int32

Variables	Description	Data Type
2G-ptmsi-signature-mismatch-attach	Total number of NAS PDU dropped due to mismatch in P-TMSI signatures in attach procedures for 2G service.	Int32
3G-ptmsi-signature-mismatch-detach	Total number of NAS PDU dropped due to mismatch in P-TMSI signatures in detach procedures for 3G service.	Int32
2G-ptmsi-signature-mismatch-detach	Total number of NAS PDU dropped due to mismatch in P-TMSI signatures in detach procedures for 2G service.	Int32
3G-ptmsi-signature-mismatch-rau	Total number of NAS PDU dropped due to mismatch in P-TMSI signatures in routing area update procedures for 3G service.	Int32
2G-ptmsi-signature-mismatch-rau	Total number of NAS PDU dropped due to mismatch in P-TMSI signatures in routing area update procedures for 2G service.	Int32
3G-total-actv-req	Total number of request messages received for 3G context activation including primary and secondary type.	Int32
2G-total-actv-req	Total number of request messages received for 2G context activation including primary and secondary type.	Int32
3G-total-actv-accept	Description: Total number of request messages accepted for 3G context activation including primary and secondary type. Triggers: Increments when the SGSN sends Activate Accept or Activate Secondary Accept to the MS upon successful PDP Activation. Availability: per SGSN service, per RAI	Int32
2G-total-actv-accept	Description: Total number of request messages accepted for 2G context activation including primary and/or secondary type. Triggers: Increments when the SGSN sends Activate Accept or Activate Secondary Accept to the MS upon successful PDP Activation. Availability: per GPRS service	Int32
3G-total-num-actv-pdp	Description: Total number of active PDP context (primary and secondary type) for 3G service in SGSN. Triggers: 1) Increments when the context is completely active in the SGSN. 2) Decrements when the context is deleted from the SGSN. Availability: per SGSN service, per RAI Type: Gauge	Int32
2G-total-num-actv-pdp	Description: Total number of active PDP context (primary and secondary type) for 2G service in SGSN. Triggers: 1) Increments when the context is completely active in the SGSN. 2) Decrements when the context is deleted from the SGSN. Availability: per GPRS service Type: Gauge	Int32
3G-total-actv-pdp-with-dir-tunnel	Total number of active PDP context (primary and secondary type) for 3G service with direct tunnel enabled. This statistic value is of Gauge.	Int32
3G-primary-actv-req	Total number of request messages received for 3G primary PDP context activation.	Int32

Variables	Description	Data Type
2G-primary-actv-req	Total number of request messages received for 2G primary PDP context activation.	Int32
3G-primary-actv-req-nrpea	Total number of request messages received for 3G primary PDP context activation from network side.	Int32
3G-primary-req-act-pdp	Total number of requests to activate primary PDP context for 3G service.	Int32
3G-primary-req-act-pdp-retrans	Total number of requests retransmitted to activate primary PDP context for 3G service.	Int32
3G-primary-actv-accept	Total number of requests accepted to activate primary PDP context for 3G service.	Int32
2G-primary-actv-accept	Total number of requests accepted to activate primary PDP context for 2G service.	Int32
3G-total-actv-reject	Description: Total number of requests rejected to activate PDP context (primary and secondary) for 3G service. Triggers: Increments when the SGSN sends Activate Reject or Activate Secondary Reject to the MS. Availability: per SGSN service, per RAI	Int32
2G-total-actv-reject	Description: Total number of requests rejected to activate PDP context (primary and secondary) for 2G service. Triggers: Increments when the SGSN sends Activate Reject or Activate Secondary Reject to the MS. Availability: per GPRS service	Int32
3G-primary-actv-reject	Total number of requests rejected to activate primary PDP context for 3G service.	Int32
2G-primary-actv-reject	Total number of requests rejected to activate primary PDP context for 2G service.	Int32
3G-secondary-actv-req	Total number of requests to activate secondary PDP context for 3G service.	Int32
2G-secondary-actv-req	Total number of requests to activate secondary PDP context for 2G service.	Int32
3G-secondary-actv-acc	Total number of requests to activate secondary PDP context for 3G service accepted.	Int32
2G-secondary-actv-acc	Total number of requests to activate secondary PDP context for 2G service accepted.	Int32
3G-secondary-actv-rej	Total number of requests to activate secondary PDP context for 3G service rejected.	Int32
2G-secondary-actv-rej	Total number of requests to activate secondary PDP context for 2G service rejected.	Int32
3G-actv-rej-odb	Total number of requests to activate PDP context for 3G service rejected due to operator determined barring.	Int32

Variables	Description	Data Type
2G-actv-rej-odb	Total number of requests to activate PDP context for 2G service rejected due to operator determined barring.	Int32
3G-actv-rej-insufficient-resources	<p>Description: Total number of requests sent to MS to activate PDP context for 3G service rejected due to one of the following:</p> <ul style="list-style-type: none"> Resource allocation failures (memory, GTP-C Teid, GTP-U Teid, etc.) in SGSN Incorrect information sent by GGSN in CPC response (PDP Type modified by GGSN, missing PDP IP address, etc.) SNDCP activation failure <p>Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per SGSN service, per RAI</p>	Int32
2G-actv-rej-insufficient-resources	<p>Description: Total number of requests sent to MS to activate PDP context for 2G service rejected due to:</p> <ul style="list-style-type: none"> Resource allocation failures (memory, GTP-C Teid, GTP-U Teid, etc.) in SGSN Incorrect information sent by GGSN in CPC response (PDP Type modified by GGSN, missing PDP IP address, etc.) SNDCP activation failure <p>Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS Service, RAI</p>	Int32
3G-actv-rej-network-failure	<p>Description: Total number of requests sent to MS to activate PDP context for 3G service rejected due to network failure.</p> <p>Triggers: Increments when the SGSN sends Activate Reject due to SGSN operator policy restrictions and the cause code was configured as Network failure. Activations can be rejected due to SGSN operator policy in which the reject cause is configurable.</p> <p>Availability: per SGSN service, per RAI</p>	Int32
2G-actv-rej-network-failure	<p>Description: Total number of requests sent to MS to activate PDP context for 2G service rejected due to network failure.</p> <p>Triggers: Increments when the SGSN sends Activate Reject due to SGSN operator policy restrictions and the cause code was configured as Network failure. Activations can be rejected due to SGSN operator policy in which the reject cause is configurable.</p> <p>Availability: per GPRS service</p>	Int32
3G-actv-rej-missing-or-unknown-apn	<p>Description: Total number of requests to activate PDP context for 3G service rejected due to APN related errors such as:</p> <ul style="list-style-type: none"> APN not present in Activate Request but multiple subscription records exist DNS query fails for APN to GGSN resolution Missing/Unknown APN received from GGSN <p>Triggers: Increments when the SGSN sends Activate Reject for all the above conditions. Availability: per SGSN service, per RAI</p>	Int32

Variables	Description	Data Type
2G-actv-rej-missing-or-unknown-apn	<p>Description: Total number of requests sent to MS to activate PDP context for 3G service rejected due to APN related errors such as:</p> <ul style="list-style-type: none"> • APN not present in Activate Request but multiple subscription records exist • DNS query fails for APN to GGSN resolution • Missing/Unknown APN received from GGSN <p>Triggers: Increments when the SGSN sends Activate Reject for all the above conditions.</p> <p>Availability: per GPRS service</p>	Int32
3G-actv-rej-unknown-pdp-addr-type	<p>Description: Total number of requests sent to MS to activate PDP context for 3G service rejected due to PDP Address related errors such as:</p> <ul style="list-style-type: none"> • PDP Address requested in Activate Request but PDP Address Type not requested • APN requested in Activate Request without PDP Address Type • Unknown PDP Address or Type error received in Create PDP Context Response from GGSN <p>Triggers: Increments when the SGSN sends Activate Reject for all the above conditions.</p> <p>Availability: per SGSN service, per RAI</p>	Int32
2G-actv-rej-unknown-pdp-addr-type	<p>Description: Total number of requests sent to MS to activate PDP context for 2G service rejected due to PDP Address related errors such as:</p> <ul style="list-style-type: none"> • PDP Address requested in Activate Request but PDP Address Type not requested • APN requested in Activate Request without PDP Address Type • Unknown PDP Address or Type error received in Create Pdp Context Response from GGSN <p>Triggers: Increments when the SGSN sends Activate Reject for all the above conditions.</p> <p>Availability: per GPRS service</p>	Int32
3G-actv-rej-usr-auth-failed	<p>Description: Total number of requests sent to MS to activate PDP context for 3G service rejected due to user authentication failure on GGSN.</p> <p>Triggers: Increments when the SGSN receives Create PDP Context Response with authentication failure cause.</p> <p>Availability: per SGSN service, per RAI</p>	Int32
2G-actv-rej-usr-auth-failed	<p>Description: Total number of requests sent to MS to activate PDP context for 2G service rejected due to user authentication failure on GGSN.</p> <p>Triggers: Increments when the SGSN receives Create PDP Context Response with authentication failure cause.</p> <p>Availability: per GPRS service</p>	Int32
3G-actv-rej-by-ggsn	<p>Description: Total number of requests sent to MS to activate PDP context for 3G service due to receiving Create PDP Context Response from GGSN with a cause of:</p> <ul style="list-style-type: none"> • "Insufficient resources" • "All Dynamic PDP address occupied" <p>Triggers: Increments when the SGSN sends Activate Reject for the above conditions.</p> <p>Availability: per SGSN service, per RAI</p>	Int32

Variables	Description	Data Type
2G-actv-rej-by-ggsn	<p>Description: Total number of requests sent to MS to activate PDP context for 2G service due to receiving Create PDP Context Response from GGSN with a cause of:</p> <ul style="list-style-type: none"> • "Insufficient resources" • "All Dynamic PDP address occupied" <p>Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS service, per RAI</p>	Int32
3G-actv-rej- unspecified-error	<p>Description: Total number of requests sent to MS to activate PDP context for 3G service rejected due to:</p> <ul style="list-style-type: none"> • Receiving Create PDP Context Response from GGSN with a cause of "system failure" • GGSN fails to respond to CPC Request • SGSN triggers PDP deletion before receiving CPC response from GGSN • HLR triggers PDP deletion before receiving CPC response ("Delete Subscriber Data" received from HLR for the PDP) <p>Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per SGSN service, per RAI</p>	Int32
2G-actv-rej- unspecified-error	<p>Description: Total number of requests sent to MS to activate PDP context for 2G service rejected due to:</p> <ul style="list-style-type: none"> • Receiving Create PDP Context Response from GGSN with a cause of "system failure" • GGSN fails to respond to CPC Request • SGSN triggers PDP deletion before receiving CPC response from GGSN • HLR triggers PDP deletion before receiving CPC response ("Delete Subscriber Data" received from HLR for the PDP) <p>Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS service</p>	Int32
3G-actv-rej-service- not-supported	<p>Description: Total number of requests to activate PDP context for 3G service rejected as requested service is not supported. Triggers: Increments when the SGSN sends Activate Reject due to SGSN operator policy restrictions and the cause code was configured as Service Not Supported. Activations can be rejected due to SGSN operator policy in which the reject cause is configurable. Availability: per SGSN service, per RAI</p>	Int32
2G-actv-rej-service- not-supported	<p>Description: Total number of requests sent to MS to activate PDP context for 2G service rejected as requested service is not supported. Triggers: Increments when the SGSN sends Activate Reject due to SGSN operator policy restrictions and the cause code was configured as Service Not Supported. Activations can be rejected due to SGSN operator policy in which the reject cause is configurable. Availability: per GPRS service</p>	Int32

Variables	Description	Data Type
3G-actv-rej-service-not-subscribed	<p>Description: Total number of requests sent to MS to activate PDP context for 3G service rejected as subscriber is not subscribed to requested service due to:</p> <ul style="list-style-type: none"> • APN Selection failures such as: <ul style="list-style-type: none"> • Requested APN/PDP-Type/PDP-Addr not matching the subscription. • Wild card APN requested but multiple subscription records exist for the subscriber. • APN Access denied, No subscription error was received in Create PDP Context Response from GGSN. <p>Triggers: Increments when the SGSN sends Activate Reject for all the above conditions. Availability: per SGSN service, per RAI</p>	Int32
2G-actv-rej-service-not-subscribed	<p>Description: Total number of requests sent to MS to activate PDP context for 2G service rejected as subscriber is not subscribed to requested service due to:</p> <ul style="list-style-type: none"> • APN selection failures such as: <ul style="list-style-type: none"> • Requested APN/PDP-Type/PDP-Addr not matching the subscription. • Wild card APN requested but multiple subscription records exist for the subscriber. • APN Access denied and No subscription error was received in Create PDP Context Response from GGSN. <p>Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS service</p>	Int32
3G-actv-rej-svc-opt-tmp-out-of-order	Total number of requests to activate PDP context for 3G service rejected as requested service option is temporarily out of order.	Int32
2G-actv-rej-svc-opt-tmp-out-of-order	Total number of requests to activate PDP context for 2G service rejected as requested service option is temporarily out of order.	Int32
3G-actv-rej-apn-restriction-incompatible	Total number of requests to activate PDP context for 3G service rejected due to restriction of APN or incompatibility of APN for service.	Int32
2G-actv-rej-apn-restriction-incompatible	Total number of requests to activate PDP context for 2G service rejected due to restriction of APN or incompatibility of APN for service.	Int32
3G-actv-rej-semantically-incorrect	<p>Description: Total number of requests sent to MS to activate PDP context for 3G service rejected due to semantically incorrect IE message in Activate PDP Request. Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per SGSN service, per RAI</p>	Int32
2G-actv-rej-semantically-incorrect	<p>Description: Total number of requests sent to MS to activate PDP context for 2G service rejected due to semantically incorrect IE message in Activate PDP Request. Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS service, per RAI</p>	Int32

Variables	Description	Data Type
3G-actv-rej-invalid-mandatory-info	Description: Total number of requests sent to MS to activate PDP context for 3G service rejected due to invalid mandatory IE in Activate PDP Request. Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per SGSN service, per RAI	Int32
2G-actv-rej-invalid-mandatory-info	Description: Total number of requests sent to MS to activate PDP context for 2G service rejected due to invalid mandatory IE in Activate PDP Request. Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS service, per RAI	Int32
3G-actv-rej-msg-type-non-existent	Total number of requests to activate PDP context for 3G service rejected due to non-existent type of message.	Int32
2G-actv-rej-msg-type-non-existent	Total number of requests to activate PDP context for 3G service rejected due to non-existent type of message.	Int32
3G-actv-rej-ie-non-existent	Description: Total number of requests sent to MS to activate PDP context for 3G service rejected upon receiving Create PDP Context Response from GGSN with a cause of "Mandatory IE missing". Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per SGSN service, per RAI	Int32
2G-actv-rej-ie-non-existent	Description: Total number of requests sent to MS to activate PDP context for 2G service rejected upon receiving Create PDP Context Response from GGSN with a cause of "Mandatory IE missing". Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS service, per RAI	Int32
3G-actv-rej-conditional-ie-err	Description: Total number of requests sent to MS to activate PDP context for 3G service rejected due to conditional IE (Information Element) error in Activate PDP Request. Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per SGSN service, per RAI	Int32
2G-actv-rej-conditional-ie-err	Description: Total number of requests sent to MS to activate PDP context for 2G service rejected due to conditional IE (Information Element) error in Activate PDP Request. Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS service, per RAI	Int32
3G-actv-rej-msg-not-compatible-with-prot-state	Description: Total number of requests sent to MS to activate PDP context for 3G service rejected as message type is not compatible with protocol state. Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per SGSN service, per RAI	Int32
2G-actv-rej-msg-not-compatible-with-prot-state	Description: Total number of requests sent to MS to activate PDP context for 2G service rejected as message type is not compatible with protocol state. Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS service, per RAI	Int32
3G-actv-rej-recovery-on-timer-expiry	Total number of requests to activate PDP context for 3G service rejected as timer expired for recovery.	Int32

Variables	Description	Data Type
2G-actv-rej-recovery-on-timer-expiry	Total number of requests to activate PDP context for 2G service rejected as timer expired for recovery.	Int32
3G-actv-rej-prot-err-unspecified	Description: Total number of requests sent to MS to activate PDP context for 3G service rejected upon receiving Create PDP Context Response from GGSN with a cause of "unspecified protocol error". Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per SGSN service, per RAI	Int32
2G-actv-rej-prot-err-unspecified	Description: Total number of requests sent to MS to activate PDP context for 2G service rejected upon receiving Create PDP Context Response from GGSN with a cause of "unspecified protocol error". Triggers: Increments when the SGSN sends Activate Reject for the above conditions. Availability: per GPRS service, per RAI	Int32
2G-actv-rej-llc-sndcp-fail	This statistic has been deprecated.	Int32
2G-actv-rej-qos-not-acc	This statistic has been deprecated.	Int32
3G-actv-rej-semantic-error-tft-operation	This statistic has been deprecated.	Int32
2G-actv-rej-semantic-error-tft-operation	This statistic has been deprecated.	Int32
3G-actv-rej-syntax-err-in-tft-operation	This statistic has been deprecated.	Int32
2G-actv-rej-syntax-err-in-tft-operation	This statistic has been deprecated.	Int32
3G-actv-rej-unknown-pdp-context	This statistic has been deprecated.	Int32
2G-actv-rej-unknown-pdp-context	This statistic has been deprecated.	Int32
3G-actv-rej-semantic-err-in-pkt-filter	This statistic has been deprecated.	Int32
2G-actv-rej-semantic-err-in-pkt-filter	This statistic has been deprecated.	Int32
3G-actv-rej-syntax-err-in-pkt-filter	This statistic has been deprecated.	Int32

Variables	Description	Data Type
2G-actv-rej-syntax-err-in-pkt-filter	This statistic has been deprecated.	Int32
3G-actv-rej-pdp-notft-actv	This statistic has been deprecated.	Int32
2G-actv-rej-pdp-notft-actv	This statistic has been deprecated.	Int32
3G-sec-actv-rej-odb	Total number of requests to activate secondary PDP context for 3G service rejected due to operator determined barring.	Int32
2G-sec-actv-rej-odb	Total number of requests to activate secondary PDP context for 2G service rejected due to operator determined barring.	Int32
3G-sec-actv-rej-insufficient-resources	Total number of requests to activate secondary PDP context for 3G service rejected due to insufficient resources.	Int32
2G-sec-actv-rej-insufficient-resources	Total number of requests to activate secondary PDP context for 2G service rejected due to insufficient resources.	Int32
3G-sec-actv-rej-by-ggsn	Total number of requests to activate secondary PDP context for 3G service rejected as request rejected by the GGSN.	Int32
2G-sec-actv-rej-by-ggsn	Total number of requests to activate secondary PDP context for 2G service rejected as request rejected by the GGSN.	Int32
3G-sec-actv-rej-unspecified-error	Total number of requests to activate secondary PDP context for 3G service rejected due to error which is not specified in this table or unknown.	Int32
2G-sec-actv-rej-unspecified-error	Total number of requests to activate secondary PDP context for 2G service rejected due to error which is not specified in this table or unknown.	Int32
3G-sec-actv-rej-service-not-supported	Description: Total number of requests sent to MS to activate secondary PDP context for 3G service rejected as requested service is not supported. Triggers: Increments when the SGSN sends Activate Secondary Reject due to SGSN operator policy restrictions and the cause code was configured as Service Not Supported. Activations can be rejected due to SGSN operator policy in which the reject cause is configurable. Availability: per SGSN service, per RAI	Int32
2G-sec-actv-rej-service-not-supported	Description: Total number of requests sent to MS to activate secondary PDP context for 2G service rejected as requested service is not supported. Triggers: Increments when the SGSN sends Activate Secondary Reject due to SGSN operator policy restrictions and the cause code was configured as Service Not Supported. Activations can be rejected due to SGSN operator policy in which the reject cause is configurable. Availability: per GPRS service	Int32

Variables	Description	Data Type
3G-sec-actv-rej-service-not-subscribed	<p>Description: Total number of requests sent to MS to activate secondary PDP context for 3G service rejected as subscriber is not subscribed to requested service due to:</p> <ul style="list-style-type: none"> • APN Selection related errors such as: <ul style="list-style-type: none"> • Activate PDP Request without PDP Address/Type and APN, and multiple subscription records present. • Activate PDP Request with PDP Type (and address) and no matching subscription records for the PDP Type. • Activate PDP Request with dynamic addressing but matching subscription records have static address. • Create PDP Context Response from GGSN is received with error code “Access denied, no subscription”. <p>Triggers: Increments when the SGSN sends Activate Reject for all the above conditions. Availability: per SGSN service, per RAI</p>	Int32
2G-sec-actv-rej-service-not-subscribed	<p>Description: Total number of requests sent to MS to activate secondary PDP context for 2G service rejected as subscriber is not subscribed to requested service due to:</p> <ul style="list-style-type: none"> • APN Selection related errors such as: <ul style="list-style-type: none"> • Activate PDP Request without PDP Address/Type and APN, and multiple subscription records present. • Activate PDP Request with PDP Type (and address) and no matching subscription records for the PDP Type. • Activate PDP Request with dynamic addressing but matching subscription records have static address. • Create PDP Context Response from GGSN is received with error code “Access denied, no subscription”. <p>Triggers: Increments when the SGSN sends Activate Reject for all the above conditions. Availability: per GPRS service</p>	Int32
3G-sec-actv-rej-svc-opt-tmp-out-of-order	Total number of requests to activate secondary PDP context for 3G service rejected as requested service option is temporarily out of order.	Int32
2G-sec-actv-rej-svc-opt-tmp-out-of-order	Total number of requests to activate secondary PDP context for 3G service rejected as requested service option is temporarily out of order.	Int32
3G-sec-actv-rej-semantically-incorrect	Total number of requests to activate secondary PDP context for 2G service rejected due to semantically incorrect message.	Int32
2G-sec-actv-rej-semantically-incorrect	Total number of requests to activate secondary PDP context for 3G service rejected as mandatory information in message is invalid.	Int32
3G-sec-actv-rej-invalid-mandatory-info	Total number of requests to activate secondary PDP context for 3G service rejected as mandatory information in message is invalid.	Int32

■ Common Syntax Options

Variables	Description	Data Type
2G-sec-actv-rej-invalid-mandatory-info	Total number of requests to activate secondary PDP context for 2G service rejected as mandatory information in message is invalid.	Int32
3G-sec-actv-rej-msg-type-non-existent	Total number of requests to activate secondary PDP context for 3G service rejected due to non-existent type of message.	Int32
2G-sec-actv-rej-msg-type-non-existent	Total number of requests to activate secondary PDP context for 3G service rejected due to non-existent type of message.	Int32
3G-sec-actv-rej-ie-non-existent	Total number of requests to activate secondary PDP context for 3G service rejected due to non-existence of information element.	Int32
2G-sec-actv-rej-ie-non-existent	Total number of requests to activate secondary PDP context for 2G service rejected due to non-existence of information element.	Int32
3G-sec-actv-rej-conditional-ie-err	Total number of requests to activate secondary PDP context for 3G service rejected due to error in conditional information element.	Int32
2G-sec-actv-rej-conditional-ie-err	Total number of requests to activate secondary PDP context for 2G service rejected due to error in conditional information element.	Int32
3G-sec-actv-rej-msg-not-compat-prot-state	Total number of requests to activate secondary PDP context for 3G service rejected as message type is not compatible with protocol state.	Int32
2G-sec-actv-rej-msg-not-compat-prot-state	Total number of requests to activate secondary PDP context for 2G service rejected as message type is not compatible with protocol state.	Int32
3G-sec-actv-rej-recovery-on-timer-expiry	Total number of requests to activate secondary PDP context for 3G service rejected as timer expired for recovery.	Int32
2G-sec-actv-rej-recovery-on-timer-expiry	Total number of requests to activate secondary PDP context for 2G service rejected as timer expired for recovery.	Int32
3G-sec-actv-rej-prot-err-unspecified	Total number of requests to activate secondary PDP context for 3G service rejected due to unspecified protocol error.	Int32
2G-sec-actv-rej-prot-err-unspecified	Total number of requests to activate secondary PDP context for 2G service rejected due to unspecified protocol error.	Int32
2G-sec-actv-rej-llc-sndcp-fail	This statistic has been deprecated.	Int32
2G-sec-actv-rej-qos-not-acc	This statistic has been deprecated.	Int32
3G-sec-actv-rej-semantic-error-tft-operation	Total number of requests to activate secondary PDP context for 3G service rejected due to semantic error in traffic flow template (TFT) operation.	Int32

Variables	Description	Data Type
2G-sec-actv-rej-semantic-err-in-tft-operation	Total number of requests to activate secondary PDP context for 3G service rejected due to semantic error in traffic flow template (TFT) operation.	Int32
3G-sec-actv-rej-syntax-err-in-tft-operation	Total number of requests to activate secondary PDP context for 3G service rejected due to syntax error in traffic flow template (TFT) operation.	Int32
2G-sec-actv-rej-syntax-err-in-tft-operation	Total number of requests to activate secondary PDP context for 2G service rejected due to syntax error in traffic flow template (TFT) operation.	Int32
3G-sec-actv-rej-unknown-pdp-context	Total number of requests to activate secondary PDP context for 3G service rejected due to unknown type of PDP context.	Int32
2G-sec-actv-rej-unknown-pdp-context	Total number of requests to activate secondary PDP context for 2G service rejected due to unknown type of PDP context.	Int32
3G-sec-actv-rej-semantic-err-in-pkt-filter	Total number of requests to activate secondary PDP context for 3G service rejected due to semantic error in packet filter.	Int32
2G-sec-actv-rej-semantic-err-in-pkt-filter	Total number of requests to activate secondary PDP context for 3G service rejected due to semantic error in packet filter.	Int32
3G-sec-actv-rej-syntax-err-in-pkt-filter	Total number of requests to activate secondary PDP context for 3G service rejected due to syntax error in packet filter.	Int32
2G-sec-actv-rej-syntax-err-in-pkt-filter	Total number of requests to activate secondary PDP context for 2G service rejected due to syntax error in packet filter.	Int32
3G-sec-actv-rej-pdp-notft-actv	Total number of requests to activate secondary PDP context for 3G service rejected due to TFT was not active.	Int32
2G-sec-actv-rej-pdp-notft-actv	Total number of requests to activate secondary PDP context for 3G service rejected due to TFT was not active.	Int32

Variables	Description	Data Type
3G-total-actv-fail	<p>Description: Total number of PDP context activation (primary and secondary) failed for 3G service due to:</p> <ul style="list-style-type: none"> • GMM procedure collision • Duplicate Activate Requests in non-active states (activation or deactivation in progress) • Detach before activation is over • Handoff to Peer before activation is over • GTP Tunnel deletion in case of Second PDP Activations • IU release before the completion of activation procedure <p>Triggers: Increments when the SGSN drops PDP Activate Request for all the above conditions. Availability: per SGSN service, per RAI</p>	Int32
2G-total-actv-fail	<p>Description: Total number of PDP context activation (primary and secondary) failed for 2G service due to:</p> <ul style="list-style-type: none"> • GMM procedure collision • Duplicate Activate Requests in non-active states (activation or deactivation in progress) • Detach before activation is over • Handoff to Peer before activation is over • GTP Tunnel deletion in case of Second PDP Activations <p>Triggers: Increments when the SGSN drops PDP Activate Request for all the above conditions. Availability: per GPRS service</p>	Int32
3G-primary-actv-fail	Total number of primary PDP context activations that failed in the 3G service.	Int32
2G-primary-actv-fail	<p>Description: Total number of Primary PDP Activation Requests dropped due to:</p> <ul style="list-style-type: none"> • GMM procedure collision. • Duplicate Activate Requests in non-active states (activation or deactivation in progress). • Detach before activation completes. • Handoff to peer before activation completes. <p>Triggers: Increments when the SGSN drops the Primary PDP Activate Request for indicated condition. Availability: per GPRS service, per RA</p>	Int32
3G-secondary-actv-fail	<p>Description: Total number of secondary PDP context activations that failed in the 3G service. Type: Counter</p>	Int32

Variables	Description	Data Type
2G-secondary-actv-fail	<p>Description: New counter in release 9.0: Total number of Secondary PDP Activation Requests dropped due to:</p> <ul style="list-style-type: none"> • GMM procedure collision. • Duplicate Activate Requests in non-active states (activation or deactivation in progress). • Detach before activation completes. • Handoff to peer before activation completes. • GTP tunnel deletion. <p>Triggers: Increments when the SGSN drops the Secondary PDP Activate Request for indicated condition.</p> <p>Availability: per GPRS service, per RA</p> <p>Type: Counter</p>	Int32
3G-actv-fail-iu-release-before-activate	<p>Description: Total number of PDP Activation Requests dropped due to IU release before the completion of activation procedure.</p> <p>Triggers: Increments when the SGSN drops PDP Activate Request due to IU release before the completion of activation procedure.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
3G-actv-fail-gaurd-timer-expiry	<p>Description: Total number of PDP Activation Requests dropped due to SM Guard Timer Expiry.</p> <p>Triggers: Increments when the SGSN drops PDP Activate Request due to SM Guard Timer Expiry.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
3G-actv-fail-duplicate-activation	<p>Description: Total number of PDP Activation Requests dropped due to an ongoing PDP Activation.</p> <p>Triggers: Increments when the SGSN drops PDP Activate Request due to PDP Activation in progress.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
3G-actv-fail-other-ongoing-procedure	<p>Description: Total number of PDP Activation Requests dropped due to other ongoing procedures such as:</p> <ul style="list-style-type: none"> • Activate Request during network initiated detach • Page timer expiry while trying to send Activate Accept/Reject <p>Triggers: Increments when the SGSN drops PDP Activate Request due to other ongoing procedures.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32
3G-actv-fail-tunnel-deactivation	<p>Description: Total number of PDP Activation Requests that fail due to tunnel deactivation.</p> <p>Availability: per SGSN service, per RA</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
3G-actv-fail-handoff-before-activate-over	<p>Description: Total number of PDP Activation Request dropped due to Handoff request from Peer SGSN for the subscriber.</p> <p>Triggers: Increments when the SGSN drops PDP Activate Request due to Handoff request from Peer SGSN for the subscriber.</p> <p>Availability: per SGSN Service and per RA</p> <p>Type: Counter</p>	Int32
3G-actv-fail-detach-before-activate-over	<p>Description: Total number of PDP Activation Requests dropped due to detach request while activation was in progress.</p> <p>Triggers: Increments when the SGSN drops PDP Activate Request due to detach request while activation was in progress. SGSN for the subscriber.</p> <p>Availability: per SGSN Service and per RA</p> <p>Type: Counter</p>	Int32
3G-actv-fail-phase-2-offload	<p>Description: This proprietary counter indicates the total number of PDP Activation failures due to Phase 2 offloading in 3G service. This statistics is specific to releases 8.1 and higher.</p> <p>Triggers: Increments when PDP Activation fails due to Phase 2 offloading.</p> <p>Availability: per SGSN service, per RA, per RNC</p> <p>Type: Counter</p>	Int32
3G-actv-fail-invalid-message-content	<p>Description: Total number of PDP Activation Requests dropped due to invalid information in activate request such as invalid Ti flag value.</p> <p>Triggers: Increments when the SGSN drops PDP Activate Request due to above condition.</p> <p>Availability: per SGSN Service and per RA</p> <p>Type: Counter</p>	Int32
2G-actv-fail-gaurd-timer-expiry	<p>Description: Total number of PDP Activation Requests dropped due to SM Guard Timer Expiry.</p> <p>Triggers: Increments when the SGSN drops PDP Activate Request due to SM Guard Timer Expiry.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
2G-actv-fail-duplicate-activation	<p>Description: Total number of PDP Activation Requests dropped due to an ongoing PDP Activation.</p> <p>Triggers: Increments when the SGSN drops PDP Activate Request due to PDP Activation in progress.</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
2G-actv-fail-other-ongoing-procedure	<p>Description: Total number of PDP Activation Requests dropped due to other ongoing procedures such as:</p> <ol style="list-style-type: none"> (1) Activate Request during network initiated detach. (2) Page timer expiry while trying to send Activate Accept/Reject. <p>Triggers: Increments when the SGSN drops PDP Activate Request due to other ongoing procedures</p> <p>Availability: per GPRS service</p> <p>Type: Counter</p>	Int32
2G-actv-fail-tunnel-deactivation	<p>Description: Total number of PDP Activation Requests that fail due to tunnel deactivation.</p> <p>Availability: per GPRS Service and per NSEI</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
2G-actv-fail-handoff-before-activate-over	Description: Total number of PDP Activation Requests dropped due to Handoff request from Peer SGSN for the subscriber. Triggers: Increments when the SGSN drops PDP Activate Request due to Handoff request from Peer SGSN for the subscriber. Availability: per GPRS service Type: Counter	Int32
2G-actv-fail-detach-before-activate-over	Description: Total number of PDP Activation Requests dropped due to detach request while activation was in progress. Triggers: Increments when the SGSN drops PDP Activate Request due to detach request while activation was in progress. SGSN for the subscriber. Availability: per GPRS service Type: Counter	Int32
2G-actv-fail-phase-2-offload	Description: This proprietary counter indicates the total number of PDP Activation failures due to Phase 2 offloading in 2G service. This statistics is specific to releases 8.1 and higher. Triggers: Increments when PDP Activation fails due to Phase 2 offloading. Availability: per GPRS service, per RA Type: Counter	Int32
2G-actv-fail-invalid-msg-content	Description: Total number of PDP Activation Requests dropped due to invalid information in activate request such as invalid Ti flag value Triggers: Increments when the SGSN drops PDP Activate Request due to above condition Availability: per GPRS service Type: Counter	Int32
3G-dupl-ti-pdpactive	Description: Total number of duplicate context activation requests for 3G service with duplicate transaction identifiers (TIs). Type: Counter	Int32
2G-dupl-ti-pdpactive	Description: Total number of duplicate context activation requests for 2G service with duplicate transaction identifiers (TIs). Type: Counter	Int32
3G-dupl-nsapi-pdpactv	Description: Total number of duplicate context activation requests for 3G service with duplicate Network Service Access Point Identifier (NSAPI). Type: Counter	Int32
2G-dupl-nsapi-pdpactv	Description: Total number of duplicate context activation requests for 2G service with duplicate Network Service Access Point Identifier (NSAPI). Type: Counter	Int32
3G-dupl-pdpaddr-apn-pdpactv	Description: Total number of duplicate context activation requests for 3G service with duplicate PDP address or APN name. Type: Counter	Int32
2G-dupl-pdpaddr-apn-pdpactv	Description: Total number of duplicate context activation requests for 2G service with duplicate PDP address or APN name. Type: Counter	Int32
3G-dupl-ti-n-pdpactive	Description: Total number of duplicate context activation requests for 3G service which are not in PDP active state with duplicate transaction identifiers (TIs). Type: Counter	Int32

Variables	Description	Data Type
2G-dupl-ti-n-pdpactive	Description: Total number of duplicate context activation requests for 2G service which are not in PDP active state with duplicate transaction identifiers (TIs). Type: Counter	Int32
3G-dupl-nsapi-n-pdpactiv	Description: Total number of duplicate context activation requests for 3G service which are not in PDP active state with duplicate Network Service Access Point Identifier (NSAPI). Type: Counter	Int32
2G-dupl-nsapi-n-pdpactiv	Description: Total number of duplicate context activation requests for 2G service which are not in PDP active state with duplicate Network Service Access Point Identifier (NSAPI). Type: Counter	Int32
3G-dupl-pdpaddr-apn-n-pdpactiv	Description: Total number of duplicate context activation requests for 3G service which are not in PDP active state with duplicate PDP address and access point name. Type: Counter	Int32
2G-dupl-pdpaddr-apn-n-pdpactiv	Description: Total number of duplicate context activation requests for 2G service which are not in PDP active state with duplicate PDP address and access point name. Type: Counter	Int32
3G-ms-modify-req	Description: Total number of MS initiated PDP context modification requests received for 3G service. Type: Counter	Int32
2G-ms-modify-req	Description: Total number of MS initiated PDP context modification requests received for 2G service. Type: Counter	Int32
3G-ms-modify-accept	Description: Total number of MS initiated PDP context modification requests accepted for 3G service. Type: Counter	Int32
2G-ms-modify-accept	Description: Total number of MS initiated PDP context modification requests accepted for 2G service. Type: Counter	Int32
3G-ms-modify-rej	Description: Total number of MS initiated PDP context modification requests rejected for 3G service. Type: Counter	Int32
2G-ms-modify-rej	Description: Total number of MS initiated PDP context modification requests rejected for 2G service. Type: Counter	Int32
3G-nw-modify-req	Description: Total number of network initiated PDP context modification requests received for 3G service. Type: Counter	Int32
2G-nw-modify-req	Description: Total number of network initiated PDP context modification requests received for 2G service. Type: Counter	Int32
3G-nw-ret-modify-req	Description: Total number of retransmitted network initiated PDP context modification requests received for 3G service. Type: Counter	Int32

Variables	Description	Data Type
2G-nw-ret-modify-req	Description: Total number of retransmitted network initiated PDP context modification requests received for 2G service. Type: Counter	Int32
3G-nw-modify-accept	Description: Total number of network initiated PDP context modification requests accepted for 3G service. Type: Counter	Int32
2G-nw-modify-accept	Description: Total number of network initiated PDP context modification requests accepted for 2G service. Type: Counter	Int32
3G-nw-modify-rej	Description: Total number of network initiated PDP context modification requests rejected for 3G service. Type: Counter	Int32
2G-nw-modify-rej	Description: Total number of network initiated PDP context modification requests rejected for 2G service. Type: Counter	Int32
3G-ms-modify-rej-insufficient-resources	Description: Total number of MS initiated modify PDP context requests for 3G service rejected due to insufficient resources. Type: Counter	Int32
2G-ms-modify-rej-insufficient-resources	Description: Total number of MS initiated modify PDP context requests for 2G service rejected due to insufficient resources. Type: Counter	Int32
3G-ms-modify-rej-service-opt-not-supported	Description: Total number of MS initiated modify PDP context requests for 3G service rejected as requested service option is not supported. Type: Counter	Int32
2G-ms-modify-rej-service-opt-not-supported	Description: Total number of MS initiated modify PDP context requests for 2G service rejected as requested service option is not supported. Type: Counter	Int32
3G-ms-modify-rej-semantic-err-tft-operation	Description: Total number of MS initiated modify PDP context requests for 3G service rejected due to semantic error in subscriber traffic flow template processing. Type: Counter	Int32
2G-ms-modify-rej-semantic-err-tft-operation	Description: Total number of MS initiated modify PDP context requests for 2G service rejected due to semantic error in subscriber traffic flow template processing. Type: Counter	Int32
3G-ms-modify-rej-syntax-err-tft-operation	Description: Total number of MS initiated modify PDP context requests for 3G service rejected due to syntax error in subscriber traffic flow template operation. Type: Counter	Int32
2G-ms-modify-rej-syntax-err-tft-operation	Description: Total number of MS initiated modify PDP context requests for 2G service rejected due to syntax error in subscriber traffic flow template operation. Type: Counter	Int32
3G-ms-modify-rej-semantic-err-pkt-filter	Description: Total number of MS initiated modify PDP context requests for 3G service rejected due to semantic error in packet filter. Type: Counter	Int32

Variables	Description	Data Type
2G-ms-modify-rej-semnatic-err-pkt-filter	Description: Total number of MS initiated modify PDP context requests for 2G service rejected due to semantic error in packet filter. Type: Counter	Int32
3G-ms-modify-rej-syntax-err-pkt-filter	Description: Total number of MS initiated modify PDP context requests for 3G service rejected due to syntax error in packet filter. Type: Counter	Int32
2G-ms-modify-rej-syntax-err-pkt-filter	Description: Total number of MS initiated modify PDP context requests for 2G service rejected due to syntax error in packet filter. Type: Counter	Int32
3G-ms-modify-rej-semnatic-incorrect-message	Description: Total number of MS initiated modify PDP context requests for 3G service rejected due to semantically incorrect message. Type: Counter	Int32
2G-ms-modify-rej-semnatic-incorrect-message	Description: Total number of MS initiated modify PDP context requests for 2G service rejected due to semantically incorrect message. Type: Counter	Int32
3G-ms-modify-rej-invalid-mand-info	Description: Total number of MS initiated modify PDP context requests for 3G service rejected as mandatory information in message is invalid. Type: Counter	Int32
2G-ms-modify-rej-invalid-mand-info	Description: Total number of MS initiated modify PDP context requests for 2G service rejected as mandatory information in message is invalid. Type: Counter	Int32
3G-ms-modify-rej-msg-non-existent	Description: Total number of MS initiated requests to modify PDP context for 3G service rejected due to non-existent type of message. Type: Counter	Int32
2G-ms-modify-rej-msg-non-existent	Description: Total number of MS initiated requests to modify PDP context for 2G service rejected due to non-existent type of message. Type: Counter	Int32
3G-ms-modify-rej-ie-non-existent	Description: Total number of MS initiated modify PDP context requests for 3G service rejected due to non-existence of information element. Type: Counter	Int32
2G-ms-modify-rej-ie-non-existent	Description: Total number of MS initiated modify PDP context requests for 2G service rejected due to non-existence of information element. Type: Counter	Int32
3G-ms-modify-rej-conditional-ie-err	Description: Total number of MS initiated modify PDP context requests for 3G service rejected due to error in conditional information element. Type: Counter	Int32
2G-ms-modify-rej-conditional-ie-err	Description: Total number of MS initiated modify PDP context requests for 2G service rejected due to error in conditional information element. Type: Counter	Int32

Variables	Description	Data Type
3G-ms-modify-rej-msg-not-compatible-prot-state	Description: Total number of MS initiated modify PDP context requests for 3G service rejected as message is not compatible with protocol state. Type: Counter	Int32
2G-ms-modify-rej-msg-not-compatible-prot-state	Description: Total number of MS initiated modify PDP context requests for 2G service rejected as message is not compatible with protocol state. Type: Counter	Int32
3G-ms-modify-rej-rcvry-on-tmr-expiry	Total number of MS initiated modify PDP context requests for 3G service rejected as timer expired for recovery. Type: Counter	Int32
2G-ms-modify-rej-rcvry-on-tmr-expiry	Description: Total number of MS initiated modify PDP context requests for 2G service rejected as timer expired for recovery. Type: Counter	Int32
3G-ms-modify-rej-prot-err-unspec	Description: Total number of MS initiated modify PDP context requests for 3G service rejected due to unspecified protocol error. Type: Counter	Int32
2G-ms-modify-rej-prot-err-unspec	Description: Total number of MS initiated modify PDP context requests for 2G service rejected due to unspecified protocol error. Type: Counter	Int32
3G-modify-rej-insufficient-resources	Description: Total number of requests to modify PDP context for 3G service rejected due to insufficient resources. Type: Counter	Int32
2G-modify-rej-insufficient-resources	Description: Total number of requests to modify PDP context for 2G service rejected due to insufficient resources. Type: Counter	Int32
3G-modify-rej-service-opt-not-supported	Description: Total number of requests to modify PDP context for 3G service rejected as requested service option is not supported. Type: Counter	Int32
2G-modify-rej-service-opt-not-supported	Description: Total number of requests to modify PDP context for 2G service rejected as requested service option is not supported. Type: Counter	Int32
3G-modify-rej-semantic-err-tft-operation	Description: Total number of requests to modify PDP context for 3G service rejected due to semantic error in subscriber traffic flow template processing. Type: Counter	Int32
2G-modify-rej-semantic-err-tft-operation	Description: Total number of requests to modify PDP context for 2G service rejected due to semantic error in subscriber traffic flow template processing. Type: Counter	Int32
3G-modify-rej-syntax-err-tft-operation	Description: Total number of requests to modify PDP context for 3G service rejected due to syntax error in subscriber traffic flow template operation. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
2G-modify-rej-syntax-err-tft-operation	Description: Total number of requests to modify PDP context for 2G service rejected due to syntax error in subscriber traffic flow template operation. Type: Counter	Int32
3G-modify-rej-semnatic-err-pkt-filter	Description: Total number of requests to modify PDP context for 3G service rejected due to semantic error in packet filter. Type: Counter	Int32
2G-modify-rej-semnatic-err-pkt-filter	Description: Total number of requests to modify PDP context for 2G service rejected due to semantic error in packet filter. Type: Counter	Int32
3G-modify-rej-syntax-err-pkt-filter	Description: Total number of requests to modify PDP context for 3G service rejected due to syntax error in packet filter. Type: Counter	Int32
2G-modify-rej-syntax-err-pkt-filter	Description: Total number of requests to modify PDP context for 2G service rejected due to syntax error in packet filter. Type: Counter	Int32
3G-modify-rej-semnatic-incorrect-message	Description: Total number of requests to modify PDP context for 3G service rejected due to semantically incorrect message. Type: Counter	Int32
2G-modify-rej-semnatic-incorrect-message	Description: Total number of requests to modify PDP context for 2G service rejected due to semantically incorrect message. Type: Counter	Int32
3G-modify-rej-invalid-mand-info	Description: Total number of requests to modify PDP context for 3G service rejected as mandatory information in message is invalid. Type: Counter	Int32
2G-modify-rej-invalid-mand-info	Description: Total number of requests to modify PDP context for 2G service rejected as mandatory information in message is invalid. Type: Counter	Int32
3G-modify-rej-msg-non-existent	Description: Total number of MS initiated requests to modify PDP context for 3G service rejected due to non-existent type of message. Type: Counter	Int32
2G-modify-rej-msg-non-existent	Description: Total number of MS initiated requests to modify PDP context for 2G service rejected due to non-existent type of message. Type: Counter	Int32
3G-modify-rej-ie-non-existent	Description: Total number of requests to modify PDP context for 3G service rejected due to non-existence of information element. Type: Counter	Int32
2G-modify-rej-ie-non-existent	Description: Total number of requests to modify PDP context for 2G service rejected due to non-existence of information element. Type: Counter	Int32
3G-modify-rej-conditional-ie-err	Description: Total number of requests to modify PDP context for 3G service rejected due to error in conditional information element. Type: Counter	Int32

Variables	Description	Data Type
2G-modify-rej-conditional-ie-err	Description: Total number of requests to modify PDP context for 2G service rejected due to error in conditional information element. Type: Counter	Int32
3G-modify-rej-msg-not-compatible-prot-state	Description: Total number of requests to modify PDP context for 3G service rejected as message is not compatible with protocol state. Type: Counter	Int32
2G-modify-rej-msg-not-compatible-prot-state	Description: Total number of requests to modify PDP context for 2G service rejected as message is not compatible with protocol state. Type: Counter	Int32
3G-modify-rej-rcvry-on-tmr-expiry	Description: Total number of requests to modify PDP context for 3G service rejected as timer expired for recovery. Type: Counter	Int32
2G-modify-rej-rcvry-on-tmr-expiry	Description: Total number of requests to modify PDP context for 2G service rejected as timer expired for recovery. Type: Counter	Int32
3G-modify-rej-prot-err-unspec	Description: Total number of requests to modify PDP context for 3G service rejected due to unspecified protocol error. Type: Counter	Int32
2G-modify-rej-prot-err-unspec	Description: Total number of requests to modify PDP context for 2G service rejected due to unspecified protocol error. Type: Counter	Int32
3G-ms-deactiv-req	Description: Total number of MS initiated PDP context deactivation requests received for 3G service. Type: Counter	Int32
2G-ms-deactiv-req	Description: Total number of MS initiated PDP context deactivation requests received for 2G service.	Int32
3G-ms-deactiv-accept	Description: Total number of MS initiated PDP context deactivation requests sent to MS accepted for 3G service. Triggers: Increments when the SGSN sends Deactivate Accept in response to MS initiated PDP deactivation. Availability: per SGSN service, per RAI Type: Counter	Int32
2G-ms-deactiv-accept	Description: Total number of MS initiated PDP context deactivation requests sent to MS accepted for 2G service. Triggers: Increments when the SGSN sends Deactivate Accept in response to MS initiated PDP deactivation. Availability: per GPRS service Type: Counter	Int32
3G-ms-deactiv-reject	Description: Total number of MS initiated PDP context deactivation requests rejected for 3G service. Type: Counter	Int32

Variables	Description	Data Type
2G-ms-deactiv-reject	Description: Total number of MS initiated PDP context deactivation requests rejected for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-odb	Description: Total number of MS initiated PDP context deactivation requests rejected for 3G service due to operator determined barring. Type: Counter	Int32
2G-ms-deactiv-rej-rx-odb	Description: Total number of MS initiated PDP context deactivation requests rejected for 2G service due to operator determined barring. Type: Counter	Int32
3G-ms-deactiv-rej-rx-mbms-cap-insuff-res	Description: Total number of MS initiated PDP context deactivation requests rejected for 3G service due to insufficient resources for Multimedia Broadcast/Multicast Service (MBMS) capability. Type: Counter	Int32
2G-ms-deactiv-rej-rx-mbms-cap-insuff-res	Description: Total number of MS initiated PDP context deactivation requests rejected for 2G service due to insufficient resources for Multimedia Broadcast/Multicast Service (MBMS) capability. Type: Counter	Int32
3G-ms-deactiv-rej-rx-llc-sndcp-fail-gb	Description: Total number of MS initiated PDP context deactivation requests rejected for 3G service due to failure at the logical link control with sub network dependent convergence protocol at Gb interface. Type: Counter	Int32
2G-ms-deactiv-rej-rx-llc-sndcp-fail-gb	Description: Total number of MS initiated PDP context deactivation requests rejected for 2G service due to failure at the logical link control with sub network dependent convergence protocol at Gb interface. Type: Counter	Int32
3G-ms-deactiv-rej-rx-insuff-res	Description: Total number of MS initiated PDP context deactivation requests rejected due to insufficient resources in download direction for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-insuff-res	Description: Total number of MS initiated PDP context deactivation requests rejected due to insufficient resources in download direction for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-miss-unkwn-apn	Description: Total number of MS initiated PDP context deactivation requests rejected due to missing or unknown APN for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-miss-unkwn-apn	Description: Total number of MS initiated PDP context deactivation requests rejected due to missing or unknown APN for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-unkwn-pdp-addr	Description: Total number of MS initiated PDP context deactivation requests rejected due to unknown PDP context name or address for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-unkwn-pdp-addr	Description: Total number of MS initiated PDP context deactivation requests rejected due to unknown PDP context name or address for 2G service. Type: Counter	Int32

Variables	Description	Data Type
3G-ms-deactiv-rej-rx-usr-auth-fail	Description: Total number of MS initiated PDP context deactivation requests rejected as user authentication failed for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-usr-auth-fail	Description: Total number of MS initiated PDP context deactivation requests rejected as user authentication failed for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-activ-rej-ggsn	Description: Total number of MS initiated PDP context deactivation requests rejected as request rejected by corresponding GGSN for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-activ-rej-ggsn	Description: Total number of MS initiated PDP context deactivation requests rejected as request rejected by corresponding GGSN for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-activ-rej-unspec	Description: Total number of MS initiated PDP context deactivation requests rejected due to unknown or unspecified reasons for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-activ-rej-unspec	Description: Total number of MS initiated PDP context deactivation requests rejected due to unknown or unspecified reasons for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-service-opt-no-support	Description: Total number of MS initiated PDP context deactivation requests rejected as requested service option is not supported for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-service-opt-no-support	Description: Total number of MS initiated PDP context deactivation requests rejected as requested service option is not supported for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-service-opt-no-subs	Description: Total number of MS initiated PDP context deactivation requests rejected as subscriber is not subscribed requested service option for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-service-opt-no-subs	Description: Total number of MS initiated PDP context deactivation requests rejected as subscriber is not subscribed requested service option for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-svc-opt-temp-out-order	Description: Total number of MS initiated PDP context deactivation requests rejected as requested service option is temporarily out of order for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-svc-opt-temp-out-order	Description: Total number of MS initiated PDP context deactivation requests rejected as requested service option is temporarily out of order for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-nsapi-already-used	Description: Total number of MS initiated PDP context deactivation requests rejected as requested NSAPI is already in use for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-nsapi-already-used	Description: Total number of MS initiated PDP context deactivation requests rejected as requested NSAPI is already in use for 2G service. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
3G-ms-deactiv-rej-rx-reg-deactiv	Description: Total number of MS initiated PDP context deactivation requests rejected due to registration of deactivate message for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-reg-deactiv	Description: Total number of MS initiated PDP context deactivation requests rejected due to registration of deactivate message for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-qos-not-acc	Description: Total number of MS initiated PDP context deactivation requests rejected as requested QoS is not accepted for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-qos-not-acc	Description: Total number of MS initiated PDP context deactivation requests rejected as requested QoS is not accepted for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-nwt-fail	Description: Total number of MS initiated PDP context deactivation requests rejected due to network failure for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-nwt-fail	Description: Total number of MS initiated PDP context deactivation requests rejected due to network failure for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-reactivation-req	Description: Total number of MS initiated PDP context deactivation requests rejected due re-activation request arrived before completion of deactivation procedure for 3G service. Type: Counter	Int32
2G-ms-deactiv-rej-rx-reactivation-req	Description: Total number of MS initiated PDP context deactivation requests rejected due re-activation request arrived before completion of deactivation procedure for 2G service. Type: Counter	Int32
3G-ms-deactiv-rej-rx-no-feature-support	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as requested feature is not supported. Type: Counter	Int32
2G-ms-deactiv-rej-rx-no-feature-support	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as requested feature is not supported. Type: Counter	Int32
3G-ms-deactiv-rej-rx-sem-err-tft-op	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to semantic error in subscriber TFT option. Type: Counter	Int32
2G-ms-deactiv-rej-rx-sem-err-tft-op	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to semantic error in subscriber TFT option. Type: Counter	Int32
3G-ms-deactiv-rej-rx-syn-err-tft-op	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to syntax error in subscriber TFT option. Type: Counter	Int32
2G-ms-deactiv-rej-rx-syn-err-tft-op	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to syntax error in subscriber TFT option. Type: Counter	Int32

Variables	Description	Data Type
3G-ms-deactiv-rej-rx-unknown-ctx	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to unknown context in request. Type: Counter	Int32
2G-ms-deactiv-rej-rx-unknown-ctx	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to unknown context in request. Type: Counter	Int32
3G-ms-deactiv-rej-rx-ctx-no-tft-already-actv	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as no TFT is active in this context. Type: Counter	Int32
2G-ms-deactiv-rej-rx-ctx-no-tft-already-actv	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as no TFT is active in this context. Type: Counter	Int32
3G-ms-deactiv-rej-rx-mcast-grp-mem-tout	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as multicast group memory is timed-out. Type: Counter	Int32
2G-ms-deactiv-rej-rx-mcast-grp-mem-tout	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as multicast group memory is timed-out. Type: Counter	Int32
3G-ms-deactiv-rej-rx-sem-err-pkt-filter	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to semantic error in packet filter. Type: Counter	Int32
2G-ms-deactiv-rej-rx-sem-err-pkt-filter	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to semantic error in packet filter. Type: Counter	Int32
3G-ms-deactiv-rej-rx-syn-err-pkt-filter	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to syntax error in packet filter. Type: Counter	Int32
2G-ms-deactiv-rej-rx-syn-err-pkt-filter	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to syntax error in packet filter. Type: Counter	Int32
3G-ms-deactiv-rej-rx-invalid-trans-id	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to invalid transaction id. Type: Counter	Int32
2G-ms-deactiv-rej-rx-invalid-trans-id	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to invalid transaction id. Type: Counter	Int32
3G-ms-deactiv-rej-rx-sem-incorrect-msg	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to semantically incorrect message. Type: Counter	Int32
2G-ms-deactiv-rej-rx-sem-incorrect-msg	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to semantically incorrect message. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
3G-ms-deactiv-rej-rx-inval-mand-info	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as mandatory information in message is invalid. Type: Counter	Int32
2G-ms-deactiv-rej-rx-inval-mand-info	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as mandatory information in message is invalid. Type: Counter	Int32
3G-ms-deactiv-rej-rx-msg-non-existent	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to non-existent type of message. Type: Counter	Int32
2G-ms-deactiv-rej-rx-msg-non-existent	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to non-existent type of message. Type: Counter	Int32
3G-ms-deactiv-rej-rx-ie-non-existent	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to non-existence of information element. Type: Counter	Int32
2G-ms-deactiv-rej-rx-ie-non-existent	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to non-existence of information element. Type: Counter	Int32
3G-ms-deactiv-rej-rx-cond-ie-err	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to error in conditional information element. Type: Counter	Int32
2G-ms-deactiv-rej-rx-cond-ie-err	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to error in conditional information element. Type: Counter	Int32
3G-ms-deactiv-rej-rx-prot-err-unspec	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to unspecified protocol error. Type: Counter	Int32
2G-ms-deactiv-rej-rx-prot-err-unspec	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to unspecified protocol error. Type: Counter	Int32
3G-ms-deactiv-rej-rx-apn-rest-incomap-actv-pdp	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to incompatible APN for PDP context activation. Type: Counter	Int32
2G-ms-deactiv-rej-rx-apn-rest-incomap-actv-pdp	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to incompatible APN for PDP context activation. Type: Counter	Int32
3G-ms-deactiv-rej-rx-msg-not-compat-prot-state	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as message is not compatible with protocol state. Type: Counter	Int32
2G-ms-deactiv-rej-rx-msg-not-compat-prot-state	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as message is not compatible with protocol state. Type: Counter	Int32

Variables	Description	Data Type
3G-ms-deactiv-rej-rx-rcvry-on-tmr-expiry	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as timer expired for recovery. Type: Counter	Int32
2G-ms-deactiv-rej-rx-rcvry-on-tmr-expiry	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as timer expired for recovery. Type: Counter	Int32
3G-sgsn-init-deact-req	Description: Total number of SGSN initiated PDP context deactivation requests received for 3G service. Type: Gauge.	Int32
2G-sgsn-init-deact-req	Description: Total number of SGSN initiated PDP context deactivation requests received for 2G service. Type: Gauge.	Int32
3G-sgsn-init-deact-acc	Description: Total number of SGSN initiated PDP context deactivation requests received from MS accepted for 3G service. Triggers: Increments when the SGSN receives Deactivate Accept corresponding to SGSN initiated Deactivation Request sent to MS. Availability: per SGSN service, per RAI Type: Gauge.	Int32
2G-sgsn-init-deact-acc	Description: Total number of SGSN initiated PDP context deactivation requests received from MS accepted for 2G service. Triggers: Increments when the SGSN receives Deactivate Accept corresponding to SGSN initiated Deactivation Request sent to MS. Availability: per GPRS service Type: Gauge.	Int32
3G-sgsn-init-deact-rej	Description: Total number of SGSN initiated PDP context deactivation requests rejected for 3G service. Type: Gauge.	Int32
2G-sgsn-init-deact-rej	Description: Total number of SGSN initiated PDP context deactivation requests rejected for 2G service. Type: Gauge.	Int32
3G-ggsn-init-deact-req	Description: Total number of GGSN initiated PDP context deactivation requests received for 3G service. Type: Gauge.	Int32
2G-ggsn-init-deact-req	Description: Total number of GGSN initiated PDP context deactivation requests received for 2G service. Type: Gauge.	Int32
3G-ggsn-init-deact-acc	Description: Total number of GGSN initiated PDP context deactivation requests received from MS accepted for 3G service. Triggers: Increments when the SGSN receives Deactivate Accept corresponding to GGSN initiated Deactivation Request sent to MS. Availability: per SGSN service, per RAI Type: Gauge.	Int32

Variables	Description	Data Type
2G-ggsn-init-deact-acc	Description: Total number of GGSN initiated PDP context deactivation requests received from MS accepted for 2G service. Triggers: Increments when the SGSN receives Deactivate Accept corresponding to GGSN initiated Deactivation Request sent to MS. Availability: per GPRS service Type: Gauge.	Int32
3G-ggsn-init-deact-rej	Description: Total number of GGSN initiated PDP context deactivation requests rejected for 3G service. Type: Gauge.	Int32
2G-ggsn-init-deact-rej	Description: Total number of GGSN initiated PDP context deactivation requests rejected for 2G service. Type: Gauge.	Int32
3G-hlr-init-deact-req	Description: Total number of HLR initiated PDP context deactivation requests received for 3G service. Type: Gauge.	Int32
2G-hlr-init-deact-req	Description: Total number of HLR initiated PDP context deactivation requests received for 2G service. Type: Gauge.	Int32
3G-hlr-init-deact-acc	Description: Total number of HLR initiated PDP context deactivation requests received from MS accepted for 3G service. Triggers: Increments when the SGSN receives Deactivate Accept corresponding to HLR initiated Deactivation Request sent to MS. Availability: per SGSN service, per RAI Type: Gauge.	Int32
2G-hlr-init-deact-acc	Description: Total number of HLR initiated PDP context deactivation requests received from MS accepted for 2G service. Triggers: Increments when the SGSN receives Deactivate Accept corresponding to HLR initiated Deactivation Request sent to MS. Availability: per GPRS service Type: Gauge.	Int32
3G-hlr-init-deact-rej	Description: Total number of HLR initiated PDP context deactivation requests rejected for 3G service. Type: Gauge.	Int32
2G-hlr-init-deact-rej	Description: Total number of HLR initiated PDP context deactivation requests rejected for 2G service. Type: Gauge.	Int32
3G-nw-deactv-rej-tx-odb	Description: Total number of MS initiated PDP context deactivation requests rejected for 3G service due to operator determined barring. Type: Gauge.	Int32
2G-nw-deactv-rej-tx-odb	Description: Total number of MS initiated PDP context deactivation requests rejected for 2G service due to operator determined barring. Type: Gauge.	Int32

Variables	Description	Data Type
3G-nw-deactiv-rej-tx-mbms-cap-insuff-res	Description: Total number of MS initiated PDP context deactivation requests rejected for 3G service due to insufficient resources for Multimedia Broadcast/Multicast Service (MBMS) capability. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-mbms-cap-insuff-res	Description: Total number of MS initiated PDP context deactivation requests rejected for 2G service due to insufficient resources for Multimedia Broadcast/Multicast Service (MBMS) capability. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-llc-sndcp-fail-gb	Description: Total number of MS initiated PDP context deactivation requests rejected for 3G service due to failure at the logical link control with sub network dependent convergence protocol at Gb interface. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-llc-sndcp-fail-gb	Description: Total number of MS initiated PDP context deactivation requests rejected for 2G service due to failure at the logical link control with sub network dependent convergence protocol at Gb interface. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-insuff-res	Description: Total number of MS initiated PDP context deactivation requests rejected due to insufficient resources in download direction for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-insuff-res	Description: Total number of MS initiated PDP context deactivation requests rejected due to insufficient resources in download direction for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-miss-unkwn-apn	Description: Total number of MS initiated PDP context deactivation requests rejected due to missing or unknown APN for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-miss-unkwn-apn	Description: Total number of MS initiated PDP context deactivation requests rejected due to missing or unknown APN for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-unkwn-pdp-addr	Description: Total number of MS initiated PDP context deactivation requests rejected due to unknown PDP context name or address for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-unkwn-pdp-addr	Description: Total number of MS initiated PDP context deactivation requests rejected due to unknown PDP context name or address for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-usr-auth-fail	Description: Total number of MS initiated PDP context deactivation requests rejected as user authentication failed for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-usr-auth-fail	Description: Total number of MS initiated PDP context deactivation requests rejected as user authentication failed for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-actv-rej-ggsn	Description: Total number of MS initiated PDP context deactivation requests rejected as request rejected by corresponding GGSN for 3G service. Type: Gauge.	Int32

■ Common Syntax Options

Variables	Description	Data Type
2G-nw-deactiv-rej-tx-actv-rej-ggsn	Description: Total number of MS initiated PDP context deactivation requests rejected as request rejected by corresponding GGSN for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-actv-rej-unspec	Description: Total number of MS initiated PDP context deactivation requests rejected due to unknown or unspecified reasons for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-actv-rej-unspec	Description: Total number of MS initiated PDP context deactivation requests rejected due to unknown or unspecified reasons for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-service-opt-no-support	Description: Total number of MS initiated PDP context deactivation requests rejected as requested service option is not supported for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-service-opt-no-support	Description: Total number of MS initiated PDP context deactivation requests rejected as requested service option is not supported for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-service-opt-no-sub	Description: Total number of MS initiated PDP context deactivation requests rejected as subscriber is not subscribed requested service option for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-service-opt-no-sub	Description: Total number of MS initiated PDP context deactivation requests rejected as subscriber is not subscribed requested service option for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-svc-opt-temp-out-order	Description: Total number of MS initiated PDP context deactivation requests rejected as requested service option is temporarily out of order for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-svc-opt-temp-out-order	Description: Total number of MS initiated PDP context deactivation requests rejected as requested service option is temporarily out of order for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-nsapi-already-used	Description: Total number of MS initiated PDP context deactivation requests rejected as requested NSAPI is already in use for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-nsapi-already-used	Description: Total number of MS initiated PDP context deactivation requests rejected as requested NSAPI is already in use for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-reg-deactiv	Description: Total number of MS initiated PDP context deactivation requests rejected due to registration of deactivate message for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-reg-deactiv	Description: Total number of MS initiated PDP context deactivation requests rejected due to registration of deactivate message for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-qos-not-acc	Description: Total number of MS initiated PDP context deactivation requests rejected as requested QoS is not accepted for 3G service. Type: Gauge.	Int32

Variables	Description	Data Type
2G-nw-deactiv-rej-tx-qos-not-acc	Description: Total number of MS initiated PDP context deactivation requests rejected as requested QoS is not accepted for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-nwt-fail	Description: Total number of MS initiated PDP context deactivation requests rejected due to network failure for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-nwt-fail	Description: Total number of MS initiated PDP context deactivation requests rejected due to network failure for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-reactivation-req	Total number of MS initiated PDP context deactivation requests rejected due re-activation request arrived before completion of deactivation procedure for 3G service. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-reactivation-req	Total number of MS initiated PDP context deactivation requests rejected due re-activation request arrived before completion of deactivation procedure for 2G service. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-no-feature-support	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as requested feature is not supported. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-no-feature-support	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as requested feature is not supported. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-sem-err-tft-op	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to semantic error in subscriber TFT option. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-sem-err-tft-op	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to semantic error in subscriber TFT option. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-syn-err-tft-op	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to syntax error in subscriber TFT option. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-syn-err-tft-op	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to syntax error in subscriber TFT option. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-unknown-ctx	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to unknown context in request. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-unknown-ctx	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to unknown context in request. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-ctx-no-tft-already-actv	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as no TFT is active in this context. Type: Gauge.	Int32

Common Syntax Options

Variables	Description	Data Type
2G-nw-deactiv-rej-tx-ctx-no-tft-already-actv	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as no TFT is active in this context. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-mcast-grp-mem-tout	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as multicast group memory is timed-out. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-mcast-grp-mem-tout	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as multicast group memory is timed-out. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-sem-err-pkt-filter	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to semantic error in packet filter. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-sem-err-pkt-filter	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to semantic error in packet filter. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-syn-err-pkt-filter	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to syntax error in packet filter. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-syn-err-pkt-filter	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to syntax error in packet filter. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-invalid-trans-id	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to invalid transaction id. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-invalid-trans-id	Total number of MS initiated PDP context deactivation requests for 2G service rejected due to invalid transaction id. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-sem-incorrect-msg	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to semantically incorrect message. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-sem-incorrect-msg	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to semantically incorrect message. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-inval-mand-info	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as mandatory information in message is invalid. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-inval-mand-info	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as mandatory information in message is invalid. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-msg-non-existent	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to non-existent type of message. Type: Gauge.	Int32

Variables	Description	Data Type
2G-nw-deactiv-rej-tx-msg-non-existent	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to non-existent type of message. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-ie-non-existent	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to non-existence of information element. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-ie-non-existent	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to non-existence of information element. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-cond-ie-err	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to error in conditional information element. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-cond-ie-err	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to error in conditional information element. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-prot-err-unspec	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to unspecified protocol error. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-prot-err-unspec	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to unspecified protocol error. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-apn-rest-incomap-actv-pdp	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected due to incompatible APN for PDP context activation. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-apn-rest-incomap-actv-pdp	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected due to incompatible APN for PDP context activation. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-msg-not-compat-prot-state	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as message is not compatible with protocol state. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-msg-not-compat-prot-state	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as message is not compatible with protocol state. Type: Gauge.	Int32
3G-nw-deactiv-rej-tx-rcvry-on-tmr-expiry	Description: Total number of MS initiated PDP context deactivation requests for 3G service rejected as timer expired for recovery. Type: Gauge.	Int32
2G-nw-deactiv-rej-tx-rcvry-on-tmr-expiry	Description: Total number of MS initiated PDP context deactivation requests for 2G service rejected as timer expired for recovery. Type: Gauge.	Int32
2G-total-sm-status-req-rx	Description: Total number of session management (SM) status request messages received for 2G service. Type: Gauge.	Int32

Variables	Description	Data Type
3G-total-sm-status-req-tx	Description: Total number of session management (SM) status request messages sent for 3G service. Type: Gauge.	Int32
2G-total-sm-status-req-tx	Description: Total number of session management (SM) status request messages sent for 2G service. Type: Gauge.	Int32
RNC-rab-modify-req	Description: Total number of Radio Network Controller (RNC) initiated radio access bearer (RAB) modify requests received at the SGSN. Type: Gauge.	Int32
RNC-rab-rel-req	Description: Total number of RNC initiated RAB release requests received at the SGSN. Type: Gauge.	Int32
RNC-rab-modify-num	Description: Total number of RNC initiated RAB modified messages received. Type: Gauge.	Int32
RNC-rab-rel-num	Description: Total number of RNC initiated RAB release requests handled at SGSN. Type: Gauge.	Int32
rab-assign-req	Description: Total number of SGSN initiated RAB assignment requests sent to all RNCs. Type: Gauge.	Int32
rab-assign-rsp	Description: Total number of SGSN initiated RAB assignment response received from all RNCs. Type: Gauge.	Int32
rab-assign-rej	Description: This statistic has been deprecated.	Int32
rab-setup-reattempt	Description: Total number of radio access bearer (RAB) setup reattempted. Type: Gauge.	Int32
rab-set/mod-req	Description: Total number of SGSN initiated RAB setup or modify requests sent to all RNCs. Type: Gauge.	Int32
rab-set/mod-acc	Description: Total number of SGSN initiated RAB setup or modify accept messages received from all RNCs. Type: Gauge.	Int32
rab-set/mod-tmr-expired	Description: Total events when RAB setup/modify timer expired. Type: Gauge.	Int32
rab-set/mod-fail	Description: Total events when RAB setup/modify procedure failed Type: Gauge.	Int32
rab-rel-req	Description: Total number of SGSN initiated RAB release request messages sent to all RNCs. Type: Gauge.	Int32
rab-rel-accept	Description: Total number of SGSN initiated RAB release accept messages received from all RNCs. Type: Gauge.	Int32
rab-rel-tmr-expired	Description: Total events when RAB release timer expired. Type: Gauge.	Int32

Variables	Description	Data Type
rab-rel-fail	Description: Total radio access bearer release requests failed Type: Gauge.	Int32
rab-queued	Description: Total radio access bearer requests queued for transmission. Type: Gauge.	Int32
rab-rel-pre-empt	Description: Total number of RAB released due to pre-empted event. Type: Gauge.	Int32
rab-rel-utran	Description: Total number of RAB released due to initiation from UTRAN. Type: Gauge.	Int32
rab-rel-ue-radio-lost	Description: Total number of RAB released due to UE radio connection lost. Type: Gauge.	Int32
total-rab-rej	Total RAB setup/modify/release requests rejected. Type: Gauge.	Int32
rab-rej-rab-preempt	Description: Total number of RAB requests rejected due to pre-empted event. Triggers: Increments when RNC initiated RAB release procedure sends RAB Release request with this cause. Availability: per SGSN service, per RAI Type: Gauge.	Int32
rab-rej-reloc-overall-tmr-exp	Description: Total number of RAB requests for relocation rejected due to expiry of timer TRELOCoverall. This specifies the maximum time for the protection of overall Relocation procedure in the source RNC. Triggers: Increments when the source RNC initiates the Iu Release Request procedure towards the SGSN with a cause value "TRELOCoverall expiry". Availability: per SGSN service, per RAI Type: Gauge.	Int32
rab-rej-reloc-prep-tmr-exp	Description: Total number of RAB requests for relocation rejected due to expiry of timer TRELOCprep. This specifies the maximum time for expiry of Relocation Preparation procedure in the source RNC. Triggers: Increments when the source RNC cancels the Relocation Preparation procedure by initiating the Relocation Cancel procedure with a cause value "TRELOCprep expiry". Availability: per SGSN service, per RAI Type: Gauge.	Int32
rab-rej-reloc-complete-tmr-exp	Description: Indicates the maximum time for waiting the relocation completion in the CN. Triggers: Increments when the SGSN initiate release of Iu connections towards the source and the target RNC initiates the Iu Release procedure with a cause value "TRELOCcomplete expiry". Availability: per SGSN service, per RAI Type: Gauge.	Int32
rab-rej-queuing-tmr-exp	Description: Indicates the maximum time in the RNC for queuing the request of RAB establishment or modification. Triggers: Increments when the RNC sends the RAB assignment response to report unsuccessful establishment/modification of RAB with the failed RAB ID list with the cause "Tqueuing Expiry". Availability: per SGSN service, per RAI Type: Gauge.	Int32

Variables	Description	Data Type
rab-rej-reloc-triggered	<p>Description: Total number of RAB requests for relocation triggered. The action fails due to relocation of MS to another RNC.</p> <p>Triggers: Increments when the Relocation required message is sent with the cause “Relocation Triggered” to the SGSN. If the relocation becomes necessary during the RAB Assignment procedure, the RNC may interrupt the ongoing RAB Assignment procedure and initiate the Relocation Preparation procedure and send the RAB assignment response as failure cause “relocation required”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-unable-to-est-reloc	<p>Description: Total number of RAB requests rejected because RAB failed to establish during relocation as it cannot be supported in the target RNC or the RAB did not exist in the source RNC.</p> <p>Triggers: Increments when the target RNC sends the RELOCATION REQUEST ACKNOWLEDGE message with a value in Cause IE “Unable to Establish During Relocation”, for the RABs rejected and received in RELOCATION REQUEST from SGSN, only if the Relocation Type IE is set to “UE involved in relocation of SRNS” in the request.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-unknown-target-rnc	<p>Description: Total number of RAB requests rejected due to unknown target RNC in request.</p> <p>Triggers: Increments when the SGSN rejects the relocation of SRNS by sending a RELOCATION PREPARATION FAILURE message to the source RNC with Cause IE set to “Unknown target RNC”, if the target RNC is unknown to SGSN.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-reloc-cancel	<p>Description: Total number of RAB requests rejected as relocation was cancelled due to interaction with other procedures.</p> <p>Triggers: Increments when SGSN issues the IU release command to RNC with the cause “Relocation Cancelled”, if the Relocation Preparation procedure is unsuccessfully terminated.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-reloc-success	<p>Description: Total number of RAB requests rejected due to completion of successful relocation.</p> <p>Triggers: Increments when SGSN issues the IU release command to RNC with the cause “Successful Relocation”, if completion of successful relocation of SRNS happened.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-cypher-algo-no-support	<p>Description: Total number of RAB requests rejected as the UTRAN or the UE is unable to support the requested ciphering and/or integrity protection algorithms.</p> <p>Triggers: If the target RNC cannot support any of the integrity protection (ciphering respectively) alternatives provided in the Integrity Protection Information IE or Encryption Information IE, in RELOCATION REQUEST from SGSN, it returns a RELOCATION FAILURE message with the cause “Requested Ciphering and/or Integrity Protection algorithms not supported”. RNC also sends the SECURITY MODE REJECT with the same cause for the same reason when receiving the SECURITY MODE COMMAND from SGSN.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
rab-rej-conflict-cipher-info	<p>Description: Total number of RAB requests rejected due to conflict with the requested security mode configuration and the already existing security mode configuration.</p> <p>Triggers: If the target RNC receives a source RNC to target RNC Transparent Container IE containing Chosen Integrity Protection (Encryption respectively) Algorithm IE without Integrity Protection (Ciphering respectively) Key IE, it returns a RELOCATION FAILURE message with the cause “Conflict with already existing Integrity protection and/or Ciphering information”. RNC also sends the SECURITY MODE REJECT with the same cause for the same reason when receiving the SECURITY MODE COMMAND from SGSN.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-failure-radio-if-proc	<p>Description: Total number of RAB requests rejected due to failure in radio interface procedure.</p> <p>Triggers: If the radio interface Security Mode Control procedure fails, a SECURITY MODE REJECT message will be sent to the SGSN with cause value “Failure in the Radio Interface Procedure” from RNC.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-rel-utran-reason	<p>Description: Total number of RAB requests rejected as RAB release is initiated due to UTRAN generated reason.</p> <p>Triggers: Increments when RNC initiated RAB release procedure sends RAB Release request with this cause.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-utran-inactivity	<p>Description: Total number of RAB requests rejected as RAB released due to user inactivity at UTRAN on one or more non real time RABs in order to optimize radio resource.</p> <p>Triggers: Increments when the source RNC initiates the Iu Release Request procedure towards the SGSN with a cause value “User Inactivity” for a particular MS.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-time-crit-relocation	<p>Description: Total number of RAB requests rejected as relocation is requested for time critical reason. This cause value is reserved to represent all critical cases where the connection is likely to be dropped if relocation is not performed.</p> <p>Triggers: Increments when the source RNC initiates relocation preparation procedure by sending a RELOCATION REQUIRED message with the cause “Time Critical Relocation”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-req-traffic-class-unavail	<p>Description: Total number of RAB request rejected as requested traffic class unavailable.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Requested Traffic Class not Available”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-invalid-rab-param-val	<p>Description: Total number of RAB requests rejected due to invalid RAB parameter value.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Invalid RAB Parameters Value”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
rab-rej-req-max-bit-rate-unavail	<p>Description: Total number of RAB requests rejected as requested maximum bit rate is unavailable.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Requested Maximum Bit Rate not Available”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-req-max-bit-rate-dl-unavail	<p>Description: Total number of RAB requests rejected as requested maximum bit rate for downlink is unavailable.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Requested Maximum Bit Rate for DL not Available”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-req-max-bit-rate-ul-unavail	<p>Description: Total number of RAB requests rejected as requested maximum bit rate for uplink is unavailable.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Requested Maximum Bit Rate for DL not Available”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-req-gbr-unavail	<p>Description: Total number of RAB requests rejected as requested guaranteed bit rate is unavailable.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID with the cause “Requested Guaranteed Bit Rate not Available”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-req-gbr-dl-unavail	<p>Description: Total number of RAB requests rejected as requested guaranteed bit rate for downlink is unavailable.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Requested Guaranteed Bit Rate for DL not Available”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-req-gbr-ul-unavail	<p>Description: Total number of RAB requests rejected as requested guaranteed bit rate for uplink is unavailable.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Requested Guaranteed Bit Rate for UL not Available”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
rab-rej-req-trans-delay-not-achievable	<p>Description: Total number of RAB requests rejected as requested transfer delay is not achievable.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Requested Transfer Delay not Achievable”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-inval-rab-param-combo	<p>Description: Total number of RAB requests rejected due to invalid RAB parameter combination.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Invalid RAB Parameters Combination”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-violation-for-sdu-param	<p>Description: Total number of RAB requests rejected due to occurrence of condition violation for Service Data Unit (SDU) parameters.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Condition Violation for SDU Parameters”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-violation-traffic-handlde-prio	<p>Description: Total number of RAB requests rejected due to occurrence of condition violation for traffic handling priority.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Condition Violation for Traffic Handling Priority”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-violation-for-gbr	<p>Description: Total number of RAB request rejected due to occurrence of condition violation for guaranteed bit rate.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Condition Violation for Guaranteed Bit Rate”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-usr-plane-ver-unsupported	<p>Description: Total number of RAB requests rejected as requested user plane version is not supported.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “User Plane Versions not Supported”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-iu-up-failure	<p>Description: Total number of RAB requests rejected due to Iu UP activation failure.</p> <p>Triggers: Increments when RNC sends the RAB assignment response to report unsuccessful establishment/modification of a RAB with the failed RAB ID list with the cause “Iu UP Failure”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
rab-rej-reloc-alloc-expiry	<p>Description: Total number of RAB requests rejected as Relocation Resource Allocation procedure failed due to expiry of the TRELOCalloc timer.</p> <p>Triggers: Increments when SGSN is unable to complete the relocation of SRNS before the TRELOCalloc expiry. The SGSN then issues a RELOCATION PREPARATION FAILURE message to the source RNC with the cause “TRELOCalloc expiry”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-reloc-failure-target-system	<p>Description: Total number of RAB request rejected due to relocation failure in target CN/RNC or target system.</p> <p>Triggers: Increments when SGSN cannot complete the relocation of SRNS due to failure in the Target CN/RNC or Target System. The SGSN then issues a RELOCATION PREPARATION FAILURE message to the source RNC with the cause “Relocation Failure in Target CN/RNC or Target System”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-invalid-rdb-id	<p>Description: Total number of RAB requests rejected due to invalid RAB ID in the RNC.</p> <p>Triggers: If the RAB ID of a RAB requested to be released is unknown in the RNC, RNC will report as a RAB failed to release with the cause value “Invalid RAB ID” in RAB Assignment Response to SGSN. If RAB ID of RAB requested to be transferred is unknown in RNC, the SRNS CONTEXT RESPONSE message will contain the cause with the RAB ID. The RAB ID IE for each RAB for which UTRAN is not able to transfer a data volume report due to unknown RAB ID is included in the DATA VOLUME REPORT message together with a Cause IE “Invalid RAB ID”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-no-remaining-rab	<p>Description: Total number of RAB requests rejected as no RAB is available.</p> <p>Triggers: Increments when SGSN issues the IU release command to RNC with the cause “No remaining RAB”, if there is no RAB associated with the IU.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-interaction-with-other-proc	<p>Description: Total number of RAB requests rejected as relocation was cancelled due to interaction with other procedure.</p> <p>Triggers: If source RNC triggers the RELOCATION CANCEL to SGSN with cause “Interaction with other procedure” when relocation preparation is triggered and it receives another message via the same signalling IU.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-integrity-check-fail	<p>Description: Total number of RAB requests rejected due to repeated failure in integrity checking.</p> <p>Triggers: Increments when RNC issues the IU release request to SGSN with the cause “Repeated Integrity Checking Failure”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
rab-rej-req-type-not-supported	<p>Description: Total number of RAB requests rejected as the RNC is not supporting the requested location request type either because it does not support the requested event or it does not support the requested report area.</p> <p>Triggers: If the RNC cannot deliver the location information as requested by the SGSN, due to non-support of the requested event, then it will send location report message indicating the UE location to be “Undetermined” with cause “Requested Request Type not supported”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-req-superseeded	<p>Description: Total number of RAB requests rejected due to a second request on the same RAB.</p> <p>Triggers: In case of a request to modify or release a RAB that contains the RAB ID of a RAB being queued, the RAB will be taken out of the queue and treated according to the second request. The first request will be responded to as RAB failed to setup or modify the cause value “Request superseded” by RNC to SGSN in RAB Assignment Response.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-rel-due-to-ue-sig-con-rel	<p>Description: Total number of RAB requests rejected as RAB released due to UE generated signaling connection release.</p> <p>Triggers: Increments when RNC issues the IU release request to SGSN with the cause “Release due to UE generated signalling connection release”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-res-optimization-reloc	<p>Description: Total number of RAB requests rejected as resource optimization for relocation occurred.</p> <p>Triggers: Increments when the source RNC initiates relocation preparation procedure by sending a RELOCATION REQUIRED message with the cause “Resource Optimization Relocation”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-req-info-unavail	<p>Description: Total number of RAB requests rejected as requested information is unavailable.</p> <p>Triggers: Increments when the source RNC initiates relocation preparation procedure by sending a RELOCATION REQUIRED message with the cause “Resource Optimization Relocation”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-reloc-due-to-radio-reason	<p>Description: Total number of RAB requests rejected due to radio related errors/causes.</p> <p>Triggers: Increments when the source RNC initiates relocation preparation procedure by sending a RELOCATION REQUIRED message with the cause “Relocation desirable for radio reasons”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-reloc-unsupported-target-system	<p>Description: Total number of RAB requests rejected as relocation is not supported in target system.</p> <p>Triggers: Increments when SGSN is unable to complete the relocation of SRNS due to failure in the Target CN/RNC or Target System. The SGSN then issues a RELOCATION PREPARATION FAILURE message to the source RNC with the cause “Relocation not supported in Target RNC or Target system”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
rab-rej-directed-retry	<p>Description: Total number of RAB requests rejected as retries directed by system.</p> <p>Triggers: Directed retry is the process of assigning a User Equipment to a radio resource that does not belong to the serving RNC, for example, in situations of congestion. It is triggered by the RAB Assignment procedure and employs relocation procedures. The RNC may indicate an impending directed retry attempt to GSM by sending a RAB ASSIGNMENT RESPONSE message with a RAB ID included in the list of RABs failed to setup and a cause value of "Directed Retry". The RNC invokes relocation by sending a RELOCATION REQUIRED message to the active SGSN node with the cause "Directed Retry". The source RNC initiates relocation preparation procedure by sending a RELOCATION REQUIRED message with the cause "Time Critical Relocation".</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-radio-con-with-ue-lost	<p>Description: Total number of RAB requests rejected as radio connection with UE is lost.</p> <p>Triggers: Increments when RNC initiated RAB release procedure sends RAB Release request with this cause.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-rnc-unable-to-estab-all-rfcs	<p>Description: Total number of RAB requests rejected as RNC is unable to establish all RAB subflow combinations indicated within the RAB Parameters IE.</p> <p>Triggers: Increments when the RNC cannot initialise the requested user plane mode for any of the user plane mode versions in the UP Mode Versions IE according to the rules for initialization of the respective user plane mode versions. The RAB Assignment Response (failure) with the cause value "RNC unable to establish all RFCs" will be received from RNC. It will be received for the same reason in RELOCATION REQUEST ACKNOWLEDGE message from RNC.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-deciphering-keys-unavail	<p>Description: Total number of RAB requests rejected as RNC is unable to provide the requested deciphering keys.</p> <p>Triggers: Increments when the RNC is unable to provide the requested deciphering keys. The RNC will then send a LOCATION RELATED DATA FAILURE message including the Cause IE to the SGSN with the cause "Deciphering Keys Not Available".</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-dedicated-assistance-data-unavail	<p>Description: Total number of RAB requests rejected as RNC is unable to successfully deliver the requested dedicated assistance data to the UE.</p> <p>Triggers: Increments when the RNC is unable to successfully deliver the requested dedicated assistance data to the UE. The RNC will then send a LOCATION RELATED DATA FAILURE message including the Cause IE to the SGSN with the cause "Dedicated Assistance data Not Available".</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
rab-rej-reloc-target-not-allowed	<p>Description: Total number of RAB requests rejected as relocation to the indicated target cell is not allowed for the UE.</p> <p>Triggers: Increments when SGSN is unable to complete the relocation of SRNS if the Relocation is not allowed in Target Cell. The SGSN then issues a RELOCATION PREPARATION FAILURE message to the source RNC with the cause “Relocation Target not allowed”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-location-reporting-congestion	<p>Description: Total number of RAB requests rejected due to an inability to support location reporting caused by overload.</p> <p>Triggers: Increments when the RNC cannot deliver the location information as requested by the SGSN due to non-availability of requested information. It will then send location report message indicating the UE location to be “Undetermined” with cause “Location Reporting Congestion”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-reduce-load-in-serving-cell	<p>Description: Total number of RAB requests rejected as the load reduction on serving cell needs to be reduced.</p> <p>Triggers: Increments when the source RNC initiates relocation preparation procedure by sending a RELOCATION REQUIRED message with the cause “Reduce Load in Serving Cell”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-no-radio-res-avail-in-target-cell	<p>Description: Total number of RAB requests rejected as radio resource is unavailable in target cell.</p> <p>Triggers: Increments when SGSN is unable to complete the relocation of SRNS if the Resource is not available in Target Cell. The SGSN then issues a RELOCATION PREPARATION FAILURE message to the source RNC with the cause “No Radio Resources Available in Target Cell”. Target RNC will send RELOCATION FAILURE message to SGSN with the cause “Radio Resources Available in Target Cell”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-geran-iu-mode-failure	<p>Description: Total number of RAB requests rejected due to failure in Iu mode in GERAN. The RAB establishment/modification/relocation failed because the GERAN BSC cannot provide an appropriate RAB due to limited capabilities within GERAN.</p> <p>Triggers: Increments when the RAB establishment/modification/relocation fails because the GERAN BSC cannot provide an appropriate RAB due to limited capabilities within GERAN. The RNC will then send RAB assignment response with the cause “GERAN Iu-mode failure”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-access-restrict-shared-nwtk	<p>Description: Total number of RAB requests rejected as access is restricted in the cell due to shared network.</p> <p>Triggers: Increments when the source RNC initiates the Iu Release Request procedure towards the SGSN with a cause value “Access Restricted Due to Shared Networks”. The source RNC initiates relocation preparation procedure by sending a RELOCATION REQUIRED message with the cause “Access Restricted Due to Shared Networks”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
rab-rej-incoming-reloc-nwt-support-puesbine	<p>Description: Total number of RAB requests rejected as the incoming relocation request is not accepted by the target RNC because of the Provision of UE Specific Behavior Information to Network Entities (PUESBINE) feature.</p> <p>Triggers: Increments when the target RNC cannot support the relocation due to PUESBINE feature. It sends a RELOCATION FAILURE message with the cause “Incoming Relocation Not Supported Due To PUESBINE Feature” To SGSN.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-traffic-target-more-source-cell	<p>Description: Total number of RAB requests rejected as the traffic load in the target cell is higher than that in the source cell.</p> <p>Triggers: Increments when SGSN is unable to complete the relocation of SRNS if the Resource is not available in Target Cell. The SGSN will then issue a RELOCATION PREPARATION FAILURE message to the source RNC with the cause “Traffic Load In The Target Cell Higher Than In The Source Cell”. Target RNC sends RELOCATION FAILURE message to SGSN with the cause “Traffic Load In The Target Cell Higher Than In The Source Cell” to SGSN when load at the target cell is higher than that in the source cell.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-mbms-no-multicat-svc-for-ue	<p>Description: Total number of RAB requests rejected for Multimedia Broadcast/Multicast Service (MBMS) feature as multicast service is not supported by user equipment.</p> <p>Triggers: Increments when SGSN is unable to process the UPLINK INFORMATION EXCHANGE REQUEST for reason that MS does not have the multicat service. The SGSN then sends the UPLINK INFORMATION EXCHANGE FAILURE message to the RNC about the reason for unsuccessful operation with a cause value “MBMS - No Multicast Service For This UE”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-mbms-unknown-ue-id	<p>Description: Total number of RAB requests rejected for MBMS feature because the user equipment identification is unknown to the CN.</p> <p>Triggers: Increments when SGSN is unable to process the UPLINK INFORMATION EXCHANGE REQUEST for reason that UE is unknown to SGSN. The SGSN then sends the UPLINK INFORMATION EXCHANGE FAILURE message to the RNC about the reason for unsuccessful operation with a cause value “MBMS - Unknown UE ID”.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-mbms-sess-start-no-data-bearer	<p>Description: Total number of RAB requests rejected for MBMS feature as the session starts without any necessary data bearer.</p> <p>Triggers: Increments when the RNC decides to wait to establish the MBMS RAB. It then sends the MBMS SESSION START RESPONSE message with the cause value “Successful MBMS Session Start - No Data Bearer Necessary” to SGSN for MBMS SESSION START REQUEST.</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
rab-rej-mbms-superseed-nnsf	<p>Description: Total number of RAB requests rejected for MBMS feature as request superseded due to NAS Node Selection Function (NNSF).</p> <p>Triggers: Increments when NNSF is active and the RNC is received from several CN nodes for a certain MBMS Bearer Service. The MBMS SESSION START message is also sent by the SGSN, and the RNC informs the SGSN with MBMS SESSION START FAILURE message and cause value "MBMS - Superseded Due To NNSF".</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-mbms-ue-linking-already-done	<p>Description: Total number of RAB requests rejected for MBMS feature as user equipment is already linked to the given Multicast service.</p> <p>Triggers: Increments when the RNC sends the MBMS UE LINKING RESPONSE message for unsuccessful linking(s) with cause value "MBMS - UE Linking Already Done".</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-mbms-ue-delinking-failure	<p>Description: Total number of RAB requests rejected for MBMS feature as user equipment delinking failed because the UE had not been linked to the given Multicast service.</p> <p>Triggers: Increments when the RNC sends the MBMS UE LINKING RESPONSE message for unsuccessful de-linking(s) with cause value "MBMS - UE De-Linking Failure - No Existing UE Linking".</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-tmgi-unknown	<p>Description: Total number of RAB requests rejected as the indicated Temporary Mobile Group Identifier (TMGI) is unknown.</p> <p>Triggers: Increments when the MBMS REGISTRATION FAILURE message sent from SGSN informs the RNC about the reason for unsuccessful MBMS registration operation with cause value "TMGI Unknown".</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
rab-rej-ms-unspecified-failure	<p>Description: Total number of RAB requests rejected due to unspecified failure at MS.</p> <p>Triggers:</p> <p>Availability: per SGSN service, per RAI</p> <p>Type: Gauge.</p>	Int32
SRNS-ctxt-req-sent	<p>Description: Total number of Serving Radio Network Subsystem (SRNS) context request sent.</p> <p>Type: Gauge.</p>	Int32
SRNS-ctxt-rsp-rcvd	<p>Description: Total number of SRNS context request received.</p> <p>Type: Gauge.</p>	Int32
SRNS-ctxt-req-tmr-expired	<p>Description: Total number of events when SRNS context request timer expired.</p> <p>Type: Gauge.</p>	Int32
SRNS-ctxt-total-pdp-acc	<p>Description: Total number of PDP context request by SRNS accepted.</p> <p>Type: Gauge.</p>	Int32
SRNS-ctxt-total-pdp-rej	<p>Description: Total number of PDP context request by SRNS rejected.</p> <p>Type: Gauge.</p>	Int32
SRNS-data-fwd-cmd-sent	<p>Description: Total number of data forward command sent by SRNS.</p> <p>Type: Gauge.</p>	Int32

Variables	Description	Data Type
sns-ctx-deny-rab-preempt	Description: Total number of PDP context request by SRNS denied due to RAB preempted procedure. Type: Gauge.	Int32
sns-ctx-deny-reloc-overall-tmr-exp	Description: Total number of PDP context request by SRNS denied due to overall timer expired for relocation. Type: Gauge.	Int32
sns-ctx-deny-reloc-prep-tmr-exp	Description: Total number of PDP context request by SRNS denied due to relocation preparation timer expired. Type: Gauge.	Int32
sns-ctx-deny-reloc-complete-tmr-exp	Description: Total number of PDP context request by SRNS denied due to relocation complete timer expired. Type: Gauge.	Int32
sns-ctx-deny-queuing-tmr-exp	Description: Total number of PDP context request by SRNS denied due to relocation queuing timer expired. Type: Gauge.	Int32
sns-ctx-deny-reloc-triggered	Description: Total number of PDP context request by SRNS denied due to relocation triggered. Type: Gauge.	Int32
sns-ctx-deny-unable-to-est-reloc	Description: Total number of PDP context request by SRNS denied due to unable to establish relocation. Type: Gauge.	Int32
sns-ctx-deny-unknown-target-rnc	Description: Total number of PDP context request by SRNS denied due to unknown target RNC. Type: Gauge.	Int32
sns-ctx-deny-reloc-cancel	Description: Total number of PDP context request by SRNS denied due to relocation cancelled. Type: Gauge.	Int32
sns-ctx-deny-reloc-success	Description: Total number of PDP context request by SRNS denied due to successful relocation. Type: Gauge.	Int32
sns-ctx-deny-cypher-algo-no-support	Description: Total number of PDP context request by SRNS denied as requested ciphering algorithm not supported. Type: Gauge.	Int32
sns-ctx-deny-conflict-cypher-info	Description: Total number of PDP context request by SRNS denied due to conflict with existing ciphering information. Type: Gauge.	Int32
sns-ctx-deny-failure-radio-if-proc	Description: Total number of PDP context request by SRNS denied due to failure in radio interface procedure. Type: Gauge.	Int32
sns-ctx-deny-rel-utran-reason	Description: Total number of PDP context request by SRNS denied as release occurred due to UTRAN generated reason. Type: Gauge.	Int32
sns-ctx-deny-utran-inactivity	Description: Total number of PDP context request by SRNS denied due to inactivity at UTRAN. Type: Gauge.	Int32

Variables	Description	Data Type
srs-ctx-deny-time-crit-relocation	Description: Total number of PDP context request by SRNS denied due to time critical relocation. Type: Gauge.	Int32
srs-ctx-deny-req-traffic-class-unavail	Description: Total number of PDP context request by SRNS denied as requested traffic class unavailable. Type: Gauge.	Int32
srs-ctx-deny-invalid-rab-param-val	Description: Total number of PDP context request by SRNS denied due invalid RAB parameter value. Type: Gauge.	Int32
srs-ctx-deny-req-max-bit-rate-unavail	Description: Total number of PDP context request by SRNS denied as requested maximum bit rate unavailable. Type: Gauge.	Int32
srs-ctx-deny-req-max-bit-rate-dl-unavail	Description: Total number of PDP context request by SRNS denied as requested maximum bit rate for downlink unavailable. Type: Gauge.	Int32
srs-ctx-deny-req-max-bit-rate-ul-unavail	Description: Total number of PDP context request by SRNS denied as requested maximum bit rate for uplink unavailable. Type: Gauge.	Int32
srs-ctx-deny-req-gbr-unavail	Description: Total number of PDP context request by SRNS denied as requested guaranteed bit rate unavailable. Type: Gauge.	Int32
srs-ctx-deny-req-gbr-dl-unavail	Description: Total number of PDP context request by SRNS denied as requested guaranteed bit rate for downlink unavailable. Type: Gauge.	Int32
srs-ctx-deny-req-gbr-ul-unavail	Description: Total number of PDP context request by SRNS denied as requested guaranteed bit rate for uplink unavailable. Type: Gauge.	Int32
srs-ctx-deny-req-trans-delay-not-achieve	Description: Total number of PDP context request by SRNS denied as requested transfer delay is not achievable. Type: Gauge.	Int32
srs-ctx-deny-invalid-rab-param-combo	Total number of PDP context request by SRNS denied as invalid RAB parameter combination. Type: Gauge.	Int32
srs-ctx-deny-violation-for-sdu-param	Description: Total number of PDP context request by SRNS denied as violation for service data unit (SDU) parameters occurred. Type: Gauge.	Int32
srs-ctx-deny-violation-traffic-handlde-prio	Description: Total number of PDP context request by SRNS denied as violation for traffic handling priority occurred. Type: Gauge.	Int32
srs-ctx-deny-violation-for-gbr	Description: Total number of PDP context request by SRNS denied as violation for guaranteed bit rate occurred. Type: Gauge.	Int32

Variables	Description	Data Type
sns-ctx-deny-usr-plane-ver-unsupported	Description: Total number of PDP context request by SRNS denied as user plane version not supported. Type: Gauge.	Int32
sns-ctx-deny-ip-up-failure	Description: Total number of PDP context request by SRNS denied as Iu activation failure occurred. Type: Gauge.	Int32
sns-ctx-deny-reloc-alloc-expiry	Description: Total number of PDP context request by SRNS denied as allocation timer expired for RAB relocation. Type: Gauge.	Int32
sns-ctx-deny-reloc-failure-target-system	Description: Total number of PDP context request by SRNS denied due to relocation failure in target system. Type: Gauge.	Int32
sns-ctx-deny-invalid-rdb-id	Description: Total number of PDP context request by SRNS denied due to invalid RAB id in message. Type: Gauge.	Int32
sns-ctx-deny-no-remaining-rab	Description: Total number of PDP context request by SRNS denied as no RAB available. Type: Gauge.	Int32
sns-ctx-deny-interaction-with-other-proc	Description: Total number of PDP context request by SRNS denied due to interaction with other procedure occurred. Type: Gauge.	Int32
sns-ctx-deny-integrity-check-fail	Description: Total number of PDP context request by SRNS denied as repeated integrity check failed. Type: Gauge.	Int32
sns-ctx-deny-req-type-not-supported	Description: Total number of PDP context request by SRNS denied as request type not supported. Type: Gauge.	Int32
sns-ctx-deny-req-superseded	Description: Total number of PDP context request by SRNS denied as request superseded by new request. Type: Gauge.	Int32
sns-ctx-deny-rel-due-to-ue-sig-con-rel	Description: Total number of PDP context request by SRNS denied as RAB released due to UE generated signaling connection release. Type: Gauge.	Int32
sns-ctx-deny-res-optimization-reloc	Description: Total number of PDP context request by SRNS denied as resource optimization for relocation occurred. Type: Gauge.	Int32
sns-ctx-deny-req-info-unavail	Description: Total number of PDP context request by SRNS denied as requested information unavailable. Type: Gauge.	Int32
sns-ctx-deny-reloc-due-to-radio-reason	Description: Total number of PDP context request by SRNS denied due to radio related errors/causes. Type: Gauge.	Int32

Variables	Description	Data Type
srs-ctx-deny-reloc-unsupport-target-sys	Description: Total number of PDP context request by SRNS denied as relocation not supported in target system. Type: Gauge.	Int32
srs-ctx-deny-directed-retry	Description: Total number of PDP context request by SRNS denied as retries directed by system. Type: Gauge.	Int32
srs-ctx-deny-radio-con-with-ue-lost	Description: Total number of PDP context request by SRNS denied as radio connection with UE lost. Type: Gauge.	Int32
srs-ctx-deny-rnc-unable-to-estab-all-rfcs	Description: Total number of PDP context request by SRNS denied as RNCs unable to establish all radio frequency communications. Type: Gauge.	Int32
srs-ctx-deny-deciphering-keys-unavail	Description: Total number of PDP context request by SRNS denied as deciphering keys not available for procedure. Type: Gauge.	Int32
srs-ctx-deny-dedicated-assist-data-unavail	Description: Total number of PDP context request by SRNS denied as dedicated assistance data not available for procedure. Type: Gauge.	Int32
srs-ctx-deny-reloc-target-not-allowed	Description: Total number of PDP context request by SRNS denied as relocation is not allowed on target system. Type: Gauge.	Int32
srs-ctx-deny-location-reporting-congestion	Description: Total number of PDP context request by SRNS denied as congestion reported in specific location. Type: Gauge.	Int32
srs-ctx-deny-reduce-load-in-serving-cell	Description: Total number of PDP context request by SRNS denied as load reduction occurred in serving cell. Type: Gauge.	Int32
srs-ctx-deny-no-radio-res-avail-target-cell	Description: Total number of PDP context request by SRNS denied as no radio resource available in target cell. Type: Gauge.	Int32
srs-ctx-deny-geran-iu-mode-failure	Description: Total number of PDP context request by SRNS denied due to failure in Iu mode in GERAN. Type: Gauge.	Int32
srs-ctx-deny-access-restrict-shared-nwtk	Description: Total number of PDP context request by SRNS denied as access restricted in shared network. Type: Gauge.	Int32
srs-ctx-deny-in-reloc-nwt-support-puesbine	Description: Total number of PDP context request by SRNS denied as incoming relocation request is not supported in network due to Provision of UE Specific Behavior Information to Network Entities (PUESBINE) feature. Type: Gauge.	Int32
srs-ctx-deny-traffic-target-more-src-cell	Description: Total number of PDP context request by SRNS denied as traffic in target cell is higher than the source cell. Type: Gauge.	Int32

Common Syntax Options

Variables	Description	Data Type
sns-ctx-deny-mbms-no-multicat-svc-for-ue	Description: Total number of SRNS context request for Multimedia Broadcast/Multicast Service (MBMS) feature denied as multicast service is not supported by user equipment. Type: Gauge.	Int32
sns-ctx-deny-mbms-unknown-ue-id	Description: Total number of SRNS context request for MBMS feature denied due to user equipment identification is unknown. Type: Gauge.	Int32
sns-ctx-deny-mbms-sess-start-no-data-bearer	Description: Total number of SRNS context request for MBMS feature denied as session start without any necessary data bearer. Type: Gauge.	Int32
sns-ctx-deny-mbms-superseed-nnsf	Description: Total number of SRNS context request for MBMS feature denied as request superseded due to NAS node selection function (NNSF). Type: Gauge.	Int32
sns-ctx-deny-mbms-ue-linking-already-done	Description: Total number of SRNS context request for MBMS feature denied as user equipment is already linked. Type: Gauge.	Int32
sns-ctx-deny-mbms-ue-delinking-failure	Description: Total number of SRNS context request for MBMS feature denied as user equipment delinking failed due to any reason. Type: Gauge.	Int32
sns-ctx-deny-tmgi-unknown	Description: Total number of SRNS context request denied as temporary mobile group identifier is unknown. Type: Gauge.	Int32
sns-ctx-deny-ms-unspecified-failure	Description: Total number of SRNS context request denied due to unspecified failure at MS. Type: Gauge.	Int32
sns-ctx-deny-no-response-from-rnc	Description: Total number of SRNS context request denied due to no response from RNC. Type: Gauge.	Int32
map-open-req-tx	Description: Total number of mobile application part (MAP) open requests sent. Availability: per MAP service Type: Gauge.	Int32
map-open-req-rx	Description: Total number of mobile application part (MAP) open requests received. Availability: per MAP service Type: Gauge.	Int32
map-open-rsp-tx	Description: Total number of MAP open response sent. Availability: per MAP service Type: Gauge.	Int32
map-open-rsp-rx	Description: Total number of MAP open response received. Availability: per MAP service Type: Gauge.	Int32
map-close-tx	Description: Total number of MAP close response sent. Availability: per MAP service Type: Gauge.	Int32

Variables	Description	Data Type
map-close-rx	Description: Total number of MAP close response received. Availability: per MAP service Type: Gauge.	Int32
map-abort-tx	Description: Total number of MAP abort request sent. Availability: per MAP service Type: Gauge.	Int32
map-abort-rx	Description: Total number of MAP abort request received. Availability: per MAP service Type: Gauge.	Int32
map-auth-req-tx	Description: Total number of Send Authentication Request messages transmitted to HLR. Triggers: Counter increments when a MAP Send Authentication Request is initiated from SGSN. Availability: per MAP service Type: Gauge.	Int32
map-auth-succes	Description: Total number of MAP authentication successful. Availability: per MAP service Type: Gauge.	Int32
map-auth-fail	Description: Total number of User Error / Provider Error received in response to SAI request. Triggers: Counter increments when User Error / Provider Error is received from HLR. Availability: per MAP service Type: Gauge.	Int32
map-auth-timeouts-rcvd	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments when there is no response from the HLR for map-auth-fail-rep-req-tx message initiated from SGSN. Availability: per MAP service Type: Gauge.	Int32
map-imei-req-tx	Description: Total number of MAP Check IMEI requests initiated towards EIR. Triggers: Counter increments when MAP CHECK IMEI Request is sent. Availability: per MAP service Type: Gauge.	Int32
map-imei-succes	Description: Total number of successful responses for MAP Check IMEI requests. Triggers: Counter increments when MAP CHECK IMEI Request is sent. Availability: per MAP service Type: Gauge.	Int32
map-imei-fail	Description: Total number of failure responses for MAP Check IMEI requests received from EIR. Triggers: Counter increments when MAP Return Error / Provider Error is received in response. Availability: per MAP service Type: Gauge.	Int32
map-imei-timeout	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments when there is no response from HLR. Availability: per MAP service Type: Gauge.	Int32

Variables	Description	Data Type
map-gprs-update-loc-req-tx	Description: Total number of UGL (GPRS Update Location) request initiated towards HLR. Triggers: Counter increments when UGL request is sent to HLR. Availability: per MAP service Type: Gauge.	Int32
map-gprs-update-loc-rsp-tx	Description: Total number of successful response messages sent in response to UGL request. Triggers: Counter increments when successful response is received from the HLR. Availability: per MAP service Type: Gauge.	Int32
map-gprs-update-loc-err-tx	Description: Total number of Failure response (User Error/Provider Error) messages received in response to UGL request. Triggers: Counter increments when MAP Return Error / Provider Error is received to UGL request. Availability: per MAP service Type: Gauge.	Int32
map-gprs-update-loc-timeouts-rx	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments if there is no response from HLR. Availability: per MAP service Type: Gauge.	Int32
map-cancel-loc-req-rx	Description: Total number of Cancel Location Request received from HLR. Triggers: Counter increments when MAP Cancel Location Request is received. Availability: per MAP service Type: Gauge.	Int32
map-cancel-loc-rsp-tx	Description: Total number of successful Cancel Location Response messages sent to HLR. Triggers: Counter increments when successful response is sent to HLR. Availability: per MAP service Type: Gauge.	Int32
map-cancel-loc-err-tx	Description: Total number of Error response messages sent to HLR. Triggers: Counter increments when MAP Return Error is sent to HLR. Availability: per MAP service Type: Gauge.	Int32
map-del-subscription-req-rx	Description: Total number of Delete Subscription Data Request received from HLR. Triggers: Counter increments when MAP Delete Subscription Data (DSD) message is received. Availability: per MAP service Type: Gauge.	Int32
map-del-subscription-rsp-tx	Description: Total number of successful responses for Delete Subscription Data request sent to HLR. Triggers: Counter increments when MAP Delete Subscription Data (DSD) message is received. Availability: per MAP service Type: Gauge.	Int32
map-del-subscription-ret-tx	Description: Total number of Error responses sent for Delete Subscription Data (DSD) request received. Triggers: Counter increments when failure response is sent to HLR. Availability: per MAP service Type: Gauge.	Int32

Variables	Description	Data Type
map-insert-sub-rcvd	Description: Total number of insert subscriber data requests received by MAP. Availability: per MAP service Type: Gauge.	Int32
map-standalone-isd-rcvd	Description: Total number of standalone insert subscriber data requests received by MAP. Availability: per MAP service Type: Gauge.	Int32
map-isd-rsp-tx	Description: Total number of insert subscriber data requests sent by MAP. Availability: per MAP service Type: Gauge.	Int32
map-isd-err-tx	Description: Total number of insert subscriber data failure response sent by MAP. Availability: per MAP service Type: Gauge.	Int32
map-auth-fail-rept-req-tx	Description: Total number of Authentication Failure Report Request messages transmitted by MAP. Triggers: Counter increments when a message is initiated to inform HLR that certain vectors had problem in authenticating with the MS. Availability: per MAP service Type: Gauge.	Int32
map-auth-fail-rept-rsp-rx	Description: Total number of Authentication Failure Report Request messages received by MAP. Triggers: Counter increments when successful response is received in response to map-auth-fail-rep-req-tx. Availability: per MAP service Type: Gauge.	Int32
map-auth-fail-rept-err-rx	Description: Total number of User Error and Provider Error received for the Authentication Failure Report Request sent to HLR. Triggers: Counter increments when MAP Return Error/Provider Error is received in response to map-auth-fail-rep-req-tx message. There will be no effect on the call due to this. Availability: per MAP service Type: Gauge.	Int32
map-auth-fail-rept-timeouts-rcvd	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments when MAP Return Error / Provider Error is received in response to map-auth-fail-rep-req-tx. There will be no effect on the call due to this. Availability: per MAP service Type: Gauge.	Int32
map-purge-req-tx	Description: Total number of MAP Purge Request messages initiated towards HLR. Triggers: Counter increments when MAP Purge Request is transmitted. Availability: per MAP service Type: Gauge.	Int32
map-purge-success	Description: Total number of successful MAP Purge Request messages sent to HLR. Triggers: Counter increments when successful response is received from HLR. Availability: per MAP service Type: Gauge.	Int32

Variables	Description	Data Type
map-purge-fail	Description: Total number of Failure response received from HLR. Triggers: Counter increments when MAP Return Error / Provider Error is received in response. Availability: per MAP service Type: Gauge.	Int32
map-purge-timeouts-rcvd	Description: Total number of timeouts that occurred while waiting for response from HLR. Triggers: Counter increments when there is no response from HLR. Availability: per MAP service Type: Gauge.	Int32
map-hlr-reset-rcvd	Description: Total number of HLR reset indicator received by MAP. Availability: per MAP service Type: Gauge.	Int32
map-mo-fwd-req-sent	Description: Total number of mobile originated forward request messages sent to MAP. Availability: per MAP service Type: Gauge.	Int32
map-mo-fwd-rsp-rcvd	Description: Total number of mobile originated forward response messages received from MAP. Availability: per MAP service Type: Gauge.	Int32
map-mo-fwd-rsp-failed	Description: Total number of mobile originated forward response messages failed at MAP. Availability: per MAP service Type: Gauge.	Int32
map-mo-fwd-rsp-time-out	Description: Total number of mobile originated forward response messages timed-out at MAP. Availability: per MAP service Type: Gauge.	Int32
map-mt-fwd-req-sent	Description: Total number of mobile terminated forward request messages sent to MAP. Availability: per MAP service Type: Gauge.	Int32
map-mt-fwd-rsp-rcvd	Description: Total number of mobile terminated forward request messages received from MAP. Availability: per MAP service Type: Gauge.	Int32
map-mt-fwd-rsp-failed	Description: Total number of mobile terminated forward response messages failed at MAP. Availability: per MAP service Type: Gauge.	Int32
map-ready-for-sm-req	Description: Total number of MAP ready for session management request received. Availability: per MAP service Type: Gauge.	Int32
map-ready-for-sm-rsp	Description: Total number of MAP ready for session management request response received. Availability: per MAP service Type: Gauge.	Int32
map-ready-for-sm-rsp-failed	Description: Total number of MAP ready for session management requests failed. Availability: per MAP service Type: Gauge.	Int32

Variables	Description	Data Type
map-ready-for-sm-rsp-time-out	Description: Total number of MAP ready for session management requests timed-out. Availability: per MAP service Type: Gauge.	Int32
tcap-total-active-trans	Description: Total number of active transaction capabilities application part (TCAP) Dialogs in the system. Triggers: Counter increments when a new TCAP Dialog is created. Type: Gauge	Int32
tcap-total-active-invoks	Description: Total number of active transactions invoked by TCAP. Type: Gauge	Int32
tcap-total-msg-drops	Description: Total number of TCAP message drops. Type: Gauge.	Int32
tcap-total-msg-rcvd	Description: Total number of TCAP message received. Type: Gauge.	Int32
tcap-total-msg-sent	Description: Total number of TCAP message sent. Type: Gauge.	Int32
tcap-uni-dir-msg-rcvd	Description: Total number of TCAP unidirectional messages received. Type: Gauge.	Int32
tcap-uni-dir-msg-sent	Description: Total number of TCAP unidirectional messages sent. Type: Gauge.	Int32
tcap-begin-msg-rcvd	Description: Total number of messages received for TCAP begin state. Type: Gauge.	Int32
tcap-begin-msg-sent	Description: Total number of messages sent for TCAP begin state. Type: Gauge.	Int32
tcap-continue-msg-rcvd	Description: Total number of messages received for TCAP continue state. Type: Gauge.	Int32
tcap-continue-msg-sent	Description: Total number of messages sent for TCAP continue state. Type: Gauge.	Int32
tcap-end-msg-rcvd	Description: Total number of messages received for TCAP end state. Type: Gauge.	Int32
tcap-end-msg-sent	Description: Total number of messages sent for TCAP end state. Type: Gauge.	Int32
tcap-total-abort-rcvd	Description: Total number of messages received for TCAP abort state. Type: Gauge.	Int32
tcap-total-abort-sent	Description: Total number of messages sent for TCAP abort state. Type: Gauge.	Int32
tcap-total-comp-rx	Description: Total number of TCAP components received. Type: Gauge.	Int32
tcap-total-comp-tx	Description: Total number of TCAP components sent. Type: Gauge.	Int32

Variables	Description	Data Type
tcap-total-comp- invoke-rx	Description: Total number of invoke messages for TCAP component received. Type: Gauge.	Int32
tcap-total-comp- invoke-tx	Description: Total number of invoke messages for TCAP component sent. Type: Gauge.	Int32
tcap-comp- retresult-rx	Description: Total number of return result messages for TCAP component received. Type: Gauge.	Int32
tcap-comp- retresult-tx	Description: Total number of return result messages for TCAP component sent. Type: Gauge.	Int32
tcap-comp-reterr-rx	Description: Total number of return error messages for TCAP component received. Type: Gauge.	Int32
tcap-comp-reterr-tx	Description: Total number of return error messages for TCAP component sent. Type: Gauge.	Int32
tcap-comp-retrej-rx	Description: Total number of return reject messages for TCAP component received. Type: Gauge.	Int32
tcap-comp-retrej-tx	Description: Total number of return reject messages for TCAP component sent. Type: Gauge.	Int32
tcap-tran-unrec- msgtype-rx	Description: Total number of protocol errors in transaction portion (P-ABORT) with unrecognized message type for TCAP received. Type: Gauge.	Int32
tcap-tran-unrec- msgtype-tx	Description: Total number of protocol errors in transaction portion with unrecognized message type for TCAP sent. Type: Gauge.	Int32
tcap-tran-incorrect- rx	Description: Total number of protocol errors in transaction portion with incorrect information for TCAP received. Type: Gauge.	Int32
tcap-tran-incorrect- tx	Description: Total number of protocol errors in transaction portion with incorrect information for TCAP sent. Type: Gauge.	Int32
tcap-tran- badformed-rx	Description: Total number of protocol errors in transaction portion with badly formatted transaction portion for TCAP received. Type: Gauge.	Int32
tcap-tran- badformed-tx	Description: Total number of protocol errors in transaction portion with badly formatted transaction portion for TCAP sent. Type: Gauge.	Int32
tcap-tran- unrecognised-rx	Description: Total number of protocol errors in transaction portion with unrecognized transaction portion for TCAP received. Type: Gauge.	Int32
tcap-tran- unrecognised-tx	Description: Total number of protocol errors in transaction portion with unrecognized transaction portion for TCAP sent. Type: Gauge.	Int32

Variables	Description	Data Type
tcap-tran-resource-limit-rx	Description: Total number of protocol errors in transaction portion with resource limit message for TCAP received. Type: Gauge.	Int32
tcap-tran-resource-limit-tx	Description: Total number of protocol errors in transaction portion with resource limit message for TCAP sent. Type: Gauge.	Int32
tcap-comp-unrecognised-rx	Description: Total number of errors in component portion with unrecognized information for TCAP received. Type: Gauge.	Int32
tcap-comp-unrecognised-tx	Description: Total number of errors in component portion with unrecognized information for TCAP sent. Type: Gauge.	Int32
tcap-comp-incorrect-rx	Description: Total number of errors in component portion with incorrect information for TCAP received. Type: Gauge.	Int32
tcap-comp-incorrect-tx	Description: Total number of errors in component portion with incorrect information for TCAP sent. Type: Gauge.	Int32
tcap-comp-badformed-rx	Description: Total number of errors in component portion with badly formed information for TCAP received. Type: Gauge.	Int32
tcap-comp-badformed-tx	Description: Total number of errors in component portion with badly formed information for TCAP sent. Type: Gauge.	Int32
tcap-comp-unrec-linkid-rx	Description: Total number of errors in component portion with unrecognized link id for TCAP received. Type: Gauge.	Int32
tcap-comp-unrec-linkid-tx	Description: Total number of errors in component portion with unrecognized link id for TCAP sent. Type: Gauge.	Int32
tcap-comp-unrec-invid-res-rx	Description: Total number of errors in component portion with unrecognized invoke id (return result) for TCAP received. Type: Gauge.	Int32
tcap-comp-unrec-invid-res-tx	Description: Total number of errors in component portion with unrecognized invoke id (return result) for TCAP sent. Type: Gauge.	Int32
tcap-comp-unexp-res-rx	Description: Total number of errors in component portion with unexpected return result for TCAP received. Type: Gauge.	Int32
tcap-comp-unexp-res-tx	Description: Total number of errors in component portion with unexpected return result for TCAP sent. Type: Gauge.	Int32

Variables	Description	Data Type
tcap-comp-unrec-invid-err-rx	Description: Total number of errors in component portion with unrecognized invoke id (return error) for TCAP received. Type: Gauge.	Int32
tcap-comp-unrec-invid-err-tx	Description: Total number of errors in component portion with unrecognized invoke id (return error) for TCAP sent. Type: Gauge.	Int32
tcap-comp-unexp-err-rx	Description: Total number of errors in component portion with unexpected return error for TCAP received. Type: Gauge.	Int32
tcap-comp-unexp-err-tx	Description: Total number of errors in component portion with unexpected return error for TCAP sent. Type: Gauge.	Int32
tcap-user-duplicate-invid-rx	Description: Total number of user generated errors of duplicate invoke id for TCAP received. Type: Gauge.	Int32
tcap-user-duplicate-invid-tx	Description: Total number of user generated errors of duplicate invoke id for TCAP sent. Type: Gauge.	Int32
tcap-user-unrec-opcode-rx	Description: Total number of user generated errors of unrecognized operation code for TCAP received. Type: Gauge.	Int32
tcap-user-unrec-opcode-tx	Description: Total number of user generated errors of unrecognized operation code for TCAP sent. Type: Gauge.	Int32
tcap-user-incorr-params-rx	Description: Total number of user generated errors of incorrect invoke parameter for TCAP received. Type: Gauge.	Int32
tcap-user-incorr-params-tx	Description: Total number of user generated errors of incorrect invoke parameter for TCAP sent. Type: Gauge.	Int32
tcap-user-resourcelimit-rx	Description: Total number of user generated errors of resource limit invoke error for TCAP received. Type: Gauge.	Int32
tcap-user-resourcelimit-tx	Description: Total number of user generated errors of resource limit invoke error for TCAP sent. Type: Gauge.	Int32
tcap-user-initiate-release-rx	Description: Total number of user generated errors of release initiated invoke error for TCAP received. Type: Gauge.	Int32
tcap-user-initiate-release-tx	Description: Total number of user generated errors of release initiated invoke error for TCAP sent. Type: Gauge.	Int32
tcap-user-unexp-linked-resp-rx	Description: Total number of user generated errors of unexpected linked response error for TCAP received. Type: Gauge.	Int32

Variables	Description	Data Type
tcap-user-unexp-linked-resp-tx	Description: Total number of user generated errors of unexpected linked response error for TCAP sent. Type: Gauge.	Int32
tcap-user-unexp-linked-oper-rx	Description: Total number of user generated errors of unexpected linked operation error for TCAP received. Type: Gauge.	Int32
tcap-user-unexp-linked-oper-tx	Description: Total number of user generated errors of unexpected linked operation error for TCAP sent. Type: Gauge.	Int32
tcap-user-res-incorr-params-rx	Description: Total number of user generated errors of result code with incorrect parameter for TCAP received. Type: Gauge.	Int32
tcap-user-res-incorr-params-tx	Description: Total number of user generated errors of result code with incorrect parameter for TCAP sent. Type: Gauge.	Int32
tcap-user-res-unrec-errcode-rx	Description: Total number of user generated errors of result code with unrecognized error code for TCAP received. Type: Gauge.	Int32
tcap-user-res-unrec-errcode-tx	Description: Total number of user generated errors of result code with unrecognized error code for TCAP sent. Type: Gauge.	Int32
tcap-user-res-unexp-errcode-rx	Description: Total number of user generated errors of result code with unexpected error code for TCAP received. Type: Gauge.	Int32
tcap-user-res-unexp-errcode-tx	Description: Total number of user generated errors of result code with unexpected error code for TCAP sent. Type: Gauge.	Int32
tcap-user-err-incorr-params-rx	Description: Total number of user generated errors of error code with incorrect parameter for TCAP received. Type: Gauge.	Int32
tcap-user-err-incorr-params-tx	Description: Total number of user generated errors of error code with incorrect parameter for TCAP sent. Type: Gauge.	Int32
mo-sms-in-progress	Description: Total number of mobile originated SMS that are waiting in the SGSN to be delivered. Type: Gauge.	Int32
mt-sms-in-progress	Description: Total number of mobile terminated (MT) SMS in progress. Type: Gauge.	Int32

Variables	Description	Data Type
mt-sms-in-queue	Description: New gauge in release 9.0: Total number of mobile terminated SMS in the queue. Triggers: If there is already an MT-SMS transaction in progress, then the gauge increments when any new messages are received and queued. Availability: per MAP service Type: Gauge	Int32
sms-memory-available-in-progress	Description: Total number of procedures for retrieval of available SMS memory in progress. Type: Gauge.	Int32
mo-sms-attempted	Description: Total number of mobile originated SMSs attempted. Type: Counter	Int32
mo-sms-successful	Description: Total number of mobile originated SMSs successful. Type: Counter	Int32
mt-sms-attempted	Description: Total number of mobile terminated SMSs attempted. Type: Counter	Int32
mt-sms-successful	Description: Total number of mobile terminated SMSs successful. Type: Counter	Int32
sms-memory-available-attempted	Description: Total number of procedures for retrieval of available SMS memory attempted. Type: Counter	Int32
sms-memory-available-successful	Description: Total number of procedures for retrieval of available SMS memory successful. Type: Counter	Int32
conn-prot-data-tx	Description: Total number of protocol data units sent during connection setup. Type: Counter	Int32
conn-prot-data-rx	Description: Total number of protocol data units received during connection setup. Type: Counter	Int32
conn-prot-ack-tx	Description: Total number of Ack messages sent during connection setup. Type: Counter	Int32
conn-prot-ack-rx	Description: Total number of Ack messages received during connection setup. Type: Counter	Int32
conn-prot-error-tx	Description: Total number of protocol errors during connection setup in Tx message. Type: Counter	Int32
conn-prot-error-rx	Description: Total number of protocol errors during connection setup n Rx message. Type: Counter	Int32
conn-prot-error-nwt-fail-tx	Description: Total number of protocol errors during connection setup due to network failure in Tx message. Type: Counter	Int32
conn-prot-error-nwt-fail-rx	Description: Total number of protocol errors during connection setup due to network failure in Rx message. Type: Counter	Int32

Variables	Description	Data Type
conn-prot-error-congestion-tx	Description: Total number of protocol errors during connection setup due to congestion in Tx message. Type: Counter	Int32
conn-prot-error-congestion-rx	Description: Total number of protocol errors during connection setup due to congestion in Rx message. Type: Counter	Int32
conn-prot-error-invalid-tid-tx	Description: Total number of protocol errors during connection setup due to invalid transaction id (TID) in Tx message. Type: Counter	Int32
conn-prot-error-invalid-tid-rx	Description: Total number of protocol errors during connection setup due to invalid transaction id (TID) in Rx message. Type: Counter	Int32
conn-prot-error-invalid-semantic-tx	Description: Total number of protocol errors during connection setup due to invalid semantics in Tx message. Type: Counter	Int32
conn-prot-error-invalid-semantic-rx	Description: Total number of protocol errors during connection setup due to invalid semantics in Rx message. Type: Counter	Int32
conn-prot-error-invalid-mand-info-tx	Description: Total number of protocol errors during connection setup as mandatory information in Tx message is invalid. Type: Counter	Int32
conn-prot-error-invalid-mand-info-rx	Description: Total number of protocol errors during connection setup as mandatory information in Rx message is invalid. Type: Counter	Int32
conn-prot-error-invalid-msg-type-tx	Description: Total number of protocol errors during connection setup due to invalid Tx message type. Type: Counter	Int32
conn-prot-error-invalid-msg-type-rx	Description: Total number of protocol errors during connection setup due to invalid Tx message type. Type: Counter	Int32
conn-prot-error-invalid-prot-state-tx	Description: Total number of protocol errors during connection setup as protocol state in Tx message is invalid. Type: Counter	Int32
conn-prot-error-invalid-prot-state-rx	Description: Total number of protocol errors during connection setup as protocol state in Rx message is invalid. Type: Counter	Int32
conn-prot-error-invalid-ie-tx	Description: Total number of protocol errors during connection setup as information element in Tx message is invalid. Type: Counter	Int32
conn-prot-error-invalid-ie-rx	Description: Total number of protocol errors during connection setup as information element in Rx message is invalid. Type: Counter	Int32

Variables	Description	Data Type
conn-prot-error-protocol-error-tx	Description: Total number of protocol errors during connection setup as protocol error in Tx message. Type: Counter	Int32
conn-prot-error-protocol-error-rx	Description: Total number of protocol errors during connection setup as protocol error in Rx message. Type: Counter	Int32
conn-prot-error-undefined-cause-tx	Description: Total number of protocol errors during connection setup due to unspecified error in Tx message. Type: Counter	Int32
conn-prot-error-undefined-cause-rx	Description: Total number of protocol errors during connection setup due to unspecified error in Rx message. Type: Counter	Int32
conn-prot-data-dropped	Description: Total number of data packets dropped during connection setup. Type: Counter	Int32
conn-prot-ack-dropped	Description: Total number of Ack message dropped during connection setup. Type: Counter	Int32
conn-prot-error-dropped	Description: Total number of data packets dropped during connection setup due to error in connection. Type: Counter	Int32
conn-prot-inval-tid-rcvd	Description: Total number of message dropped during connection setup due to invalid transaction id (TID) received. Type: Counter	Int32
relay-prot-data-tx	Description: Total number of protocol data units sent during message relay. Type: Counter	Int32
relay-prot-data-rx	Description: Total number of protocol data units received during message relay. Type: Counter	Int32
relay-prot-ack-tx	Description: Total number of Ack messages sent during message relay. Type: Counter	Int32
relay-prot-ack-rx	Description: Total number of Ack messages received during message relay. Type: Counter	Int32
relay-prot-err-tx	Description: Total number of protocol errors during message relay in Tx message. Type: Counter	Int32
relay-prot-err-rx	Description: Total number of protocol errors during message relay in Rx message. Type: Counter	Int32
relay-prot-err-unassigned-num	Description: Total number of protocol errors during message relay due to unassigned protocol number. Type: Counter	Int32
relay-prot-err-opr-determ-barring	Description: Total number of protocol errors during message relay due to operator determined barring. Type: Counter	Int32

Variables	Description	Data Type
relay-prot-err-call-barred	Description: Total number of protocol errors during message relay due to call barring. Type: Counter	Int32
relay-prot-err-reserved	Description: Total number of protocol errors during message relay due to reserved resources. Type: Counter	Int32
relay-prot-err-sm-transfer-rej	Description: Total number of protocol errors during message relay due to session manager transfer rejection. Type: Counter	Int32
relay-prot-err-dest-out-of-order	Description: Total number of protocol errors during message relay due to out of order on destination. Type: Counter	Int32
relay-prot-err-unidentified-sub	Description: Total number of protocol errors during message relay due to unidentified subscriber. Type: Counter	Int32
relay-prot-err-facility-rej	Description: Total number of protocol errors during message relay due facility rejection. Type: Counter	Int32
relay-prot-err-unknown-sub	Description: Total number of protocol errors during message relay due to unknown subscriber. Type: Counter	Int32
relay-prot-err-netwk-out-of-order	Description: Total number of protocol errors during message relay as network in out-of-order. Type: Counter	Int32
relay-prot-err-temp-fail	Description: Total number of protocol errors during message relay due to temporary failure in network. Type: Counter	Int32
relay-prot-err-congestion	Description: Total number of protocol errors during message relay due to congestion in network. Type: Counter	Int32
relay-prot-err-not-subscribed	Description: Total number of protocol errors during message relay as this service is not subscribed by subscriber. Type: Counter	Int32
relay-prot-err-not-implemented	Description: Total number of protocol errors during message relay as this service is not yet implemented. Type: Counter	Int32
relay-prot-err-interworking-err	Description: Total number of protocol errors during message relay due to interworking error between two network or technology. Type: Counter	Int32
relay-prot-err-res-unavail	Description: Total number of protocol errors during message relay as resources are not available. Type: Counter	Int32
relay-prot-err-mem-capacity-exceed	Description: Total number of protocol errors during message relay as capacity exceeded. Type: Counter	Int32
relay-prot-err-inval-ref-num-tx	Description: Total number of protocol errors during message relay as invalid reference in Tx message. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
relay-prot-err-ival-ref-num-rx	Description: Total number of protocol errors during message relay as invalid reference in Rx message. Type: Counter	Int32
relay-prot-err-ival-semantic-tx	Description: Total number of protocol errors during message relay due to invalid semantics in Tx message. Type: Counter	Int32
relay-prot-err-ival-semantic-rx	Description: Total number of protocol errors during message relay due to invalid semantics in Rx message. Type: Counter	Int32
relay-prot-err-ival-mand-info-tx	Description: Total number of protocol errors during message relay as mandatory information in Tx message is invalid. Type: Counter	Int32
relay-prot-err-ival-mand-info-rx	Description: Total number of protocol errors during message relay as mandatory information in Rx message is invalid. Type: Counter	Int32
relay-prot-err-ival-msg-type-tx	Description: Total number of protocol errors during message relay due to invalid Tx message type. Type: Counter	Int32
relay-prot-err-ival-msg-type-rx	Description: Total number of protocol errors during message relay due to invalid Tx message type. Type: Counter	Int32
relay-prot-err-ival-prot-state-tx	Description: Total number of protocol errors during message relay as protocol state in Tx message is invalid. Type: Counter	Int32
relay-prot-err-ival-prot-state-rx	Description: Total number of protocol errors during message relay as protocol state in Rx message is invalid. Type: Counter	Int32
relay-prot-err-ival-ie-tx	Description: Total number of protocol errors during message relay as information element in Tx message is invalid. Type: Counter	Int32
relay-prot-err-ival-ie-rx	Description: Total number of protocol errors during message relay as the information element in Rx message is invalid. Type: Counter	Int32
relay-prot-err-protocol-error-rx	Description: Total number of RP ERROR messages sent with the cause Protocol Error in the message header. Triggers: Counter increments when receiving an RP ERROR, with cause Protocol Error, from the MS/SMSC. Availability: per MAP service Type: Counter	Int32
relay-prot-err-protocol-error-tx	Description: Total number of protocol errors during message relay when there are protocol errors in the transmitted message. Type: Counter	Int32

Variables	Description	Data Type
relay-prot-err-unidentified-error-tx	Description: Total number of protocol errors during message relay due to unspecified error in Tx message. Type: Counter	Int32
relay-prot-err-unidentified-error-rx	Description: Total number of protocol errors during message relay due to unspecified error in Rx message. Type: Counter	Int32
relay-prot-smma-rx	Description: Counter new in release 9.0: Total number RP SMMA messages received. Triggers: Counter increments when the SGSN receives an RP SMMA message from the MS/UE. Availability: per MAP service Type: Counter	Int32
relay-prot-data-dropped	Description: Total number of data packets dropped during message relay. Type: Counter	Int32
relay-prot-ack-dropped	Description: Total number of Ack message dropped during message relay. Type: Counter	Int32
relay-prot-error-dropped	Description: Total number of data packets dropped during message relay due to error in connection. Type: Counter	Int32
relay-prot-decode-failure	Description: Total number of message dropped during message relay due to invalid transaction id (TID) received. Type: Counter	Int32
concat-mo-sms	Description: Total number of concatenated mobile originated SMSs. Type: Counter	Int32
conn-prot-timer-expiry	Description: Total number of events when timer expired during connection setup. Type: Counter	Int32
tr1n-timer-expiry	Description: Total number of events when TR1N timer expired during mobile terminated SMS is in wait state for RP-ACK. Type: Counter	Int32
tr2n-timer-expiry	Description: Total number of events when TR2N timer expired during mobile terminated SMS is in wait state to send RP-ACK. Type: Counter	Int32
conn-prot-data-retrans	Description: Total number of protocol data units retransmitted during connection setup. Type: Counter	Int32
relay-prot-msg-encode-fail	Description: Total number of message encoding failed during message relay. Type: Counter	Int32
conn-prot-data-tx-fail	Description: Total number of protocol data units Tx messages failed during connection setup. Type: Counter	Int32
conn-prot-data-inval-tid	Description: Total number of protocol data units with invalid transaction id (ID) during connection setup. Type: Counter	Int32

Variables	Description	Data Type
conn-prot-max-retrans-reached	Description: Total number of events when retransmission limit exhausted during connection setup. Type: Counter	Int32
mt-fail-no-db-rec	Description: Total number of mobile terminated messages failed as not database record available. Type: Counter	Int32
mt-fail-conn-prot-data-no-ack-rcvd	Description: Total number of mobile terminated messages failed as no acknowledgement received during connection setup. Type: Counter	Int32
mt-fail-fwd-busy-subs	Description: Total mobile terminated messages failed due to busy subscriber. Type: Counter	Int32
mt-fail-fwd-detached-subs	Description: Total mobile terminated messages failed due to detached subscriber. Type: Counter	Int32
mt-fail-mt-queue-full	Description: Total mobile terminated messages failed as messaged queue was full. Type: Counter	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 62

SGTP Schema Statistics

The SGTP schema provides operational statistics that can be used for monitoring and troubleshooting the following products: SGSN

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

IMPORTANT: Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 62. Bulk Statistic Variables in the SGTP Schema

Variables	Description	Data Type
vpn-id	Identifier for the VPN context in which this SGTP service is running. This is a key variable.	Int32

Common Syntax Options

Variables	Description	Data Type
vpn-name	Name of the VPN context in which this SGTP service is running. This is a key variable.	String
service-name	Name of the SGTP service for which this bulk statistics are collected. This is a key variable.	String
iups-service	Name of the corresponding Iu-PS interface service for this SGTP service. This is a key variable.	String
rnc-address	Address of the corresponding radio network controller (RNC) for this SGTP service. This is a key variable.	String
ggsn-address	This statistic is obsoleted.	
sgtpc-total-cpc-req	Total GTP-C messages for create PDP context requests received.	Int32
sgtpc-cpc-req-v1-pri	Total GTP-Cv1 messages for create primary PDP context requests received.	Int32
sgtpc-cpc-req-v0-pri	Total GTP-Cv0 messages for create primary PDP context requests received.	Int32
sgtpc-cpc-req-sec	Total GTP-C (v1 and v0) messages for create secondary PDP context requests received.	Int32
sgtpc-cpc-req-accept	Total GTP-C (v1 and v0) messages for create PDP context requests accepted.	Int32
sgtpc-cpc-req-denied	Total GTP-C (v1 and v0) messages for create PDP context requests denied.	Int32
sgtpc-cpc-rsp-v1-pri	Total GTP-Cv1 messages response sent for create primary PDP context requests.	Int32
sgtpc-cpc-rsp-v0-pri	Total GTP-Cv0 messages response sent for create primary PDP context requests.	Int32
sgtpc-cpc-rsp-sec	Total GTP (v1 and v0) message response for create secondary PDP context requests sent.	Int32
sgtpc-total-upc-req	Total GTP-C (v1 and v0) messages for update PDP context requests received.	Int32
sgtpc-upc-req-v1-tx	Total GTP-Cv1 message response for update PDP context requests sent.	Int32
sgtpc-upc-req-v0-tx	Total GTP-Cv0 message response for update PDP context requests sent.	Int32
sgtpc-upc-req-v1-rx	Total GTP-Cv1 messages for update PDP context requests received.	Int32
sgtpc-upc-req-v0-rx	This statistic has been obsoleted.	
sgtpc-upc-req-accept-tx	Total GTP-C update PDP context request accept messages sent.	Int32
sgtpc-upc-req-accept-rx	Total GTP-C update PDP context request accept messages received.	Int32
sgtpc-upc-req-accept-v1-tx	Total GTP-C v1 update PDP context requests accept messages sent.	Int32
sgtpc-upc-req-accept-v1-rx	Total GTP-Cv1 message response for update PDP context requests received.	Int32
sgtpc-upc-req-accept-v0-rx	Total GTP-C v0 update PDP context requests accept messages received.	Int32
sgtpc-upc-req-denied-tx	Total GTP-C (v1 and v0) update PDP context requests denied messages sent.	Int32

Variables	Description	Data Type
sgtpc-upc-req-denied-rx	Total GTP-C (v1 and v0) update PDP context requests denied messages received.	Int32
sgtpc-total-dpc-req	Total GTP-C (v1 and v0) messages for delete PDP context requests received.	Int32
sgtpc-dpc-req-v1-tx	Total GTP-Cv1 message response for delete PDP context requests sent.	Int32
sgtpc-dpc-req-v0-tx	Total GTP-Cv0 message response for delete PDP context requests sent.	Int32
sgtpc-dpc-req-v1-rx	Total GTP-Cv1 messages for update PDP delete requests received.	Int32
sgtpc-dpc-req-v0-rx	Total GTP-Cv0 message response for delete PDP context requests received.	Int32
sgtpc-dpc-req-accept-tx	Total GTP-C delete PDP context request accept messages sent.	Int32
sgtpc-dpc-req-accept-rx	Total GTP-C delete PDP context request accept messages received.	Int32
sgtpc-dpc-req-accept-v1-tx	Total GTP-Cv1 delete PDP context requests accept messages sent.	Int32
sgtpc-dpc-req-accept-v0-tx	Total GTP-Cv0 delete PDP context requests accept messages received.	Int32
sgtpc-dpc-req-accept-v1-rx	Total GTP-Cv1 delete PDP context requests accept messages received.	Int32
sgtpc-dpc-req-accept-v0-rx	Total GTP-Cv0 delete PDP context requests accept messages received.	sgtpc-dpc-req-accept-v1-rx
sgtpc-dpc-req-denied-tx	Total GTP-C (v1 and v0) delete PDP context requests denied messages sent.	Int32
sgtpc-dpc-req-denied-rx	Total GTP-C (v1 and v0) delete PDP context requests denied messages received.	Int32
sgtpc-total-pdu-not-req	Total number of GTP-C (v1 and v0) PDUs not requested but received for primary PDP context.	Int32
sgtpc-pdu-not-req-v1-pri	Total number of GTP-Cv1 PDUs not requested but received for primary PDP context.	Int32
sgtpc-pdu-not-req-v0-pri	Total number of GTP-Cv0 PDUs not requested but received for primary PDP context.	Int32
sgtpc-pdu-not-req-sec	Total number of GTP-C (v1 and v0) PDUs not requested but received for secondary PDP context.	Int32
sgtpc-pdu-not-req-v1-pri-ret	Total number of GTP-Cv1 PDUs not requested but received for primary PDP context and retried.	Int32
sgtpc-pdu-not-req-v0-pri-ret	Total number of GTP-Cv0 PDUs not requested but received for primary PDP context and retried	Int32
sgtpc-pdu-not-req-sec-ret	Total number of GTP-C (v1 and v0) PDUs not requested but received for secondary PDP context retried.	Int32

Common Syntax Options

Variables	Description	Data Type
sgtpc-pdu-not-req-accept-v1	Total number of GTP-Cv1 PDUs not requested but received for secondary PDP context and accepted.	Int32
sgtpc-pdu-not-req-accept-v0	Total number of GTP-Cv0 PDUs not requested but received for secondary PDP context accepted.	Int32
sgtpc-pdu_not-req-denied	Total number of GTP-C (v1 and v0) PDUs not requested but received and denied.	Int32
sgtpc-total-pdu-not-rej-req	Total number of GTP-C (v1 and v2) PDUs requested and not rejected.	Int32
sgtpc-pdu-not-rej-req-v1-pri	Total number of GTP-Cv1 PDUs requested and not rejected for primary PDP context.	Int32
sgtpc-pdu-not-rej-req-v0-pri	Total number of GTP-Cv0 PDUs requested and not rejected for primary PDP context.	Int32
sgtpc-pdu-not-rej-req-v1-pri-ret	Total number of GTP-Cv1 PDUs requested and not rejected for primary PDP context but retransmitted.	Int32
sgtpc-pdu-not-rej-req-v0-pri-ret	Total number of GTP-Cv0 PDUs not requested and not rejected for primary PDP context but retransmitted.	Int32
sgtpc-pdu-not-rej-req-accept-v1	Total number of GTP-Cv1 PDUs requested and not rejected for primary PDP context.	Int32
sgtpc-pdu-not-rej-req-accept-v0	Total number of GTP-Cv0 PDUs requested and not rejected for primary PDP context.	Int32
sgtpc-pdu_not-rej-req-denied	Total number of PDU notification requests which were not accepted.	Int32
sgtpc-total-sri-req	Total number of GTP-C (v1 and v0) Send Routing Information (SRI) request messages transmitted to the HLR(s).	Int32
sgtpc-sri-req-v1	Total number of GTP-Cv1 Send Routing Information (SRI) request messages transmitted to the HLR(s).	Int32
sgtpc-sri-req-v0	Total number of GTP-Cv0 Send Routing Information (SRI) request messages transmitted to the HLR(s).	Int32
sgtpc-sri-req-v1-ret	The total number of Total number of GTP-Cv1 Send Routing Information (SRI) request messages retransmitted to the HLR(s).	Int32
sgtpc-sri-req-v0-ret	Total number of GTP-Cv0 Send Routing Information (SRI) request messages retransmitted to the HLR(s).	Int32
sgtpc-sri-req-denied	Total number of GTP-C (v1 and v0) Send Routing Information (SRI) request messages transmitted to the HLR(s) and denied.	Int32
sgtpc-total-fail-rpt-req	Total number of GTP-C (v1 and v0) fail report messages requested.	Int32
sgtpc-fail-rpt-req-v1	Total number of GTP-Cv1 fail report messages requested.	Int32
sgtpc-fail-rpt-req-v0	Total number of GTP-Cv1 fail report messages requested.	Int32

Variables	Description	Data Type
sgtpc-fail-rpt-req-v1-ret	Total number of GTP-Cv1 fail report messages requested and retransmitted.	Int32
sgtpc-fail-rpt-req-v0-ret	Total number of GTP-Cv0 fail report messages requested and retransmitted.	Int32
sgtpc-fail-rpt-req-denied	Total number of GTP-Cv1 fail report messages requested and denied.	Int32
sgtpc-ident-req-v1-tx	Total GTP-C v1 identification request messages sent.	Int32
sgtpc-ident-req-v0-tx	Total GTP-C v0 identification request messages sent.	Int32
sgtpc-ident-req-v1-rx	Total GTP-C v1 identification request messages received.	Int32
sgtpc-ident-req-v0-rx	Total GTP-C v0 identification request messages received.	Int32
sgtpc-ident-req-accept-tx	Total GTP-C identification request accept messages sent.	Int32
sgtpc-ident-req-accept-rx	Total GTP-C identification request accept messages received.	Int32
sgtpc-ident-req-accept-v1-tx	Total GTP-Cv1 identification request accept messages sent.	Int32
sgtpc-ident-req-accept-v0-tx	Total GTP-Cv0 identification request accept messages sent.	Int32
sgtpc-ident-req-accept-v1-rx	Total GTP-Cv1 identification request accept messages received.	Int32
sgtpc-ident-req-accept-v0-rx	Total GTP-Cv0 identification request accept messages received.	Int32
sgtpc-ident-req-denied-tx	Total GTP-C (v1 and v0) identification request denied messages sent.	Int32
sgtpc-ident-req-denied-rx	Total GTP-C (v1 and v0) identification request denied messages received.	Int32
sgtpc-sgsn-ctxt-req-v1-tx	Total GTP-Cv1 SGSN context request messages sent.	Int32
sgtpc-sgsn-ctxt-req-v0-tx	Total GTP-Cv0 SGSN context request messages sent.	Int32
sgtpc-sgsn-ctxt-req-v1-rx	Total GTP-Cv1 SGSN context request messages received.	Int32
sgtpc-sgsn-ctxt-req-v0-rx	Total GTP-Cv0 SGSN context request messages received.	Int32
sgtpc-sgsn-ctxt-req-accept-tx	Total GTP-C SGSN context request accept messages sent.	Int32
sgtpc-sgsn-ctxt-req-accept-rx	Total GTP-C SGSN context request accept messages received.	Int32

Common Syntax Options

Variables	Description	Data Type
sgtpc-sgsn-ctxt-req-accept-v1-tx	Total GTP-Cv1 SGSN context request accept messages sent.	Int32
sgtpc-sgsn-ctxt-req-accept-v0-tx	Total GTP-Cv0 SGSN context request accept messages sent.	Int32
sgtpc-sgsn-ctxt-req-accept-v1-rx	Total GTP-Cv1 SGSN context request accept messages received.	Int32
sgtpc-sgsn-ctxt-req-accept-v0-rx	Total GTP-Cv0 SGSN context request accept messages received.	Int32
sgtpc-sgsn-ctxt-req-denied-tx	Total GTP-C (v1 and v0) SGSN context request denied messages sent.	Int32
sgtpc-sgsn-ctxt-req-denied-rx	Total GTP-C (v1 and v0) SGSN context request denied messages received.	Int32
sgtpc-sgsn-ctxt-ack-accept-tx	Total GTP-C SGSN context acknowledgement accept messages sent.	Int32
sgtpc-sgsn-ctxt-ack-accept-rx	Total GTP-C SGSN context acknowledgement accept messages sent.	Int32
sgtpc-sgsn-ctxt-ack-accept-v1-tx	Total GTP-Cv1 SGSN context request accept acknowledge messages sent.	Int32
sgtpc-sgsn-ctxt-ack-accept-v0-tx	Total GTP-Cv0 SGSN context request accept acknowledge messages sent.	Int32
sgtpc-sgsn-ctxt-ack-accept-v1_rx	Total GTP-Cv1 SGSN context request accept acknowledge messages received.	Int32
sgtpc-sgsn-ctxt-ack-accept-v0_rx	Total GTP-Cv0 SGSN context request accept acknowledge messages received.	Int32
sgtpc-sgsn-ctxt-ack-denied-tx	Total GTP-C (v1 and v0) SGSN context request denial acknowledge messages sent.	Int32
sgtpc-sgsn-ctxt-ack-denied-rx	Total GTP-C (v1 and v0) SGSN context request denial acknowledge messages received.	Int32
sgtpc-fwd-reloc-req-tx	Total GTP-C (v1 and v0) forward relocation request messages sent.	Int32
sgtpc-fwd-reloc-req-rx	Total GTP-C (v1 and v0) forward relocation request messages received.	Int32
sgtpc-fwd-reloc-discard-tx	This statistic has been obsoleted.	
sgtpc-fwd-reloc-req-accept-tx	Total GTP-C (v1 and v0) forward relocation request accept response messages sent.	Int32
sgtpc-fwd-reloc-req-accept-rx	Total GTP-C (v1 and v0) forward relocation request accept response messages received.	Int32

Variables	Description	Data Type
sgtpc-fwd-reloc-denied-tx	Total GTP-C (v1 and v0) forward relocation request denied response messages sent.	Int32
sgtpc-fwd-reloc-denied-rx	Total GTP-C (v1 and v0) forward relocation request denied response messages received.	Int32
sgtpc-fwd-srnsctxt-req-tx	Total GTP-C (v1 and v0) forward relocation request messages with serving radio network subsystem (SRNS) context request sent.	Int32
sgtpc-fwd-srnsctxt-req-rx	Total GTP-C (v1 and v0) forward relocation request messages with SRNS context request received.	Int32
sgtpc-fwd-srnsctxt-discard-rx	This statistic has been obsoleted.	
sgtpc-fwd-srnsctxt-ack-tx	Total GTP-C (v1 and v0) forward relocation request messages with SRNS context request acknowledge sent.	Int32
sgtpc-fwd-srnsctxt-ack-rx	Total GTP-C (v1 and v0) forward relocation request messages with SRNS context request acknowledge received.	Int32
sgtpc-fwd-srnsctxt-ack-denied-tx	Total GTP-C (v1 and v0) forward relocation request messages with SRNS context request denied sent.	Int32
sgtpc-fwd-srnsctxt-ack-denied-rx	Total GTP-C (v1 and v0) forward relocation request messages with SRNS context request denied received.	Int32
sgtpc-fwd-reloc-compl-tx	Total GTP-C (v1 and v0) forward relocation request messages with procedure complete message sent.	Int32
sgtpc-fwd-reloc-compl-rx	Total GTP-C (v1 and v0) forward relocation request messages with procedure complete message received.	Int32
sgtpc-fwd-rel-compl-ack-accept-tx	Total GTP-C (v1 and v0) forward relocation request messages for procedure complete acknowledge sent.	Int32
sgtpc-fwd-rel-compl-ack-accept-rx	Total GTP-C (v1 and v0) forward relocation request messages for procedure complete acknowledge received.	Int32
sgtpc-fwd-rel-compl-ack-denied-tx	Total GTP-C (v1 and v0) forward relocation request messages for procedure complete sent with ACK denial.	Int32
sgtpc-fwd-rel-compl-ack-denied-rx	Total GTP-C (v1 and v0) forward relocation request messages for procedure complete received with ACK denial.	Int32
sgtpc-reloc-cncl-req-tx	Total GTP-C (v1 and v0) messages sent with relocation cancel request.	Int32
sgtpc-reloc-cncl-req-rx	Total GTP-C (v1 and v0) message response received for relocation cancel request.	Int32
sgtpc-reloc-cncl-req-accept-tx	Total GTP-C (v1 and v0) messages sent with acceptance for relocation cancel request.	Int32
sgtpc-reloc-cncl-req-accept-rx	Total GTP-C (v1 and v0) message response received with acceptance for relocation cancel request.	Int32

Common Syntax Options

Variables	Description	Data Type
sgtpc-reloc-cncl-denied-tx	Total GTP-C (v1 and v0) messages sent with denial for relocation cancel request.	Int32
sgtpc-reloc-cncl-denied-rx	Total GTP-C (v1 and v0) message response with received with denial for relocation cancel request.	Int32
sgtpc-paket-discarded	Total GTP-C (v1 and v0) packets discarded.	Int32
sgtpc-v1-echo-req-tx	Total GTP-C v1 echo request messages sent.	Int32
sgtpc-v0-echo-req-tx	Total GTP-C v1 echo request messages sent.	Int32
sgtpc-v1-retrnas-echo-req-tx	Total GTP-C v1 echo request messages retransmitted.	Int32
sgtpc-v0-retrnas-echo-req-tx	Total GTP-C v0 echo request messages retransmitted.	Int32
sgtpc-v1-echo-req-rx	Total GTP-C v1 echo request messages received.	Int32
sgtpc-v0-echo-req-rx	Total GTP-C v0 echo request messages received.	Int32
sgtpc-ret-v1-echo-req-rx	Total GTP-C v1 echo request retransmitted messages received.	Int32
sgtpc-ret-v0-echo-req-rx	Total GTP-C v0 echo request retransmitted messages received.	Int32
sgtpc-v1-echo-rsp-tx	Total GTP-C v1 echo response messages sent.	Int32
sgtpc-v0-echo-rsp-tx	Total GTP-C v0 echo response messages sent.	Int32
sgtpc-v1-echo-rsp-rx	Total GTP-C v1 echo response messages received.	Int32
sgtpc-v0-echo-rsp-rx	Total GTP-C v0 echo response messages received.	Int32
sgtpc-ver-not-supported-rx	Total GTP-C messages of not supported version of GTP received.	Int32
sgtpc-ver-not-supported-tx	Total GTP-C messages of not supported version of GTP messages sent.	Int32
sgtpc-supp-extn-hdr-notif-rx	Total GTP messages with supported extension headers notification received.	Int32
sgtpc-supp-extn-hdr-notif-tx	Total GTP messages with supported extension headers notification sent.	Int32
sgtput-ggsn-pkt-sent	Total packets for GTP-U messages sent to GGSN.	Int64
sgtput-ggsn-byts-sent	Description: Total number of GTP-U messages bytes sent to GGSN at a given instance of time. Triggers: Changes every time an uplink packet is sent to the GGSN. Availability: Across all SGTP services, per SGTP service, per GGSN Type: Counter	Int64
sgtput-rnc-pkt-sent	Total packets for GTP-U messages sent to RNC.	Int64

Variables	Description	Data Type
sgtpu-rnc-byts-sent	Description: Total number of bytes for GTP-U messages sent to the RNC at a given instance in time. Triggers: Changes every time a downlink packet is sent to the RNC. Availability: Across all SGTP services, per SGTP service, per RNC Type: Counter	Int64
sgtpu-sgsn-pkt-sent	Total packets for GTP-U messages sent to SGSN.	Int64
sgtpu-sgsn-byts-sent	Description: Total number of GTP-U message bytes sent to the peer SGSN at a given instance of time. Triggers: Changes every time a packet is sent to a “new” SGSN during an Inter SGSN handoff. Availability: Across all SGTP services, per SGTP service Type: Counter	Int64
sgtpu-ggsn-pkt-rcvd	Total packets for GTP-U messages received from GGSN.	Int64
sgtpu-ggsn-byts-rcvd	Description: Total number of GTP-U message bytes received from the GGSN at a given instance of time. Triggers: Changes every time a downlink packet is received from the GGSN. Availability: Across all SGTP services, per SGTP service, per GGSN Type: Counter	Int64
sgtpu-ggsn-pkt-queued	Total packets queued for GTP-U messages from GGSN.	Int64
sgtpu-ggsn-byts-queued	Total bytes queued for GTP-U messages from GGSN.	Int64
sgtpu-ggsn-pkt-forwarded	Description: This proprietary counter indicates the total number of packets that are forwarded from the GGSN queue. Triggers: Increments when a packet is forwarded from the GGSN queue. Availability: Per SGTP service Type: Counter	Int64
sgtpu-ggsn-byts-forwarded	Description: This proprietary counter indicates the total number of bytes that are forwarded from the GGSN queue. Triggers: Increments when a byte is forwarded from the GGSN queue. Availability: Per SGTP service Type: Counter	Int64
sgtpu-total-ggsn-pkt-drop	Total packets dropped for GTP-U messages from GGSN.	Int64
sgtpu-total-ggsn-byts-drop	Total bytes dropped for GTP-U messages from GGSN.	Int64
sgtpu-ggsn-pkt-queue-full	Total packets dropped due to queued buffer limit full for GTP-U messages from GGSN.	Int64
sgtpu-ggsn-byts-queue-full	Total bytes dropped due to queued buffer limit full for GTP-U messages from GGSN.	Int64
sgtpu-total-pkt-ctxt-preserved	Total number of GTP packets from GGSN dropped in preserved context.	Int64

Common Syntax Options

Variables	Description	Data Type
sgtpu-total-byts-ctxt-preserved	Total number of GTP bytes from GGSN dropped in preserved with context.	Int64
sgtpu-ggsn-pkt-unkwn-sess	Total number of GTP packets from GGSN dropped in unknown session.	Int64
sgtpu-ggsn-byts-unkwn-sess	Total number of GTP bytes from GGSN dropped in unknown session.	Int64
sgtpu-ggsn-pkt-drop-suspend-dealloc-st	Total number of GTP packets from GGSN dropped due to session de-allocation state was in suspended state.	Int64
sgtpu-ggsn-byts-drop-suspend-dealloc-st	Total number of GTP bytes from GGSN dropped due to session de-allocation state was in suspended state.	Int64
sgtpu-ggsn-pkt-page-fail	Total number of GTP packets dropped due to paging failure when there was downlink data from GGSN.	Int64
sgtpu-ggsn-byts-page-fail	Total number of GTP bytes dropped due to paging failure when there was downlink data from GGSN.	Int64
sgtpu-ggsn-pkt-v0-seq-num-nt-pres	Total number of packets from GGSN dropped as GTP-Uv0 messages received with sequence number flag set to false.	Int64
sgtpu-ggsn-byts-v0-seq-num-nt-pres	Total number of bytes from GGSN dropped as GTP-Uv0 messages received with sequence number flag set to false.	Int64
sgtpu-ggsn-pkt-unknown-version	Total number of GTP-U packets received from GGSN with unknown GTP version.	Int64
sgtpu-ggsn-byts-unknown-version	Total number of GTP-U bytes received from GGSN with unknown GTP version.	Int64
sgtpu-ggsn-pkt-invalid-msg-length	Total number of GTP packets from GGSN dropped as GTP-U messages received with invalid message length.	Int64
sgtpu-ggsn-byts-invalid-msg-length	Total number of GTP bytes from GGSN dropped due to GTP-U messages received with invalid message length.	Int64
sgtpu-ggsn-pkt-traffic-policing	Total number of GTP-U packets received from GGSN under subscriber traffic policing support.	Int64
sgtpu-ggsn-byts-traffic-policing	Total number of GTP-U bytes received from GGSN under subscriber traffic policing support.	Int64
sgtpu-ggsn-pkt-iu-release	<p>Description: Total number of downlink packets that were queued but dropped due to IU/RAB release.</p> <p>Triggers: Counter at the new SGSN increments when Iu/RAB gets released while inter-SGSN-RAU is in progress and downlink data is queued during RAU.</p> <p>Availability: Per SGTP service</p> <p>Type: Counter</p>	Int64

Variables	Description	Data Type
sgtpu-ggsn-byts-iu-release	<p>Description: Total number of downlink bytes that were queued but dropped due to IU/RAB release.</p> <p>Triggers: Counter at the new SGSN increments when Iu/RAB gets released while inter-SGSN-RAU is in progress and downlink data is queued during RAU.</p> <p>Availability: per SGTP service</p> <p>Type: Counter</p>	Int64
sgtpu-ggsn-pkt-t3-tmr-expiry	<p>Description: Total number of downlink packets that were queued but dropped due to T3-tunnel timer expiry during inter-SGSN RAU procedure.</p> <p>Triggers: During inter-SGSN RAU at the old SGSN, neither Cancel Location or SGSN Context Ack are received when t3-tunnel timer is fired causing the RAU procedure to abort. If old RABs are not available, the data queued during the RAU will be dropped.</p> <p>Availability: per SGTP service</p> <p>Type: Counter</p>	Int64
sgtpu-ggsn-byts-t3-tmr-expiry	<p>Description: Total number of downlink bytes that were queued but dropped due to T3-tunnel timer expiry during inter-SGSN RAU procedure.</p> <p>Triggers: During inter-SGSN RAU at the old SGSN, neither Cancel Location or SGSN Context Ack are received when t3-tunnel timer is fired causing the RAU procedure to abort. If old RABs are not available, the data queued during the RAU will be dropped.</p> <p>Availability: per SGTP service</p> <p>Type: Counter</p>	Int64
sgtpu-ggsn-pkt-bvc-block	<p>Description: This proprietary counter indicates the total number of packets that are dropped from the GGSN queue, because of BVC Block or BVC Reset messages received for the MM context.</p> <p>Triggers: Increments when a packet is dropped from the GGSN queue because of BVC Reset/BVC Block received for the MM context.</p> <p>Availability: per SGTP service</p> <p>Type: Counter</p>	Int64
sgtpu-ggsn-byts-bvc-block	<p>Description: This proprietary counter indicates the total number of bytes that are dropped from the GGSN queue, because of BVC Block or BVC Reset messages received for the MM context.</p> <p>Triggers: Increments when a byte is dropped from the GGSN queue because of BVC Reset/BVC Block received for the MM context.</p> <p>Availability: per SGTP service</p> <p>Type: Counter</p>	Int64
sgtpu-rnc-pkt-rcvd	Total packets for GTP-U messages received from RNC.	Int64
sgtpu-rnc-byts-rcvd	<p>Description: Total number of GTP-U messages bytes received from the RNC at a given instance of time.</p> <p>Triggers: Increments when SGSN receives an uplink packet from an RNC.</p> <p>Availability: Across all SGTP services, per SGTP service, per RNC</p> <p>Type: Counter</p>	Int64
sgtpu-rnc-pkt-queued	Total packets queued for GTP-U messages from RNC.	Int64
sgtpu-rnc-byts-queued	Total bytes queued for GTP-U messages from RNC.	Int64
sgtpu-total-rnc-pkt-drop	Total packets dropped for GTP-U messages from RNC.	Int64

■ Common Syntax Options

Variables	Description	Data Type
sgtpu-total-rnc-byts-drop	Total bytes dropped for GTP-U messages from RNC.	Int64
sgtpu-rnc-pkt-queue-full	Total packets dropped due to queued buffer limit full for GTP-U messages from RNC.	Int64
sgtpu-rnc-byts-queue-full	Total bytes dropped due to queued buffer limit full for GTP-U messages from RNC.	Int64
sgtpu-rnc-pkt-unkwn-sess	Total number of GTP packets from RNC dropped in unknown session.	Int64
sgtpu-rnc-byts-unkwn-sess	Total number of GTP bytes from RNC dropped in unknown session.	Int64
sgtpu-rnc-pkt-rau-in-active-reg-st	Total number of GTP packets from RNC dropped due to routing area update procedure in active registration state.	Int64
sgtpu-rnc-byts-rau_in_active-reg-st	Total number of GTP bytes from RNC dropped due to routing area update procedure in active registration state.	Int64
sgtpu-rnc-pkt-drop-suspended-dealloc-st	Total number of GTP packets from RNC dropped due to session de-allocation state was in suspended state.	Int64
sgtpu-rnc-byts-drop-suspended-dealloc-st	Total number of GTP bytes from RNC dropped due to session de-allocation state was in suspended state.	Int64
sgtpu-rnc-pkt-unknown-version	Total number of GTP-U packets received from RNC with unknown GTP version.	Int64
sgtpu-rnc-byts-unknown-version	Total number of GTP-U bytes received from RNC for packets with unknown GTP version.	Int64
sgtpu-rnc-pkt-invalid-msg-length	Total number of GTP packets from RNC dropped due to GTP-Uv0 messages received with invalid message length.	Int64
sgtpu-rnc-byts-invalid-msg-length	Total number of GTP bytes from RNC dropped due to TP-Uv0 messages received with invalid message length.	Int64
sgtpu-rnc-pkt-source-ip-viol	Total number of GTP packets from RNC dropped as received GTP-Uv0 message shows source IP violation.	Int64
sgtpu-rnc-byts-source-ip-viol	Total number of GTP bytes from RNC dropped as received GTP-Uv0 message shows source IP violation.	Int64
sgtpu-rnc-pkt-traffic-policing	Total number of GTP-U packets received from RNC under subscriber traffic policing support.	Int64
sgtpu-rnc-byts-traffic-policing	Total number of GTP-U bytes received from RNC under subscriber traffic policing support.	Int64
sgtpu-sgsn-pkt-rcvd	Total packets for GTP-U messages received from peer SGSN.	Int64
sgtpu-sgsn-byts-rcvd	Total bytes for GTP-U messages received from peer SGSN.	Int64
sgtpu-sgsn-pkt-queued	Total packets queued for GTP-U messages from peer SGSN.	Int64

Variables	Description	Data Type
sgtpu-sgsn-byts-queued	Total bytes queued for GTP-U messages from peer SGSN.	Int64
sgtpu-total-sgsn-pkt-drop	Total packets dropped for GTP-U messages from peer SGSN.	Int64
sgtpu-total-sgsn-byts-drop	Total bytes dropped for GTP-U messages from peer SGSN.	Int64
sgtpu-sgsn-pkt-queue-full	Total packets dropped due to queued buffer limit full for GTP-U messages from peer SGSN.	Int64
sgtpu-sgsn-byts-queue-full	Total bytes dropped due to queued buffer limit full for GTP-U messages from peer SGSN.	Int64
sgtpu-sgsn-pkt-unkwn-sess	Total number of GTP packets from peer SGSN dropped in unknown session.	Int64
sgtpu-sgsn-byts-unkwn-sess	Total number of GTP bytes from peer SGSN dropped in unknown session.	Int64
sgtpu-sgsn-pkt-iu-release	Total number of GTP packets from peer SGSN received with Iu release message.	Int64
sgtpu-sgsn-byts-iu-release	Total number of GTP bytes from peer SGSN received with Iu release message.	Int64
sgtpu-sgsn-pkt-inconsistent-tunnel-state	Total number of GTP packets from peer SGSN received during inconsistent tunnel state.	Int64
sgtpu-sgsn-byts-inconsistent-tunnel-state	Total number of GTP bytes from peer SGSN received during inconsistent tunnel state.	Int64
sgtpu-sgsn-pkt-sess-dealloc	Total number of GTP packets from peer SGSN received during session deallocation procedure.	Int64
sgtpu-sgsn-byts-sess-dealloc	Total number of GTP bytes from peer SGSN received during session deallocation procedure.	Int64
sgtpu-sgsn-pkt-unknown-version	Total number of GTP-U packets received from peer SGSN with unknown GTP version.	Int64
sgtpu-sgsn-byts-unknown-version	Total number of GTP-U bytes received from peer SGSN with unknown GTP version.	Int64
sgtpu-sgsn-pkt-invalid-msg-length	Total number of GTP packets from peer SGSN received with invalid message length.	Int64
sgtpu-sgsn-byts-invalid-msg-length	Total number of GTP bytes from peer SGSN received with invalid message length.	Int64
sgtpu-echo-req-tx	Total number of GTP-U echo request messages sent.	Int32
sgtpu-echo-req-rx	Total number of GTP-U echo request messages received.	Int32
sgtpu-echo-rsp-tx	Total number of GTP-U echo response messages sent.	Int32

Common Syntax Options

Variables	Description	Data Type
sgtpu-echo-rsp-rx	Total number of GTP-U echo response messages received.	Int32
sgtpu-v1-echo-req-tx	Total GTP-Uv1 echo request messages sent.	Int32
sgtpu-v0-echo-req-tx	Total GTP-Uv0 echo request messages sent.	Int32
sgtpu-v1-echo-req-rx	Total GTP-Uv1 echo request messages received.	Int32
sgtpu-v0-echo-req-rx	Total GTP-Uv0 echo request messages received.	Int32
sgtpu-v1-echo-rsp-tx	Total GTP-Uv1 echo request response messages sent.	Int32
sgtpu-v0-echo-rsp-tx	Total GTP-Uv0 echo request response messages sent.	Int32
sgtpu-v1-echo-rsp-rx	Total GTP-Uv1 echo request response messages received.	Int32
sgtpu-v0-echo-rsp-rx	Total GTP-Uv0 echo request response messages received.	Int32
sgtpu-v1-echo-req-retrans	Total GTP-Uv1 echo request response messages retransmitted.	Int32
sgtpu-v0-echo-req-retrans	Total GTP-Uv0 echo request response messages retransmitted.	Int32
sgtpu-ggsn-errind-sent	Total GTP-U (v1 and v0) messages sent to GGSN with error indication.	Int32
sgtpu-ggsn-errind-rcvd	Total GTP-U (v1 and v0) messages received from GGSN with error indication.	Int32
sgtpu-rnc-errind-sent	Total GTP-U (v1 and v0) messages sent to RNC with error indication.	Int32
sgtpu-rnc-errind-rcvd	Total GTP-U (v1 and v0) messages received from RNC with error indication.	Int32
sgtpu-sgsn-unknown-errind	Total GTP-U (v1 and v0) messages sent to peer SGSN with unknown error indication.	Int32
sgtpu-sgsn-unsolicited-data-pkt	Total GTP-U (v1 and v0) messages received with unsolicited data packets in GTP-U messages.	Int32
sgtpu-sgsn-err-ind-for-unsolicited-pkt	Total GTP-U (v1 and v0) messages received with error indication for unsolicited data packets in GTP-U messages.	Int32
sgtpu-total-active-ggsn	Total active GGSN nodes. This statistic value is of Gauge.	Int32
sgtpu-total-active-rnc	Total active RNC nodes. This statistic value is of Gauge.	Int32
sgtpu-errors-payload-length-mismatch	Description: Total number of “invalid” packets received from GGSN or RNC with errors due to mismatch in payload length. Triggers: Increments when received GTP-U (v1 and v0) header does not match with the actual payload length field. Availability: Across all SGTP services, per SGTP service Type: Counter	Int32

<div style="border: 1px solid black; padding: 10px;">  <p>IMPORTANT: For information on statistics that are common to all schema see the <i>Statistics and Counters Overview</i> chapter.</p> </div>		

Chapter 63

S-GW Node Level Schema Statistics

The S-GW schema provides operational statistics that can be used for monitoring and troubleshooting the following products: S-GW

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 63. Bulk Statistic Variables in the S-GW Node Level Schema

Variables	Description	Data Type
-----------	-------------	-----------

■ Common Syntax Options

Variables	Description	Data Type
vpname	The name of the context configured on the system that is currently facilitating the S-GW service. This is a key variable. Type: Information	String
vpnid	The identification number of the context configured on the system that is currently facilitating the S-GW service. This is an internal reference number. This is a key variable. Type: Information	Int32
servname	Displays the name of the S-GW service for which the statistics are displayed. This is a key variable. Type: Information	String
servid	The identification number of the service configured on the system that is currently facilitating the S-GW service. This is an internal reference number. This is a key variable. Type: Information	Int32
sess-cur	The total number of sessions currently established on this system. Type: Gauge	Int32
sessstat-totcur-ueidle	Session Statistics - Total Current - UE Idle Type: Gauge	Int32
sessstat-totcur-ueactive	Session Statistics - Total Current - UE Active Type: Gauge	Int32
sessstat-totcur-pdn	Session Statistics - Total Current - PDN Type: Gauge	Int32
sessstat-totcur-bearers	Session Statistics - Total Current - Bearers Type: Gauge	Int32
sessstat-totsetup-ue	Session Statistics - Total Setup - UE Type: Counter	Int32
sessstat-totsetup-pdn	Session Statistics - Total Setup - PDN Type: Counter	Int32
sessstat-totsetup-bearers	Session Statistics - Total Setup - Bearers Type: Counter	Int32
sessstat-pdnsetuptype-ipv4	Session Statistics - Total PDNs Setup Per PDN-type - IPv4 Type: Counter	Int32
sessstat-pdnsetuptype-ipv6	Session Statistics - Total PDNs Setup Per PDN-type - IPv6 Type: Counter	Int32
sessstat-pdnsetuptype-ipv4v6	Session Statistics - Total PDNs Setup Per PDN-type - IPv4v6 Type: Counter	Int32
sessstat-pdnsetupinterface-s11	Session Statistics - Total PDNs Setup Per Interface - S11 Type: Counter	Int32

Variables	Description	Data Type
sessstat-pdnsetupinrface-s4	Session Statistics - Total PDNs Setup Per Interface - S4 Type: Counter	Int32
sessstat-pdnsetups5proto-gtp	Session Statistics - Total PDNs Setup Per S5 Proto - GTP Type: Counter	Int32
sessstat-pdnsetups5proto-pmip	Session Statistics - Total PDNs Setup Per S5 Proto - PMIP Type: Counter	Int32
sessstat-pdnrel-ipv4	Session Statistics - Total PDNs Released - IPv4 Type: Counter	Int32
sessstat-pdnrel-ipv6	Session Statistics - Total PDNs Released - IPv6 Type: Counter	Int32
sessstat-pdnrel-ipv4v6	Session Statistics - Total PDNs Released - IPv4v6 Type: Counter	Int32
sessstat-pdnrelrsn-mme	Session Statistics - Total PDNs Released reason - MME Initiated Type: Counter	Int32
sessstat-pdnrelrsn-pgw	Session Statistics - Total PDNs Released reason - PGW Initiated Type: Counter	Int32
sessstat-pdnrelrsn-pcrf	Session Statistics - Total PDNs Released reason - PCRF Initiated Type: Counter	Int32
sessstat-pdnrelrsn-local	Session Statistics - Total PDNs Released reason - Local Type: Counter	Int32
sessstat-pdnrelrsn-s1err	Session Statistics - Total PDNs Released reason - S1 Error Ind Type: Counter	Int32
sessstat-pdnrelrsn-s5err	Session Statistics - Total PDNs Released reason - S5 Error Ind Type: Counter	Int32
sessstat-pdnrelrsn-s4err	Session Statistics - Total PDNs Released reason - S4 Error Ind Type: Counter	Int32
sessstat-pdnrelrsn-s12err	Session Statistics - Total PDNs Released reason - S12 Error Ind Type: Counter	Int32
sessstat-pdnrelrsn-pathfail-S11	Session Statistics - Total PDNs Released reason - S11 Path Failure Type: Counter	Int32
sessstat-pdnrelrsn-pathfail-S5	Session Statistics - Total PDNs Released reason - S5 Path Failure Type: Counter	Int32
sessstat-pdnrelrsn-pathfail-S5-u	Session Statistics - Total PDNs Released reason - Path Failure S5-U Type: Counter	Int32
sessstat-pdnrelrsn-pathfail-S1-u	Session Statistics - Total PDNs Released reason - Path Failure S1-U Type: Counter	Int32
sessstat-pdnrelrsn-pathfail-S4	Session Statistics - Total PDNs Released reason - Path Failure S4 Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
sessstat-pdnreln-pathfail-S12	Session Statistics - Total PDNs Released reason - Path Failure S12 Type: Counter	Int32
sessstat-pdnreln-pathfail-S4-u	Session Statistics - Total PDNs Released reason - Path Failure S4-U Type: Counter	Int32
sessstat-pdnreln-other	Session Statistics - Total PDNs Released reason - Other Type: Counter	Int32
sessstat-pdnrej-ipv4	Session Statistics - Total PDNs Rejected - IPv4 Type: Counter	Int32
sessstat-pdnrej-ipv6	Session Statistics - Total PDNs Rejected - IPv6 Type: Counter	Int32
sessstat-pdnrej-ipv4v6	Session Statistics - Total PDNs Rejected - IPv4v6 Type: Counter	Int32
sessstat-pdnrejrns-pgw	Session Statistics - Total PDNs Rejected Reason - PGW Reject Type: Counter	Int32
sessstat-pdnrejrns-license	Session Statistics - Total PDNs Rejected Reason - License Type: Counter	Int32
sessstat-pdnrejrns-newcall-policy	Session Statistics - Total PDNs Rejected Reason - Newcall Policy Type: Counter	Int32
sessstat-pdnrejrns-overload	Session Statistics - Total PDNs Rejected Reason - Overload Type: Counter	Int32
sessstat-pdnrejrns-cong	Session Statistics - Total PDNs Rejected Reason - Congestion Type: Counter	Int32
sessstat-pdnrejrns-other	Session Statistics - Total PDNs Rejected Reason - Other Type: Counter	Int32
totepsbearsetup-qci1	Total EPS Bearers Setup - QCI 1 Type: Counter	Int32
totepsbearsetup-qci2	Total EPS Bearers Setup - QCI 2 Type: Counter	Int32
totepsbearsetup-qci3	Total EPS Bearers Setup - QCI 3 Type: Counter	Int32
totepsbearsetup-qci4	Total EPS Bearers Setup - QCI 4 Type: Counter	Int32
totepsbearsetup-qci5	Total EPS Bearers Setup - QCI 5 Type: Counter	Int32
totepsbearsetup-qci6	Total EPS Bearers Setup - QCI 6 Type: Counter	Int32
totepsbearsetup-qci7	Total EPS Bearers Setup - QCI 7 Type: Counter	Int32

Variables	Description	Data Type
totepsbearsetup-qci8	Total EPS Bearers Setup - QCI 8 Type: Counter	Int32
totepsbearsetup-qci9	Total EPS Bearers Setup - QCI 9 Type: Counter	Int32
totepsbearsetup-other	Total EPS Bearers Setup - Other Type: Counter	Int32
totepsbearmod	Total EPS Bearers Modified Type: Counter	Int32
totepsbearrel-qci1	Total EPS Bearers Released - QCI 1 Type: Counter	Int32
totepsbearrel-qci2	Total EPS Bearers Released - QCI 2 Type: Counter	Int32
totepsbearrel-qci3	Total EPS Bearers Released - QCI 3 Type: Counter	Int32
totepsbearrel-qci4	Total EPS Bearers Released - QCI 4 Type: Counter	Int32
totepsbearrel-qci5	Total EPS Bearers Released - QCI 5 Type: Counter	Int32
totepsbearrel-qci6	Total EPS Bearers Released - QCI 6 Type: Counter	Int32
totepsbearrel-qci7	Total EPS Bearers Released - QCI 7 Type: Counter	Int32
totepsbearrel-qci8	Total EPS Bearers Released - QCI 8 Type: Counter	Int32
totepsbearrel-qci9	Total EPS Bearers Released - QCI 9 Type: Counter	Int32
totepsbearrel-other	Total EPS Bearers Released - Other Type: Counter	Int32
totepsbearmod-qci1	Total EPS Bearers Modified - QCI 1 Type: Counter	Int32
totepsbearmod-qci2	Total EPS Bearers Modified - QCI 2 Type: Counter	Int32
totepsbearmod-qci3	Total EPS Bearers Modified - QCI 3 Type: Counter	Int32
totepsbearmod-qci4	Total EPS Bearers Modified - QCI 4 Type: Counter	Int32
totepsbearmod-qci5	Total EPS Bearers Modified - QCI 5 Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
totepsbearmod-qci6	Total EPS Bearers Modified - QCI 6 Type: Counter	Int32
totepsbearmod-qci7	Total EPS Bearers Modified - QCI 7 Type: Counter	Int32
totepsbearmod-qci8	Total EPS Bearers Modified - QCI 8 Type: Counter	Int32
totepsbearmod-qci9	Total EPS Bearers Modified - QCI 9 Type: Counter	Int32
totepsbearmod-other	Total EPS Bearers Modified - Other Type: Counter	Int32
totepsbearrel-dedrsn-pgw	Total EPS Bearers Released - Dedicated Bearers Released Reason - PGW Ini Type: Counter	Int32
totepsbearrel-dedrsn-pcrf	Total EPS Bearers Released - Dedicated Bearers Released Reason - PCRF Ini Type: Counter	Int32
totepsbearrel-dedrsn-s1err	Total EPS Bearers Released - Dedicated Bearers Released Reason - S1 Error Ind Type: Counter	Int32
totepsbearrel-dedrsn-s5err	Total EPS Bearers Released - Dedicated Bearers Released Reason - S5 Error Ind Type: Counter	Int32
totepsbearrel-dedrsn-s4err	Total EPS Bearers Released - Dedicated Bearers Released Reason - S4 Error Ind Type: Counter	Int32
totepsbearrel-dedrsn-s12err	Total EPS Bearers Released - Dedicated Bearers Released Reason - S12 Error Ind Type: Counter	Int32
totepsbearrel-dedrsn-local	Total EPS Bearers Released - Dedicated Bearers Released Reason - Local Type: Counter	Int32
totepsbearrel-dedrsn-pdn	Total EPS Bearers Released - Dedicated Bearers Released Reason - PDN Down Type: Counter	Int32
totepsbearrel-dedrsn-pathfail-s1-u	Total EPS Bearers Released - Total Dedicated Bearers Released Reason - Path Failure S1-U Type: Counter	Int32
totepsbearrel-dedrsn-pathfail-s5-u	Total EPS Bearers Released - Total Dedicated Bearers Released Reason - Path Failure S5-U Type: Counter	Int32
totepsbearrel-dedrsn-pathfail-s12	Total EPS Bearers Released - Total Dedicated Bearers Released Reason - Path Failure S12 Type: Counter	Int32
totepsbearrel-dedrsn-pathfail-s4-u	Total EPS Bearers Released - Total Dedicated Bearers Released Reason - Path Failure S4-U Type: Counter	Int32

Variables	Description	Data Type
totepsbearrel-dedrsn-other	Total EPS Bearers Released - Dedicated Bearers Released Reason - Other Type: Counter	Int32
datastat-uplink-qci1totbyte	Data Statistics - Uplink Stats - QCI 1 Total-Bytes Type: Counter	Int64
datastat-uplink-qci1totpkt	Data Statistics - Uplink Stats - QCI 1 Total-Packets Type: Counter	Int64
datastat-uplink-qci2totbyte	Data Statistics - Uplink Stats - QCI 2 Total-Bytes Type: Counter	Int64
datastat-uplink-qci2totpkt	Data Statistics - Uplink Stats - QCI 2 Total-Packets Type: Counter	Int64
datastat-uplink-qci3totbyte	Data Statistics - Uplink Stats - QCI 3 Total-Bytes Type: Counter	Int64
datastat-uplink-qci3totpkt	Data Statistics - Uplink Stats - QCI 3 Total-Packets Type: Counter	Int64
datastat-uplink-qci4totbyte	Data Statistics - Uplink Stats - QCI 4 Total-Bytes Type: Counter	Int64
datastat-uplink-qci4totpkt	Data Statistics - Uplink Stats - QCI 4 Total-Packets Type: Counter	Int64
datastat-uplink-qci5totbyte	Data Statistics - Uplink Stats - QCI 5 Total-Bytes Type: Counter	Int64
datastat-uplink-qci5totpkt	Data Statistics - Uplink Stats - QCI 5 Total-Packets Type: Counter	Int64
datastat-uplink-qci6totbyte	Data Statistics - Uplink Stats - QCI 6 Total-Bytes Type: Counter	Int64
datastat-uplink-qci6totpkt	Data Statistics - Uplink Stats - QCI 6 Total-Packets Type: Counter	Int64
datastat-uplink-qci7totbyte	Data Statistics - Uplink Stats - QCI 7 Total-Bytes Type: Counter	Int64
datastat-uplink-qci7totpkt	Data Statistics - Uplink Stats - QCI 7 Total-Packets Type: Counter	Int64
datastat-uplink-qci8totbyte	Data Statistics - Uplink Stats - QCI 8 Total-Bytes Type: Counter	Int64
datastat-uplink-qci8totpkt	Data Statistics - Uplink Stats - QCI 8 Total-Packets Type: Counter	Int64
datastat-uplink-qci9totbyte	Data Statistics - Uplink Stats - QCI 9 Total-Bytes Type: Counter	Int64
datastat-uplink-qci9totpkt	Data Statistics - Uplink Stats - QCI 9 Total-Packets Type: Counter	Int64

■ Common Syntax Options

Variables	Description	Data Type
datastat-uplink-othertotbyte	Data Statistics - Uplink Stats - Other Total-Bytes Type: Counter	Int64
datastat-uplink-othertotpkt	Data Statistics - Uplink Stats - Other Total-Packets Type: Counter	Int64
datastat-uplink-dropstat-qci1totbyte	Data Statistics - Uplink Bytes Dropped - QCI 1 Total-Bytes Type: Counter	Int32
datastat-uplink-dropstat-qci1totpkt	Data Statistics - Uplink Packets Dropped - QCI 1 Total-Packets Type: Counter	Int32
datastat-uplink-dropstat-qci2totbyte	Data Statistics - Uplink Bytes Dropped - QCI 2 Total-Bytes Type: Counter	Int32
datastat-uplink-dropstat-qci2totpkt	Data Statistics - Uplink Packets Dropped - QCI 2 Total-Packets Type: Counter	Int32
datastat-uplink-dropstat-qci3totbyte	Data Statistics - Uplink Bytes Dropped - QCI 3 Total-Bytes Type: Counter	Int32
datastat-uplink-dropstat-qci3totpkt	Data Statistics - Uplink Packets Dropped - QCI 3 Total-Packets Type: Counter	Int32
datastat-uplink-dropstat-qci4totbyte	Data Statistics - Uplink Bytes Dropped - QCI 4 Total-Bytes Type: Counter	Int32
datastat-uplink-dropstat-qci4totpkt	Data Statistics - Uplink Packets Dropped - QCI 4 Total-Packets Type: Counter	Int32
datastat-uplink-dropstat-qci5totbyte	Data Statistics - Uplink Bytes Dropped - QCI 5 Total-Bytes Type: Counter	Int32
datastat-uplink-dropstat-qci5totpkt	Data Statistics - Uplink Packets Dropped - QCI 5 Total-Packets Type: Counter	Int32
datastat-uplink-dropstat-qci6totbyte	Data Statistics - Uplink Bytes Dropped - QCI 6 Total-Bytes Type: Counter	Int32
datastat-uplink-dropstat-qci6totpkt	Data Statistics - Uplink Packets Dropped - QCI 6 Total-Packets Type: Counter	Int32
datastat-uplink-dropstat-qci7totbyte	Data Statistics - Uplink Bytes Dropped - QCI 7 Total-Bytes Type: Counter	Int32
datastat-uplink-dropstat-qci7totpkt	Data Statistics - Uplink Packets Dropped - QCI 7 Total-Packets Type: Counter	Int32
datastat-uplink-dropstat-qci8totbyte	Data Statistics - Uplink Bytes Dropped - QCI 8 Total-Bytes Type: Counter	Int32
datastat-uplink-dropstat-qci8totpkt	Data Statistics - Uplink Packets Dropped - QCI 8 Total-Packets Type: Counter	Int32
datastat-uplink-dropstat-qci9totbyte	Data Statistics - Uplink Bytes Dropped - QCI 9 Total-Bytes Type: Counter	Int32

Variables	Description	Data Type
datastat-uplink-dropstat-qci9totpkt	Data Statistics - Uplink Packets Dropped - QCI 9 Total-Packets Type: Counter	Int32
datastat-uplink-dropstat-othertotbyte	Data Statistics - Uplink Bytes Dropped - Other Total-Bytes Type: Counter	Int32
datastat-uplink-dropstat-othertotpkt	Data Statistics - Uplink Packets Dropped - Other Total-Packets Type: Counter	Int32
datastat-downlink-qci1totbyte	Data Statistics - Downlink Stats - QCI 1 Total-Bytes Type: Counter	Int64
datastat-downlink-qci1totpkt	Data Statistics - Downlink Stats - QCI 1 Total-Packets Type: Counter	Int64
datastat-downlink-qci2totbyte	Data Statistics - Downlink Stats - QCI 2 Total-Bytes Type: Counter	Int64
datastat-downlink-qci2totpkt	Data Statistics - Downlink Stats - QCI 2 Total-Packets Type: Counter	Int64
datastat-downlink-qci3totbyte	Data Statistics - Downlink Stats - QCI 3 Total-Bytes Type: Counter	Int64
datastat-downlink-qci3totpkt	Data Statistics - Downlink Stats - QCI 3 Total-Packets Type: Counter	Int64
datastat-downlink-qci4totbyte	Data Statistics - Downlink Stats - QCI 4 Total-Bytes Type: Counter	Int64
datastat-downlink-qci4totpkt	Data Statistics - Downlink Stats - QCI 4 Total-Packets Type: Counter	Int64
datastat-downlink-qci5totbyte	Data Statistics - Downlink Stats - QCI 5 Total-Bytes Type: Counter	Int64
datastat-downlink-qci5totpkt	Data Statistics - Downlink Stats - QCI 5 Total-Packets Type: Counter	Int64
datastat-downlink-qci6totbyte	Data Statistics - Downlink Stats - QCI 6 Total-Bytes Type: Counter	Int64
datastat-downlink-qci6totpkt	Data Statistics - Downlink Stats - QCI 6 Total-Packets Type: Counter	Int64
datastat-downlink-qci7totbyte	Data Statistics - Downlink Stats - QCI 7 Total-Bytes Type: Counter	Int64
datastat-downlink-qci7totpkt	Data Statistics - Downlink Stats - QCI 7 Total-Packets Type: Counter	Int64
datastat-downlink-qci8totbyte	Data Statistics - Downlink Stats - QCI 8 Total-Bytes Type: Counter	Int64
datastat-downlink-qci8totpkt	Data Statistics - Downlink Stats - QCI 8 Total-Packets Type: Counter	Int64

■ Common Syntax Options

Variables	Description	Data Type
datastat-downlink-qci9totbyte	Data Statistics - Downlink Stats - QCI 9 Total-Bytes Type: Counter	Int64
datastat-downlink-qci9totpkt	Data Statistics - Downlink Stats - QCI 9 Total-Packets Type: Counter	Int64
datastat-downlink-othertotbyte	Data Statistics - Downlink Stats - Other Total-Bytes Type: Counter	Int64
datastat-downlink-othertotpkt	Data Statistics - Downlink Stats - Other Total-Packets Type: Counter	Int64
datastat-downlink-dropstat-qci1totbyte	Data Statistics - Downlink Bytes Dropped - QCI 1 Total-Bytes Type: Counter	Int32
datastat-downlink-dropstat-qci1totpkt	Data Statistics - Downlink Packets Dropped - QCI 1 Total-Packets Type: Counter	Int32
datastat-downlink-dropstat-qci2totbyte	Data Statistics - Downlink Bytes Dropped - QCI 2 Total-Bytes Type: Counter	Int32
datastat-downlink-dropstat-qci2totpkt	Data Statistics - Downlink Packets Dropped - QCI 2 Total-Packets Type: Counter	Int32
datastat-downlink-dropstat-qci3totbyte	Data Statistics - Downlink Bytes Dropped - QCI 3 Total-Bytes Type: Counter	Int32
datastat-downlink-dropstat-qci3totpkt	Data Statistics - Downlink Packets Dropped - QCI 3 Total-Packets Type: Counter	Int32
datastat-downlink-dropstat-qci4totbyte	Data Statistics - Downlink Bytes Dropped - QCI 4 Total-Bytes Type: Counter	Int32
datastat-downlink-dropstat-qci4totpkt	Data Statistics - Downlink Packets Dropped - QCI 4 Total-Packets Type: Counter	Int32
datastat-downlink-dropstat-qci5totbyte	Data Statistics - Downlink Bytes Dropped - QCI 5 Total-Bytes Type: Counter	Int32
datastat-downlink-dropstat-qci5totpkt	Data Statistics - Downlink Packets Dropped - QCI 5 Total-Packets Type: Counter	Int32
datastat-downlink-dropstat-qci6totbyte	Data Statistics - Downlink Bytes Dropped - QCI 6 Total-Bytes Type: Counter	Int32
datastat-downlink-dropstat-qci6totpkt	Data Statistics - Downlink Packets Dropped - QCI 6 Total-Packets Type: Counter	Int32
datastat-downlink-dropstat-qci7totbyte	Data Statistics - Downlink Bytes Dropped - QCI 7 Total-Bytes Type: Counter	Int32
datastat-downlink-dropstat-qci7totpkt	Data Statistics - Downlink Packets Dropped - QCI 7 Total-Packets Type: Counter	Int32
datastat-downlink-dropstat-qci8totbyte	Data Statistics - Downlink Bytes Dropped - QCI 8 Total-Bytes Type: Counter	Int32

Variables	Description	Data Type
datastat-downlink-dropstat-qci8totpkt	Data Statistics - Downlink Packets Dropped - QCI 8 Total-Packets Type: Counter	Int32
datastat-downlink-dropstat-qci9totbyte	Data Statistics - Downlink Bytes Dropped - QCI 9 Total-Bytes Type: Counter	Int32
datastat-downlink-dropstat-qci9totpkt	Data Statistics - Downlink Packets Dropped - QCI 9 Total-Packets Type: Counter	Int32
datastat-downlink-dropstat-othertotbyte	Data Statistics - Downlink Bytes Dropped - Other Total-Bytes Type: Counter	Int32
datastat-downlink-dropstat-othertotpkt	Data Statistics - Downlink Packets Dropped - Other Total-Packets Type: Counter	Int32
intersgwhaovstat-pdnin-x2	Inter-SGW Handover Statistics - Total PDNs Incoming - X2 based Type: Counter	Int32
intersgwhaovstat-pdnin-x2-success	Inter-SGW Handover Statistics - Total PDNs Incoming - X2 based - success Type: Counter	Int32
intersgwhaovstat-pdnin-x2-fail	Inter-SGW Handover Statistics - Total PDNs Incoming - X2 based - failure Type: Counter	Int32
intersgwhaovstat-pdnin-idletau	Inter-SGW Handover Statistics - Total PDNs Incoming - Idle-mode TAU Type: Counter	Int32
intersgwhaovstat-pdnin-idletau-success	Inter-SGW Handover Statistics - Total PDNs Incoming - Idle-mode TAU - success Type: Counter	Int32
intersgwhaovstat-pdnin-idletau-fail	Inter-SGW Handover Statistics - Total PDNs Incoming - Idle-mode TAU - failure Type: Counter	Int32
intersgwhaovstat-pdnin-s1	Inter-SGW Handover Statistics - Total PDNs Incoming - S1 Based Type: Counter	Int32
intersgwhaovstat-pdnin-s1-success	Inter-SGW Handover Statistics - Total PDNs Incoming - S1 Based- success Type: Counter	Int32
intersgwhaovstat-pdnin-s1-fail	Inter-SGW Handover Statistics - Total PDNs Incoming - S1 Based - failure Type: Counter	Int32
intersgwhaovstat-pdnout	Inter-SGW Handover Statistics - Total PDNs Outgoing Type: Counter	Int32
intersgwhaovstat-intersystem	Intra-SGW Handover Stats - Inter-system Type: Counter	Int32
intersgwhaovstat-intersystem-success	Intra-SGW Handover Stats - Inter-system - success Type: Counter	Int32
intersgwhaovstat-intersystem-fail	Intra-SGW Handover Stats - Inter-system - failure Type: Counter	Int32
intrasgwhaovstat-intramme	Intra-SGW Handover Stats - Intra-MME Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
intrasgwhaovstat-intramme-success	Intra-SGW Handover Stats - Intra-MME - success Type: Counter	Int32
intrasgwhaovstat-intramme-fail	Intra-SGW Handover Stats - Intra-MME - failure Type: Counter	Int32
intrasgwhaovstat-intermme	Intra-SGW Handover Stats - Inter-MME Type: Counter	Int32
intrasgwhaovstat-intermme-success	Intra-SGW Handover Stats - Inter-MME - success Type: Counter	Int32
intrasgwhaovstat-intermme-fail	Intra-SGW Handover Stats - Inter-MME - failure Type: Counter	Int32
intrasgwhaovstat-intrasgsn	Intra-SGW Handover Stats - Intra-SGSN Type: Counter	Int32
intrasgwhaovstat-intrasgsn-success	Intra-SGW Handover Stats - Intra-SGSN - success Type: Counter	Int32
intrasgwhaovstat-intrasgsn-fail	Intra-SGW Handover Stats - Intra-SGSN - failure Type: Counter	Int32
intrasgwhaovstat-intersgsn	Intra-SGW Handover Stats - Inter-SGSN Type: Counter	Int32
intrasgwhaovstat-intersgsn-success	Intra-SGW Handover Stats - Inter-SGSN - success Type: Counter	Int32
intrasgwhaovstat-intersgsn-fail	Intra-SGW Handover Stats - Inter-SGSN - failure Type: Counter	Int32
intrasgwhaovstat-mme-to-sgsn	Intra-SGW Handover Stats - MME-to-SGSN Type: Counter	Int32
intrasgwhaovstat-mme-to-sgsn-success	Intra-SGW Handover Stats - MME-to-SGSN - success Type: Counter	Int32
intrasgwhaovstat-mme-to-sgsn-fail	Intra-SGW Handover Stats - MME-to-SGSN - failure Type: Counter	Int32
intrasgwhaovstat-sgsn-to-mme	Intra-SGW Handover Stats - SGSN-to-MME Type: Counter	Int32
intrasgwhaovstat-sgsn-to-mme-success	Intra-SGW Handover Stats - SGSN-to-MME - success Type: Counter	Int32
intrasgwhaovstat-sgsn-to-mme-fail	Intra-SGW Handover Stats - SGSN-to-MME - failure Type: Counter	Int32
pagingstat-req	Paging Statistics - Requests Type: Counter	Int32
pagingstat-rej	Paging Statistics - Rejects Type: Counter	Int32

Variables	Description	Data Type
pagingstat-fail	Paging Statistics - Failures Type: Counter	Int32
pagingstat-actidleuetrans	Paging Statistics - Active-Idle UE Transitions Type: Counter	Int32
pagingstat-idleactuetrans	Paging Statistics - Idle-Active UE Transitions Type: Counter	Int32
pagingreldatastat-totbytebuff	Paging Related Data Statistics - Total Bytes Buffered Type: Counter	Int32
pagingreldatastat-disc	Paging Related Data Statistics - Discarded Type: Counter	Int32
misc-updatabeforembreq	Miscellaneous - Uplink Data Before MBReq Type: Counter	Int32
misc-cbregrcvbeforecsrps	Miscellaneous - CBReq Rcvd Before CSRsp Type: Counter	Int32
indftstat-totcur-tunnels	Indirect forward tunneling: The total number of current tunnels. Type: Gauge	Int32
indftstat-totcur-bearers	Indirect forward tunneling: The total number of current bearers. Type: Gauge	Int32
indftstat-totsetup-tunnels	Indirect forward tunneling: The total number of tunnels set up. Type: Counter	Int32
indftstat-totsetup-bearers	Indirect forward tunneling: The total number of bearers set up. Type: Counter	Int32
indftstat-totrel-tunnels	Indirect forward tunneling: The total number of released tunnels. Type: Counter	Int32

s#-downlnk-drop-qci9totpkt	S# Data Statistics: Downlink dropped QCI9 total packets. Type: Counter	Int64

Variables	Description	Data Type
s#-downlnk-drop-othertotbyte	S# Data Statistics: Downlink dropped other total bytes. Type: Counter	Int64
s#-downlnk-drop-othertotpkt	S# Data Statistics: Downlink dropped other total packets. Type: Counter	Int64

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 64

SS7Link Schema Statistics

The SS7Link schema provides operational statistics that can be used for monitoring and troubleshooting the following products: SGSN

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 64. Bulk Statistic Variables in the SS7 Link

Variables	Description	Data Type
-----------	-------------	-----------

■ Common Syntax Options

Variables	Description	Data Type
ss7rd-number	Number identifies the SS7 routing domain. This is a key variable.	Int32
ss7-linkset-id	Link set identifier This is a key variable.	Int32
ss7-link-id	Link identifier This is a key variable.	Int32
ss7-link-mtp3-changeover-order-tx	Changeover order sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-changeover-order-rx	Changeover order received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-changeover-order-ack-tx	Changeover order acknowledgement sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-changeover-order-ack-rx	Changeover order acknowledgement received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-changeback-declaration-tx	Change-back declaration sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-changeback-declaration-rx	Change-back declaration received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-changeback-ack-tx	Change-back acknowledgement sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-changeback-ack-rx	Change-back acknowledgement received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-emergency-changeover-tx	Emergency Changeover sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-emergency-changeover-rx	Emergency Changeover received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-emergency-changeover-ack-tx	Emergency Changeover acknowledgement sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-emergency-changeover-ack-rx	Emergency Changeover acknowledgement received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-inhibit-tx	Link Inhibit sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-inhibit-rx	Link Inhibit received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-inhibit-ack-tx	Link Inhibit acknowledgement sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-inhibit-ack-rx	Link Inhibit acknowledgement received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-uninhibit-tx	Link Uninhibit sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32

Variables	Description	Data Type
ss7-link-mtp3-uninhibit-rx	Link Uninhibit received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-uninhibit-ack-tx	Link Uninhibit acknowledgement sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-uninhibit-ack-rx	Link Uninhibit acknowledgement received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-inhibit-deny-tx	Link Inhibit Denied sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-inhibit-deny-rx	Link Inhibit Denied received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-force-uninhibit-tx	Link force uninhibit sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-force-uninhibit-rx	Link force uninhibit received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-local-inhibit-test-tx	Link local inhibit test sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-local-inhibit-test-rx	Link local inhibit test received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-remote-inhibit-test-tx	Link remote inhibit test sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-remote-inhibit-test-rx	Link remote inhibit test received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-connection-order-tx	Link connection order sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-connection-order-rx	Link connection order received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-connection-order-ack-tx	Link connection order acknowledgement sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-connection-order-ack-rx	Link connection order acknowledgement received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-test-tx	Link Test sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-test-rx	Link Test received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-test-ack-tx	Link Test acknowledgement sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-test-ack-rx	Link Test acknowledgement received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-sif-octet-tx	SIF octets sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-sif-octet-rx	SIF octets received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-sio-octet-tx	SIO octet sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32

Common Syntax Options

Variables	Description	Data Type
ss7-link-mtp3-sio-octet-rx	SIO octet received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-sio-msu-tx	MSUs sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-sio-msu-rx	MSUs received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-tx-msu-dropped	MSUs dropped per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-tx-msu-congestion-dropped	MSUs dropped due to congestion per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-invalid-pdu-rx	Invalid PDUs received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-congestion-threshold1	Link congestion threshold 1 per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-congestion-threshold2	Link congestion threshold 2 per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-congestion-threshold3	Link congestion threshold 3 per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-unavail-duration	Link unavailable duration per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-congested-duration	Link Congested duration per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-mtp3-inhibited-duration	<p>Description: Total inhibited duration of the SS7 MTP3 link in deci-seconds. This counter is specific to releases 8.1 and higher.</p> <p>Triggers:</p> <ol style="list-style-type: none"> 1. Increments when the SGSN's MTP3 link is inhibited, using a management operation command, for maintenance or testing purposes. 2. Increments when the SGSN receives an Inhibit MTP3 message from the remote end. <p>Availability: per MTP3 layer of the SS7 link</p> <p>Type: Counter</p>	Int 32
ss7-signalling-link-failure	<p>Description: Total number of times the MTP3 link has failed between the SGSN and another network element and caused a loss of link connectivity.</p> <p>Triggers: Increments when SS7 signaling link goes to inactive state from active state due to link failure due to:</p> <ul style="list-style-type: none"> - physical link failure - peer restarts - link is put-down by management for maintenance - no response from the peer node and the SSCOP link 'keep-alive- timer timeslot <p>Availability: per SS7 routing domain, per linkset, per link</p> <p>Type: Counter</p>	Int32
ss7-dpc-point-code	Destination Point Code	Int32
ss7-dpc-route-set-test-msg-tx	Route set test messages sent per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-route-set-congestion-test-msg-tx	Route set congestion test message sent per SS7 Routing Domain ID and Destination Point Code.	Int32

Variables	Description	Data Type
ss7-dpc-transfer-prohibited-tx	Transfer prohibited sent per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-transfer-restricted-tx	Transfer restricted sent per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-transfer-allowed-tx	Transfer allowed sent per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-transfer-controlled-tx	Transfer controlled sent per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-sif-octets-tx	Number of SIF octets sent per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-sio-octets-tx	Number of SIO octets sent per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-route-set-test-msg-rx	Route set test message received per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-route-set-congestion-test-msg-rx	Route set congestion test message received per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-transfer-prohibited-rx	Transfer prohibited received per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-transfer-restricted-rx	Transfer restricted received per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-transfer-allowed-rx	Transfer allowed received per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-transfer-controlled-rx	Transfer controlled received per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-usn-msg-rx	Number of USN message received per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-unavailable-duration	Route Unavailable duration per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-dpc-unavailable-count	Route unavailable count per SS7 Routing Domain ID and Destination Point Code.	Int32
ss7-link-sscf-mtp3-frames-tx	MTP3 Frames sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-out-of-service-pdu-tx	Out of service Pdu sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-processor-outage-tx	Processor outage Pdu sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-in-service-pdu-tx	In service Pdu sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-normal-pdu-tx	Normal Pdu sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-emergency-pdu-tx	Emergency Pdu sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-alignment-not-successfull-pdu-tx	Alignment not successful Pdu sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-management-initiated-pdu-tx	Management initiated Pdu sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32

Common Syntax Options

Variables	Description	Data Type
ss7-link-sscf-protocol-error-pdu-tx	Protocol error pdu sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-proving-not-successfull-pdu-tx	Proving not successful Pdu sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-mtp3-frames-rx	MTP3 Frames received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-out-of-service-pdu-rx	Out of service Pdu received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-processor-outage-rx	Processor outage Pdu received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-in-service-pdu-rx	In service Pdu received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-normal-pdu-rx	Normal Pdu received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-emergency-pdu-rx	Emergency Pdu received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-alignment-not-successfull-pdu-rx	Alignment not successful Pdu received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-management-initiated-pdu-rx	Management initiated Pdu received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-protocol-error-pdu-rx	Protocol error PDU received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-sscf-proving-not-successfull-pdu-rx	Proving not successful Pdu received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaaal-vpi	Virtual path identifier per SS7 Routing Domain ID, Linkset ID, and Link ID used for the Quasi Signaling Application Adaptation Layer (QSAAL).	Int32
ss7-link-qsaaal-vci	Virtual channel identifier per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaaal-req-initialization-tx	Request Initialization (BGN) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaaal-req-ack-tx	Request Acknowledgement (BGAK) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaaal-connection-reject-tx	Connection Reject (BGREJ) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaaal-disconnect-command-tx	Disconnect Command (END) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaaal-disconnect-ack-tx	Disconnect Acknowledgement (ENDAK) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaaal-resynchronization-command-tx	Resynchronization Command (RS) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaaal-resynchronization-ack-tx	Resynchronization Acknowledgement (RSAK) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32

Variables	Description	Data Type
ss7-link-qsaal-recovery-command-tx	Recovery Command (ER) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-recovery-ack-tx	Recovery Acknowledgement (ERAK) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-seq-connection-mode-data-tx	Sequenced Connection-mode Data (SD) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-poll-tx	Transmitter State Information with request for Receive State Information (POLL) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-stat-tx	Solicited Receiver State Information (STAT) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-ustat-tx	Unsolicited Receiver State Information (USTAT) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-unnumbered-user-data-tx	Unnumbered User Data (UD) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-unnumbered-management-data-tx	Unnumbered Management Data (MD) sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-unknown-pdu-type-tx	Unknown PDU Type sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-tx-discarded-sdus	SDUs discarded sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-tx-pdus-error-pdus	PdUs with error sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-tx-discarded-pdus	PdUs discarded sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-tx-buffer-in-use-counter	Buffer in-use counter sent per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-tx-buffer-in-use-gauge	Buffer in-use gauge sent per SS7 Routing Domain ID, Linkset ID, and Link ID. This statistic value is of Gauge.	Int32
ss7-link-qsaal-req-initialization-rx	Request Initialization (BGN) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-req-ack-rx	Request Acknowledgement (BGAK) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-connection-reject-rx	Connection Reject (BGREJ) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-disconnect-command-rx	Disconnect Command (END) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-disconnect-ack-rx	Disconnect Acknowledgement (ENDAK) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaal-resynchronization-command-rx	Resynchronization Command (RS) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32

■ Common Syntax Options

Variables	Description	Data Type
ss7-link-qsaa-resynchronization-ack-rx	Resynchronization Acknowledgement (RSAK) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-recovery-command-rx	Recovery Command (ER) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-recovery-ack-rx	Recovery Acknowledgement (ERAK) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-seq-connection-mode-data-rx	Sequenced Connection-mode Data (SD) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-poll-rx	Transmitter State Information with request for Receive State Information (POLL) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-stat-rx	Solicited Receiver State Information (STAT) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-ustat-rx	Unsolicited Receiver State Information (USTAT) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-unnumbered-user-data-rx	Unnumbered User Data (UD) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-unnumbered-management-data-rx	Unnumbered Management Data (MD) received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-unknown-pdu-type-rx	Unknown PDU Type received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-rx-pdus-error-pdus	PDUs with error received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-rx-discarded-pdus	PDUs discarded received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-rx-buffer-in-use-counter	Buffer in-use counter received per SS7 Routing Domain ID, Linkset ID, and Link ID.	Int32
ss7-link-qsaa-rx-buffer-in-use-gauge	Buffer in-use gauge received per SS7 Routing Domain ID, Linkset ID, and Link ID. This statistic value is of Gauge.	Int32

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 65

SS7 Routing Domain Schema Statistics

The SS7 Routing Domain schema provides operational statistics that can be used for monitoring and troubleshooting the following products: SGSN

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 65. SS7 Routing Domain Statistics

Variables	Description	Data Type
-----------	-------------	-----------

■ Common Syntax Options

Variables	Description	Data Type
ss7rd-number	Number identifying the SS7 routing domain This is a key variable.	Int32
ss7rd-asp_instance	The Application Server Process instance in the SS7 Routing domain This is a key variable.	Int32
ss7rd-sctp-init-tx	Total number of SCTP Init chunks sent per SS7 Routing Domain.	Int32
ss7rd-sctp-init-rtx	Total number of SCTP Init chunks resent per SS7 Routing Domain.	Int32
ss7rd-sctp-init-rx	Total number of SCTP Init chunks received per SS7 Routing Domain.	Int32
ss7rd-sctp-init-ack-tx	Total number of number INIT_ACKs sent per SS7 Routing Domain.	Int32
ss7rd-sctp-init-ack-rx	Total number of number INIT_ACKs received per SS7 Routing Domain.	Int32
ss7rd-sctp-shutdown-tx	Total number SHUTDOWNs sent per SS7 Routing Domain.	Int32
ss7rd-sctp-shutdown-rtx	Total number SHUTDOWNs resent per SS7 Routing Domain.	Int32
ss7rd-sctp-shutdown-rx	Total Number SHUTDOWNs received per SS7 Routing Domain.	Int32
ss7rd-sctp-shutdown-ack-tx	Total number of SHUTDOWN_ACKs sent per SS7 Routing Domain.	Int32
ss7rd-sctp-shutdown-ack-rtx	Total number of SHUTDOWN_ACKs resent per SS7 Routing Domain.	Int32
ss7rd-sctp-shutdown-ack-rx	Total number of SHUTDOWN_ACKs received per SS7 Routing Domain.	Int32
ss7rd-sctp-cookie-tx	Total number of COOKIES sent per SS7 Routing Domain.	Int32
ss7rd-sctp-cookie-rtx	Total number COOKIES resent per SS7 Routing Domain.	Int32
ss7rd-sctp-cookie-rx	Total number of COOKIES received per SS7 Routing Domain.	Int32
ss7rd-sctp-cookie-ack-tx	Total number of COOKIE_ACKs sent per SS7 Routing Domain.	Int32
ss7rd-sctp-cookie-ack-rx	Total number COOKIE_ACKs received per SS7 Routing Domain.	Int32
ss7rd-sctp-data-tx	Total number of DATAs sent per SS7 Routing Domain.	Int32
ss7rd-sctp-data-rtx	Total number of DATAs resent per SS7 Routing Domain.	Int32
ss7rd-sctp-data-rx	Total number of DATAs received per SS7 Routing Domain.	Int32
ss7rd-sctp-sack-tx	Total number of SACKs sent per SS7 Routing Domain.	Int32
ss7rd-sctp-sack-rx	Total number of SACKs received per SS7 Routing Domain.	Int32
ss7rd-sctp-shutdown-compl-tx	Total number of Shutdown completed sent per SS7 Routing Domain.	Int32
ss7rd-sctp-shutdown-compl-rx	Total number of Shutdown completed received per SS7 Routing Domain.	Int32

Variables	Description	Data Type
ss7rd-sctp-heartbeat-tx	Total number of HEARTBEATs sent per SS7 Routing Domain.	Int32
ss7rd-sctp-heartbeat-rx	Total number of HEARTBEATs received per SS7 Routing Domain.	Int32
ss7rd-sctp-heartbeat-ack-tx	Total number of HBEAT_ACKs sent per SS7 Routing Domain.	Int32
ss7rd-sctp-heartbeat-ack-rx	Total number of HBEAT_ACKs received per SS7 Routing Domain.	Int32
ss7rd-sctp-abort-tx	Total number of ABORTs sent per SS7 Routing Domain.	Int32
ss7rd-sctp-abort-rx	Total number of ABORTs received per SS7 Routing Domain.	Int32
ss7rd-sctp-error-tx	Total number of Errors sent per SS7 Routing Domain.	Int32
ss7rd-sctp-error-rx	Total number of Errors received per SS7 Routing Domain.	Int32
ss7rd-sctp-bytes-tx	Total number of bytes sent per SS7 Routing Domain.	Int32
ss7rd-sctp-bytes-rx	Total number of bytes received per SS7 Routing Domain.	Int32
ss7rd-m3ua-data-tx	Total number of M3UA DATA messages sent	Int32
ss7rd-m3ua-duna-tx	Total number of M3UA DUNA messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-dava-tx	Total number of M3UA DAVA messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-daud-tx	Total number of M3UA DAUD messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-scon-tx	Total number of M3UA SCON messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-dupu-tx	Total number of M3UA DUPU messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-drst-tx	Total number of M3UA DRST messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-regreq-tx	Total number of M3UA REG-REQ messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-regrsp-tx	Total number of M3UA REG-RSP messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-deregreq-tx	Total number of M3UA DEREG-REQ messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-deregrsp-tx	Total number of M3UA DEREG-RSP messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspup-tx	Total number of M3UA ASPUP messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspup-ack-tx	Total number of M3UA ASPUP ACK messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspdn-tx	Total number of M3UA ASPDN messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspdn-ack-tx	Total number of M3UA ASPDN ACK messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspac-tx	Total number of M3UA ASPAC messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspac-ack-tx	Total number of M3UA ASPAC ACK messages sent per SS7 Routing Domain.	Int32

■ Common Syntax Options

Variables	Description	Data Type
ss7rd-m3ua-aspia-tx	Total number of M3UA SPIA messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspia-ack-tx	Total number of M3UA SPIA ACK messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-hearbeat-tx	Total number of M3UA HBEAT messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-hearbeat-ack-tx	Total number of M3UA HBEAT ACK messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-error-tx	Total number of M3UA ERR messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-notify-tx	Total number of M3UA NTFY messages sent per SS7 Routing Domain.	Int32
ss7rd-m3ua-data-rx	Total number of M3UA DATA messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-duna-rx	Total number of M3UA DUNA messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-dava-rx	Total number of M3UA DAVA messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-daud-rx	Total number of M3UA DAUD messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-scon-rx	Total number of M3UA SCON messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-dupu-rx	Total number of M3UA DUPU messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-drst-rx	Total number of M3UA DRST messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-regreq-rx	Total number of M3UA REG-REQ messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-regrsp-rx	Total number of M3UA REG-RSP messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-deregreq-rx	Total number of M3UA DEREG-REQ messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-deregrsp-rx	Total number of M3UA DEREG-RSP messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspup-rx	Total number of M3UA ASPUP messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspup-ack-rx	Total number of M3UA ASPUP ACK messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspdn-rx	Total number of M3UA ASPDN messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspdn-ack-rx	Total number of M3UA ASPDN ACK messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspac-rx	Total number of M3UA ASPAC messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspac-ack-rx	Total number of M3UA ASPAC ACK messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspia-rx	Total number of M3UA SPIA messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-aspia-ack-rx	Total number of M3UA SPIA ACK messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-hearbeat-rx	Total number of M3UA HBEAT messages received per SS7 Routing Domain.	Int32

Variables	Description	Data Type
ss7rd-m3ua-hearbeat-ack-rx	Total number of M3UA HBEAT ACK messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-error-rx	Total number of M3UA ERR messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-notify-rx	Total number of M3UA NTFY messages received per SS7 Routing Domain.	Int32
ss7rd-m3ua-lower-intf-pdu-tx	Description: Total number of PDUs transmitted to lower interface (SCTP layer). Triggers: Availability: per SS7 routing domain Type: Counter (Proprietary)	Int32
ss7rd-m3ua-lower-intf-pdusize-tx	Size of DATA PDUs transmitted on lower interface per SS7 Routing Domain.	Int32
ss7rd-m3ua-lower-intf-pdu-rx	Number of DATA PDUs received on lower interface per SS7 Routing Domain.	Int32
ss7rd-m3ua-lower-intf-pdusize-rx	Size of DATA PDUs received on lower interface per SS7 Routing Domain.	Int32
ss7rd-m3ua-upper-intf-pdu-tx	Number of DATA PDUs transmitted on upper interface per SS7 Routing Domain.	Int32
ss7rd-m3ua-upper-intf-pdusize-tx	Size of DATA PDUs transmitted on upper interface per SS7 Routing Domain.	Int32
ss7rd-m3ua-upper-intf-pdu-rx	Number of DATA PDUs received on upper interface per SS7 Routing Domain.	Int32
ss7rd-m3ua-upper-intf-pdusize-rx	Size of DATA PDUs received on upper interface per SS7 Routing Domain.	Int32
ss7rd-m3ua-down-no-route-found	Layer Data Error Statistics downward: no route found per SS7 Routing Domain.	Int32
ss7rd-m3ua-down-pc-unavailable	Layer Data Error Statistics downward: point code unavailable per SS7 Routing Domain.	Int32
ss7rd-m3ua-down-pc-congested	Layer Data Error Statistics downward: point code congested per SS7 Routing Domain.	Int32
ss7rd-m3ua-down-no-ppsp-avail	Layer Data Error Statistics downward: no PSP available per SS7 Routing Domain.	Int32
ss7rd-m3ua-down-no-nsap-avail	Layer Data Error Statistics downward: no NSAP available per SS7 Routing Domain.	Int32
ss7rd-m3ua-down-msg-failed	Layer Data Error Statistics downward: M3UA message failed per SS7 Routing Domain.	Int32
ss7rd-m3ua-down-loadshare-failed	Layer Data Error Statistics downward: load-sharing failed per SS7 Routing Domain.	Int32
ss7rd-m3ua-down-data-conges-q	Layer Data Error Statistics downward: data queued in congested Q per SS7 Routing Domain.	Int32

■ Common Syntax Options

Variables	Description	Data Type
ss7rd-m3ua-down-data-as-pend-q	Layer Data Error Statistics downward: data queued in AS pending Q per SS7 Routing Domain.	Int32
ss7rd-m3ua-up-no-route-found	Layer Data Error Statistics upward: no route found per SS7 Routing Domain.	Int32
ss7rd-m3ua-up-pc-unavailable	Layer Data Error Statistics upward: point code unavailable per SS7 Routing Domain.	Int32
ss7rd-m3ua-up-pc-congested	Layer Data Error Statistics upward: point code congested per SS7 Routing Domain.	Int32
ss7rd-m3ua-up-no-psp-avail	Layer Data Error Statistics upward: no PSP available per SS7 Routing Domain.	Int32
ss7rd-m3ua-up-no-nsap-avail	Layer Data Error Statistics upward: no NSAP available per SS7 Routing Domain.	Int32
ss7rd-m3ua-up-msg-failed	Layer Data Error Statistics upward: M3UA message failed per SS7 Routing Domain.	Int32
ss7rd-m3ua-up-loadshare-failed	Layer Data Error Statistics upward: load-sharing failed per SS7 Routing Domain.	Int32
ss7rd-m3ua-up-data-conges-q	Layer Data Error Statistics upward: data queued in congested Q per SS7 Routing Domain.	Int32
ss7rd-m3ua-up-data-as-pend-q	Layer Data Error Statistics upward: data queued in AS pending Q per SS7 Routing Domain.	Int32
ss7rd-m3ua-psp-ps-id	Peer Server Identifier This is a key variable.	Int32
ss7rd-m3ua-psp-instance	Peer Server Process Instance This is a key variable.	Int32
ss7rd-m3ua-psp-data-tx	Total number of M3UA PSP DATA messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-psp-duna-tx	Total number of M3UA PSP DUNA messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-psp-dava-tx	Total number of M3UA PSP DAVA messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-psp-daud-tx	Total number of M3UA PSP DAUD messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-psp-scon-tx	Total number of M3UA SCON messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-psp-dupu-tx	Total number of M3UA PSP DUPU messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-psp-drst-tx	Total number of M3UA PSP DRST messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32

Variables	Description	Data Type
ss7rd-m3ua-ppsp-regreq-tx	Total number of M3UA PSP REG-REQ messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-regrsp-tx	Total number of M3UA PSP REG-RSP messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-dereqreq-tx	Total number of M3UA PSP DEREG-REQ messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-deregrsp-tx	Total number of M3UA PSP DEREG-RSP messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspup-tx	Total number of M3UA PSP ASPUP messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspup-ack-tx	Total number of M3UA PSP ASPUP ACK messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspdn-tx	Total number of M3UA PSP ASPDN messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspdn-ack-tx	Total number of M3UA PSP ASPDN ACK messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspac-tx	Total number of M3UA PSP ASPAC messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspac-ack-tx	Total number of M3UA PSP ASPAC ACK messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspia-tx	Total number of M3UA PSP ASPIA messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspia-ack-tx	Total number of M3UA PSP ASPIA ACK messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-hearbeat-tx	Total number of M3UA PSP HBEAT messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-hearbeat-ack-tx	Total number of M3UA PSP HBEAT ACK messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-error-tx	Total number of M3UA PSP ERR messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-notify-tx	Total number of M3UA PSP NTFY messages sent per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-data-rx	Total number of M3UA PSP DATA messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-duna-rx	Total number of M3UA PSP DUNA messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-dava-rx	Total number of M3UA PSP DAVA messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32

■ Common Syntax Options

Variables	Description	Data Type
ss7rd-m3ua-ppsp-daud-rx	Total number of M3UA PSP DAUD messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-scon-rx	Total number of M3UA PSP SCON messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-dupu-rx	Total number of M3UA PSP DUPU messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-drst-rx	Total number of M3UA PSP DRST messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-regreq-rx	Total number of M3UA PSP REG-REQ messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-regrsp-rx	Total number of M3UA PSP REG-RSP messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-deregreq-rx	Total number of M3UA PSP DEREG-REQ messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-deregrsp-rx	Total number of M3UA PSP DEREG-RSP messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspup-rx	Total number of M3UA PSP ASPUP messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspup-ack-rx	Total number of M3UA PSP ASPUP ACK messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspdn-rx	Total number of M3UA PSP ASPDN messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspdn-ack-rx	Total number of M3UA PSP ASPDN ACK messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspac-rx	Total number of M3UA PSP ASPAC messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspac-ack-rx	Total number of M3UA PSP ASPAC ACK messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspia-rx	Total number of M3UA PSP ASPIA messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-aspia-ack-rx	Total number of M3UA PSP ASPIA ACK messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-hearbeat-rx	Total number of M3UA PSP HBEAT messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-hearbeat-ack-rx	Total number of M3UA PSP HBEAT ACK messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-error-rx	Total number of M3UA PSP ERR messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32

Variables	Description	Data Type
ss7rd-m3ua-ssp-notify-rx	Total number of M3UA PSP NTFY messages received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-data-pdu-tx	Number of PSP DATA PDUs transmitted per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-data-pdusize-tx	Size of DATA PDUs transmitted per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-data-pdu-rx	Number of DATA PDUs received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-data-pdusize-rx	Size of DATA PDUs received per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-up-no-route-found	Layer Data Error Statistics: no route found per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-up-pc-unavailable	Layer Data Error Statistics: point code unavailable per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-up-pc-congested	Layer Data Error Statistics: point code congested per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-up-no-ssp-avail	Layer Data Error Statistics: no PSP available per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-up-no-nsap-avail	Layer Data Error Statistics: no NSAP available per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-up-msg-failed	Layer Data Error Statistics: M3UA message failed per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-up-loadshare-failed	Layer Data Error Statistics: load-sharing failed per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-up-data-conges-q	Layer Data Error Statistics: data queued in congested Q per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-up-data-as-pend-q	Layer Data Error Statistics: data queued in AS pending Q per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-congestion-count	Congestion count per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-congestion-level1	Congestion level 1 per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-congestion-level2	Congestion level 2 per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-congestion-level3	Congestion level 3 per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ssp-congestion-queue-size	Congestion queue size per SS7 Routing Domain, peer server ID, and PSP instance.	Int32

■ Common Syntax Options

Variables	Description	Data Type
ss7rd-m3ua-ppsp-congestion-queue-hw	Congestion queue Hw per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-congestion-duration	Duration of Congestion per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-unavailable-count	Unavailable count per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-m3ua-ppsp-unavailable-duration	Unavailable duration per SS7 Routing Domain, peer server ID, and PSP instance.	Int32
ss7rd-mtp3-user-part-unavail-tx	Description: Total number of MTP3 User-part Unavailable messages that were sent. Triggers: Increments when a message is sent. Availability: per SS7 routing domain Type: Counter (ITU Q.704, ANSI T1.114)	Int32
ss7rd-mtp3-traffic-restart-allowed-tx	Description: Total number of MTP3 Traffic Restart Allowed messages that were sent. Triggers: Increments <ul style="list-style-type: none"> 1. when the first signalling link of a signalling linkset is available. 2. in the case of an ANSI variant, when a Traffic Restart Waiting message is received. Availability: per SS7 routing domain Type: Counter (ITU Q.704, ANSI T1.114)	Int32
ss7rd-mtp3-traffic-restart-waiting-tx	Description: Total number of MTP3 Traffic Restart Waiting messages that were sent. Triggers: Increments when the first signalling link of a signalling link set is available. Availability: per SS7 routing domain Type: Counter (ITU Q.704, ANSI T1.114)	Int32
ss7rd-mtp3-user-part-unavail-rx	Description: Total number of MTP3 User-part Unavailable messages that were received. Triggers: Increments when a message is received. Availability: per SS7 routing domain Type: Counter (ITU Q.704, ANSI T1.114)	Int32
ss7rd-mtp3-traffic-restart-allowed-rx	Description: Total number of MTP3 Traffic Restart Allowed messages that were received. Triggers: Increments when a message is received. Availability: per SS7 routing domain Type: Counter (ITU Q.704, ANSI T1.114)	Int32
ss7rd-mtp3-traffic-restart-waiting-rx	Description: Total number of MTP3 Traffic Restart Waiting messages that were received. Triggers: Increments when a message is received. Availability: per SS7 routing domain Type: Counter (ITU Q.704, ANSI T1.114)	Int32

Variables	Description	Data Type
ss7rd-mtp3-msu-dropped-routing-err	<p>Description: Total number of M3UA messages dropped due to routing error.</p> <p>Triggers: Increments for anyone of the following:</p> <ol style="list-style-type: none"> 1. signalling point code restart, 2. route restart, 3. no route found, 4. no NSAP found, 5. invalid SLS, 6. invalid link type, 7. invalid data. <p>Availability: per SS7 routing domain Type: Counter - Proprietary</p>	Int32
ss7-adjacent-point-code	<p>Adjacent Point Code This is a key variable.</p>	Int32
ss7-adjacent-spc-not-accessible	<p>Description: Total number of failures to access the adjacent (directly connected via SS7 link) signaling point code (SPC) element, such as the RNC, HLR, signaling gateway, etc.,.</p> <p>Triggers: Increments when the adjacent SPC goes to unavailable state from available state, possibly due to:</p> <ul style="list-style-type: none"> - all SS7 links connected to the adjacent SPC are unavailable - the adjacent SPC is made inaccessible by management <p>Availability: per adjacent point code Type: Counter</p>	Int32
<p> IMPORTANT: For information on statistics that are common to all schema see the <i>Statistics and Counters Overview</i> chapter.</p>		

Chapter 66

System Schema Statistics

The System schema provides operational statistics that can be used for monitoring and troubleshooting the following products: All

This schema provides the following types of statistics:

- **Counter:** A counter records incremental data cumulatively and rolls over when the counter limit is reached.
 - All counter statistics are cumulative and reset only by one of the following methods: roll-over when limit is reached, after a system restart, or after a clear command is performed.
 - The limit depends upon the data type.
- **Gauge:** A gauge statistic indicates a single value; a snapshot representation of a single point in time within a defined time frame. The gauge changes to a new value with each snapshot though a value may repeat from one period to the next. The limit depends upon the data type.
- **Information:** This type of statistic provides information, often intended to differentiate sets of statistics; for example, a VPN name or IP address. The type of information provided depends upon the data type.

The data type defines the format of the data for the value provided by the statistic. The following data types are used in statistics for this schema:

- **Int32/Int64:** An integer, either 32-bit or 64-bit:
 - For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295.
 - For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.
- **Float:** A numeric value that can be represented fractionally; for example, 1.345.
- **String:** A series of ASCII alphanumeric characters in a single grouping, usually pre-configured.

 **IMPORTANT:** Unless otherwise indicated, all statistics are counters and all statistics are standards-based.

Key Variables: Every schema has some variables which are typically referred to as 'key variables'. These key variables provide index markers to identify which object the statistics apply to. For example, in the card schema, the card number (variable %card%) uniquely identifies a card. For an HA service, the keys would be "%vpnname%" plus "%servname%", as the combination uniquely identifies an HA service. So, in a given measurement interval, one row of statistics will be generated per unique key. The schema keys are identified in the Description section of the table.

Table 66. Bulk Statistic Variables in the System-Level Schema

Variables	Description	Data Type
-----------	-------------	-----------

Variables	Description	Data Type
sess-ttlarrived	Description: The total number of calls for all Session Managers for which registration requests were received. Type: Counter	Int32
sess-ttlrejected	Description: The total number of calls for all Session Managers that were rejected. Type: Counter	Int32
sess-ttlconnected	Description: The total number of calls for all Session Managers that are connected (including active, dormant, being set up, and being torn down). Type: Gauge	Int32
sess-ttlfailed	Description: The total number of calls for all Session Managers that failed. Type: Counter	Int32
sess-ttldisconn	Description: The total number of calls disconnected for all Session Managers. Type: Counter	Int32
sess-ttlhandoff	Description: The total number of handoffs for all Session Managers. Type: Counter	Int64
sess-ttlrenewal	Description: The total number of renewals for all Session Managers. Type: Counter	Int64
sess-ttlcallop	Description: The total number of call operations for all Session Managers. The number of call operations is calculated as the total number of calls that arrived, were rejected, were disconnected, handed-off, and renewed. Type: Counter	Int64
sess-ttlauthsucc	Description: The total number of successful authentications for calls for all Session Managers. Trigger: Increments whenever the local or RADIUS authentication is successful for a session. Availability: Per Session Manager instance Type: Counter	Int32
sess-ttlauthfail	Description: The total number of failed authentications for calls for all Session Managers. Trigger: Increments whenever the local or RADIUS authentication fails for a session. Availability: Per Session Manager instance Type: Counter	Int32
sess-curaaaactive	Description: Indicates the number of currently active AAA sessions for all Session Managers. Trigger: Increments whenever a new AAA session is established. Decrements when the session is disconnected Availability: Per Session Manager instance Type: Gauge	Int32

Variables	Description	Data Type
sess-curaaaadeleting	<p>Description: Indicates the number of current AAA sessions being deleted for all Session Managers.</p> <p>Trigger: Increments when a AAA session is disconnected and the final accounting message is still pending to be delivered to an external server. Decrements when the final accounting message is delivered to the server.</p> <p>Availability: Per Session Manager instance</p> <p>Type: Gauge</p>	Int32
sess-curaaaacctpending	<p>Description: Indicates the number of current AAA sessions with accounting pending for all Session Managers.</p> <p>Trigger: Increments for every occurrence of AAA sessions with accounting message pending for all Session Managers. Decrements when the accounting message is delivered to the external server.</p> <p>Availability: Per Session Manager instance</p> <p>Type: Gauge</p>	Int32
sess-curaaaacctitemsused	<p>Description: Indicates the number of current AAA accounting items used by all Session Manager instances.</p> <p>Trigger: Increments whenever the current AAA accounting request is generated and used by all Session Manager instances. Decrements when the accounting message is delivered to the external server.</p> <p>Availability: Per Session Manager instance</p> <p>Type: Gauge</p>	Int32
sess-curaaaacctitemsmax	<p>Description: Indicates the number of current AAA accounting items allowed by all Session Manager instances.</p> <p>Trigger: Increments whenever the current AAA accounting request is allowed by all Session Manager instances.</p> <p>Availability: Per Session Manager instance</p> <p>Type: Gauge</p>	Int32
sess-curaaabuffused	<p>Description: Indicates the number of current AAA buffer space in megabytes used by all Session Manager instances.</p> <p>Trigger: Increments whenever the current AAA buffer is allocated and used by all Session Manager instances. Decrements whenever the current AAA buffer is freed for use.</p> <p>Availability: Per Session Manager instance</p> <p>Type: Gauge</p>	Int32
sess-curaaabuffmax	<p>Description: Indicates the current maximum AAA buffer space allowed in megabytes used by all Session Manager instances.</p> <p>Trigger: Increments whenever the current AAA buffer space is allowed and used by all Session Manager.</p> <p>Availability: Per Session Manager instance</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
sess-ttlaaacanauth	<p>Description: The total number of AAA authentication requests cancelled by all Session Manager instances. The cancellation can be due to various reasons like administrative clear or access side call clear, etc.</p> <p>Trigger: Increments when a Session Manager cancels an outstanding authentication request which is waiting for a response from authentication server.</p> <p>Availability: Per Session Manager instance</p> <p>Type: Counter</p>	Int32
sess-ttlaaacctpurged	<p>Description: The total number of AAA accounting requests received by this Session Manager instance, that have to be purged for all Session Managers because the storage limit of pending accounting requests has exceeded.</p> <p>Trigger: Increments whenever a AAA accounting request has to be purged for all Session Managers</p> <p>Availability: Per Session Manager instance</p> <p>Type: Counter</p>	Int32
sess-ttlradacctpurged	<p>Description: The total number of RADIUS accounting requests received by this Session Manager instance, that have to be purged for all Session Managers because the storage limit of pending accounting requests has exceeded.</p> <p>Trigger: Increments whenever a RADIUS accounting request has to be purged for all Session Managers</p> <p>Availability: Per Session Manager instance</p> <p>Type: Counter</p>	Int32
sess-ttlcpup	<p>Description: The total number of calls for all Session Managers that have completed the Link Control Protocol (LCP) phase of the registration process.</p> <p>Type: Counter</p>	Int32
sess-ttlipcpup	<p>Description: The total number of calls for all Session Managers that have completed the Internet Protocol Control Protocol (IPCP) phase of the registration process.</p> <p>Type: Counter</p>	Int32
sess-ttlsrcviol	<p>Description: The total number of source violations experienced for all calls for all Session Managers.</p> <p>Type: Counter</p>	Int32
sess-ttlkeepfail	<p>Description: The total number of keep-alive failures experienced for all calls for all Session Managers.</p> <p>Type: Counter</p>	Int32
sess-ttlempyfwd	<p>Description: The total number of empty forwarded packet sessions.</p> <p>Type: Counter</p>	Int32
sess-ttlempyrev	<p>Description: The total number of empty reverse packet sessions.</p> <p>Type: Counter</p>	Int32
sess-ttlproxydns-redirect	<p>Description: The total number of sessions redirected by Proxy-DNS.</p> <p>Type: Counter</p>	Int32
sess-ttlproxydns-passthru	<p>Description: The total number of sessions passed through by Proxy-DNS.</p> <p>Type: Counter</p>	Int32
sess-ttlproxydns-drop	<p>Description: The total number of sessions dropped by Proxy-DNS.</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
sess-curtlcalls	Description: The number of calls for all Session Managers that are currently in progress (active, dormant, being set up, or being torn down). Type: Gauge	Int32
sess-curnonanchorconn	Description: The total number of non-anchor session connections on ASN-GW. Type: Counter	Int32
sess-curauthonlyconn	Description: The total number of calls which connected in Auth-Only mode. Type: Counter	Int32
sess-cursipconn	Description: The total number of Simple IP data sessions that are currently being supported for all Session Managers. Type: Gauge	Int32
sess-curmipconn	Description: The total number of Mobile IP data sessions that are currently being supported for all Session Managers. Type: Gauge	Int32
sess-curpmipconn	Description: The total number of Proxy Mobile IP data sessions that are currently being supported for all Session Managers. Type: Gauge	Int32
sess-curhaipseconn	Description: The total number of sessions that are in progress in the HA-IPSEC connected state Type: Gauge	Int32
sess-curl2tplacconn	Description: The number of L2TP LAC sessions that are currently being supported for all Session Managers. Type: Gauge	Int32
sess-curpdptypeipconn	Description: The number of sessions that are currently in progress in the PDP-TYPE-IP Connected State Type: Gauge	Int32
sess-curpdtypepppconn	Description: The number of sessions that are currently in progress in the PDP-TYPE-PPP Connected State Type: Gauge	Int32
sess-curbcmesconn	Description: The number of sessions that are currently in progress in the BCMCS Connected State. Type: Gauge	Int32
sess-curactcall	Description: The number of sessions currently active for all Session Managers. Type: Gauge	Int32
sess-curdormcall	Description: The number of sessions currently dormant for all Session Managers. Type: Gauge	Int32
sess-curalwayson	Description: The number of always-on calls that are currently in progress. Type: Gauge	Int32
sess-curarrived	Description: The number of sessions that are currently at the onset of the registration process for all Session Managers. Type: Gauge	Int32

■ Common Syntax Options

Variables	Description	Data Type
sess-curlcpnegot	Description: The number of sessions for all Session Managers that are currently in the Link Control Protocol (LCP) negotiation phase of the registration process. Type: Gauge	Int32
sess-curlcpup	Description: The number of sessions for all Session Managers that have just completed the Link Control Protocol (LCP) negotiation phase of the registration process. Type: Gauge	Int32
sess-curauth	Description: The number of sessions for all Session Managers that are currently in the process of being authenticated. Type: Gauge	Int32
sess-curbcmcsauth	Description: The number of sessions currently in progress that are at the BCMCS Service Authenticating state. Type: Gauge	Int32
sess-curauthed	Description: The number of sessions for all Session Managers that have just completed the authentication phase of the registration process. Type: Gauge	Int32
sess-curdhcpending	Description: The number of sessions for all Session Managers that are pending for DHCP. Type: Gauge	Int32
sess-curl2tplacconnecting	Description: The number of sessions currently in progress that are at the L2TP-LAC Connecting state. Type: Gauge	Int32
sess-curipcpup	Description: The number of sessions for all Session Managers that have just completed the Internet Protocol Control Protocol (IPCP) phase of the registration process. Type: Gauge	Int32
sess-curimsauthorizing	Description: The number of sessions for all Session Managers that are currently in the process of being authorized for IMS. Type: Gauge	Int32
sess-curimsauthorized	Description: The number of sessions for all Session Managers that are currently being authorized for IMS. Type: Gauge	Int32
sess-curimmeattached	Description: The total number of MME sessions that are currently attached with this MME. Type: Gauge	Int32
sess-curdisc	Description: The number of sessions for all Session Managers that are currently in the process of disconnecting. Type: Gauge	Int32
sess-ttlprepaid	Description: The total number of pre-paid sessions processed by all Session Managers. Type: Counter	Int32
sess-curprepaid	Description: The number of pre-paid sessions currently being processed by all Session Managers. Type: Gauge	Int32

Variables	Description	Data Type
sess-tlonlineauthreq	Description: The total number of 3GPP2 online authentication requests for all Session Managers. Trigger: Increments whenever 3GPP2 RADIUS prepaid online authentication requests are sent out Availability: Per Session Manager instance Type: Counter	Int32
sess-tlonlineauthsucc	Description: The total number of successful authentications for Online Access Requests for all Session Managers. Trigger: Increments whenever 3GPP2 RADIUS prepaid online authentication successful message is received Availability: Per Session Manager instance Type: Counter	Int32
sess-tlonlineauthfail	Description: The total number of failed authentications for Online Access Requests for all Session Managers. Trigger: Increments whenever 3GPP2 RADIUS prepaid online authentication failure happens Availability: Per Session Manager instance Type: Counter	Int32
sess-tlonlineprepaiderr	Description: The total number of 3GPP2 online prepaid errors. Trigger: Increments whenever 3GPP2 RADIUS prepaid online authentication response is not honored due to failures like attribute missing, etc Availability: Per Session Manager instance Type: Counter	Int32
sess-ttlprepaidinitautherr	Description: The total number of 3GPP2 prepaid initial authorization errors. Trigger: Increments when 3GPP2 RADIUS prepaid online authentication rejects for the first online access request Availability: Per Session Manager instance Type: Counter	Int32
sess-ttlcrprattempt	Description: The total number of Closed RP-RP attempted handoffs. Type: Counter	Int32
sess-ttlcrprsuccess	Description: The total number of Closed RP-RP successful handoffs. Type: Counter	Int32
sess-ttlrcrprattempt	Description: The total number of RP-Closed RP attempted handoff s Type: Counter	Int32
sess-ttlrcrprsuccess	Description: The total number of RP-Closed RP successful handoffs. Type: Counter	Int32
sess-tlinterasngwattempt	Description: The total number of sessions attempting inter-ASN-GW handovers. Type: Counter	Int32
sess-tlinterasngwsuccess	Description: The total number of sessions successfully completing inter-ASN-GW handovers. Type: Counter	Int32
sess-tlintraasngwattempt	Description: The total number of sessions attempting intra-ASN-GW handovers. Type: Counter	Int32

Variables	Description	Data Type
sess-tlintraasngwsuccess	Description: The total number of sessions successfully completing intra-ASN-GW handovers. Type: Counter	Int32
sess-rxpkt-16	Description: The total number of uplink packets of less than 17 bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-tpkt-16	Description: The total number of downlink packets of less than 17 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpkt-64	Description: The total number of uplink packets between 17 and 64 bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-tpkt-64	Description: The total number of downlink packets between 17 and 64 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpkt-127	Description: The total number of uplink packets between 65 and 127 bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-tpkt-127	Description: The total number of downlink packets between 65 and 127 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpkt-255	Description: The total number of uplink packets between 128 and 255 bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-tpkt-255	Description: The total number of downlink packets between 128 and 255 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpkt-511	Description: The total number of uplink packets between 256 and 511 bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-tpkt-511	Description: The total number of downlink packets between 256 and 511 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpkt-1023	Description: The total number of uplink packets between 512 and 1023 bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-tpkt-1023	Description: The total number of downlink packets between 512 and 1023 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpkt-2047	Description: The total number of uplink packets between 1024 and 2047 bytes sent from UEs to all Session Managers. Type: Counter	Int64

Variables	Description	Data Type
sess-txpkt-2047	Description: The total number of downlink packets between 1024 and 2047 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpkt-4095	Description: The total number of uplink packets between 2048 and 4095 bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-txpkt-4095	Description: The total number of downlink packets between 2048 and 4095 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpkt-4500	Description: The total number of uplink packets between 4096 and 4500 bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-txpkt-4500	Description: The total number of downlink packets between 4096 and 4500 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpkt-over4500	Description: The total number of uplink packets greater than 4500 bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-txpkt-over4500	Description: The total number of downlink packets greater than 4500 bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-txbytes	Description: The number of downlink bytes sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxbytes	Description: The number of uplink bytes sent from UEs to all Session Managers. Type: Counter	Int64
sess-txpackets	Description: The number of downlink packets sent to UEs from all Session Managers. Type: Counter	Int64
sess-rxpackets	Description: The number of uplink packets sent from UEs to all Session Managers. Type: Counter	Int64
sess-ttlconnected-1xrtt	Description: The total number of sessions connected with 1xRTT. Type: Counter	Int32
sess-txbytes-1xrtt	Description: The number of bytes transmitted via 1xRTT. Type: Counter	Int64
sess-rxbytes-1xrtt	Description: The number of bytes received via 1xRTT. Type: Counter	Int64
sess-txpackets-1xrtt	Description: The number of packets transmitted via 1xRTT. Type: Counter	Int64
sess-rxpackets-1xrtt	Description: The number of packets received via 1xRTT. Type: Counter	Int64

Variables	Description	Data Type
sess-ttlconnected-evdorev0	Description: The total number of sessions connected with EvDO Rev 0. Type: Counter	Int32
sess-txbytes-evdorev0	Description: The number of bytes transmitted via EvDO Rev 0. Type: Counter	Int64
sess-rxbytes-evdorev0	Description: The number of bytes received via EvDO Rev 0. Type: Counter	Int64
sess-txpackets-evdorev0	Description: The number of packets transmitted via EvDO Rev 0. Type: Counter	Int64
sess-rxpackets-evdorev0	Description: The number of packets received via EvDO Rev 0. Type: Counter	Int64
sess-ttlconnected-evdoreva	Description: The total number of sessions connected with EvDO Rev A. Type: Counter	Int32
sess-txbytes-evdoreva	Description: The number of bytes transmitted via EvDO Rev A. Type: Counter	Int64
sess-rxbytes-evdoreva	Description: The number of bytes received via EvDO Rev A. Type: Counter	Int64
sess-txpackets-evdoreva	Description: The number of packets transmitted via EvDO Rev A. Type: Counter	Int64
sess-rxpackets-evdoreva	Description: The number of packets received via EvDO Rev A. Type: Counter	Int64
sess-siptxbytes	Description: The number of bytes transmitted via Simple IP-type sessions. Type: Counter	Int64
sess-siprxbytes	Description: The number of bytes received for Simple IP-type sessions. Type: Counter	Int64
sess-miptxbytes	Description: The number of bytes transmitted for Mobile IP-type sessions. Type: Counter	Int64
sess-miprxbytes	Description: The number of bytes received for Mobile IP-type sessions. Type: Counter	Int64
sess-calldur-1min	Description: The total number of sessions for all Session Managers that lasted less than 1 minute. Type: Counter	Int32
sess-calldur-2min	Description: The total number of sessions for all Session Managers that lasted less than 2 minutes but were greater than or equal to 1 minute. Type: Counter	Int32
sess-calldur-5min	Description: The total number of sessions for all Session Managers that lasted less than 5 minutes but were greater than or equal to 2 minutes. Type: Counter	Int32

Variables	Description	Data Type
sess-calldur-15min	Description: The total number of sessions for all Session Managers that lasted less than 15 minutes but were greater than or equal to 5 minutes. Type: Counter	Int32
sess-calldur-1hour	Description: The total number of sessions for all Session Managers that lasted less than 1 hour but greater than or equal to 15 minutes. Type: Counter	Int32
sess-calldur-4hour	Description: The total number of sessions for all Session Managers that lasted less than 4 hours but were greater than or equal to 1 hour. Type: Counter	Int32
sess-calldur-12hour	Description: The total number of sessions for all Session Managers that lasted less than 12 hours but were greater than or equal to 4 hours. Type: Counter	Int32
sess-calldur-24hour	Description: The total number of sessions for all Session Managers that lasted less than 24 hours but were greater than or equal to 12 hours. Type: Counter	Int32
sess-calldur-over24hour	Description: The total number of sessions for all Session Managers that lasted 24 hours or longer. Type: Counter	Int32
sess-setuptime-100ms	Description: The total number of sessions for all Session Managers that were setup in less than 100 milliseconds. Type: Counter	Int32
sess-setuptime-200ms	Description: The total number of sessions for all Session Managers for which the setup time was less than 200 milliseconds but greater than or equal to 100 milliseconds. Type: Counter	Int32
sess-setuptime-300ms	Description: The total number of sessions for all Session Managers for which the setup time was less than 300 milliseconds but greater than or equal to 200 milliseconds. Type: Counter	Int32
sess-setuptime-400ms	Description: The total number of sessions for all Session Managers for which the setup time was less than 400 milliseconds but greater than or equal to 300 milliseconds. Type: Counter	Int32
sess-setuptime-500ms	Description: The total number of sessions for all Session Managers for which the setup time was less than 500 milliseconds but greater than or equal to 400 milliseconds. Type: Counter	Int32
sess-setuptime-600ms	Description: The total number of sessions for all Session Managers for which the setup time was less than 600 milliseconds but greater than or equal to 500 milliseconds. Type: Counter	Int32
sess-setuptime-700ms	Description: The total number of sessions for all Session Managers for which the setup time was less than 700 milliseconds but greater than or equal to 600 milliseconds. Type: Counter	Int32
sess-setuptime-800ms	Description: The total number of sessions for all Session Managers for which the setup time was less than 800 milliseconds but greater than or equal to 700 milliseconds. Type: Counter	Int32

Variables	Description	Data Type
sess-setuptime-900ms	Description: The total number of sessions for all Session Managers for which the setup time was less than 900 milliseconds but greater than or equal to 800 milliseconds. Type: Counter	Int32
sess-setuptime-1sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 1 second but greater than or equal to 200 milliseconds. Type: Counter	Int32
sess-setuptime-2sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 2 seconds but greater than or equal to 1 second. Type: Counter	Int32
sess-setuptime-3sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 3 seconds but greater than or equal to 2 seconds. Type: Counter	Int32
sess-setuptime-4sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 4 seconds but greater than or equal to 3 seconds. Type: Counter	Int32
sess-setuptime-6sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 6 seconds but greater than or equal to 4 seconds. Type: Counter	Int32
sess-setuptime-8sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 8 seconds but greater than or equal to 6 seconds. Type: Counter	Int32
sess-setuptime-10sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 10 seconds but greater than or equal to 8 seconds. Type: Counter	Int32
sess-setuptime-12sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 12 seconds but greater than or equal to 10 seconds. Type: Counter	Int32
sess-setuptime-14sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 14 seconds but greater than or equal to 12 seconds. Type: Counter	Int32
sess-setuptime-16sec	Description: The total number of sessions for all Session Managers for which the setup time was less than 16 seconds but greater than or equal to 14 seconds. Type: Counter	Int32
sess-setuptime-over16sec	Description: The total number of sessions for all Session Managers for which the setup time was 16 seconds or more. Type: Counter	Int32
sess-setuptime-18sec	Description: Proprietary counter indicates the total number of sessions for all Session Managers for which the setup time was more than 16 seconds but less than or equal to 18 seconds. Triggers: Changes whenever a new session takes setup time of more that 16 seconds but less than or equal to 18 seconds. Availability: Across the System. Type: Counter	Int32

Variables	Description	Data Type
sess-setup-time-over18sec	Description: Proprietary counter indicates the total number of sessions for all Session Managers for which the setup time was more than 18 seconds. Triggers: Changes every time when a new session takes more than 18 seconds to setup. Availability: Across the System. Type: Counter	Int32
ggsn-ttlsgsnconn	Description: The total number of connections registered between GGSN and SGSN on this system. Type: Gauge	Int32
ggsn-cursgsnact	Description: The total number of SGSNs currently active with GGSN on this system. Type: Gauge	Int32
flow-ttlestab	Description: The total number of flows that were established by session managers. Type: Counter	Int32
flow-ttl-disconn	The total number of flows that were disconnected by session managers. Type: Counter	Int32
flow-curdynamic	Description: The current number of dynamic flows. Type: Gauge	Int32
aaa-ttlreq	Description: The total number of AAA requests. Trigger: Increments when a AAA request is sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curreq	Description: The number of active AAA requests. Trigger: Increments when an active AAA request is sent to the server Decrements when a response is received from the server for the active AAA request Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-ttlauthreq	Description: The total number of AAA authentication requests. Trigger: Increments when a AAA authentication request is sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curauthreq	Description: The number of active AAA authentication requests. Trigger: Increments when an active AAA authentication request is sent to the server Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-ttlauthprobe	Description: The total number of AAA authentication probes. Trigger: Increments when a AAA authentication probe request is sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curauthprobe	Description: The number of active AAA authentication probes. Trigger: Increments when an active AAA authentication probe request is sent to the server Availability: Per AAA Manager Instance Type: Gauge	Int32

Variables	Description	Data Type
aaa-ttlauthkeepalive	Description: The total number of AAA authentication keepalive requests sent. Trigger: Increments when a AAA authentication keepalive request is sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curauthkeepalive	Description: The number of current AAA authentication keepalive requests being processed. Trigger: Increments when an active AAA authentication keepalive request is sent to the server Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-ttlacctreq	Description: The total number of AAA accounting requests. Trigger: Increments when a AAA accounting request is sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curacctreq	Description: The number of active AAA accounting requests. Trigger: Increments when an active AAA accounting request is sent to the server Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-ttlacctkeepalive	Description: The total number of AAA accounting keepalive requests sent. Trigger: Increments when a AAA accounting keepalive request is sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curacctkeepalive	Description: The number of current AAA accounting keepalive requests being processed. Trigger: Increments when an active AAA accounting keepalive request is sent to the server Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-ttlauthsucc	Description: The total number of successful AAA authentication. Trigger: Increments whenever the AAA authentication is successful Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlauthfail	Description: The total number of AAA authentication failed. Trigger: Increments whenever the AAA authentication fails Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlauthpurged	Description: The total number of AAA authentication purged. Trigger: Increments whenever a AAA authentication request is purged Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlauthcancelled	Description: The total number of AAA authentication requests cancelled. Trigger: Increments whenever a AAA authentication request is cancelled Availability: Per AAA Manager Instance Type: Counter	Int32

Variables	Description	Data Type
aaa-tlauthkeepalivesuccess	Description: The total number of AAA authentication keepalive successes. Trigger: Increments whenever a AAA keepalive authentication is successful Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-tlauthkeepalivefailure	Description: The total number of AAA authentication keepalive failures. Trigger: Increments whenever a AAA keepalive authentication fails Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-tlauthkeepalivepurged	Description: The total number of AAA authentication keepalive purges. Trigger: Increments whenever a AAA authentication keepalive request is purged Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-tlauthdmuchal	Description: The total number of AAA authentication DMU challenged. Trigger: Increments whenever a AAA authentication request is challenged for Dynamic Mobile Keying update. Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curallocreq	Description: The number of current allocation requests being processed. Trigger: Increments when a currently allocated request has been processed Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-curmaxreq	Description: The number of current maximum requests being processed. Trigger: Increments when a current maximum request has been processed Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-tldiamauthreq	Description: The total number of Diameter authentication requests. Trigger: Increments when a Diameter authentication request is sent to the Diameter server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curdiamauthreq	Description: The total number of current Diameter authentication requests. Trigger: Increments when a Diameter authentication request is sent to the Diameter server Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-tldiamauthreqretried	Description: The total number of Diameter authentication requests retried. Trigger: Increments when a Diameter authentication request is retried Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-tldiamauthreqdrop	Description: The total number of Diameter authentication requests dropped. Trigger: Increments when a Diameter authentication request is dropped or ignored Availability: Per AAA Manager Instance Type: Counter	Int32

Variables	Description	Data Type
aaa-ttlradauthreq	Description: The total number of AAA authentication requests on RADIUS server. Trigger: Increments when a AAA authentication request is sent to the RADIUS server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curradauthreq	Description: The number of active AAA authentication requests on RADIUS server. Trigger: Increments when an active AAA authentication request is sent to the RADIUS server Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-ttlradauthreqretried	Description: The total number of AAA authentication requests retried on RADIUS server. Trigger: Increments when a AAA authentication request is retried on to the RADIUS server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlradauthrspdrop	Description: The total number of RADIUS authentication requests dropped. Trigger: Increments when a RADIUS authentication request is dropped or ignored Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlclauthreq	Description: The total number of AAA authentication requests on local server. Trigger: Increments when a AAA authentication request is sent to the local server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curclauthreq	Description: The number of active local authentication requests. Trigger: Increments when an active AAA authentication request is sent to the local server Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-ttlpseudoauthreq	Description: The total number of pseudo AAA authentication requests. Trigger: Increments when a pseudo AAA authentication request is sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-curpseudoauthreq	Description: The number of active pseudo AAA authentication requests. Trigger: Increments when an active pseudo AAA authentication request is sent to the server Availability: Per AAA Manager Instance Type: Gauge	Int32
aaa-ttlauthnulluser	Description: The total number of unattempted AAA authentication requests. Trigger: Increments when an unattempted AAA authentication request is sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlacctsucc	Description: The total number of AAA accounting requests succeeded. Trigger: Increments when a AAA accounting request is successfully sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32

Variables	Description	Data Type
aaa-ttlacctpurged	Description: The total number of AAA accounting requests purged. Trigger: Increments when a AAA accounting request is purged Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlacctcancelled	Description: The total number of AAA accounting requests cancelled. Trigger: Increments when a AAA accounting request is cancelled Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlacctkeepalivesuccess	Description: The total number of AAA accounting keepalive successes. Trigger: Increments when a AAA accounting keepalive request is successfully sent to the server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlacctkeepalivetimeout	Description: The total number of AAA accounting keepalive timeouts Trigger: Increments when a AAA accounting keepalive request is timed out Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlacctkeepalivepurged	Description: The total number of AAA accounting keepalive purges. Trigger: Increments when a AAA accounting keepalive request is purged Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlradacctreq	Description: The total number of RADIUS accounting requests. Trigger: Increments when a RADIUS accounting request is sent to the RADIUS server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlradacctcancelled	Description: The total number of RADIUS accounting requests cancelled. Trigger: Increments when a RADIUS accounting request is cancelled Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlradacctpurged	Description: The total number of RADIUS accounting requests purged. Trigger: Increments when a RADIUS accounting request is purged Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlradacctreqretried	Description: The total number of AAA accounting requests retried on RADIUS server. Trigger: Increments when a AAA accounting request is retried on to the RADIUS server Availability: Per AAA Manager Instance Type: Counter	Int32
aaa-ttlradacctrspdropped	Description: The total number of RADIUS accounting responses dropped. Trigger: Increments when a RADIUS accounting response is dropped or ignored Availability: Per AAA Manager Instance Type: Counter	Int32

Variables	Description	Data Type
aaa-ttlmgrpurgedrequests	Description: The total number of AAAMgr purged requests. Trigger: Increments for every occurrence of AAA Manager purged requests Availability: Per AAA Manager Instance Type: Counter	Int32
diamauth-msg-mareq	Description: Diameter Authentication Message Statistics - The total number of Multimedia-Auth-Request messages sent. Trigger: Increments when an MAR is sent Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-maans	Description: Diameter Authentication Message Statistics - The total number of Multimedia-Auth-Answer messages received. Trigger: Increments when an MAA is received Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-marretry	Description: Diameter Authentication Message Statistics - The total number of retries for Multimedia-Auth-Request messages. Trigger: Increments when an MAR is retried Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-maatimeout	Description: Diameter Authentication Message Statistics - The total number of timeouts of Multimedia-Auth-Answer messages. Trigger: Increments when an MAA is timed out Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-maadropped	Description: Diameter Authentication Message Statistics - The total number of Multimedia-Auth-Answer messages dropped. Trigger: Increments when an MAA is dropped Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-sareq	Description: Diameter Authentication Message Statistics - The total number of Server-Assignment-Request messages sent. Trigger: Increments when an SAR is sent Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-saans	Description: Diameter Authentication Message Statistics - The total number of Server-Assignment-Answer messages received. Trigger: Increments when an SAA is received Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-sarretry	Description: Diameter Authentication Message Statistics - The total number of retries for Server-Assignment-Request Messages. Trigger: Increments when an SAR is retried Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamauth-msg-saatimeout	Description: Diameter Authentication Message Statistics - The total number of timeouts of Server-Assignment-Answer messages. Trigger: Increments when an SAA is timed out Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-saadropped	Description: Diameter Authentication Message Statistics - The total number of Server-Assignment-Answer messages dropped. Trigger: Increments when an SAA is dropped Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-uareq	Description: Diameter Authentication Message Statistics - The total number of User-Authorization-Request messages sent. Trigger: Increments when a UAR is sent Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-uaans	Description: Diameter Authentication Message Statistics - The total number of User-Authorization-Answer messages received. Trigger: Increments when a UAA is received Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-uarretry	Description: Diameter Authentication Message Statistics - The total number of retries for User-Authorization-Request messages. Trigger: Increments when a UAR is retried Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-uaatimeout	Description: Diameter Authentication Message Statistics - The total number of timeouts of User-Authorization-Answer messages. Trigger: Increments when a UAA is timed out Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-uaadropped	Description: Diameter Authentication Message Statistics - The total number of User-Authorization-Answer messages dropped. Trigger: Increments when a UAA is dropped Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-lireq	Description: Diameter Authentication Message Statistics - The total number of Location-Info-Request messages sent. Trigger: Increments when an LIR is sent Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-lians	Description: Diameter Authentication Message Statistics - The total number of Location-Info-Answer messages received. Trigger: Increments when an LIA is received Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamauth-msg-lirretry	Description: Diameter Authentication Message Statistics - The total number of retries for Location-Info-Request messages. Trigger: Increments when an LIR is retried Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-liatimeout	Description: Diameter Authentication Message Statistics - The total number of timeouts of Location-Info-Answer messages. Trigger: Increments when an LIA is timed out Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-liadropped	Description: Diameter Authentication Message Statistics - The total number of Location-Info-Answer messages dropped. Trigger: Increments when an LIA is dropped Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-rtreq	Description: Diameter Authentication Message Statistics - The total number of Registration-Termination-Request messages received. Trigger: Increments when an RTR is received Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-rtans	Description: Diameter Authentication Message Statistics - The total number of Registration-Termination-Answer messages sent. Trigger: Increments when an RTA is sent Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-rtreject	Description: Diameter Authentication Message Statistics - The total number of Registration-Termination-Request messages rejected. Trigger: Increments when an RTR is rejected. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-ppreq	Description: Diameter Authentication Message Statistics - The total number of Push-Profile-Request messages received. Trigger: Increments when a PPR is received. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-ppans	Description: Diameter Authentication Message Statistics - The total number of Push-Profile-Answer Messages Request messages sent. Trigger: Increments when a PPR is sent. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-ppreject	Description: Diameter Authentication Message Statistics - The total number of Push-Profile-Request messages rejected. Trigger: Increments when a PPR is rejected. Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamauth-msg-dereq	Description: Diameter Authentication Message Statistics - The total number of Diameter-EAP-Request messages sent. Trigger: Increments when a DER is sent. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-deans	Description: Diameter Authentication Message Statistics - The total number of Diameter-EAP-Answer messages received. Trigger: Increments when a DEA is received. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-deaaccept	Description: Diameter Authentication Message Statistics - The total number of Diameter-EAP-Answer messages accepted. Trigger: Increments when a DEA is received with Result-Code value as 2001. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-deareject	Description: Diameter Authentication Message Statistics - The total number of Diameter-EAP-Answer messages rejected. Trigger: Increments when a DEA is rejected. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-derretry	Description: Diameter Authentication Message Statistics - The total number of retries for Diameter-EAP-Request messages. Trigger: Increments when a DER is retried. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-deatimeout	Description: Diameter Authentication Message Statistics - The total number of timeouts of Diameter-EAP-Answer messages. Trigger: Increments when a DEA is timed out. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-deadropped	Description: Diameter Authentication Message Statistics - The total number of Diameter-EAP-Answer messages dropped. Trigger: Increments when a DEA is dropped. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-asr	Description: Diameter Authentication Message Statistics - The total number of Abort-Session-Request messages received. Trigger: Increments when an ASR is received. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-asa	Description: Diameter Authentication Message Statistics - The total number of Abort-Session-Answer messages sent. Trigger: Increments when an ASA is sent. Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamauth-msg-rar	Description: Diameter Authentication Message Statistics - The total number of Re-Auth-Request messages received. Trigger: Increments when an RAR is received. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-raa	Description: Diameter Authentication Message Statistics - The total number of Re-Auth-Answer messages sent. Trigger: Increments when an RAA is sent. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-str	Description: Diameter Authentication Message Statistics - The total number of Session-Termination-Request messages sent. Trigger: Increments when an STR is sent. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-sta	Description: Diameter Authentication Message Statistics - The total number of Session-Termination-Answer messages received. Trigger: Increments when an STA is received. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-msg-strretry	Description: Diameter Authentication Message Statistics - The total number of retries for Session-Termination-Request Messages. Trigger: Increments when an STR is retried. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-demsgerr-proto	Description: Diameter Authentication DE Message Error Statistics - The total number of error messages received with error Diameter Protocol Errors. Trigger: Increments when a DEA is received with 3xxx result-code. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-demsgerr-badans	Description: Diameter Authentication DE Message Error Statistics - The total number of error messages received with error Bad-Answer. Trigger: Increments when a DEA is received with malformed or wrong AVPs. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-demsgerr-unksessreq	Description: Diameter Authentication DE Message Error Statistics - The total number of error messages received with error Session-Id or unknown session values. Trigger: Increments when a DEA is received with unknown session-id. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-demsgerr-badreq	Description: Diameter Authentication DE Message Error Statistics - The total number of error messages received with bad request command code value. Trigger: Increments when a DEA is received with wrong command-code value. Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamauth-demsgerr-reqtmo	Description: Diameter Authentication DE Message Error Statistics - The total number of Request Timeout happened for DER message. Trigger: Increments when a DER is timed out. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-demsgerr-parse	Description: Diameter Authentication DE Message Error Statistics - The total number of parse failures happened for DEA message. Trigger: Increments when parse failure happens for DEA. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-demsgerr-reqretry	Description: Diameter Authentication DE Message Error Statistics - The total number of request retries happened for DER message. Trigger: Increments when a DER is retried Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-logout	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Diameter-Logout. Trigger: Increments when an STR is sent with Termination-Cause as Diameter-Logout. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-noserv	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Service-Not-Provided. Trigger: Increments when an STR is sent with Termination-Cause as Service-Not-Provided. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-badans	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Bad-Answer. Trigger: Increments when an STR is sent with Termination-Cause as Bad-Answer. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-admin	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Administrative. Trigger: Increments when an STR is sent with Termination-Cause as Administrative. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-linkbroken	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Link-Broken Trigger: Increments when an STR is sent with Termination-Cause as Link-Broken. Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamauth-strterm-authexp	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Auth-Expired. Trigger: Increments when an STR is sent with Termination-Cause as Auth-Expired. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-usermoved	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause User-Moved. Trigger: Increments when an STR is sent with Termination-Cause as User-Moved. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-sesstmo	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Session-Timeout. Trigger: Increments when an STR is sent with Termination-Cause as Session-Timeout. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-userreq	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause User-Request. Trigger: Increments when an STR is sent with Termination-Cause as User-Request. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-lostcarrier	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Lost Carrier. Trigger: Increments when an STR is sent with Termination-Cause as Lost-Carrier. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-lostsvc	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Lost Service. Trigger: Increments when an STR is sent with Termination-Cause as Lost-Service. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-idletmo	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Idle-Timeout. Trigger: Increments when an STR is sent with Termination-Cause as Idle-Timeout. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-nastmo	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause NAS Related Session-Timeout. Trigger: Increments when an STR is sent with Termination-Cause as NAS-Related-Session-Timeout. Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamauth-strterm-adminreset	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Admin-Reset. Trigger: Increments when an STR is sent with Termination-Cause as Admin-Reset. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-adminreboot	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Admin Reboot. Trigger: Increments when an STR is sent with Termination-Cause as Admin-Reboot. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-port	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Port Error Trigger: Increments when an STR is sent with Termination-Cause as Port-Error. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-naserr	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause NAS Error. Trigger: Increments when an STR is sent with Termination-Cause as NAS-Error. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-nasreq	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause NAS Request. Trigger: Increments when an STR is sent with Termination-Cause as NAS-Request. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-nasreboot	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause NAS Reboot. Trigger: Increments when an STR is sent with Termination-Cause as NAS-Reboot. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-portunneed	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Port Unneeded. Trigger: Increments when an STR is sent with Termination-Cause as Port-Unneeded. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-portpreempt	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Port Preempted. Trigger: Increments when an STR is sent with Termination-Cause as Port-Preempted. Availability: Per AAA Manager instance. Type: Counter	Int32
diamauth-strterm-portsusp	Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Port Suspended. Trigger: Increments when an STR is sent with Termination-Cause as Port-Suspended. Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamauth-strterm-svcunavail	<p>Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Service Unavailable.</p> <p>Trigger: Increments when an STR is sent with Termination-Cause as Service-Unavailable.</p> <p>Availability: Per AAA Manager instance.</p> <p>Type: Counter</p>	Int32
diamauth-strterm-cback	<p>Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Callback.</p> <p>Trigger: Increments when an STR is sent with Termination-Cause as Callback.</p> <p>Availability: Per AAA Manager instance.</p> <p>Type: Counter</p>	Int32
diamauth-strterm-user	<p>Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause User-Error.</p> <p>Trigger: Increments when an STR is sent with Termination-Cause as User-Error.</p> <p>Availability: Per AAA Manager instance.</p> <p>Type: Counter</p>	Int32
diamauth-strterm-hostreq	<p>Description: Diameter Authentication STR Termination Cause Statistics - The total number of Session-Termination-Request messages with termination cause Host-Request.</p> <p>Trigger: Increments when an STR is sent with Termination-Cause as Host-Request.</p> <p>Availability: Per AAA Manager instance.</p> <p>Type: Counter</p>	Int32
diamacct-msg-acreq	<p>Description: Diameter Accounting Message Statistics - The total number of Accounting-Request messages sent.</p> <p>Trigger: Increments when an ACR is sent</p> <p>Availability: Per AAA Manager instance.</p> <p>Type: Counter</p>	Int32
diamacct-msg-acans	<p>Description: Diameter Accounting Message Statistics - The total number of Accounting-Answer messages received.</p> <p>Trigger: Increments when an ACA is received</p> <p>Availability: Per AAA Manager instance.</p> <p>Type: Counter</p>	Int32
diamacct-msg-acrstart	<p>Description: Diameter Accounting Message Statistics - The total number of Accounting-Request Start messages sent.</p> <p>Trigger: Increments when an ACR-START is sent</p> <p>Availability: Per AAA Manager instance.</p> <p>Type: Counter</p>	Int32
diamacct-msg-acastart	<p>Description: Diameter Accounting Message Statistics - The total number of Accounting-Answer Start messages received.</p> <p>Trigger: Increments when an ACA-START is received</p> <p>Availability: Per AAA Manager instance.</p> <p>Type: Counter</p>	Int32

Variables	Description	Data Type
diamacct-msg-acrstartretry	Description: Diameter Accounting Message Statistics - The total number of retries for Accounting-Request Start messages. Trigger: Increments when an ACR-START is retried Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acastarttmo	Description: Diameter Accounting Message Statistics - The total number of timeouts of Accounting-Answer Start messages. Trigger: Increments when an ACA-START is timed out Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acrinterim	Description: Diameter Accounting Message Statistics - The total number of Accounting-Request Interim messages sent. Trigger: Increments when an ACR-INTERIM is sent Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acainterim	Description: Diameter Accounting Message Statistics - The total number of Accounting-Answer Interim messages received. Trigger: Increments when an ACA-INTERIM is received Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acrinterimretry	Description: Diameter Accounting Message Statistics - The total number of retries for Accounting-Request Interim messages. Trigger: Increments when an ACR-INTERIM is retried Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acainterimtmo	Description: Diameter Accounting Message Statistics - The total number of timeouts of Accounting-Answer Interim messages. Trigger: Increments when an ACA-INTERIM is timed out Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acrevent	Description: Diameter Accounting Message Statistics - The total number of Accounting-Request Event messages sent. Trigger: Increments when an ACR-EVENT is sent Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acaevent	Description: Diameter Accounting Message Statistics - The total number of Accounting-Answer Event messages received. Trigger: Increments when an ACA-EVENT is received Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acrstop	Description: Diameter Accounting Message Statistics - The total number of Accounting-Request Stop messages sent. Trigger: Increments when an ACR-STOP is sent. Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamacct-msg-acastop	Description: Diameter Accounting Message Statistics - The total number of Accounting-Answer Stop messages received. Trigger: Increments when an ACR-STOP is received. Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acrstopretry	Description: Diameter Accounting Message Statistics - The total number of retries for Accounting-Request Stop messages. Trigger: Increments when an ACR-STOP is retried. Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acastoptmo	Description: Diameter Accounting Message Statistics - The total number of timeouts of Accounting-Answer Stop messages. Trigger: Increments when an ACA-STOP is timed out Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-msg-acadropped	Description: Diameter Accounting Message Statistics - The total number of Accounting-Answer messages dropped. Trigger: Increments when an ACA is dropped. Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-acmsgerr-proto	Description: Diameter Accounting Message Error Statistics - The total number of error messages received with error Diameter Protocol Errors. Trigger: Increments when an ACA is received with Result-Code value as 3xxx. Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-acmsgerr-badans	Description: Diameter Accounting Message Error Statistics - The total number of error messages received with error Bad-Answer. Trigger: Increments when an ACA is received with malformed or wrong AVPs. Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-acmsgerr-unksessreq	Description: Diameter Accounting Message Error Statistics - The total number of error messages received with error Session-Id or unknown session values. Trigger: Increments when an ACA is received with unknown session-id Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-acmsgerr-reqtmo	Description: Diameter Accounting Message Error Statistics - The total number of ACRs that are timed out. Trigger: Increments when an ACR is timed out. Availability: Per AAA Manager instance. Type: Counter	Int32
diamacct-acmsgerr-parse	Description: Diameter Accounting Message Error Statistics - The total number of parse failures happened for ACR message. Trigger: Increments when parse failure happens for ACR. Availability: Per AAA Manager instance. Type: Counter	Int32

Variables	Description	Data Type
diamacct-acmsgerr-requery	Description: Diameter Accounting Message Error Statistics - The total number of request retries happened for ACR message. Trigger: Increments when an ACR is retried. Availability: Per AAA Manager instance. Type: Counter	Int32
a11-ttlarrived	Description: The total number of sessions for all A11 Managers that were received. Type: Counter	Int32
a11-ttlrejected	Description: The total number of sessions for all A11 Managers that were rejected. Type: Counter	Int32
a11-ttlDEMULT	Description: The total number of sessions that were successfully setup for all A11 Managers. Type: Counter	Int32
a11-ttlDEREG	Description: The total number of sessions for all A11 Managers that were successfully de-registered, or disconnected. Type: Counter	Int32
a11-curaCTIVE	Description: The number of active sessions currently being facilitated by all A11 Managers. Type: Gauge	Int32
fa-ttlarrived	Description: The total number of session requests that arrived for all FA Managers. Type: Counter	Int32
fa-ttlrejected	Description: The total number of sessions for all FA Managers that were rejected. Type: Counter	Int32
fa-ttlDEMULT	Description: The total number of sessions for all FA Managers that were successfully setup. Type: Counter	Int32
fa-ttlDEREG	Description: The total number of sessions for all FA Managers that were successfully de-registered or disconnected. Type: Counter	Int32
fa-curaCTIVE	Description: The number of active sessions currently being facilitated by all FA Managers. Type: Gauge	Int32
ha-ttlarrived	Description: The total number of session requests that arrived for all HA Managers. Type: Counter	Int32
ha-ttlrejected	Description: The total number of sessions for all HA Managers that were rejected. Type: Counter	Int32
ha-ttlDEMULT	Description: The total number of sessions for all HA Managers that were successfully setup. Type: Counter	Int32
ha-ttlDEREG	Description: The total number of sessions for all HA Managers that were successfully de-registered, or disconnected. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
ha-curactive	Description: The number of active sessions currently being facilitated by all HA Managers. Type: Gauge	Int32
pdif-cursess	Description: The number of Credit Control Application (CCA) sessions currently active. Type: Gauge	Int32
pdif-curactive	Description: The number of active sessions currently being facilitated by PDIF. Type: Gauge	Int32
pdif-curdormant	Description: The number of dormant sessions currently being facilitated by PDIF. Type: Gauge	Int32
pdif-ttlsetup	Description: The total number of PDIF sessions on a system. Type: Counter	Int32
pdif-curchildsa	Description: The number of current child SAs Type: Gauge	Int32
sess-15peak-curactcall	Description: The number of current calls (active only). Peak values represent the highest sample seen over the last 15 minutes. Type: Gauge	Int32
sess-15peak-curtlcall	Description: The number of current calls. Peak values represent the highest sample seen over the last 15 minutes. Type: Gauge	Int32
sess-cursipactive	Description: The number of Simple IP sessions currently active. Type: Gauge	Int32
sess-15peak-cursipactive	Description: The number of Simple IP sessions currently active. Peak values represent the highest sample seen over the last 15 minutes. Type: Gauge	Int32
sess-curmipactive	Description: The number of Mobile IP sessions currently active. Type: Gauge	Int32
sess-15peak-curmipactive	Description: The number of currently active Mobile IP sessions. Peak values represent the highest sample seen over the last 15 minutes. Type: Gauge	Int32
a11-15peak-curactive	Description: Peak active A11 sessions (a11-curactive) over the last 15 minutes. Type: Gauge	Int32
crp-curactive	Description: Current number of active Closed RP calls. Type: Gauge	Int32
crp-15peak-curactive	Description: Peak active Closed-RP calls (crp-curactive) over the last 15 minutes. Type: Gauge	Int32
fa-15peak-curactive	Description: The number of FA sessions currently active. Peak values represent the highest sample seen over the last 15 minutes. Type: Gauge	Int32

Variables	Description	Data Type
ha-15peak-curactive	Description: The number of HA sessions currently active. Peak values represent the highest sample seen over the last 15 minutes. Type: Gauge	Int32
flow-15peak-curdynamic	Description: Peak flows (flow-curdynamic) over the last 15 minutes. Type: Gauge	Int32
sess-15min-usageactive	Description: Total minute usage by all the active sessions over the last 15 minutes. Type: Gauge	Int32
sess-15min-usageall	Description: Total minute usage by all flows over the last 15 minutes. Type: Gauge	Int32
pdp-ctx-15peak-active	Description: The number of peak active simultaneous PDP contexts over the last 15 minutes. This is sum of SGSN and GGSN service sessions on a system. Type: Gauge	Int32
pdp-ctx-5peak-active	Description: The number of peak active simultaneous PDP contexts over the last 5 minutes. This is sum of SGSN and GGSN service sessions on a system. Type: Gauge	Int32
cc-cursess	Description: The total number of Credit Control Application (CCA) sessions currently active. Trigger: Increments when a Gy session is successfully created Decrements when the Gy session is terminated Availability: Per Credit Control Group Type: Gauge	Int64
cc-ttlecsadd	Description: The total number of ECS sessions added to CCA. Trigger: Increments when a new CC session is being created by ECS. Availability: Per Credit Control Group Type: Counter	Int64
cc-ttlstart	Description: The total number of CCA sessions started. Trigger: Increments when CCR-I is successfully sent. Availability: Per Credit Control Group Type: Counter	Int64
cc-ttlsessupd	Description: The total number of CCA sessions updated. Trigger: Increments when a CC session update is sent by ECS to DCCA module. Availability: Per Credit Control Group Type: Counter	Int64
cc-ttlterm	Description: The total number of CCA sessions terminated. Trigger: Increments when a CC session terminate is sent by ECS to DCCA module. Availability: Per Credit Control Group Type: Counter	Int64
cc-sessfailover	Description: The total number of CCA sessions failed. Trigger: Increments when a CC session message is retried on a secondary server due to session failover. Availability: Per Credit Control Group Type: Counter	Int64

Variables	Description	Data Type
cc-msg-recv	Description: The total number of CCA messages received. Trigger: Increments when a CCA message is successfully received Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-sent	Description: The total number of CCA messages sent. Trigger: Increments when a CCA message is successfully sent to the server Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-request	Description: The total number of CCR (Credit Control Request) messages that are sent out from the system to the Diameter Server. The CCR can be Initial/Update or Terminate. Trigger: Increments when CCR (Credit Control Request) message is sent out from system to the Diameter Server Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-answer	Description: The total number of CCA (Credit Control Answer) messages that are received by the system from the Diameter Server. Trigger: Increments when CCA message is received Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccrinit	Description: The total number of CCR-Initial (Initial Credit Control Request) messages that are sent out from the system to the Diameter Server. Trigger: Increments when CCR-I message is successfully sent Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccainit	Description: The total number of CCA-Initial (Initial Credit Control Answer) messages that are received by the system from the Diameter Server. Trigger: Increments when CCA-I message is successfully received Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccainitaccept	Description: The total number of CCA-Initial (Initial Credit Control Answer) messages that are sent from Diameter Server and accepted by the system Trigger: Increments when a CCA-Initial message from Diameter Server is accepted by the system Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccainitreject	Description: The total number of CCA-Initial (Initial Credit Control Answer sent) messages that are sent from Diameter Server and rejected by the system Trigger: Increments when a CCA-Initial (Initial Credit Control Answer sent) message from Diameter Server is rejected by system Availability: Per Credit Control Group Type: Counter	Int64

Variables	Description	Data Type
cc-msg-ccainittimeout	Description: The total number of CCA-Initial-Timeouts (CCR-I sent but did not receive CCA till the timer expired) messages that are sent to the system from Diameter Server. Trigger: Increments when CCR-I is sent but CCA-I is not received till Tx timer expiry. Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccrupdate	Description: The total number of CCR-Updates (Credit Control Request with Update) messages that are sent out from the system to the Diameter Server. Trigger: Increments whenever a CCR-Update request is successfully sent from the system. Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccaupdate	Description: The total number of CCA-Update (Credit Control Answer for update) messages that are received by the system from the Diameter Server. Trigger: Increments whenever an update answer message is received from the server. Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccaupdatetimeout	Description: The total number of CCA-Update Timeouts (CCR-U sent but did not receive CCA till the timer expired) messages that are sent to the system from Diameter Server. Trigger: Increments when CCR-U is sent but an answer for this request is not received till Tx timer expiry. Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccrfinal	Description: The total number of CCR-Final (Credit Control Request with Final) messages that are sent out from the system to the Diameter Server. Trigger: Increments whenever a CCR-Terminate request for a session is successfully sent from the system Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccafinal	Description: The total number of CCA-Final (Credit Control Answer for final update sent) messages that are received by the system from Diameter Server. Trigger: Increments when the system receives answer message (CCA-T) for Terminate request that was sent Availability: Per Credit Control Group Type: Counter	Int64
cc-msg-ccafinaltimeout	Description: The total number of CCA-Final Timeouts (CCR-T sent but did not receive CCA till the timer expired) messages that are received by the system from Diameter Server. Trigger: Increments when CCR-T is sent but an answer for this request is not received till Tx timer expiry. Availability: Per Credit Control Group Type: Counter	Int64

Variables	Description	Data Type
cc-msg-asr	<p>Description: The total number of Abort Session Request messages that are sent from the Diameter Server to the system.</p> <p>Trigger: Increments when the system receives answer message (CCA-T) for Terminate request that was sent</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msg-asa	<p>Description: The total number of Abort Session Answer messages sent from the system to the Diameter server. This message will be followed by a CCR-Terminate to terminate the session.</p> <p>Trigger: Increments when the system replies with an Abort Session Answer message for the Abort Session Request message sent from Diameter Server</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msg-rar	<p>Description: The total number of ReAuth Request messages that are sent from the Diameter Server to the system.</p> <p>Trigger: Increments when a Re-Authorization Request message is sent from Diameter Server</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msg-raa	<p>Description: The total number of ReAuth Answer messages sent from the system to the Diameter server. This message is followed by a CCR-Update to update the Diameter server about the session.</p> <p>Trigger: Increments when the system replies with a Re-auth Answer message for the Re-Auth Request sent from Diameter Server</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msg-ccadropped	<p>Description: The total number of CCA (Credit Control Answer) messages dropped by the system.</p> <p>Trigger: Increments when the system drops/ignores a CCA message received from the server</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msgerr-PROTO	<p>Description: The total message errors due to Diameter protocol.</p> <p>Trigger: Increments whenever a message with result-codes 3xxx- errors due to Diameter protocol is received from the server</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msgerr-badanswer	<p>Description: The total message errors due to invalid response - CCA Parse error.</p> <p>Trigger: Increments when the system receives an undefined mandatory AVP from the server</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msgerr-unknownsess	<p>Description: The total message errors due to invalid session requests.</p> <p>Trigger: Increments for every occurrence of invalid session request message</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64

Variables	Description	Data Type
cc-msgerr-unknowncomm	<p>Description: The total message errors due to invalid/unknown command code (CCA, ASR, RAR).</p> <p>Trigger: Increments whenever a response is received for a valid request with corrupted Command Code.</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msgerr-reqtimeout	<p>Description: The total message errors due to request timeout.</p> <p>Trigger: Increments whenever a request message is timed-out</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msgerr-parse	<p>Description: The total message errors due to parsing errors.</p> <p>Trigger: Increments whenever a message is received with parsing errors</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msgerr-unkratinggrp	<p>Description: The total message errors due to invalid/unknown Rating Groups. Rating group is used to identify a particular type of traffic.</p> <p>Trigger: Increments when Unknown Rating-Group is preemptively received from server or a preemptive MSCC is received after session abortion</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msgerr-unkrulebase	<p>Description: The total message errors due to invalid/unknown Rulebase applied.</p> <p>Trigger: Increments when rulebase change is attempted and the system is not able to switch to this because the plan indicated might be unknown/invalid.</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-msgerr-unkfailure	<p>Description: The total number of unknown server -provided session failover actions. This counts the number of unknown server-provided session failover actions.</p> <p>Trigger: Increments when an unknown CCFH action is received from the server (terminate/continue/retry and terminate are considered to be valid CCFH values)</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-upd-threshold	<p>Description: For each Rating group, the Diameter server sends a threshold (this is also configurable in the system) after which an update needs to be sent. For example, a subscriber quota of 1000 bytes with 900 as a threshold is sent to CCA. When 900 bytes have been used by the system, an update message is sent for quota. This counter gives the number of updates sent because of the threshold.</p> <p>Trigger: Increments whenever threshold value for a quota-type allocated to any rating-group is reached and an update request is sent to the server to report the usage.</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-upd-qht	<p>Description: The total number of updates sent due to expiry of Quota Hold Timer (QHT).</p> <p>Trigger: Increments when updates are sent due to QHT expiry</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64

Variables	Description	Data Type
cc-upd-final	<p>Description: The total number of updates sent due to exhaustion/invalidation/service denial.</p> <p>Trigger: Increments when updates are sent due to quota exhaustion/invalidation/service denial.</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-upd-quotaexhaust	<p>Description: The total number of updates sent due to exhaustion of subscriber quota.</p> <p>Trigger: Increments when updates are sent because the quota for a particular rating-group is exhausted</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-upd-validitytime	<p>Description: The total number of updates sent due to expiry of the session validity time.</p> <p>Trigger: Increments when updates are sent due to validity time expiry for a rating-group</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-upd-otherquota	<p>Description: The total number of updates sent to report the usage of one quota type, while the other quota reached a trigger condition.</p> <p>Trigger: Increments when updates are sent to report the usage of one quota type, while the other quota reached a trigger condition</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-upd-ratingchange	<p>Description: The total number of updates sent due to changes in RAT/QOS/SGSN/CELLID/LAC.</p> <p>Trigger: Increments when updates are sent due to changes in RAT/QOS/SGSN/CELLID/LAC</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-upd-forcedreauth	<p>Description: The total number of updates sent because of RAR.</p> <p>Trigger: Increments when the server asks for forced-reauthorization of the subscriber and sends the update request</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-upd-titsutime	<p>Description: The total number of updates sent due to time interval after tariff switch. This is specific to WiMax prepaid customers.</p> <p>Trigger: Increments when updates are sent due to time interval after tariff switch</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-term-diamlogout	<p>Description: The total number of CCA sessions terminated due to subscriber logout.</p> <p>Trigger: Increments when a subscriber initiates termination of a Diameter session</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64

Variables	Description	Data Type
cc-term-servnotprov	<p>Description: The total number of CCA sessions terminated due to unavailability of service.</p> <p>Trigger: Increments when a session is terminated due to unavailability of Diameter service</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-term-badanswer	<p>Description: The total number of CCA sessions terminated due to invalid/unknown response received.</p> <p>Trigger: Increments when a session is terminated due to invalid/unknown/unsuccessful response received</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-term-admin	<p>Description: The total number of CCA sessions terminated by an administrative user.</p> <p>Trigger: Increments when a session termination is done by the system - administrative decision taken by our system in relevant scenarios</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-term-linkbroken	<p>Description: The total number of CCA sessions terminated due to broken uplink/downlink (connection between peers).</p> <p>Trigger: Increments when a session is terminated because the connection between peers is lost - Diameter link is broken.</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-term-authexpired	<p>Description: The total number of CCA sessions terminated due to expiry of subscriber authorization.</p> <p>Trigger: Increments when an update is sent to check for the expiry of lifetime authorization of the subscriber and if the server indicates expiry of authorization, the session will be terminated.</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-term-usermoved	<p>Description: The total number of CCA sessions terminated as subscriber moved out of the service area.</p> <p>Trigger: Increments when session termination happens because the subscriber has moved out of the service area.</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-term-sesstimeout	<p>Description: The total number of CCA sessions terminated due to timeout.</p> <p>Trigger: Increments when a session terminates because the session manager has indicated a session-timeout.</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64
cc-badans-auth-appid	<p>Description: The absence or unexpected value in Auth-Application-Id AVP.</p> <p>Trigger: Increments when a session is terminated because of Diameter bad answer due to absence or unexpected value of Auth-Application-Id AVP.</p> <p>Availability: Per Credit Control Group</p> <p>Type: Counter</p>	Int64

Variables	Description	Data Type
cc-badans-sessid	Description: The absence or unexpected value in Session-Id AVP. Trigger: Increments when a session is terminated because of Diameter bad answer due to absence or unexpected value of Session-id AVP Availability: Per Credit Control Group Type: Counter	Int64
cc-badans-cc-req-num	Description: The absence or unexpected value in CC-Request-Number AVP. Trigger: Increments when a session is terminated because of Diameter bad answer due to absence or unexpected value of CC-Request-Number AVP Availability: Per Credit Control Group Type: Counter	Int64
cc-badans-cc-req-type	Description: The absence or unexpected value in CC-Request-Type AVP. Trigger: Increments when a session is terminated because of Diameter bad answer due to absence or unexpected value of CC-Request-Type AVP Availability: Per Credit Control Group Type: Counter	Int64
cc-badans-origin-host	Description: The absence of Origin-Host AVP. Trigger: Increments when a session is terminated because of Diameter bad answer due to absence or unexpected value of Origin-Host AVP Availability: Per Credit Control Group Type: Counter	Int64
cc-badans-origin-realm	Description: The absence of Origin-Realm AVP. Trigger: Increments when a session is terminated because of Diameter bad answer due to absence or unexpected value of Origin-Realm AVP Availability: Per Credit Control Group Type: Counter	Int64
cc-badans-parsemsg-err	Description: The number of parse errors in the message. Trigger: Increments when a session is terminated because of Diameter bad answer due to parsing errors in the message Availability: Per Credit Control Group Type: Counter	Int64
cc-badans-parsemscc-err	Description: The number of parse errors in MSCC AVP. Trigger: Increments when a session is terminated because of Diameter bad answer due to parsing errors detected while processing the Multiple-Services-Credit-Control AVP in the message Availability: Per Credit Control Group Type: Counter	Int64
cc-badans-misc-err	Description: The number of other miscellaneous errors. Trigger: Increments when a session is terminated because of Diameter bad answer due to miscellaneous reasons like failure installing the rulebase change/bandwidth/firewall policy, etc. Availability: Per Credit Control Group Type: Counter	Int64

Variables	Description	Data Type
cc-traf-catcreate	Description: The total traffic categories (MSCC) created. Trigger: Increments when a new MSCC is created. Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-catdelete	Description: The total traffic categories (MSCC) deleted. Trigger: Increments whenever an MSCC is deleted in an ongoing session. Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-catlookup	Description: The total traffic categories/MSCC lookups failed. Trigger: Increments when a lookup operation is performed in the list of MSCCs. Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-hits	Description: The total traffic categories/MSCC lookups successful. Trigger: Increments when a lookup of MSCC is successful Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-misses	Description: The total traffic categories triggered/MSCC lookups failed. Trigger: Increments when a lookup operation for a particular MSCC fails. Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-triggerevent	Description: The total triggers for traffic categories/MSCCs. Trigger: Increments whenever there is a change in certain trigger parameters like RAT, SGSN-IP-ADDRESS, QOS, CELLID, etc. Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-finalunit	Description: The total final-units-actions taken on MSCCs. Trigger: Increments whenever FUJ action is imposed on a particular rating group. Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-catsuccess	Description: The total number of successful allocation of credits for traffic category/MSCC (result-code 2001). Trigger: Increments when the server responds with result-code 2001 indicating successful allocation of credits for traffic category Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-ratingfail	Description: The total number of quota retries because of rating failure due to category not recognized (result-code 5031). Trigger: Increments when the server responds with result-code 5031 indicating rating failure due to category not recognized Availability: Per Credit Control Group Type: Counter	Int64

■ Common Syntax Options

Variables	Description	Data Type
cc-traf-servdenied	Description: The total number of quota retries due to denial of end user service (result-code 4010). Trigger: Increments when the server responds with result-code 4010 indicating end user service denial. Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-limitreached	Description: The total number of retries due to credit limit reached (result-code 4012). Trigger: Increments when the server responds with result-code 4012 indicating that the credit limit has reached Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-authreject	Description: The total number of retries due to authorization rejected (result-code 5003). Trigger: Increments when the server responds with result-code 5003 indicating authorization rejection. Availability: Per Credit Control Group Type: Counter	Int64
cc-traf-othererror	Description: The total number of miscellaneous/unknown errors not specified by the system (Diameter_unable_to_comply [result-code 5012]). Trigger: Increments when the server responds with result-code 5012 indicating miscellaneous/unknown errors not specified by the system Availability: Per Credit Control Group Type: Counter	Int64
Content Filtering In-line Service - URL Blacklisting related statistics		
url-blacklisting-hits	Description: The total number of blacklisted URL hits of all the configured billing plans. Trigger: Increments when a URL is found in the BL DB (stored as BL cache at ACSMgr). Availability: Per Active Charging Service. Type: Counter	Int64
url-blacklisting-misses	Description: The total number of blacklisted URL misses of all the configured billing plans. Trigger: Increments when a URL is not found in the BL DB (stored as BL cache at ACSMgr). Availability: Per Active Charging Service. Type: Counter	Int64
Content Filtering In-line Service - Category-based content filtering related statistics		
cf-static-ratereq	Description: The total number of static rating requests. Trigger: Increments when a request arrives at any SRDB for static rating. Availability: Per Active Charging Service. Type: Counter	Int64
cf-static-ratesucc	Description: The total number of “successful” response for static rating requests. Trigger: Increments when a “successful” response is sent for static rating requests from SRDBs. Availability: Per Active Charging Service. Type: Counter	Int64

Variables	Description	Data Type
cf-static-rateblock	Description: The total number of “blocked” response for static rating requests. Trigger: Increments when a “blocked” response is sent for static rating requests from SRDBs. Availability: Per Active Charging Service. Type: Counter	Int64
cf-static-ratefail	Description: The total number of “failed” response for static rating requests. Trigger: Increments when an SRDB fails to send a response for static rating requests. Availability: Per Active Charging Service. Type: Counter	Int64
cf-static-ratefail-nr	Description: The total number of “failed” response for static requests due to no rating in database. Trigger: Increments when an SRDB fails to send a response for static rating requests, due to no rating in database. Availability: Per Active Charging Service. Type: Counter	Int64
cf-static-ratefail-notindb	Description: The total number of “failed” response for static requests due to no listing in database. Trigger: Increments when an SRDB fails to send a response for static rating requests, due to no listing in database. Availability: Per Active Charging Service. Type: Counter	Int64
cf-dyn-ratereq	Description: The total number of dynamic rating requests. Trigger: Increments when a request arrives at any SRDB for dynamic rating. Availability: Per Active Charging Service. Type: Counter	Int64
cf-dyn-ratesucc	Description: The total number of “successful” response for dynamic rating requests. Trigger: Increments when a “successful” response is sent for dynamic rating requests from SRDBs. Availability: Per Active Charging Service. Type: Counter	Int64
cf-dyn-ratefail	Description: The total number of “failed” response for dynamic rating requests. Trigger: Increments when an SRDB fails to send a response for dynamic rating requests. Availability: Per Active Charging Service. Type: Counter	Int64
cf-cache-hits	Description: The total number of URLs that get a hit (found) in the CF cache. Trigger: Increments when a URL is found in the CF cache. Availability: Per Active Charging Service. Type: Counter	Int64
cf-cache-misses	Description: The total number of URLs that get a miss (not found) in the CF cache. Trigger: Increments when a URL is not found in the CF cache. Availability: Per Active Charging Service. Type: Counter	Int64

Variables	Description	Data Type
cf-cache-has-path-hits	<p>Description: The total number of URLs whose domain_name entries are found in the CF cache based, and haspath bit was not set in the domain_name entry. I.e., no extended URLs are present in the SRDB for those domain_name URLs, so there is no need to go for rating.</p> <p>Trigger: Increments when a URL (whose domain_name entry is found in the CF cache) does not have its haspath bit set in the domain_name entry. That is, no extended URLs are present in the SRDB for that domain_name URL, so there is no need to go for rating.</p> <p>Availability: Per Active Charging Service.</p> <p>Type: Counter</p>	Int64
cf-cache-flushes	<p>Description: The total number of URLs that are flushed from the CF cache.</p> <p>Trigger: Increments when a URL is flushed from the CF cache.</p> <p>Availability: Per Active Charging Service.</p> <p>Type: Counter</p>	Int64
cf-ratereq	<p>Description: The total number of rating requests.</p> <p>Trigger: Increments when a static or dynamic request is sent to SRDB for rating.</p> <p>Availability: Per Active Charging Service.</p> <p>Type: Counter</p>	Int64
cf-ratesucc	<p>Description: The total number of “successful” responses against all rating requests.</p> <p>Trigger: Increments when a “successful” response is sent for static or dynamic rating requests from SRDBs.</p> <p>Availability: Per Active Charging Service.</p> <p>Type: Counter</p>	Int64
cf-rateblock	<p>Description: The total number of “blocked” responses against all rating requests.</p> <p>Trigger: Increments when a “blocked” response is sent for static rating requests from SRDBs.</p> <p>Availability: Per Active Charging Service.</p> <p>Type: Counter</p>	Int64
cf-ratefail	<p>Description: The total number of “failed” response against all rating requests.</p> <p>Trigger: Increments when an SRDB fails to send a response for static or dynamic rating requests.</p> <p>Availability: Per Active Charging Service.</p> <p>Type: Counter</p>	Int64
cf-ttlsub	<p>Description: The total number of CF subscribers.</p> <p>Trigger: Increments when a subscriber enables CF policy.</p> <p>Availability: Per Active Charging Service.</p> <p>Type: Counter</p>	Int32
cf-cursub	<p>Description: The current number of CF subscribers.</p> <p>Trigger: Increments when a subscriber enables CF policy. Decrements when the call is aborted.</p> <p>Availability: Per Active Charging Service.</p> <p>Type: Gauge</p>	Int32

Variables	Description	Data Type
cf-cat-abor-pkts-hit	Description: The total number of packets from sites with CF category “abortion” accessed. Trigger: Increments whenever a packet from sites with CF category “abortion” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-abor-pkts-block	Description: The total number of packets from sites with CF category “abortion” blocked. Trigger: Increments whenever a packet from sites with CF category “abortion” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-adult-pkts-hit	Description: The total number of packets from sites with CF category “adult” accessed. Trigger: Increments whenever a packet from sites with CF category “adult” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-adult-pkts-block	Description: The total number of packets from sites with CF category “adult” blocked. Trigger: Increments whenever a packet from sites with CF category “adult” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-advert-pkts-hit	Description: The total number of packets from sites with CF category “advertising site” accessed. Trigger: Increments whenever a packet from sites with CF category “advertising site” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-advert-pkts-block	Description: The total number of packets from sites with CF category “advertising site” blocked. Trigger: Increments whenever a packet from sites with CF category “advertising site” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-anon-pkts-hit	Description: The total number of packets from sites with CF category “anonymous” accessed. Trigger: Increments whenever a packet from sites with CF category “anonymous” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-anon-pkts-block	Description: The total number of packets from sites with CF category “anonymous” blocked. Trigger: Increments whenever a packet from sites with CF category “anonymous” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-art-pkts-hit	Description: The total number of packets from sites with CF category “art” accessed. Trigger: Increments whenever a packet from sites with CF category “art” is accessed. Availability: Per Active Charging Service.	Int32

Variables	Description	Data Type
cf-cat-art-pkts-block	Description: The total number of packets from sites with CF category “art” blocked. Trigger: Increments whenever a packet from sites with CF category “art” is blocked. Availability: Per Active Charging Service.	Int32
cf-cat-auto-pkts-hit	Description: The total number of packets from sites with CF category “auto” accessed. Trigger: Increments whenever a packet from sites with CF category “auto” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-auto-pkts-block	Description: The total number of packets from sites with CF category “auto” blocked. Trigger: Increments whenever a packet from sites with CF category “auto” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-backup-pkts-hit	Description: The total number of packets from sites with CF category “backup” accessed. Trigger: Increments whenever a packet from sites with CF category “backup” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-backup-pkts-block	Description: The total number of packets from sites with CF category “backup” blocked. Trigger: Increments whenever a packet from sites with CF category “backup” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-black-pkts-hit	Description: The total number of packets from sites with CF category “black” accessed. Trigger: Increments whenever a packet from sites with CF category “black” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-black-pkts-block	Description: The total number of packets from sites with CF category “black” blocked. Trigger: Increments whenever a packet from sites with CF category “black” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-blog-pkts-hit	Description: The total number of packets from sites with CF category “blog” accessed. Trigger: Increments whenever a packet from sites with CF category “blog” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-blog-pkts-block	Description: The total number of packets from sites with CF category “blog” blocked. Trigger: Increments whenever a packet from sites with CF category “blog” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-busi-pkts-hit	Description: The total number of packets from sites with CF category “business” accessed. Trigger: Increments whenever a packet from sites with CF category “business” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-busi-pkts-block	Description: The total number of packets from sites with CF category “business” blocked. Trigger: Increments whenever a packet from sites with CF category “business” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-car-pkts-hit	Description: The total number of packets from sites with CF category “career” accessed. Trigger: Increments whenever a packet from sites with CF category “career” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-car-pkts-block	Description: The total number of packets from sites with CF category “career” blocked. Trigger: Increments whenever a packet from sites with CF category “career” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-cdn-pkts-hit	Description: The total number of packets from sites with CF category “cdn” accessed. Trigger: Increments whenever a packet from sites with CF category “cdn” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-cdn-pkts-block	Description: The total number of packets from sites with CF category “cdn” blocked. Trigger: Increments whenever a packet from sites with CF category “cdn” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-chat-pkts-hit	Description: The total number of packets from sites with CF category “chat” accessed. Trigger: Increments whenever a packet from sites with CF category “chat” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-chat-pkts-block	Description: The total number of packets from sites with CF category “chat” blocked. Trigger: Increments whenever a packet from sites with CF category “chat” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-cmc-pkts-hit	Description: The total number of packets with CF category “virtual community” accessed. Trigger: Increments whenever a packet from sites with CF category “virtual community” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-cmc-pkts-block	Description: The total number of packets with CF category “virtual community” blocked. Trigger: Increments whenever a packet from sites with CF category “virtual community” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-crime-pkts-hit	Description: The total number of packets from sites with CF category “crime” accessed. Trigger: Increments whenever a packet from sites with CF category “crime” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-crime-pkts-block	Description: The total number of packets from sites with CF category “crime” blocked. Trigger: Increments whenever a packet from sites with CF category “crime” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-cult-pkts-hit	Description: The total number of packets from sites with CF category “cult” accessed. Trigger: Increments whenever a packet from sites with CF category “cult” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-cult-pkts-block	Description: The total number of packets from sites with CF category “cult” blocked. Trigger: Increments whenever a packet from sites with CF category “cult” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-drug-pkts-hit	Description: The total number of packets from sites with CF category “drug” accessed. Trigger: Increments whenever a packet from sites with CF category “drug” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-drug-pkts-block	Description: The total number of packets from sites with CF category “drug” blocked. Trigger: Increments whenever a packet from sites with CF category “drug” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-dynam-pkts-hit	Description: The total number of packets from sites with CF category “dynamic content” accessed. Trigger: Increments whenever a packet from sites with CF category “dynamic content” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-dynam-pkts-block	Description: The total number of packets from sites with CF category “dynamic content” blocked. Trigger: Increments whenever a packet from sites with CF category “dynamic content” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-edu-pkts-hit	Description: The total number of packets from sites with CF category “education” accessed. Trigger: Increments whenever a packet from sites with CF category “education” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-edu-pkts-block	Description: The total number of packets from sites with CF category “education” blocked. Trigger: Increments whenever a packet from sites with CF category “education” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-energy-pkts-hit	Description: The total number of packets from sites with CF category “energy” accessed. Trigger: Increments whenever a packet from sites with CF category “energy” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-energy-pkts-block	Description: The total number of packets from sites with CF category “energy” blocked. Trigger: Increments whenever a packet from sites with CF category “energy” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-ent-pkts-hit	Description: The total number of packets from sites with CF category “entertainment” accessed. Trigger: Increments whenever a packet from sites with CF category “entertainment” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-ent-pkts-block	Description: The total number of packets from sites with CF category “entertainment” blocked. Trigger: Increments whenever a packet from sites with CF category “entertainment” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-fin-pkts-hit	Description: The total number of packets from sites with CF category “finance” accessed. Trigger: Increments whenever a packet from sites with CF category “finance” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-fin-pkts-block	Description: The total number of packets from sites with CF category “finance” blocked. Trigger: Increments whenever a packet from sites with CF category “finance” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-forum-pkts-hit	Description: The total number of packets from sites with CF category “forum” accessed. Trigger: Increments whenever a packet from sites with CF category “forum” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-forum-pkts-block	Description: The total number of packets from sites with CF category “forum” blocked. Trigger: Increments whenever a packet from sites with CF category “forum” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-gamb-pkts-hit	Description: The total number of packets from sites with CF category “gambling” accessed. Trigger: Increments whenever a packet from sites with CF category “gambling” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-gamb-pkts-block	Description: The total number of packets from sites with CF category “gambling” blocked. Trigger: Increments whenever a packet from sites with CF category “gambling” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-game-pkts-hit	Description: The total number of packets from sites with CF category “game” accessed. Trigger: Increments whenever a packet from sites with CF category “game” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-game-pkts-block	Description: The total number of packets from sites with CF category “game” blocked. Trigger: Increments whenever a packet from sites with CF category “game” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-glam-pkts-hit	Description: The total number of packets from sites with CF category “glamour” accessed. Trigger: Increments whenever a packet from sites with CF category “glamour” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-glam-pkts-block	Description: The total number of packets from sites with CF category “glamour” blocked. Trigger: Increments whenever a packet from sites with CF category “glamour” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-govern-pkts-hit	Description: The total number of packets from sites with CF category “government” accessed. Trigger: Increments whenever a packet from sites with CF category “government” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-govern-pkts-block	Description: The total number of packets from sites with CF category “government” blocked. Trigger: Increments whenever a packet from sites with CF category “government” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-hack-pkts-hit	Description: The total number of packets from sites with CF category “hacker” accessed. Trigger: Increments whenever a packet from sites with CF category “hacker” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-hack-pkts-block	Description: The total number of packets from sites with CF category “hacker” blocked. Trigger: Increments whenever a packet from sites with CF category “hacker” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-hate-pkts-hit	Description: The total number of packets from sites with CF category “hate” accessed. Trigger: Increments whenever a packet from sites with CF category “hate” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-hate-pkts-block	Description: The total number of packets from sites with CF category “hate” blocked. Trigger: Increments whenever a packet from sites with CF category “hate” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-health-pkts-hit	Description: The total number of packets from sites with CF category “health” accessed. Trigger: Increments whenever a packet from sites with CF category “health” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-health-pkts-block	Description: The total number of packets from sites with CF category “health” blocked. Trigger: Increments whenever a packet from sites with CF category “health” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-hobby-pkts-hit	Description: The total number of packets from sites with CF category “hobby” accessed. Trigger: Increments whenever a packet from sites with CF category “hobby” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-hobby-pkts-block	Description: The total number of packets from sites with CF category “hobby” blocked. Trigger: Increments whenever a packet from sites with CF category “hobby” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-hosts-pkts-hit	Description: The total number of packets from sites with CF category “host” accessed. Trigger: Increments whenever a packet from sites with CF category “host” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-hosts-pkts-block	Description: The total number of packets from sites with CF category “host” blocked. Trigger: Increments whenever a packet from sites with CF category “host” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-kids-pkts-hit	Description: The total number of packets from sites with CF category “kids” accessed. Trigger: Increments whenever a packet from sites with CF category “kids” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-kids-pkts-block	Description: The total number of packets from sites with CF category “kids” blocked. Trigger: Increments whenever a packet from sites with CF category “kids” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-legal-pkts-hit	Description: The total number of packets from sites with CF category “legal” accessed. Trigger: Increments whenever a packet from sites with CF category “legal” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-legal-pkts-block	Description: The total number of packets from sites with CF category “legal” blocked. Trigger: Increments whenever a packet from sites with CF category “legal” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-lifes-pkts-hit	Description: The total number of packets from sites with CF category “lifes” accessed. Trigger: Increments whenever a packet from sites with CF category “life” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-lifes-pkts-block	Description: The total number of packets from sites with CF category “lifes” blocked. Trigger: Increments whenever a packet from sites with CF category “life” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-mail-pkts-hit	Description: The total number of packets from sites with CF category “mail” accessed. Trigger: Increments whenever a packet from sites with CF category “mail” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-mail-pkts-block	Description: The total number of packets from sites with CF category “mail” blocked. Trigger: Increments whenever a packet from sites with CF category “mail” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-mil-pkts-hit	Description: The total number of packets from sites with CF category “military” accessed. Trigger: Increments whenever a packet from sites with CF category “military” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-mil-pkts-block	Description: The total number of packets from sites with CF category “military” blocked. Trigger: Increments whenever a packet from sites with CF category “military” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-news-pkts-hit	Description: The total number of packets from sites with CF category “news” accessed. Trigger: Increments whenever a packet from sites with CF category “news” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-news-pkts-block	Description: The total number of packets from sites with CF category “news” blocked. Trigger: Increments whenever a packet from sites with CF category “news” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-occult-pkts-hit	Description: The total number of packets from sites with CF category “occult” accessed. Trigger: Increments whenever a packet from sites with CF category “occult” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-occult-pkts-block	Description: The total number of packets from sites with CF category “occult” blocked. Trigger: Increments whenever a packet from sites with CF category “occult” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-peer-pkts-hit	Description: The total number of packets from sites with CF category “peer” accessed. Trigger: Increments whenever a packet from sites with CF category “peer” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-peer-pkts-block	Description: The total number of packets from sites with CF category “peer” blocked. Trigger: Increments whenever a packet from sites with CF category “peer” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-pers-pkts-hit	Description: The total number of packets from sites with CF category “pers” accessed. Trigger: Increments whenever a packet from sites with CF category “pers” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-pers-pkts-block	Description: The total number of packets from sites with CF category “pers” blocked. Trigger: Increments whenever a packet from sites with CF category “pers” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-photo-pkts-hit	Description: The total number of packets from sites with CF category “photo” accessed. Trigger: Increments whenever a packet from sites with CF category “photo” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-photo-pkts-block	Description: The total number of packets from sites with CF category “photo” blocked. Trigger: Increments whenever a packet from sites with CF category “photo” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-plag-pkts-hit	Description: The total number of packets from sites with CF category “plag” accessed. Trigger: Increments whenever a packet from sites with CF category “plag” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-plag-pkts-block	Description: The total number of packets from sites with CF category “plag” blocked. Trigger: Increments whenever a packet from sites with CF category “plag” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-poltic-pkts-hit	Description: The total number of packets from sites with CF category “poltic” accessed. Trigger: Increments whenever a packet from sites with CF category “poltic” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-poltic-pkts-block	Description: The total number of packets from sites with CF category “poltic” blocked. Trigger: Increments whenever a packet from sites with CF category “poltic” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-porn-pkts-hit	Description: The total number of packets from sites with CF category “porn” accessed. Trigger: Increments whenever a packet from sites with CF category “porn” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-porn-pkts-block	Description: The total number of packets from sites with CF category “porn” blocked. Trigger: Increments whenever a packet from sites with CF category “porn” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-portal-pkts-hit	Description: The total number of packets from sites with CF category “portal” accessed. Trigger: Increments whenever a packet from sites with CF category “portal” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-portal-pkts-block	Description: The total number of packets from sites with CF category “portal” blocked. Trigger: Increments whenever a packet from sites with CF category “portal” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-proxy-pkts-hit	Description: The total number of packets from sites with CF category “proxy” accessed. Trigger: Increments whenever a packet from sites with CF category “proxy” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-proxy-pkts-block	Description: The total number of packets from sites with CF category “proxy” blocked. Trigger: Increments whenever a packet from sites with CF category “proxy” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-ref-pkts-hit	Description: The total number of packets from sites with CF category “ref” accessed. Trigger: Increments whenever a packet from sites with CF category “ref” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-ref-pkts-block	Description: The total number of packets from sites with CF category “ref” blocked. Trigger: Increments whenever a packet from sites with CF category “ref” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-rel-pkts-hit	Description: The total number of packets from sites with CF category “rel” accessed. Trigger: Increments whenever a packet from sites with CF category “rel” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-rel-pkts-block	Description: The total number of packets from sites with CF category “rel” blocked. Trigger: Increments whenever a packet from sites with CF category “rel” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-sci-pkts-hit	Description: The total number of packets from sites with CF category “sci” accessed. Trigger: Increments whenever a packet from sites with CF category “sci” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-sci-pkts-block	Description: The total number of packets from sites with CF category “sci” blocked. Trigger: Increments whenever a packet from sites with CF category “sci” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-search-pkts-hit	Description: The total number of packets from sites with CF category “search” accessed. Trigger: Increments whenever a packet from sites with CF category “search” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-search-pkts-block	Description: The total number of packets from sites with CF category “search” blocked. Trigger: Increments whenever a packet from sites with CF category “search” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-shop-pkts-hit	Description: The total number of packets from sites with CF category “shop” accessed. Trigger: Increments whenever a packet from sites with CF category “shop” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-shop-pkts-block	Description: The total number of packets from sites with CF category “shop” blocked. Trigger: Increments whenever a packet from sites with CF category “shop” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-sport-pkts-hit	Description: The total number of packets from sites with CF category “sport” accessed. Trigger: Increments whenever a packet from sites with CF category “sport” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-sport-pkts-block	Description: The total number of packets from sites with CF category “sport” blocked. Trigger: Increments whenever a packet from sites with CF category “sport” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-stream-pkts-hit	Description: The total number of packets from sites with CF category “stream” accessed. Trigger: Increments whenever a packet from sites with CF category “stream” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-stream-pkts-block	Description: The total number of packets from sites with CF category “stream” blocked. Trigger: Increments whenever a packet from sites with CF category “stream” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-suic-pkts-hit	Description: The total number of packets from sites with CF category “suic” accessed. Trigger: Increments whenever a packet from sites with CF category “suic” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-suic-pkts-block	Description: The total number of packets from sites with CF category “suic” blocked. Trigger: Increments whenever a packet from sites with CF category “suic” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-sxed-pkts-hit	Description: The total number of packets from sites with CF category “sxed” accessed. Trigger: Increments whenever a packet from sites with CF category “sxed” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-sxed-pkts-block	Description: The total number of packets from sites with CF category “sxed” blocked. Trigger: Increments whenever a packet from sites with CF category “sxed” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-tech-pkts-hit	Description: The total number of packets from sites with CF category “tech” accessed. Trigger: Increments whenever a packet from sites with CF category “tech” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-tech-pkts-block	Description: The total number of packets from sites with CF category “tech” blocked. Trigger: Increments whenever a packet from sites with CF category “tech” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-trav-pkts-hit	Description: The total number of packets from sites with CF category “trav” accessed. Trigger: Increments whenever a packet from sites with CF category “trav” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-trav-pkts-block	Description: The total number of packets from sites with CF category “trav” blocked. Trigger: Increments whenever a packet from sites with CF category “trav” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-viol-pkts-hit	Description: The total number of packets from sites with CF category “viol” accessed. Trigger: Increments whenever a packet from sites with CF category “viol” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-viol-pkts-block	Description: The total number of packets from sites with CF category “viol” blocked. Trigger: Increments whenever a packet from sites with CF category “viol” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-voip-pkts-hit	Description: The total number of packets from sites with CF category “voip” accessed. Trigger: Increments whenever a packet from sites with CF category “voip” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-voip-pkts-block	Description: The total number of packets from sites with CF category “voip” blocked. Trigger: Increments whenever a packet from sites with CF category “voip” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-weap-pkts-hit	Description: The total number of packets from sites with CF category “weap” accessed. Trigger: Increments whenever a packet from sites with CF category “weap” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-weap-pkts-block	Description: The total number of packets from sites with CF category “weap” blocked. Trigger: Increments whenever a packet from sites with CF category “weap” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-white-pkts-hit	Description: The total number of packets from sites with CF category “white” accessed. Trigger: Increments whenever a packet from sites with CF category “white” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-white-pkts-block	Description: The total number of packets from sites with CF category “white” blocked. Trigger: Increments whenever a packet from sites with CF category “white” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-unknow-pkts-hit	Description: The total number of packets from sites with CF category “unknow” accessed. Trigger: Increments whenever a packet from sites with CF category “unknow” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-unknow-pkts-block	Description: The total number of packets from sites with CF category “unknow” blocked. Trigger: Increments whenever a packet from sites with CF category “unknow” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-xcategory-pkts-hit	Description: The total number of packets from sites with CF category “xcategory” accessed. Trigger: Increments whenever a packet from sites with CF category “xcategory” is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-xcategory-pkts-block	Description: The total number of packets from sites with CF category “xcategory” blocked. Trigger: Increments whenever a packet from sites with CF category “xcategory” is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-all-pkts-hit	Description: The total number of URLs categorized by default action. Trigger: Increments whenever a packet categorized by default action is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-all-pkts-block	Description: The total number of URLs blocked by default action. Trigger: Increments whenever a packet categorized by default action is blocked. Availability: Per Active Charging Service. Type: Counter	Int32

Variables	Description	Data Type
cf-cat-timer-pkts-hit	Description: The total number of URLs categorized by timeout action. Trigger: Increments whenever a packet categorized by timeout action is accessed. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-timer-pkts-block	Description: The total number of URLs blocked by timeout action. Trigger: Increments whenever a packet categorized by timeout action is blocked. Availability: Per Active Charging Service. Type: Counter	Int32
cf-cat-pkts-hit-summary	Description: Summary of total packets with CF category accessed. Trigger: Increments whenever a packet of any of the above categories is accessed. Availability: Per Active Charging Service. Type: Counter	String
cf-cat-pkts-block-summary	Description: Summary of total packets with CF category blocked. Trigger: Increments whenever a packet of any of the above categories is blocked. Availability: Per Active Charging Service. Type: Counter	String
ipsg-total-call-arrived	Description: The total number of IPSG calls arrived on this system. Trigger: Increments when a new IPSG call arrives. Availability: Per system. Type: Counter	Int32
ipsg-total-call-rejected	Description: The total number of IPSG calls rejected by this system. Trigger: Increments when an IPSG call is rejected. Availability: Per system. Type: Counter	Int32
ipsg-total-call-demult	Description: The total number of IPSG calls de-multiplexed by this system. Trigger: Increments when an IPSG is de-multiplexed. Availability: Per system. Type: Counter	Int32
ipsg-total-dereg-rep-sent	Description: The total number of IPSG calls de-registered by this system. Trigger: Increments when an IPSG call is de-registered. Availability: Per system. Type: Counter	Int32
ipsg-cur-active-call	Description: The number of IPSG calls currently active on this system. Trigger: Increments when an IPSG call comes up. Decrements when an IPSG call ends. Availability: Per system. Type: Gauge	Int32
ipsg-total-active-serv	Description: The total number of active IPSG services on this system. Trigger: Increments when an IPSG service is configured on the system. Decrements when an IPSG service is removed. Availability: Per system. Type: Gauge	Int32

Variables	Description	Data Type
dpca-cursess	Description: The total number of active DPCA sessions currently running on the node. Trigger: Increments when a DPCA session is created. Decrements when a DPCA session is terminated. Availability: Per IMS Authorization Service Type: Gauge	Int32
dcca-cursess	Description: The total number of active DCCA sessions currently running on the node. Trigger: Increments when an online Diameter session is created Decrements when an online session is terminated, or when an online session is converted to offline Availability: Per Credit Control Group Type: Gauge	Int32
asngw-cur-active-call	Description: The total number of active ASN-GW session on a system. Type: Gauge	Int32
asngw-total-sess-setup	Description: The total number of ASN-GW sessions setup on a system. Type: Counter	Int32
asngw-retriesexhaust	Description: The total number of retries for R6 connection setup for ASN-GW service on a system. Type: Counter	Int32
asngw-sfs	Description: The total number of ASN-GW service flows. Type: Counter	Int32
asngw-tidfail	Description: The total number of ASN-GW Transaction id (tid) failures on a system. Type: Counter	Int32
asngw-handoffattempt	Description: The total number of intra-ASN Gateway and inter-ASN Gateway hand-offs attempted on a system. Type: Counter	Int32
asngw-handoffdenied	Description: The total number of intra-ASN Gateway and inter-ASN Gateway hand-offs denied/failed on a system. Type: Counter	Int32
asngw-handoffcomp	Description: The total number of successful intra-ASN Gateway and inter-ASN Gateway hand-offs completed on a system. Type: Counter	Int32
asngw-authsucc	Description: The total number of successful EAP authorization on a system for ASN-GW service. Type: Counter	Int32
asngw-authfailures	Description: The total number of failed EAP authorization on a system for ASN-GW service. Type: Counter	Int32
asngw-simple-ip-reanchored	Description: The total number of sessions that have completed a simple IP re-anchoring on ASNGW. Type: Counter	Int32

Variables	Description	Data Type
asnpc-cursess	Description: The total number of ASN-PC sessions currently running on a system. This is a Cisco Proprietary statistic. Trigger: A new session was created on an ASNPC service. Availability: This value is cumulative for all ASNPC services configured on the system. Type: Counter	Int64
asnpc-curactive	Description: The total number of active ASN-PC sessions on a system. Type: Gauge	Int64
asnpc-ttlsetup	Description: The total number of historic ASN-PC sessions that have been set up on a system. This is a Cisco proprietary statistic. Trigger: A new session was created on the system for an ASNPC service. Availability: The historic cumulative total for all ASNPC services configured on the system. Type: Counter	Int64
asnpc-retriesexhaust	Description: The total number of retries exhaust happened for R6 connection setup for an ASN-PC service on a system. This is a Cisco proprietary statistic. Trigger: The max retransmission limit for R6 for ASNPC call setup has been exceeded. Availability: This is a cumulative total for all ASNPC services configured on the system. Type: Counter	Int32
asnpc-tidfail	Description: The total number of ASN-PC Transaction id (TID) failures on a system. This is a Cisco proprietary statistic. Trigger: A TID error due to call setup occurred on an ASNPC service. Availability: This total is cumulative for all ASNPC services configured on the system. Type: Counter	Int32
asnpc-luattempted	Description: The total number of location update Req messages received on ASN-PC. This is a Cisco proprietary statistic. Trigger: A Location Update was attempted by the MS in Idle mode. Availability: This total is cumulative for all ASNPC services configured on the system. Type: Counter	Int32
asnpc-ludenied	Description: The total number of Location Update Requests denied/failed on a system. This is a Cisco proprietary statistic. Trigger: A Location Update was denied by the MS in Idle mode. Availability: This total is cumulative for all ASNPC services configured on the system. Type: Counter	Int32
asnpc-lucomp	Description: The total number of successfully completed Location Updates on ASN-PC. This is a Cisco proprietary statistic. Trigger: Successful completion of a Location Update in Idle Mode. Availability: This total is cumulative for all ASNPC services configured on the system. Type: Counter	Int32
asnpc-pagattempted	Description: The total number of paging procedures started on ASN-PC. This is a Cisco proprietary statistic. Trigger: Paging was attempted by an ASNPC service for making the MS active, etc. Availability: This total is cumulative for all ASNPC services configured on the system. Type: Counter	Int32

Variables	Description	Data Type
asnpc-pagsucceeded	Description: The total number of paging procedures successfully completed on ASN-PC. This is a Cisco proprietary statistic. Trigger: The system successfully received an IM Exit or Location Update from MS, after an ASNPC service sent a Paging Announce. Availability: This total is cumulative for all ASNPC services configured on the system. Type: Counter	Int32
asnpc-annoucetriggered	Description: The total number of paging announce messages scheduled to be sent by ASN-PC. This is a Cisco proprietary statistic. Trigger: The ASNGW requested an ASNPC service to trigger paging. Availability: This total is cumulative for all ASNPC services configured on the system. Type: Counter	Int32
phsgw-cursess	Not supported in this release. Type: Gauge	Int32
phsgw-cur-active-call	Not supported in this release. Type: Gauge	Int32
phsgw-total-sess-setup	Not supported in this release.	Int32
phsgw-retriesexhaust	Not supported in this release.	Int32

phspc-locupdate-attempt	Not supported in this release.	Int32
phspc-locupdate-denied	Not supported in this release.	Int32
phspc-locupdate-comp	Not supported in this release.	Int32

Variables	Description	Data Type
phspc-paging-attempt	Not supported in this release.	Int32
ikev2-cursa	Description: The total number of current security associations with Internet Key Exchange v2 (IKEv2). Type: Gauge	Int32
ikev2-cursainit	Description: The total number of current security associations for which the peers initiated the IKE_SA_INIT exchanges. Type: Gauge	Int32
ikev2-cursaresp	Description: The total number of response for active security associations with Internet Key Exchange v2 (IKEv2) Type: Gauge	Int32
ikev2-ttlsa	Description: The total number of security associations with Internet Key Exchange v2 (IKEv2) Type: Counter	Int32
ikev2-ttlsainit	Description: The total number of security associations for which the gateway initiated the IKE_SA_INIT exchanges. Type: Counter	Int32
ikev2-ttlsaresp	Description: The total number of security associations for which the peers initiated the IKE_SA_INIT exchanges. Type: Counter	Int32
ikev2-attempt	Description: The total number of attempts for security association tunnel with Internet Key Exchange v2 (IKEv2) Type: Counter	Int32
ikev2-attemptinit	Description: The total number of attempts for which the gateway initiated the IKE_SA_INIT exchanges. Type: Counter	Int32
ikev2-attemptresp	Description: The total number of attempts for which the peers initiated the IKE_SA_INIT exchanges. Type: Counter	Int32
ikev2-rxpacket	Description: The total number of packets received with Internet Key Exchange v2 (IKEv2) Type: Counter	Int32
ikev2-txpacket	Description: The total number of packets transmitted with Internet Key Exchange v2 (IKEv2) Type: Counter	Int32
ikev2-rxoctet	Description: The total number of octets received with Internet Key Exchange v2 (IKEv2) Type: Counter	Int32
ikev2-txoctet	Description: The total number of octets transmitted with Internet Key Exchange v2 (IKEv2) Type: Counter	Int32

Variables	Description	Data Type
ikev2-initfail	Description: The total number of failed negotiations for which the gateway initiated the IKE_SA_INIT exchanges. Type: Counter	Int32
ikev2-initfail-noresp	Description: The total number of negotiations initiated by the gateway that failed because of no responses from peers. Type: Counter	Int32
ikev2-initfail-resp	Description: The total number of negotiations initiated by the peers and responded to by the gateway that failed because of errors. Type: Counter	Int32
ikev2-invcookie	Description: The total number of invalid cookie errors. Type: Counter	Int32
ikev2-congrej	Description: The total number of negotiations that were rejected because of congestion control. Type: Counter	Int32
ikev2-congdrop	Description: The total number of negotiations that were dropped because of congestion control. Type: Counter	Int32
ikev2-unkxchgspi	Description: The total number of unknown exchange security parameter indexes. Type: Counter	Int32
ikev2-nattkeepalive-recv	Description: The total number of NAT-T Keep-Alive messages received with IKEv2 Type: Counter	Int32
ikev2-nattkeepalive-send	Description: The total number of NAT-Keep-Alive messages sent with IKEv2 Type: Counter	Int32
ikev2-dpd-recv	Description: The total number of DPD (Dead-Peer-Detection) request messages received. Type: Counter	Int32
ikev2-dpd-send	Description: The total number of DPD request messages sent. Type: Counter	Int32
ikev2-dpd-recv-reply	Description: The total number of DPD reply messages received. Type: Counter	Int32
ikev2-dpd-send-reply	Description: The total number of DPD reply messages sent. Type: Counter	Int32
ikev2-dpd-timeout	Description: The total number of failures to receive DPD reply messages before timeout. Type: Counter	Int32
ikev2-dpd-disconnect	Description: The total number of disconnections of security associations due to DPD timeout. Type: Counter	Int32
ipsec-dpd-plrekey	Description: The total number of successful IKE SA rekeys. Type: Counter	Int32
ikev2-ikesadel	Description: The total number of deletes sent or received. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
ikev2-ikesadelreq-sent	Description: The total number of delete requests sent. Type: Counter	Int32
ikev2-ikesadelreq-recv	Description: The total number of delete requests received. Type: Counter	Int32
ikev2-ikesadelrep-sent	Description: The total number of delete replies sent. Type: Counter	Int32
ikev2-ikesadelrep-recv	Description: The total number of delete replies received. Type: Counter	Int32
ikev2-curikev2sa	Description: The total number of current IKEv2 Security Associations. Type: Gauge	Int32
ikev2-curhalfsa	Description: The total number of negotiations in which the subject has received IKE_SA_INIT requests but has not finished IKE_AUTH exchanges. Type: Gauge	Int32
ikev2-curconnsa	Description: The total number of negotiations in which the subject has sent or received IKE_SA_INIT requests but has not finished IKE_AUTH exchanges. Type: Gauge	Int32
ikev2-curestsa	Description: The total number of currently established IKEv2 Security Associations. Type: Gauge	Int32
ikev2-curchildsa	Description: The total number of current Child Security Associations. Type: Gauge	Int32
ikev2-exp-retran	Description: The total number of IKESA retransmission expirations. Type: Counter	Int32
ikev2-exp-setupnoxchg	Description: The total number of IKESA setup expirations (no exchange). Type: Counter	Int32
ikev2-exp-setup	Description: The total number of IKESA setup expirations. Type: Counter	Int32
ikev2-exp-lifesoft	Description: The total number of IKESA lifetime (soft) expirations. Type: Counter	Int32
ikev2-exp-lifehard	Description: The total number of IKESA lifetime (hard) expirations. Type: Counter	Int32
ikev2-exp-childsetupnoxchg	Description: The total number of Child Security Association setup expirations (no exchange). Type: Counter	Int32
ikev2-exp-childlifesoft	Description: The total number of Child Security Association lifetime (soft) expirations. Type: Counter	Int32
ikev2-exp-childlifehard	Description: The total number of Child Security Association lifetime (hard) expirations. Type: Counter	Int32
ikev2-csa-createreqsnt	Description: The total number of IKEv2 Create CHILD_SA Exchange Requests sent. Type: Counter	Int32

Variables	Description	Data Type
ikev2-csa-createreqrcv	Description: The total number of IKEv2 Create CHILD_SA Exchange Requests received. Type: Counter	Int32
ikev2-csa-createrspsnt	Description: The total number of IKEv2 Create CHILD_SA Exchange Responses sent. Type: Counter	Int32
ikev2-csa-creatersprcv	Description: The total number of IKEv2 Create CHILD_SA Exchange Responses received. Type: Counter	Int32
ikev2-csa-createsucc	Description: The total number of IKEv2 Create CHILD_SA Exchange successes. Type: Counter	Int32
ikev2-csa-creatfail	Description: The total number of IKEv2 Create CHILD_SA Exchange failures. Type: Counter	Int32
ikev2-csa-createsftovrflw	Description: The total number of IKEv2 Create CHILD_SA Exchange soft limit overflow attempts. Type: Counter	Int32
ikev2-csa-createhrdovrflw	Description: The total number of IKEv2 Create CHILD_SA Exchange hard limit overflow attempts. Type: Counter	Int32
ikev2-csa-sngldelpldsnt	Description: The total number of IKEv2 INFORMATIONAL Exchanges with a single CHILD_SA Delete payload sent. Type: Counter	Int32
ikev2-csa-sngldelpldrcv	Description: The total number of IKEv2 INFORMATIONAL Exchanges with a single CHILD_SA Delete payload received. Type: Counter	Int32
ikev2-csa-multdelpldsnt	Description: The total number of IKEv2 INFORMATIONAL Exchanges with multiple CHILD_SA Delete payloads sent. Type: Counter	Int32
ikev2-csa-multdelpldrcv	Description: The total number of IKEv2 INFORMATIONAL Exchanges with multiple CHILD_SA Delete payloads received. Type: Counter	Int32
ikev2-csa-delpldsnglspisnt	Description: The total number of IKEv2 INFORMATIONAL Exchanges with a CHILD_SA Delete payload with a single SPI sent. Type: Counter	Int32
ikev2-csa-delpldsnglspircv	Description: The total number of IKEv2 INFORMATIONAL Exchanges with a CHILD_SA Delete payload with a single SPI received. Type: Counter	Int32
ikev2-csa-delmultspisnt	Description: The total number of IKEv2 INFORMATIONAL Exchanges with a CHILD_SA Delete payload with multiple SPIs sent. Type: Counter	Int32
ikev2-csa-delmultspircv	Description: The total number of IKEv2 INFORMATIONAL Exchanges with a CHILD_SA Delete payload with multiple SPIs received. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
ikev2-auth-p1succ	Description: The total number of IKEv2 Phase 1 authentication successes. Type: Counter	Int32
ikev2-auth-p1fail	Description: The total number of IKEv2 Phase 1 authentication failures. Type: Counter	Int32
ikev2-auth-p1req	Description: The total number of IKEv2 Phase 1 authentication requests sent. Type: Counter	Int32
ikev2-auth-p1rsp	Description: The total number of IKEv2 Phase 1 authentication responses received. Type: Counter	Int32
ikev2-auth-p1finalsent	Description: The total number of IKEv2 Phase 1 authentication requests or responses sent in the final exchange of Phase 1 authentication. Type: Counter	Int32
ikev2-auth-p1finalrcvd	Description: The total number of IKEv2 Phase 1 authentication requests or responses received in the final exchange of Phase 1 authentication. Type: Counter	Int32
ikev2-auth-p2succ	Description: The total number of IKEv2 Phase 2 authentication successes. Type: Counter	Int32
ikev2-auth-p2fail	Description: The total number of IKEv2 Phase 2 authentication failures. Type: Counter	Int32
ikev2-auth-p2req	Description: The total number of IKEv2 Phase 2 authentication requests sent. Type: Counter	Int32
ikev2-auth-p2rsp	Description: The total number of IKEv2 Phase 2 authentication responses received. Type: Counter	Int32
ikev2-auth-p2succmd5	Description: The total number of IKEv2 Phase 2 authentication MD5 successes. Type: Counter	Int32
ikev2-auth-p2failmd5	Description: The total number of IKEv2 Phase 2 authentication MD5 failures. Type: Counter	Int32
ikev2-auth-p2succgtc	Description: The total number of IKEv2 Phase 2 authentication Generic Token Card successes. Type: Counter	Int32
ikev2-auth-p2failgtc	Description: The total number of IKEv2 Phase 2 authentication Generic Token Card failures. Type: Counter	Int32
ikev2-auth-p2finalsent	Description: The total number of IKEv2 Phase 2 authentication requests or responses sent in the final exchange of Phase 2 authentication. Type: Counter	Int32
ikev2-auth-p2finalrcvd	Description: The total number of IKEv2 Phase 2 authentication requests or responses received in the final exchange of Phase 2 authentication. Type: Counter	Int32
ikev2-auth-failhash	Description: The total number of IKEv2 authentication hash match failures. Type: Counter	Int32

Variables	Description	Data Type
ikev2-auth-failsign	Description: The total number of IKEv2 authentication signing failures. Type: Counter	Int32
ikev2-auth-failmskmiss	Description: The total number of IKEv2 Master Session Keys missing at Phase 1 completion. Type: Counter	Int32
ikev2-auth-failmissanother	Description: The total number of IKEv2 authentication that failed because of missing NOTIFY (ANOTHER_AUTH_FOLLOWS) payload. Type: Counter	Int32
ikev2-xchg-droprspnoikesa	Description: The total number of IKEv2 exchanges dropped (response packets dropped). No IKE SA. Type: Counter	Int32
ikev2-xchg-dropinvrsp	Description: The total number of IKEv2 exchanges dropped (invalid responses). Type: Counter	Int32
ikev2-xchg-droptoninitnoikesa	Description: The total number of IKEv2 exchanges dropped (non-init exchanges dropped). No IKE SA. Type: Counter	Int32
ikev2-xchg-dropinvmmsgid	Description: The total number of IKEv2 exchanges dropped (invalid message ID). Type: Counter	Int32
ikev2-xchg-dropinvmajver	Description: The total number of IKEv2 exchanges dropped (invalid major version). Type: Counter	Int32
ikev2-xchg-dropikesaerr	Description: The total number of IKEv2 exchanges dropped (IKE SA error). Type: Counter	Int32
ikev2-xchg-dropunkcrit	Description: The total number of IKEv2 exchanges dropped (unknown critical payload). Type: Counter	Int32
ikev2-xchg-dropretransdisc	Description: The total number of IKEv2 exchanges dropped (retransmitted request). Type: Counter	Int32
ikev2-notif-cooksent	Description: The total number of IKEv2 Cookie Notify payloads sent. Type: Counter	Int32
ikev2-notif-cookrecv	Description: The total number of IKEv2 Cookie Notify payloads received. Type: Counter	Int32
ikev2-notif-cookmatch	Description: The total number of IKEv2 Cookie Notify payloads matched. Type: Counter	Int32
ikev2-notif-cooknotmatch	Description: The total number of IKEv2 Cookie Notify payloads not matched. Type: Counter	Int32
ikev2-notif-multauthsupp	Description: The total number of IKEv2 multiple authentications supported. Type: Counter	Int32
ikev2-notif-anothauth	Description: The total number of NOTIFY (ANOTHER_AUTH_FOLLOWS) payloads received. Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
ikev2-rekey-ikesareqsent	Description: Total IKEv2 IKE SA rekey requests sent. Type: Counter	Int32
ikev2-rekey-ikesareqrcvd	Description: Total IKEv2 IKE SA rekey requests received. Type: Counter	Int32
ikev2-rekey-ikesarspsent	Description: Total IKEv2 IKE SA rekey responses sent. Type: Counter	Int32
ikev2-rekey-ikesarsprcvd	Description: Total IKEv2 IKE SA rekey responses received. Type: Counter	Int32
ikev2-rekey-ikesaignored	Description: Total IKEv2 IKE SA rekeys ignored. Type: Counter	Int32
ikev2-rekey-childsareqsent	Description: Total IKEv2 Child SA rekey requests sent. Type: Counter	Int32
ikev2-rekey-childsareqrcv	Description: Total IKEv2 Child SA rekey requests received. Type: Counter	Int32
ikev2-rekey-childsarspsent	Description: Total IKEv2 Child SA rekey responses sent. Type: Counter	Int32
ikev2-rekey-childsarsprcv	Description: Total IKEv2 Child SA rekey responses received. Type: Counter	Int32
ikev2-rekey-childsaignored	Description: Total IKEv2 Child SA rekeys ignored. Type: Counter	Int32
ikev2-mobike-sent	Description: Total IKEv2 MOBIKE_SUPPORTED Notify payloads sent. Type: Counter	Int32
ikev2-mobike-recv	Description: Total IKEv2 MOBIKE_SUPPORTED Notify payloads received. Type: Counter	Int32
ikev2-mobike-ignored	Description: Total IKEv2 MOBIKE_SUPPORTED Notify payloads ignored. Type: Counter	Int32
ikev2-misc-ikesacrefail	Description: Total IKEv2 SA create failures. Type: Counter	Int32
ikev2-misc-saflopfail	Description: Total IKEv2 child SA flow operation failures. Type: Counter	Int32
ikev2-notifpaysent-invke	Description: Total IKEv2 Notify payloads sent (invalid KE payload). Type: Counter	Int32
ikev2-notifpaysent-invmajver	Description: Total IKEv2 Notify payloads sent (invalid major version). Type: Counter	Int32
ikev2-notifpaysent-invmmsgid	Description: Total IKEv2 Notify payloads sent (invalid message ID). Type: Counter	Int32
ikev2-notifpaysent-invsyn	Description: Total IKEv2 Notify payloads sent (invalid syntax). Type: Counter	Int32

Variables	Description	Data Type
ikev2-notifpaysent-noaddsa	Description: Total IKEv2 Notify payloads sent (no additional SAs). Type: Counter	Int32
ikev2-notifpaysent-noprop	Description: Total IKEv2 Notify payloads sent (no proposal chosen). Type: Counter	Int32
ikev2-notifpaysent-tsunaccept	Description: Total IKEv2 Notify payloads sent (TS unacceptable). Type: Counter	Int32
ikev2-notifpaysent-unsupcrit	Description: Total IKEv2 Notify payloads sent (unsupported critical payload). Type: Counter	Int32
ikev2-notifpaysent-intfail	Description: Total IKEv2 Notify payloads received (internal failure sent). Type: Counter	Int32
ikev2-notifpayrecv-invke	Description: Total IKEv2 Notify payloads received (invalid KE payload). Type: Counter	Int32
ikev2-notifpayrecv-invmajver	Description: Total IKEv2 Notify payloads received (invalid major version). Type: Counter	Int32
ikev2-notifpayrecv-invmmsgid	Description: Total IKEv2 Notify payloads received (invalid message ID). Type: Counter	Int32
ikev2-notifpayrecv-invsyn	Description: Total IKEv2 Notify payloads received (invalid syntax). Type: Counter	Int32
ikev2-notifpayrecv-noaddsa	Description: Total IKEv2 Notify payloads received (no additional SAs). Type: Counter	Int32
ikev2-notifpayrecv-noprop	Description: Total IKEv2 Notify payloads received (no proposal chosen). Type: Counter	Int32
ikev2-notifpayrecv-tsunaccept	Description: Total IKEv2 Notify payloads received (TS unacceptable). Type: Counter	Int32
ikev2-notifpayrecv-unsupcrit	Description: Total IKEv2 Notify payloads received (unsupported critical payload). Type: Counter	Int32
ikev2-decfail-pktfail	Description: Total IKEv2 exchange decode failures (packet errors). Type: Counter	Int32
ikev2-decfail-interr	Description: Total IKEv2 exchange decode failures (internal errors). Type: Counter	Int32
ikev2-decfail-iphdr	Description: Total IKEv2 exchange decode failures (invalid IP header). Type: Counter	Int32
ikev2-decfail-udphdr	Description: Total IKEv2 exchange decode failures (invalid UDP header). Type: Counter	Int32
ikev2-decfail-ikehdr	Description: Total IKEv2 exchange decode failures (invalid IKE header). Type: Counter	Int32
ikev2-decfail-ikehdrpay	Description: Total IKEv2 exchange decode failures (invalid IKE header payload). Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
ikev2-decfail-ikehdrnitspi	Description: Total IKEv2 exchange decode failures (invalid IKE header init Security Parameter Index). Type: Counter	Int32
ikev2-decfail-ikehdrrspspi	Description: Total IKEv2 exchange decode failures (invalid IKE header response Security Parameter Index). Type: Counter	Int32
ikev2-decfail-ikehdrmajver	Description: Total IKEv2 exchange decode failures (invalid IKE header major version). Type: Counter	Int32
ikev2-decfail-ikehdrminorver	Description: Total IKEv2 exchange decode failures (invalid IKE header minor version). Type: Counter	Int32
ikev2-decfail-ikehdrxchgtyp	Description: Total IKEv2 exchange decode failures (invalid IKE header exchange type). Type: Counter	Int32
ikev2-decfail-ikehdrrecvflag	Description: Total IKEv2 exchange decode failures (invalid IKE header received flag). Type: Counter	Int32
ikev2-decfail-ikehdrrlen	Description: Total IKEv2 exchange decode failures (invalid IKE header length). Type: Counter	Int32
ikev2-decfail-syn	Description: Total IKEv2 exchange decode failures (invalid syntax). Type: Counter	Int32
ikev2-decfail-paysyn	Description: Total IKEv2 exchange decode failures (invalid payload syntax). Type: Counter	Int32
ikev2-decfail-paylen	Description: Total IKEv2 exchange decode failures (invalid payload length). Type: Counter	Int32
ikev2-decfail-unkcritpay	Description: Total IKEv2 exchange decode failures (unknown critical payload). Type: Counter	Int32
ikev2-decfail-toomanypay	Description: Total IKEv2 exchange decode failures (too many payloads). Type: Counter	Int32
ikev2-decfail-sapaylen	Description: Total IKEv2 exchange decode failures (invalid SA payload length). Type: Counter	Int32
ikev2-decfail-saprophdr	Description: Total IKEv2 exchange decode failures (invalid SA proposal header). Type: Counter	Int32
ikev2-decfail-saprophdrrecv	Description: Total IKEv2 exchange decode failures (invalid SA proposal header received). Type: Counter	Int32
ikev2-decfail-toomanytrans	Description: Total IKEv2 exchange decode failures (too many transforms). Type: Counter	Int32
ikev2-decfail-saprophdrrlen	Description: Total IKEv2 exchange decode failures (invalid SA proposal header length). Type: Counter	Int32
ikev2-decfail-toomanyprop	Description: Total IKEv2 exchange decode failures (too many proposals). Type: Counter	Int32

Variables	Description	Data Type
ikev2-decfail-1stsapropnum	Description: Total IKEv2 exchange decode failures (invalid first SA proposal). Type: Counter	Int32
ikev2-decfail-saprotid	Description: Total IKEv2 exchange decode failures (invalid protocol ID in SA proposal). Type: Counter	Int32
ikev2-decfail-sapropnum	Description: Total IKEv2 exchange decode failures (invalid SA proposal number). Type: Counter	Int32
ikev2-decfail-translen	Description: Total IKEv2 exchange decode failures (invalid transform length). Type: Counter	Int32
ikev2-decfail-transhdr	Description: Total IKEv2 exchange decode failures (invalid transform header). Type: Counter	Int32
ikev2-decfail-transhdrrecv	Description: Total IKEv2 exchange decode failures (invalid transform header received). Type: Counter	Int32
ikev2-decfail-transtype	Description: Total IKEv2 exchange decode failures (invalid transform type). Type: Counter	Int32
ikev2-decfail-transid	Description: Total IKEv2 exchange decode failures (invalid transform ID). Type: Counter	Int32
ikev2-decfail-kepaylen	Description: Total IKEv2 exchange decode failures (invalid KE payload length). Type: Counter	Int32
ikev2-decfail-kedhgrp	Description: Total IKEv2 exchange decode failures (invalid KE DH group). Type: Counter	Int32
ikev2-decfail-kedhgrplen	Description: Total IKEv2 exchange decode failures (invalid KE DH group length). Type: Counter	Int32
ikev2-decfail-idpaylen	Description: Total IKEv2 exchange decode failures (invalid ID payload length). Type: Counter	Int32
ikev2-decfail-idpaytype	Description: Total IKEv2 exchange decode failures (invalid ID payload type). Type: Counter	Int32
ikev2-decfail-authpaylen	Description: Total IKEv2 exchange decode failures (invalid authentication payload length). Type: Counter	Int32
ikev2-decfail-noncepaylen	Description: Total IKEv2 exchange decode failures (invalid nonce payload length). Type: Counter	Int32
ikev2-decfail-notifpaylen	Description: Total IKEv2 exchange decode failures (invalid Notify payload length). Type: Counter	Int32
ikev2-decfail-notifpayspilen	Description: Total IKEv2 exchange decode failures (invalid Notify payload Security Parameter Index length). Type: Counter	Int32
ikev2-decfail-notifpaynat	Description: Total IKEv2 exchange decode failures (invalid Notify payload NAT). Type: Counter	Int32

Common Syntax Options

Variables	Description	Data Type
ikev2-decfail-notifpayprotid	Description: Total IKEv2 exchange decode failures (invalid Notify payload protocol ID). Type: Counter	Int32
ikev2-decfail-eappaylen	Description: Total IKEv2 exchange decode failures (invalid EAP payload length). Type: Counter	Int32
ikev2-decfail-notifpayrekey	Description: Total IKEv2 exchange decode failures (invalid Notify payload rekey). Type: Counter	Int32
ikev2-decfail-cppaylen	Description: Total IKEv2 exchange decode failures (invalid CP payload length). Type: Counter	Int32
ikev2-decfail-notifpaycook	Description: Total IKEv2 exchange decode failures (invalid Notify payload cookie). Type: Counter	Int32
ikev2-decfail-tspaylen	Description: Total IKEv2 exchange decode failures (invalid TS payload length). Type: Counter	Int32
ikev2-decfail-cppayattrlen	Description: Total IKEv2 exchange decode failures (invalid CP payload attribute length). Type: Counter	Int32
ikev2-decfail-tspayrecv	Description: Total IKEv2 exchange decode failures (invalid TS payload received). Type: Counter	Int32
ikev2-decfail-encrpaylen	Description: Total IKEv2 exchange decode failures (invalid encrypted payload length). Type: Counter	Int32
ikev2-decfail-tspaytstype	Description: Total IKEv2 exchange decode failures (invalid TS payload TS type). Type: Counter	Int32
ikev2-decfail-unsuppcrippay	Description: Total IKEv2 exchange decode failures (unsupported critical payload). Type: Counter	Int32
ikev2-decfail-unsuppcertpay	Description: Total IKEv2 exchange decode failures (unsupported certificate payload). Type: Counter	Int32
ikev2-decfail-unsuppnotifprotah	Description: Total IKEv2 exchange decode failures (unsupported Notify protocol authentication header). Type: Counter	Int32
ikev2-decfail-unsuppauthmeth	Description: Total IKEv2 exchange decode failures (unsupported authentication method). Type: Counter	Int32
ikev2-decfail-unsuppaycritvid	Description: Total IKEv2 exchange decode failures (unsupported payload critical VID). Type: Counter	Int32
ikev2-decfail-unsuppmeth	Description: Total IKEv2 exchange decode failures (unsupported method). Type: Counter	Int32
ikev2-decfail-unkerr	Description: Total IKEv2 exchange decode failures (unknown error). Type: Counter	Int32
ikev2-decfail-unsupsapayprotah	Description: Total IKEv2 exchange decode failures (unsupported SA payload protocol authentication header). Type: Counter	Int32

Variables	Description	Data Type
ikev2-decfail-unsuptspaytsnum	Description: Total IKEv2 exchange decode failures (unsupported TS payload TS number). Type: Counter	Int32
ikev2-decfail-unsuptspaytstype	Description: Total IKEv2 exchange decode failures (unsupported TS payload TS type). Type: Counter	Int32
ikev2-decfail-unsuptspaytsprot	Description: Total IKEv2 exchange decode failures (unsupported TS payload TS protocol). Type: Counter	Int32
ikev2-decfail-cppaynoipaddr	Description: Total IKEv2 exchange decode failures (invalid CP payload—no IP address). Type: Counter	Int32
ikev2-decfail-cppayunkattr	Description: Total IKEv2 exchange decode failures (invalid CP payload—unknown attribute). Type: Counter	Int32
ikev2-decryptfail	Description: Total IKEv2 decryption failures (packets failure). Type: Counter	Int32
ikev2-decryptfail-hmac	Description: Total IKEv2 decryption failures (HMAC mismatch). Type: Counter	Int32
ikev2-decryptfail-pad	Description: Total IKEv2 decryption failures (PAD length error). Type: Counter	Int32
ikev2-xchg-badmsgid	Description: Total IKEv2 exchange statistics (bad message ID). Type: Counter	Int32
ikev2-xchg-badresp	Description: Total IKEv2 exchange statistics (bad response). Type: Counter	Int32
ikev2-xchg-stalemsgid	Description: Total IKEv2 exchange statistics (stale message ID). Type: Counter	Int32
ikev2-xchg-unkerr	Description: Total IKEv2 exchange statistics (unknown error). Type: Counter	Int32
ikev2-xchg-statelookfail	Description: Total IKEv2 exchange statistics (state lookup failure). Type: Counter	Int32
ikev2-notifrecv-unsupcritpay	Description: Total IKEv2 Notify message receive statistics (unsupported critical payload). Type: Counter	Int32
ikev2-notifrecv-invikespi	Description: Total IKEv2 Notify message receive statistics (invalid IKE Security Parameter Index). Type: Counter	Int32
ikev2-notifrecv-invmajver	Description: Total IKEv2 Notify message receive statistics (invalid major version). Type: Counter	Int32
ikev2-notifrecv-invsyn	Description: Total IKEv2 Notify message receive statistics (invalid syntax). Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
ikev2-notifrecv-invmmsgid	Description: Total IKEv2 Notify message receive statistics (invalid message ID). Type: Counter	Int32
ikev2-notifrecv-invspi	Description: Total IKEv2 Notify message receive statistics (invalid Security Parameter Index). Type: Counter	Int32
ikev2-notifrecv-nopropchosen	Description: Total IKEv2 Notify message receive statistics (no proposal chosen). Type: Counter	Int32
ikev2-notifrecv-invkepay	Description: Total IKEv2 Notify message receive statistics (invalid KE payload). Type: Counter	Int32
ikev2-notifrecv-authfail	Description: Total IKEv2 Notify message receive statistics (authentication failure). Type: Counter	Int32
ikev2-notifrecv-singpairreq	Description: Total IKEv2 Notify message receive statistics (single pair required). Type: Counter	Int32
ikev2-notifrecv-noaddsa	Description: Total IKEv2 Notify message receive statistics (no additional SAs). Type: Counter	Int32
ikev2-notifrecv-intaddrfail	Description: Total IKEv2 Notify message receive statistics (internal address failure). Type: Counter	Int32
ikev2-notifrecv-failcpreq	Description: Total IKEv2 Notify message receive statistics (failed CP required). Type: Counter	Int32
ikev2-notifrecv-tsunaccept	Description: Total IKEv2 Notify message receive statistics (TS unacceptable). Type: Counter	Int32
ikev2-notifrecv-invsel	Description: Total IKEv2 Notify message receive statistics (invalid selectors). Type: Counter	Int32
ikev2-notifrecv-unacceptaddr	Description: Total IKEv2 Notify message receive statistics (unacceptable addresses). Type: Counter	Int32
ikev2-notifrecv-multiauthsupp	Description: Total IKEv2 Notify message receive statistics (multiple authentication supported). Type: Counter	Int32
ikev2-notifrecv-anothauthfoll	Description: Total IKEv2 Notify message receive statistics (another authentication follows). Type: Counter	Int32
ikev2-notifrecv-unexpectnat	Description: Total IKEv2 Notify message receive statistics (unexpected NAT detected). Type: Counter	Int32
ikev2-notifrecv-macauthfail	Description: Total IKEv2 Notify message receive statistics (MAC address authentication failed). Type: Counter	Int32
ikev2-notifrecv-hsserrusrunk	Description: Total IKEv2 Notify message receive statistics (HSS error—user unknown). Type: Counter	Int32

Variables	Description	Data Type
ikev2-notifrecv-initcont	Description: Total IKEv2 Notify message receive statistics (initial contact). Type: Counter	Int32
ikev2-notifrecv-windsiz	Description: Total IKEv2 Notify message receive statistics (set window size). Type: Counter	Int32
ikev2-notifrecv-addtsposs	Description: Total IKEv2 Notify message receive statistics (additional TS possible). Type: Counter	Int32
ikev2-notifrecv-ipcompsupp	Description: Total IKEv2 Notify message receive statistics (IPCOMP supported). Type: Counter	Int32
ikev2-notifrecv-natdetsrcip	Description: Total IKEv2 Notify message receive statistics (NAT detection—source IP). Type: Counter	Int32
ikev2-notifrecv-natdetdstip	Description: Total IKEv2 Notify message receive statistics (NAT detection—destination IP). Type: Counter	Int32
ikev2-notifrecv-cookie	Description: Total IKEv2 Notify message receive statistics (cookie). Type: Counter	Int32
ikev2-notifrecv-usetransmode	Description: Total IKEv2 Notify message receive statistics (use transport mode). Type: Counter	Int32
ikev2-notifrecv-httpcertsupp	Description: Total IKEv2 Notify message receive statistics (HTTP certificate lookup supported). Type: Counter	Int32
ikev2-notifrecv-rekeysa	Description: Total IKEv2 Notify message receive statistics (rekey SA). Type: Counter	Int32
ikev2-notifrecv-nonfirstfragalso	Description: Total IKEv2 Notify message receive statistics (non-first fragment also). Type: Counter	Int32
ikev2-notifrecv-mobikesupp	Description: Total IKEv2 Notify message receive statistics (MOBIKE supported). Type: Counter	Int32
ikev2-notifrecv-addip4addr	Description: Total IKEv2 Notify message receive statistics (additional IPv4 address). Type: Counter	Int32
ikev2-notifrecv-addip6addr	Description: Total IKEv2 Notify message receive statistics (additional IPv6 address). Type: Counter	Int32
ikev2-notifrecv-noaddaddr	Description: Total IKEv2 Notify message receive statistics (no additional address). Type: Counter	Int32
ikev2-notifrecv-updsaaddr	Description: Total IKEv2 Notify message receive statistics (update SA addresses). Type: Counter	Int32
ikev2-notifrecv-cookie2	Description: Total IKEv2 Notify message receive statistics (cookie 2). Type: Counter	Int32
ikev2-notifrecv-nonatallow	Description: Total IKEv2 Notify message receive statistics (no NAT allowed). Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
ikev2-notifrecv-other	Description: Total IKEv2 Notify message receive statistics (others or unknown). Type: Counter	Int32
ikev2-notifrecv-sipfallbnottallow	Description: Total IKEv2 Notify message receive statistics (SIP fallback not allowed). Type: Counter	Int32
ikev2-notifrecv-esptfcadnotsupp	Description: Total IKEv2 Notify message receive statistics (ESP TFC padding not supported). Type: Counter	Int32
ikev2-notifrecv-congrejrecv	Description: Total IKEv2 Notify message receive statistics (congestion rejections received). Type: Counter	Int32
ikev2-cert-reqsent	Description: Total IKEv2 certification statistics (certificate requests sent). Type: Counter	Int32
ikev2-cert-reqrecv	Description: Total IKEv2 certification statistics (certificate requests received). Type: Counter	Int32
ikev2-cert-sent	Description: Total IKEv2 certification statistics (certificates sent). Type: Counter	Int32
ikev2-cert-recv	Description: Total IKEv2 certification statistics (certificates received). Type: Counter	Int32
ike-udpflows	Description: IKE statistics (current UDP flows). Type: Gauge	Int32
ike-cookieflows	Description: IKE statistics (current cookie flows). Type: Gauge	Int32
ike-txpackets	Description: Total IKE Transmit statistics (IKE packets transmitted). Type: Counter	Int32
ike-rxpackets	Description: Total IKE Receive statistics (IKE packets received). Type: Counter	Int32
ike-reqrecv	Description: Total IKE Receive statistics (new IKE requests). Type: Counter	Int32
ike-udpflowpackets	Description: Total IKE Receive statistics (UDP flow packets). Type: Counter	Int32
ike-cookieflowpackets	Description: Total IKE Receive statistics (cookie flow packets). Type: Counter	Int32
crypto-txesppacket	Description: Total Transmit statistics (ESP encoded packets). Type: Counter	Int64
crypto-txespoctet	Description: Total Transmit statistics (ESP encoded bytes). Type: Counter	Int64
crypto-txahpacket	Description: Total Transmit statistics (Authentication Header encoded packets). Type: Counter	Int64

Variables	Description	Data Type
crypto-txahoctet	Description: Total Transmit statistics (Authentication Header encoded bytes). Type: Counter	Int64
crypto-rxesppacket	Description: Total Receive statistics (ESP decoded packets). Type: Counter	Int64
crypto-rxespoctet	Description: Total Receive statistics (ESP decoded bytes). Type: Counter	Int64
crypto-rxahpacket	Description: Total Receive statistics (Authentication Header encoded packets). Type: Counter	Int64
crypto-rxahoctet	Description: Total Receive statistics (Authentication Header encoded bytes). Type: Counter	Int64
crypto-errauthpacket	Description: Total Receive statistics (error counter—authentication packets). Type: Counter	Int64
crypto-errauthoctet	Description: Total Receive statistics (error counter-authentication bytes). Type: Counter	Int64
crypto-errbadrecpacket	Description: Total Receive statistics (error counter-bad record packets). Type: Counter	Int64
crypto-errbadrecoctet	Description: Total Receive statistics (error counter-bad record bytes). Type: Counter	Int64
crypto-errdiscpacket	Description: Total Receive statistics (error counter—discarded packets). Type: Counter	Int64
crypto-errdiscoctet	Description: Total Receive statistics (error counter—discarded bytes). Type: Counter	Int64
crypto-errignpacket	Description: Total Receive statistics (error counter—ignored packets). Type: Counter	Int64
crypto-errignoctet	Description: Total Receive statistics (error counter—ignored bytes). Type: Counter	Int64
crypto-errunderrunpacket	Description: Total Receive statistics (error counter—input under-run packets). Type: Counter	Int64
crypto-errunderrunoctet	Description: Total Receive statistics (error counter—input under-run bytes). Type: Counter	Int64
crypto-errinvpacket	Description: Total Receive statistics (error counter—invalid packets). Type: Counter	Int64
crypto-errinvcoctet	Description: Total Receive statistics (error counter—invalid bytes). Type: Counter	Int64
crypto-errreplaypacket	Description: Total Receive statistics (error counter—replay packets). Type: Counter	Int64
crypto-errreplayoctet	Description: Total Receive statistics (error counter—replay bytes). Type: Counter	Int64

Variables	Description	Data Type
ipsectrl-lte-template-reqs	Description: IPSec Controller - LTE - The total number of service template request messages. Type: Counter	Int32
ipsectrl-lte-template-unreg-reqs	Description: IPSec Controller - LTE - The total number of service template unregister request messages. Type: Counter	Int32
ipsectrl-lte-map-reqs	Description: IPSec Controller - LTE - The total number of crypto map request messages. Type: Counter	Int32
ipsectrl-lte-map-est	Description: IPSec Controller - LTE - The total number of crypto map established messages. Type: Counter	Int32
ipsectrl-lte-map-del-reqs	Description: IPSec Controller - LTE - The total number of crypto map delete request messages. Type: Counter	Int32
ipsectrl-lte-map-failed	Description: IPSec Controller - LTE - The total number of crypto map failed messages. Type: Counter	Int32
ipsectrl-lte-map-state-notif	Description: IPSec Controller - LTE - The total number of crypto map state change notifications sent by this system. Type: Counter	Int32
ipsectrl-lte-ipsecmgr-death-notif	Description: IPSec Controller - LTE - The total number of ipsecmgr death notification messages sent to the registered facilities. Type: Counter	Int32
ipsectrl-lte-qos-maps	Description: IPSec Controller - LTE - The total number of crypto maps with QoS. Type: Gauge	Int32
ssl-cursess	Description: This proprietary gauge indicates the total number of SSL sessions currently running on the system. Type: Gauge	Int64
ssl-curconninit	Description: This proprietary gauge indicates the total number of current SSL connections that have been initiated. Type: Gauge	Int64
ssl-curconnresp	Description: This proprietary gauge indicates the total number of current SSL connections that have been responded to. Type: Gauge	Int64
ssl-curconnected	Description: This proprietary gauge indicates the total number of current SSL connections that are connected. Type: Gauge	Int64
ssl-curconnfail	Description: This proprietary gauge indicates the total number of current SSL connections that have failed. Type: Gauge	Int64

Variables	Description	Data Type
ssl-curconnecting	Description: This proprietary gauge indicates the total number of current SSL connections that are connecting. Type: Gauge	Int64
ssl-conclosesent	Description: This proprietary counter tracks the total number of SSL connection close messages sent. Type: Counter	Int64
ssl-concloserecvd	Description: This proprietary counter tracks the total number of SSL connection close messages received. Type: Counter	Int64
ssl-cachehits	Description: This proprietary counter tracks the total number of hits for the SSL session cache. Type: Counter	Int64
ssl-cachemiss	Description: This proprietary counter tracks the total number of misses for the SSL session cache. Type: Counter	Int64
ssl-cachetimeout	Description: This proprietary counter tracks the total number of timeouts for the SSL session cache. Type: Counter	Int64
ssl-cachefull	Description: This proprietary counter tracks the total number of times the SSL session cache has been full. Type: Counter	Int64
ssl-cachetotalsess	Description: This proprietary counter tracks the total number of current sessions for the SSL session cache. Type: Gauge	Int64
ssl-txrecord	Description: This proprietary counter tracks the total number of SSL records transmitted. Type: Counter	Int64
ssl-txmsg	Description: This proprietary counter tracks the total number of SSL messages transmitted. Type: Counter	Int64
ssl-txbyte	Description: This proprietary counter tracks the total number of SSL bytes transmitted. Type: Counter	Int64
ssl-rxrecord	Description: This proprietary counter tracks the total number of SSL records received. Type: Counter	Int64
ssl-rxmsg	Description: This proprietary counter tracks the total number of SSL messages transmit received. Type: Counter	Int64
ssl-rxbyte	Description: This proprietary counter tracks the total number of SSL bytes received. Type: Counter	Int64
ssl-encerr	Description: This proprietary counter tracks the total number of SSL encryption errors. Type: Counter	Int64

Variables	Description	Data Type
ssl-decerr	Description: This proprietary counter tracks the total number of SSL decode errors. Type: Counter	Int64
ssl-decryerr	Description: This proprietary counter tracks the total number of SSL decryption errors. Type: Counter	Int64
ssl-autherr	Description: This proprietary counter tracks the total number of SSL authentication errors. Type: Counter	Int64
ssl-failinithserr	Description: This proprietary counter tracks the total number of SSL initiated handshakes failed with errors. Type: Counter	Int64
ssl-failtimeouthserr	Description: This proprietary counter tracks the total number of SSL handshakes failed with timeouts. Type: Counter	Int64
ssl-failrespserr	Description: This proprietary counter tracks the total number of SSL responded handshakes failed with errors. Type: Counter	Int64
ssl-alertrecv	Description: This proprietary counter tracks the total number of SSL alerts received. Type: Counter	Int64
ssl-alertrecv-unexpmsg	Description: This proprietary counter tracks the total number of SSL alerts received for unexpected message. Type: Counter	Int64
ssl-alertrecv-badrecmac	Description: This proprietary counter tracks the total number of SSL alerts received for bad MAC record. Type: Counter	Int64
ssl-alertrecv-decryfail	Description: This proprietary counter tracks the total number of SSL alerts received for decryption failure. Type: Counter	Int64
ssl-alertrecv-compfail	Description: This proprietary counter tracks the total number of SSL alerts received for decompression failure. Type: Counter	Int64
ssl-alertrecv-recoverflow	Description: This proprietary counter tracks the total number of SSL alerts received for record overflow. Type: Counter	Int64
ssl-alertrecv-handshake	Description: This proprietary counter tracks the total number of SSL alerts received for handshake failure. Type: Counter	Int64
ssl-alertrecv-illparm	Description: This proprietary counter tracks the total number of SSL alerts received for illegal parameters. Type: Counter	Int64

Variables	Description	Data Type
ssl-alertrecv-certunsupp	Description: This proprietary counter tracks the total number of SSL alerts received for unsupported certificates. Type: Counter	Int64
ssl-alertrecv-certbad	Description: This proprietary counter tracks the total number of SSL alerts received for bad certificate. Type: Counter	Int64
ssl-alertrecv-certexpir	Description: This proprietary counter tracks the total number of SSL alerts received - certificate expired. Type: Counter	Int64
ssl-alertrecv-certrevok	Description: Number of SSL alerts received for certificate revoked. Type: Counter	Int64
ssl-alertrecv-certunk	Description: This proprietary counter tracks the total number of SSL alerts received for certificate unknown. Type: Counter	Int64
ssl-alertrecv-accdeny	Description: This proprietary counter tracks the total number of SSL alerts received for access denied. Type: Counter	Int64
ssl-alertrecv-decode	Description: This proprietary counter tracks the total number of SSL alerts received for decode errors. Type: Counter	Int64
ssl-alertrecv-decryerr	Description: Number of SSL alerts received - decryption error. Type: Counter	Int64
ssl-alertrecv-export	Description: This proprietary counter tracks the total number of SSL alerts received for export restricted. Type: Counter	Int64
ssl-alertrecv-protover	Description: This proprietary counter tracks the total number of SSL alerts received for protocol version. Type: Counter	Int64
ssl-alertrecv-interr	Description: This proprietary counter tracks the total number of SSL alerts received for internal errors. Type: Counter	Int64
ssl-alertrecv-insuffsec	Description: This proprietary counter tracks the total number of SSL alerts received for insufficient security. Type: Counter	Int64
ssl-alertrecv-usercanc	Description: This proprietary counter tracks the total number of SSL alerts received for user cancellation. Type: Counter	Int64
ssl-alertrecv-noreneg	Description: This proprietary counter tracks the total number of SSL alerts received for no renegotiation. Type: Counter	Int64

■ Common Syntax Options

Variables	Description	Data Type
ssl-alertrecv-unknownca	Description: This proprietary counter tracks the total number of SSL alerts received for unknown certificate authority. Type: Counter	Int64
ssl-alertsent	Description: This proprietary counter tracks the total number of SSL alerts sent. Type: Counter	Int64
ssl-alertsent-unexpmsg	Description: This proprietary counter tracks the total number of SSL alerts sent for unexpected messages. Type: Counter	Int64
ssl-alertsent-badrecmac	Description: This proprietary counter tracks the total number of SSL alerts sent for bad MAC records. Type: Counter	Int64
ssl-alertsent-decryfailed	Description: This proprietary counter tracks the total number of SSL alerts sent for decryption failed. Type: Counter	Int64
ssl-alertsent-recoflow	Description: This proprietary counter tracks the total number of SSL alerts sent for record overflow. Type: Counter	Int64
ssl-alertsent-handshake	Description: This proprietary counter tracks the total number of SSL alerts sent for handshake failure. Type: Counter	Int64
ssl-alertsent-illparam	Description: This proprietary counter tracks the total number of SSL alerts sent for illegal parameters. Type: Counter	Int64
ssl-alertsent-accdenied	Description: This proprietary counter tracks the total number of SSL alerts sent for access denied. Type: Counter	Int64
ssl-alertsent-decodeerror	Description: This proprietary counter tracks the total number of SSL alerts sent for decode error. Type: Counter	Int64
ssl-alertsent-decrypterror	Description: This proprietary counter tracks the total number of SSL alerts sent for decryption error. Type: Counter	Int64
ssl-alertsent-export	Description: This proprietary counter tracks the total number of SSL alerts sent for export restriction. Type: Counter	Int64
ssl-alertsent-protover	Description: This proprietary counter tracks the total number of SSL alerts sent for protocol version. Type: Counter	Int64
ssl-alertsent-interr	Description: This proprietary counter tracks the total number of SSL alerts sent for internal error. Type: Counter	Int64

Variables	Description	Data Type
ssl-alertsent-noregen	Description: This proprietary counter tracks the total number of SSL alerts sent for no renegotiation. Type: Counter	Int64
ssl-alertsent-unknown	Description: This proprietary counter tracks the total number of SSL alerts sent for unknown reason. Type: Counter	Int64
hamipv6-totsubscriber	Description: Current number of system-wide HAMIPv6 subscribers. Type: Gauge	Int32
disc-reason-0 through disc-reason-xxx	Description: Refer to the separate table for disconnect reasons System-level Schema Statistics for Disconnect Reasons Type: Counter	Int64
enddate	Description: The date at which data ceased to be gathered in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day. Type: Information	String
endtime	Description: The time at which data ceased to be gathered in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds. Type: Information	String
localenddate	Description: The date (adjusted for the local timezone) at which data ceased to be gathered in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day. Type: Information	String
localendtime	Description: The time (adjusted for the local timezone) at which data ceased to be gathered in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds. Type: Information	String
swversion	Description: The system software version in a string of the form "5.0" Type: Information	String
peak-cpuusage	Description: The system level maximum value of CPU usage. Type: Gauge	Float
peak-memusage	Description: The system level maximum value of memory usage. Type: Gauge	Float
uptimestr	Description: The system uptime as a string that shows days, hours, and minutes. Type: Information	String
system-capacity-usage	Description: Chassis wide system capacity usage Type: Gauge	Float
session-capacity	Description: Chassis wide session capacity Type: Gauge	Int32
session-capacity-usage	Description: Chassis wide session capacity usage Type: Gauge	Int32

■ Common Syntax Options

Variables	Description	Data Type
npu-capacity	Description: Chassis wide NPU capacity Type: Gauge	Int32
npu-capacity-usage	Description: Chassis wide NPU capacity usage Type: Gauge	Int32
sess-max-lastreset-time	Description: The timestamp the last reset for the maximum number of sessions. Type: Information	String
sess-maxpdsn	Description: The maximum number of PDSN sessions. Type: Gauge	Int32
sess-maxpdsn-time	Description: The timestamp for max PDSN sessions. Type: Information	String
sess-maxha	Description: The maximum number of HA sessions. Type: Gauge	Int32
sess-maxha-time	Description: The timestamp for maximum number of HA sessions. Type: Information	String
sess-maxl2tplns	Description: The maximum number of L2TP LNS sessions. Type: Gauge	Int32
sess-maxl2tplns-time	Description: The timestamp for maximum number of L2TP sessions. Type: Information	String
sess-maxecsv2	Description: The maximum number of ECSv2 sessions. Type: Gauge	Int32
sess-maxecsv2-time	Description: The timestamp for maximum number of ECSv2 sessions. Type: Information	String
sess-maxevdoreva-pdsn	Description: The maximum number of EVDO Rev A sessions. Type: Gauge	Int32
sess-maxevdoreva-pdsn-time	Description: The timestamp for maximum number of EVDO Rev A Sessions. Type: Information	String
sess-maxipsg	Description: The maximum number of IP Services Gateway (IPSG) sessions. Type: Gauge	Int32
sess-maxipsg-time	Description: The timestamp for maximum number of IPSG sessions. Type: Information	String
sess-maxasngw	Description: The maximum number of Access Service Network Gateway (ASN-GW) sessions. Type: Gauge	Int32
sess-maxasngw-time	Description: The timestamp for maximum number of ASN-GW sessions. Type: Information	String
sess-maxasnrlr	Description: The maximum number of Access Service Network Gateway location Register (ASNLR) sessions. Type: Gauge	Int32

Variables	Description	Data Type
sess-maxasnlr-time	Description: The timestamp for maximum number of ASNLR sessions. Type: Information	String
lic-pdsn	Description: The number of licensed PDSN sessions supported by the system. Type: Information	Int32
lic-ha	Description: The number of licensed HA sessions supported by the system. Type: Information	Int32
lic-ggsn	Description: The number of licensed GGSN sessions supported by the system. Type: Information	Int32
lic-l2tplns	Description: The number of licensed L2TP LNS sessions supported by the system. Type: Information	Int32
lic-combo-phone	Description: The number of licensed combo phone sessions supported by the system Type: Information	Int32
lic-ecsv2	Description: The number of licensed Enhanced Charging Service version 2 sessions supported by the system. Type: Information	Int32
lic-ipservices-gateway	Description: The number of licensed IP Services Gateway sessions supported by the system. Type: Information	Int32
lic-evdoreva-pdsn	Description: The number of licensed EVDO rev. A PDSN sessions supported by the system. Type: Information	Int32
lic-scm-proxyregistrar-ietfRFC3261	Description: The number of licensed Session Control Manager (SCM) proxy server IETF RFC3261 sessions supported by the system. Type: Information	Int32
lic-scm-proxypcscf	Description: The number of licensed SCM proxy Call Service Control Function (CSCF) sessions supported by the system Type: Information	Int32
lic-scm-servingscscf	Description: The number of licensed SCM serving CSCF sessions supported by the system. Type: Information	Int32
lic-scm-interrogatingcscf	Description: The number of licensed SCM interrogating CSCF sessions supported by the system. Type: Information	Int32
lic-asngw	Description: The number of licensed Access Service Network (ASN) Gateway sessions supported by the system. Type: Information	Int32
lic-asnlr	Description: The number of ASN Location Register sessions supported by the system. Type: Information	Int32
lic-ipsg	Description: The number of IPSG Location Register sessions supported by the system. Type: Information	Int32

Common Syntax Options

Variables	Description	Data Type
lic-combo-3g4g-gw	Description: The number of licensed sessions supported for generic 3G and 4G combined subscribers by the system. Type: Information	Int32
sess-total-curr	Description: The total number of sessions currently registered with system. Type: Gauge	Int32
curr-proxy	Description: The total number of current DHCP proxy sessions. Type: Gauge	Int32
curr-relay-agent	Description: The total number of current DHCP relay agent sessions. Type: Gauge	Int32
dhcp-curservsess	Description: The total number of DHCP service sessions active on this system. Availability: Available across the system. Changes every time when the new DHCP server is started or existing session is terminated. Type: Gauge	Int32
sess-total-setup	Description: The total number of DHCP setup sessions. Type: Counter	Int32
setup-proxy	Description: The total number of setup DHCP proxy sessions. Type: Counter	Int32
setup-relay-agent	Description: The total number of DHCP setup relay agent sessions. Type: Counter	Int32
dhcp-ttlservsess	Description: The total number of DHCP service sessions registered on this system. Availability: Available across the system. Changes every time when the new DHCP session started. Type: Counter	Int32
total-released	Description: The total number of DHCP sessions released. Type: Counter	Int32
proxy-bearer-call-term	Description: The total number of DHCP proxy session calls terminated by bearer. Type: Counter	Int32
proxy-lease-exp-policy	Description: The total number of DHCP proxy session released due to lease expiry policy. Type: Counter	Int32
proxy-lease-renew-failure	Description: The total number of DHCP proxy session released due to lease renew failure. Type: Counter	Int32
proxy-ip-mis-match	Description: The total number of DHCP proxy session released due to IP address mis-match. Type: Counter	Int32
proxy-lease-time-mis-match	Description: The total number of DHCP proxy session released due to lease time mis-match. Type: Counter	Int32
proxy-other-reasons	Description: The total number of DHCP proxy session released due reasons not mentioned in this table. Type: Counter	Int32

Variables	Description	Data Type
relay-admin-releases	Description: The total number of DHCP relay session released due administrative reasons. Type: Counter	Int32
relay-bearer-call-term	Description: The total number of DHCP relay session calls terminated by bearer. Type: Counter	Int32
relay-lease-time-out	Description: The total number of DHCP relay session released due to lease timeout. Type: Counter	Int32
relay-other-reasons	Description: The total number of DHCP relay session released due reasons not mentioned in this table. Type: Counter	Int32
dhcp-servdisc-admin	Description: The total number of DHCP servers disconnected due administrative reasons. Availability: Available across the system. Changes whenever the DHCP session is disconnected due to admin intervention. Type: Counter	Int32
dhcp-servdisc-callterm	Description: The total number of DHCP session calls terminated by bearer. Availability: Available across the system. Changes whenever the DHCP call is cleared due to arrival of DHCP Release. Type: Counter	Int32
dhcp-servdisc-leaseimo	Description: The total number of DHCP session released due to lease timeout. Availability: Available across the system. Changes whenever the DHCP session is released due to lease expiry. Type: Counter	Int32
dhcp-servdisc-other	Description: The total number of DHCP server sessions disconnected due to reasons other than those in this table. Type: Counter	Int32
dhcp-msg-discover-tx	Description: The total number of DHCP discover messages transmitted. Type: Counter	Int32
dhcp-msg-discover-retransmitted	Description: The total number of DHCP discover messages retransmitted. Type: Counter	Int32
dhcp-msg-discover-rx	Description: The total number of DHCP discover messages received. Type: Counter	Int32
dhcp-msg-discover-retried-rx	Description: The total number of DHCP discover messages received after retry. Type: Counter	Int32
dhcp-msg-discover-relayed	Description: The total number of DHCP discover messages relayed. Type: Counter	Int32
dhcp-msg-discover-retried-relayed	Description: The total number of DHCP discover messages retried and relayed. Type: Counter	Int32
dhcp-msg-offer-rx	Description: The total number of DHCP offer messages received. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
dhcp-msg-offer-discarded	Description: The total number of DHCP offer messages received and discarded. Type: Counter	Int32
dhcp-msg-offer-tx	Description: The total number of DHCP offer messages transmitted. Type: Counter	Int32
dhcp-msg-offer-relayed	Description: The total number of DHCP offer messages relayed. Type: Counter	Int32
dhcp-msg-request-tx	Description: The total number of DHCP request messages transmitted. Type: Counter	Int32
dhcp-msg-request-retransmitted	Description: The total number of DHCP request messages retransmitted. Type: Counter	Int32
dhcp-msg-request-rx	Description: The total number of DHCP request messages received. Type: Counter	Int32
dhcp-msg-request-renewal-rx	Description: The total number of DHCP request messages received for renewal. Type: Counter	Int32
dhcp-msg-request-requesting-relayed	Description: The total number of DHCP request messages relayed while requesting. Type: Counter	Int32
dhcp-msg-request-renewing-relayed	Description: The total number of DHCP request messages relayed while renewing. Type: Counter	Int32
dhcp-msg-ack-rx	Description: The total number of DHCP Ack messages received. Type: Counter	Int32
dhcp-msg-ack-for-inform	Description: The total number of DHCP Ack messages received for information. Type: Counter	Int32
dhcp-msg-ack-renewing-rx	Description: The total number of DHCP Ack messages for renewing received. Type: Counter	Int32
dhcp-msg-ack-tx	Description: The total number of DHCP Ack messages transmitted. Type: Counter	Int32
dhcp-msg-ack-renewing-tx	Description: The total number of DHCP Ack messages for renewing transmitted. Type: Counter	Int32
dhcp-msg-ack-relayed	Description: The total number of DHCP Ack messages relayed. Type: Counter	Int32
dhcp-msg-ack-renewing-relayed	Description: The total number of DHCP Ack messages for renewing relayed. Type: Counter	Int32
dhcp-msg-nak-rx	Description: The total number of DHCP NACK messages received. Type: Counter	Int32
dhcp-msg-nak-for-inform	Description: The total number of DHCP NACK messages received for information. Type: Counter	Int32
dhcp-msg-nak-tx	Description: The total number of DHCP NACK messages transmitted. Type: Counter	Int32

Variables	Description	Data Type
dhcp-msg-nak-relayed	Description: The total number of DHCP NACK messages relayed. Type: Counter	Int32
dhcp-msg-decline-tx	Description: The total number of DHCP decline messages transmitted. Type: Counter	Int32
dhcp-msg-decline-rx	Description: The total number of DHCP decline messages received. Type: Counter	Int32
dhcp-msg-decline-relayed	Description: The total number of DHCP decline messages relayed. Type: Counter	Int32
dhcp-msg-release-tx	Description: The total number of DHCP release messages transmitted. Type: Counter	Int32
dhcp-msg-release-rx	Description: The total number of DHCP release messages received. Type: Counter	Int32
dhcp-msg-release-relayed	Description: The total number of DHCP release messages relayed. Type: Counter	Int32
dhcp-msg-release-for-relay-call	Description: The total number of DHCP release messages for relay calls. Type: Counter	Int32
dhcp-msg-inform-tx	Description: The total number of DHCP inform messages transmitted. Type: Counter	Int32
dhcp-msg-inform-retransmitted	Description: The total number of DHCP inform messages retransmitted. Type: Counter	Int32
dhcp-msg-inform-rx	Description: The total number of DHCP inform messages received. Type: Counter	Int32
dhcp-msg-inform-relayed	Description: The total number of DHCP inform messages relayed. Type: Counter	Int32
offer-dis-parse-err	Description: The total number of DHCP offer messages discarded due to parse error. Type: Counter	Int32
offer-dis-lease-less-than-min	Description: The total number of DHCP offer messages discarded due to lease time was less than the minimum duration. Type: Counter	Int32
offer-dis-lease-greater-than-max	Description: The total number of DHCP offer messages discarded due to lease time was greater than the maximum duration. Type: Counter	Int32
offer-dis-ip-val-failed	Description: The total number of DHCP offer messages discarded due to IP validation failed. Type: Counter	Int32
offer-dis-xid-mis-match	Description: The total number of DHCP offer messages discarded due to exchange id mismatch. Type: Counter	Int32

■ Common Syntax Options

Variables	Description	Data Type
ack-dis-parse-err	Description: The total number of DHCP Ack messages discarded due to parse error. Type: Counter	Int32
ack-dis-xid-mis-match	Description: The total number of DHCP Ack messages discarded due to exchange id mismatch. Type: Counter	Int32
decline-dis-ip-mis-match	Description: The total number of DHCP decline messages discarded due to IP address mismatch. Type: Counter	Int32
ip-lease-renewal	Description: The total number of DHCP IP lease renewals. Type: Counter	Int32
failed-ip-lease-renew	Description: The total number of DHCP IP lease renewals failed. Type: Counter	Int32
no-rly-from-server	Description: The total number of replies from DHCP server. Type: Counter	Int32
server-nak	Description: The total number of NACK replies from DHCP server. Type: Counter	Int32
ip-addr-mis-match	Description: The total number of IP address mis-match in DHCP session. Type: Counter	Int32
lease-mis-match	Description: The total number of lease time mis-match in DHCP session. Type: Counter	Int32
discover-dis-parse-err	Description: The total number of discover messages discarded due to a parsing error. Type: Counter	Int32
request-dis-parse-err	Description: The total number of request messages discarded due to a parsing error. Type: Counter	Int32
release-dis-parse-err	Description: The total number of release messages discarded due to a parsing error. Type: Counter	Int32
storage-name	Description: Name of the Hard Disk Storage policy. Type: Information	String
storage-curavail	Description: Total storage space currently remaining (in bytes). Type: Gauge	Int64
storage-ttlavail	Description: Total storage capacity (in bytes). Type: Gauge	Int64
fng-cursess	Description: The total number of current Femto Network Gateway (FNG) sessions. Type: Gauge	Int32
fng-curactive	Description: The total number of active FNG sessions currently being facilitated by all Session Managers. Type: Gauge	Int32

Variables	Description	Data Type
fng-curdormant	Description: The total number of dormant FNG sessions currently being facilitated by the FNG. Type: Gauge	Int32
fng-ttlsetup	Description: The total number of FNG sessions setup on a system. Type: Counter	Int32
fng-curchildsa	Description: The total number of current FNG Child Security Associations. Type: Gauge	Int32

IMPORTANT: See *Statistics and Counters Overview* for statistics that are common to all schema.

Another bulk-statistic for “Disconnect Reasons” under system-level schema is available to export system wide counts for disconnect reasons.

In the following table, the indicator number at the end of the statistic name will vary depending upon the software build in which the show command is issued. To ensure that you have the correct reason, issue the **show session disconnect-reasons verbose** command.

A special field “disc-reason-summary” contains all of the disconnect reason counters at once in following semi-colon separated format:

code = count; code = count; code = count; code = count

The following variables are supported:

Table 67. System-level Schema Statistics for Disconnect Reasons

Reason No.	Description	Data Type
disc-reason-0	Name: Unknown Description: The total number of sessions disconnected due to unknown reason. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-1	<p>Name: Admin-disconnect</p> <p>Description: The total number of sessions disconnected due to any of the following reasons:</p> <ul style="list-style-type: none"> Sessions disconnected when the Administrator issues the clear subscribers all CLI command. Sessions disconnected by ECS due to any of the following reasons: <ul style="list-style-type: none"> Bearer does not contain active rules—when the last bearer has no rules left as part of some PCRF trigger. Charging-action has the flow action parameter configured as terminate-session. Sessions disconnected by Diameter Credit Control Application (DCCA) due to any of the following reasons: <ul style="list-style-type: none"> Result code 4010 or 4012 is received at the command level, and for CCR-Initial and CCR-Update Credit Control Failure Handling (CCFH) is configured as Terminate or Retry-and-Terminate. Result code 5003 or 5030 is received at the command level. Abort-Session-Request message is received. <p>Type: Counter</p>	Int64
disc-reason-2	<p>Name: Remote-disconnect</p> <p>Description: The total number of sessions disconnected by a remote system.</p> <p>Type: Counter</p>	Int64
disc-reason-3	<p>Name: Local-disconnect</p> <p>Description: The total number of sessions disconnected by local system.</p> <p>Type: Counter</p>	Int64
disc-reason-4	<p>Name: No-resource</p> <p>Description: The total number of sessions disconnected due to non-availability of resources.</p> <p>Type: Counter</p>	Int64
disc-reason-5	<p>Name: Service-limit-exceeded</p> <p>Description: The total number of sessions disconnected due to exceed in service limit.</p> <p>Type: Counter</p>	Int64
disc-reason-6	<p>Name: PPP-LCP-negotiation-failed</p> <p>Description: The total number of sessions disconnected due to LCP negotiation failed.</p> <p>Type: Counter</p>	Int64
disc-reason-7	<p>Name: PPP-LCP-no-response</p> <p>Description: The total number of sessions disconnected due to no response in PPP-LCP session.</p> <p>Type: Counter</p>	Int64
disc-reason-8	<p>Name: PPP-LCP-loopback-detected</p> <p>Description: The total number of sessions disconnected due to loop back detected in PPP-LCP.</p> <p>Type: Counter</p>	Int64
disc-reason-9	<p>Name: PPP-LCP-max-retry-reached</p> <p>Description: The total number of sessions disconnected due to maximum retries in PPP-LCP session.</p> <p>Type: Counter</p>	Int64

Reason No.	Description	Data Type
disc-reason-10	Name: PPP-LCP-echo-failed Description: The total number of sessions disconnected due to PPP-LCP echo not received. Type: Counter	Int64
disc-reason-11	Name: PPP-Auth-failed Description: The total number of sessions disconnected due to authorization failed in PPP. Type: Counter	Int64
disc-reason-12	Name: PPP-Auth-failed-no-AAA-response Description: The total number of sessions disconnected due to authorization failed by no response on AAA server. Type: Counter	Int64
disc-reason-13	Name: PPP-Auth-failed-no-peer-response Description: The total number of sessions disconnected due to PPP authorization failed on no peer response. Type: Counter	Int64
disc-reason-14	Name: PPP-Auth-failed-max-retry-reached Description: The total number of sessions disconnected due to PPP authorization failed and reaching maximum retries limit. Type: Counter	Int64
disc-reason-15	Name: Invalid-AAA-attr-in-auth-response Description: The total number of sessions disconnected due to invalid AAA attributes in authorization response. Type: Counter	Int64
disc-reason-16	Name: Could-not-apply-subscriber-ACL Description: The total number of sessions disconnected due to inability in applying subscriber's Access Control List (ACL). Type: Counter	Int64
disc-reason-17	Name: Could-not-provide-service Description: The total number of sessions disconnected due to service is not available. Type: Counter	Int64
disc-reason-18	Name: AAA-return-IP-address-not-valid Description: The total number of sessions disconnected due to return IP address from AAA server is invalid. Type: Counter	Int64
disc-reason-19	Name: Pool-IP-address-not-valid Description: The total number of sessions disconnected due to IP address in pool is invalid. Type: Counter	Int64
disc-reason-20	Name: PPP-IPCP-negotiation-failed Description: The total number of sessions disconnected due to PPP-IPCP negotiation failed. Type: Counter	Int64
disc-reason-21	Name: PPP-IPCP-no-response Description: The total number of sessions disconnected due to no response in PPP-IPCP. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-22	Name: PPP-IPCP-max-retry-reached Description: The total number of sessions disconnected due to maximum retries in PPP-IPCP session. Type: Counter	Int64
disc-reason-23	Name: No-IPV4-address-for-subscriber Description: The total number of sessions disconnected due to no IPv4 address are available for subscriber. Type: Counter	Int64
disc-reason-24	Name: Inactivity-timeout Description: The total number of sessions disconnected due to system time out limit for silence (ideal) reached. Type: Counter	Int64
disc-reason-25	Name: Absolute-timeout Description: The total number of sessions disconnected due to timeout in complete session. Type: Counter	Int64
disc-reason-26	Name: Max-data-limit-exceeded Description: The total number of sessions disconnected due to maximum data limit exceeded. Type: Counter	Int64
disc-reason-27	Name: Invalid-source-IP-address Description: The total number of sessions disconnected due to invalid IPv4 address of subscriber. Type: Counter	Int64
disc-reason-28	Name: MSID-auth-failed Description: The total number of sessions disconnected due to MSID authentication failed. Type: Counter	Int64
disc-reason-29	Name: MSID-auth-failed-no-aaa-response Description: The total number of sessions disconnected due to MSID authentication failed and/or no response from AAA server. Type: Counter	Int64
disc-reason-30	Name: A11-max-retry-reached Description: The total number of sessions disconnected due to maximum limit for retries reached for A11 interface. Type: Counter	Int64
disc-reason-31	Name: A11-lifetime-expired Description: The total number of sessions disconnected due to A11 interface lifetime expired. Type: Counter	Int64
disc-reason-32	Name: A11-msg-integrity-failure Description: The total number of sessions disconnected due to failure in message integrity in A11 interface. Type: Counter	Int64
disc-reason-33	Name: PPP-LCP-remote-disconnect Description: The total number of sessions disconnected due to PPP-LCP remote disconnect. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-34	Name: Session-setup-timeout Description: The total number of sessions disconnected due to timeout in setting up of session. Type: Counter	Int64
disc-reason-35	Name: PPP-keepalive-failure Description: The total number of sessions disconnected due to PPP keepalive attribute failure. Type: Counter	Int64
disc-reason-36	Name: Flow-add-failed Description: The total number of sessions disconnected due to fail in adding flow to session. Type: Counter	Int64
disc-reason-37	Name: Call-type-detection-failed Description: The total number of sessions disconnected due to failure in call type detection. Type: Counter	Int64
disc-reason-38	Name: Wrong-ipcp-params Description: The total number of sessions disconnected due to invalid IPCP parameters. Type: Counter	Int64
disc-reason-39	Name: MIP-remote-dereg Description: The total number of sessions disconnected due to de-registration of Mobile IP on remote system. Type: Counter	Int64
disc-reason-40	Name: MIP-lifetime-expiry Description: The total number of sessions disconnected due to expiry of Mobile IP life time. Type: Counter	Int64
disc-reason-41	Name: MIP-proto-error Description: The total number of sessions disconnected due to protocol error in Mobile IP. Type: Counter	Int64
disc-reason-42	Name: MIP-auth-failure Description: The total number of sessions disconnected due to Mobile IP authentication failure. Type: Counter	Int64
disc-reason-43	Name: MIP-reg-timeout Description: The total number of sessions disconnected due to registration request timeout. Type: Counter	Int64
disc-reason-44	Name: Invalid-dest-context Description: The total number of sessions disconnected due to invalid destination context. Type: Counter	Int64
disc-reason-45	Name: Source-context-removed Description: The total number of sessions disconnected due to source context is removed from system. Type: Counter	Int64
disc-reason-46	Name: Destination-context-removed Description: The total number of sessions disconnected due to destination context is removed from system. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-47	Name: Required-service-address-unavailable Description: The total number of sessions disconnected due to unavailability of required service address. Type: Counter	Int64
disc-reason-48	Name: demux-mgr-failed-could-not-restart Description: The total number of sessions disconnected due to failure in demux-mgr. Type: Counter	Int64
disc-reason-49	Name: internal-error Description: The total number of sessions disconnected due to some internal system error. Type: Counter	Int64
disc-reason-50	Name: AAA-context-removed Description: The total number of sessions disconnected due to AAA context is removed from system. Type: Counter	Int64
disc-reason-51	Name: invalid-service-type Description: The total number of sessions disconnected due to invalid service type. Type: Counter	Int64
disc-reason-52	Name: mip-relay-req-failed Description: The total number of sessions disconnected due to failure in Mobile IP relay request. Type: Counter	Int64
disc-reason-53	Name: mip-rcvd-relay-failure Description: The total number of sessions disconnected due to failure in Mobile IP received. Type: Counter	Int64
disc-reason-54	Name: ppp_restart_inter_pdsn_handoff Description: The total number of sessions disconnected due to restart in inter PDSN handoff. Type: Counter	Int64
disc-reason-55	Name: gre-key-mismatch Description: The total number of sessions disconnected due to mismatch in Generic Routing Encapsulation (GRE) key. Type: Counter	Int64
disc-reason-56	Name: invalid-tunnel-context Description: The total number of sessions disconnected due to invalid Tunnel context. Type: Counter	Int64
disc-reason-57	Name: no-peer-lns-address Description: The total number of sessions disconnected due to no peer LNS address Type: Counter	Int64
disc-reason-58	Name: failed-tunnel-connect Description: The total number of sessions disconnected due to failure in Tunnel connect. Type: Counter	Int64
disc-reason-59	Name: l2tp-tunnel-disconnect-remote Description: The total number of LT2P sessions disconnected due to tunnel disconnected by remote system. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-60	Name: l2tp-tunnel-timeout Description: The total number of LT2P sessions disconnected due to tunnel timeout. Type: Counter	Int64
disc-reason-61	Name: l2tp-protocol-error-remote Description: The total number of LT2P sessions disconnected due to protocol error on remote system. Type: Counter	Int64
disc-reason-62	Name: l2tp-protocol-error-local Description: The total number of LT2P sessions disconnected due to protocol error on local system. Type: Counter	Int64
disc-reason-63	Name: l2tp-auth-failed-remote Description: The total number of LT2P sessions disconnected due to authorization failed on remote system. Type: Counter	Int64
disc-reason-64	Name: l2tp-auth-failed-local Description: The total number of LT2P sessions disconnected due to authorization failed on local system Type: Counter	Int64
disc-reason-65	Name: l2tp-try-another-lns-from-remote Description: The total number of LT2P sessions disconnected due to remote system tried for another LNS. Type: Counter	Int64
disc-reason-66	Name: l2tp-no-resource-local Description: The total number of LT2P sessions disconnected due to non-availability of resource on local system. Type: Counter	Int64
disc-reason-67	Name: l2tp-no-resource-remote Description: The total number of LT2P sessions disconnected due to non-availability of resource on remote system. Type: Counter	Int64
disc-reason-68	Name: l2tp-tunnel-disconnect-local Description: The total number of LT2P sessions disconnected due to tunnel disconnected on local system. Type: Counter	Int64
disc-reason-69	Name: l2tp-admin-disconnect-remote Description: The total number of LT2P sessions disconnected by administrator on remote system. Type: Counter	Int64
disc-reason-70	Name: l2tpmgr-reached-max-capacity Description: The total number of LT2P sessions disconnected due to L2TP Manager logging facility reached to maximum logging capacity. Type: Counter	Int64
disc-reason-71	Name: MIP-Reg-Revocation Description: The total number of sessions disconnected due to a failure in Mobile IP registration revocation. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-72	Name: path-failure Description: The total number of sessions disconnected due to path failure in connecting session. Type: Counter	Int64
disc-reason-73	Name: Dhcp-Relay-IP-Validation-Failed Description: The total number of sessions disconnected due to a failure with the validation of the IP addresses with DHCP relay method. Type: Counter	Int64
disc-reason-74	Name: Gtp-unknown-pdp-addr-or-pdp-type Description: The total number of sessions disconnected due to unknown PDP address or PDP type. Type: Counter	Int64
disc-reason-75	Name: Gtp-all-dynamic-pdp-addr-occupied Description: The total number of sessions disconnected due to all dynamic PDP addresses are occupied and no PDP address is available to allocate. Type: Counter	Int64
disc-reason-76	Name: Gtp-no-memory-is-available Description: The total number of sessions disconnected due to out of memory problem. Type: Counter	Int64
disc-reason-77	Name: dhcp-relay-static-ip-addr-not-allowed Description: The total number of sessions disconnected due to the mobile requesting the use of a static IP address when static IP address requests are not allowed. Type: Counter	Int64
disc-reason-78	Name: dhcp-no-ip-addr-allocated Description: The total number of sessions disconnected as no IP address is allocated on DHCP Server. Type: Counter	Int64
disc-reason-79	Name: dhcp-ip-addr-allocation-tmr-exp Description: The total number of sessions disconnected due to time expired for IP address allocation on DHCP Server. Type: Counter	Int64
disc-reason-80	Name: dhcp-ip-validation-failed Description: The total number of sessions disconnected due to a failure with the validation of the IP address. This occurs because the IP address returned by DHCP Server is not present in the static pool in the destination context. Type: Counter	Int64
disc-reason-81	Name: dhcp-static-addr-not-allowed Description: The total number of sessions disconnected due to a failure with IP address in the static pool on destination context is not allowed by DHCP Server. Type: Counter	Int64
disc-reason-82	Name: dhcp-ip-addr-not-available-at-present Description: The total number of sessions disconnected due to non availability of IP address on DHCP Server. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-83	Name: dhcp-lease-expired Description: The total number of sessions disconnected due to expiration of IP address lease time. Type: Counter	Int64
disc-reason-84	Name: lpool-ip-validation-failed Description: The total number of sessions disconnected due to validation failure of IP address in IP pool. Type: Counter	Int64
disc-reason-85	Name: lpool-static-ip-addr-not-allowed Description: The total number of sessions disconnected due to specified static IP address is not allowed in IP pool. Type: Counter	Int64
disc-reason-86	Name: static-ip-validation-failed Description: The total number of sessions disconnected due to a failure in validation of static IP address on remote system. Type: Counter	Int64
disc-reason-87	Name: static-ip-addr-not-present Description: The total number of sessions disconnected due to allocated static address is removed or not available. Type: Counter	Int64
disc-reason-88	Name: static-ip-addr-not-allowed Description: The total number of sessions disconnected due to prohibition of defined static IP address. Type: Counter	Int64
disc-reason-89	Name: radius-ip-validation-failed Description: The total number of sessions disconnected due to a failure in IP address validation on RADIUS. Type: Counter	Int64
disc-reason-90	Name: radius-ip-addr-not-provided Description: The total number of sessions disconnected due to IP address is not provided by RADIUS. Type: Counter	Int64
disc-reason-91	Name: invalid-ip-addr-from-ggsn Description: The total number of sessions disconnected due to invalid IP address received from GGSN. Type: Counter	Int64
disc-reason-92	Name: no-more-sessions-in-aaa Description: The total number of sessions disconnected due to sessions cleared in AAA. Type: Counter	Int64
disc-reason-93	Name: ggsn-aaa-auth-req-failed Description: The total number of sessions disconnected due to authentication request failure between GGSN and AAA server. Type: Counter	Int64
disc-reason-94	Name: conflict-in-ip-addr-assignment Description: The total number of sessions disconnected due to conflict in IP address assignment. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-95	Name: apn-removed Description: The total number of sessions disconnected because the APN was removed during the session. Type: Counter	Int64
disc-reason-96	Name: credits-used-bytes-in Description: The total number of sessions disconnected due to exceeding the incoming data/bytes credit. Type: Counter	Int64
disc-reason-97	Name: credits-used-bytes-out Description: The total number of sessions disconnected due to exceeding the outgoing data/bytes credit. Type: Counter	Int64
disc-reason-98	Name: credits-used-bytes-total Description: The total number of sessions disconnected due to exceeding the total data/bytes credit. Type: Counter	Int64
disc-reason-99	Name: prepaid-failed Description: The total number of sessions disconnected due to a failure in processing prepaid account information. Type: Counter	Int64
disc-reason-100	Name: l2tp-ipsec-tunnel-failure Description: The total number of sessions disconnected due to the IPSec tunnel being failed to connect. Type: Counter	Int64
disc-reason-101	Name: l2tp-ipsec-tunnel-disconnected Description: The total number of sessions disconnected due to the IPSec tunnel being disconnected. Type: Counter	Int64
disc-reason-102	Name: mip-ipsec-sa-inactive Description: The total number of sessions disconnected due to in active security association (SA) of IPSec for specific Mobile IP address. Type: Counter	Int64
disc-reason-103	Name: Long-duration-timeout Description: The total number of sessions disconnected due to the expiration of the configured long-duration timer. Type: Counter	Int64
disc-reason-104	Name: proxy-mip-registration-failure Description: The total number of Proxy Mobile IP sessions disconnected due to Registration failures. Type: Counter	Int64
disc-reason-105	Name: proxy-mip-binding-update Description: The total number of Proxy Mobile IP sessions disconnected due to errors occurring during binding updates. Type: Counter	Int64
disc-reason-106	Name: proxy-mip-inter-pdsn-handoff-require-ip-address Description: The total number of Proxy Mobile IP sessions disconnected due to the mobile not providing the IP address it was assigned during IPCP negotiations resulting from inter-PDSN handoffs. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-107	Name: proxy-mip-inter-pdsn-handoff-mismatched-address Description: The total number of Proxy Mobile IP sessions disconnected due to the mobile providing an IP address other than what it was assigned during IPCP negotiations resulting from inter-PDSN handoffs. Type: Counter	Int64
disc-reason-108	Name: Local-purge Description: The total number of sessions disconnected due to a locally-initiated purge. Type: Counter	Int64
disc-reason-109	Name: failed-update-handoff Description: The total number of sessions disconnected due to failure in update handoff. Type: Counter	Int64
disc-reason-110	Name: closed_rp-handoff-complete Description: The total number of sessions disconnected due to handoff completed. Type: Counter	Int64
disc-reason-111	Name: closed_rp-duplicate-session Description: The total number of sessions disconnected due to duplicate session. Type: Counter	Int64
disc-reason-112	Name: closed_rp-handoff-session-not-found Description: The total number of sessions disconnected due to hand off session not found. Type: Counter	Int64
disc-reason-113	Name: closed_rp-handoff-failed Description: The total number of sessions disconnected due to handoff failed for session. Type: Counter	Int64
disc-reason-114	Name: pcf-monitor-keep-alive-failed Description: The total number of sessions disconnected due to the expiration of the configured max-inactivity timer indicating that the PCF was unavailable. Type: Counter	Int64
disc-reason-115	Name: call-internal-reject Description: The total number of sessions disconnected due to call rejected internally. Type: Counter	Int64
disc-reason-116	Name: call-restarted Description: The total number of sessions disconnected due to call restarted on unknown reason. Type: Counter	Int64
disc-reason-117	Name: a11-mn-ha-auth-failure Description: The total number of sessions disconnected due to failure in authentication between Mobile node and Home Agent (HA). Type: Counter	Int64
disc-reason-118	Name: a11-badly-formed Description: The total number of sessions disconnected as A11 interface is formed badly. Type: Counter	Int64
disc-reason-119	Name: a11-t-bit-not-set Description: The total number of sessions disconnected due to t-bit is not set in interface. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-120	Name: a11-unsupported-vendor-id Description: The total number of sessions disconnected due to unsupported vendor Id in interface. Type: Counter	Int64
disc-reason-121	Name: a11-mismatched-id Description: The total number of sessions disconnected due to mismatched Id in A11 interface. Type: Counter	Int64
disc-reason-122	Name: mipfa-dup-home-addr-req Description: The total number of sessions disconnected due to duplicate home address request on HA. Type: Counter	Int64
disc-reason-123	Name: mipfa-dup-imsi-session Description: The total number of sessions disconnected due to duplicate IMSI in session on HA. Type: Counter	Int64
disc-reason-124	Name: ha-unreachable Description: The total number of sessions disconnected due to unreachable HA. Type: Counter	Int64
disc-reason-125	Name: IPSP-addr-in-use Description: The total number of sessions disconnected due to IP Pool Sharing Protocol address is in use/not free on HA. Type: Counter	Int64
disc-reason-126	Name: mipfa-dup-home-addr-req Description: The total number of sessions disconnected due to duplicate home address request on FA. Type: Counter	Int64
disc-reason-127	Name: mipfa-ip-pool-busyout Description: The total number of sessions disconnected due to IP pool busyout. Type: Counter	Int64
disc-reason-128	Name: inter-pdsn-handoff Description: The total number of sessions disconnected due to inter-PDSN handoff failure. Type: Counter	Int64
disc-reason-129	Name: active-to-dormant Description: The total number of sessions disconnected due to system enters to dormant state from active state. Type: Counter Note: Sessions facilitated through PDSN Closed R-P services are always displayed as “Active” due to the fact that PDSN Closed R-P services do not receive dormancy information from the PCF.	Int64
disc-reason-130	Name: ppp-renegotiation Description: The total number of sessions disconnected due to failure/conflict in PPP renegotiation. Type: Counter	Int64
disc-reason-131	Name: active-start-parameter-change Description: The total number of sessions disconnected due to change in start parameters. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-132	Name: accounting-tariff-boundary Description: The total number of sessions disconnected due to the closure of an accounting record based configured tariff time. Type: Counter	Int64
disc-reason-133	Name: a11-disconnect-no-active-stop Description: The total number of sessions disconnected due to A11 interface is not active or stopped. Type: Counter	Int64
disc-reason-134	Name: nw-reachability-failed-reject Description: The total number of sessions disconnected due to failure in network reachability and request rejected. Type: Counter	Int64
disc-reason-135	Name: nw-reachability-failed-redirect Description: The total number of sessions disconnected due to failure in network reachability and request redirected. Type: Counter	Int64
disc-reason-136	Name: container-max-exceeded Description: The total number of sessions disconnected due to the closure of an accounting record based on the configured maximum number of container changes being exceeded. Type: Counter	Int64
disc-reason-137	Name: static-addr-not-allowed-in-apn Description: The total number of sessions disconnected due to static IP address is not allowed in APN. Type: Counter	Int64
disc-reason-138	Name: static-addr-required-by-radius Description: The total number of sessions disconnected due to static IP address required by RADIUS. Type: Counter	Int64
disc-reason-139	Name: static-addr-not-allowed-by-radius Description: The total number of sessions disconnected due to static IP address is not allowed by RADIUS. Type: Counter	Int64
disc-reason-140	Name: mip-registration-dropped Description: The total number of sessions disconnected due to registration dropped for Mobile IP address. Type: Counter	Int64
disc-reason-141	Name: counter-rollover Description: The total number of sessions disconnected due to counter rollover. Type: Counter	Int64
disc-reason-142	Name: constructed-nai-auth-failed Description: The total number of sessions disconnected due to authentication failure in subscriber's Network Access Identifier (NAI). Type: Counter	Int64
disc-reason-143	Name: inter-pdsn-service-optimize-handoff-disabled Description: The total number of sessions disconnected due to disabled inter-PDSN service optimization handoff. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-144	Name: gre-key-collision Description: The total number of sessions disconnected due to collision in Generic Routing Encapsulation (GRE) key. Type: Counter	Int64
disc-reason-145	Name: inter-pdsn-service-optimize-handoff-triggered Description: The total number of sessions disconnected when inter PDSN service optimization handoff triggered. Type: Counter	Int64
disc-reason-146	Name: intra-pdsn-handoff-triggered Description: The total number of sessions disconnected when intra-PDSN service optimization handoff triggered. Type: Counter	Int64
disc-reason-147	Name: delayed-abort-timer-expired Description: The total number of sessions disconnected due to abort timer duration expired. Type: Counter	Int64
disc-reason-148	Name: Admin-AAA-disconnect Description: The total number of sessions disconnected as AAA server disconnected Administratively. Type: Counter	Int64
disc-reason-149	Name: Admin-AAA-disconnect-handoff Description: The total number of sessions disconnected due to AAA handoff disconnected Administratively. Type: Counter	Int64
disc-reason-150	Name: PPP-IPV6CP-negotiation-failed Description: The total number of sessions disconnected due to IPv6CP negotiation failed. Type: Counter	Int64
disc-reason-151	Name: PPP-IPV6CP-no-response Description: The total number of sessions disconnected due to no response during IPv6CP negotiation. Type: Counter	Int64
disc-reason-152	Name: PPP-IPV6CP-max-retry-reached Description: The total number of sessions disconnected due to maximum retries failed on IPv6CP negotiation. Type: Counter	Int64
disc-reason-153	Name: PPP-Restart-Invalid-source-IPV4-address Description: The total number of sessions disconnected due to PPP restarted by invalid Pv4 address of source. Type: Counter	Int64
disc-reason-154	Name: a11-disconnect-handoff-no-active-stop Description: The total number of sessions disconnected due to handoff in A11 interface is not active or stopped. Type: Counter	Int64
disc-reason-155	Name: call-restarted-inter-pdsn-handoff Description: The total number of sessions disconnected due to call restarted during inter PDSN handoff. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-156	Name: call-restarted-ppp-termination Description: The total number of sessions disconnected due to call restarted on PPP termination. Type: Counter	Int64
disc-reason-157	Name: mipfa-resource-conflict Description: The total number of sessions disconnected due to resource conflict on FA. Type: Counter	Int64
disc-reason-158	Name: failed-auth-with-charging-svc Description: The total number of sessions disconnected due to authentication failure in charging services. Type: Counter	Int64
disc-reason-159	Name: mipha-dup-imsi-session-purge Description: The total number of sessions disconnected due to clearing of duplicate IMSI in session on HA. Type: Counter	Int64
disc-reason-160	Name: mipha-rev-pending-newcall Description: The total number of sessions disconnected due to revival of pending new calls. Type: Counter	Int64
disc-reason-161	Name: volume-quota-reached Description: The total number of sessions disconnected due to allocated data quota volume reached. Type: Counter	Int64
disc-reason-162	Name: duration-quota-reached Description: The total number of sessions disconnected due to time-out reached. Type: Counter	Int64
disc-reason-163	Name: gtp-user-auth-failed Description: The total number of sessions disconnected due to a failure in user/subscriber authentication. Type: Counter	Int64
disc-reason-164	Name: MIP-Reg-Revocation-no-lcp-term Description: The total number of sessions disconnected due to termination of an MIP Session for a Revocation being received from the HA and the PDSN is not configured to send a LCP Terminate Request. Type: Counter	Int64
disc-reason-165	Name: MIP-private-ip-no-rev-tunnel Description: The total number of sessions disconnected due to no reverse tunnel for MIP. Type: Counter	Int64
disc-reason-166	Name: Invalid-Prepaid-AAA-attr-in-auth-response Description: The total number of sessions disconnected due to invalid Prepaid attribute in authentication response. Type: Counter	Int64
disc-reason-167	Name: mipha-prepaid-reset-dynamic-newcall Description: The total number of MIP HA sessions disconnected due to receiving MIP registration with a home address of 0.0.0.0. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-168	Name: gre-flow-control-timeout Description: The total number of RP sessions disconnected due to the PCF not removing flow control for a specified amount of time if GRE flow control for RP sessions is enabled. Type: Counter	Int64
disc-reason-169	Name: mip-paaa-bc-query-not-found Description: The total number of sessions that were disconnected because the binding cache was not found. Type: Counter	Int64
disc-reason-170	Name: mipha-dynamic-ip-addr-not-available Description: The total number of MIP HA sessions that were disconnected because a dynamic IP address was not available. Type: Counter	Int64
disc-reason-171	Name: a11-mismatched-id-on-handoff Description: The total number of sessions disconnected due to a mismatched ID in the A11 interface during a handoff. Type: Counter	Int64
disc-reason-172	Name: a11-badly-formed-on-handoff Description: The total number of sessions disconnected because the A11 interface is formed badly during a handoff. Type: Counter	Int64
disc-reason-173	Name: a11-unsupported-vendor-id-on-handoff Description: The total number of sessions disconnected due to unsupported vendor Id in the A11 interface during a handoff. Type: Counter	Int64
disc-reason-174	Name: a11-t-bit-not-set-on-handoff Description: The total number of sessions disconnected due to t-bit is not set in the A11 interface during a handoff. Type: Counter	Int64
disc-reason-175	Name: MIP-Reg-Revocation-i-bit-on Description: The total number of Mobile IP sessions disconnected at the PDSN/FA due to Revocation received from HA (with I bit set). Type: Counter	Int64
disc-reason-176	Name: a11-RRQ-Deny-Max-Count Description: The total number of sessions disconnected due to failures in processing A11-Registration-Request despite retries of the message by the PCF. Type: Counter	Int64
disc-reason-177	Name: Dormant-Transition-During-Session-Setup Description: The total number of sessions disconnected because they entered the dormant state during session setup. Type: Counter Note: Sessions facilitated through PDSN Closed R-P services are always displayed as “Active” due to the fact that PDSN Closed R-P services do not receive dormancy information from the PCF.	Int64

Reason No.	Description	Data Type
disc-reason-178	Name: PPP-Rem-Reneg-Disc-Always-Cfg Description: The total number of PPP sessions disconnected because they were renegotiated by the remote side by sending LCP Conf-req/nak/ack and the “always” option was used for the remote-renegotiation disconnect command/attribute. Type: Counter	Int64
disc-reason-179	Name: PPP-Rem-Reneg-Disc-NAI-MSID-Mismatch Description: The total number of PPP sessions disconnected because they were renegotiated by the remote side by sending LCP Conf-req/nak/ack and the “nai-prefix-msid-mismatch” option was used for the remote-renegotiation disconnect command/attribute. Type: Counter	Int64
disc-reason-180	Name: mipha-subscriber-ipsec-tunnel-down Description: The total number of subscribers disconnected because the IPsec tunnel facilitating their sessions went down. Type: Counter	Int64
disc-reason-181	Name: mipha-subscriber-ipsec-tunnel-fail Description: The total number of subscribers disconnected because an IPsec tunnel failed to be established. Type: Counter	Int64
disc-reason-182	Name: mipha-subscriber-ipsecmgr-death Description: The total number of subscribers disconnected because the IPsec Manager software task facilitating their sessions crashed. Type: Counter	Int64
disc-reason-183	Name: flow-is-deactive Description: The total number of sessions disconnected because their respective flow was deactivated. Type: Counter	Int64
disc-reason-184	Name: ecs-license-exceeded Description: The total number of sessions disconnected because the licensed session capacity for the Enhanced Charging Service feature has been exceeded. Type: Counter	Int64
disc-reason-185	Name: IPSPG-Auth-failed Description: The total number of sessions disconnected because IPSPG authentication failed. Type: Counter	Int64
disc-reason-186	Name: driver-initiated Description: The total number of sessions disconnected due to driver initiation. Type: Counter	Int64
disc-reason-187	Name: ims-authorization-failed Description: The total number of sessions disconnected because of IMS authorization failures. Type: Counter	Int64
disc-reason-188	Name: service-instance-released Description: The total number of sessions disconnected because they were released by the service instances facilitating them. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-189	Name: flow-release Description: The total number of sessions disconnected because their respective flows were released. Type: Counter	Int64
disc-reason-190	Name: ppp-renego-no-ha-addr Description: The total number of sessions disconnect because no HA address was supplied during PPP renegotiation. Type: Counter	Int64
disc-reason-191	Name: intra-pdsn-handoff Description: The total number of sessions disconnected during an intra-PDSN service handoff. Type: Counter	Int64
disc-reason-192	Name: overload-disconnect Description: The total number of sessions disconnected because the configured overload-disconnect threshold has been exceeded. Type: Counter	Int64
disc-reason-193	Name: css-service-not-found Description: The total number of sessions because the CSS service specified for handling the session was not found. Type: Counter	Int64
disc-reason-194	This is not supported at this time.	Int64
disc-reason-195	Name: dhcp-client-sent-release Description: The total number of sessions disconnected because the DHCP client sent a release. Type: Counter	Int64
disc-reason-196	Name: dhcp-client-sent-nak Description: The total number of sessions disconnected because the DHCP client sent a negative acknowledge message. Type: Counter	Int64
disc-reason-197	Name: msid-dhcp-chaddr-mismatch Description: The total number of sessions disconnected because the DHCP Client Hardware (MAC) Address (CHADDR) does not match with MSID of the ASN-GW session. Type: Counter	Int64
disc-reason-198	Name: link-broken Description: The total number of sessions disconnected because the link between the SGSN and the GGSN is broken resulting in the termination of ongoing Diameter Credit-Control sessions with the DIAMETER_LINK_BROKEN termination-cause. Type: Counter	Int64
disc-reason-199	Name: prog-end-timeout Description: The total number of sessions disconnected because the allowed BCMCS program limit time expires. Type: Counter	Int64
disc-reason-200	Name: qos-update-wait-timeout Description: The total number of sessions disconnected because the PDSN failed to update QoS for them. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-201	Name: css-synch-cause Description: The total number of sessions disconnected because the session-audit between the ACS Manager task and Session Manager disconnects any dangling sessions in the Session Manager. Type: Counter	Int64
disc-reason-202	Name: Gtp-context-replacement Description: The total number of sessions disconnected due to GTP context replacement. Type: Counter	Int64
disc-reason-203	Name: PDIF-Auth-failed Description: The total number of sessions disconnected due to PDIF authentication process unable to set up a secure IPSec tunnel to subscriber. Type: Counter	Int64
disc-reason-204	Name: l2tp-unknown-apn Description: The total number of sessions disconnected due to unknown APN in L2TP message. Type: Counter	Int64
disc-reason-205	Name: ms-unexpected-network-reentry Description: The total number of sessions disconnected due unexpected network reentry by MS in Wimax network. Type: Counter	Int64
disc-reason-206	Name: r6-invalid-nai Description: The total number of sessions disconnected due invalid NAI in R6 message in WiMAX network. Type: Counter	Int64
disc-reason-207	Name: eap-max-retry-reached Description: The total number of sessions disconnected due maximum retry limit for EAP authentication exhausted in Wimax network. Type: Counter	Int64
disc-reason-208	Name: vbm-hoa-session-disconnected Description: The total number of disconnects that occurred between the Visitor Bearer Manager (VBM) and home network IP address (HoA). Type: Counter	Int64
disc-reason-209	Name: vbm-voa-session-disconnected Description: The total number of disconnects that occurred between the Visitor Bearer Manager (VBM) and visited address (VoA). Type: Counter	Int64
disc-reason-210	Name: in-acl-disconnect-on-violation Description: the total number of disconnects resulting from an inbound Access Control List violation. Type: Counter	Int64
disc-reason-211	Name: eap-msk-lifetime-expiry Description: The total number of sessions disconnected due to EAP Master Session Key lifetime expiry in Wimax network. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-212	Name: eap-msk-lifetime-too-low Description: The total number of sessions disconnected due to EAP Master Session Key lifetime is too less to allow session. Type: Counter	Int64
disc-reason-213	Name: inter-service-handoff Description: The total number of sessions disconnected due to inter-service handoff in Wimax network. Type: Counter	Int64
disc-reason-214	Name: r6-max-retry-reached Description: The total number of sessions disconnected due to maximum retry limit for R6 message exhausted in Wimax network. Type: Counter	Int64
disc-reason-215	Name: r6-nwexit-recd Description: The total number of sessions disconnected due to network exit message received on R6 interface in Wimax network. Type: Counter	Int64
disc-reason-216	Name: r6-dereg-req-recd Description: The total number of sessions disconnected due to de-registration message received on R6 interface in Wimax network. Type: Counter	Int64
disc-reason-217	Name: r6-remote-failure Description: The total number of sessions disconnected due to remote peer failure on R6 interface in Wimax network. Type: Counter	Int64
disc-reason-218	Name: r6r4-protocol-errors Description: The total number of sessions disconnected due to protocol error on R6 and/or R4 interface in Wimax network. Type: Counter	Int64
disc-reason-219	Name: wimax-qos-invalid-aaa-attr Description: The total number of sessions disconnected due to invalid AAA attributes for QoS to a subscriber in Wimax network. Type: Counter	Int64
disc-reason-220	Name: npu-gre-flows-not-available Description: The total number of sessions disconnected due to requested NPU GRE flow is not available for a subscriber in Wimax network. Type: Counter	Int64
disc-reason-221	Name: r4-max-retry-reached Description: The total number of sessions disconnected due to maximum retry limit for R4 message exhausted in Wimax network. Type: Counter	Int64
disc-reason-222	Name: r4-nwexit-recd Description: The total number of sessions disconnected due to network exit message received on R4 interface in Wimax network. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-223	Name: r4-dereg-req-recd Description: The total number of sessions disconnected due to de-registration message received on R4 interface in Wimax network. Type: Counter	Int64
disc-reason-224	Name: r4-remote-failure Description: The total number of sessions disconnected due to remote peer failure on R4 interface in Wimax network. Type: Counter	Int64
disc-reason-225	Name: ims-authorization-revoked Description: The total number of sessions disconnected due to IMS authorization revoked. Type: Counter	Int64
disc-reason-226	Name: ims-authorization-released Description: The total number of sessions disconnected due to IMS authorization released. Type: Counter	Int64
disc-reason-227	Name: ims-auth-decision-invalid Description: The total number of sessions disconnected due to invalid IMS authorization decision. Type: Counter	Int64
disc-reason-228	Name: mac-addr-validation-failed Description: The total number of sessions disconnected due to MAC address validation failure in WiMAX network. Type: Counter	Int64
disc-reason-229	Name: excessive-wimax-pd-flows-configured Description: The total number of sessions disconnected due to excessive packet data flows configured in WiMAX network. Type: Counter	Int64
disc-reason-230	Name: sgsn-cancel-location-sub-withdraw Description: The total number of sessions disconnected due to request for location substitution withdrawn was cancelled. Type: Counter	Int64
disc-reason-231	Name: sgsn-cancel-location-update Description: The total number of sessions disconnected because the location update was cancelled. Type: Counter	Int64
disc-reason-232	Name: sgsn-mnr-expiry Description: The total number of sessions disconnected due to manager expiry. Type: Counter	Int64
disc-reason-233	Name: sgsn-identity-failure Description: The total number of sessions disconnected due to identity check failure. Type: Counter	Int64
disc-reason-234	Name: sgsn-security-failure Description: The total number of sessions disconnected due to security verification failure. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-235	Name: sgsn-auth-failure Description: The total number of sessions disconnected due to authentication failure. Type: Counter	Int64
disc-reason-236	Name: sgsn-glu-failure Description: The total number of sessions disconnected due to Global Location Update (GLU) failure. Type: Counter	Int64
disc-reason-237	Name: sgsn-implicit-detach Description: The total number of sessions disconnected due to an implicit detach. Type: Counter	Int64
disc-reason-238	Name: sgsn-subscriber-moved-to-different-smgr-instance Description: The total number of sessions disconnected due to subscriber moving to a different SMGR instance. Type: Counter	Int64
disc-reason-239	Name: sgsn-subscriber-moved-to-peer-sgsn Description: The total number of sessions disconnected due to subscriber moving to a peer SGSN. Type: Counter	Int64
disc-reason-240	Name: sgsn-dns-failure-inter-rau Description: The total number of sessions disconnected due to DNS failure during Inter-RAU. Type: Counter	Int64
disc-reason-241	Name: sgsn-context-response-failure Description: The total number of sessions disconnected due to context response failure. Type: Counter	Int64
disc-reason-242	Name: sgsn-hlr-not-found-for-imsi Description: The total number of sessions disconnected due to HLR not found for particular IMSI. Type: Counter	Int64
disc-reason-243	Name: sgsn-ms-init-detach Description: The total number of sessions disconnected due to MS initiated detach. Type: Counter	Int64
disc-reason-244	Name: sgsn-roaming-not-allowed Description: The total number of sessions disconnected because MS was not allowed to roam. Type: Counter	Int64
disc-reason-245	Name: sgsn-duplicate-context Description: The total number of sessions disconnected due to duplicate context. Type: Counter	Int64
disc-reason-246	Name: hss-profile-update-failed Description: The total number of sessions disconnected due to failure of HSS profile update. Type: Counter	Int64
disc-reason-247	Name: inactive-without-activating-any-pdp Description: The total number of sessions disconnected where session is inactive and no PDP context is activated from this session. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-248	Name: asnpc-idle-mode-timeout Description: The total number of sessions disconnected due to configured idle mode timeout duration is exhausted for ASN paging controller in WiMAX network. Type: Counter	Int64
disc-reason-249	Name: asnpc-idle-mode-exit Description: The total number of sessions disconnected due to idle mode exit message for ASN paging controller in WiMAX network. Type: Counter	Int64
disc-reason-250	Name: asnpc-idle-mode-entry-auth-failed Description: The total number of sessions disconnected due to authentication failure during idle mode entry for ASN paging controller in WiMAX network. Type: Counter	Int64
disc-reason-251	Name: asngw-invalid-qos-configuration Description: The total number of sessions disconnected due to invalid QoS configuration for subscriber in WiMAX network. Type: Counter	Int64
disc-reason-252	Name: sgsn-dsd-allgprswithdrawn Description: The total number of sessions disconnected due to receipt of Delete Subscriber Data (DSD) message including the IE “all GPRS subscriptions withdrawn”. Type: Counter	Int64
disc-reason-253	Name: r6-pmk-key-change-failure Description: The total number of sessions disconnected due to primary master key change failure on R6 interface in WiMAX network. Type: Counter	Int64
disc-reason-254	Name: sgsn-illegal-me Description: The total number of sessions disconnected because the ME was illegal. Type: Counter	Int64
disc-reason-255	Name: sess-termination-timeout Description: The total number of sessions disconnected due to failure monitored through BS monitor keep-alive probe. Type: Counter	Int64
disc-reason-256	Name: sgsn-sai-failure Description: The total number of sessions disconnected due to an SGSN Service Area Identity (SAI) attachment failure. Type: Counter	Int64
disc-reason-257	Name: sgsn-rnc-removal Description: The total number of sessions disconnected due to an error in SGSN inbound SRNS (Serving Radio Network Subsystem) registration state. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-258	Name: sgsn-rai-removal Description: The total number of sessions disconnected due to error in Update PDP Context Response message for direct tunnel functionality. Direct tunnel functionality at GGSN was expecting some fields which were not received in the Update PDP Context Response message. Hence, GGSN was not able to establish tunnel appropriately with SGSN or RNC. Type: Counter	Int64
disc-reason-259	Name: sgsn-init-deact Description: The total number of sessions disconnected at SGSN due to unknown PDP context. Type: Counter	Int64
disc-reason-260	Name: ggsn-init-deact Description: The total number of sessions disconnected at SGSN due to PDP authentication failed. Type: Counter	Int64
disc-reason-261	Name: hlr-init-deact Description: The total number of sessions disconnected at SGSN due to duplicate PDP context Type: Counter	Int64
disc-reason-262	Name: ms-init-deact Description: The total number of sessions disconnected at SGSN due to no response from GGSN. Type: Counter	Int64
disc-reason-263	Name: sgsn-detach-init-deact Description: The total number of sessions disconnected at SGSN due to failed response from GGSN. Type: Counter	Int64
disc-reason-264	Name: sgsn-rab-rel-init-deact Description: The total number of sessions disconnected at SGSN due to unknown APN. Type: Counter	Int64
disc-reason-265	Name: sgsn-iu-rel-init-deact Description: The total number of sessions disconnected at SGSN due to service request initiated deactivation. Type: Counter	Int64
disc-reason-266	Name: sgsn-gtpu-path-failure Description: The total number of sessions disconnected at SGSN due to attachment procedure initiated abort. Type: Counter	Int64
disc-reason-267	Name: sgsn-gtpc-path-failure Description: The total number of sessions disconnected at SGSN due to ISRAU initiated abort procedure. Type: Counter	Int64
disc-reason-268	Name: sgsn-local-handoff-init-deact Description: The total number of sessions disconnected at SGSN due to unknown APN. Type: Counter	Int64
disc-reason-269	Name: sgsn-remote-handoff-init-deact Description: The total number of sessions disconnected at SGSN due to MM context cleanup initiated abort procedure. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-270	Name: sgsn-gtp-no-resource Description: The total number of sessions disconnected at SGSN due to unknown abort procedure. Type: Counter	Int64
disc-reason-271	Name: sgsn-rnc-no-resource Description: The total number of sessions disconnected at SGSN due to abort procedure started by guard timeout. Type: Counter	Int64
disc-reason-272	Name: sgsn-odb-init-deact Description: The total number of sessions disconnected at SGSN due to abort procedure initiated on DHCP IP validate request. Type: Counter	Int64
disc-reason-273	Name: sgsn-invalid-ti Description: The total number of sessions disconnected due to id mismatch in MIPv6 session. Type: Counter	Int64
disc-reason-274	Name: sgsn-actv-rejected-due-to-rnc Description: The total number of sessions disconnected as AAA session id not-found Type: Counter	Int64
disc-reason-275	Name: sgsn-apn-restrict-vio Description: The total number of sessions disconnected due to security associate rekeying failure. Type: Counter	Int64
disc-reason-276	Name: sgsn-actv-rejected-by-sgsn Description: The total number of sessions disconnected due to failure in relocation in ASN-PC service. Type: Counter	Int64
disc-reason-277	Name: sgsn-abnormal-deact Description: The total number of sessions disconnected due to failure in paging controller relocation in ASN PC service. Type: Counter	Int64
disc-reason-278	Name: sgsn-actv-rejected-by-ggsn Description: The total number of sessions disconnected due to mismatch in authentication policy. Type: Counter	Int64
disc-reason-279	Name: sgsn-err-ind Description: The total number of sessions disconnected as DELETE MS ENTRY message received by the ASN Paging Controller. Type: Counter	Int64
disc-reason-280	Name: asngw-non-anchor-prohibited Description: The total number of sessions disconnected due to non-anchor ASN-GW being prohibited. Type: Counter	Int64
disc-reason-281	Name: asngw-im-entry-prohibited Description: The total number of sessions disconnected due to unknown reason. Type: Counter	Int64
disc-reason-282	Name: Session-idle-mode-entry-timeout Description: The total number of sessions disconnected Administratively. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-283	Name: session-idle-mode-exit-timeout Description: The total number of sessions disconnected by remote system Type: Counter	Int64
disc-reason-284	Name: asnpc-ms-power-down-nwexit Description: The total number of sessions disconnected by local system. Type: Counter	Int64
disc-reason-285	Name: asnpc-r4-nwexit-recd Description: The total number of sessions disconnected due to non-availability of resources. Type: Counter	Int64
disc-reason-286	Name: sgsn-iu-rel-before-call-est Description: The total number of sessions disconnected due to exceed in service limit. Type: Counter	Int64
disc-reason-287	Name: ikev2-subscriber-ipsecmgr-death Description: The total number of sessions disconnected due to LCP negotiation failed. Type: Counter	Int64
disc-reason-288	Name: All-dynamic-pool-addr-occupied Description: The total number of sessions disconnected due to no response in PPP-LCP session. Type: Counter	Int64
disc-reason-289	Name: mipv6ha-ip-addr-not-available Description: The total number of sessions disconnected due to loop back detected in PPP-LCP. Type: Counter	Int64
disc-reason-290	Name: bs-monitor-keep-alive-failed Description: The total number of sessions disconnected due to maximum retries in PPP-LCP session. Type: Counter	Int64
disc-reason-291	Name: sgsn-attach-in-reg-state Description: The total number of SGSN sessions disconnected due to an error in the SGSN attachment during the registration state. Type: Counter	Int64
disc-reason-292	Name: sgsn-inbound-srns-in-reg-state Description: The total number of SGSN sessions disconnected due to an error in the SGSN inbound SRNS in a registration state. Type: Counter	Int64
disc-reason-293	Name: dt-ggsn-tun-reestablish-failed Description: The total number of SGSN sessions disconnected due to error in Update PDP Context Response message for direct tunnel functionality. Direct tunnel functionality at GGSN was expecting some fields which were not received in the Update PDP Context Response message. Hence, the GGSN was not able to establish a tunnel appropriately with the SGSN or the RNC. Type: Counter	Int64
disc-reason-294	Name: sgsn-pdp-unknown Description: The total number of SGSN sessions disconnected due to an unknown PDP context. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-295	Name: sgsn-pdp-auth-failure Description: The total number of SGSN sessions disconnected because the PDP authentication failed. Type: Counter	Int64
disc-reason-296	Name: sgsn-duplicate-pdp-context Description: The total number of SGSN sessions disconnected because the PDP authentication failed. Type: Counter	Int64
disc-reason-297	Name: sgsn-no-rsp-from-ggsn Description: The total number of SGSN sessions disconnected because the SGSN does not receive a response from the GGSN. Type: Counter	Int64
disc-reason-298	Name: sgsn-failure-rsp-from-ggsn Description: The total number of SGSN sessions disconnected due to failed response from the GGSN. Type: Counter	Int64
disc-reason-299	Name: sgsn-apn-unknown Description: The total number of SGSN sessions disconnected due to an unknown APN. Type: Counter	Int64
disc-reason-300	Name: sgsn-pdp-status-mismatch Description: The total number of SGSN sessions disconnected due to deactivation initiated by a service request. Type: Counter	Int64
disc-reason-301	Name: sgsn-attach-on-attach-init-abort Description: The total number of SGSN sessions disconnected due to an attachment procedure-initiated abort. Type: Counter	Int64
disc-reason-302	Name: sgsn-iu-rel-in-israu-init-abort Description: The total number of SGSN sessions disconnected due to an aborted Inter-SGSN Routing Area Update (ISRAU) procedure. Type: Counter	Int64
disc-reason-303	Name: sgsn-smgr-init-ab Description: The total number of SGSN sessions disconnected because the SessMgr initiates an abort. Type: Counter	Int64
disc-reason-304	Name: sgsn-mm-ctx-cleanup-init-abort Description: The total number of SGSN sessions disconnected due to the MM context cleanup-initiated abort procedure. Type: Counter	Int64
disc-reason-305	Name: sgsn-unknown-abort Description: The total number of SGSN sessions disconnected due to an unknown abort procedure. Type: Counter	Int64
disc-reason-306	Name: sgsn-guard-timeout-abort Description: The total number of SGSN sessions disconnected because the abort procedure was started by the guard timer timeout. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-307	Name: vpn-bounce-dhcpip-validate-req Description: The total number of SGSN sessions disconnected because the abort procedure was initiated upon receiving a DHCP IP validate request. Type: Counter	Int64
disc-reason-308	Name: mipv6-id-mismatch Description: The total number of sessions disconnected due to id mismatch in MIPv6 session. Type: Counter	Int64
disc-reason-309	Name: aaa-session-id-not-found Description: The total number of sessions disconnected as AAA session id not-found Type: Counter	Int64
disc-reason-310	Name: x1/x5-max-retry-reach Description: The total number of sessions disconnected due to security associate rekeying failure. Type: Counter	Int64
disc-reason-311	Name: x1-nwexit-recd Description: The total number of sessions disconnected due to failure in relocation in ASN-PC service. Type: Counter	Int64
disc-reason-312	Name: x1-dereg-req-recd Description: The total number of sessions disconnected due to failure in paging controller relocation in ASN PC service. Type: Counter	Int64
disc-reason-313	Name: x1-remote-failure Description: The total number of sessions disconnected due to mismatch in authentication policy. Type: Counter	Int64
disc-reason-314	Name: x1x2-protocol-errors Description: The total number of sessions disconnected as DELETE MS ENTRY message received by the ASN Paging Controller. Type: Counter	Int64
disc-reason-315	Name: x2/x6-max-retry-reached Description: The total number of sessions disconnected because the ASNGW TID entry was not found. Type: Counter	Int64
disc-reason-316	Name: x2/x6-nwexit-recd Description: The total number of sessions disconnected due to network exit message received on X2 interface in PHS network. Type: Counter	Int64
disc-reason-317	Name: x2-dereg-req-recd Description: The total number of sessions disconnected due to deregistration request received on X2 interface in PHS network. Type: Counter	Int64
disc-reason-318	Name: x2-remote-failure Description: The total number of sessions disconnected by remote system due to failure on X2 interface in PHS network. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-319	Name: x1-pmk-key-change-failure Description: The total number of sessions disconnected due to primary master key change failure on X1 interface in PHS network. Type: Counter	Int64
disc-reason-320	Name: SA-Rekeying-Failure Description: The total number of sessions disconnected because of an IKE SA rekeying failure. Type: Counter	Int64
disc-reason-321	Name: Sess-sleep-mode-entry-timeout Description: The total number of sessions disconnected due to session sleep mode entry timeout on PHS GW. Type: Counter	Int64
disc-reason-322	Name: phsgw-non-anchor-prohibited Description: The total number of sessions disconnected due to non-anchor PHS GW being prohibited. Type: Counter	Int64
disc-reason-323	Name: asnpc-pc-relocation-failed Description: The total number of sessions disconnected due to failure in paging controller relocation in ASN PC service. Type: Counter	Int64
disc-reason-324	Name: asnpc-pc-relocation Description: The total number of sessions disconnected due to paging controller relocation in ASN PC service. Type: Counter	Int64
disc-reason-325	Name: auth_policy_mismatch Description: The total number of sessions disconnected due to authorization policy mismatch. Type: Counter	Int64
disc-reason-326	Name: ike/ipsec-sa-lifetime-expired Description: The total number of sessions disconnected due to IKE/IPsec security associate lifetime timer expiration. Type: Counter	Int64
disc-reason-327	Name: asnpc-del-ms-entry-recd Description: The total number of sessions disconnected as DELETE MS ENTRY message received by the ASN Paging Controller. Type: Counter	Int64
disc-reason-328	Name: phspc-sleep-mode-timeout Description: The total number of sessions disconnected due to sleep mode timeout by the PHS Paging Controller. Type: Counter	Int64
disc-reason-329	Name: phspc-sleep-mode-exit Description: The total number of sessions disconnected due to sleep mode exit by the PHS Paging Controller. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-330	Name: phspc-sleep-mode-entry-auth-failed Description: The total number of sessions disconnected due to failed sleep mode entry authorization by the PHS Paging Controller. Type: Counter	Int64
disc-reason-331	Name: phspc-ms-power-down-nwexit Description: The total number of sessions disconnected due to ms power down network exit message received by the PHS Paging Controller. Type: Counter	Int64
disc-reason-332	Name: phspc-x6-nwexit-recd Description: The total number of PHS Paging Controller sessions disconnected due to network exit message received from X2 interface in PHS network. Type: Counter	Int64
disc-reason-333	Name: invalid-nat-config Description: The total number of sessions disconnected due to the following reasons: 1. When SessMgr and ACSMgr are running in non-optimized mode. 2. When an undefined NAT pool is configured for subscriber. NAT must be disabled if ACS is not running in optimized mode. Type: Counter	Int64
disc-reason-334	Name: asngw-tid-entry-not-found Description: The total number of sessions disconnected because the ASNGW TID entry was not found. Type: Counter	Int64
disc-reason-335	Name: No-NAT-IP-Addr-for-subscriber Description: The total number of sessions disconnected due to NAT IP address being unavailable during call setup for allocation to a subscriber. Type: Counter	Int64
disc-reason-336	Name: excessive-phs-pd-flows-configured Description: The total number of sessions disconnected due to configuration of excessive PHS pd flows. Type: Counter	Int64
disc-reason-337	Name: phsgw-invalid-qos-configuration Description: The total number of sessions disconnected due to invalid QoS configuration for subscriber in PHS network. Type: Counter	Int64
disc-reason-338	Name: Interim-Update Description: The total number of sessions disconnected due to Interim Update. Type: Counter	Int64
disc-reason-339	Name: sgsn-inbound-attach-abort-radio-status-bad-lost Description: The total number of SGSN sessions disconnected because the inbound attach requests aborted due to poor radio status or lost radio connections. Type: Counter	Int64
disc-reason-340	Name: sgsn-inbound-irau-abort-radio-status-bad-lost Description: The total number of SGSN sessions disconnected due to inbound IRAU requests aborting as the radio status was poor or the radio connection lost. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-341	Name: ike-keep-alive-failed Description: The total number of sessions disconnected due to IKE keepalive failure. Type: Counter	Int64
disc-reason-342	Name: sgsn-attach-abort-ms-suspend Description: The total number of SGSN sessions disconnected due to attach requests aborting because MS was in suspend mode. Type: Counter	Int64
disc-reason-343	Name: sgsn-inbound-irau-abort-ms-suspend Description: The total number of SGSN sessions disconnected due to IRAU requests aborted when MS was in suspend mode. Type: Counter	Int64
disc-reason-344	Name: duplicate-session-detected Description: The total number of sessions disconnected due to detection of duplicate sessions for the same session id. Type: Counter	Int64
disc-reason-345	Name: sgsn-xid-response-failure Description: The total number of SGSN sessions disconnected due to XID response failure. Type: Counter	Int64
disc-reason-346	Name: sgsn-nse-cleanup Description: The total number of SGSN sessions disconnected due to record cleanup or reset on the network service entity (NSE). Type: Counter	Int64
disc-reason-347	Name: sgsn-gtp-req-failure Description: The total number of SGSN sessions disconnected due to failure of the GTPP request. Type: Counter	Int64
disc-reason-348	Name: sgsn-imsi-mismatch Description: The total number of SGSN sessions disconnected due to mismatches of the IMSIs. Type: Counter	Int64
disc-reason-349	Name: sgsn-bvc-blocked Description: The total number of SGSN sessions disconnected because the BSSGP Virtual Connection (BVC) was blocked. Type: Counter	Int64
disc-reason-350	Name: sgsn-attach-on-inbound-irau Description: The total number of SGSN sessions disconnected as the session was attached on inbound IRAU requests. Type: Counter	Int64
disc-reason-351	Name: sgsn-attach-on-outbound-irau Description: The total number of SGSN sessions disconnected while the session was attached on outbound IRAU requests. Type: Counter	Int64
disc-reason-352	Name: sgsn-incorrect-state Description: The total number of SGSN sessions disconnected due to incorrect state of network elements. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-353	Name: sgsn-t3350-expiry Description: The total number of SGSN sessions disconnected due to expiry of the T-3350 timer. Type: Counter	Int64
disc-reason-354	Name: sgsn-page-timer-expiry Description: The total number of SGSN sessions disconnected due to expiry of the paging timer. Type: Counter	Int64
disc-reason-355	Name: phsgw-tid-entry-not-found Description: The total number of SGSN sessions disconnected due to local purging of PDP contexts. Type: Counter	Int64
disc-reason-356	Name: phspc-del-ms-entry-recd Description: The total number of sessions disconnected as DELETE MS ENTRY message received by the PHS Paging Controller. Type: Counter	Int64
disc-reason-357	Name: sgsn-pdp-local-purge Description: The total number of SGSN sessions disconnected due to local purging of PDP contexts. The field indicator number will vary depending upon the build of the software. Type: Counter	Int64
disc-reason-358	Name: phs-invalid-nai Description: The total number of sessions disconnected due to invalid NAI in PHS network. Type: Counter	Int64
disc-reason-359	Name: Session-sleep-mode-exit-timeout Description: The total number of sessions disconnected due to sleep mode exit timeout for PHS paging controller in PHS network. Type: Counter	Int64
disc-reason-360	Name: sgsn-offload-phase2 Description: With Iu/Gb flex enabled, this is the total number of SGSN sessions disconnected when the subscriber has been forcefully cleared via phase2 offloading from one SGSN to another SGSN within the SGSN pool. Type: Counter	Int64
disc-reason-361	Name: phs-thirdparty-auth-fail Description: The total number of sessions disconnected due to third party authorization failure in PHS network. Type: Counter	Int64
disc-reason-362	Name: Remote-error-notification Description: The total number of sessions disconnected due to remote error notifications. Type: Counter	Int64
disc-reason-363	Name: No-response Description: The total number of sessions disconnected due to no response from any of the network entity. Type: Counter	Int64
disc-reason-364	Name: PDG-Auth-failed Description: The total number of sessions disconnected due re-authorization failure at any stage. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-365	Name: mme-s1AP-send-failed Description: The total number of sessions disconnected because of a MME and s1AP send failure. Type: Counter	Int64
disc-reason-366	Name: mme-egtpc-connection-failed Description: The total number of sessions disconnected because of a MME-eGTPC connection failure. Type: Counter	Int64
disc-reason-367	Name: mme-egtpc-create-session-failed Description: The total number of sessions disconnected because of the MME-eGTPC create session failed. Type: Counter	Int64
disc-reason-368	Name: mme-authentication-failure Description: The total number of sessions disconnected because of a MME authentication failure. Type: Counter	Int64
disc-reason-369	Name: mme-ue-detach Description: The total number of sessions disconnected because of MME and UE detach. Type: Counter	Int64
disc-reason-370	Name: mme-mme-detach Description: The total number of sessions disconnected because of MME to MME detach. Type: Counter	Int64
disc-reason-371	Name: mme-hss-detach Description: The total number of sessions disconnected because of a MME HSS detach. Type: Counter	Int64
disc-reason-372	Name: mme-pgw-detach Description: The total number of sessions disconnected because of a MME and P-GW detach. Type: Counter	Int64
disc-reason-373	Name: mme-sub-validation-failure Description: The total number of sessions disconnected because of a MME sub validation failure. Type: Counter	Int64
disc-reason-374	Name: mme-hss-connection-failure Description: The total number of sessions disconnected because of a MME HSS connection failure. Type: Counter	Int64
disc-reason-375	Name: mme-hss-user-unknown Description: The total number of sessions disconnected because the MME HSS user is unknown. Type: Counter	Int64
disc-reason-376	Name: dhcp-lease-mismatch-detected Description: The total number of sessions disconnected due to mismatch in DHCP lease time mismatch. Type: Counter	Int64
disc-reason-377	Name: nemo-link-layer-down Description: The total number of disconnected sessions due to the NEMO (Network Mobility) link layer being down. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-378	Name: eapol-max-retry-reached Description: The total number of sessions disconnected because of eapol-max-retry-reached. Type: Counter	Int64
disc-reason-379	Name: sgsn-offload-phase3 Description: With Iu/Gb flex enabled, this is the total number of SGSN sessions disconnected when the subscriber has been forcefully cleared via phase3 offloading from one SGSN to another SGSN within the SGSN pool. Type: Counter	Int64
disc-reason-380	Name: mbms-bearer-service-disconnect Description: The total number of sessions disconnected due to disconnect in MBMS bearer service. Type: Counter	Int64
disc-reason-381	Name: disconnect-on-violation-odb Description: The total number of sessions disconnected due to violation on Operator Determined Barring (ODB) of services. Type: Counter	Int64
disc-reason-382	Name: disconn-on-violation-focs-odb Description: The total number of sessions disconnected due to violation on Operator Determined Barring (ODB) of Free-of-Charge service (FOCS). Type: Counter	Int64
disc-reason-383	Name: CSCF-REG-Admin-disconnect Description: The total number of CSCF sessions disconnected through CLI registration clearing by administrator. Type: Counter	Int64
disc-reason-384	Name: CSCF-REG-User-disconnect Description: The total number of CSCF sessions disconnected by UE with an explicit deregister message. Type: Counter	Int64
disc-reason-385	Name: CSCF-REG-Lifetime-Expiry Supported in releases prior to 14.0. Description: The total number of CSCF sessions disconnected due to registration expiry. Type: Counter	Int64
disc-reason-386	Name: CSCF-REG-Network-disconnect Description: The total number of CSCF sessions disconnected due to network-initiated deregistration. Type: Counter	Int64
disc-reason-387	Name: CSCF-Call-Admin-disconnect Description: The total number of CSCF sessions disconnected through CLI call clearing by administrator. Type: Counter	Int64
disc-reason-388	Name: CSCF-Call-User-disconnect Description: The total number of CSCF sessions disconnected by UE using BYE message. Type: Counter	Int64
disc-reason-389	Name: CSCF-CALL-Local-disconnect Description: The total number of CSCF sessions disconnected locally due to some processing failure, task death, recovery failure, etc. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-390	Name: CSCF-CALL-No-Resource Description: The total number of CSCF sessions disconnected because locally due to congestion caused by max calline/flow usage from high cpu/memory utilization in sessmgr. Type: Counter	Int64
disc-reason-391	Name: CSCF-CALL-No-Response Description: The total number of CSCF sessions disconnected due to response timeout (SIP response code 408). Type: Counter	Int64
disc-reason-392	Name: CSCF-CALL-Inactivity-timeout Description: The total number of CSCF sessions disconnected due to session timer timeout. Type: Counter	Int64
disc-reason-393	Name: CSCF-CALL-Media-Auth-Failure Description: The total number of CSCF sessions disconnected due to media authorization failure. Type: Counter	Int64
disc-reason-394	Name: CSCF-REG-No-Resource Description: The total number of CSCF sessions disconnected because register message is rejected due to congestion caused by max calline/flow usage from high cpu/memory utilization in sessmgr. Type: Counter	Int64
disc-reason-395	Name: ms-unexpected-idle-mode-entry Description: The total number of disconnects due to ms-unexpected-idle-mode-entry. Type: Counter	Int64
disc-reason-396	Name: Re-Auth-failed Description: The total number of disconnects due to Re-Auth-failed. Type: Counter	Int64
disc-reason-397	Name: sgsn-pdp-nse-cleanup Description: The total number of SGSN sessions disconnected because the NSE configured in the GPRS service is removed and there are PDP contexts associated with the subscribers attached in this NSE. Type: Counter	Int64
disc-reason-398	Name: sgsn-mm-ctxt-gtp-no-resource Description: The total number of SGSN sessions disconnected because an SGTP service could not be assigned to an MM context. The field indicator number will vary depending upon the build of the software Type: Counter	Int64
disc-reason-399	Name: unknown-apn Description: The total number of disconnects due to an unknown Access Point Name (APN). Type: Counter	Int64
disc-reason-400	Name: gtpc-path-failure Description: The total number of disconnects due to a GTPC path failure. Type: Counter	Int64
disc-reason-401	Name: gtpu-path-failure Description: The total number of disconnects due to a GTPU path failure. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-402	Name: actv-rejected-by-ggsn Description: The total number of disconnects due to activation being rejected by GGSN. Type: Counter	Int64
disc-reason-403	Name: sgsn-pdp-gprs-camel-release Description: The total number of PDP activation failures due to release from CAMEL. Type: Counter	Int64
disc-reason-404	Name: sgsn-check-imei-failure Description: The total number of Attaches/RAUs rejected due to failure in the IMEI checking (due either to black listing or to grey listing and an SGSN operator policy is configured with deny-grey-list). Type: Counter This counter is available in releases 9.0 and higher.	Int64
disc-reason-405	Name: sgsn-sndcp-init-deact Description: The total number of PDP contexts deactivated upon receiving a cleanup indication from the SNDCP (Sub Network Dependent Convergence Protocol) layer. Type: Counter	Int64
disc-reason-406	Name: sgsn-pdp-inactivity-timeout Description: The total number of subscribers detached or PDP context(s) deactivated due to subscriber inactivity during a configured (in the SGSN operator policy) time. Type: Counter	Int64
disc-reason-407	Name: fw-and-nat-policy-removed Description: The total number of NAT-enabled sessions dropped due to Firewall-and-NAT policy updates in mid session. Type: Counter	Int64
disc-reason-408	Name: FNG-Auth-failed Description: The total number of FNG sessions disconnected due to authorization failures based on mismatched Femtocell Access Point (FAP) credentials. Type: Counter	Int64
disc-reason-409	Name: ha-stale-key-disconnect Description: The total number of disconnects due to an ha-stale-key. Type: Counter	Int64
disc-reason-410	Name: No-IPV6-address-for-subscriber Description: The total number of disconnects because there was no IPV6 address for the subscriber. Type: Counter	Int64
disc-reason-411	Name: prefix-registration-failure Description: The total number of disconnects due to a prefix registration failure. Type: Counter	Int64
disc-reason-412	Name: disconnect-from-policy-server Description: the total number of disconnects initiated from a policy server. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-413	Name: s6b-auth-failed Description: The total number of subscriber sessions disconnected due to failure of authentication over S6b interface with HSS. This support is added for interoperability of GGSN with P-GW and HA. Type: Counter	Int64
disc-reason-414	Name: gtpc-err-ind Description: The total number of sessions disconnected due to a GTP control plane error indication message. Type: Counter	Int64
disc-reason-415	Name: gtpu-err-ind Description: The total number of sessions disconnected due to a GTP user plane error indication message. Type: Counter	Int64
disc-reason-416	Name: invalid-pdn-type Description: The total number of sessions disconnected due to an invalid PDN-type error. Type: Counter	Int64
disc-reason-417	Name: aaa-auth-req-failed Description: The total number of subscriber sessions disconnected due to a AAA authentication request failure. Type: Counter	Int64
disc-reason-418	Name: apn-denied-no-subscription Description: The total number of subscriber sessions disconnected due to denial of APN as requested APN was not subscribed to subscriber. Type: Counter	Int64
disc-reason-419	Name: Sgw-context-replacement Description: The total number of sessions disconnected due to an S-GW context replacement. Type: Counter	Int64
disc-reason-420	Name: dup-static-ip-addr-req Description: The total number of subscriber sessions disconnected due to new session request received with duplicate IP address at GGSN. This support is added for interoperability of GGSN with P-GW and HA. Type: Counter	Int64
disc-reason-421	Name: apn-restrict-violation Description: The total number of subscriber sessions disconnected due to violation of level of restriction to ensure controlled co-existence of the Primary PDP Contexts in APN. Type: Counter	Int64
disc-reason-422	Name: invalid-wapn Description: The total number of sessions disconnected due to invalid or no W-APN details received from the UE. Type: Counter	Int64
disc-reason-423	Name: ttg-nsapi-allocation-failed Description: The total number of TTG sessions disconnected due to an NSAPI (Network Service Access Point Identifier) allocation failure. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-424	Name: mandatory-gtp-ie-missing Description: The total number of sessions disconnected due to the unavailability of a mandatory GTP Information-Element during PDP context creation. Type: Counter	Int64
disc-reason-425	Name: aaa-unreachable Description: The total number of disconnected sessions due to RADIUS server not being reachable. For mobile-IP calls, aaa-unreachable cause code is set when re-authentication failure happens. RADIUS generates this only for a mobile IP call and RADIUS server is down during authentication. Type: Counter	Int64
disc-reason-426	Name: asngw-service-flow-deletion Description: The total number of disconnects resulting from flow deletion by ANS-GW. Type: Counter	Int64
disc-reason-427	Name: CT-PMIP-RRQ-NVSE-Value-Change Description: The total number of disconnects resulting from a PMIP (Proxy-MIP) registration request (RRQ) returning an NVSE (Normal/Vendor organization Special Extension) value change [WiMAX]. Type: Counter	Int64
disc-reason-428	Name: tcp-read-failed Description: The total number of disconnected sessions due to a TCP read failure. Type: Counter	Int64
disc-reason-429	Name: tcp-write-failed Description: The total number of disconnected sessions due to a TCP write failure. Type: Counter	Int64
disc-reason-430	Name: ssl-handshake-failed Description: The total number of disconnected Secure Sockets Layer (SSL) sessions due to a handshake failure. Type: Counter	Int64
disc-reason-431	Name: ssl-renegotiate-failed Description: The total number of disconnected SSL sessions due to a renegotiation failure. Type: Counter	Int64
disc-reason-432	Name: ssl-bad-message Description: The total number of disconnected SSL sessions due to corrupted messages. Type: Counter	Int64
disc-reason-433	Name: ssl-alert-received Description: The total number of disconnected SSL sessions due to an alert. Type: Counter	Int64
disc-reason-434	Name: ssl-disconnect Description: The total number of SSL disconnections. Type: Counter	Int64
disc-reason-435	Name: ssl-migration Description: The total number of SSL migrations. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-436	Name: sgsn-ard-failure Description: The total number of session disconnects due to ARD (access restriction data) subscription restriction received from the HLR. Type: Counter	Int64
disc-reason-437	Name: sgsn-camel-release Description: The total number of session disconnects experienced by the SGSN due to Detach/Attach Rejects due to explicit “Release GPRS” received from CAMEL component GSM-SCF or due to failures during CAMEL handling. Type: Counter	Int64
disc-reason-438	Name: sgsn-egtpc-connection-failed Replaced by disc-reason-439 in Release 14.0.	Int64
disc-reason-439	Name: sgsn-egtpc-create-session-failed Supported in Release 14. Type: Counter	Int64
disc-reason-440	Name: sgsn-hss-detach Replaced by disc-reason-230 in Release 14.0	Int64
disc-reason-441	Name: sgsn-hss-connection-failure Replaced by disc-reason-236 in Release 14.0.	Int64
disc-reason-442	Name: sgsn-pgw-detach Not yet supported.	Int64
disc-reason-443	Name: sgsn-s5-no-support-for-apn Supported in Release 14. Type: Counter	Int64
disc-reason-444	Name: sgsn-no-rab-for-gbr-bearer Not yet supported - in development for future use. Type: Counter	Int64
disc-reason-445	Name: sgsn-sgw-selection-failure Supported in Release 14.0. Description: The total number of session disconnects resulting from the S4-SGSN’s inability to establish a PDP context in the following scenario: <ol style="list-style-type: none"> 1 . Either EPS or GPRS subscription is used. 2 . S4-SGSN chooses S4 interface for PDP activation because <ul style="list-style-type: none"> • The UE is EPC-capable. • EGTP service is configured. • Operator Policy does not override the core-nw-interface to Gn. 3 . The SGSN successfully resolves P-GW address (S5/S8 address) for the APN requested. 4 . The SGSN tries S-GW resolution. If the DNS response fails and no local S-GW is configured for the RAI, then the PDP activation is rejected with this disconnect reason. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-446	Name: sgsn-pgw-selection-failure Supported in Release 14.0. Description: The total number of disconnects by the S4-enabled SGSN due to P-GW DNS failure for any cause other than the DNS response does not contain an S5/S8 address. Type: Counter	Int64
disc-reason-447	Name: wimax-hotlining-status-change Description: The total number of disconnects resulting from a status change in the Hotlining-Capabilities sub-attribute in the WiMAX-Capabilities attribute. Type: Counter	Int64
disc-reason-448	Name: ggsn-no-rsp-from-sgsn Description: The total number of sessions disconnected on GGSN node due to no response received from SGSN for a request. Type: Counter	Int64
disc-reason-453	Name: mipha-dup-wimax-session Description: The total number of WiMAX session disconnects resulting from duplicate Mobile IP Home Agent (MIPHA) logins. Type: Counter	Int64
disc-reason-454	Name: invalid-version-attr Description: This disconnect reason is set, if there is mismatch of WiMAX-Release version supported by ASNGW and that supported by AAA. Triggers: Mismatch of WiMAX-Release version supported by ASNGW and that supported by AAA. AAA sends WiMAX release in Radius packet. Availability: This total is cumulative for all ASNGW services configured on the system. Type: Counter	Int64
disc-reason-455	Name: sgsn-zone-code-failure Description: The total number of session disconnects experienced by the SGSN due to verification failure during the zone-code checking procedure. Type: Counter	Int64
disc-reason-456	Name: invalid-qci Description: The total number of session disconnects resulting from the receipt of invalid QoS class identifiers (QCIs). This error is returned if an invalid QCI is used in certain operations such as create bearer, which expects a QCI. A QCI is deemed invalid if it is not a standard QCI (1-9) or the QCI is not defined in the QCI table associated with the service. Type: Counter	Int64
disc-reason-458	Name: sgsn-rnc-no-dual-pdp-init-pdp-deact Type: Counter	Int64
disc-reason-459	Name: mme-init-ctxt-setup-failure Description: The total number of session disconnects resulting from context setup failures in the ENodeB during EMM/ECM procedures. Type: Counter	Int64
disc-reason-460	Name: mme-driver-initiated Description: The total number of session disconnects resulting from the default value for mme-sessions. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-461	Name: mme-s1ap-connection-down Description: The total number of session disconnects resulting from S1AP connection failures. Type: Counter	Int64
disc-reason-462	Name: mme-s1ap-reset-recd Description: The total number of session disconnects resulting from partial or full resets received for the S1 connection. Type: Counter	Int64
disc-reason-463	Name: mme-s6a-response-timeout Description: The total number of session disconnects resulting from requests to the HSS that timed out (AIR or ULR). Type: Counter	Int64
disc-reason-464	Name: mme-s13-response-timeout Description: The total number of session disconnects resulting from EIR query time outs. Type: Counter	Int64
disc-reason-465	Name: mme-Illegal-equipment Description: The total number of session disconnects resulting from EIR query failures. Type: Counter	Int64
disc-reason-466	Name: mme-unexpected-attach Description: The total number of session disconnects resulting from older sessions getting disconnected due to the UE executing an ATTACH procedure. Type: Counter	Int64
disc-reason-467	Name: mme-sgw-selection-failure Description: The total number of session disconnects resulting from failed selections of S-GWs for the UE's current location. Type: Counter	Int64
disc-reason-468	Name: mme-pgw-selection-failure Description: The total number of session disconnects resulting from failed selections of P-GWs for default APNs. Type: Counter	Int64
disc-reason-469	Name: mme-reselection-to-sgsn Description: The total number of session disconnects resulting from a context request from an SGSN relocated call to 3G. Type: Counter	Int64
disc-reason-470	Name: mme-relocation-to-sgsn Description: The total number of session disconnects resulting from calls transitioned to an SGSN using handover signaling. Type: Counter	Int64
disc-reason-471	Name: mme-reselection-to-mme Description: The total number of session disconnects resulting from a context request from an MME relocated call to a different MME. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-472	Name: mme-relocation-to-mme Description: The total number of session disconnects resulting from calls transitioned to an MME using handover signaling. Type: Counter	Int64
disc-reason-473	Name: mme-tau-attach-collision Description: The total number of session disconnects resulting from processing a TAU request with a foreign GUTI that cleared an existing session on the MME. Type: Counter	Int64
disc-reason-474	Name: mme-old-sgsn-resolution-failure Description: The total number of session disconnects resulting from calls setup using a PTMSI that failed due to failure in resolution of the old SGSN context. Type: Counter	Int64
disc-reason-475	Name: mme-old-mme-resolution-failure Description: The total number of session disconnects resulting from calls setup using a foreign GUTI that failed due to a failure in resolution of the old MME context. Type: Counter	Int64
disc-reason-476	Name: mme-reloc-ho-notify-timeout Description: The total number of session disconnects resulting from a handover based session origination failure due to an ho-notify timeout. Type: Counter	Int64
disc-reason-477	Name: mme-reloc-ho-req-ack-timeout Description: The total number of session disconnects resulting from a handover based session origination failure due to an ho-request-ack timeout. Type: Counter	Int64
disc-reason-478	Name: mme-create-session-timeout Description: The total number of session disconnects resulting from a create session request to the S-GW that timed out. Type: Counter	Int64
disc-reason-479	Name: mme-create-session-failure Description: The total number of session disconnects resulting from a create session request to the S-GW that returned a failure response. Type: Counter	Int64
disc-reason-480	Name: mme-s11-path-failure Description: The total number of session disconnects resulting from a call cleared due to an S11 path failure. Type: Counter	Int64
disc-reason-481	Name: mme-policy-no-ue-irat Description: The total number of session disconnects resulting from a call cleared due to policy restrictions on inter-RAT handovers. Type: Counter	Int64
disc-reason-482	Name: mme-x2-handover-failed Description: The total number of session disconnects resulting from a call cleared due to failures in x2 handovers. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-483	Name: mme-attach-restrict Description: The total number of session disconnects resulting from an operator policy based attach restriction. Type: Counter	Int64
disc-reason-484	Name: mme-regional-zone-code Description: The total number of session disconnects resulting from the UE being in a zone code where the UE is not allowed to roam. Type: Counter	Int64
disc-reason-485	Name: mme-no-response-from-ue Description: The total number of session disconnects resulting from the maximum retransmission of a NAS message during session setup. Type: Counter	Int64
disc-reason-486	Name: mme-sgw-relocation-failed Description: The total number of session disconnects resulting from an S-GW relocation procedure failing. Type: Counter	Int64
disc-reason-487	Name: mme-implicit-detach Description: The total number of session disconnects resulting from the UE being implicitly detached due to inactivity. Type: Counter	Int64
disc-reason-488	Name: sgsn-detach-notify Replaced by disc-reason-505 in Release 14.0.	Int64
disc-reason-489	In StarOS 12.1 and earlier releases. Name: policy-initiated-release Description: The total number of times that a call disconnect occurs due to a Gx-initiated bearer release. For example, this disconnect reason may be used if there are any errors in the manner of the policy or rule configurations. Type: Counter	Int64
disc-reason-490	In StarOS 12.1 and earlier releases. Name: gy-result-code-system-failure Description: The total number of sessions disconnected due to failure result codes received from the Online Charging Server that resulted in system failure on the GTP side. Type: Counter	Int64
disc-reason-491	In StarOS 12.1 and earlier releases. Name: emergency-inactivity-timeout Description: The total number of sessions disconnected due to emergency inactivity timeout. The emergency session inactivity timeout is set on an APN configured as an emergency APN for VoLTE-based E911 support. Type: Counter	Int64
disc-reason-492	Name: mme-zone-code-validation-failed Description: The total number of session disconnects resulting from the UE being in a zone code where the UE is not allowed to roam. Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-493	Name: sgsn-pgw-init-deact Supported in Release 14.0. Type: Counter	Int64
disc-reason-494	Name: s6b-ip-validation-failed Not supported in releases 12.0 or 12.2 - in development for future release. Type: Counter	Int64
disc-reason-495	Name: sgsn-failure-rsp-from-sgw Supported in Release 14.0. Type: Counter	Int64
disc-reason-496	Name: tcp-remote-close Description: The total number of sessions disconnected due to a TCP FIN (finished sending) message received from the UE. Type: Counter	Int64
disc-reason-497	Name: tcp-reset-received Description: The total number of sessions disconnected due to a TCP RST (reset) message received from the UE. Type: Counter	Int64
disc-reason-498	Name: tcp-socket-error Description: The total number of sessions disconnected due to a socket error received from the trek stack at the access-side TCP socket connection between the UE and the TTG. Type: Counter	Int64
disc-reason-500	Name: camel-invalid-configuration Supported in Release 14.0. Type: Counter	Int64
disc-reason-501	Name: 4Gto3G-context-replacement Type: Counter	Int64
disc-reason-502	Name: mme-isr-sgsn-init-detach Description: The total number of times an MME, with IRS enabled, deletes a subscriber to detach the UE after receiving an S3 Detach Notification from the SGSN with cause code "complete detach". Type: Counter	Int64
disc-reason-503	Name: sgsn-isr-addl-ptmsi-rai Supported in Release 14.0. Type: Counter	Int64
disc-reason-504	Name: sgsn-sgw-dbr-cause-isr-deact Supported in Release 14.0. Type: Counter	Int64
disc-reason-505	Name: sgsn-isr-mme-init-detach Supported in Release 14.0. Type: Counter	Int64
disc-reason-506	Name: mme-sgw-dbr-cause-isr-deact Type: Counter	Int64

Reason No.	Description	Data Type
disc-reason-507	Name: sgsn-ptmsi-crunch Supported in Release 14.0. Type: Counter	Int64
disc-reason-508	Name: 3Gto4G-context-replacement Supported in Release 14.0 Type: Counter	Int64
disc-reason-509	Name: sgsn-actv-reject-on-dns-failure Never used. Removed in Release 14.0.	Int64
disc-reason-509	Name: mme-no-eps-bearers-activated Type: Counter	Int64
disc-reason-summary	Description: Contains all of the disconnect reason counters at once in following format: <i>code = count; code = count; ;code = count</i> all non-zero disconnect counters will be exported in a semi-colon separated format. If no disconnect statistics are available, the value of This statistic will be a zero-length string. Type: Information	String

IMPORTANT: For information on statistics that are common to all schema see the *Statistics and Counters Overview* chapter.

Chapter 67

show aaa group name

Table 68. show aaa group name Command Output Descriptions

Field	Description
Group name	The AAA server group name.
Context	The context name.
Diameter config:	
Authentication:	
Dictionary	The Diameter dictionary used for authentication.
Endpoint name	The Diameter endpoint used for authentication.
Max-transmissions	The maximum number of transmission attempts for Diameter authentication.
Max-retries	The number of retry attempts for Diameter authentication requests.
Request-timeout	The Diameter authentication request timeout period.
Redirect-host-avp	Indicates whether to use just one returned AVP, or use the first returned AVP as selecting the primary host and the second returned AVP as selecting the secondary host.
Accounting:	
Dictionary	The Diameter dictionary used for accounting.
Endpoint name	The Diameter endpoint used for accounting.
Max-transmissions	The maximum number of transmission attempts for Diameter accounting.
Max-retries	The number of retry attempts for Diameter accounting requests.
Request-timeout	The Diameter accounting request timeout period.
Radius Config:	
Dictionary	The RADIUS dictionary.
Strip-domain	Indicates whether the domain is stripped from the user name prior to authentication or accounting.
Authenticator-validation	Indicates whether the MD5 authentication of RADIUS user is enabled.
Allow authentication-down	Indicates whether the system allows subscriber sessions when RADIUS authentication is unavailable.

Field	Description
Allow accounting-down	Indicates whether the system allows subscriber sessions when RADIUS accounting is unavailable.
Attributes:	
Nas-identifier	The attribute name by which the system is identified in Access-Request messages.
Nas-ip	The AAA interface IP address(es) used to identify the system.
Nas-ip backup	The IP address of the secondary interface to use in the current context.
Nextthop	The next hop IP address for this NAS IP address.
MPLS-label	Indicates the MPLS label used for traffic from the specified RADIUS client NAS IP address.
VRF	The Virtual Routing and Forwarding (VRF) Context instance associated with this AAA group.
Authentication	
called-station-id	Indicates whether RADIUS authentication attribute for called station id is enabled. The attribute must also be supported in the configured RADIUS dictionary.
calling-station-id	Indicates whether RADIUS authentication attribute for calling station id is enabled. The attribute must also be supported in the configured RADIUS dictionary.
imsi	Indicates whether RADIUS authentication attribute for IMSI is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-pdp-type	Indicates whether RADIUS authentication attribute for 3GPP PDP type is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-cg-address	Indicates whether RADIUS authentication attribute for 3GPP CG address is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-gprs-qos-negotiated-profile	Indicates whether RADIUS authentication attribute for 3GPP GPRS QoS negotiated profile is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-sgsn-address	Indicates whether RADIUS authentication attribute for 3GPP SGSN address is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-ggsn-address	Indicates whether RADIUS authentication attribute for 3GPP GGSN address is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-imsi-mcc-mnc	Indicates whether RADIUS authentication attribute for 3GPP IMSI MCC MNC is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-ggsn-mcc-mnc	Indicates whether RADIUS authentication attribute for 3GPP GGSN MCC MNC is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-nsapi	Indicates whether RADIUS authentication attribute for 3GPP NSAPI is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-select-mode	Indicates whether RADIUS authentication attribute for 3GPP select mode is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-charging-characteristics	Indicates whether RADIUS authentication attribute for 3GPP charging characteristics is enabled. The attribute must also be supported in the configured RADIUS dictionary.

Field	Description
3gpp-sgsn-mcc-mnc	Indicates whether RADIUS authentication attribute for 3GPP SGSN MCC MNC is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-imeisv	Indicates whether RADIUS authentication attribute for 3GPP imeisv is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-rat-type	Indicates whether RADIUS authentication attribute for 3GPP RAT type is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-user-location-info	Indicates whether RADIUS authentication attribute for 3GPP user location information is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-ms-timezone	Indicates whether RADIUS authentication attribute for 3GPP ms timezone is enabled. The attribute must also be supported in the configured RADIUS dictionary.
Accounting	
called-station-id	Indicates whether RADIUS accounting attribute for called station id is enabled. The attribute must also be supported in the configured RADIUS dictionary.
calling-station-id	Indicates whether RADIUS accounting attribute for calling station id is enabled. The attribute must also be supported in the configured RADIUS dictionary.
acct-input-octets	Indicates whether RADIUS accounting attribute for accounting input octets is enabled. The attribute must also be supported in the configured RADIUS dictionary.
acct-input-packets	Indicates whether RADIUS accounting attribute for accounting input packets is enabled. The attribute must also be supported in the configured RADIUS dictionary.
acct-session-time	Indicates whether RADIUS accounting attribute for accounting session time is enabled. The attribute must also be supported in the configured RADIUS dictionary.
acct-output-octets	Indicates whether RADIUS accounting attribute for accounting output octets is enabled. The attribute must also be supported in the configured RADIUS dictionary.
acct-output-packets	Indicates whether RADIUS accounting attribute for accounting output packets is enabled. The attribute must also be supported in the configured RADIUS dictionary.
event-timestamp	Indicates whether RADIUS accounting attribute for event timestamp is enabled. The attribute must also be supported in the configured RADIUS dictionary.
imsi	Indicates whether RADIUS accounting attribute for IMSI is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-charging-id	Indicates whether RADIUS accounting attribute for 3GPP charging ID is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-pdp-type	Indicates whether RADIUS accounting attribute for 3GPP PDP type is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-cg-address	Indicates whether RADIUS accounting attribute for 3GPP CG address is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-gprs-qos-negotiated-profile	Indicates whether RADIUS accounting attribute for 3GPP GPRS QoS negotiated profile is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-sgsn-address	Indicates whether RADIUS accounting attribute for 3GPP SGSN address is enabled. The attribute must also be supported in the configured RADIUS dictionary.

■ Common Syntax Options

Field	Description
3gpp-ggsn-address	Indicates whether RADIUS accounting attribute for 3GPP GGSN address is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-imsi-mcc-mnc	Indicates whether RADIUS accounting attribute for 3GPP IMSI MCC MNC is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-ggsn-mcc-mnc	Indicates whether RADIUS accounting attribute for 3GPP GGSN MCC MNC is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-nsapi	Indicates whether RADIUS accounting attribute for 3GPP NSAPI is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-select-mode	Indicates whether RADIUS accounting attribute for 3GPP select mode is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-charging-characteristics	Indicates whether RADIUS accounting attribute for 3GPP charging characteristics is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-sgsn-mcc-mnc	Indicates whether RADIUS accounting attribute for 3GPP SGSN MCC MNC is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-imeisv	Indicates whether RADIUS accounting attribute for 3GPP imeisv is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-rat-type	Indicates whether RADIUS accounting attribute for 3GPP RAT type is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-user-location-info	Indicates whether RADIUS accounting attribute for 3GPP user location information is enabled. The attribute must also be supported in the configured RADIUS dictionary.
3gpp-ms-timezone	Indicates whether RADIUS accounting attribute for 3GPP ms timezone is enabled. The attribute must also be supported in the configured RADIUS dictionary.
Authentication:	
Algorithm	The RADIUS authentication server selection algorithm for the current context.
Deadtime	The time period to wait before changing the state of a RADIUS server from “Down” to “Active”, in minutes.
Max-outstanding	The maximum number of messages a AAA manager will queue.
Max-retries	The maximum number of times communication with a AAA server is attempted before it is marked as “Not Responding” and the detect dead server’s consecutive failures count is incremented.
Max-transmissions	The maximum number of re-transmissions for RADIUS authentication requests.
Timeout	The time period to wait for a response from the RADIUS server before re-sending the messages, in seconds.
Apn-to-be-included	The APN name included for RADIUS authentication.
Authenticate null-username	Indicates whether authentication of user names that are blank or empty is enabled.
Probe:	
Interval	The time period between two RADIUS authentication probes.

Field	Description
Timeout	The timeout period for HAGR to wait for a response for RADIUS authentication probes.
Max-retries	The maximum number of retries for RADIUS authentication probe response.
Keepalive:	
Interval	The time period between two keepalive access requests.
Timeout	The time period between two keepalive access request retries.
Retries	The number of times the keepalive access request is sent before marking the server as unreachable.
consecutive-response	The number of consecutive authentication responses after which the server is marked as reachable.
Username	The user name used for authentication.
Calling-station-id	The calling station ID used for keepalive authentication.
Password	The password used for authentication.
Allow access-reject	Indicates whether both access-accept and access-reject are considered as success for the keepalive authentication request.
Detect-dead-server:	
Consecutive-failures	The number of consecutive failures, for any AAA manager, before a server's state is changed from "Active" to "Down".
Response-timeout	The time period for any AAA manager to wait for a response to any message before a server's state is changed from "Active" to "Down", in seconds.
Keepalive	Indicates whether the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers is enabled.
Accounting:	
Algorithm	The RADIUS accounting server selection algorithm for the current context.
Deadtime	The time period to wait before changing the state of a RADIUS server from "Down" to "Active", in minutes.
Fire-And-Forget	Displays whether or not the Fire-and-Forget feature is enabled in the AAA Group configuration.
Max-outstanding	The maximum number of messages a AAA manager will queue.
Max-retries	The maximum number of times communication with a AAA server will be attempted before it is marked as "Not Responding" and the detect dead server's consecutive failures count is incremented.
Max-transmissions	The maximum number of re-transmissions for RADIUS accounting requests.
Max-pdu-size	The maximum sized packet data unit which can be accepted/generated, in bytes.
Interim-timeout	The timeout period for sending accounting INTERIM-UPDATE records, in seconds.
Interim-downlink-volume	The downlink volume limit that triggers RADIUS interim accounting, in bytes.
Interim-uplink-volume	The uplink volume limit that triggers RADIUS interim accounting, in bytes.
Interim-total-volume	The total volume limit for RADIUS interim accounting, in bytes.

■ Common Syntax Options

Field	Description
Timeout	The time period to wait for a response from a RADIUS server before retransmitting a request.
Remote-address	Indicates whether remote IP address lists are configured, and collection of accounting data for the addresses in those lists on a per-subscriber basis is enabled.
Archive	Indicates whether archiving of RADIUS Accounting messages in the system after the accounting message has exhausted retries to all available RADIUS Accounting servers is enabled.
Apn-to-be-included	The APN name included for RADIUS accounting.
R-P originated:	
Trigger active-start	Indicates whether when an Active-Start is received from the PCF and there has been a parameter change, an R-P event occurs.
Trigger active-handoff	Indicates whether when an Active PCF-to-PFC Handoff occurs, a single or two R-P events will occur (one for the Connection Setup, and the second for the Active-Start).
Trigger active-stop	Indicates whether when an Active-Stop is received from the PCF, an R-P event occurs.
Trigger policy	the overall accounting policy for R-P sessions.
Trigger stop-start	Indicates whether a stop/start RADIUS accounting pair is sent to the RADIUS server when an applicable R-P event occurs.
Handoff policy	The overall accounting policy for R-P sessions.
TOD	The time of day a RADIUS event is generated for accounting.
GTP originated:	
Trigger policy	The RADIUS accounting policy for GTP.
MIP HA:	
Policy	The RADIUS accounting policy for Mobile IP HA calls.
Keepalive:	
Interval	The time period between the two keepalive access requests.
Timeout	The time period between each keepalive access request retries.
Retries	The number of times the keepalive access request is sent before marking the server as unreachable.
consecutive-response	The number of consecutive authentication response after which the server is marked as reachable.
Username	The user name used for authentication.
Calling-station-id	The calling station ID used for keepalive authentication.
Framed-ip-address	The framed-ip-address used for keepalive accounting.
Detect-dead-server:	
Consecutive-failures	The number of consecutive failures, for any AAA manager, before a server's state is changed from "Active" to "Down".
Response-timeout	The time period for any AAA manager to wait for a response to any message before a server's state is changed from "Active" to "Down", in seconds.

Field	Description
Keepalive	Indicates whether the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers is enabled.
Charging:	
Auth-algorithm	The RADIUS authentication algorithm.
Acct-algorithm	The RADIUS accounting algorithm.
Deadtime	The time period to wait before changing the state of a RADIUS server from “Down” to “Active”, in minutes.
Max-outstanding	The maximum number of messages a AAA manager will queue.
Max-retries	The maximum number of times communication with a AAA server will be attempted before it is marked as “Not Responding” and the detect dead server’s consecutive failures count is incremented.
Max-transmissions	The maximum number of re-transmissions for RADIUS requests.
Timeout	The time period to wait for a response from a RADIUS server before retransmitting a request.
Detect-dead-server:	
Consecutive-failures	The number of consecutive failures, for any AAA manager, before a server’s state is changed from “Active” to “Down”.
Response-timeout	The time period for any AAA manager to wait for a response to any message before a server’s state is changed from “Active” to “Down”, in seconds.

Chapter 68

show active-charging

This chapter includes the `show active-charging` command output tables.

show active-charging analyzer statistics name dns

Table 69. show active-charging analyzer statistics name dns Command Output Descriptions

Field	Description
ACS DNS Session Stats:	
Total Uplink Bytes	The total number of DNS bytes detected in uplink direction.
Total Downlink Bytes	The total number of DNS bytes detected in downlink direction.
Total Uplink Pkts	The total number of DNS packets detected in uplink direction.
Total Downlink Pkts	The total number of DNS packets detected in downlink direction.
Unknown OPCODE	The total number of DNS packets with an unknown operational code.
Invalid Pkts	The total number of invalid DNS packets detected.
DNS Over TCP:	
Uplink Bytes	The total number of DNS uplink bytes that were detected over TCP.
Downlink Bytes	The total number of DNS downlink bytes that were detected over TCP.
Uplink Pkts	The total number of DNS uplink packets that were detected over TCP.
Downlink Pkts	The total number of DNS downlink packets that were detected over TCP.
Request:	
A Query Type	The total number of DNS requests received for A query types.
CNAME Query Type	The total number of DNS requests received for CNAME query types.
NS Query Type	The total number of DNS requests received for NS query types.
PTR Query Type	The total number of DNS requests received for PTR query types.
SRV Query Type	The total number of DNS requests received for SRV query types.
Unknown Query Type	The total number of DNS requests received for unknown query types.
AAAA Query Type	The total number of DNS requests received for AAAA query types.
Response:	
A Query Type	The total number of DNS responses received for A query types.
CNAME Query Type	The total number of DNS responses received for CNAME query types.
NS Query Type	The total number of DNS responses received for NS query types.
PTR Query Type	The total number of DNS responses received for PTR query types.
SRV Query Type	The total number of DNS responses received for SRV query types.

Field	Description
Unknown Query Type	The total number of DNS responses received for unknown query types.
AAAA Query Type	The total number of DNS responses received for AAAA query types.

show active-charging analyzer statistics name h323

Table 70. show active-charging analyzer statistics name h323 Command Output Descriptions

Field	Description
H323 Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Packets	Total number of packets uplinked.
Total Downlink Packets	Total number of packets downlinked.
Total H323 calls	Total number of H323 calls.
Total RAS messages	Total number of RAS messages.
Total Q931 messages	Total number of Q931 messages.
Total H245 messages	Total number of H245 messages.

show active-charging analyzer statistics name h323 verbose

Table 71. show active-charging analyzer statistics name h323 verbose Command Output Descriptions

Field	Description
H323 Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Packets	Total number of packets uplinked.
Total Downlink Packets	Total number of packets downlinked.
Total H323 calls	Total number of H323 calls.
Total RAS messages	Total number of RAS messages.
Total Q931 messages	Total number of Q931 messages.
Total H245 messages	Total number of H245 messages.
RAS messages	
Uplink	Total number of uplink packets sent from the subscriber for RAS messages.
Downlink	Total number of downlink packets sent from the subscriber for RAS messages.
GatekeeperRequest	The message sent from the H323 endpoint to find a Gatekeeper.
GatekeeperConfirm	The message sent from the Gatekeeper to H323 endpoint which requested for service.
GatekeeperReject	The message sent from the Gatekeeper to H323 endpoint indicating that it must try a different Gatekeeper.
RegistrationRequest	The message sent from the H323 endpoint to register to a particular Gatekeeper.
RegistrationConfirm	The message sent from the Gatekeeper to H323 endpoint indicating that it has been registered.
RegistrationReject	The message sent from the Gatekeeper to H323 endpoint indicating that the registration failed.
UnregistrationRequest	The message sent from the H323 endpoint to unregister from a particular Gatekeeper.
UnregistrationConfirm	The message sent from the Gatekeeper to H323 endpoint indicating that it has been unregistered.
UnregistrationReject	The message sent from the Gatekeeper to H323 endpoint indicating that unregistration failed.
AdmissionRequest	The message sent from the H323 endpoint to a Gatekeeper before accepting or initiating a call.
AdmissionConfirm	The message sent from the Gatekeeper to H323 endpoint indicating that the call is allowed.
AdmissionReject	The message sent from the Gatekeeper to H323 endpoint indicating that the call is not allowed.
LocationRequest	The message sent to the Gatekeeper requesting the transport address of an endpoint.
LocationConfirm	The message sent from the Gatekeeper containing the transport address of an endpoint.

Field	Description
LocationReject	The message sent from the Gatekeeper indicating that the location request is rejected.
DisengageRequest	The message sent from an H323 endpoint to Gatekeeper indicating that the call is getting dropped.
DisengageConfirm	The message confirming the DisengageRequest message from the Gatekeeper.
DisengageReject	The message sent from the Gatekeeper if an endpoint is not registered.
InfoRequest	The message sent from the Gatekeeper to endpoint requesting the status information.
InfoRequestResponse	The message sent from the H323 endpoint to Gatekeeper containing the status information.
RequestInProgress	The message sent by the Gatekeeper or endpoint to indicate to RAS that it cannot respond in normal processing time.
Unclassified	The RAS message that is not classified by the H323 ALG.
Q931 messages	
Uplink	Total number of uplink packets sent from the subscriber for Q931 messages.
Downlink	Total number of downlink packets sent from the subscriber for Q931 messages.
Alerting	The message sent by the called user to indicate that alerting has been initiated.
CallProceeding	The message sent by an H323 endpoint indicating that it has initiated to set up the call.
Setup	The message sent by the calling H323 endpoint to the called H323 endpoint.
Connect	The message sent by the called H323 endpoint to the calling H323 endpoint indicating the acceptance of call.
ReleaseComplete	The message sent by the called H323 endpoint indicating the release of the call.
Facility	The message used to redirect a call or start a new H245 channel.
Progress	The message used to indicate the progress of a call.
Information	The message sent by the called H323 endpoint to provide additional information for a call.
Unclassified	The Q931 message that is not classified by the H323 ALG.
H245 messages	
Uplink	Total number of uplink packets sent from the subscriber for H245 messages.
Downlink	Total number of downlink packets sent from the subscriber for H245 messages.
OpenLogicalChannel	The message sent by an H323 endpoint to open a logical connection between two endpoints.
OpenLogicalChannelAck	The message sent by an H323 endpoint to accept the connection request in an open logical channel.
OpenLogicalChannelReject	The message sent by an H323 endpoint to reject the connection request in an open logical channel.
OpenLogicalChannelConfirm	The message sent by an H323 endpoint indicating that the reverse channel is open.
RequestChannelClose	The message sent by an H323 endpoint to close an existing logical channel between two endpoints.

Field	Description
CloseLogicalChannel	The message sent by an H323 endpoint to close an existing logical channel between two endpoints.
CloseLogicalChannelAck	The message sent by an H323 endpoint to confirm the close of a logical channel.
EndSessionCommand	The message sent by an H323 endpoint to indicate end of H245 session.
Unclassified	The H245 message that is not classified by the H323 ALG.

show active-charging analyzer statistics name icmpv6

Table 72. show active-charging analyzer statistics name icmpv6 Command Output Descriptions

Field	Description
ACS ICMPv6 Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Pkts	Total number of packets uplinked.
Total Downlink Pkts	Total number of packets downlinked.
Uplink Bytes Fragmented	Total number of uplink bytes that were fragmented.
Downlink Bytes Fragmented	Total number of downlink bytes that were fragmented.
Uplink Pkts Fragmented	Total number of uplink packets that were fragmented.
Downlink Pkts Fragmented	Total number of downlink packets that were fragmented.
Uplink Bytes Invalid	Total number of invalid uplink bytes.
Downlink Bytes Invalid	Total number of invalid downlink bytes.
Uplink Pkts Invalid	Total number of invalid uplink packets.
Downlink Pkts Invalid	Total number of invalid downlink packets.

show active-charging analyzer statistics name ip verbose

Table 73. show active-charging analyzer statistics name ip verbose Command Output Descriptions

Field	Description
ACS IP Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Pkts	Total number of packets uplinked.
Total Downlink Pkts	Total number of packets downlinked.
Uplink Bytes Fragmented	Total number of uplink bytes that were fragmented.
Downlink Bytes Fragmented	Total number of downlink bytes that were fragmented.
Uplink Pkts Fragmented	Total number of uplink packets that were fragmented.
Downlink Pkts Fragmented	Total number of downlink packets that were fragmented.
Uplink Bytes Invalid Length	Total number of uplink bytes of invalid length.
Downlink Bytes Invalid Length	Total number of downlink bytes of invalid length.
Uplink Pkts Invalid Length	Total number of uplink packets of invalid length.
Downlink Pkts Invalid Length	Total number of downlink packets of invalid length.
Uplink Bytes Invalid Length (After Reassembly)	Total number of uplink bytes of invalid length after reassembly.
Downlink Bytes Invalid Length (After Reassembly)	Total number of downlink bytes of invalid length after reassembly.
Uplink Pkts Invalid Length (After Reassembly)	Total number of uplink packets of invalid length after reassembly.
Downlink Pkts Invalid Length (After Reassembly)	Total number of downlink packets of invalid length after reassembly.
Uplink Bytes Invalid Version	Total number of uplink bytes of invalid version.
Downlink Bytes Invalid Version	Total number of downlink bytes of invalid version.
Uplink Pkts Invalid Version	Total number of uplink packets of invalid version.
Downlink Pkts Invalid Version	Total number of downlink packets of invalid version.
Uplink Bytes Invalid Checksum	Total number of bytes received in uplink direction with invalid checksum errors.
Downlink Bytes Invalid Checksum	Total number of bytes received in downlink direction with invalid checksum errors.
Uplink Pkts Invalid Checksum	Total number of packets received in uplink direction with invalid checksum errors.

```
■ show active-charging analyzer statistics name ip verbose
```

Field	Description
Downlink Pkts Invalid Checksum	Total number of packets received in downlink direction with invalid checksum errors.
Uplink Bytes IP reassembly Timeout	Total number of bytes in uplink traffic dropped due to IP reassembly timeout.
Uplink Pkts IP reassembly Timeout	Total number of packets in uplink traffic dropped due to IP reassembly timeout.
Downlink Bytes IP reassembly Timeout	Total number of bytes in downlink traffic dropped due to IP reassembly timeout.
Downlink Pkts IP reassembly Timeout	Total number of packets in downlink traffic dropped due to IP reassembly timeout.
Uplink Bytes IP reassembly Max. Fragments reached	Total number of times Max fragments was reached in uplinked bytes reassembly.
Uplink Pkts IP reassembly Max. Fragments reached	Total number of times Max fragments was reached in uplinked packets reassembly.
Downlink Bytes IP reassembly Max. Fragments reached	Total number of times Max fragments was reached in downlinked bytes reassembly.
Downlink Pkts IP reassembly Max. Fragments reached	Total number of times Max fragments was reached in downlinked packets reassembly.
Uplink Bytes received after reassembly	Total number of uplink bytes received after reassembly.
Uplink Pkts received after reassembly	Total number of uplink packets received after reassembly.
Downlink Bytes received after reassembly	Total number of downlink bytes received after reassembly.
Downlink Pkts received after reassembly	Total number of downlink packets received after reassembly.

show active-charging analyzer statistics name ipv6

Table 74. *show active-charging analyzer statistics name ipv6* Command Output Descriptions

Field	Description
ACS IPv6 Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Pkts	Total number of packets uplinked.
Total Downlink Pkts	Total number of packets downlinked.
Uplink Bytes Fragmented	Total number of uplink bytes that were fragmented.
Downlink Bytes Fragmented	Total number of downlink bytes that were fragmented.
Uplink Pkts Fragmented	Total number of uplink packets that were fragmented.
Downlink Pkts Fragmented	Total number of downlink packets that were fragmented.
Uplink Bytes Invalid	Total number of invalid uplink bytes.
Downlink Bytes Invalid	Total number of invalid downlink bytes.
Uplink Pkts Invalid	Total number of invalid uplink packets.
Downlink Pkts Invalid	Total number of invalid downlink packets.

show active-charging analyzer statistics name ipv6 verbose

Table 75. show active-charging analyzer statistics name ipv6 verbose Command Output Descriptions

Field	Description
ACS IPv6 Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Pkts	Total number of packets uplinked.
Total Downlink Pkts	Total number of packets downlinked.
Uplink Bytes Fragmented	Total number of uplink bytes that were fragmented.
Downlink Bytes Fragmented	Total number of downlink bytes that were fragmented.
Uplink Pkts Fragmented	Total number of uplink packets that were fragmented.
Downlink Pkts Fragmented	Total number of downlink packets that were fragmented.
Uplink Bytes Invalid Length	Total number of uplink bytes of invalid length.
Downlink Bytes Invalid Length	Total number of downlink bytes of invalid length.
Uplink Pkts Invalid Length	Total number of uplink packets of invalid length.
Downlink Pkts Invalid Length	Total number of downlink packets of invalid length.
Uplink Bytes Invalid Length (After Reassembly)	Total number of uplink bytes of invalid length after reassembly.
Downlink Bytes Invalid Length (After Reassembly)	Total number of downlink bytes of invalid length after reassembly.
Uplink Pkts Invalid Length (After Reassembly)	Total number of uplink packets of invalid length after reassembly.
Downlink Pkts Invalid Length (After Reassembly)	Total number of downlink packets of invalid length after reassembly.
Uplink Bytes IP reassembly Timeout	Total number of bytes in uplink traffic dropped due to IP reassembly timeout.
Uplink Pkts IP reassembly Timeout	Total number of packets in uplink traffic dropped due to IP reassembly timeout.
Downlink Bytes IP reassembly Timeout	Total number of bytes in downlink traffic dropped due to IP reassembly timeout.
Downlink Pkts IP reassembly Timeout	Total number of packets in downlink traffic dropped due to IP reassembly timeout.
Uplink Bytes IP reassembly Max. Fragments reached	Total number of times Max fragments was reached in uplinked bytes reassembly.

Field	Description
Uplink Pkts IP reassembly Max. Fragments reached	Total number of times Max fragments was reached in uplinked packets reassembly.
Downlink Bytes IP reassembly Max. Fragments reached	Total number of times Max fragments was reached in downlinked bytes reassembly.
Downlink Pkts IP reassembly Max. Fragments reached	Total number of times Max fragments was reached in downlinked packets reassembly.

show active-charging analyzer statistics name p2p verbose

Table 76. show active-charging analyzer statistics name p2p verbose Command Output Descriptions

Field	Description
Non-P2P	
Uplink Bytes:	The total number of bytes uplinked.
Downlink Bytes:	The total number of bytes downlinked.

Downlink Pkts	The total number of packets downlinked.
Itunes	
Uplink Bytes	The total number of bytes uplinked.

Field	Description
Downlink Bytes	The total number of bytes downlinked.
Uplink Pkts	The total number of packets uplinked.
Downlink Pkts	The total number of packets downlinked.
Myspace	
Uplink Bytes	The total number of bytes uplinked.
Downlink Bytes	The total number of bytes downlinked.
Uplink Pkts	The total number of packets uplinked.
Downlink Pkts	The total number of packets downlinked.
Teamviewer	
Uplink Bytes	The total number of bytes uplinked.
Downlink Bytes	The total number of bytes downlinked.
Uplink Pkts	The total number of packets uplinked.
Downlink Pkts	The total number of packets downlinked.
Twitter	
Uplink Bytes	The total number of bytes uplinked.
Downlink Bytes	The total number of bytes downlinked.
Uplink Pkts	The total number of packets uplinked.
Downlink Pkts	The total number of packets downlinked.
Viber	
Uplink Bytes	The total number of bytes uplinked.
Downlink Bytes	The total number of bytes downlinked.
Uplink Pkts	The total number of packets uplinked.
Downlink Pkts	The total number of packets downlinked.
Scydo	
Uplink Bytes	The total number of bytes uplinked.
Downlink Bytes	The total number of bytes downlinked.
Uplink Pkts	The total number of packets uplinked.
Downlink Pkts	The total number of packets downlinked.
Whatsapp	
Uplink Bytes	The total number of bytes uplinked.
Downlink Bytes	The total number of bytes downlinked.

Field	Description
Uplink Pkts	The total number of packets uplinked.
Downlink Pkts	The total number of packets downlinked.

show active-charging analyzer statistics name pptp

Table 77. show active-charging analyzer statistics name pptp Command Output Descriptions

Field	Description
ACS PPTP Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Pkts	Total number of packets uplinked.
Total Downlink Pkts	Total number of packets downlinked.
Total GRE Sessions	Total number of GRE sessions.
Invalid PPTP Pkts	Total number of invalid PPTP packets.
Unknown PPTP Pkts	Total number of unknown PPTP packets.
ACS PPTP-GRE Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Pkts	Total number of packets uplinked.
Total Downlink Pkts	Total number of packets downlinked.

show active-charging analyzer statistics name sip

Table 78. show active-charging analyzer statistics name sip Command Output Descriptions

Field	Description
SIP Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Pkts	Total number of packets uplinked.
Total Downlink Pkts	Total number of packets downlinked.
Uplink Valid Bytes	Total number of valid bytes uplinked.
Downlink Valid Bytes	Total number of valid bytes downlinked.
Uplink Valid Pkts	Total number of valid packets uplinked.
Downlink Valid Pkts	Total number of valid packets downlinked.
Uplink Retry Bytes	Total number of retry bytes uplinked.
Downlink Retry Bytes	Total number of retry bytes downlinked.
Uplink Retry Pkts	Total number of retry packets uplinked.
Downlink Retry Pkts	Total number of retry packets downlinked.
Uplink Error Bytes	Total number of error bytes uplinked.
Downlink Error Bytes	Total number of error bytes downlinked.
Uplink Error Pkts	Total number of error packets uplinked.
Downlink Error Pkts	Total number of error packets downlinked.
SIP Calls	Total number of SIP calls.
SIP Advanced Session Stats	
Total Uplink Bytes	Total uplink bytes processed by SIP ALG.
Total Downlink Bytes	Total downlink bytes processed by SIP ALG.
Total Uplink Packets	Total uplink packets processed by SIP ALG.
Total Downlink Packets	Total downlink packets processed by SIP ALG.
SIP Calls	Total number of active SIP calls processed by SIP ALG.

Field	Description
SIP Request	Displays the following SIP Requests. <ul style="list-style-type: none"> • Register: Total REGISTER requests. • Invite: Total INVITE requests. • Ack: Total ACK requests. • Bye: Total BYE requests. • Info: Total INFO requests. • Prack: Total PRACK requests. • Refer: Total REFER requests. • Cancel: Total CANCEL requests. • Update: Total UPDATE requests. • Message: Total MESSAGE requests. • Options: Total OPTIONS requests. • Publish: Total PUBLISH requests. • Subscribe: Total SUBSCRIBE requests. • Notify: Total NOTIFY requests.
Total Received	Total number of SIP requests received by SIP ALG.
Total Transmitted	Total number of SIP requests transmitted by SIP ALG.
Retransmitted	Total number of SIP requests retransmitted by SIP ALG.
SIP Response	Displays the following SIP Responses. <ul style="list-style-type: none"> • 1XX: Total 1xx responses. • 2XX: Total 2xx responses. • 3XX: Total 3xx responses. • 4XX: Total 4xx responses. • 5XX: Total 5xx responses. • 6XX: Total 6xx responses.
Total Received	Total number of SIP responses received by SIP ALG.
Total Transmitted	Total number of SIP responses transmitted by SIP ALG.
Retransmitted	Total number of SIP responses retransmitted by SIP ALG.

show active-charging analyzer statistics name tcp verbose

Table 79. show active-charging analyzer statistics name tcp verbose Command Output Descriptions

Field	Description
ACS TCP Session Stats:	
Total Uplink Bytes	The total number of bytes uplinked.
Total Downlink Bytes	The total number of bytes downlinked.
Total Uplink Pkts	The total number of packets uplinked.
Total Downlink Pkts	The total number of packets downlinked.
Uplink Bytes Retrans	The number of uplink bytes that were retransmitted.
Downlink Bytes Retrans	The number of downlink bytes that were retransmitted.
Uplink Pkts Retrans	The number of uplink packets that were retransmitted.
Downlink Pkts Retrans	The number of downlink packets that were retransmitted.
Uplink Out of Order Pkts Successfully Analyzed	The number of uplink out of order packets that were successfully analyzed.
Downlink Out of Order Pkts Successfully Analyzed	The number of downlink out of order packets that were successfully analyzed.
Uplink Out of Order Pkts Failure	The number of uplink out of order packets that failed.
Downlink Out of Order Pkts Failure	The number of downlink out of order packets that failed.
Uplink Out of Order Pkts Retransmitted	The number of uplink out of order packets that retransmitted.
Downlink Out of Order Pkts Retransmitted	The number of downlink out of order packets that retransmitted.
Uplink Bytes Invalid Length	The number of uplink bytes of invalid length.
Downlink Bytes Invalid Length	The number of downlink bytes of invalid length.
Uplink Pkts Invalid Length	The number of uplink packets of invalid length.
Downlink Pkts Invalid Length	The number of downlink packets of invalid length.
Uplink Bytes Out of Sequence	The number of uplink bytes out of sequence.
Downlink Bytes Out of Sequence	The number of downlink bytes out of sequence.
Uplink Pkts Out of Sequence	The number of uplink packets that were out of sequence.
Downlink Pkts Out of Sequence	The number of downlink packets that were out of sequence.

Field	Description
Uplink Bytes Invalid Close Wait	The total number of bytes received in uplink direction while system is in invalid wait state to close connection.
Downlink Bytes Invalid Close Wait	The total number of bytes received in downlink direction while system is in invalid wait state to close connection.
Uplink Pkts Invalid Close Wait	The total number of packets received in uplink direction while system is in invalid wait state to close connection.
Downlink Pkts Invalid Close Wait	The total number of bytes received in downlink direction while system is in invalid wait state to close connection.
Uplink Bytes Invalid Close State	The total number of bytes received in uplink direction while connection is in invalid closed state.
Downlink Bytes Invalid Close State	The total number of bytes received in downlink direction while connection is in invalid closed state.
Uplink Pkts Invalid Close State	The total number of packets received in uplink direction while connection is in invalid closed state.
Downlink Pkts Invalid Close State	Total number of packets received in downlink direction while connection is in invalid closed state.
Uplink Bytes Out of Order Timeout Failure	The total number of bytes received in uplink direction while timeout duration to wait for out of order packets is exhausted.
Downlink Bytes Out of Order Timeout Failure	The total number of bytes received in downlink direction while timeout duration to wait for out of order packets is exhausted.
Uplink Pkts Out of Order Timeout Failure	The total number of packets received in uplink direction while timeout duration to wait for out of order packets is exhausted.
Downlink Pkts Out of Order Timeout Failure	The total number of bytes received in downlink direction while timeout duration to wait for out of order packets is exhausted.
Uplink Bytes Out of Order Failure in Allocation	The total number of bytes received in uplink direction while allocation of out of order packet is failed.
Downlink Bytes Out of Order Failure in Allocation	The total number of bytes received in downlink direction while allocation of out of order packet is failed.
Uplink Pkts Out of Order Failure in Allocation	The total number of packets received in uplink direction while allocation of out of order packet is failed.
Downlink Pkts Out of Order Failure in Allocation	The total number of packets received in downlink direction while allocation of out of order packet is failed.
Uplink Pkts Invalid Window Size	The total number of packets received in uplink direction with invalid window size for buffer.
Uplink Bytes Invalid Window Size	The total number of bytes received in uplink direction with invalid window size for buffer.
Downlink Pkts Invalid Window Size	The total number of packets received in downlink direction with invalid window size for buffer.

Field	Description
Downlink Bytes Invalid Window Size	Total total number of bytes received in downlink direction with invalid window size for buffer.
Uplink Pkts Invalid Checksum	The total number of packets received in uplink direction with invalid checksum errors.
Uplink Bytes Invalid Checksum	The total number of bytes received in uplink direction with invalid checksum errors.
Downlink Pkts Invalid Checksum	The total number of packets received in downlink direction with invalid checksum errors.
Downlink Bytes Invalid Checksum	The total number of bytes received in downlink direction with invalid checksum errors.

show active-charging analyzer statistics name tftp

Table 80. show active-charging analyzer statistics name tftp Command Output Descriptions

Field	Description
ACS TFTP Session Stats:	
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total Uplink Packets	Total number of packets uplinked.
Total Downlink Packets	Total number of packets downlinked.
Total Read Sessions	Total number of read sessions.
Total Write Sessions	Total number of write sessions.
Total Invalid Control Packets	Total number of invalid control packets.
Total Invalid Data Packets	Total number of invalid data packets.
Total Packets with Unknown Request Type	Total number of packets with unknown request type.

show active-charging bandwidth-policy name

Table 81. show active-charging bandwidth-policy name Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
Bandwidth Policy Name	Name of the bandwidth policy.
Flow Limit-for-Bandwidth ID and Group-ID Associations:	
Flow Limit-for-Bandwidth ID	The ACS flow limit-for-bandwidth ID.
Group-ID	The ACS Bandwidth Policy Group ID.
Total number of bw-ids configured in Bandwidth-Policy <policy>	The total number of bandwidth IDs configured in the specified bandwidth policy.
Group-Limits for Group-ID	The group limits set for the group ID.
Rates & Actions	Lists the following rates and actions: <ul style="list-style-type: none"> • Peak Data Rate • Peak Burst Size • Violate Action • Committed Data Rate • Committed Burst Size • Exceed Action
Uplink	For bandwidth control in uplink direction indicates: <ul style="list-style-type: none"> • Peak data rate in bits per second • Peak burst size in bytes • Violate action configured: discard/lower-ip-precedence • Committed data rate in bits per second • Committed burst size in bytes • Exceed action configured: discard/lower-ip-precedence
Downlink	For bandwidth control in downlink direction indicates: <ul style="list-style-type: none"> • Peak data rate in bits per second • Peak burst size in bytes • Violate action configured: discard/lower-ip-precedence • Committed data rate in bits per second • Committed burst size in bytes • Exceed action configured: discard/lower-ip-precedence

■ show active-charging bandwidth-policy name

Field	Description
Total number of group-limits configured in Bandwidth-Policy <policy>	The total number of group limits configured in the specified bandwidth policy.
Total bandwidth-policies found	The total number of bandwidth policies matching the specified criteria.

show active-charging charging-action all

Table 82. show active-charging charging-action all Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
Charging Action Name	Name of the charging action. There may be several charging actions configured per charging service.
Content ID	The content ID to use in the generated billing records as the Rating-Group Attribute Value Pair (AVP) for this charging action.
Service ID	Service identifier value configured in the Charging Action mode.
EDRs	Indicates whether Event Detail Record (EDR) billing action for packets matching this charging action is enabled, and the EDR format.  IMPORTANT: This field is available only in 12.1 and earlier releases.
Charging EDRs	Indicates whether EDR billing action for packets matching this charging action is enabled, and the charging EDR format name.  IMPORTANT: This field is available only in 12.2 and later releases.
Reporting EDRs	Indicates whether EDR billing action for packets matching this charging action is enabled, and the reporting EDR format name.  IMPORTANT: This field is available only in 12.2 and later releases.
EGCDRs	Indicates whether eG-CDRs for billing of the packets matching with this charging action is enabled.
UDRs	Indicates whether UDR generation is enabled.
Flow Idle Timeout	Displays the idle-timeout for flows inspected by ECS.
Limit For Flow Type	Indicates whether Limit For Flow Type is enabled/disabled.
Limit For Uplink Bandwidth	Indicates whether Limit For Uplink Bandwidth is enabled/disabled.

Field	Description
Limit For Downlink Bandwidth	Indicates whether Limit For Downlink Bandwidth is enabled/disabled.
QoS Renegotiate Traffic-Class	Indicates whether QoS Renegotiate Traffic-Class is enabled/disabled.
QoS Class Identifier	Indicates whether QoS Class Identifier is configured.
IP Type of Service	Indicates whether IP Type of Service is configured.
Flow-Mapping Idle Timeout	Indicates the flow-mapping timeout value, in seconds.
Count Retransmissions	Indicates whether Count Retransmissions is enabled.
Content Filtering	Indicates whether Content Filtering is enabled.
Type of Service	Displays the service type (PDSN, GGSN, etc.)
Count Retries	Indicates if the ECS service is counting retransmitted packets per subscriber.
GCDRs	Indicates if G-CDRs are enabled or disabled.
Discard	Specifies if the packets that match the flow should be discarded.
Credit Control	Specifies if credit control is being used in this charging action
Flow Action	
Redirect URL	Indicates whether the redirection of URL for packets that matches a ruledef is enabled/disabled. If enabled, redirects the HTTP packets matched to this Ruledef to the specified URL.
Clear Quota Retry Timer	Indicates whether Clear Quota Retry Timer is enabled/disabled. If enabled, resets the Credit Control Application quota retry timer for specific subscriber upon redirection.
Conditional Redirect	Indicates whether Conditional Redirect end token action is enabled/disabled. If enabled, conditionally redirects the HTTP packets matched to a configured user-agent to a specified URL.
Discard	Indicates whether discard action is enabled/disabled. If enabled, discards the packet associated with the charging action.
Terminate-Flow	Indicates whether terminate flow action is enabled/disabled. If enabled, terminates the TCP connection gracefully between the subscriber and external server and sends a TCP FIN to the subscriber and a TCP RST to the server. If the flow does not use TCP, this option simply discard the packets. This option is used for flows that use TCP only.
Billing Action	
Event Data Record	Indicates whether EDRs are enabled/disabled.
GGSN charging Data Record	Indicates whether GGSN CDRs are enabled/disabled.
User Data Record	Indicates whether UDRs are enabled/disabled.
Radius Accounting Record	Indicates whether RADIUS accounting records is enabled/disabled.

Field	Description
Charge Volume	Indicates the charge volume for packet-length (payload).
Total charging action(s) found	The number of charging actions that matched the criteria.
Readdressing	Indicates whether CAE re-addressing on the Mobile Video Gateway is enabled or disabled.
Percentage Rate Reduction	If enabled, indicates the configured bit rate reduction for mobile video as a percentage of the input bit rate.

show active-charging charging-action statistics name

Table 83. show active-charging charging-action statistics name Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
Charging Action Name	Name of the charging action. There are be several charging actions per charging service.
Uplink Pkts Retrans	Total number of uplink packets that were retransmitted.
Downlink Pkts Retrans	Total number of downlink packets that were retransmitted.
Uplink Bytes Retrans	Total number of uplink bytes that were retransmitted.
Downlink Bytes Retrans	Total number of downlink bytes that were retransmitted.
Upl Pkts Readdressed	Total number of readdressed uplink packets.
Dnl Pkts Readdressed	Total number of readdressed downlink packets.
Upl Bytes Readdressed	Total number of readdressed uplink bytes.
Dnl Bytes Readdressed	Total number of readdressed downlink bytes.
PP Upl Pkts Readdressed	Total number of post-processed uplink packets readdressed.
PP Dnl Pkts Readdressed	Total number of post-processed downlink packets readdressed.
PP Upl Bytes Readdressed	Total number of post-processed uplink bytes readdressed.
PP Dnl Bytes Readdressed	Total number of post-processed downlink bytes readdressed.
XHeader Information:	
XHeader Bytes Injected	Total number of x-header bytes injected.
XHeader Pkts Injected	Total number of x-header packets injected.
NCQoS Discarded Packets:	
Rule Bound elsewhere	Total number of rules bound elsewhere.
Rule Binding pending	Total number of rule binding pending.
Unbound Rule hit	Total number of unbound rule hits.
Statistic	Statistic type.
flow-action	Total number of matching flows/sessions/packets for the statistic.
pp-flow-action	Total number of matching flows/sessions/packets for the statistic.
flow-limit	Total number of matching flows/sessions/packets for the statistic.
bandwidth-limit	Total number of matching flows/sessions/packets for the statistic.

Field	Description
Total Charging Action(s) matched	Total number of charging actions matching the criteria.
CAE-Readdressing:	
GET Requests redirected	Total number of HTTP GET requests redirected to a CAE.
POST Requests redirected	Total number of HTTP POST requests redirected to a CAE.
Other Requests redirected	Total number of other HTTP requests redirected to a CAE.
HTTP Responses redirected	Total number of HTTP responses redirected to a CAE.
HTTP Requests having xheader inserted	Total number of HTTP requests that have x-headers inserted.
Total Connect failed to video server	Total number of failed connections to the video server.
Total uplink bytes	Total number of uplink bytes.
Total uplink packets	Total number of uplink packets.
Total downlink bytes	Total number of downlink bytes.
Total downlink packets	Total number of downlink packets.

show active-charging content-filtering category policy-id all

Table 84. show active-charging content-filtering category policy-id all Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
Content Filtering Policy	The Content Filtering Policy ID.
Content Filtering Categories	
Category	Category of the content rated.
Priority	Priority of the CF category in the CF Policy.
Action	Action taken for the indicated result of CF analysis.
Content Insert	The content string inserted in place of message returned from prohibited or restricted site or content server.
Redirect	The URL to redirect subscribers.
Reply Code	The reply code specified for www-reply-code-and-terminate-flow action.
EDR	The EDR file format name to generate separate CF EDRs based on action and content category.
Failure Action	The failure end condition if rating cannot be performed.
Discarded-Flow-Content-ID	The content ID for the discarded flows. If not configured, this field is not displayed.

show active-charging content-filtering category statistics rulebase name

Table 85. show active-charging content-filtering category statistics rulebase name Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service in which category-based content filtering application is configured.
Rulebase Name	Name of rulebase for category-based content filtering application.
Content Filtering Statistics	
Flows discarded	Total number of flows discarded in content filtering application.
Flows redirected	Total number of flows redirected in content filtering application.
Flows allowed	Total number of flows allowed in content filtering application.
Flows terminated	Total number of flows terminated in content filtering application.
Flows discarded with content insertion	Total number of flows discarded and information content inserted in header of flow in content filtering application.
Total Flows blocked	Total number of flows blocked in content filtering application.
Total Number of dynamic DB lookups	Total number of lookups in dynamic database for Category-based Content Filtering application. This counter is not available in 9.0 and later releases.
Total number of static DB lookups	Total number of lookups in static URL database for category based content filtering application.
Total number of successful Cache lookups	The total number of successful lookups in cache memory for URLs.
Total number of unknown URLs	Total number of flows/requests with unknown URL.
Actions For Rating Attempts Not Completed	
Flows discarded	Total number of flows discarded in content filtering application.
Flows redirected	Total number of flows redirected in content filtering application.
Flows allowed	Total number of flows allowed in content filtering application.
Flows terminated	Total number of flows terminated in content filtering application.
Flows discarded with content insertion	Total number of flows discarded and information content inserted in header of flow in content filtering application.
Total Flows blocked	Total number of flows blocked in content filtering application.

■ show active-charging content-filtering category statistics rulebase name

Field	Description
Time taken for rating	A URL is classified (rated) as belonging to a distinct category (search, portal, etc.). This column displays the time taken to rate the URL in ms, in time slots of 100 ms, up to 1000 ms, and above 1000 ms.
Number of URLs	Indicates the number of URLs rated in each time slot.
Number of URLs (SRDB)	Indicates the number of URLs rated in a specific time slot from static rating database (SRDB).
Number of URLs (Cache)	Indicates the number of URLs rated in a specific time slot from the cached list of URLs in memory.
Attempts not completed	Indicates the number of URL rating attempts not completed.
Total rulebases matched	Total number of rulebases that matched the criteria.

show active-charging content-filtering category statistics

Table 86. *show active-charging content-filtering category statistics Command Output Descriptions*

Field	Description
Service Name	Name of the Active Charging Service in which category-based content filtering application is configured.
Cumulative Content Filtering Statistics:	
Flows discarded	Total number of flows discarded.
Flows redirected	Total number of flows redirected.
Flows allowed	Total number of flows allowed.
Flows terminated	Total number of flows terminated.
Flows discarded with content insertion	Total number of flows discarded and content inserted in header of flow.
Total Flows blocked	Total number of flows blocked.
Total Number of dynamic DB lookups	Total number of lookups in dynamic database. This counter is not available in 9.0 and later releases.
Total number of static DB lookups	Total number of lookups in static URL database.
Total number of successful Cache lookups	Total number of successful URL lookups in cache memory.
Total number of unknown URLs	Total number of flows/requests with unknown URL.
Failure Action (Rating Attempts Not Completed):	
Flows discarded	Total number of flows discarded due to failure action.
Flows redirected	Total number of flows redirected due to failure action.
Flows allowed	Total number of flows allowed due to failure action.
Flows terminated	Total number of flows terminated due to failure action.
Flows discarded with content insertion	Total number of flows discarded and information content inserted in header of flow due to failure action.
Total Flows blocked	Total number of flows blocked due to failure action.
Time taken for rating	A URL is classified (rated) as belonging to a distinct category (search, portal, etc.). This column displays the time taken to rate the URL in ms, in time slots of 100 ms, up to 1000 ms, and above 1000 ms.
Number of URLs	Total number of URLs rated in each time slot.

Field	Description
Attempts not completed	Total number of URL rating attempts not completed.
Cumulative Dynamic Content Filtering Statistics	
Dynamic Flows discarded	Total number of dynamic flows discarded.
Dynamic Flows redirected	Total number of dynamic flows redirected.
Dynamic Flows allowed	Total number of dynamic flows allowed.
Dynamic Flows terminated	Total number of dynamic flows terminated.
Dynamic Flows discarded with content insertion	Total number of dynamic flows discarded and content inserted in header of flow.
Total Dynamic Flows blocked	Total number of dynamic flows blocked.
Total Number of dynamic lookups	Total number of dynamic lookups.
Total number of unknown URLs	Total number of flows/requests with unknown URLs.
Response codes not in range 2xx	Number of responses that were not sent for dynamic rating as the response was not in the 2xx range.
Dynamic Failure Action (Rating Attempts Not Completed):	
Flows discarded	Total number of flows discarded due to failure action.
Flows redirected	Total number of flows redirected due to failure action.
Flows allowed	Total number of flows allowed due to failure action.
Flows terminated	Total number of flows terminated due to failure action.
Flows discarded with content insertion	Total number of flows discarded and information content inserted in header of flow due to failure action.
Total Flows blocked	Total number of flows blocked due to failure action.
Time taken for Dynamic rating	A URL is classified (rated) as belonging to a distinct category (search, portal, etc.). This column displays the time taken to rate the URL in ms, in time slots of 100 ms, up to 1000 ms, and above 1000 ms.
Number of URLs	Total number of URLs rated in each time slot.
Attempts not completed	Total number of URL rating attempts not completed.
Number of Packets Hit per Category	Indicates the specific category and the number of packets hit per category. If during runtime, an x-category was added, the x-category is also displayed.
Number of Packets Blocked per Category	Indicates the specific category and the number of packets blocked per category. If during runtime, an x-category was added, the x-category is also displayed.
Total Responses Inspected	Indicates the number of responses eligible for dynamic rating (i.e. rated as UNKNOW / DYNAM by static rating when dynamic rating is enabled)
Responses Buffered	Indicates the number of responses actually buffered.

Field	Description
Total Dynamic Lookups	Indicates the total number of dynamic lookups of URLs.
Lookups Completed	Indicates the total number of lookups completed.
Responses Too Big	Indicates the size of response more than the maximum value allowed (256KB).
Out of Rating Buffer	Indicates the out of rating buffer limit.
Min Response Size	Indicates the size of the smallest response inspected.
Max Response Size	Indicates the size of the largest response inspected.
Session QLimit Exceeded	Indicates the number of times we exceeded queue limit for a session (i.e. limit on number of packets that can be queued).
Max Pkt per Session	Indicates the maximum number of packets buffered for a single session.
Current Active Sessions	Indicates the current number of responses subjected to dynamic CF.
Max Active Sessions	Indicates the maximum number of responses subjected to dynamic CF simultaneously.

show active-charging content-filtering server-group name

Table 87. show active-charging content-filtering server-group name Command Output Descriptions

Field	Description
Content Filtering Group	Name of the Content Filtering Server Group (CFSG).
Context	The context in which the CFSG is configured.
Origin Address	IP address of the origin endpoint or ICAP client.
Response Timeout	The response-timeout duration configured to wait for response.
Connection Retry Timeout	The connection retry timeout duration configured to check the TCP connection status between ICAP sever and client.
Dictionary	The dictionary used for encoding requests to the server(s).
Timeout Action	The action configured for connection timeout.
Deny Message	The text string message that is returned to the subscriber in a deny response.
URI-extraction	The ICAP URL extraction mode: <ul style="list-style-type: none"> • after-parsing: Percent-encoded hex characters in URLs sent from the ACF client to the ICAP server are converted to corresponding ASCII characters and sent. • raw: The URLs contain percent-encoded hex characters as is.
Content Filtering Group Connections	The total number of CF server group connections open.
Priority	Displays the priority of the CF server for which statistics has to be displayed.
ICAP Address (Port)	Displays the IP address and port number of ICAP server within CF Server Group.
Max Outstanding	The total number of unanswered outstanding messages to this ICAP server.
ACSMgr Instance	Number of ACS Manager instance.
Connection State	Status of ACS Manager instance for CF server group connection.
Total content filtering groups matching specified criteria	The total number of CFSG matching the criteria.

show active-charging content-filtering server-group statistics verbose

Table 88. show active-charging content-filtering server-group statistics verbose Command Output Descriptions

Field	Description
Content Filtering Group	Name of the Content Filtering Server Group (CFSG).
Connection Statistics	
Current Open Connections	Total number of open connections.
Connection DHOST requests	Total number of DHOST requests.
Successful Connections	Total number of successful connections.
Connections DHOST remove	Total number of connections removed from DHOST.
Connection SHUTDOWN req	Total number of requests for SHUTDOWN.
ACF Unreachable(read)	Total number of attempts for Active Content Filter server (ICAP server) to read.
ACF Unreachable(write)	Total number of attempts for Active Content Filter server (ICAP server) to write.
Reconnect attempts	Total number of reconnect attempts for ACF server (ICAP server).
Connection Timeout	Total number of connections timeout after reconnect attempts for ACF server (ICAP server).
Connection Failure Statistics	
Connection DHOST errors	Total number of DHOST errors in connection.
Connection CONNECT error	Total number of CONNECT errors in connection.
Socket open errors	Total number of errors due to SOCKET open in connection.
Connection bind errors	Total number of BIND errors in connection.
Connection setvr errors	Total number of SETVER errors in connection.
Connection NONBLOCK errors	Total number of NONBLOCK errors in connection.
Connection SHUTDOWN errors	Total number of SHUTDOWN errors in connection.
Incomplete 3-way handshaking	Total number of errors due to incomplete 3-way handshaking in TCP connection.
ACF Statistics	
ACF Requests Created	Total number of requests created for ACF.
Response Timeout	Total number of response timeout for requests to ACF.
Write request success	Total number of successful WRITE requests.
Write request failed	Total number of failed WRITE requests.

Field	Description
Read response success	Total number of successful READ response.
Read response failed	Total number of failed READ response.
HTTP Permit	Total number of HTTP URLs permitted from ACF.
WAP Permit	Total number of WAP URLs permitted from ACF.
HTTP Deny	Total number of HTTP URLs denied from ACF.
WAP Deny	Total number of WAP URLs denied from ACF.
HTTP Redirect	Total number of HTTP URLs redirected from ACF.
WAP Redirect	Total number of WAP URLs redirected from ACF.
Invalid ACTION	Total number of invalid ACTION message from ACF.
Redirect URL not defined	Total number of errors due to undefined redirect URL.
Buffer List Empty	Total number of errors due to empty buffer list.
Failure Action (communication failure with server-group):	
Permit	Total number of connections permitted after connection failure.
Content Insertion	Total number of connections with content inserted after connection failure.
Discard	Total number of connections discarded after connection failure.
Terminate Flow	Total number of connections terminated after connection failure.
Redirect URL	Total number of connections redirected after connection failure.
Total action taken	Total number of actions taken after connection failure.
Num pkts dropped for DENY	Total number of packets dropped after denying the connection due to failure in connection.
Num pkts dropped for REDIRECT	Total number of packets dropped after redirecting the connection due to failure in connection.
Num pkts dropped for DENY Timeout action	Total number of packets dropped after denying the connection due to timeout action.
Num pkts dropped for REDIRECT Timeout action	Total number of packets dropped after redirecting the connection due to timeout action.
Failure Action (communication with server-group not attempted):	
Permit	Total number of connections permitted after connection failure.
Content Insertion	Total number of connections with content inserted after connection failure.
Discard	Total number of connections discarded after connection failure.
Terminate Flow	Total number of connections terminated after connection failure.
Redirect URL	Total number of connections redirected after connection failure.

Field	Description
ACF Req Error Statistics	Statistics related to ACF request errors.
Host field Null	Total number of HTTP GET requests which has the host field NULL.
URL Invalid	Total number of nonblank URLs with strlen != 0 but URL having “ “, \t, \n characters only.
Host same as ICAP server:port	Total number of HTTP GET requests with host same as the configured ICAP server port.
ACF Resp Parse Statistics	Statistics related to ACF response parsing.
Parse ACF resp success	Total number of successful ACF parse response.
Parse ACF resp ver err	Total number of successful ACF parse response version error.
Misc Statistics	Miscellaneous statistics.
Total pkts sent	Total number of packets sent through ICAP connection.
Invalid ACF group config	Total number of errors due to invalid CF Server Group (Active Content Filter server groups) configuration.
Invalid bind address	Total number of errors due to invalid binding address configuration.
Invalid ICAP address	Total number of errors due to invalid ICAP server addresses.
ICAP queue length statistics	
SessionMgr ID	Session Manager ID.
ICAP queue length	Queue size of outstanding ICAP requests per Session Manager.
Histogram of ICAP Server's Response time	
Response Time(ms)	Response time slots, in milliseconds.
No Of Responses	Number of responses per time slot.

show active-charging credit-control session-states

Table 89. *show active-charging credit-control session-states* Command Output Descriptions

Field	Description
Charging	Number of sessions/categories in charging state.
NoCharge	Number of sessions/categories in free-of-charge (received 4011 at MSCC level) state.
Blacklist Service Denied	Number of sessions/categories in Service-Denied (received 4010 at MSCC level) state.
Blacklist Rating Failed	Number of sessions/categories in Rating-Failed (received 5031 at MSCC level) state.
Blacklist Auth Rejected	Number of sessions/categories in Auth-Rejected (received 5003 or 5012 at MSCC level) state.
Blacklist Limit Reached	Number of sessions/categories in Limit-Reached (received 4012 at MSCC level) state.
Blacklist Final Unit	Number of sessions/categories in FUI-Terminated state at MSCC level.
Blacklist Other	Number of sessions/categories in Blacklisted state after recovery.
Pending Initial Request	Number of sessions pending for Initial Credit-Control Answer from the server.
Pending Update Request	Number of sessions pending for Update Credit-Control Answer from the server.
Pending Terminate Request	Number of sessions pending for Terminate Credit-Control Answer from the server.

show active-charging credit-control statistics

Table 90. show active-charging credit-control statistics Command Output Descriptions

Field	Description
Active Charging Service	Name of the Active Charging Service.
Credit Control Group	Name of the credit control group. This field is displayed only if there are credit control group(s) configured.
CC Session Stats	
Total Current Sessions	Total number of credit control sessions active.
Total ECS Adds	Total number of ECS sessions added to credit control application.
Total CC Starts	Total number of credit control sessions started.
Total Session Updates	Total number of credit control sessions updated.
Total Terminated	Total number of credit control sessions terminated.
CC Session Failovers	Total number of credit control sessions failed.
CC Message Stats	
Total Messages Received	Total number of credit control messages received.
Total Messages Sent	Total number of credit control messages sent.
Total CC Requests	Total number of Credit Control Request (CCR) messages that went out from system to the credit control server. The CCR can be Initial/Update or Terminate.
Total CC Answers	Total number of Credit Control Answer (CCA) messages that came into system from credit control server.
CCR-Initial	Total number of Initial Credit Control Request (CCR-Initial) messages that went out from system to the credit control server.
CCA-Initial	Total number of Initial Credit Control Answer (CCA-Initial) messages that came into system from Diameter Server.
CCA-Initial Accept	Total number of CCA-Initial-Accept (Initial Credit Control Answer sent and accepted) messages that came into system from Credit Control Server.
CCA-Initial Reject	Total number of CCA-Initial-Reject (Initial Credit Control Answer sent and rejected.) messages that came into system from credit control server.
CCA-Initial Timeouts	Total number of CCA-Initial-Timeouts (Initial Credit Control Answer sent and timed out) messages that came into system from credit control server.

Field	Description
CCR-Update	Total number of CCR-Updates (Credit Control Request with Update) messages that went out from system to the credit control server.
CCA-Update	Total number of CCA-Update (Credit Control Answer for update) messages that came into system from credit control server.
CCA-Update Timeouts	Total number of CCA-Update Timeouts (Credit Control Answer for update sent and timed out) messages that came into system from credit control server.
CCR-Final	Total number of CCR-Final (Credit Control Request with Final) messages that went out from system to the credit control server.
CCA-Final	Total number of CCA-Final (Credit Control Answer for final update sent) messages that came into system from credit control server.
CCA-Final Timeouts	Total number of CCA-Final Timeouts (Credit Control Answer for final update sent and time-out) messages that came into system from credit control server.
ASR	Total number of Abort-Session Request messages came into system from credit control server.
ASA	Total number of Abort-Session Accept messages sent from system to credit control server. This message will be followed by a CCR-Terminate to terminate the session.
RAR	Total number of ReAuth Request messages that came into system from Diameter Server.
RAA	Total number of ReAuth Accept messages sent from system to Credit Control server. This message is followed by a CCR-Update to update the Credit Control server about the session.
CCA Dropped	Total number of Credit Control Answer (CCA) messages dropped by system.
CC Message Error Stats	
Diameter Protocol Errs	Total number of message errors due to Diameter protocol errors.
Transient Failures	Total number of errors that fall within the transient failures category are used to inform a peer that the request could not be satisfied at the time it was received, but may be able to satisfy the request in the future. The Result-Code data field contains 4xxx for Transient Failures.
Permanent Failures	Total number of errors that fall within the permanent failures category are used to inform the peer that the request failed, and should not be attempted again. The Result-Code data field contains 5xxx for Permanent Failures.
Bad Answers	Total number of message errors due to invalid responses.
Unknown Session Reqs	Total number of message errors due to invalid session requests.
Unknown Command Code	Total number of message errors due to invalid/unknown command code (ASR, RAR).
Request Timeouts	Total number of message errors due to request timeout.
Parse Errors	Total number of message errors due to parsing errors.
Unknown Rating Group	Total number of message errors due to invalid/unknown rating groups. Rating group is used to identify a particular type of traffic.
Unknown Rulebase	Total number of message errors due to invalid/unknown rulebase applied.

Field	Description
Unk Failure Handling	Total number of message errors due to invalid/unknown reasons.
CC Update Reporting Reason Stats	
Threshold	For each of the rating group, the credit control server send a threshold (this is also configurable in a system) after which a update needs to be sent. For example, a subscriber quota of 1000 bytes with 900 as threshold is sent to credit control application. When 900 bytes have consumed by the system, an update message is sent for quota. This counter gives the number of updates sent because of threshold.
QHT	Total number of credit control updates sent due to expiry of Quota Hold Timer (QHT).
Final	Total number of credit control updates sent due to expiry of final unit of quota.
Quota Exhausted	Total number of credit control updates sent due to subscriber quota getting exhausted.
Validity Time	Total number of credit control updates sent because of the session validity time expired.
Other Quota	Total number of credit control updates sent due to request for additional quota for subscriber.
Rating Condition Change	Total number of credit control updates sent due to change in RAT/QOS/SGSN/CELLID/LAC.
Forced Reauthorization	Total number of credit control updates sent due to RAR.
TITSU Time	This counter is incremented when the RADIUS online access-request is triggered because the Time Interval after TariffSwitchUpdate expired.
CC Termination Cause Stats	
Diameter Logout	Total number of Credit Control Application session(s) terminated due to subscriber logout.
Service Not Provided	Total number of Credit Control Application session(s) terminated as service was not available.
Bad Answer	Total number of Credit Control Application session(s) terminated due to invalid/unknown response received.

Field	Description
Administrative	The total number of sessions disconnected due to any of the following reasons: <ul style="list-style-type: none"> • Sessions disconnected when the Administrator issues the clear subscribers all CLI command. • Sessions disconnected by ECS due to any of the following reasons: <ul style="list-style-type: none"> • Bearer does not contain active rules—when the last bearer has no rules left as part of some PCRF trigger. • Charging-action has the flow action parameter configured as terminate-session. • Sessions disconnected by the Diameter Credit Control Application (DCCA) due to any of the following reasons: <ul style="list-style-type: none"> • Result code 4010 or 4012 is received at the command level, and for CCR-Initial and CCR-Update Credit Control Failure Handling (CCFH) is configured as Terminate or Retry-and-Terminate. • Result code 5003 or 5030 is received at the command level. • Abort-Session-Request message is received.
Link Broken	Total number of Credit Control Application session(s) terminated due to broken/down link.
Auth Expired	Total number of Credit Control Application session(s) terminated due to authorization of subscriber expired.
User Moved	Total number of Credit Control Application session(s) terminated as subscriber moved out of service area.
Session Timeout	Total number of Credit Control Application session(s) terminated due to timeout.
CCBad Answer Stats	
Auth-Application-Id	Indicates the absence or unexpected value in Auth-Application-Id AVP.
Session-Id	Indicates the absence or unexpected value in Session-Id AVP.
CC-Request-Number	Indicates the absence or unexpected value in CC-Request-Number AVP.
CC-Request-Type	Indicates the absence or unexpected value in CC-Request-Type AVP.
Origin-Host	Indicates the absence of Origin-Host AVP.
Origin-Realm	Indicates the absence of Origin-Realm AVP.
Parse-Message-Errors	Indicates the total number of parse errors in the message.
Parse-Mscc-Errors	Indicates the total number of parse errors in MSCC AVP.
Misc	Indicates the total number of other miscellaneous errors.
CC Traffic Category Stats	
Category Creates	The total traffic categories created.
Category Deletes	The total traffic categories deleted.
Category Lookups	The total traffic categories available.

Field	Description
Hits	The total traffic categories triggered.
Misses	The total traffic categories triggered and missed.
Trigger Events	The total traffic categories triggered.
Final Unit Consumed	The total units consumed by subscriber during session.
Category Success	The total number of successful traffic category sessions.
Rating Failed	The total Rating Groups failed during session.
Service Denied	The total number of services denied during session.
Limit Reached	The total number of events when subscriber reached quota limit.
Auth Rejected	The total number of authorization rejected.
Other Errors	The total number of miscellaneous/unknown errors not specified by system.

show active-charging edr-format all

Table 91. *show active-charging edr-format all* Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
EDR Format Name	Name of the configured EDR format.
Attribute	Attribute information configured in specific EDR format.
Total edr-format(s) found	The total number of configured existing EDR formats.

show active-charging edr-format statistics

Table 92. *show active-charging edr-format statistics* Command Output Descriptions

Field	Description
Total edr-formats	The total number of EDR formats configured.
Total edrs generated	The total number of EDRs generated.
Total NAT bind records generated	The total number of Network Address Translation (NAT) bind records generated. This field is only displayed, if configured, in 8.3 and later releases.

show active-charging edr-udr-file flow-control-counters

Table 93. *show active-charging edr-udr-file flow-control-counters* Command Output Descriptions

Field	Description
Num of Times Flow Control initiated	Total number of times the flow control initiated.
Num of Outstanding Messages	Total number outstanding messages for flow control.
Num of unsent Messages	Total number unsent messages for flow control.
Num of CDR records Discarded due to flow control	Total number of charging detail records (CDRs) discarded due to flow control action.
Last flow control occurrence	Date and time of the last occurrence of flow control action.

show active-charging edr-udr-file statistics

Table 94. show active-charging edr-udr-file statistics Command Output Descriptions

Field	Description
EDR-UDR file Statistics	
CDRMOD Instance Id	The CDRMOD instance identifier.
Overall Statistics	
Files rotated	Total number of EDR and UDR files rotated.
Files rotated due to volume limit	Total number of EDR and UDR files rotated due to volume limit.
Files rotated due to time limit	Total number of EDR and UDR files rotated due to time limit.
Files rotated due to records limit	Total number of files rotated because of record limits.
File rotation failures	Total number of times rotation failed for EDR and UDR file.
Files deleted	Total number of EDR and UDR files deleted.
Records deleted	Total number of records deleted.
Records received	Total number of records received.
Files received	Total number of EDR and UDR files received by service.
Current open files	Total number of EDR and UDR files open.
Time of last file deletion	Date and time of last EDR/UDR file deleted.
EDR Specific Statistics	
EDR files rotated	Total number of EDR files rotated.
EDR files rotated due to volume limit	Total number of EDR files rotated due to volume limit.
EDR files rotated due to time limit	Total number of EDR files rotated due to time limit.
EDR files rotated due to records limit	Total number of EDR files rotated due to records limit
EDR file rotation failures	Total number of rotation failed for EDR file.
EDR files deleted	Total number of EDR files deleted.
EDR records deleted	Total number of EDR records deleted.
EDR records received	Total number of EDR records received.
Current open EDR files	Total number of EDR files open.
Time of last EDR file deletion	Date and time of last EDR file deleted.
UDR Specific Statistics	

Field	Description
UDR files rotated	Total number of UDR files rotated.
UDR files rotated due to volume limit	Total number of UDR files rotated due to volume limit.
UDR files rotated due to time limit	Total number of UDR files rotated due to time limit.
UDR files rotated due to records limit	Total number of UDR files rotated due to records limit.
UDR files rotation failures	Total number of rotation failed for UDR file.
UDR files deleted	Total number of UDR files deleted.
UDR records deleted	Total number of UDR records deleted.
UDR records received	Total number of UDR records received.
Current open UDR files	Total number of UDR files open.
Time of last UDR file deletion	Date and time of last UDR file deletion.
EDR-UDR PUSH Statistics	
Overall Statistics	
Primary Server Statistics	
Secondary Server Statistics	
Successful File Transfers	Total number of successful file transfers.
Failed File Transfers	Total number of failed file transfers.
Num of times PUSH initiated	Total number of times an EDR/UDR push attempt was initiated.
Num of times PUSH Failed	Total number of times an EDR/UDR push attempt failed.
Num of times PUSH cancelled due to HD failure	Total number of times EDR/UDR push was cancelled due to hard disk failures.
Num of periodic PUSH	Total number of periodic push.
Num of manual PUSH	Total number of manual push.
Current status of PUSH	Current status of push: Running/Not Running
Last completed PUSH time	The date and time the last push completed.

show active-charging firewall statistics

Table 95. show active-charging firewall statistics Command Output Descriptions

Field	Description
Firewall Statistics for context	Name of the context.
Data Stats:	
Total Packets Received	Total number of packets received by Stateful Firewall.
Total Bytes Received	Total number of bytes received by Stateful Firewall.
Total Packets Sent	Total number of packets sent by Stateful Firewall.
Total Bytes Sent	Total number of bytes sent by Stateful Firewall.
Total Packets Injected	Total number of packets injected by Stateful Firewall.
Total Bytes Injected	Total number of bytes injected by Stateful Firewall.
Uplink Packets Dropped	Total number of uplink packets dropped by Stateful Firewall.
Uplink Bytes Dropped	Total number of uplink bytes dropped by Stateful Firewall.
Downlink Packets Dropped	Total number of downlink packets dropped by Stateful Firewall.
Downlink Bytes Dropped	Total number of downlink bytes dropped by Stateful Firewall.
Total Malformed Packets	Total number of malformed packets detected by Stateful Firewall.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by Stateful Firewall.
Total Flows Processed by Firewall	Total number of flows processed by Stateful Firewall.

show active-charging firewall statistics nat-realm

Table 96. show active-charging firewall statistics nat-realm Command Output Descriptions

Field	Description
Firewall Statistics for NAT-realm	The NAT realm name for which the statistics are displayed.
Data Stats:	
Total Packets Received	Total number of packets received by the NAT realm.
Total Bytes Received	Total number of bytes received by the NAT realm.
Total Packets Sent	Total number of packets sent by the NAT realm.
Total Bytes Sent	Total number of bytes sent by the NAT realm.
Total Packets Injected	Total number of packets injected by the NAT realm.
Total Bytes Injected	Total number of bytes injected by the NAT realm.
Uplink Packets Dropped	Total number of uplink packets dropped by the NAT realm.
Uplink Bytes Dropped	Total number of uplink bytes dropped by the NAT realm.
Downlink Packets Dropped	Total number of downlink packets dropped by the NAT realm.
Downlink Bytes Dropped	Total number of downlink bytes dropped by the NAT realm.
Total Malformed Packets	Total number of malformed packets detected by the NAT realm.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by the NAT realm.
Total Flows Processed by NAT-realm	Total number of flows processed by the NAT realm.

show active-charging firewall statistics verbose

Table 97. show active-charging firewall statistics verbose Command Output Descriptions

Field	Description
Firewall Statistics for Context	Name of the context.
IP Stats:	
Land Attacks	Total number of Land attacks detected by Stateful Firewall.
Jolt Attacks	Total number of Jolt attacks detected by Stateful Firewall.
Teardrop Attacks	Total number of Teardrop attacks detected by Stateful Firewall.
Zero Length IP Option	Total number of Zero-length IP option attacks detected by Stateful Firewall.
IP Source-router Attacks	Total number of IP Source-router attacks detected by Stateful Firewall.
Packets with IP-Unaligned-Timestamp	Total number of packets with IP unaligned timestamps detected by Stateful Firewall.
Packets with Short IP Header Length	Total number of packets with short IP header length detected by Stateful Firewall.
Packets Dropped due to IP Checksum Errors	Total number of packets dropped due to IP Checksum error.
Downlink Dropped Bytes on IP Reassembly Failure	Total number of downlink bytes dropped on IP Reassembly failure.
Uplink Dropped Bytes on IP Reassembly Failure	Total number of uplink bytes dropped on IP Reassembly failure.
TCP Stats:	
Data Packets Received After RST/FIN	Total number of data packets received after receiving RST (reset) request by Stateful Firewall.
Invalid SEQ Number Received with RST	Total number of invalid sequence-number received with RST (reset) request by Stateful Firewall.
Data without Connection Established	Total number of data packets received before the establishment of connection by Stateful Firewall.
Invalid TCP Connection Requests	Total number of invalid TCP connection requests received by Stateful Firewall.
Invalid TCP pre-connection Requests	Total number of invalid TCP pre-connection requests received by Stateful Firewall.
Invalid ACK Value (Cookie Enabled)	Total number of invalid ACK values (to enable cookies) received by Stateful Firewall.
Invalid TCP Packet Length	Total number of TCP packets with invalid length received by Stateful Firewall.

Field	Description
Packets with Short TCP Header Length	Total number of TCP packets with invalid/short header length received by Stateful Firewall.
Packets Dropped due to TCP Checksum Errors	Total number of packets dropped due to TCP Checksum error.
Packets with SEQ/ACK Out-of-range	Total number of packets with out of range SEQ/ACK.
TCP Null Scan Attacks	Total number of TCP Null Scan attacks detected by Stateful Firewall.
Post Connection SYN	Total number of Post Connection SYN attacks detected by Stateful Firewall.
Unable to Send SYN Packet	Total number of attempts detected by Stateful Firewall when node failed to send SYN packets.
Send Final ACK to Target Failed	Total number of attempts detected by Stateful Firewall when node failed to send Final ACK packet to target node.
Invalid TCP Packet: SYN-ACK Expected	Total number of invalid TCP packets received by Stateful Firewall in place of SYN+ACK packets.
No TCP Flags Set	Total number of TCP packets received with no flags set.
All TCP Flags Set	Total number of TCP flags received with all flags set.
Invalid TCP Packets	Total number of invalid TCP packets including all type of errors and attacks received by Stateful Firewall.
Flows Closed by RST before 3-Way Handshake	Total number flows closed by RST (reset) message before the 3-way handshaking.
Flows Timed-out in SYN_RCVD1 State	Total number of flows timed out in SYN_RCVD1 state.
Flows Timed-out in SYN_RCVD2 State	Total number of flows timed out in SYN_RCVD2 state.
Flows Terminated due to WinNuke Attack	Total number of flows terminated due to WinNuke attacks by Stateful Firewall.
TCP-SYN Flood Attacks	Total number of TCP-SYN Flood attacks detected by Stateful Firewall.
Packets Dropped on TCP-SYN Flood Attack	Total number of packets dropped by Stateful Firewall in TCP-SYN Flood attacks.
FTP-Bounce Attacks	Total number of FTP-Bounce attacks detected by Stateful Firewall.
Mime-Flood Attacks	Total number of Mime-Flood attacks detected by Stateful Firewall.
Proxy Handshakes Completed	Total number of times proxy handshake was completed.
Packets Dropped due to source port zero	Total number of packets dropped due to source port zero error.
SYN Packets Dropped due to ECE/CWR Set	Total number of SYN packets dropped due to ECE/CWR Flags Set.
UDP Stats:	
Invalid UDP Echo Response	Total number of invalid UDP echo responses.
Invalid UDP Packet Length	Total number of invalid UDP packet length.
Packets Dropped due to UDP Checksum Errors	Total number of packets dropped due to UDP Checksum errors.

Field	Description
Packets with Short UDP Header Length	Total number of packets with short UDP header length.
Packets Dropped on UDP Flood Attack	Total number of packets dropped by Stateful Firewall in UDP flood attacks.
Packets Dropped due to exceeding ICMP dest unreachable threshold	Total number of packets dropped due to exceeding ICMP destination unreachable threshold.
ICMP Stats:	
Invalid ICMP Response	Total number of invalid ICMP responses.
ICMP Reply Error	Total number of ICMP reply errors.
Invalid ICMP Type Packet	Total number of invalid ICMP type packets.
ICMP Error Message Replay Attacks	Total number of ICMP error message replay attacks detected by Stateful Firewall.
ICMP Packets with Duplicate Sequence Number	Total number of ICMP packets with duplicate sequence numbers.
Packets with Short ICMP Header Length	Total number of packets with short ICMP header length.
Invalid ICMP Packet Length	Total number of packets with invalid ICMP packet length.
Packets Dropped on ICMP Flood Attack	Total number of packets dropped by Stateful Firewall in ICMP flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMP Checksum Errors	Total number of packets dropped due to ICMP Checksum error.
ICMP Packets With Destination Unreachable Message	Total number of ICMP packets with destination unreachable message.
ICMP Echo Packets Dropped due to ID Zero	Total number of ICMP echo packets dropped due to zero ID.
ICMPv6 Stats:	
Invalid ICMPv6 Response	Total number of invalid ICMPv6 responses.
ICMPv6 Reply Error	Total number of ICMPv6 reply errors.
Invalid ICMPv6 Type Packet	Total number of invalid ICMPv6 type packets.
ICMPv6 Error Message Replay Attacks	Total number of ICMPv6 error message replay attacks detected by Stateful Firewall.
ICMPv6 Packets with Duplicate Sequence Number	Total number of ICMPv6 packets with duplicate sequence numbers.
Packets with Short ICMPv6 Header Length	Total number of packets with short ICMPv6 header length.
Invalid ICMPv6 Packet Length	Total number of packets with invalid ICMPv6 packet length.
Packets Dropped on ICMPv6 Flood Attack	Total number of packets dropped by Stateful Firewall in ICMPv6 flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMPv6 Checksum Errors	Total number of packets dropped due to ICMPv6 Checksum error.

Field	Description
ICMPv6 Packets With Destination Unreachable Message	Total number of ICMPv6 packets with destination unreachable message.
ICMPv6 Echo Packets Dropped due to ID Zero	Total number of ICMPv6 echo packets dropped due to zero ID.
IPv6 Stats:	
Land Attacks	Total number of land attacks detected by Stateful Firewall.
Jolt Attacks	Total number of jolt attacks detected by Stateful Firewall.
Teardrop Attacks	Total number of teardrop attacks detected by Stateful Firewall.
Invalid IP Option Length	Total number of packets with invalid IP option length.
IPv6 Source-router Attacks	Total number of IPv6 source-router attacks detected by Stateful Firewall.
Packets with Short IPv6 Header Length	Total number of packets with short IPv6 header length detected by Stateful Firewall.
Packets with Nested Fragmentation Header	Total number of packets with nested fragmentation header.
Packets with Unspecified IPv6 Address	Total number of packets with unspecified IPv6 address.
Packets with invalid Payload Length	Total number of packets with invalid payload length.
Packets with more than threshold Extension Headers	Total number of packets with more than threshold extension headers.
Packets with invalid Hop By Hop Extension Header	Total number of packets with invalid hop by hop extension header.
Packets with ICMPv4 in IPv6 Header	Total number of packets with ICMPv4 in IPv6 header.
Packets with invalid Destination Extension Header	Total number of packets with invalid destination extension header.
Downlink Dropped Bytes on IPv6 Reassembly Failure	Total number of downlink bytes dropped on IPv6 Reassembly failure.
Uplink Dropped Bytes on IPv6 Reassembly Failure	Total number of uplink bytes dropped on IPv6 Reassembly failure.
General Stats:	
Packets without Any Data Received	Total number of packets received without any data.
No Matching Uplink Ruledef	Total number of uplink packets with no matching ruledef.
No Matching Downlink Ruledef	Total number of downlink packets with no matching ruledef.
Deny Ruledef Matched	Total number of times deny ruledef was matched.
Packets Dropped due to No Ruledef in Rulebase	Total number of packets dropped due to no ruledef in rulebase.
Packets Dropped due to Miscellaneous Errors	Total number of packets dropped due to miscellaneous errors.
Flows Timed-out	Total number of flows that timed out.
Flows Not Established from External Network	Total number of flows from external networks that were not established.

Field	Description
Max Flows Limit Reached	Total number of times the maximum flows limit was reached.
ALG statistics:	
Packets dropped by SIP ALG	Total number of packets dropped by SIP ALG.
Packets injected by SIP ALG	Total number of packets injected by SIP ALG.
Data Stats:	
Total Packets Received	Total number of packets received in uplink and downlink flows.
Total Bytes Received	Total number of bytes received by Stateful Firewall.
Total Packets Sent	Total number of packets sent by Stateful Firewall.
Total Bytes Sent	Total number of bytes sent by Stateful Firewall.
Total Packets Injected	Total number of packets injected by Stateful Firewall.
Total Bytes Injected	Total number of bytes injected by Stateful Firewall.
Uplink Packets Dropped	Total number of packets in uplink flow dropped by Stateful Firewall.
Uplink Bytes Dropped	Total number of bytes in uplink flow dropped by Stateful Firewall.
Downlink Packets Dropped	Total number of packets in downlink flow dropped by Stateful Firewall.
Downlink Bytes Dropped	Total number of bytes in downlink flow dropped by Stateful Firewall.
Total Malformed Packets	Total number of malformed packets detected by Stateful Firewall.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by Stateful Firewall.
Total Flows Processed by Firewall	Total number of flows processed by Stateful Firewall.
Total NAT Flows Processed by Firewall	Total number of NAT flows processed by Stateful Firewall.

show active-charging firewall statistics protocol icmp verbose

Table 98. show active-charging firewall statistics protocol icmp verbose Command Output Descriptions

Field	Description
Firewall Statistics for Protocol: ICMP	
ICMP Stats	
Invalid ICMP Response	Total number of invalid ICMP responses.
ICMP Reply Error	Total number of ICMP reply errors.
Invalid ICMP Type Packet	Total number of invalid ICMP type packets.
ICMP Error Message Replay Attacks	Total number of ICMP error message replay attacks detected by Stateful Firewall.
ICMP Packets with Duplicate Sequence Number	Total number of ICMP packets with duplicate sequence numbers.
Packets with Short ICMP Header Length	Total number of packets with short ICMP header length.
Invalid ICMP Packet Length	Total number of packets with invalid ICMP packet length.
Packets Dropped on ICMP Flood Attack	Total number of packets dropped by Stateful Firewall in ICMP flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMP Checksum Errors	Total number of packets dropped due to ICMP Checksum error.
ICMP Packets With Destination Unreachable Message	Total number of ICMP packets with destination unreachable message.
ICMP Echo Packets Dropped due to ID Zero	Total number of ICMP echo packets dropped due to zero ID.
Data Stats	
Total Packets Received	Total number of packets received in uplink and downlink flows.
Total Bytes Received	Total number of bytes received by Stateful Firewall.
Total Packets Sent	Total number of packets sent by Stateful Firewall.
Total Bytes Sent	Total number of bytes sent by Stateful Firewall.
Total Packets Injected	Total number of packets injected by Stateful Firewall.
Total Bytes Injected	Total number of bytes injected by Stateful Firewall.
Uplink Packets Dropped	Total number of packets in uplink flow dropped by Stateful Firewall.
Uplink Bytes Dropped	Total number of bytes in uplink flow dropped by Stateful Firewall.
Downlink Packets Dropped	Total number of packets in downlink flow dropped by Stateful Firewall.
Downlink Bytes Dropped	Total number of bytes in downlink flow dropped by Stateful Firewall.

Field	Description
Total Malformed Packets	Total number of malformed packets detected by Stateful Firewall.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by Stateful Firewall.
Total Flows Processed by Firewall	Total number of flows processed by Stateful Firewall.
Total NAT Flows Processed by Firewall	Total number of NAT flows processed by Stateful Firewall.

show active-charging firewall statistics protocol icmpv6 verbose

Table 99. show active-charging firewall statistics protocol icmpv6 verbose Command Output Descriptions

Field	Description
Firewall Statistics for Protocol: ICMPv6	
ICMPv6 Stats	
Invalid ICMPv6 Response	Total number of invalid ICMPv6 responses.
ICMPv6 Reply Error	Total number of ICMPv6 reply errors.
Invalid ICMPv6 Type Packet	Total number of invalid ICMPv6 type packets.
ICMPv6 Error Message Replay Attacks	Total number of ICMPv6 error message replay attacks detected by Stateful Firewall.
ICMPv6 Packets with Duplicate Sequence Number	Total number of ICMPv6 packets with duplicate sequence numbers.
Packets with Short ICMPv6 Header Length	Total number of packets with short ICMPv6 header length.
Invalid ICMPv6 Packet Length	Total number of packets with invalid ICMPv6 packet length.
Packets Dropped on ICMPv6 Flood Attack	Total number of packets dropped by Stateful Firewall in ICMPv6 flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMPv6 Checksum Errors	Total number of packets dropped due to ICMPv6 Checksum error.
ICMPv6 Packets With Destination Unreachable Message	Total number of ICMPv6 packets with destination unreachable message.
ICMPv6 Echo Packets Dropped due to ID Zero	Total number of ICMPv6 echo packets dropped due to zero ID.
Data Stats	
Total Packets Received	Total number of packets received in uplink and downlink flows.
Total Bytes Received	Total number of bytes received by Stateful Firewall.
Total Packets Sent	Total number of packets sent by Stateful Firewall.
Total Bytes Sent	Total number of bytes sent by Stateful Firewall.
Total Packets Injected	Total number of packets injected by Stateful Firewall.
Total Bytes Injected	Total number of bytes injected by Stateful Firewall.
Uplink Packets Dropped	Total number of packets in uplink flow dropped by Stateful Firewall.
Uplink Bytes Dropped	Total number of bytes in uplink flow dropped by Stateful Firewall.

Field	Description
Downlink Packets Dropped	Total number of packets in downlink flow dropped by Stateful Firewall.
Downlink Bytes Dropped	Total number of bytes in downlink flow dropped by Stateful Firewall.
Total Malformed Packets	Total number of malformed packets detected by Stateful Firewall.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by Stateful Firewall.
Total Flows Processed by Firewall	Total number of flows processed by Stateful Firewall.
Total NAT Flows Processed by Firewall	Total number of NAT flows processed by Stateful Firewall.

show active-charging firewall statistics protocol ip verbose

Table 100. show active-charging firewall statistics protocol ip verbose Command Output Descriptions

Field	Description
Firewall Statistics for Protocol IP in Context	Name of the context.
IP Stats:	
Land Attacks	Total number of Land attacks detected.
Jolt Attacks	Total number of Jolt attacks detected.
Teardrop Attacks	Total number of Teardrop attacks detected.
Zero Length IP Option	Total number of Zero-length IP Option attacks detected.
IP Source-router Attacks	Total number of IP Source-router attacks detected.
Packets with IP-Unaligned-Timestamp	Total number of packets with IP-Unaligned-Timestamp.
Packets with Short IP Header Length	Total number of packets with short IP header length.
Packets Dropped due to IP Checksum Errors	Total number of packets dropped due to checksum errors.
Downlink Dropped Bytes on IP Reassembly Failure	Total number of bytes dropped in downlink flow on IP Reassembly failure.
Uplink Dropped Bytes on IP Reassembly Failure	Total number of bytes dropped in uplink flow on IP Reassembly failure.
Data Stats:	
Total Packets Received	Total number of packets received by Stateful Firewall.
Total Bytes Received	Total number of bytes received by Stateful Firewall.
Total Packets Sent	Total number of packets sent by Stateful Firewall.
Total Bytes Sent	Total number of bytes sent by Stateful Firewall.
Total Packets Injected	Total number of packets injected by Stateful Firewall.
Total Bytes Injected	Total number of bytes injected by Stateful Firewall.
Uplink Packets Dropped	Total number of uplink packets dropped by Stateful Firewall.
Uplink Bytes Dropped	Total number of uplink bytes dropped by Stateful Firewall.
Downlink Packets Dropped	Total number of downlink packets dropped by Stateful Firewall.
Downlink Bytes Dropped	Total number of downlink bytes dropped by Stateful Firewall.
Total Malformed Packets	Total number of malformed packets detected by Stateful Firewall.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by Stateful Firewall.
Total Flows Processed by Firewall	Total number of flows processed by Stateful Firewall.

show active-charging firewall statistics protocol ipv6 verbose

Table 101. show active-charging firewall statistics protocol ipv6 verbose Command Output Descriptions

Field	Description
Firewall Statistics for Protocol: IPv6	
IPv6 Stats	
Land Attacks	Total number of land attacks detected by Stateful Firewall.
Jolt Attacks	Total number of jolt attacks detected by Stateful Firewall.
Teardrop Attacks	Total number of teardrop attacks detected by Stateful Firewall.
Invalid IP Option Length	Total number of packets with invalid IP option length.
IPv6 Source-router Attacks	Total number of IPv6 source-router attacks detected by Stateful Firewall.
Packets with Short IPv6 Header Length	Total number of packets with short IPv6 header length.
Packets with Nested Fragmentation Header	Total number of packets with nested fragmentation header.
Packets with Unspecified IPv6 Address	Total number of packets with unspecified IPv6 address.
Packets with invalid Payload Length	Total number of packets with invalid payload length.
Packets with more than threshold Extension Headers	Total number of packets with more than threshold extension headers.
Packets with invalid Hop By Hop Extension Header	Total number of packets with invalid hop by hop extension header.
Packets with ICMPv4 in IPv6 Header	Total number of packets with ICMPv4 in IPv6 header.
Packets with invalid Destination Extension Header	Total number of packets with invalid destination extension header.
Downlink Dropped Bytes on IPv6 Reassembly Failure	Total number of downlink bytes dropped due to reassembly failure.
Uplink Dropped Bytes on IPv6 Reassembly Failure	Total number of uplink bytes dropped due to reassembly failure.
Data Stats	
Total Packets Received	Total number of packets received in uplink and downlink flows.
Total Bytes Received	Total number of bytes received by Stateful Firewall.
Total Packets Sent	Total number of packets sent by Stateful Firewall.
Total Bytes Sent	Total number of bytes sent by Stateful Firewall.
Total Packets Injected	Total number of packets injected by Stateful Firewall.
Total Bytes Injected	Total number of bytes injected by Stateful Firewall.
Uplink Packets Dropped	Total number of packets in uplink flow dropped by Stateful Firewall.
Uplink Bytes Dropped	Total number of bytes in uplink flow dropped by Stateful Firewall.

Field	Description
Downlink Packets Dropped	Total number of packets in downlink flow dropped by Stateful Firewall.
Downlink Bytes Dropped	Total number of bytes in downlink flow dropped by Stateful Firewall.
Total Malformed Packets	Total number of malformed packets detected by Stateful Firewall.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by Stateful Firewall.
Total Flows Processed by Firewall	Total number of flows processed by Stateful Firewall.
Total NAT Flows Processed by Firewall	Total number of NAT flows processed by Stateful Firewall.

show active-charging firewall statistics protocol udp verbose

Table 102. show active-charging firewall statistics protocol udp verbose Command Output Descriptions

Field	Description
Firewall Statistics for Protocol: UDP	
UDP Stats	
Invalid UDP Echo Response	Total number of invalid UDP echo responses.
Invalid UDP Packet Length	Total number of invalid UDP packet length.
Packets Dropped due to UDP Checksum Errors	Total number of packets dropped due to UDP Checksum errors.
Packets with Short UDP Header Length	Total number of packets with short UDP header length.
Packets Dropped on UDP Flood Attack	Total number of packets dropped by Stateful Firewall in UDP flood attacks.
Packets Dropped due to exceeding ICMP dest unreachable threshold	Total number of packets dropped due to exceeding ICMP destination unreachable threshold.
Data Stats	
Total Packets Received	Total number of packets received in uplink and downlink flows.
Total Bytes Received	Total number of bytes received by Stateful Firewall.
Total Packets Sent	Total number of packets sent by Stateful Firewall.
Total Bytes Sent	Total number of bytes sent by Stateful Firewall.
Total Packets Injected	Total number of packets injected by Stateful Firewall.
Total Bytes Injected	Total number of bytes injected by Stateful Firewall.
Uplink Packets Dropped	Total number of packets in uplink flow dropped by Stateful Firewall.
Uplink Bytes Dropped	Total number of bytes in uplink flow dropped by Stateful Firewall.
Downlink Packets Dropped	Total number of packets in downlink flow dropped by Stateful Firewall.
Downlink Bytes Dropped	Total number of bytes in downlink flow dropped by Stateful Firewall.
Total Malformed Packets	Total number of malformed packets detected by Stateful Firewall.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by Stateful Firewall.
Total Flows Processed by Firewall	Total number of flows processed by Stateful Firewall.

show active-charging firewall statistics callid <call_id> verbose

Table 103. show active-charging firewall statistics callid <call_id> verbose Command Output Descriptions

Field	Description
Firewall Statistics for Callid: <call_id>	
IP Stats:	
Land Attacks	Total number of Land attacks detected by Stateful Firewall.
Jolt Attacks	Total number of Jolt attacks detected by Stateful Firewall.
Teardrop Attacks	Total number of Teardrop attacks detected by Stateful Firewall.
Invalid IP Option Length	Total number of Invalid IP Option Length attacks detected by Stateful Firewall.
IP Source-router Attacks	Total number of IP Source-router attacks detected by Stateful Firewall.
Packets with IP-Unaligned-Timestamp	Total number of packets with IP unaligned timestamps detected by Stateful Firewall.
Packets with Short IP Header Length	Total number of packets with short IP header length detected by Stateful Firewall.
Packets Dropped due to IP Checksum Errors	Total number of packets dropped due to IP Checksum error.
Downlink Dropped Bytes on IP Reassembly Failure	Total number of downlink bytes dropped on IP Reassembly failure.
Uplink Dropped Bytes on IP Reassembly Failure	Total number of uplink bytes dropped on IP Reassembly failure.
TCP Stats:	
Data Packets Received After RST/FIN	Total number of data packets received after receiving RST (reset) request by Stateful Firewall.
Invalid SEQ Number Received with RST	Total number of invalid sequence-number received with RST (reset) request by Stateful Firewall.
Data without Connection Established	Total number of data packets received before the establishment of connection by Stateful Firewall.
Invalid TCP Connection Requests	Total number of invalid TCP connection requests received by Stateful Firewall.
Invalid TCP pre-connection Requests	Total number of invalid TCP pre-connection requests received by Stateful Firewall.
Invalid ACK Value (Cookie Enabled)	Total number of invalid ACK values (to enable cookies) received by Stateful Firewall.
Invalid TCP Packet Length	Total number of TCP packets with invalid length received by Stateful Firewall.

```
show active-charging firewall statistics callid <call_id> verbose
```

Field	Description
Packets with Short TCP Header Length	Total number of TCP packets with invalid/short header length received by Stateful Firewall.
Packets Dropped due to TCP Checksum Errors	Total number of packets dropped due to TCP Checksum error.
Packets with SEQ/ACK Out-of-range	Total number of packets with out of range SEQ/ACK.
TCP Null Scan Attacks	Total number of TCP Null Scan attacks detected by Stateful Firewall.
Post Connection SYN	Total number of Post Connection SYN attacks detected by Stateful Firewall.
Unable to Send SYN Packet	Total number of attempts detected by Stateful Firewall when node failed to send SYN packets.
Send Final ACK to Target Failed	Total number of attempts detected by Stateful Firewall when node failed to send Final ACK packet to target node.
Invalid TCP Packet: SYN-ACK Expected	Total number of invalid TCP packets received by Stateful Firewall in place of SYN+ACK packets.
No TCP Flags Set	Total number of TCP packets received with no flags set.
All TCP Flags Set	Total number of TCP flags received with all flags set.
Invalid TCP Packets	Total number of invalid TCP packets including all type of errors and attacks received by Stateful Firewall.
Flows Closed by RST before 3-Way Handshake	Total number flows closed by RST (reset) message before the 3-way handshaking.
Flows Timed-out in SYN_RCVD1 State	Total number of flows timed out in SYN_RCVD1 state.
Flows Timed-out in SYN_RCVD2 State	Total number of flows timed out in SYN_RCVD2 state.
Flows Terminated due to WinNuke Attack	Total number of flows terminated due to WinNuke attacks by Stateful Firewall.
TCP-SYN Flood Attacks	Total number of TCP-SYN Flood attacks detected by Stateful Firewall.
Packets Dropped on TCP-SYN Flood Attack	Total number of packets dropped by Stateful Firewall in TCP-SYN Flood attacks.
FTP-Bounce Attacks	Total number of FTP-Bounce attacks detected by Stateful Firewall.
Mime-Flood Attacks	Total number of Mime-Flood attacks detected by Stateful Firewall.
Proxy Handshakes Completed	Total number of times proxy handshake was completed.
Packets Dropped during Proxy Handshake	Total number of packets dropped during proxy handshake.
UDP Stats:	
Invalid UDP Echo Response	Total number of invalid UDP echo responses.
Invalid UDP Packet Length	Total number of invalid UDP packet length.
Packets Dropped due to UDP Checksum Errors	Total number of packets dropped due to UDP Checksum errors.
Packets with Short UDP Header Length	Total number of packets with short UDP header length.

Field	Description
Packets Dropped on UDP Flood Attack	Total number of packets dropped by Stateful Firewall in UDP flood attacks.
Packets Dropped due to exceeding ICMP dest unreachable threshold	Total number of packets dropped due to exceeding ICMP destination unreachable threshold.
ICMP Stats:	
Invalid ICMP Response	Total number of invalid ICMP responses.
ICMP Reply Error	Total number of ICMP reply errors.
Invalid ICMP Type Packet	Total number of invalid ICMP type packets.
ICMP Error Message Replay Attacks	Total number of ICMP error message replay attacks detected by Stateful Firewall.
ICMP Packets with Duplicate Sequence Number	Total number of ICMP packets with duplicate sequence numbers.
Packets with Short ICMP Header Length	Total number of packets with short ICMP header length.
Invalid ICMP Packet Length	Total number of packets with invalid ICMP packet length.
Packets Dropped on ICMP Flood Attack	Total number of packets dropped by Stateful Firewall in ICMP flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMP Checksum Errors	Total number of packets dropped due to ICMP Checksum errors.
ICMP Packets With Destination Unreachable Message	Total number of ICMP packets with Destination Unreachable Message.
ICMP Echo Packets Dropped due to ID Zero	Total number of ICMP echo packets dropped due to zero ID.
ICMPv6 Stats:	
Invalid ICMPv6 Response	Total number of invalid ICMPv6 responses.
ICMPv6 Reply Error	Total number of ICMPv6 reply errors.
Invalid ICMPv6 Type Packet	Total number of invalid ICMPv6 type packets.
ICMPv6 Error Message Replay Attacks	Total number of ICMPv6 error message replay attacks detected by Stateful Firewall.
ICMPv6 Packets with Duplicate Sequence Number	Total number of ICMPv6 packets with duplicate sequence numbers.
Packets with Short ICMPv6 Header Length	Total number of packets with short ICMPv6 header length.
Invalid ICMPv6 Packet Length	Total number of packets with invalid ICMPv6 packet length.
Packets Dropped on ICMPv6 Flood Attack	Total number of packets dropped by Stateful Firewall in ICMPv6 flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMPv6 Checksum Errors	Total number of packets dropped due to ICMPv6 Checksum errors.

```
show active-charging firewall statistics callid <call_id> verbose
```

Field	Description
ICMPv6 Packets With Destination Unreachable Message	Total number of ICMPv6 packets with Destination Unreachable Message.
ICMPv6 Echo Packets Dropped due to ID Zero	Total number of ICMPv6 echo packets dropped due to zero ID.
General Stats:	
Packets without Any Data Received	Total number of packets received without any data.
No Matching Uplink Ruledef	Total number of uplink packets with no matching ruledef.
No Matching Downlink Ruledef	Total number of downlink packets with no matching ruledef.
Deny Ruledef Matched	Total number of times deny ruledef was matched.
Packets Dropped due to No Ruledef in Rulebase	Total number of packets dropped due to no ruledef in rulebase.
Packets Dropped due to Miscellaneous Errors	Total number of packets dropped due to miscellaneous errors.
Flows Timed-out	Total number of flows that timed out.
Flows Not Established from External Network	Total number of flows from external networks that were not established.
Max Flows Limit Reached	Total number of times the maximum flows limit was reached.
IP Retransmitted Packets Dropped	Total number of IP retransmitted packets dropped.
Data Stats:	
Total Packets Received	Total number of packets received in uplink and downlink flows.
Total Bytes Received	Total number of bytes received by Stateful Firewall.
Total Packets Sent	Total number of packets sent by Stateful Firewall.
Total Bytes Sent	Total number of bytes sent by Stateful Firewall.
Total Packets Injected	Total number of packets injected by Stateful Firewall.
Total Bytes Injected	Total number of bytes injected by Stateful Firewall.
Uplink Packets Dropped	Total number of packets in uplink flow dropped by Stateful Firewall.
Uplink Bytes Dropped	Total number of bytes in uplink flow dropped by Stateful Firewall.
Downlink Packets Dropped	Total number of packets in downlink flow dropped by Stateful Firewall.
Downlink Bytes Dropped	Total number of bytes in downlink flow dropped by Stateful Firewall.
Total Malformed Packets	Total number of malformed packets detected by Stateful Firewall.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by Stateful Firewall.
Total Flows Processed by Firewall	Total number of flows processed by Stateful Firewall.

show active-charging firewall statistics domainname <domain_name> verbose

Table 104. show active-charging firewall statistics domainname <domain_name> verbose Command Output Descriptions

Field	Description
Firewall Statistics for 2 Sessions with Domain-name: <domain_name>	
IP Stats:	
Land Attacks	Total number of Land attacks detected by Stateful Firewall.
Jolt Attacks	Total number of Jolt attacks detected by Stateful Firewall.
Teardrop Attacks	Total number of Teardrop attacks detected by Stateful Firewall.
Invalid IP Option Length	Total number of Invalid IP Option Length attacks detected by Stateful Firewall.
IP Source-router Attacks	Total number of IP Source-router attacks detected by Stateful Firewall.
Packets with IP-Unaligned-Timestamp	Total number of packets with IP unaligned timestamps detected by Stateful Firewall.
Packets with Short IP Header Length	Total number of packets with short IP header length detected by Stateful Firewall.
Packets Dropped due to IP Checksum Errors	Total number of packets dropped due to IP Checksum error.
Downlink Dropped Bytes on IP Reassembly Failure	Total number of downlink bytes dropped on IP Reassembly failure.
Uplink Dropped Bytes on IP Reassembly Failure	Total number of uplink bytes dropped on IP Reassembly failure.
TCP Stats:	
Data Packets Received After RST/FIN	Total number of data packets received after receiving RST (reset) request by Stateful Firewall.
Invalid SEQ Number Received with RST	Total number of invalid sequence-number received with RST (reset) request by Stateful Firewall.
Data without Connection Established	Total number of data packets received before the establishment of connection by Stateful Firewall.
Invalid TCP Connection Requests	Total number of invalid TCP connection requests received by Stateful Firewall.
Invalid TCP pre-connection Requests	Total number of invalid TCP pre-connection requests received by Stateful Firewall.
Invalid ACK Value (Cookie Enabled)	Total number of invalid ACK values (to enable cookies) received by Stateful Firewall.

```
show active-charging firewall statistics domainname <domain_name> verbose
```

Field	Description
Invalid TCP Packet Length	Total number of TCP packets with invalid length received by Stateful Firewall.
Packets with Short TCP Header Length	Total number of TCP packets with invalid/short header length received by Stateful Firewall.
Packets Dropped due to TCP Checksum Errors	Total number of packets dropped due to TCP Checksum error.
Packets with SEQ/ACK Out-of-range	Total number of packets with out of range SEQ/ACK.
TCP Null Scan Attacks	Total number of TCP Null Scan attacks detected by Stateful Firewall.
Post Connection SYN	Total number of Post Connection SYN attacks detected by Stateful Firewall.
Unable to Send SYN Packet	Total number of attempts detected by Stateful Firewall when node failed to send SYN packets.
Send Final ACK to Target Failed	Total number of attempts detected by Stateful Firewall when node failed to send Final ACK packet to target node.
Invalid TCP Packet: SYN-ACK Expected	Total number of invalid TCP packets received by Stateful Firewall in place of SYN+ACK packets.
No TCP Flags Set	Total number of TCP packets received with no flags set.
All TCP Flags Set	Total number of TCP flags received with all flags set.
Invalid TCP Packets	Total number of invalid TCP packets including all type of errors and attacks received by Stateful Firewall.
Flows Closed by RST before 3-Way Handshake	Total number flows closed by RST (reset) message before the 3-way handshaking.
Flows Timed-out in SYN_RCVD1 State	Total number of flows timed out in SYN_RCVD1 state.
Flows Timed-out in SYN_RCVD2 State	Total number of flows timed out in SYN_RCVD2 state.
Flows Terminated due to WinNuke Attack	Total number of flows terminated due to WinNuke attacks by Stateful Firewall.
TCP-SYN Flood Attacks	Total number of TCP-SYN Flood attacks detected by Stateful Firewall.
Packets Dropped on TCP-SYN Flood Attack	Total number of packets dropped by Stateful Firewall in TCP-SYN Flood attacks.
FTP-Bounce Attacks	Total number of FTP-Bounce attacks detected by Stateful Firewall.
Mime-Flood Attacks	Total number of Mime-Flood attacks detected by Stateful Firewall.
Proxy Handshakes Completed	Total number of times proxy handshake was completed.
Packets Dropped during Proxy Handshake	Total number of packets dropped during proxy handshake.
UDP Stats:	
Invalid UDP Echo Response	Total number of invalid UDP echo responses.
Invalid UDP Packet Length	Total number of invalid UDP packet length.
Packets Dropped due to UDP Checksum Errors	Total number of packets dropped due to UDP Checksum errors.

Field	Description
Packets with Short UDP Header Length	Total number of packets with short UDP header length.
Packets Dropped on UDP Flood Attack	Total number of packets dropped by Stateful Firewall in UDP flood attacks.
Packets Dropped due to exceeding ICMP dest unreachable threshold	Total number of packets dropped due to exceeding ICMP destination unreachable threshold.
ICMP Stats:	
Invalid ICMP Response	Total number of invalid ICMP responses.
ICMP Reply Error	Total number of ICMP reply errors.
Invalid ICMP Type Packet	Total number of invalid ICMP type packets.
ICMP Error Message Replay Attacks	Total number of ICMP error message replay attacks detected by Stateful Firewall.
ICMP Packets with Duplicate Sequence Number	Total number of ICMP packets with duplicate sequence numbers.
Packets with Short ICMP Header Length	Total number of packets with short ICMP header length.
Invalid ICMP Packet Length	Total number of packets with invalid ICMP packet length.
Packets Dropped on ICMP Flood Attack	Total number of packets dropped by Stateful Firewall in ICMP flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMP Checksum Errors	Total number of packets dropped due to ICMP Checksum errors.
ICMP Packets With Destination Unreachable Message	Total number of ICMP packets with Destination Unreachable Message.
ICMP Echo Packets Dropped due to ID Zero	Total number of ICMP echo packets dropped due to zero ID.
ICMPv6 Stats:	
Invalid ICMPv6 Response	Total number of invalid ICMPv6 responses.
ICMPv6 Reply Error	Total number of ICMPv6 reply errors.
Invalid ICMPv6 Type Packet	Total number of invalid ICMPv6 type packets.
ICMPv6 Error Message Replay Attacks	Total number of ICMPv6 error message replay attacks detected by Stateful Firewall.
ICMPv6 Packets with Duplicate Sequence Number	Total number of ICMPv6 packets with duplicate sequence numbers.
Packets with Short ICMPv6 Header Length	Total number of packets with short ICMPv6 header length.
Invalid ICMPv6 Packet Length	Total number of packets with invalid ICMPv6 packet length.
Packets Dropped on ICMPv6 Flood Attack	Total number of packets dropped by Stateful Firewall in ICMPv6 flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMPv6 Checksum Errors	Total number of packets dropped due to ICMPv6 Checksum errors.

```
show active-charging firewall statistics domainname <domain_name> verbose
```

Field	Description
ICMPv6 Packets With Destination Unreachable Message	Total number of ICMPv6 packets with Destination Unreachable Message.
ICMPv6 Echo Packets Dropped due to ID Zero	Total number of ICMPv6 echo packets dropped due to zero ID.
General Stats:	
Packets without Any Data Received	Total number of packets received without any data.
No Matching Uplink Ruledef	Total number of uplink packets with no matching ruledef.
No Matching Downlink Ruledef	Total number of downlink packets with no matching ruledef.
Deny Ruledef Matched	Total number of times deny ruledef was matched.
Packets Dropped due to No Ruledef in Rulebase	Total number of packets dropped due to no ruledef in rulebase.
Packets Dropped due to Miscellaneous Errors	Total number of packets dropped due to miscellaneous errors.
Flows Timed-out	Total number of flows that timed out.
Flows Not Established from External Network	Total number of flows from external networks that were not established.
Max Flows Limit Reached	Total number of times the maximum flows limit was reached.
IP Retransmitted Packets Dropped	Total number of IP retransmitted packets dropped.
Data Stats:	
Total Packets Received	Total number of packets received in uplink and downlink flows.

Invalid TCP Packets	Total number of invalid TCP packets including all type of errors and attacks received by Stateful Firewall.
Flows Closed by RST before 3-Way Handshake	Total number flows closed by RST (reset) message before the 3-way handshaking.
Flows Timed-out in SYN_RCVD1 State	Total number of flows timed out in SYN_RCVD1 state.
Flows Timed-out in SYN_RCVD2 State	Total number of flows timed out in SYN_RCVD2 state.
Flows Terminated due to WinNuke Attack	Total number of flows terminated due to WinNuke attacks by Stateful Firewall.
TCP-SYN Flood Attacks	Total number of TCP-SYN Flood attacks detected by Stateful Firewall.
Packets Dropped on TCP-SYN Flood Attack	Total number of packets dropped by Stateful Firewall in TCP-SYN Flood attacks.
FTP-Bounce Attacks	Total number of FTP-Bounce attacks detected by Stateful Firewall.
Mime-Flood Attacks	Total number of Mime-Flood attacks detected by Stateful Firewall.
Proxy Handshakes Completed	Total number of times proxy handshake was completed.
Packets Dropped during Proxy Handshake	Total number of packets dropped during proxy handshake.
UDP Stats:	
Invalid UDP Echo Response	Total number of invalid UDP echo responses.
Invalid UDP Packet Length	Total number of invalid UDP packet length.
Packets Dropped due to UDP Checksum Errors	Total number of packets dropped due to UDP Checksum errors.

Field	Description
Packets with Short UDP Header Length	Total number of packets with short UDP header length.
Packets Dropped on UDP Flood Attack	Total number of packets dropped by Stateful Firewall in UDP flood attacks.
Packets Dropped due to exceeding ICMP dest unreachable threshold	Total number of packets dropped due to exceeding ICMP destination unreachable threshold.
ICMP Stats:	
Invalid ICMP Response	Total number of invalid ICMP responses.
ICMP Reply Error	Total number of ICMP reply errors.
Invalid ICMP Type Packet	Total number of invalid ICMP type packets.
ICMP Error Message Replay Attacks	Total number of ICMP error message replay attacks detected by Stateful Firewall.
ICMP Packets with Duplicate Sequence Number	Total number of ICMP packets with duplicate sequence numbers.
Packets with Short ICMP Header Length	Total number of packets with short ICMP header length.
Invalid ICMP Packet Length	Total number of packets with invalid ICMP packet length.
Packets Dropped on ICMP Flood Attack	Total number of packets dropped by Stateful Firewall in ICMP flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMP Checksum Errors	Total number of packets dropped due to ICMP Checksum errors.
ICMP Packets With Destination Unreachable Message	Total number of ICMP packets with Destination Unreachable Message.
ICMP Echo Packets Dropped due to ID Zero	Total number of ICMP echo packets dropped due to zero ID.
ICMPv6 Stats:	
Invalid ICMPv6 Response	Total number of invalid ICMPv6 responses.
ICMPv6 Reply Error	Total number of ICMPv6 reply errors.
Invalid ICMPv6 Type Packet	Total number of invalid ICMPv6 type packets.
ICMPv6 Error Message Replay Attacks	Total number of ICMPv6 error message replay attacks detected by Stateful Firewall.
ICMPv6 Packets with Duplicate Sequence Number	Total number of ICMPv6 packets with duplicate sequence numbers.
Packets with Short ICMP Header Length	Total number of packets with short ICMP header length.
Invalid ICMPv6 Packet Length	Total number of packets with invalid ICMPv6 packet length.
Packets Dropped on ICMPv6 Flood Attack	Total number of packets dropped by Stateful Firewall in ICMPv6 flood attacks.
Ping Of Death Attacks	Total number of Ping-of-Death attacks detected by Stateful Firewall.
Packets Dropped due to ICMPv6 Checksum Errors	Total number of packets dropped due to ICMPv6 Checksum errors.

```
show active-charging firewall statistics username <user_name> verbose

Total Packets Injected	Total number of packets injected by Stateful Firewall.
Total Bytes Injected	Total number of bytes injected by Stateful Firewall.
Uplink Packets Dropped	Total number of packets in uplink flow dropped by Stateful Firewall.
Uplink Bytes Dropped	Total number of bytes in uplink flow dropped by Stateful Firewall.
Downlink Packets Dropped	Total number of packets in downlink flow dropped by Stateful Firewall.
Downlink Bytes Dropped	Total number of bytes in downlink flow dropped by Stateful Firewall.
Total Malformed Packets	Total number of malformed packets detected by Stateful Firewall.
Total DOS Attacks	Total number of Denial-of-Service attacks detected by Stateful Firewall.
Total Flows Processed by Firewall	Total number of flows processed by Stateful Firewall.

show active-charging firewall track-list attacking-servers

Table 106. show active-charging firewall track-list attacking-servers Command Output Descriptions

Field	Description
Attacking Servers:	
Server IP address	IP address of server being tracked for involvement in Denial-of-Service (DOS) attacks.
Time of last attack	Date and time of last attack from the server.
Time of first attack	Date and time of first attack from the server.
Total attacks	Total number of attacks from the server.
Last Attack Type	The last DOS attack type from the server.
Total attacking servers found	Total number of attacking servers found.

show active-charging fw-and-nat policy name

Table 107. show active-charging fw-and-nat policy name Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
Firewall Policy Name	Name of the Firewall-and-NAT Policy.
Firewall Status IPv4	Indicates whether IPv4 Stateful Firewall is enabled or disabled in the Firewall-and-NAT policy.
Firewall Status IPv6	Indicates whether IPv6 Stateful Firewall is enabled or disabled in the Firewall-and-NAT policy.
NAT Status	Indicates whether NAT is enabled or disabled in the Firewall-and-NAT policy.
Firewall and NAT Action Priorities	
Ruledef Name	Name of the access ruledef.
Type	Indicates the ruledef type. <ul style="list-style-type: none"> • FD: Firewall Dynamic Ruledef — Predefined and disabled rules that can be enabled/disabled by the policy server. • FS: Firewall Static Ruledef — Predefined and enabled rules that cannot be modified by the policy server. • FSDP: Firewall Static & Dynamic Ruledef — Predefined and enabled rules that can be enabled/disabled by the policy server.
Priority	Priority of the access ruledef in the Firewall-and-NAT policy.
Charging-action/ Fw-and-nat-action	The charging action (C) or the fw-and-nat action (F) configured with the access ruledef.
Port-trigger aux-ports:direction	The auxiliary ports open for traffic, and the direction from which the auxiliary connection is initiated.
NAT-Realm	Name of the NAT realm.
Firewall Configuration	
Dos-Protection	
Source-Route	Indicates status of protection against IP Source Route IP Option attacks.
Win-Nuke	Indicates status of protection against Win Nuke attacks.
Mime-Flood	Indicates status of protection against MIME Flood attacks.
FTP-Bounce	Indicates status of protection against FTP Bounce attacks.
IP-Unaligned-Timestamp	Indicates status of protection against IP Unaligned Timestamp attacks.
TCP-Window-Containment	Indicates status of protection against TCP Window Containment.

Field	Description
Teardrop	Indicates status of protection against Teardrop attacks.
UDP Flooding	Indicates status of protection against UDP Flooding attacks.
ICMP Flooding	Indicates status of protection against ICMP Flooding attacks.
SYN Flooding	Indicates status of protection against SYN Flooding attacks.
Port Scan	Indicates status of protection against Port Scan attacks.
IPv6 Extension Headers Limit	Indicates status of protection against maximum limit of IPv6 extension headers in an IPv6 packet. An IPv6 packet can contain zero or more extension headers.
IPv6 Hop By Hop Options	Indicates status of protection against IPv6 packets containing hop-by-hop extension header options.
Hop By Hop Router Alert Option	Indicates status of protection against IPv6 packets containing router alert hop-by-hop option.
Hop By Hop Jumbo Payload Option	Indicates status of protection against IPv6 packets containing jumbo payload hop-by-hop option.
Invalid Hop By Hop Options	Indicates status of protection against IPv6 packets containing invalid hop-by-hop options.
Unknown Hop By Hop Options	Indicates status of protection against IPv6 packets containing unknown hop-by-hop options.
IPv6 Destination Options	Indicates status of protection against IPv6 packets containing IPv6 destination options header.
Invalid Destination Options	Indicates status of protection against IPv6 packets containing invalid destination options.
Unknown Destination Options	Indicates status of protection against IPv6 packets containing unknown destination options.
IPv6 Nested Fragmentation	Indicates status of protection against IPv6 packets containing IPv6 nested fragmentation.
Max-Packet-Size	
ICMP	For ICMP protocol, the maximum IP packet size (after IP reassembly) allowed over Stateful Firewall.
Non-ICMP	For non-ICMP protocol, the maximum IP packet size (after IP reassembly) allowed over Stateful Firewall.
Flooding	
ICMP limit	The maximum number of ICMP packets allowed during a sampling interval.
UDP limit	The maximum number of UDP packets allowed during a sampling interval.
TCP-SYN limit	The maximum number of TCP-SYN packets allowed during a sampling interval.
Sampling Interval	The flooding sampling interval, in seconds.
TCP-SYN Flood Intercept	

■ show active-charging fw-and-nat policy name

Field	Description
Mode	The TCP SYN flood intercept mode. <ul style="list-style-type: none"> • none • intercept • watch
Watch-timeout	The TCP intercept watch timeout, in seconds.
Mime-Flood Params	
HTTP Header-Limit	The maximum number of headers allowed in an HTTP packet.
HTTP Max-Header-Field-Size	The maximum header field size allowed in an HTTP header, in bytes.
No Firewall Ruledef Match Action	
Uplink Action	Action configured for uplink packets with no access ruledef matches.
Uplink Charging-Action	Charging action configured for uplink packets with no access ruledef matches.
Uplink NAT-Realm	The NAT-realm to be used if none of the firewall ruledefs are matched for the uplink traffic.
Uplink Fw-and-nat-action	The Fw-and-nat action to be used if none of the firewall ruledefs are matched for the uplink traffic.
Downlink Action	Action configured for downlink packets with no access ruledef matches.
Downlink Charging-Action	Charging action configured for downlink packets with no access ruledef matches.
Downlink NAT-Realm	The NAT-realm to be used if none of the firewall ruledefs are matched for the downlink traffic.
Downlink Fw-and-nat-action	The Fw-and-nat action to be used if none of the firewall ruledefs are matched for the downlink traffic.
TCP RST Message Threshold	Indicates whether a threshold limit is set on the number of TCP reset messages sent by the subscriber for a particular data flow.
TCP RST Message Threshold Value	The threshold value set for the number of TCP reset messages sent by the subscriber for a particular data flow. Range: 1 to 100
ICMP Dest-Unreachable Threshold	Indicates whether a threshold limit is set on the number of ICMP error messages sent by the subscriber for a particular data flow.
ICMP Dest-Unreachable Threshold Value	The threshold value set for the number of ICMP error messages sent by the subscriber for a particular data flow.
Action upon receiving TCP SYN packet with ECN/CWR Flag set	Indicates the action to be taken on receiving a TCP SYN packet with ECN/CWR Flag set.
Action upon receiving a malformed packet	Indicates the action to be taken on receiving a malformed packet.
Action upon IP Reassembly Failure	Indicates the action to be taken on IP reassembly failure.

Field	Description
Action upon receiving an IP packet with invalid Options	Indicates the action to be taken on receiving an IP packet with invalid options.
Action upon receiving a TCP packet with invalid Options	Indicates the action to be taken on receiving a TCP packet with invalid options.
Action upon receiving an ICMP packet with invalid Checksum	Indicates the action to be taken on receiving an ICMP packet with invalid checksum.
Action upon receiving a TCP packet with invalid Checksum	Indicates the action to be taken on receiving a TCP packet with invalid checksum.
Action upon receiving a UDP packet with invalid Checksum	Indicates the action to be taken on receiving a UDP packet with invalid checksum.
Action upon receiving an ICMP echo packet with id zero	Indicates the action to be taken on receiving an ICMP echo packet with id zero.
TCP Stateful Checks	Indicates whether stateful checks for TCP is enabled or disabled.
First Packet Non-SYN Action	Indicates the action to be taken on flows with first packet Non-SYN.
ICMP Stateful Checks	Indicates whether Stateful checks for ICMP is enabled or disabled.
TCP Partial Connection Timeout	Displays the time period for TCP partial connection, in seconds.
NAT Configuration	
NBR Format	Displays the NAT Binding Record format.
Private IP NPU Flow Timeout	The time period for private IP NPU Flow, in seconds.
Suppress sending NAT bind update to AAA	Indicates if the NAT bind update sent to AAA is suppressed or not.
Default NAT-Realm	The default NAT-realm to be used if no NAT-realm is found as part of firewall ruledefs.
Default Fw-and-nat-action	The Fw-and-nat action to be used when the default NAT-realm is used.

show active-charging flows full

For a TCP flow.

Table 108.show active-charging flows full Command Output Descriptions

Field	Description
Flow-ID	Identifier for flows.
Session-ID	Identifier for ACS session.
Uplink Packets	Total number of packets uplinked.
Uplink Bytes	Total number of bytes uplinked.
Downlink Packets	Total number of packets downlinked.
Downlink Bytes	Total number of bytes downlinked.
MS IP	The MS IP address.
MS NAT IP	The MS NAT IP address.
Server IP	The server IP address.
Transport Protocol	The transport protocol: TCP, UDP, ICMP
Application Protocol	The application protocol.
Video Pacing	Indicates whether video pacing is enabled or disabled.
Video Encoded Bit Rate	The currently enforced bit rate for video pacing.
Video Pacing Initial Burst Size	The initial burst size allowed, in bytes, during video pacing.
Video Pacing Normal Burst Size	The normal burst size allowed, in bytes, during video pacing.
Video Pacing Dropped Bytes	The number of data bytes dropped during video pacing.
Video Payload Bytes Sent towards User	The number of data bytes sent to the UE during video pacing.
Video Pacing Duration	The duration, in seconds, of the video being paced.
TCP MS Port	The TCP MS port number.
TCP MS NAT Port	The TCP MS NAT port number. This field is not displayed for one-to-one NAT.
TCP Server Port	The TCP server port number.
TCP State	Indicates the TCP state.
TCP Prev State	Indicates the previous TCP state.
MS Window Size	The mobile window size.

Field	Description
Server Window Size	The server window size.
MS Retries	Total number of mobile subscriber retries.
Server Retries	Total number of server retries.
ITC Action Applied	Indicates the ITC action applied.
Socket Migration Details:	TCP Proxy Socket Migration related information:
State	Indicates Socket Migration state of the flow. For example, SOCK_MIG_DONE.
Highest ACK Frm Server	Highest acknowledgement number from the server.
Highest Seq Frm Server	Highest sequence number from the server.
Highest ACK Frm MS	Highest acknowledgement number from the MS.
Highest Seq Frm MS	Highest sequence number from the MS.
Seq Frm MS at Mig	Sequence number from MS at migration.
ACK Frm MS at Mig	Acknowledgement number from MS at migration.
Seq Frm Server at Mig	Sequence number from server at migration.
ACK Frm Server at Mig	Acknowledgement number from server at migration.
Data To Be Delivered To MS	Data to be delivered to the MS.
Data To Be Delivered To Server	Data to be delivered to the server.
Highest Seq Frm MS	Highest sequence number from the MS.
Timestamps Enabled	Indicates if timestamps option is enabled.
SACK Enabled	Indicates if selective acknowledgement is enabled.
Wscale From MS	Window scale value from MS.
Wscale From Server	Window scale value from server.
Buffering Statistics:	
Buffered Uplink Packets	Total buffered uplink packets.
Buffered Uplink Bytes	Total buffered uplink bytes.
Buffered Downlink Packets	Total buffered downlink packets.
Buffered Downlink Bytes	Total buffered downlink bytes.
Uplink Packets in Buffer	Total uplink packets in the buffer.
Uplink Bytes in Buffer	Total uplink bytes in the buffer.
Downlink Packets in Buffer	Total downlink packets in the buffer.
Downlink Bytes in Buffer	Total downlink bytes in the buffer.
Buff Over-limit Uplink Pkts	Total number of uplink packets that are over the limit in the buffer.

■ show active-charging flows full

Field	Description
Buff Over-limit Uplink Bytes	Total number of uplink bytes that are over the limit in the buffer.
Buff Over-limit Downlink Pkts	Total number of downlink packets that are over the limit in the buffer.
Buff Over-limit Downlink Bytes	Total number of downlink bytes that are over the limit in the buffer.
CAE-Readdressing:	
GET Requests redirected	Total number of HTTP GET requests redirected to a CAE.
POST Requests redirected	Total number of HTTP POST requests redirected to a CAE.
Other Requests redirected	Total number of other HTTP requests redirected to a CAE.
HTTP Responses redirected	Total number of HTTP responses redirected to a CAE.
Requests having xheader inserted	Total number of HTTP requests that have x-headers inserted.
Total connect failed to video server	Total number of failed connections to the video server.
Total uplink Bytes	Total number of uplink bytes.
Total uplink Packets	Total number of uplink packets.
Total downlink Bytes	Total number of downlink bytes.
Total downlink Packets	Total number of downlink packets.
Link Monitoring	
Average Throughput	The average TCP throughput of downlink TCP traffic towards the mobile device, in kbps.
Average RTT	The average TCP RTT (Round Trip Time) of downlink TCP traffic towards the mobile device, in milliseconds.
Total ACS flows matching specified criteria	The total ACS flows that match the specified criteria.

show active-charging flows full type p2p

Table 109. show active-charging flows full type p2p Command Output Descriptions

Field	Description
Flow-ID	Identifier for flows.
Session-ID	Identifier for Active Charging session with P2P.
Uplink Packets	Total packets uplinked.
Downlink Packets	Total packets downlinked.
Uplink Bytes	Total bytes uplinked.
Downlink Bytes	Total bytes downlinked.
Transport Protocol	The protocol used for data transport.
Application Protocol	The type of application protocol used for this session.
UDP Client Port	UDP port on client communication.
UDP Server Port	UDP port on server for communication.
ITC Action Applied	Status of Intelligent Traffic Control (ITC) on this session traffic.

show active-charging flows type p2p

Table 110. show active-charging flows type p2p Command Output Descriptions

Field	Description
Flow-ID	Identifier for Flows.
Session-ID	Identifier for Active Charging session with P2P.
Flow-num	Identifies the flow number.
Application Protocol (VV)	<p>The protocol used for application. Supported application protocols are:</p> <ul style="list-style-type: none"> • HT- HTTP • HS - HTTPS • SM - SMTP • P3 - POP3 • WT - WTP • WS - WSP • DN - DNS • RT - RTP • EM - EMAIL • MM - MMS • FT - FTP • SI - SIP • WW - WWW • RS - RTSP • IM - IMAP • P2 - P2P • RC - RTCP • TF - TFTP • WC - WSP Connection Oriented • WX - WSP Connection-less • XX - Unknown • H3 - H323 • PP - PPTP

Field	Description
Transport Protocol (v)	The protocol used for data transport. Supported data transport protocols are: <ul style="list-style-type: none"> • T - TCP • U - UDP • I - ICMP and ICMPv6 • G - GREv1 • X - Unknown
Bytes-Up	Total bytes uplinked.
Bytes-Down	Total bytes downlinked.
Packets-Up	Total packets uplinked.
Packets-Down	Total packets downlinked.
Uplink Bytes	Total bytes uplinked.
Downlink Bytes	Total bytes downlinked.
Transport Protocol	The protocol used for data transport.
Application Protocol	The type of application protocol used for this session.
UDP Client Port	UDP port on client communication.
UDP Server Port	UDP port on server for communication.
ITC Action Applied	Status of intelligent traffic control (ITC) on this session traffic.

show active-charging flow-mappings all

Table 111. show active-charging edr-format statistics Command Output Descriptions

Field	Description
Call-ID	The call identification number to which the data flow belongs.
MS IP	The IP address of the mobile subscriber.
MS NAT IP	The NAT IP address allocated to the mobile subscriber.
MS Server IP	The server IP address of the mobile subscriber.
Transport Protocol	The transport protocol of the flow: TCP or UDP
TCP MS Port	The TCP port number of the mobile subscriber.
TCP MS NAT Port	The TCP NAT port number allocated to the mobile subscriber. This field is applicable for many-to-one NAT.
TCP Server Port	The TCP server port number for this flow (destination server port).
UDP MS Port	The UDP port number of the mobile subscriber.
UDP MS NAT Port	The UDP NAT port number allocated to the mobile subscriber. This field is applicable for many-to-one NAT.
UDP Server Port	The UDP server port number for this flow (destination server port).
Flow-Mapping timeout	The timeout after which the flow-mappings will be deleted.
Mapping Expiry	The time in seconds left for the flow-mapping timeout to happen. This value decrements starting from a maximum of “Flow-Mapping timeout”. This value upon reaching zero, the flow mapping will be deleted.

show active-charging group-of-ruledefs name

Table 112. show active-charging group-of-ruledefs name Command Output Descriptions

Field	Description
Service Name	The service in which the specified group-of-ruledefs is configured.
Group-of-Ruledefs Name	Name of the group-of-ruledefs.
Ruledef Name	Names of the ruledefs added to the group-of-ruledefs.
Priority	The priorities configured for each of the ruledefs in the group-of-ruledefs.
Total group(s)-of-ruledefs found	The total number of group(s)-of-ruledefs matching the specified criteria.

show active-charging nat statistics

Table 113. show active-charging nat statistics Command Output Descriptions

Field	Description
NAT Realm Utilization:	
Realm Name	Name of the NAT realm.
Context	Context in which the NAT realm is configured.
Current IP Address-In-Use	The number of IP addresses from the NAT realm currently in use.
Total IP Address	The total number of IP addresses for the NAT realm.
Current Calls Using-Realm	The number of current calls using the NAT realm.
Current Port-Chunks Available	The number of port chunks currently available.
Current Port-Chunks-In-Use	The number of port chunks currently in use.
Total Port-Chunks	The total number of port chunks for the NAT realm.
Port-Chunk Size	The size of the port chunks.
Statistics:	
Total AAA alloc msgs sent	The total number of AAA allocation messages sent.
Total AAA dealloc msgs sent	The total number of AAA deallocation messages sent.
Total flows denied IP	The total number of subscriber flows that were denied NAT IP address.
Total flows denied port	The total number of subscriber flows that were denied a port.
Total bytes Transferred	The total number of bytes transferred.
Total flows processed	The total number of flows processed.
Average TCP port usage	The average TCP port usage in the allocated TCP ports, i.e out of allocated TCP ports how many got used.
Average UDP port usage	The average UDP port usage in the allocated UDP ports, i.e out of allocated UDP ports how many got used.
Average Others port usage	The average Others (ICMP or GRE) port usage in the allocated others ports, i.e out of allocated 'Others' ports how many got used.
Port-Chunks distribution	

Field	Description
Max no.of chunks used	The maximum number of port chunks used.
Total no.of subscribers	Total number of subscribers using maximum number of port chunks.
Current no.of subscribers	Total number of current subscribers using maximum number of port chunks.
Total Realms	The total number of NAT realms found.

show active-charging p2p-dynamic-rules verbose

This command is under development for a future release and is not supported in this release.

show active-charging rulebase name

Table 114. show active-charging rulebase name Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
Rule Base Name	Name of the rulebase.
Charging Action Priorities	
Name	Name of the charging ruledef / group-of-ruledefs.
Type	The ruledef / group-of-ruledefs type. <ul style="list-style-type: none"> • RD: Dynamic ruledef • RS: Static ruledef • RSD: Static and dynamic ruledef • GD: Dynamic group-of-ruledefs • GS: Static group-of-ruledefs • GSD: Static and dynamic group-of-ruledefs
Priority	Priority of the ruledef / group-of-ruledefs in the rulebase.
Charging-action	The charging action configured with the ruledef / group-of-ruledefs.
Timedef	The time definition configured with the ruledef / group-of-ruledefs.
Description	Description of the charging ruledef / group-of-ruledefs configuration.
Post-processing Action Priorities	
Name	Name of the Post-processing ruledef.
Type	The Post-processing ruledef type.
Priority	Priority of the Post-processing ruledef in the rulebase.
Charging-action	The charging action configured.
Description	Description of the Post-processing ruledef configuration.
Routing Action Priorities	
Ruledef Name	Name of the routing action ruledef.
Priority	Priority of the routing action ruledef in the rulebase.
Analyzer	Name of the applicable analyzer to routing action ruledef.
Description	Description of the routing ruledef configuration.
Firewall Action Priorities	

Field	Description
Ruledef Name	Name of the Stateful Firewall ruledef.
Type	Indicates the Stateful Firewall ruledef type. <ul style="list-style-type: none"> • FD: Firewall Dynamic Ruledef—Predefined and disabled Stateful Firewall rules that can be enabled/disabled by the policy server. • FS: Firewall Static Ruledef—Predefined and enabled Stateful Firewall rules that cannot be modified by the policy server. • FSDP: Firewall Static & Dynamic Ruledef—Predefined and enabled Stateful Firewall rules that can be disabled/enabled by the policy server.
Priority	Priority of the Stateful Firewall ruledef in the rulebase.
Charging-action	The charging action configured.
Port-trigger aux-ports:direction	The auxiliary ports open for traffic, and the direction from which the auxiliary connection is initiated.
EGCDR Fields	
Tariff Time thresholds (min:hrs)	Threshold for tariff in minutes and hours.
Internal Threshold	Internal threshold to generate eG-CDRs in seconds.
Uplink Octets	Total number of octets uplinked.
Downlink Octets	Total number of octets downlinked.
Total Octets	Total number of octets uplinked and downlinked.
Time Based Metering	Status of time based metering.
Content Filtering Group	Status of Content Filtering Server Group support for offline content filtering server (ICAP) support.
Content Filtering Flow Any Error	Indicates whether Content Filtering packets are allowed/discarded in case of ACS error scenarios. This field is displayed only if either the Content Filtering mode or, ICAP server-group is configured.
Content Filtering Policy	The Content Filtering policy.
Content Filtering Mode	Indicates the Content Filtering mode. <ul style="list-style-type: none"> • Static • Static-and-dynamic
URL-Blacklisting Action	Indicates action to be taken on URL Blacklisting match.
UDR Fields	
Tariff Time thresholds (min:hrs)	Threshold for tariff, in minutes and hours.
Internal Threshold	Internal threshold to generate UDRs, in seconds.
Uplink Octets	Total number of octets uplinked.

Field	Description
Downlink Octets	Total number of octets downlinked.
Total Octets	Total number of octets uplinked and downlinked.
CCA Fields	Information regarding Credit Control Application for prepaid charging.
RADIUS charging context	Name of the RADIUS charging context.
RADIUS Charging Group	Name of RADIUS charging server group.
RADIUS interim interval	Interim interval for RADIUS charging generation.
DIAMETER Requested Service Unit	Information regarding requested service unit for prepaid charging through Diameter.
Uplink Octets	Total number of octets uplinked in Diameter charging.
Downlink Octets	Total number of octets downlinked in Diameter charging.
Total Octets	Total number of octets uplinked and downlinked in Diameter charging.
Quota Retry Time	Duration set to retry for prepaid credit limit.
Quota Holding Time (QHT)	Status of quota holding time configuration.
Quota Time Duration Algorithms	Applicable algorithm for quota time duration.
Flow End Condition	Status of flow end condition configuration.
Handoff	Indicates whether EDRs are generated for handoffs.
Timeout	Indicates whether EDRs are generated for timeouts.
Normal-end-signaling	Indicates whether EDRs are generated for normal end signaling.
Session-end	Indicates whether EDRs are generated for session ends.
Hagr	Indicates whether EDRs are generated for HAGR.
Content-Filtering	Indicates whether EDRs are generated for Content Filtering.
edr-format	Name of the EDR format.
Flow Any Error Charging Action	Indicates the charging action configured for accounting action on packets dropped by Firewall due to any error. If disabled, no accounting is performed on such packets.
Billing Records	Status of billing record generation.
Limit For Total Flows	Status of flow limit setting across all applications.
Limit For TCP Flows	Status of TCP flow limit setting.
Limit For Non-TCP Flows	Status of non-TCP flow limit setting.

■ show active-charging rulebase name

Field	Description
Charging Rule Optimization	Type of optimization rule setting for charging.
Firewall Configuration	
Dos-Protection	
Source-Route	Indicates status of protection against IP Source Route IP Option attacks.
Win-Nuke	Indicates status of protection against Win Nuke attacks.
Mime-Flood	Indicates status of protection against MIME Flood attacks.
FTP-Bounce	Indicates status of protection against FTP Bounce attacks.
IP-Unaligned-Timestamp	Indicates status of protection against IP Unaligned Timestamp attacks.
Seq-Number-Prediction	Indicates status of protection against Sequence Number Prediction attacks.
TCP-Window-Containment	Indicates status of protection against TCP Window Containment.
Teardrop	Indicates status of protection against Teardrop attacks.
UDP Flooding	Indicates status of protection against UDP Flooding attacks.
ICMP Flooding	Indicates status of protection against ICMP Flooding attacks.
SYN Flooding	Indicates status of protection against SYN Flooding attacks.
Port Scan	Indicates status of protection against Port Scan attacks.
Max-Packet-Size	
ICMP	For ICMP protocol, the maximum IP packet size (after IP reassembly) allowed over Stateful Firewall.
Non-ICMP	For non-ICMP protocol, the maximum IP packet size (after IP reassembly) allowed over Stateful Firewall.
Flooding	
ICMP limit	The maximum number of ICMP packets allowed during a sampling interval.
UDP limit	The maximum number of UDP packets allowed during a sampling interval.
TCP-SYN limit	The maximum number of TCP-SYN packets allowed during a sampling interval.
Sampling Interval	The flooding sampling interval, in seconds.
TCP-SYN Flood Intercept	
Mode	The TCP SYN flood intercept mode. <ul style="list-style-type: none"> • none • intercept • watch
Max-Attempts	The maximum number of attempts for sending proxy SYN to the target.

Field	Description
Retrans-timeout	The SYN-Proxy retransmit timeout, in seconds.
Watch-timeout	The TCP intercept watch timeout, in seconds.
Mime-Flood Params	
HTTP Header-Limit	The maximum number of headers allowed in an HTTP packet.
HTTP Max-Header-Field-Size	The maximum header field size allowed in an HTTP header, in bytes.
No Firewall Ruledef Match Action	
Uplink Action	Action configured for uplink packets with no Stateful Firewall ruledef matches.
Uplink Charging-Action	Charging action configured for uplink packets with no Stateful Firewall ruledef matches.
Downlink Action	Action configured for downlink packets with no Stateful Firewall ruledef matches.
Downlink Charging-Action	Charging action configured for downlink packets with no Stateful Firewall ruledef matches.
ICMP Dest-Unreachable Threshold	Indicates whether a threshold limit is set on the number of ICMP error messages sent by the subscriber for a particular data flow.
ICMP Dest-Unreachable Threshold Value	The threshold value set for the number of ICMP error messages sent by the subscriber for a particular data flow.
QoS Renegotiation Timeout	The timeout setting for the Quality of Service (QoS) Renegotiation feature.
EDR Suppress zero byte records	Indicates whether EDR suppression of zero byte records is enabled.
EDR Timestamp Rounding	Type of timestamp rounding set for Event Detail Records.
EGCDR Timestamp Rounding	Type of timestamp rounding set for eG-CDRs.
RTP Dynamic Routing	Status of RTP dynamic routing configuration.
Ignore port no. in application headers	Status of ignoring port numbers in application headers.
Delayed Charging	Status of charging configuration to exclude initial handshaking TCP packets from charging.
IP Reassembly-Timeout	IP reassembly timeout period in milliseconds.
IP Reset ToS field	Status of IP Reset ToS field.
TCP Out-of-Order-Timeout	TCP out-of-order timeout period in milliseconds.
TCP 2MSL Timeout	TCP 2MSL timeout period in seconds.

Field	Description
WTP Out-of-Order-Timeout	WTP out-of-order timeout period in milliseconds.
TCP transmit-out-of-order-packets	Status of transmitting TCP out-of-order packets.
Verify TCP checksum	Status of verifying TCP checksum errors.
Verify UDP checksum	Status of verifying UDP checksum errors.
P2P Dynamic Routing	Status of P2P dynamic routing.
Total rulebase(s) found	Total number of rulebases matching the criteria.
CAE-Readdressing	Indicates whether CAE re-addressing on the Mobile Video Gateway is enabled or disabled.
Percentage Rate Reduction	If enabled, indicates the configured bit rate reduction for mobile video as a percentage of the input bit rate.
HTTP header-parse-limit	For a customer-specific feature, this field indicates the HTTP header parse limit, in bytes. On exceeding this limit the flow is marked as permanent failure and is matched and charged against http error = TRUE ruledef. If the feature is disabled, shows “disabled”.

show active-charging rulebase statistics

Table 115. show active-charging rulebase statistics Command Output Descriptions

Field	Description
Service Name	Name of the ACS service.
Rulebase Name	Name of the rulebase.
Uplink Pkts	Total number of packets uplinked.
Uplink Bytes	Total number of bytes uplinked.
Downlink Pkts	Total number of packets downlinked.
Downlink Bytes	Total number of bytes downlinked.
Readdressed Upl Pkts	Total number of readdressed uplinked packets.
Readdressed Upl Bytes	Total number of readdressed uplinked bytes.
Readdressed Dnl Pkts	Total number of readdressed downlinked packets.
Readdressed Dnl Bytes	Total number of readdressed downlinked bytes.
TCP MSS Inserted Pkts	Total number of TCP Maximum Segment Size (MSS) inserted packets.
TCP MSS Limited Pkts	Total number of TCP MSS limited packets.
ITC Terminated Flows	Total number of ITC terminated flows.
Total PP Dropped Packets	Total number of packets dropped.
Total PP Dropped Packet Bytes	Total number of bytes dropped.
R7Gx Rule-Matching Failure Stats:	
Total Dropped Packets	Total number of packets dropped by R7Gx due to rule matching failure, for the rulebase.
Total Dropped Packet Bytes	Total number of bytes dropped by R7Gx due to rule matching failure, for the rulebase.
TCP-proxy reset for non-SYN flows	Total number of resets sent by TCP Proxy for flows with no SYN packet after recovery.
EDRs	
Total EDRs generated	Total number of EDRs generated.
EDRs generated for handoff	Total number of EDRs generated for handoffs.
EDRs generated for timeout	Total number of EDRs generated for timeouts.
EDRs generated for normal-end-signaling	Total number of EDRs generated for normal end signalling.
EDRs generated for session end	Total number of EDRs generated for session ending.

Field	Description
EDRs generated for rule match	Total number of EDRs generated for rule matches.
EDRs generated for hagr	Total number of EDRs generated for HAGR.
EDRs generated for flow-end content-filtering	Total number of EDRs generated for flow-end Category-based Content Filtering.
EDRs generated for flow-end url-blacklisting	Total number of EDRs generated for flow-end URL Blacklisting.
EDRs generated for content-filtering	Total number of EDRs generated for Category-based Content Filtering.
EDRs generated for url-blacklisting	Total number of EDRs generated for URL Blacklisting.
EDRs generated for any-error packets	Total number of EDRs generated for any-error packets.
EDRs generated for firewall deny rule match	Total number of EDRs generated for firewall deny rule match.
EDRs generated for transaction completion	Total number of EDRs generated for completion of transactions.
EDRs generated for voip call end	Total number of EDRs generated on completion of voice calls.
Total Flow-Overflow EDRs	Total number of Flow-Overflow EDRs.
UDRs	
Total UDRs generated	Total number of UDRs generated.
UDRs generated for handoff	Total number of UDRs generated for handoffs.
UDRs generated for time limit	Total number of UDRs generated for time limits.
UDRs generated for volume limit	Total number of UDRs generated for volume limits.
UDRs generated for call end	Total number of UDRs generated for call endings.
UDRs generated for hagr	Total number of UDRs generated for HAGR.
GCDRs	
Total EGCDRs generated	Total number of eG-CDRs generated.
GCDRs for Normal Release	Total number of G-CDRs generated for normal releases.
GCDRs for Abnormal Release	Total number of G-CDRs generated for abnormal releases.
GCDRs for Volume Limit	Total number of G-CDRs generated for volume limits.
GCDRs for Time Limit	Total number of G-CDRs generated for time limits.
GCDRs for SGSN Change	Total number of G-CDRs generated for SGSN change.
GCDRs for Max Change Cond	Total number of G-CDRs generated for maximum change condition.
GCDRs for Mgmt Intervention	Total number of G-CDRs generated for management interventions.
GCDRs for RAT Change	Total number of G-CDRs generated for RAT changes.
GCDRs for MS Timezone Change	Total number of G-CDRs generated for MS timezone changes.

Field	Description
GCDRs for SGSN PLMN ID Change	Total number of G-CDRs generated for SGSN PLMN ID changes.
PGWCDRs for Normal Release	Total number of PGW-CDRs generated for normal releases.
PGWCDRs for Abnormal Release	Total number of PGW-CDRs generated for abnormal releases.
PGWCDRs for Volume Limit	Total number of PGW-CDRs generated for volume limits.
PGWCDRs for Time Limit	Total number of PGW-CDRs generated for time limits.
PGWCDRs for ServingNode Change	Total number of PGW-CDRs generated for Serving Node change.
PGWCDRs for Max Change Cond	Total number of PGW-CDRs generated for maximum change condition.
PGWCDRs for Mgmt Intervention	Total number of PGW-CDRs generated for management interventions.
PGWCDRs for RAT Change	Total number of PGW-CDRs generated for RAT changes.
PGWCDRs for MS Timezone Change	Total number of PGW-CDRs generated for MS timezone changes.
PGWCDRs for SGSN PLMN ID Change	Total number of PGW-CDRs generated for SGSN PLMN ID changes.
NBRs	NAT Binding Record (NBR) statistics. These fields are displayed, only if configured, in 8.3 and later releases.
Total NBRs generated	Total number of NBRs generated.
NBRs generated for port chunk allocation	Total number of NBRs generated for port chunk allocation.
NBRs generated for port chunk release	Total number of NBRs generated for port chunk release.
CAE-Readdressing:	
GET Requests redirected	Total number of HTTP GET requests redirected to a CAE.
POST Requests redirected	Total number of HTTP POST requests redirected to a CAE.
Other Requests redirected	Total number of other HTTP requests redirected to a CAE.
HTTP Responses redirected	Total number of HTTP responses redirected to a CAE.
HTTP Requests having xheader inserted	Total number of HTTP requests that have x-headers inserted.
Total Connect failed to video server	Total number of failed connections to the video server.
Total uplink bytes	Total number of uplink bytes.
Total uplink packets	Total number of uplink packets.
Total downlink bytes	Total number of downlink bytes.
Total downlink packets	Total number of downlink packets.

show active-charging rulebase statistics name

Table 116. show active-charging rulebase statistics name Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
Rulebase Name	Name of the rulebase.
Uplink Pkts	Total number of packets uplinked.
Uplink Bytes	Total number of bytes uplinked.
Downlink Pkts	Total number of packets downlinked.
Downlink Bytes	Total number of bytes downlinked.
Readdressed Upl Pkts	Total number of readdressed uplink packets.
Readdressed Upl Bytes	Total number of readdressed uplink bytes.
Readdressed Dnl Pkts	Total number of readdressed downlink packets.
Readdressed Dnl Bytes	Total number of readdressed downlink bytes.
TCP MSS Inserted Pkts	Total number of Maximum Segment Size (MSS) inserted packets.
TCP MSS Limited Pkts	Total number of MSS limited packets.
ITC Terminated Flows	Total number of flows terminated by Intelligent Traffic Control service.
Total PP Dropped Packets	Total number of packets dropped.
Total PP Dropped Packet Bytes	Total number of bytes dropped.
R7Gx Rule-Matching Failure Stats:	
Total Dropped Packets	Total number of packets dropped by R7Gx due to rule matching failure, for the rulebase.
Total Dropped Packet Bytes	Total number of bytes dropped by R7Gx due to rule matching failure, for the rulebase.
P2P random drop stats:	
Total Dropped Packets	Total number of packets dropped due to random drop to degrade voice quality.
Total Dropped Packet Bytes	Total number of bytes dropped due to random drop to degrade voice quality.
EDRs:	
Total EDRs generated	Total number of EDRs generated.
EDRs generated for handoff	Total number of EDRs generated for handoffs.
EDRs generated for timeout	Total number of EDRs generated for timeouts.

Field	Description
EDRs generated for normal-end-signaling	Total number of EDRs generated for normal end signaling.
EDRs generated for session end	Total number of EDRs generated for session ends.
EDRs generated for rule match	Total number of EDRs generated for rule matches.
EDRs generated for hagr	Total number of EDRs generated for HAGR.
EDRs generated for flow-end content-filtering	Total number of EDRs generated for flow-end content filtering.
EDRs generated for content-filtering	Total number of EDRs generated for content filtering.
EDRs generated for any-error packets	Total number of EDRs generated for packets dropped by Firewall due to any error.
EDRs generated for firewall deny rule match	Total number of EDRs generated for firewall deny rule matches.
EDRs generated for voip call end	Total number of EDRs generated on completion of voice calls.
UDRs:	
Total UDRs generated	Total number of UDRs generated.
UDRs generated for handoff	Total number of UDRs generated for handoffs.
UDRs generated for time limit	Total number of UDRs generated for time limits.
UDRs generated for volume limit	Total number of UDRs generated for volume limits.
UDRs generated for call end	Total number of UDRs generated for call ends.
UDRs generated for hagr	Total number of UDRs generated for HAGR.
GCDRs:	
Total EGCDRs generated	Total number of eG-CDRs generated.
GCDRs for Normal Release	Total number of G-CDRs generated for normal releases.
GCDRs for Abnormal Release	Total number of G-CDRs generated for abnormal releases.
GCDRs for Volume Limit	Total number of G-CDRs generated for volume limits.
GCDRs for Time Limit	Total number of G-CDRs generated for time limits.
GCDRs for SGSN Change	Total number of G-CDRs generated for SGSN changes.
GCDRs for Max Change Cond	Total number of G-CDRs generated for maximum change condition.
GCDRs for Mgmt Intervention	Total number of G-CDRs generated for management interventions.
GCDRs for RAT Change	Total number of G-CDRs generated for RAT changes.
GCDRs for MS Timezone Change	Total number of G-CDRs generated for MS timezone changes.
GCDRs for SGSN PLMN ID Change	Total number of G-CDRs generated for SGSN PLMN ID changes.
Total rulebases matched	Total number of rulebases that matched the specified criteria.

show active-charging ruledef firewall

Table 117. show active-charging ruledef firewall Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
Ruledef Name	Name of the ruledef.
tcp dst-port	The TCP destination port number.
tcp src-port	The TCP source port number.
udp dst-port	The UDP destination port number.
udp src-port	The TCP source port number.
ip any-match	Indicates whether the ruledef analyzes user traffic based on IP analyzed state—true/false.
Rule Application Type	The rule application type—firewall.
Create-log-record	Indicates whether logging is enabled or disabled.
Total ruledef(s) configured	Total number of Stateful Firewall ruledefs configured.

show active-charging ruledef statistics

Table 118. show active-charging ruledef statistics Command Output Descriptions

Field	Description
Total Charging Ruledefs	Total number of charging ruledefs configured.
Uplink Packets	Total number of packets received in uplink flow.
Uplink Bytes	Total number of bytes received in uplink flow.
Downlink Packets	Total number of packets received in downlink flow.
Downlink Bytes	Total number of bytes received in downlink flow.
Hits	Total number of events.
Total Post-processing Ruledefs	Total number of post-processing ruledefs configured.
Uplink Packets	Total number of packets received in uplink flow.
Uplink Bytes	Total number of bytes received in uplink flow.
Downlink Packets	Total number of packets received in downlink flow.
Downlink Bytes	Total number of bytes received in downlink flow.
Hits	Total number of events.
Total Firewall Ruledefs	Total number of Stateful Firewall ruledefs configured.
Uplink Packets	Total number of packets received in uplink flow.
Uplink Bytes	Total number of bytes received in uplink flow.
Downlink Packets	Total number of packets received in downlink flow.
Downlink Bytes	Total number of bytes received in downlink flow.
Uplink Packets Dropped	Total number of packets dropped in uplink flow.
Uplink Bytes Dropped	Total number of bytes dropped in uplink flow.
Downlink Packets Dropped	Total number of packets dropped in downlink flow.
Downlink Bytes Dropped	Total number of bytes dropped in downlink flow.
Hits	Total number of events.

show active-charging ruledef statistics all firewall wide

Table 119. show active-charging ruledef statistics all firewall wide Command Output Descriptions

Field	Description
Ruledef Name	Name of the Stateful Firewall ruledef.
Packets-Down	Total number of packets downlinked.
Bytes-Down	Total number of bytes downlinked.
Packets-Up	Total number of packets uplinked.
Bytes-Up	Total number of bytes uplinked.
Pkts-Drop-Dn	Total number of downlink packets dropped.
Bytes-Drop-Dn	Total number of downlink bytes dropped.
Pkts-Drop-Up	Total number of uplink packets dropped.
Bytes-Drop-Up	Total number of uplink bytes dropped.
Hits	Total number of events.
Total Ruledef(s)	Total number of ruledefs.

show active-charging ruledef statistics all charging

Table 120. show active-charging ruledef statistics all charging Command Output Descriptions

Field	Description
Ruledef Name	Name of the charging ruledef.
Packets-Down	Total number of packets downlinked.
Bytes-Down	Total number of bytes downlinked.
Packets-Up	Total number of packets uplinked.
Bytes-Up	Total number of bytes uplinked.
Hits	Total number of events.
Total Ruledef(s)	Total number of charging ruledefs.

show active-charging ruledef statistics all tpo

Table 121. show active-charging ruledef statistics all tpo Command Output Descriptions

Field	Description
Ruledef Name	Name of each TPO ruledef configured.
Hits	Number of hits per each TPO ruledef.
Total Ruledef(s)	Total number of TPO ruledefs configured.

show active-charging service all

Table 122. show active-charging service all Command Output Descriptions

Field	Description
Service name	Name of the Active Charging Service.
TCP Flow Idle Timeout	TCP flow idle timeout period, in seconds.
UDP Flow Idle Timeout	UDP flow idle timeout period, in seconds.
ICMP Flow Idle Timeout	ICMP flow idle timeout period, in seconds.
ALG Media Idle Timeout	The configured ALG media idle timeout value, in seconds.
TCP Flow-Mapping Idle Timeout	The configured TCP flow-mapping timeout value, in seconds.
UDP Flow-Mapping Idle Timeout	The configured UDP flow-mapping timeout value, in seconds.
Deep Packet Inspection	Indicates whether Deep Packet Inspection is enabled.
Passive Mode	Indicates whether Passive Mode is enabled.
CDR Flow Control	Indicates whether CDR Flow Control is enabled.
Content Filtering	Indicates whether Category-based Content Filtering is enabled.
Dynamic Content Filtering	Indicates whether Dynamic Content Filtering is enabled.
URL-Blacklisting	Indicates whether URL Blacklisting is enabled.
URL-Blacklisting Match-method	Indicates the URL Blacklisting method to look up URLs in the URL Blacklisting database.
Content Filtering Match-method	Indicates the match method to look up URLs in the category-based content filtering database.
Interpretation of Charging-rule-base-name	Indicates how the Charging-Rule-Base-Name AVP from PCRF is interpreted, either as ACS rulebase or ACS group-of-ruledefs.
Credit Control:	
Mode	Indicates the pre-paid charging application mode—Diameter or RADIUS.
APN-name-to-be-included	Indicates the APN name to be sent in CCA messages.
Trigger-Type	Indicates the credit control reauthorization trigger type.
Failure-Handling	
Initial-Request	Indicates whether initial-request calls will be continued/terminated/retired in the event of a communication failure with the pre-paid server.

Field	Description
Update-Request	Indicates whether update-request calls will be continued/terminated/retired in the event of a communication failure with the pre-paid server.
Terminate-Request	Indicates whether terminate-request calls will be continued/terminated/retired in the event of a communication failure with the pre-paid server.
Server Unreachable Failure-Handling	
Initial-Request	Indicates whether initial-request calls will be continued/terminated when Diameter server(s)/OCS are unreachable.
Update-Request	Indicates whether update-request calls will be continued/terminated when Diameter server(s)/OCS are unreachable.
Diameter:	
Endpoint	Name of the Diameter endpoint.
Endpoint-Realm	Realm of the Diameter endpoint.
Dictionary	The Diameter dictionary used for Credit Control.
Session-Failover	Indicates whether Session Failover is supported.
Pending-Timeout	Indicates the pending timeout period, in seconds.
Peer-Select:	
Peer	Name of the peer.
Realm	Indicates realm for the peer.
Secondary-Peer	Name of the secondary peer.
Realm	Indicates realm for the secondary peer.
IMSI-Based Start-Value	To select the Diameter peer based on the International Mobile Subscriber Identification (IMSI) number, specify the start of range in integer value of IMSI.
IMSI-Based End-Value	The end of range in integer value of IMSI.
Quota	
Request-Trigger	Indicates the trigger action on packets on crossing the threshold limit of subscriber quota in the pre-paid credit control service.
Holding-Time	Indicates the Quota Holding Time (QHT).
Validity-Time	Indicates the validity lifetime of the quota in seconds.
Time-Threshold	Indicates the time threshold for pre-paid credit control quota.
Units-Threshold	Indicates the units threshold for DCCA quota in percentage.
Volume-Threshold	Indicates the volume threshold for pre-paid credit control quota.
Pending-Traffic-Treatment	
trigger	Indicates the trigger status.
forced-reauth	Indicates status of the Diameter credit control pending traffic treatment for forced reauthorization.

Field	Description
no-quota	Indicates status of the Diameter credit control pending traffic treatment quota.
quota-exhausted	Indicates status of the Diameter credit control pending traffic treatment for exhausted quota.
validity-expired	Indicates status of the Diameter credit control pending traffic treatment for validity.
diameter mscc-final-unit-action terminate	Indicates whether a PDP session or a category is terminated based on the user's quota and Final-Unit-Action (FUA) at Multiple-Services-Credit-Control (MSCC) level.

show active-charging sessions firewall required

Table 123. show active-charging sessions firewall required Command Output Descriptions

Field	Description
SESSIONID	The active charging session ID.
CALLID	The call ID.
IMSI/MSID	The International Mobile Subscriber Identification/Mobile Station ID.
IP	IP address of client.
USERNAME	Name of the subscriber.
Total acs sessions matching specified criteria	Total number of ACS sessions with firewall enabled.

show active-charging sessions full

Table 124. show active-charging session full Command Output Descriptions

Field	Description
Session-ID	The active charging session ID.
Username	Name of the subscriber.
Callid	The Call ID.
IMSI/MSID	Indicates the International Mobile Subscriber Identification/Mobile Station ID.
ACSMgr Instance	Total instances of ACS Manager.
ACSMgr Card/Cpu	Total number of ACS Manager Card/CPU.
Client-IP	In 12.3 and earlier releases, IPv6 address or IPv4 address of the client for all call types.
SessMgr Instance	Total instances of Session Manager.
NAS-IP	IP address of Network Access Server.
NAS-PORT	TCP port of Network Access Server.
Access-NAS-IP(FA)	IP address of accessed Network Access Server Foreign Agent (FA).
NSAPI	Total instances of NS APIs used.
Acct-Session-ID	The accounting session ID.
NAS-ID	The Network Access Server ID.
Access-NAS-ID(FA)	Accessed Network Access Server Foreign Agent (FA) ID.
3GPP2-BSID	3GPP2 base station ID.
Access-Correlation-ID(FA)	Access correlation ID for FA.
3GPP2-Correlation-ID	Mobile IP Correlation ID.
MEID	Mobile equipment's unique Mobile Equipment Identifier (MEID).
Carrier-ID	Carrier or service ID.
ESN	Electronic Serial Number (ESN) of mobile equipment.
Uplink Bytes	Total bytes uploaded.
Downlink Bytes	Total bytes downloaded.
Uplink Packets	Total packets uploaded.
Downlink Packets	Total packets downloaded.
Injected Uplink Bytes	Total bytes injected to upload.

Field	Description
Injected Downlink Bytes	Total bytes injected to download.
Injected Uplink Packets	Total packets injected to upload.
Injected Downlink Packets	Total packets injected to download.
Buffered Uplink Packets	Total buffered packets for uplink.
Buffered Downlink Packets	Total buffered packets for downlink.
Buffered Uplink Bytes	Total buffered bytes for uplink.
Buffered Downlink Bytes	Total buffered bytes for uplink.
Uplink Packets in Buffer	Total number of uplink packets in the buffer.
Uplink Bytes in Buffer	Total number of uplink bytes in the buffer.
Downlink Packets in Buffer	Total number of downlink packets in the buffer.
Downlink Bytes in Buffer	Total number of downlink bytes in the buffer.
Buff Over-limit Uplink Pkts	Total number of uplink packets that were over the buffer limit.
Buff Over-limit Uplink Bytes	Total number of uplink bytes that were over the buffer limit.
Buff Over-limit Downlink Pkts	Total number of downlink packets that were over the buffer limit.
Buff Over-limit Downlink Bytes	Total number of downlink bytes that were over the buffer limit.
Processed Uplink Packets	Total packets processed for upload.
Processed Downlink Packets	Total packets processed for download.
Dropped Uplink Packets	Total packets dropped in uplink direction.
Dropped Downlink Packets	Total packets dropped in downlink direction.
Uplink Out of Order Packets	Total out of order packets in uplink direction.
Downlink Out of Order Packets	Total out of order packets in downlink direction.
ITC Terminated Flows	Total number of flows terminated by Intelligent Traffic Control service.
ITC Redirected Flows	Total number of flows redirected by Intelligent Traffic Control service.
ITC Dropped Packets	Total number of packets dropped by Intelligent Traffic Control service.
ITC ToS Remarkd Packets	Total number of packets marked with Type of Service (ToS) by Intelligent Traffic Control service.

Field	Description
ITC Dropped Upd Pkts	Total number of packets in uplink direction, that were dropped by Intelligent Traffic Control service.
ITC Dropped Dnl Pkts	Total number of packets in downlink direction, that were dropped by Intelligent Traffic Control service.
ITC Dropped Upd Bytes	Total number of uplink bytes dropped by Intelligent Traffic Control service.
ITC Dropped Dnl Bytes	Total number of downlink bytes dropped by Intelligent Traffic Control service.
R7Gx Dropped Upd Packets	Total number of packets dropped by R7Gx in uplink direction.
R7Gx Dropped Dnl Packets	Total number of packets dropped by R7Gx in downlink direction.
R7Gx Dropped Upd Pkts RuleMatch Fail	Total number of packets dropped by R7Gx in uplink direction due to rulematch failure—no matching rule is found.
R7Gx Dropped Upd Bytes RuleMatch Fail	Total number of bytes dropped by R7Gx in uplink direction due to rulematch failure.
R7Gx Dropped Dnl Pkts RuleMatch Fail	Total number of packets dropped by R7Gx in downlink direction due to rulematch failure.
R7Gx Dropped Dnl Bytes RuleMatch Fail	Total number of bytes dropped by R7Gx in downlink direction due to rulematch failure.
CC Dropped Uplink Packets	Total number of packets dropped by credit control in uplink direction.
CC Dropped Uplink Bytes	Total number of bytes dropped by credit control in uplink direction.
CC Dropped Downlink Packets	Total number of packets dropped by credit control in downlink direction.
CC Dropped Downlink Bytes	Total number of bytes dropped by credit control in downlink direction.
NRUPC Req Made	Total number of Network Requested Update PDP Context (NRUPC) requests made.
NRUPC Req Success	Total number of NRUPC requests succeeded.
NRUPC Req Failed	Total number of NRUPC requests failed.
NRUPC Req Time Out	Total number of NRUPC requests timed out.
Current Readdressed Sessions	Number of current re-addressed sessions
Total Readdressed Uplink Pkts	Total number of re-addressed uplink packets.
Total Readdressed Uplink Bytes	Total number of re-addressed uplink bytes.
Total Readdressed Downlink Pkts	Total number of re-addressed downlink packets.

■ show active-charging sessions full

Field	Description
Total Readdressed Downlink Bytes	Total number of re-addressed downlink bytes.
Total Readdressing Failure	Total number re-addressing failures.
Creation Time	Time display in UTC format.
Last Pkt Time	Time of last packet created.
Duration	Duration of session.
Active Charging Service name	Name of the active charging service.
Rule Base name	Name of the rulebase applied.
Bandwidth Policy	The ACS bandwidth policy applicable for subscriber.
Firewall Policy	Indicates whether Stateful Firewall processing is required for subscriber.
FW-and-NAT Policy	The Stateful Firewall-and-NAT policy applicable for subscriber.
NAT Policy	Indicates whether NAT processing is required for subscriber.
TPO Policy	The TPO policy applicable for subscriber.
CF Policy ID	The content filtering policy identifier applicable for subscriber.
Dynamic Charging	Status of dynamic charging functionality.
Dynamic Chrg Msg Received	Total number of messages received for dynamic charging.
Rule Definitions Received	Total number of ruledefs received.
Installs Received	Total number of “Charging-Rule-Install” messages received.
Removes Received	Total number of “Charging-Rule-Remove” messages received.
Installs Succeeded	Total number of charging rules installed successfully.
Installs Failed	Total number of charging rules installation failed.
Removes Succeeded	Total number of charging rules removed successfully.
Removes Failed	Total number of charging rules removal failed.
Uplink Dynamic Rule Packets	Total number of packets uplinked with dynamic rules.
Uplink Dynamic Rule Bytes	Total number of bytes uplinked with dynamic rules.
Downlink Dynamic Rule Packets	Total number of packets downlinked with dynamic rules.
Downlink Dynamic Rule Bytes	Total number of bytes downlinked with dynamic rules.

Field	Description
Credit-Control	Status of DCCA (on/off).
CC Peer	Name of the credit control (CC) peer.
CC Group	Displays the selected credit control group information.
CC Mode	Indicates the credit control mode: RADIUS or DIAMETER
CC Failure Handling	Action configured for credit control failure handling.
CC Session Failover	Credit control session failover status.
CCR-I Server Unreachable Handling	Indicates whether initial-request calls will be continued/terminated when Diameter server(s)/OCS are unreachable.
CCR-U Server Unreachable Handling	Indicates whether update-request calls will be continued/terminated when Diameter server(s)/OCS are unreachable.
Total CCR-U	The total number of CCR-Updates (Credit Control Request with Update) messages sent to the credit control server.
Current TCP Proxy Flows	Total number of current TCP Proxy flows for the session.
Total TCP Proxy Flows	Total number of TCP Proxy flows for the session.
TCP-proxy reset for non-SYN flows	Total number of resets sent by TCP Proxy for flows with no SYN packet after recovery.
Current IP Flows	Total number of current IP flows.
Current ICMP Flows	Total number of current ICMP flows.
Current IPv6 Flows	Total number of current IPv6 flows.
Current ICMPv6 Flows	Total number of current ICMPv6 flows.
Current TCP Flows	Total number of current TCP flows.
Current UDP Flows	Total number of current UDP flows.
Current HTTP Flows	Total number of current HTTP flows.
Current HTTPS Flows	Total number of current HTTPS flows.
Current FTP Flows	Total number of current FTP flows.
Current POP3 Flows	Total number of current POP3 flows.
Current SMTP Flows	Total number of current SMTP flows.
Current SIP Flows	Total number of current SIP flows.
Current RTSP Flows	Total number of current RTSP flows.
Current RTP Flows	Total number of current RTP flows.
Current RTCP Flows	Total number of current RTCP flows.
Current IMAP Flows	Total number of current IMAP flows.
Current WSP-CO Flows	Total number of current WSP-CO flows.

■ show active-charging sessions full

Field	Description
Current WSP-CL Flows	Total number of current WSP-CL flows.
Current MMS Flows	Total number of current MMS flows.
Current DNS Flows	Total number of current DNS flows.
Current PPTP-GRE Flows	Total number of current PPTP-GRE flows.
Current PPTP Flows	Total number of current PPTP flows.
Current TFTP Flows	Total number of current TFTP flows.
Current P2P Flows	Total number of current P2P flows.
Current H323 Flows	Total number of current H323 flows.
Current UNKNOWN Flows	Total number of current UNKNOWN flows.
CAE-Readdressing:	
GET Requests redirected	Total number of HTTP GET requests redirected to a CAE.
POST Requests redirected	Total number of HTTP POST requests redirected to a CAE.
Other Requests redirected	Total number of other HTTP requests redirected to a CAE.
HTTP Responses redirected	Total number of HTTP responses redirected to a CAE.
Requests having xheader inserted	Total number of HTTP requests that have x-headers inserted.
Total connection failed to video server	Total number of failed connections to the video server.
Total uplink Bytes	Total number of uplink bytes.
Total uplink Packets	Total number of uplink packets.
Total downlink Bytes	Total number of downlink bytes.
Total downlink Packets	Total number of downlink packets.
Rating-Group	Rating-Group of the MSCC which is used by DCCA.
Service-Identifier	Service-Identifier of the MSCC which is used by DCCA
State	State in which the MSCC (identified by Rating-Group and Service-Identifier) is present. For example, Charging, Limit-Reached, Rating-Failed
Checkpoint State	Checkpoint status of the MSCC. It can be either Current or Outdated. Current implies that the MSCC is checkpointed recently. Outdated means the MSCC is ready to get checkpointed to update its new status.
Pending Update	This indicates whether a response is awaited from the server for this MSCC, after sending a CCR-U.
Last Answer	Time duration from the last sent CCR-Update request for this MSCC.
Ruledef Name	Name of the ACS ruledef.

Field	Description
Pkts-Down	Total number of packets downlinked.
Bytes-Down	Total number of bytes downlinked.
Pkts-Up	Total number of packets uplinked.
Bytes-Up	Total number of bytes uplinked.
Hits	Total number of packets handled in uplink and downlink directions.
Firewall-Ruledef Name	Name of the Stateful Firewall ruledef.
Pkts-Down	Total number of packets downlinked.
Bytes-Down	Total number of bytes downlinked.
Pkts-Up	Total number of packets uplinked.
Bytes-Up	Total number of bytes uplinked.
Hits	Total number of packets handled in uplink and downlink directions.
Dynamic Charging Rule Name Statistics	Dynamic charging rule name statistics.
Dynamic Charging Rule Name Configured	Dynamic charging rule name configured.
Predefined Rules Enabled List	List of enabled predefined rules.
Predefined Firewall Rules Enabled List	List of enabled predefined Firewall rules.
NCQoS NRUPC Req Made	Total number of network-controlled QoS Network Requested Update PDP Context requests made.
NCQoS NRSPCA Req Made	Total number of network-controlled QoS Network Requested Secondary PDP Context Activation requests made.
NCQoS NRUPC Req Failed	Total number of network-controlled QoS Network Requested Update PDP Context requests failed.
NCQoS NRSPCA Req Failed	Total number of network-controlled QoS Network Requested Secondary PDP Context Activation requests failed.
NCQoS NRUPC Req Success	Total number of network-controlled QoS Network Requested Update PDP Context requests succeeded.
NCQoS NRSPCA Req Success	Total number of network-controlled QoS Network Requested Secondary PDP Context Activation requests succeeded.
Total acs sessions matching specified criteria	Total number of ACS sessions matching the specified criteria.

show active-charging sessions full all

Table 125. show active-charging sessions full all Command Output Descriptions

Field	Description
Session-ID	The active charging session ID.
Username	The subscriber's name.
Callid	Call identification.
IMSI/MSID	The International Mobile Subscriber Identification/Mobile Station ID.
ACSMgr Instance	Total instance of ACS Manager.
ACSMgr Card/Cpu	Total number of ACS Manager Card/CPU.
SessMgr Instance	Total instance of session manager.
Client-IP	In 12.3 and earlier releases, IPv6 address or IPv4 address of the client for all call types.
NAS-IP	Indicates the IP address of Network Access Server.
Access-NAS-IP(FA)	Indicates the IP address of accessed Network Access Server Foreign Agent (FA).
NAS-PORT	Indicates the TCP port of Network Access Server.
NSAPI	Total instances of NS APIs used.
Acct-Session-ID	Indicates the accounting session ID.
NAS-ID	The Network Access Server identifier.
Access-NAS-ID(FA)	Indicates the identifier of accessed Network Access Server Foreign Agent (FA).
3GPP2-BSID	Indicates the 3GPP2 base station identifier.
Access-Correlation-ID(FA)	Indicates the access correlation ID for FA.
3GPP2-Correlation-ID	Indicates the Mobile IP Correlation ID.
MEID	Indicates the Mobile equipment's unique Mobile Equipment Identifier (MEID).
Carrier-ID	Indicates the carrier or service ID.
ESN	Indicates the Electronic Serial Number (ESN) of mobile equipment.
Uplink Bytes	Total bytes uploaded.
Downlink Bytes	Total bytes downloaded.
Uplink Packets	Total packets uploaded.
Downlink Packets	Total packets downloaded.
Injected Uplink Bytes	Total bytes injected to upload.

Field	Description
Injected Downlink Bytes	Total bytes injected to download.
Injected Uplink Packets	Total packets injected to upload.
Injected Downlink Packets	Total packets injected to download.
Buffered Uplink Packets	Total buffered packets for uplink.
Buffered Downlink Packets	Total buffered packets for downlink.
Buffered Uplink Bytes	Total buffered bytes for uplink.
Buffered Downlink Bytes	Total buffered bytes for uplink.
Uplink Packets in Buffer	Total number of uplink packets in the buffer.
Uplink Bytes in Buffer	Total number of uplink bytes in the buffer.
Downlink Packets in Buffer	Total number of downlink packets in the buffer.
Downlink Bytes in Buffer	Total number of downlink bytes in the buffer.
Buff Over-limit Uplink Pkts	Total number of uplink packets that were over the buffer limit.
Buff Over-limit Uplink Bytes	Total number of uplink bytes that were over the buffer limit.
Buff Over-limit Downlink Pkts	Total number of downlink packets that were over the buffer limit.
Buff Over-limit Downlink Bytes	Total number of downlink bytes that were over the buffer limit.
Processed Uplink Packets	Total packets processed for upload.
Processed Downlink Packets	Total packets processed for download.
Dropped Uplink Packets	Total packets dropped in uplink direction.
Dropped Downlink Packets	Total packets dropped in downlink direction.
Uplink Out of Order Packets	Total out of order packets in uplink direction.
Downlink Out of Order Packets	Total out of order packets in downlink direction.
ITC Terminated Flows	Total number of flows terminated by Intelligent Traffic Control service.
ITC Redirected Flows	Total number of flows redirected by Intelligent Traffic Control service.
ITC Dropped Packets	Total number of packets dropped by Intelligent Traffic Control service.
ITC ToS Remarked Packets	Total number of packets marked with Type of Service (ToS) by Intelligent Traffic Control service.
R7Gx Dropped Upl Packets	Total number of packets dropped by R7Gx in uplink direction.
R7Gx Dropped Dnl Packets	Total number of packets dropped by R7Gx in downlink direction.
R7Gx Dropped Upl Pkts RuleMatch Fail	Total number of packets dropped by R7Gx in uplink direction due to rulematch failure—no matching rule is found.
R7Gx Dropped Upl Bytes RuleMatch Fail	Total number of bytes dropped by R7Gx in uplink direction due to rulematch failure.

■ show active-charging sessions full all

Field	Description
R7Gx Dropped Dnl Pkts RuleMatch Fail	Total number of packets dropped by R7Gx in downlink direction due to rulematch failure.
R7Gx Dropped Dnl Bytes RuleMatch Fail	Total number of bytes dropped by R7Gx in downlink direction due to rulematch failure.
CC Dropped Uplink Packets	Total number of packets dropped by credit control in uplink direction.
CC Dropped Uplink Bytes	Total number of bytes dropped by credit control in uplink direction.
CC Dropped Downlink Packets	Total number of packets dropped by credit control in downlink direction.
CC Dropped Downlink Bytes	Total number of bytes dropped by credit control in downlink direction.
NRUPC Req Made	Total number of Network Requested Update PDP Context (NRUPC) requests made.
NRUPC Req Success	Total number of NRUPC requests succeeded.
NRUPC Req Failed	Total number of NRUPC requests failed.
NRUPC Req Time Out	Total number of NRUPC requests timed out.
Current Readdressed Sessions	Total number of current readdressed sessions.
Total Readdressed Uplink Pkts	Total number of readdressed uplink packets.
Total Readdressed Uplink Bytes	Total number of readdressed uplink bytes.
Total Readdressed Downlink Pkts	Total number of readdressed downlink packets.
Total Readdressed Downlink Bytes	Total number of readdressed downlink bytes.
Total Readdressing Failure	Total number of readdressing failures.
Creation Time	Time display in UTC format.
Last Pkt Time	Time of last packet created.
Duration	Duration of session.
Active Charging Service name	Name of the Active Charging Service.
Rule Base name	Name of the ACS rulebase applied.
Bandwidth Policy	The ACS bandwidth policy applicable for subscriber.
Firewall Policy	Indicates whether Stateful Firewall processing is required for subscriber.
FW-and-NAT Policy	The Stateful Firewall-and-NAT policy applicable for subscriber.
NAT Policy	Indicates whether NAT processing is required for subscriber.
TPO Policy	The TPO policy applicable for subscriber.
CF Policy ID	The Content Filtering policy ID applicable for subscriber.
Dynamic Charging	Status of dynamic charging functionality.
Dynamic Chrg Msg Received	Total number of messages received for dynamic charging.

Field	Description
Rule Definitions Received	Total number of ruledefs received.
Installs Received	Total number of “Charging-Rule-Install” messages received.
Removes Received	Total number of “Charging-Rule-Remove” messages received.
Installs Succeeded	Total number of charging rules installed successfully.
Installs Failed	Total number of charging rules installation failed.
Removes Succeeded	Total number of charging rules removed successfully.
Removes Failed	Total number of charging rules removal failed.
Uplink Dynamic Rule Packets	Total number of packets uplinked with dynamic rules.
Uplink Dynamic Rule Bytes	Total number of bytes uplinked with dynamic rules.
Downlink Dynamic Rule Packets	Total number of packets downlinked with dynamic rules.
Downlink Dynamic Rule Bytes	Total number of bytes downlinked with dynamic rules.
Dynamic Charging Packet Drop Statistics	
Bearer BW Limit Upd Pkts	Total number of uplink packets dropped due to bearer bandwidth limiting.
Bearer BW Limit Dnl Pkts	Total number of downlink packets dropped due to bearer bandwidth limiting.
Bearer BW Limit Upd Bytes	Total number of uplink bytes dropped due to bearer bandwidth limiting.
Bearer BW Limit Dnl Bytes	Total number of downlink bytes dropped due to bearer bandwidth limiting.
PCC Rule BW Limit Upd Pkts	Total number of uplink packets dropped due to PCC rule bandwidth limiting.
PCC Rule BW Limit Dnl Pkts	Total number of downlink packets dropped due to PCC rule bandwidth limiting.
PCC Rule BW Limit Upd Bytes	Total number of uplink bytes dropped due to PCC rule bandwidth limiting.
PCC Rule BW Limit Dnl Bytes	Total number of downlink bytes dropped due to PCC rule bandwidth limiting.
PCC Rule Gating Upd Pkts	Total number of uplink packets dropped due to PCC rule gating.
PCC Rule Gating Dnl Pkts	Total number of downlink packets dropped due to PCC rule gating.
PCC Rule Gating Upd Bytes	Total number of uplink bytes dropped due to PCC rule gating.
PCC Rule Gating Dnl Bytes	Total number of downlink bytes dropped due to PCC rule gating.
RuleMatch Fail Upd Pkts	Total number of uplink packets dropped due to rule match failure.
RuleMatch Fail Dnl Pkts	Total number of downlink packets dropped due to rule match failure.
RuleMatch Fail Upd Bytes	Total number of uplink bytes dropped due to rule match failure.
RuleMatch Fail Dnl Bytes	Total number of downlink bytes dropped due to rule match failure.
Credit-Control	Indicates DCCA status: On/Off
CC Peer	Name of the credit control (CC) peer.
CC Group	Displays the selected credit control group information.

■ show active-charging sessions full all

Field	Description
CC Mode	Indicates the credit control mode: RADIUS or DIAMETER
CC Failure Handling	Action configured for credit control failure handling.
CC Session Failover	Credit control session failover status.
CCR-I Server Unreachable Handling	Indicates whether initial-request calls will be continued/terminated when Diameter server(s)/OCS are unreachable.
CCR-U Server Unreachable Handling	Indicates whether update-request calls will be continued/terminated when Diameter server(s)/OCS are unreachable.
Total CCR-U	The total number of CCR-Updates (Credit Control Request with Update) messages sent to the credit control server.
Current TCP Proxy Flows	Total number of current TCP Proxy flows for the session.
Total TCP Proxy Flows	Total number of TCP Proxy flows for the session.
TCP-proxy reset for non-SYN flows	Total number of resets sent by TCP Proxy for flows with no SYN packet after recovery.
Current IP Flows	Total number of current IP flows.
Current ICMP Flows	Total number of current ICMP flows.
Current IPv6 Flows	Total number of current IPv6 flows.
Current ICMPv6 Flows	Total number of current ICMPv6 flows.
Current TCP Flows	Total number of current TCP flows.
Current UDP Flows	Total number of current UDP flows.
Current HTTP Flows	Total number of current HTTP flows.
Current HTTPS Flows	Total number of current HTTPS flows.
Current FTP Flows	Total number of current FTP flows.
Current POP3 Flows	Total number of current POP3 flows.
Current SMTP Flows	Total number of current SMTP flows.
Current SIP Flows	Total number of current SIP flows.
Current RTSP Flows	Total number of current RTSP flows.
Current RTP Flows	Total number of current RTP flows.
Current RTCP Flows	Total number of current RTCP flows.
Current IMAP Flows	Total number of current IMAP flows.
Current WSP-CO Flows	Total number of current WSP-CO flows.
Current WSP-CL Flows	Total number of current WSP-CL flows.
Current MMS Flows	Total number of current MMS flows.
Current DNS Flows	Total number of current DNS flows.

Field	Description
Current PPTP-GRE Flows	Total number of current PPTP-GRE flows.
Current PPTP Flows	Total number of current PPTP flows.
Current P2P Flows	Total number of current P2P flows.
Current H323 Flows	Total number of current H323 flows.
Current UNKNOWN Flows	Total number of current UNKNOWN flows.
CAE-Readdressing:	
GET Requests redirected	Total number of HTTP GET requests redirected to a CAE.
POST Requests redirected	Total number of HTTP POST requests redirected to a CAE.
Other Requests redirected	Total number of other HTTP requests redirected to a CAE.
HTTP Responses redirected	Total number of HTTP responses redirected to a CAE.
Requests having xheader inserted	Total number of HTTP requests that have x-headers inserted.
Total connection failed to video server	Total number of failed connections to the video server.
Total uplink Bytes	Total number of uplink bytes.
Total uplink Packets	Total number of uplink packets.
Total downlink Bytes	Total number of downlink bytes.
Total downlink Packets	Total number of downlink packets.
STATIC CF STATISTICS	
CF Packets Allowed	Total number of packets allowed after applying content filtering service. NOTE: This statistic has been renamed to Flows Allowed in 12.0 and later releases.
CF Packets Discarded without Responding	Total number of packets discarded without sending any response after applying content filtering service. NOTE: This statistic has been renamed to Flows Discarded in 12.0 and later releases.
CF Packets Discarded with Flow Redirection	Total number of packets discarded with traffic flow redirection after applying content filtering service. NOTE: This statistic has been renamed to Flows Redirected in 12.0 and later releases.
CF Packets Discarded with Flow Termination	Total number of packets discarded and traffic flow terminated after applying content filtering service. NOTE: This statistic has been renamed to Flows Terminated in 12.0 and later releases.
CF Packets Discarded with Flow Content Insertion	Total number of packets discarded and content inserted in response message after applying content filtering service. NOTE: This statistic has been renamed to Flows Discarded with Content Insertion in 12.0 and later releases.
CF Static DB Look-ups	Total number of lookups in static rating database for content filtering service.
CF Successful Cache Look-ups	Total number of lookups in cache memory for static rating of URLs and returned successful after applying content filtering service.

■ show active-charging sessions full all

Field	Description
DYNAMIC CF STATISTICS	
Flows Allowed	Total number of flows allowed by dynamic CF. Typically a flow is allowed if the matched flow category contains the action “allow” in the CF configuration.
Flows Discarded	Total number of flows discarded by dynamic CF.
Flows Redirected	Total number of flows redirected by dynamic CF.
Flows Terminated	Total number of flows terminated by dynamic CF.
Flows Discarded with Content Insertion	Total number of flows discarded with content insertion by dynamic CF.
CF Dynamic Lookups	Total number of lookups in dynamic rating database for content filtering service.
Charging ruledef(s) matching the specified criteria	Charging ruledef(s) matching the specified criteria.
Firewall ruledef(s) match the specified criteria	Stateful Firewall ruledef(s) matching the specified criteria.
Dynamic Charging Rule Name Statistics	Dynamic charging rule name statistics.
Total Dynamic Rules	Total number of dynamic rules.
Total Predefined Rules	Total number of predefined rules.
Total Firewall Predefined Rules	Total number of Stateful Firewall predefined rules.
Dynamic Charging Rule Definitions Configured	Dynamic charging rules configured.
Total Dynamic Charging Rule Names	Total number of dynamic charging rules.
Total Dynamic Firewall Rule Names	Total number of dynamic Stateful Firewall rules.
Predefined Rules Enabled List	List of enabled predefined rules.
Predefined Firewall Rules Enabled List	List of enabled predefined Firewall rules.
Total acs sessions matching specified criteria	Total number of ACS sessions matching the specified criteria.

show active-charging sessions summary

Table 126. show active-charging sessions summary Command Output Descriptions

Field	Description
Session-ID	The active charging session ID.
Username	Name of the subscriber.
Callid	Call identification.
IMSI/MSID	Indicates the International Mobile Subscriber Identification / Mobile Station ID.
ACSMgr Instance	Total instance of ACS Manager.
ACSMgr Card/Cpu	Total number of ACS Manager Card/CPU.
Client-IP	Indicates the IP address of Client.
SessMgr Instance	Total instance of session manager.
NAS-IP	Indicates the IP address of Network Access Server.
NAS-PORT	Indicates the TCP port of Network Access Server.
Access-NAS-IP(FA)	Indicates the IP address of accessed Network Access Server Foreign Agent (FA).
Acct-Session-ID	Indicates the accounting session ID.
3GPP2-Correlation-ID	Indicates the Mobile IP Correlation ID.
Access-Correlation-ID(FA)	Indicates the access correlation ID for FA.
MEID	Indicates the Mobile equipment's unique Mobile Equipment Identifier (MEID).
Carrier-ID	Indicates the Carrier or service ID.
ESN	Indicates the Electronic Serial Number (ESN) of mobile equipment.
Uplink Bytes	Total bytes uploaded.
Downlink Bytes	Total bytes downloaded.
Uplink Packets	Total packets uploaded.
Downlink Packets	Total packets downloaded.
Injected Uplink Bytes	Total bytes injected to upload.
Injected Downlink Bytes	Total bytes injected to download.
Injected Uplink Packets	Total packets injected to upload.
Injected Downlink Packets	Total packets injected to download.
Uplink Out of Order Packets	Total out of order packets in uplink direction.

Field	Description
Downlink Out of Order Packets	Total out of order packets in downlink direction.
Creation Time	Time display in UTC format.
Last Pkt Time	Time of last packet created.
Duration	Duration of session.
Active Charging Service name	Name of the ACS service.
Rule Base name	Name of the rulebase applied.
Credit-Control	DCCA status: On/Off
CC peer	Name of the Credit Control (CC) peer.
CC Failure Handling	Action configured to handle CC failure.
CC Session Failover	CC Session Failover status.
Rating-Group	Rating-Group of the MSCC which is used by DCCA
State	State in which the MSCC (identified by Rating-Group and Service-Identifier) is present. For example, Charging, Limit-Reached, Rating-Failed, etc.
Pending Update	This indicates whether a response is awaited from the server for this MSCC, after sending a CCR-U.
Last CCA	Time duration from the last sent CCR-Update request for this MSCC.
Time Threshold	Threshold for CC.
Quota	Quota assigned for pre-paid subscriber.
Usage	Usage by subscriber.
Ruledef Name	Name of the Ruledef.
Pkts-Down	Total packets in downlink direction.
Bytes-Down	Total byte in downlink direction.
Pkts-Up	Total Packets in upward direction.
Bytes-Up	Total bytes in upward direction.
Hits	Total packets in upload and download direction.
Current IP Sessions	Total number of current IP sessions.
Current ICMP Sessions	Total number of current ICMP sessions.
Current IPv6 Sessions	Total number of current IPv6 sessions.
Current ICMPv6 Sessions	Total number of current ICMPv6 sessions.
Current TCP Sessions	Total number of current TCP sessions.
Current UDP Sessions	Total number of current UDP sessions.

Field	Description
Current HTTP Sessions	Total number of current HTTP sessions.
Current HTTPS Sessions	Total number of current HTTPS sessions.
Current FTP Sessions	Total number of current FTP sessions.
Current POP3 Sessions	Total number of current POP3 sessions.
Current SMTP Sessions	Total number of current SMTP sessions.
Current SIP Sessions	Total number of current SIP sessions.
Current RTSP Sessions	Total number of current RTSP sessions.
Current RTP Sessions	Total number of current RTP sessions.
Current RTCP Sessions	Total number of current RTCP sessions.
Current IMAP Sessions	Total number of current IMAP sessions.
Current WSP-CO Sessions	Total number of current WSP-CO sessions.
Current WSP-CL Sessions	Total number of current WSP-CL sessions.
Current MMS Sessions	Total number of current MMS sessions.
Current DNS Sessions	Total number of current DNS sessions.
Current PPTP Sessions	Total number of current PPTP sessions.
Current PPTP-GRE Sessions	Total number of current PPTP-GRE sessions.
Current P2P Sessions	Total number of current P2P sessions.
Current H323 Sessions	Total number of current H323 sessions.
Current TFTP Sessions	Total number of current TFTP sessions.
Current UNKNOWN Sessions	Total number of current UNKNOWN sessions.
Current SKYPE Sessions	Total number of current SKYPE sessions.
Current YAHOO Sessions	Total number of current YAHOO sessions.
 IMPORTANT: The following voice/non-voice counters are available only for 10.0 and earlier releases.	
Current SKYPE voice Sessions	Total number of current SKYPE voice sessions.
Current YAHOO voice Sessions	Total number of current YAHOO voice sessions.
Current SKYPE non-voice Sessions	Total number of current SKYPE non-voice sessions.

Field	Description
Current YAHOO non-voice Sessions	Total number of current YAHOO non-voice sessions.
 IMPORTANT: The following two audio counters are available only for 11.0 and later releases.	
Current SKYPE Audio Sessions	Total number of current SKYPE audio sessions.
Current YAHOO Audio Sessions	Total number of current YAHOO audio sessions.
Current YAHOO Video Sessions	Total number of current YAHOO video sessions.
Current EDONKEY Sessions	Total number of current EDONKEY sessions.
Current ORB Sessions	Total number of current ORB sessions.
Current MSN Sessions	Total number of current MSN sessions.
Current GNUTELLA Sessions	Total number of current GNUTELLA sessions.
 IMPORTANT: The following voice/non-voice counters are available only for 10.0 and earlier releases.	
Current MSN voice Sessions	Total number of current MSN voice sessions.
Current MSN non-voice Sessions	Total number of current MSN non-voice sessions.
Current BITTORRENT Sessions	Total number of current BITTORRENT sessions.
 IMPORTANT: The following audio/video counters are available only for 11.0 and later releases.	
Current MSN Audio Sessions	Total number of current MSN audio sessions.
Current MSN Video Sessions	Total number of current MSN video sessions.
Current SLINGBOX Sessions	Total number of current SLINGBOX sessions.
Current JABBER Sessions	Total number of current JABBER sessions.
Current WINNY Sessions	Total number of current WINNY sessions.
Current MANOLITO Sessions	Total number of current MANOLITO sessions.

Field	Description
Current PANDO Sessions	Total number of current PANDO sessions.
Current FILETOPIA Sessions	Total number of current FILETOPIA sessions.
Current SOULSEEK Sessions	Total number of current SOULSEEK sessions.
Current PPSTREAM Sessions	Total number of current PPSTREAM sessions.
Current QQ Sessions	Total number of current QQ sessions.
Current QQLIVE Sessions	Total number of current QQLIVE sessions.
Current IMESH Sessions	Total number of current IMESH sessions.
Current MUTE Sessions	Total number of current MUTE sessions.
Current PPLIVE Sessions	Total number of current PPLIVE sessions.
Current GADUGADU Sessions	Total number of current GADUGADU sessions.
Current FEIDIAN Sessions	Total number of current FEIDIAN sessions.
Current APPLEJUICE Sessions	Total number of current APPLEJUICE sessions.
Current fasttrack Sessions	Total number of current Fasttrack sessions.
Current ZATTOO Sessions	Total number of current ZATTOO sessions.
Current SKINNY Sessions	Total number of current SKINNY sessions.
Current SOPCAST Sessions	Total number of current SOPCAST sessions.
Current DIRECTCONNECT Sessions	Total number of current DIRECTCONNECT sessions.
Current ARES Sessions	Total number of current ARES sessions.
Current OSCAR Sessions	Total number of current OSCAR sessions.
 IMPORTANT: The following voice/non-voice counters are available only for 10.0 and earlier releases.	
Current OSCAR voice Sessions	Total number of current OSCAR voice sessions.
Current OSCAR non-voice Sessions	Total number of current OSCAR non-voice sessions.
 IMPORTANT: The following two counters are available only for 11.0 and later releases.	

Field	Description
Current OSCAR Audio Sessions	Total number of current OSCAR audio sessions.
Current OSCAR Video Sessions	Total number of current OSCAR video sessions.
Current POPO Sessions	Total number of current POPO sessions.
Current IRC Sessions	Total number of current IRC sessions.
Current STEAM Sessions	Total number of current STEAM sessions.
Current DDLINK Sessions	Total number of current DDLINK sessions.
Current HALFLIFE2 Sessions	Total number of current HALFLIFE2 sessions.
Current HAMACHIVPN Sessions	Total number of current HAMACHIVPN sessions.
Current TVANTS Sessions	Total number of current TVANTS sessions.
Current TVUPLAYER Sessions	Total number of current TVUPLAYER sessions.
Current UUSEE Sessions	Total number of current UUSEE sessions.
Current VPNX Sessions	Total number of current VPNX sessions.
Current VTUN Sessions	Total number of current VTUN sessions.
Current WINMX Sessions	Total number of current WINMX sessions.
Current WOFWARCRAFT Sessions	Total number of current WOFWARCRAFT sessions.
Current XBOX Sessions	Total number of current XBOX sessions.
Current ISKOOT Sessions	Total number of current ISKOOT sessions.
Current FRING Sessions	Total number of current FRING sessions.
Current GTALK Sessions	Total number of current GTALK sessions.
 IMPORTANT: The following voice/non-voice counters are available only for 10.0 and earlier releases.	
Current GTALK voice Sessions	Total number of current GTALK voice sessions.
Current GTALK non-voice Sessions	Total number of current GTALK non-voice sessions.

Field	Description
 IMPORTANT: The following two counters are available only for 11.0 and later releases.	
Current GTALK Audio Sessions	Total number of current GTALK audio sessions.
Current GTALK Video Sessions	Total number of current GTALK video sessions.
Current OOVOO Sessions	Total number of current OOVOO sessions.
Current FREENET Sessions	Total number of current FREENET sessions.
Current AIMINI Sessions	Total number of current AIMINI sessions.
Current BATTLEFIELD Sessions	Total number of current BATTLEFIELD sessions.
Current OPENFT Sessions	Total number of current OPENFT sessions.
Current QQGAME Sessions	Total number of current QQGAME sessions.
Current QUAKE Sessions	Total number of current QUAKE sessions.
Current SECONDLIFE Sessions	Total number of current SECONDLIFE sessions.
Current ACTIVESYNC Sessions	Total number of current ACTIVESYNC sessions.
Current NIMBUZZ Sessions	Total number of current NIMBUZZ sessions.
Current IAX Sessions	Total number of current IAX sessions.
Current PALTALK Sessions	Total number of current PALTALK sessions.
Current WARCRAFT3 Sessions	Total number of current WARCRAFT3 sessions.
Current IPTV Sessions	Total number of current IPTV sessions.
Current RDP Sessions	Total number of current RDP sessions.
Current PANDORA Sessions	Total number of current PANDORA sessions.
Current ICECAST Sessions	Total number of current ICECAST sessions.
Current KONTIKI Sessions	Total number of current KONTIKI sessions.
Current MEEBO Sessions	Total number of current MEEBO sessions.
Current SHOUTCAST Sessions	Total number of current SHOUTCAST sessions.
Current TRUPHONE Sessions	Total number of current TRUPHONE sessions.

Field	Description
Current THUNDER Sessions	Total number of current THUNDER sessions.
Current ARMAGETTRON Sessions	Total number of current ARMAGETTRON sessions.
Current BLACKBERRY Sessions	Total number of current BLACKBERRY sessions.
Current CITRIX Sessions	Total number of current CITRIX sessions.
Current CLUBPENGUIN Sessions	Total number of current CLUBPENGUIN sessions.
Current CROSSFIRE Sessions	Total number of current CROSSFIRE sessions.
Current DOFUS Sessions	Total number of current DOFUS sessions.
Current FIESTA Sessions	Total number of current FIESTA sessions.
Current FLORENSIA Sessions	Total number of current FLORENSIA sessions.
Current FUNSHION Sessions	Total number of current FUNSHION sessions.
Current GUILDWARS Sessions	Total number of current GUILDWARS sessions.
Current ISAKMP Sessions	Total number of current ISAKMP sessions.
Current MAPLESTORY Sessions	Total number of current MAPLESTORY sessions.
Current MGCP Sessions	Total number of current MGCP sessions.
Current OCTOSHAPe Sessions	Total number of current OCTOSHAPe sessions.
Current OFF Sessions	Total number of current OFF sessions.
Current PS3 Sessions	Total number of current PS3 sessions.
Current RMSTREAM Sessions	Total number of current RMSTREAM sessions.
Current RFACTOR Sessions	Total number of current RFACTOR sessions.
Current SPLASHFIGHTER Sessions	Total number of current SPLASHFIGHTER sessions.
Current SSDP Sessions	Total number of current SSDP sessions.
Current STEALTHNET Sessions	Total number of current STEALTHNET sessions.
Current STUN Sessions	Total number of current STUN sessions.
Current TEAMSPEAK Sessions	Total number of current TEAMSPEAK sessions.
Current TOR Sessions	Total number of current TOR sessions.

Field	Description
Current VEOHTV Sessions	Total number of current VEOHTV sessions.
Current WII Sessions	Total number of current WII sessions.
Current WMSTREAM Sessions	Total number of current WMSTREAM sessions.
Current WOFKUNGFU Sessions	Total number of current WOFKUNGFU sessions.
Current XDCC Sessions	Total number of current XDCC sessions.
Current YOURFREEDOM Sessions	Total number of current YOURFREEDOM sessions.
Current FACEBOOK Sessions	Total number of current FACEBOOK sessions.
Current GMAIL Sessions	Total number of current GMAIL sessions.
Current ITUNES Sessions	Total number of current ITUNES sessions.
Current MYSPACE Sessions	Total number of current MYSPACE sessions.
Current TEAMVIEWER Sessions	Total number of current TEAMVIEWER sessions.
Current TWITTER Sessions	Total number of current TWITTER sessions.
Current VIBER Sessions	Total number of current VIBER sessions.
Current SCYDO Sessions	Total number of current SCYDO sessions.
Current WHATSAPP Sessions	Total number of current WHATSAPP sessions.

show active-charging sessions summary type p2p

Table 127. show active-charging sessions summary type p2p Command Output Descriptions

Field	Description
Total Active Charging Sessions	The total number of active charging sessions.
Uplink Bytes	Total bytes uploaded.
Downlink Bytes	Total bytes downloaded.
Uplink Packets	Total packets uploaded.
Downlink Packets	Total packets downloaded.
Current IP Sessions	Total number of current IP sessions.
Current ICMP Sessions	Total number of current ICMP sessions.
Current IPv6 Sessions	Total number of current IPv6 sessions.
Current ICMPv6 Sessions	Total number of current ICMPv6 sessions.
Current TCP Sessions	Total number of current TCP sessions.
Current UDP Sessions	Total number of current UDP sessions.
Current HTTP Sessions	Total number of current HTTP sessions.
Current HTTPS Sessions	Total number of current HTTPS sessions.
Current FTP Sessions	Total number of current FTP sessions.
Current POP3 Sessions	Total number of current POP3 sessions.
Current SMTP Sessions	Total number of current SMTP sessions.
Current SIP Sessions	Total number of current SIP sessions.
Current RTSP Sessions	Total number of current RTSP sessions.
Current RTP Sessions	Total number of current RTP sessions.
Current RTCP Sessions	Total number of current RTCP sessions.
Current IMAP Sessions	Total number of current IMAP sessions.
Current WSP-CO Sessions	Total number of current WSP-CO sessions.
Current WSP-CL Sessions	Total number of current WSP-CL sessions.
Current MMS Sessions	Total number of current MMS sessions.
Current DNS Sessions	Total number of current DNS sessions.
Current PPTP Sessions	Total number of current PPTP sessions.

Field	Description
Current PPTP-GRE Sessions	Total number of current PPTP-GRE sessions.
Current P2P Sessions	Total number of current P2P sessions.
Current H323 Sessions	Total number of current H323 sessions.
Current TFTP Sessions	Total number of current TFTP sessions.
Current UNKNOWN Sessions	Total number of current UNKNOWN sessions.
Current SKYPE Sessions	Total number of current SKYPE sessions.
Current YAHOO Sessions	Total number of current YAHOO sessions.
 IMPORTANT: The following voice/non-voice counters are available only for 10.0 and earlier releases.	
Current SKYPE voice Sessions	Total number of current SKYPE voice sessions.
Current YAHOO voice Sessions	Total number of current YAHOO voice sessions.
Current SKYPE non-voice Sessions	Total number of current SKYPE non-voice sessions.
Current YAHOO non-voice Sessions	Total number of current YAHOO non-voice sessions.
 IMPORTANT: The following audio/non-audio counters are available only for 11.0 and later releases.	
Current SKYPE Audio Sessions	Total number of current SKYPE audio sessions.
Current YAHOO Audio Sessions	Total number of current YAHOO audio sessions.
 IMPORTANT: The following audio/non-audio counters are available only for release 11.0.	
Current SKYPE non-audio Sessions	Total number of current SKYPE non-audio sessions.
Current YAHOO non-audio Sessions	Total number of current YAHOO non-audio sessions.
 IMPORTANT: The following counter is available only for 12.0 and later releases.	
Current YAHOO Video Sessions	Total number of current YAHOO Video sessions.
Current EDONKEY Sessions	Total number of current EDONKEY sessions.

Field	Description
Current ORB Sessions	Total number of current ORB sessions.
Current MSN Sessions	Total number of current MSN sessions.
Current GNUTELLA Sessions	Total number of current GNUTELLA sessions.
 IMPORTANT: The following counter is available only for 10.0 and earlier releases.	
Current MSN voice Sessions	Total number of current MSN voice sessions.
 IMPORTANT: The following counter is available only for 11.0 and later releases.	
Current MSN audio Sessions	Total number of current MSN audio sessions.
Current BITTORRENT Sessions	Total number of current BITTORRENT sessions.
 IMPORTANT: The following counter is available only for 10.0 and earlier releases.	
Current MSN non-voice Sessions	Total number of current MSN non-voice sessions.
 IMPORTANT: The following counter is available only for release 11.0.	
Current MSN non-audio Sessions	Total number of current MSN non-audio sessions.
Current MSN Video Sessions	Total number of current MSN video sessions.
Current MSN Unclassified Sessions	Total number of current MSN unclassified sessions.
Current SLINGBOX Sessions	Total number of current SLINGBOX sessions.
Current JABBER Sessions	Total number of current JABBER sessions.
Current WINNY Sessions	Total number of current WINNY sessions.
Current MANOLITO Sessions	Total number of current MANOLITO sessions.
Current PANDO Sessions	Total number of current PANDO sessions.
Current FILETOPIA Sessions	Total number of current FILETOPIA sessions.
Current SOULSEEK Sessions	Total number of current SOULSEEK sessions.

Field	Description
Current PPSTREAM Sessions	Total number of current PPSTREAM sessions.
Current QQ Sessions	Total number of current QQ sessions.
Current QQLIVE Sessions	Total number of current QQLIVE sessions.
Current IMESH Sessions	Total number of current IMESH sessions.
Current MUTE Sessions	Total number of current MUTE sessions.
Current PPLIVE Sessions	Total number of current PPLIVE sessions.
Current GADUGADU Sessions	Total number of current GADUGADU sessions.
Current FEIDIAN Sessions	Total number of current FEIDIAN sessions.
Current APPLEJUICE Sessions	Total number of current APPLEJUICE sessions.
Current FASTTRACK Sessions	Total number of current FASTTRACK sessions.
Current ZATTOO Sessions	Total number of current ZATTOO sessions.
Current SKINNY Sessions	Total number of current SKINNY sessions.
Current SOPCAST Sessions	Total number of current SOPCAST sessions.
Current DIRECTCONNECT Sessions	Total number of current DIRECTCONNECT sessions.
Current ARES Sessions	Total number of current ARES sessions.
Current OSCAR Sessions	Total number of current OSCAR sessions.
 IMPORTANT: The following voice/non-voice counters are available only for 10.0 and earlier releases.	
Current OSCAR voice Sessions	Total number of current OSCAR voice sessions.
Current OSCAR non-voice Sessions	Total number of current OSCAR non-voice sessions.
 IMPORTANT: The following audio/non-audio counters are available only for release 11.0 and later releases.	
Current OSCAR Audio Sessions	Total number of current OSCAR audio sessions.
Current OSCAR Video Sessions	Total number of current OSCAR video sessions.
Current POPO Sessions	Total number of current POPO sessions.
Current IRC Sessions	Total number of current IRC sessions.
Current STEAM Sessions	Total number of current STEAM sessions.

Field	Description
Current DDLINK Sessions	Total number of current DDLINK sessions.
Current HALFLIFE2 Sessions	Total number of current HALFLIFE2 sessions.
Current HAMACHIVPN Sessions	Total number of current HAMACHIVPN sessions.
Current TVANTS Sessions	Total number of current TVANTS sessions.
Current TVUPLAYER Sessions	Total number of current TVUPLAYER sessions.
Current UUSEE Sessions	Total number of current UUSEE sessions.
Current VPNX Sessions	Total number of current VPNX sessions.
Current VTUN Sessions	Total number of current VTUN sessions.
Current WINMX Sessions	Total number of current WINMX sessions.
Current WOFWARCRAFT Sessions	Total number of current WOFWARCRAFT sessions.
Current XBOX Sessions	Total number of current XBOX sessions.
Current ISKOOT Sessions	Total number of current ISKOOT sessions.
Current FRING Sessions	Total number of current FRING sessions.
Current GTALK Sessions	Total number of current GTALK sessions.
 IMPORTANT: The following voice/non-voice counters are available only for 10.0 and earlier releases.	
Current GTALK voice Sessions	Total number of current GTALK voice sessions.
Current GTALK non-voice Sessions	Total number of current GTALK non-voice sessions.
 IMPORTANT: The following audio/non-audio counters are available only for 11.0 and later releases.	
Current GTALK Audio Sessions	Total number of current GTALK Audio sessions.
Current GTALK Video Sessions	Total number of current GTALK video sessions.
Current OOVOO Sessions	Total number of current OOVOO sessions.
Current FREENET Sessions	Total number of current FREENET sessions.
Current AIMINI Sessions	Total number of current AIMINI sessions.
Current BATTLEFIELD Sessions	Total number of current BATTLEFIELD sessions.
Current OPENFT Sessions	Total number of current OPENFT sessions.
Current QQGAME Sessions	Total number of current QQGAME sessions.

Field	Description
Current QUAKE Sessions	Total number of current QUAKE sessions.
Current SECONDLIFE Sessions	Total number of current SECONDLIFE sessions.
Current ACTIVESYNC Sessions	Total number of current ACTIVESYNC sessions.
Current NIMBUZZ Sessions	Total number of current NIMBUZZ sessions.
Current IAX Sessions	Total number of current IAX sessions.
Current PALTALK Sessions	Total number of current PALTALK sessions.
Current WARCRAFT3 Sessions	Total number of current WARCRAFT3 sessions.
Current IPTV Sessions	Total number of current IPTV sessions.
Current RDP Sessions	Total number of current RDP sessions.
Current PANDORA Sessions	Total number of current PANDORA sessions.
Current ICECAST Sessions	Total number of current ICECAST sessions.
Current KONTIKI Sessions	Total number of current KONTIKI sessions.
Current MEEBO Sessions	Total number of current MEEBO sessions.
Current SHOUTCAST Sessions	Total number of current SHOUTCAST sessions.
Current TRUPHONE Sessions	Total number of current TRUPHONE sessions.
Current THUNDER Sessions	Total number of current THUNDER sessions.
Current ARMAGETTRON Sessions	Total number of current ARMAGETTRON sessions.
Current BLACKBERRY Sessions	Total number of current BLACKBERRY sessions.
Current CITRIX Sessions	Total number of current CITRIX sessions.
Current CLUBPENGUIN Sessions	Total number of current CLUBPENGUIN sessions.
Current CROSSFIRE Sessions	Total number of current CROSSFIRE sessions.
Current DOFUS Sessions	Total number of current DOFUS sessions.
Current FIESTA Sessions	Total number of current FIESTA sessions.
Current FLORENSIA Sessions	Total number of current FLORENSIA sessions.
Current FUNSHION Sessions	Total number of current FUNSHION sessions.
Current GUILDWARS Sessions	Total number of current GUILDWARS sessions.
Current ISAKMP Sessions	Total number of current ISAKMP sessions.
Current MAPLESTORY Sessions	Total number of current MAPLESTORY sessions.
Current MGCP Sessions	Total number of current MGCP sessions.
Current OCTOSHAPE Sessions	Total number of current OCTOSHAPE sessions.
Current OFF Sessions	Total number of current OFF sessions.

Field	Description
Current PS3 Sessions	Total number of current PS3 sessions.
Current RMSTREAM Sessions	Total number of current RMSTREAM sessions.
Current RFACTOR Sessions	Total number of current RFACTOR sessions.
Current SPLASHFIGHTER Sessions	Total number of current SPLASHFIGHTER sessions.
Current SSDP Sessions	Total number of current SSDP sessions.
Current STEALTHNET Sessions	Total number of current STEALTHNET sessions.
Current STUN Sessions	Total number of current STUN sessions.
Current TEAMSPEAK Sessions	Total number of current TEAMSPEAK sessions.
Current TOR Sessions	Total number of current TOR sessions.
Current VEOHTV Sessions	Total number of current VEOHTV sessions.
Current WII Sessions	Total number of current WII sessions.
Current WMSTREAM Sessions	Total number of current WMSTREAM sessions.
Current WOFKUNGFU Sessions	Total number of current WOFKUNGFU sessions.
Current XDCC Sessions	Total number of current XDCC sessions.
Current YOURFREEDOM Sessions	Total number of current YOURFREEDOM sessions.
Current FACEBOOK Sessions	Total number of current FACEBOOK sessions.
Current GMAIL Sessions	Total number of current GMAIL sessions.
Current ITUNES Sessions	Total number of current ITUNES sessions.
Current MYSPACE Sessions	Total number of current MYSPACE sessions.
Current TEAMVIEWER Sessions	Total number of current TEAMVIEWER sessions.
Current TWITTER Sessions	Total number of current TWITTER sessions.
Current VIBER Sessions	Total number of current VIBER sessions.
Current SCYDO Sessions	Total number of current SCYDO sessions.
Current WHATSAPP Sessions	Total number of current WHATSAPP sessions.

show active-charging subsystem all

Table 128. show active-charging subsystem all Command Output Descriptions

Field	Description
Total ACS Managers	Total number of Active Charging Service managers running on the system.
Session Creation Succ	Total number of sessions created successfully.
Session Creation Fail	Total number of session creation failures.
Total subscribers	Total number of subscribers configured on system.
Current subscribers	Total number of subscriber active on system.
Total CF subscribers	Total number of Content Filtering subscribers configured on the system.
Current CF subscribers	Total number of Content Filtering subscribers active on the system.
Total Flows Connected	Total number of flows connected.
Total Flows Disconnected	Total number of flows disconnected.
Total Uplink Pkts	Total number of packets uplinked.
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Pkts	Total number of packets downlinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total ICMP flows	Total number of ICMP flows.
Current ICMP flows	Total number of current ICMP flows.
Total ICMPv6 flows	Total number of ICMPv6 flows.
Current ICMPv6 flows	Total number of current ICMPv6 flows.
Total TCP flows	Total number of TCP flows.
Current TCP flows	Total number of current TCP flows.
Total UDP flows	Total number of UDP flows.
Current UDP flows	Total number of current UDP flows.
Total DNS flows	Total number of DNS flows.
Current DNS flows	Total number of current DNS flows.
Total FTP flows	Total number of FTP flows.
Current FTP flows	Total number of current FTP flows.
Total HTTP flows	Total number of HTTP flows.

■ show active-charging subsystem all

Field	Description
Current HTTP flows	Total number of current HTTP flows.
Total HTTPS flows	Total number of HTTPS flows.
Current HTTPS flows	Total number of current HTTPS flows.
Total POP3 flows	Total number of POP3 flows.
Current POP3 flows	Total number of current POP3 flows.
Total SMTP flows	Total number of SMTP flows.
Current SMTP flows	Total number of current SMTP flows.
Total SIP flows	Total number of SIP flows.
Current SIP flows	Total number of current SIP flows.
Total RTSP flows	Total number of RTSP flows.
Current RTSP flows	Total number of current RTSP flows.
Total RTP flows	Total number of RTP flows.
Current RTP flows	Total number of current RTP flows.
Total RTCP flows	Total number of RTCP flows.
Current RTCP flows	Total number of current RTCP flows.
Total IMAP flows	Total number of IMAP flows.
Current IMAP flows	Total number of current IMAP flows.
Total WSP-CO flows	Total number of WSP-CO flows.
Current WSP-CO flows	Total number of current WSP-CO flows.
Total WSP-CL flows	Total number of WSP-CL flows.
Current WSP-CL flows	Total number of current WSP-CL flows.
Total MMS flows	Total number of MMS flows.
Current MMS flows	Total number of current MMS flows.
Total TFTP flows	Total number of TFTP flows.
Current TFTP flows	Total number of current TFTP flows.
Total PPTP flows	Total number of PPTP flows.
Current PPTP flows	Total number of current PPTP flows.
Total PPTP-GRE flows	Total number of PPTP-GRE flows.
Current PPTP-GRE flows	Total number of current PPTP-GRE flows.
Total H323 flows	Total number of H323 flows.
Current H323 flows	Total number of current H323 flows.

Field	Description
Total P2P flows	Total number of P2P flows.
Current P2P flows	Total number of current P2P flows.
Total P2P Voice flows	Total number of P2P voice flows.
Total video flows paced	Total number of TCP video flows paced.
Current video flows paced	Total number of current TCP video flows paced.
Current P2P Voice flows	Total number of current P2P voice flows.
Total Rule-Hits	Total number of rule hits.
Total Readdr flows	Total number of re-addressed flows.
Current Readdr flows	Total number of current re-addressed flows.
Total P2P Sessions	Total number of P2P sessions formed from start.
Total PP Rule-Hits	Total number of Post-processing rule hits.
Total P2P Subscribers	Total number of P2P subscribers.
Total Firewall Subscribers	Total number of Firewall subscribers. NOTE: This statistic is obsolete in 11.0 and later releases.
Total NAT Subscribers	Total number of Network Address Translation subscribers. NOTE: This statistic is obsolete in 11.0 and later releases.
Total Blacklisted URL hits	Total number of Blacklisted URL hits.
Total Blacklisted URL misses	Total number of Blacklisted URL misses.
Total Readdr flows	Total number of readdressed flows.
Current Readdr flows	Current number of readdressed flows.
Total URLs Outstanding for Rating (SRDB)	Total number of URLs outstanding for Static Rating Database rating.
Firewall/NAT Subscribers:	
Firewall IPv4 Enabled	Displays the total and the active number of subscribers with IPv4 Firewall enabled.
Firewall IPv6 Enabled	Displays the total and the active number of subscribers with IPv6 Firewall enabled.
NAT Enabled	Displays the total and the active number of subscribers with NAT enabled. NOTE: This statistic is available only from releases 11.0 to 12.1.
Firewall and NAT Enabled	Displays the total and the active number of subscribers with IPv4 or IPv6 Firewall and NAT enabled.
Fair Usage Statistics:	
CPU Credits (used/max)	Number of CPU credits used and maximum number of CPU credits.
RADIUS Prepaid Statistics	Indicates the group of statistics for RADIUS prepaid session.
Total prepaid sess	Total number of active/dormant/inactive prepaid sessions.

■ show active-charging subsystem all

Field	Description
Current prepaid sess	Total number of prepaid sessions currently active.
Total prepaid auth req	Total number of AAA authorization requests for prepaid sessions.
Total prepaid auth success	Total number of successful AAA authorization for prepaid sessions.
Total prepaid auth fail	Total number of failed AAA authorization for prepaid sessions.
Total prepaid errors	Total number of errors occurred in prepaid sessions.
Content Filtering URL Cache Statistics	Indicates URL caching statistics for Content Filtering.
Total cached entries	Total number of cached entries in memory.
Total hits	Total number of attempts to access URLs which are cached in memory with rating.
Total misses	Total number of attempts failed to access URLs which are cached in memory with rating.
Total has-path hits	Total number of attempts to access URLs which are cached in memory with rating with specified path.
Total flushes	total number of flushing of URL cache to clear memory with stale URL list and rating.
Total URLs not cached	Total number of URLs accessed but not cached in memory.
Total Cache size	Total cache size adding maximum cache size for all volume provided for URLs caching.
Percentage Full	Indicates the percentage of memory used out of allocated space for URL caching.
Last Flush request received Time	Indicates the time of last flush request received for cache flushing.
Total Control Pkts Rx	Total number of control packets received.
Total Control Pkts Tx	Total number of control packets transmitted.
Data statistics	Statistics of data flow.
Receive Pkts	Total number of packets received in different size based frequency
Transmit pkts	Total number of packets transmitted in different size based frequency
User Data statistics	Indicates the group of statistics of user data traffic.
Data octets from User	Total number of bytes originated from user.
Data packets from User	Total number of data packets originated from user.
Data octets to User	Total number of bytes sent to user.
Data packets to User	Total number of data packets sent to user.
EDR/UDR statistics	
Records Generated	The total number of EDR/UDR records generated.
Msgs sent to CDRMOD	The total number of EDR/UDR messages sent to CDRMOD.
Records sent to CDRMOD	The total number of EDR/UDR records sent to CDRMOD.

Field	Description
Msgs bounced from CDRMOD	The total number of EDR/UDR messages that were bounced from CDRMOD.
Records bounced from CDRMOD	The total number of EDR/UDR records that were bounced from CDRMOD.
Successful Msgs sent to CDRMOD	The total number of successful EDR/UDR messages that were sent to CDRMOD.
Successful records sent to CDRMOD	The total number of successful EDR/UDR records that were sent to CDRMOD.

show active-charging subsystem facility acsmgr instance

Table 129. show active-charging subsystem facility acsmgr instance Command Output Descriptions

Field	Description
ACSMgr Instance	The ACS Manager instance.
Card/CPU	The card and CPU ID.
Session Creation Succ	Total number of sessions created successfully.
Session Creation Fail	Total number of session creation failures.
Total subscribers	Total number of subscribers configured on system.
Current subscribers	Total number of subscriber active on system.
Total CF subscribers	Total number of Content Filtering subscribers configured on the system.
Current CF subscribers	Total number of Content Filtering subscribers active on the system.
Total Flows Connected	Total number of flows connected.
Total Flows Disconnected	Total number of flows disconnected.
Total Uplink Pkts	Total number of packets uplinked.
Total Uplink Bytes	Total number of bytes uplinked.
Total Downlink Pkts	Total number of packets downlinked.
Total Downlink Bytes	Total number of bytes downlinked.
Total ICMP flows	Total number of ICMP flows.
Current ICMP flows	Total number of current ICMP flows.
Total ICMPv6 flows	Total number of ICMPv6 flows.
Current ICMPv6 flows	Total number of current ICMPv6 flows.
Total TCP flows	Total number of TCP flows.
Current TCP flows	Total number of current TCP flows.
Total UDP flows	Total number of UDP flows.
Current UDP flows	Total number of current UDP flows.
Total DNS flows	Total number of DNS flows.
Current DNS flows	Total number of current DNS flows.
Total FTP flows	Total number of FTP flows.
Current FTP flows	Total number of current FTP flows.

Field	Description
Total HTTP flows	Total number of HTTP flows.
Current HTTP flows	Total number of current HTTP flows.
Total HTTPS flows	Total number of HTTPS flows.
Current HTTPS flows	Total number of current HTTPS flows.
Total POP3 flows	Total number of POP3 flows.
Current POP3 flows	Total number of current POP3 flows.
Total SMTP flows	Total number of SMTP flows.
Current SMTP flows	Total number of current SMTP flows.
Total SIP flows	Total number of SIP flows.
Current SIP flows	Total number of current SIP flows.
Total RTSP flows	Total number of RTSP flows.
Current RTSP flows	Total number of current RTSP flows.
Total RTP flows	Total number of RTP flows.
Current RTP flows	Total number of current RTP flows.
Total RTCP flows	Total number of RTCP flows.
Current RTCP flows	Total number of current RTCP flows.
Total IMAP flows	Total number of IMAP flows.
Current IMAP flows	Total number of current IMAP flows.
Total WSP-CO flows	Total number of WSP-CO flows.
Current WSP-CO flows	Total number of current WSP-CO flows.
Total WSP-CL flows	Total number of WSP-CL flows.
Current WSP-CL flows	Total number of current WSP-CL flows.
Total MMS flows	Total number of MMS flows.
Current MMS flows	Total number of current MMS flows.
Total TFTP flows	Total number of TFTP flows.
Current TFTP flows	Total number of current TFTP flows.
Total PPTP flows	Total number of PPTP flows.
Current PPTP flows	Total number of current PPTP flows.
Total PPTP-GRE flows	Total number of PPTP-GRE flows.
Current PPTP-GRE flows	Total number of current PPTP-GRE flows.
Total H323 flows	Total number of H323 flows.

Field	Description
Current H323 flows	Total number of current H323 flows.
Total P2P flows	Total number of P2P flows.
Current P2P flows	Total number of current P2P flows.
Total Rule-Hits	Total number of rule hits.
Blacklisted URL hits	The number of Blacklisted URL hits.
Blacklisted URL misses	The number of Blacklisted URL misses.
Total URLs Outstanding for Rating (SRDB)	Total number of URLs outstanding for Static Rating Database rating.
Firewall/NAT Subscribers:	
Firewall IPv4 Enabled	Displays the total and the active number of subscribers with IPv4 Firewall enabled.
Firewall IPv6 Enabled	Displays the total and the active number of subscribers with IPv6 Firewall enabled.
NAT44 Enabled	Displays the total and the active number of subscribers with NAT44 enabled.
Firewall and NAT Enabled	Displays the total and the active number of subscribers with IPv4 or IPv6 Firewall and NAT enabled.
RADIUS Prepaid Statistics: Indicates the group of statistics for RADIUS prepaid session.	
Total prepaid sess	Total number of active/dormant/inactive prepaid sessions.
Current prepaid sess	Total number of prepaid sessions currently active.
Total prepaid auth req	Total number of AAA authorization requests for prepaid sessions.
Total prepaid auth success	Total number of successful AAA authorization for prepaid sessions.
Total prepaid auth fail	Total number of failed AAA authorization for prepaid sessions.
Total prepaid errors	Total number of errors occurred in prepaid sessions.
Content Filtering Policy <policy> for Service <service> Matched	
Content Filtering URL Cache Statistics	Indicates the group of statistics of URL caching for content filtering service.
Total cached entries	Total number of cached entries in memory.
Total hits	Total number of attempts to access URLs which are cached in memory with rating.
Total misses	Total number of attempts failed to access URLs which are cached in memory with rating.
Total has-path hits	Total number of attempts to access URLs which are cached in memory with rating with specified path.
Total flushes	Total number of flushing of URL cache to clear memory with stale URL list and rating.
Total Cache size (all volumes)	Total cache size adding maximum cache size for all volume provided for URLs caching.
Percentage Full	Indicates the percentage of memory used out of allocated space for URL caching.

Field	Description
Last Flush request received time	Indicates the time of last flush request received for cache flushing.
Volume - <volume>	The volume.
Cached entries	For the volume, indicates the total number of cached entries in memory.
Hits	For the volume, indicates the total number of attempts failed to access URLs which are cached in memory with rating.
Misses	For the volume, indicates the total number of attempts failed to access URLs which are cached in memory with rating.
has-path hits	For the volume, indicates the total number of attempts to access URLs which are cached in memory with rating with specified path.
Flushes	For the volume, indicates the total number of times the URL cache has been flushed to clear memory with stale URL list and rating.
Percentage Full	For the volume, indicates the percentage of memory used out of allocated space for URL caching.
Last Access Time	For the volume, indicates the last access time.
Last Flush Time	For the volume, indicates the last flush time.
Data statistics	
Receive Pkts	Total number of packets received.
Transmit Pkts	Total number of packets transmitted.

show active-charging tcp-proxy statistics all verbose

Table 130. show active-charging tcp-proxy statistics all verbose Command Output Descriptions

Field	Description
TCP Proxy Stack Statistics	
Statistics	
Cumulative Statistics	
Total Pkts to Stack	Total number of packets received by stack.
Total Bytes to Stack	Total number of bytes received by stack.
Total Pkts from Stack	Total number of packets sent from stack.
Total Bytes from Stack	Total number of bytes sent from stack.
API Statistics	
Total Sockets Opened	Total number of sockets opened.
Socket Open Failed	Total number of sockets open failures.
Total Connect Attempts	Total number of connection attempts.
Total Listening Sockets	Total number of sockets listening.
Socket Listening Failed	Total number of sockets listening failures.
Socket Bind Success	Total number of socket binds successful.
Socket Accept Success	Total number of socket accepts successful.
Socket Accept Failed	Total number of socket accept failures.
Total Send Success	Total number of sends successful.
Total Send Failed	Total number of send failures.
Total Send Partial Succ	Total number of sends partially successful.
Total SendTo Success	Total number of send to successful.
Total SendTo Failed	Total number of send to failures.
Total SendTo Partil Succ	Total number of send to partially successful.
Total Recv Attempted	Total number of Recv attempted.
Total Recv Fail	Total number of Recv failures.
Total RecvFrom Attempted	Total number of RecvFrom attempted.
Total RecvFrom Fail	Total number of RecvFrom failures.

Field	Description
Current Open Sockets	Total number of sockets currently open.
IP Layer Statistics	
Total Pkts Recvd at IP	Total number of packets received at IP layer.
Header Errors	Total number of IP header errors.
Unknown Protocol	Total number of unknown IP protocol errors.
Incoming Discarded Pkts	Total number of incoming packets discarded.
Outgoing Requests	Total number of outgoing requests.
Outgoing Discarded Pkts	Total number of outgoing discarded packets.
Reassembly Timeouts	Total number of reassembly timeouts.
Reassembly Success	Total number of IP datagrams that were reassembled successfully.
Fragmentation Success	Total number of IP datagrams that were fragmented successfully.
Fragmentation Fails	Total number of IP datagrams that were discarded due to fragmentation failures.
Fragments Created	Total number of fragments created.
TCP Layer Statistics	
Incoming TCP Segments	Total number of incoming segments received at TCP layer.
Incoming TCP Bytes	Total number of incoming bytes received at TCP layer.
Incoming TCP Error Seg	Total number of incoming segments containing some error.
In TCP Retrans Seg	Total number of incoming TCP retransmitted segments.
In TCP Retrans Byte	Total number of incoming TCP retransmitted bytes.
Outgoing TCP Data Seg	Total number of outgoing TCP segments having some data.
Outgoing TCP Reset Seg	Total number of outgoing TCP resets.
Outgoing TCP Retrans Seg	Total number of packets retransmitted by the stack.
In TCP Partial Retr Seg	Total number of incoming TCP partial retransmitted segments.
In TCP Partial Retr Byte	Total number of incoming TCP partial retransmitted bytes.
In TCP OOO Segments	Total number of incoming TCP Out-of-Order segments.
In TCP OOO Bytes	Total number of incoming TCP Out-of-Order bytes.
In TCP OOO+Retrans Seg	Total number of incoming TCP Out-of-Order+retransmitted segments.
In TCP OOO+Retrans Bytes	Total number of incoming TCP Out-of-Order+retransmitted bytes.
In TCP OOO Succ Seg	Total number of incoming TCP Out-of-Order Succ segments.
In TCP OOO Succ Bytes	Total number of incoming TCP Out-of-Order Succ bytes.
In TCP Csum Err Seg	Total number of incoming TCP checksum error segments.

■ show active-charging tcp-proxy statistics all verbose

Field	Description
In TCP Csum Err Bytes	Total number of incoming TCP checksum error bytes.
Active Open	Total number of active connections initiated by the stack.
Passive Open	Total number of connections accepted by the stack.
Connection Failure	Total number failed connections.
Reset in Est State	Total number of resets received in Established state.
Current Est Connections	Total number of active established connections.
TCP Proxy Statistics for Rulebase	
Cumulative TCP proxy Statistics for Rulebase:	
Total Proxy Flows	Total number of TCP Proxy flows in this rulebase.
Current Proxy Flows	Total no of current TCP Proxy flows in this rulebase.
Uplink TCP Proxy:	
Pkts received from uplink	Total number of uplink packets on Gn interface.
Pkts forwarded to application	Total number uplink packets forwarded by stack to TCP Proxy application.
Pkts received from application	Total number uplink packets received from TCP Proxy application to stack.
Pkts for transmission to uplink	Total number uplink packets sent by stack on Gi interface.
Pkts received after connection with server	Total number uplink packets received after connection with server.
Pkts received before connection with server	Total number uplink packets received before connection with server.
Number of connect tried	Total number times the connect was called.
Downlink TCP Proxy:	
Pkts received from downlink	Total number of downlink packets on Gi interface.
Pkts forwarded to application	Total number downlink packets forwarded by stack to TCP Proxy application.
Pkts received from application	Total number downlink packets received from TCP Proxy application to stack.
Pkts for transmission to downlink	Total number downlink packets from application on Gn interface.
Pkts received after connection with client	Total number of downlink packets received after connection with client.
Pkts received before connection with client	Total number downlink packets received before connection with client.
Number of connect tried	Total number times the connect was called.
Downlink and uplink TCP proxy events:	
Total received failed	Total number of Recv calls failed.
Total error received	Total number of socket errors.
Total reset received	Total number of RESETs received (both from Gn and Gi side).
Total remote closed received	Total number of Remote Close events occurred (both from Gn and Gi side).

Field	Description
Total close complete received	Total number of Remote Close Complete events occurred (both from Gn and Gi side).
Total accept received	Total number of accept events received (both from Gn and Gi side).
Total accept failed	Total number of accept requests failed.
Total registerCB failed	Total number of calls to registerCB function failed.
Total recv occurred	Total number of Recv events occurred.
Total connect complete received	Total number of connect complete events occurred.
Total send failed	Total number of calls to send function failed.
Proxy Session counters:	
Current Connecting Conn (AO on GN)	Total number of current connecting connections active open on GN.
Current Connecting Conn (AO on GI)	Total number of current connecting connections active open on GI.
Current Connected Conn (AO on GN)	Total number of current connected connections active open on GN.
Current Connected Conn (AO on GI)	Total number of current connected connections active open on GI.
Current Un-Accepted Conn (PO on GN)	Total number of current unaccepted connections passive open on GN.
Current Un-Accepted Conn (PO on GI)	Total number of current unaccepted connections passive open on GI.
Current Accepted Conn (PO on GN)	Total number of current accepted connections passive open on GN.
Current Accepted Conn (PO on GI)	Total number of current accepted connections passive open on GI.
Current EST conn on both side	Total number of current EST connections on both side.
Total PO Succ on GN	Total number of passive open successful on GN.
Total AO Succ on GI	Total number of active open successful on GI.
Total PO Succ on GI	Total number of passive open successful on GI.
Total AO Succ on GN	Total number of active open successful on GN.
Flows not proxied - Proxy flow limit	Total number of flows not proxied due to proxy flow limit.
Flows not proxied - Backlog limit	Total number of flows not proxied due to backlog limit.
Flows not proxied - Gn sock limit	Total number of flows not proxied due to Gn sock limit.
Flows not proxied - Gi sock limit	Total number of flows not proxied due to Gi sock limit.
Flows cleared - incomplete active open	Total number of flows cleared due to incomplete active open.
Flows cleared - incomplete passive open	Total number of flows cleared due to incomplete passive open.
Proxy Error counters:	
Socket Open Failed	Socket open failed statistics on Gn and Gi.
Socket Error Events	Socket error event statistics on Gn and Gi.

■ show active-charging tcp-proxy statistics all verbose

show active-charging tcp-proxy statistics socket-migration

Table 131. show active-charging tcp-proxy statistics socket-migration Command Output Descriptions

Field	Description
Socket Migration Statistics	
Cumulative Statistics	
Total Flows Initialized	Total number of flows for which Socket Migration was initialized.
Total Flows Migration Attempt	Total number of flows for which socket migration was started.
Total Flows Success	Total number of flows for which socket migration was successful.
Total Flows Failed	Total number of flows for which socket migration failed with reason.
Memory Alloc Failed	Total number of flows for which socket migration failed due to memory allocation failure.
Permission Denied	Total number of flows for which socket migration failed due to permission denials.
Possible TCP State Change	Total number of flows for which socket migration failed due to possible TCP state change.
Pkt Trimming Failed	Total number of flows for which socket migration failed due to packet trimming failures.
Others	Total number of flows for which socket migration failed due to other reasons.
Total Pkts Trimmed	Total number of packets trimmed during stabilization phase.
Current Statistics	
Current Socket Migrated Flows	Number of current flows for which socket migration is activated.
Flows in Init State	Number of current flows that are in Init state.
Flows in Pre-mig State	Number of current flows that are in Pre-migration state.
Flows in Mig Started State	Number of current flows that are in Migration Started state.
Flows in Post-Mig State	Number of current flows that are in Post Migration state.
Flows in Mig-Done State	Number of current flows that are in Migration Completed state.
Flows in Cant-Do State	Number of current flows that are in Migration Can't be Done state.

show active-charging timedef all

Table 132. show active-charging timedef all Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
Timedef Name	Name of the time definition.
Start Day	Start day configured for each timeslot in the timedef. If the day is not configured, shows "Daily".
Start Time	Start time configured for each timeslot in the timedef.
End Day	End day configured for each timeslot in the timedef. If the day is not configured, shows "Daily".
End Time	End time configured for each timeslot in the timedef.
Total timedef(s) found	The total number of timedefs found.

show active-charging tpo profile statistics name

Table 133. show active-charging tpo profile statistics name <tpo_profile_name> Command Output Descriptions

Field	Description
TPO profile name	Name of the TPO profile.
Number of TPO enabled flows	Number of TPO-enabled flows.
Number of times TPO is disabled by P2P	Number of times TPO optimizations were disabled due to detection of P2P flows.
Number of times the TPO profile is selected	Number of times the TPO profile was selected.
TCP optimization statistics:	
Number of optimized flows	Total number of TCP optimized flows.
Total bytes transferred	Total number of bytes transferred.
Total bytes retransmitted	Total number of bytes retransmitted.
Total transfer duration(in ms)	Total transfer duration, in ms.
Average goodput(in kB/s)	The average goodput, in kb/s.
Total bytes transferred during slow start	Total number of bytes transferred during Slow Start phase.
Total slow start duration(in ms)	Total slow start duration, in ms.
Average goodput during slow start(in kB/s)	The average goodput during slow start, in kb/s.
Total bytes transferred during congestion avoidance	Total number of bytes transferred during congestion avoidance phase.
Total congestion avoidance duration(in ms)	Total congestion avoidance duration, in ms.
Average goodput during congestion avoidance(in kB/s)	The average goodput during congestion avoidance, in kb/s.
Average connection setup time(in ms)	The average connection setup time, in ms.
Connections with max throughput not achieved during initial window	Total number of connections with maximum throughput not achieved during initial window.
Limited by receive window on mobile	Total number of connections with maximum throughput not achieved due to limited receive window on the mobile client.
Limited by data unavailability	Total number of connections with maximum throughput not achieved due to unavailability of data.
Congestion Control Algorithm:	
Number of times basic is enabled	Total number of times Basic congestion control algorithm was enabled.
Number of times vegas is enabled	Total number of times the Vegas congestion control algorithm was enabled.

Field	Description
Number of times westwood-plus is enabled	Total number of times the Westwood Plus congestion control algorithm was enabled.
Number of data segments sent	Total number of data segments sent.
Number of data segments received	Total number of data segments received.
Number of ACKs sent	Total number of ACKs sent.
Number of ACKs received	Total number of ACKs received.
Number of duplicate ACKs sent	Total number of duplicate ACKs sent.
Number of duplicate ACKs received	Total number of duplicate ACKs received.
Number of RTO timeouts	Total number of RTO timeouts.
Number of Fast retransmissions	Total number of Fast Retransmissions.
HTTP url-rewrite statistics:	
Number of optimized flows	Total number of optimized flows.
Number of non-optimized flows	Total number of non-optimized flows.
Due to content-type	Total number of non-optimized flows due to content type.
Due to response code	Total number of non-optimized flows due to response code.
Due to content encoding	Total number of non-optimized flows due to content encoding.
Due to in-sufficient system resources	Total number of non-optimized flows due to insufficient system resources.
Due to request-type	Total number of non-optimized flows due to request type.
Number of tags parsed	Total number of tags parsed.
Number of DNS resolutions	Total number of DNS resolutions.
Resolved locally	Total number of DNS resolutions resolved locally.
Resolved Remotely	Total number of DNS resolutions resolved remotely.
Resolution failures	Total number of DNS resolution failures.
Total Number of bytes added to URL	Total number of bytes added to URL.
Average Number of bytes added per flow	The average number of bytes added per flow.
HTTP compression statistics:	
Number of optimized flows	Total number of optimized flows.
Number of non-optimized flows	Total number of non-optimized flows.
Due to content-type	Total number of non-optimized flows due to content type.
Due to response code	Total number of non-optimized flows due to response code.
Due to content encoding	Total number of non-optimized flows due to content encoding.
Due to client not supporting compression	Total number of non-optimized flows due to client not supporting compression.

Field	Description
Due to in-sufficient system resources	Total number of non-optimized flows due to insufficient system resources.
Due to request-type	Total number of non-optimized flows due to request type.
Number of IN bytes	Total number of incoming bytes.
Number of OUT bytes	Total number of outgoing bytes.
Average Compression Gain	The average compression gain.
Number of flows decompressed	Total number of flows decompressed.
Number of server compressions prevented	Total number of server compressions prevented.
Number of times the compression gain is low	Total number of times the compression gain was low.
HTTP Ad-filter statistics:	
Number of advertisements blocked	Total number of advertisements blocked by the Advertisement Filter feature.
Number of advertisements accessed	Total number of advertisements accessed.
Ad-filter display statistics:	
Number of pages delivered with text-only display	Total number of Web pages with text-only display delivered to mobile client.
Number of pages delivered with onclick-with-text display	Total number of pages with onclick-with-text display delivered to mobile client.
Number of bytes added to web pages	Total number of bytes added to Web pages delivered due to the Advertisement Filter feature.
TPO error statistics:	
Allocation failures:	
HTTP url-rewrite	Total number of allocation failures HTTP URL Rewrite feature.
HTTP compression	Total number of allocation failures HTTP Compression feature.
HTTP ad-filter	Total number of allocation failures HTTP Advertisement Filter feature.

show active-charging udr-format all

Table 134. show active-charging udr-format all Command Output Descriptions

Field	Description
Service Name	Name of the Active Charging Service.
UDR Format Name	Name of the configured UDR format.
Attribute	Attribute informations configured in specific UDR format.
Total udr-format(s) found	The total number of the configured UDR formats.

show active-charging url-blacklisting statistics

Table 135. show active-charging url-blacklisting statistics Command Output Descriptions

Field	Description
Service name	Name of the Active Charging Service.
Cumulative URL-Blacklisting Statistics	
Total Blacklisted URL hits	The total number of Blacklisted URL hits.
Total Blacklisted URL misses	The total number of Blacklisted URL misses.

show active-charging url-blacklisting statistics rulebase name

Table 136. show active-charging url-blacklisting statistics rulebase name Command Output Descriptions

Field	Description
Service name	Name of the Active Charging Service.
Rulebase name	Name of the rulebase.
Blacklisted URL hits	The total number of Blacklisted URL hits.
Blacklisted URL misses	The total number of Blacklisted URL misses.
Total rulebases matched	The total number of rulebases matching the specified criteria.

show active-charging video detailed-statistics

Table 137. show active-charging video detailed-statistics Command Output Descriptions

Field	Description
RAT (Radio Access Type)	
GPRS Del. Rate	The average video delivery rate for GPRS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
GPRS Enc. Rate	The average video encoding rate for GPRS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
GPRS Tot. Bytes	The total payload bytes (excluding IP and TCP headers) transferred to the RAN side for GPRS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
GPRS %download	The average percentage (in terms of bytes) of video files downloaded for GPRS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
GPRS Tot. Video	The total number of video clips for GPRS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
UMTS Del. Rate	The average video delivery rate for UMTS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
UMTS Enc. Rate	The average video encoding rate for UMTS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
UMTS Tot. Bytes	The total payload bytes (excluding IP and TCP headers) transferred to the RAN side for UMTS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
UMTS %download	The average percentage (in terms of bytes) of video files downloaded for UMTS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
UMTS Tot. Video	The total number of video clips for UMTS Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
LTE Del. Rate	The average video delivery rate for LTE Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
LTE Enc. Rate	The average video encoding rate for LTE Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
LTE Tot. Bytes	The total payload bytes (excluding IP and TCP headers) transferred to the RAN side for LTE Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
LTE %download	The average percentage (in terms of bytes) of video files downloaded for LTE Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
LTE Tot. Video	The total number of video clips for LTE Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
HSPA Del. Rate	The average video delivery rate for HSPA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.

Field	Description
HSPA Enc. Rate	The average video encoding rate for HSPA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
HSPA Tot. Bytes	The total payload bytes (excluding IP and TCP headers) transferred to the RAN side for HSPA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
HSPA %download	The average percentage (in terms of bytes) of video files downloaded for HSPA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
HSPA Tot. Video	The total number of video clips for HSPA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
CDMA Del. Rate	The average video delivery rate for CDMA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
CDMA Enc. Rate	The average video encoding rate for CDMA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
CDMA Tot. Bytes	The total payload bytes (excluding IP and TCP headers) transferred to the RAN side for CDMA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
CDMA %download	The average percentage (in terms of bytes) of video files downloaded for CDMA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
CDMA Tot. Video	The total number of video clips for CDMA Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
WLAN Del. Rate	The average video delivery rate for WLAN Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
WLAN Enc. Rate	The average video encoding rate for WLAN Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
WLAN Tot. Bytes	The total payload bytes (excluding IP and TCP headers) transferred to the RAN side for WLAN Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
WLAN %download	The average percentage (in terms of bytes) of video files downloaded for WLAN Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
WLAN Tot. Video	The total number of video clips for WLAN Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
Other Del. Rate	The average video delivery rate for other Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
Other Enc. Rate	The average video encoding rate for other Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
Other Tot. Bytes	The total payload bytes (excluding IP and TCP headers) transferred to the RAN side for other Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
Other %download	The average percentage (in terms of bytes) of video files downloaded for other Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
Other Tot. Video	The total number of video clips for other Radio Access Type for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
Container (File Format)	

Field	Description
MP4 Enc. Rate	The average video encoding rate for MP4 container file format for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
MP4 Tot. Bytes	The total bytes transferred to RAN side for MP4 container file format for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
MP4 Tot. Video	The total number of video clips for MP4 container file format for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
FLV Enc. Rate	The average video encoding rate for FLV (Flash Video) container file format for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
FLV Tot. Bytes	The total bytes transferred to RAN side for FLV (Flash Video) container file format for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
FLV Tot. Video	The total number of video clips for FLV (Flash Video) container file format for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
Other Enc. Rate	The average video encoding rate for other container file format for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
Other Tot. Bytes	The total bytes transferred to RAN side for other container file format for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.
Other Tot. Video	The total number of video clips for other container file format for iPhone/iPad/iPod (iOS) devices, Android devices, laptops, and other devices.

show active-charging video detailed-statistics container mp4

Note that there are additional `container` options for this command, as follows: `container flv` and `container others`.

Table 138. show active-charging video detailed-statistics container mp4 Command Output Descriptions

Field	Description
Device Type iOS	
Total Content Size of the Videos	The total size of the video clips in bytes for iOS User Device Type for MP4 Container Type.
Total Duration of the Videos	The total duration of the video clips, in seconds, for iOS User Device Type for MP4 Container Type.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for iOS User Device Type for MP4 Container Type.
Total Video Object Count	The total number of video objects for iOS User Device Type for MP4 Container Type. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for iOS User Device Type for MP4 Container Type.
Device Type Android	
Total Content Size of the Videos	The total size of the video clips in bytes for Android User Device Type for MP4 Container Type.
Total Duration of the Videos	The total duration of the video clips, in seconds, for Android User Device Type for MP4 Container Type.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for Android User Device Type for MP4 Container Type.
Total Video Object Count	The total number of video objects for Android User Device Type for MP4 Container Type. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for Android User Device Type for MP4 Container Type.
Device Type Laptop	
Total Content Size of the Videos	The total size of the video clips in bytes for Laptop User Device Type for MP4 Container Type.
Total Duration of the Videos	The total duration of the video clips, in seconds, for Laptop User Device Type for MP4 Container Type.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for Laptop User Device Type for MP4 Container Type.

Field	Description
Total Video Object Count	The total number of video objects for Laptop User Device Type for MP4 Container Type. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for Laptop User Device Type for MP4 Container Type.
Device Type Others	
Total Content Size of the Videos	The total size of the video clips in bytes for other User Device Type for MP4 Container Type.
Total Duration of the Videos	The total duration of the video clips, in seconds, for other User Device Type for MP4 Container Type.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for other User Device Type for MP4 Container Type.
Total Video Object Count	The total number of video objects for other User Device Type for MP4 Container Type. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for other User Device Type for MP4 Container Type.

show active-charging video detailed-statistics rat cdma

Note that there are additional **rat** options for this command, as follows: **rat gprs**, **rat hspa**, **rat lte**, **rat others**, **rat umts**, and **rat wlan**.

Table 139. show active-charging video detailed-statistics rat cdma Command Output Descriptions

Field	Description
User Device Type iOS	
Total Content Size of the Videos	The total size of the video clips in bytes for iOS User Device Type for CDMA Radio Access Type.
Total Duration of the Videos	The total duration of the video clips, in seconds, for iOS User Device Type for CDMA Radio Access Type.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for iOS User Device Type for CDMA Radio Access Type.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for iOS User Device Type for CDMA Radio Access Type.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download a video for iOS User Device Type for CDMA Radio Access Type.
Total Video Object Count	The total number of video objects for iOS User Device Type for CDMA Radio Access Type. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for iOS User Device Type for CDMA Radio Access Type.
Average Delivery Bit Rate	The average delivery bit rate for iOS User Device Type for CDMA Radio Access Type.
Percentage of Video Downloaded	The percentage of bytes downloaded for video for iOS User Device Type for CDMA Radio Access Type.
User Device Type Android	
Total Content Size of the Videos	The total size of the video clips in bytes for Android User Device Type for CDMA Radio Access Type.
Total Duration of the Videos	The total duration of the video clips, in seconds, for Android User Device Type for CDMA Radio Access Type.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for Android User Device Type for CDMA Radio Access Type.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for Android User Device Type for CDMA Radio Access Type.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download a video for Android User Device Type for CDMA Radio Access Type.

Field	Description
Total Video Object Count	The total number of video objects for Android User Device Type for CDMA Radio Access Type. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for Android User Device Type for CDMA Radio Access Type.
Average Delivery Bit Rate	The average delivery bit rate for Android User Device Type for CDMA Radio Access Type.
Percentage of Video Downloaded	The percentage of bytes downloaded for video for Android User Device Type for CDMA Radio Access Type.
User Device Type Laptop	
Total Content Size of the Videos	The total size of the video clips in bytes for Laptop User Device Type for CDMA Radio Access Type.
Total Duration of the Videos	The total duration of the video clips, in seconds, for Laptop User Device Type for CDMA Radio Access Type.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for Laptop User Device Type for CDMA Radio Access Type.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for Laptop User Device Type for CDMA Radio Access Type.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download a video for Laptop User Device Type for CDMA Radio Access Type.
Total Video Object Count	The total number of video objects for Laptop User Device Type for CDMA Radio Access Type. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for Laptop User Device Type for CDMA Radio Access Type.
Average Delivery Bit Rate	The average delivery bit rate for Laptop User Device Type for CDMA Radio Access Type.
Percentage of Video Downloaded	The percentage of bytes downloaded for video for Laptop User Device Type for CDMA Radio Access Type.
User Device Type Others	
Total Content Size of the Videos	The total size of the video clips in bytes for other User Device Type for CDMA Radio Access Type.
Total Duration of the Videos	The total duration of the video clips, in seconds, for other User Device Type for CDMA Radio Access Type.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for other User Device Type for CDMA Radio Access Type.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for other User Device Type for CDMA Radio Access Type.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download a video for other User Device Type for CDMA Radio Access Type.

Field	Description
Total Video Object Count	The total number of video objects for other User Device Type for CDMA Radio Access Type. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for other User Device Type for CDMA Radio Access Type.
Average Delivery Bit Rate	The average delivery bit rate for other User Device Type for CDMA Radio Access Type.
Percentage of Video Downloaded	The percentage of bytes downloaded for video for other User Device Type for CDMA Radio Access Type.

show active-charging video detailed-statistics ue laptop

Note that there are additional `ue` options for this command, as follows: `ue android`, `ue ios`, and `ue others`.

Table 140. show active-charging video detailed-statistics ue laptop Command Output Descriptions

Field	Description
Radio Type GPRS	
Total Content Size of the Videos	The total size in payload bytes (HTTP content length) of the video clips for GPRS Radio Access Type for laptops.
Total Duration of the Videos	The total duration of the video clips, in seconds, for GPRS Radio Access Type for laptops.
Total Bytes Sent to the User	The total payload bytes (excluding IP and TCP headers) of video data sent to the subscriber UE for GPRS Radio Access Type for laptops.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for GPRS Radio Access Type for laptops.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download all videos for GPRS Radio Access Type for laptops.
Total Video Object Count	The total number of video objects for GPRS Radio Access Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for GPRS Radio Access Type for laptops.
Average Delivery Bit Rate	The average delivery bit rate for GPRS Radio Access Type for laptops.
Percentage of Video Downloaded	The average percentage (in terms of bytes) of video files downloaded for GPRS Radio Access Type for laptops.
Radio Type UMTS	
Total Content Size of the Videos	The total size in payload bytes (HTTP content length) of the video clips for UMTS Radio Access Type for laptops.
Total Duration of the Videos	The total duration of the video clips, in seconds, for UMTS Radio Access Type for laptops.
Total Bytes Sent to the User	The total payload bytes (excluding IP and TCP headers) of video data sent to the subscriber UE for UMTS Radio Access Type for laptops.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for UMTS Radio Access Type for laptops.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download all videos for UMTS Radio Access Type for laptops.
Total Video Object Count	The total number of video objects for UMTS Radio Access Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for UMTS Radio Access Type for laptops.

Field	Description
Average Delivery Bit Rate	The average delivery bit rate for UMTS Radio Access Type for laptops.
Percentage of Video Downloaded	The average percentage (in terms of bytes) of video files downloaded for UMTS Radio Access Type for laptops.
Radio Type LTE	
Total Content Size of the Videos	The total size in payload bytes (HTTP content length) of the video clips for LTE Radio Access Type for laptops.
Total Duration of the Videos	The total duration of the video clips, in seconds, for LTE Radio Access Type for laptops.
Total Bytes Sent to the User	The total payload bytes (excluding IP and TCP headers) of video data sent to the subscriber UE for LTE Radio Access Type for laptops.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for LTE Radio Access Type for laptops.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download all videos for LTE Radio Access Type for laptops.
Total Video Object Count	The total number of video objects for LTE Radio Access Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for LTE Radio Access Type for laptops.
Average Delivery Bit Rate	The average delivery bit rate for LTE Radio Access Type for laptops.
Percentage of Video Downloaded	The average percentage (in terms of bytes) of video files downloaded for LTE Radio Access Type for laptops.
Radio Type HSPA	
Total Content Size of the Videos	The total size in payload bytes (HTTP content length) of the video clips for HSPA Radio Access Type for laptops.
Total Duration of the Videos	The total duration of the video clips, in seconds, for HSPA Radio Access Type for laptops.
Total Bytes Sent to the User	The total payload bytes (excluding IP and TCP headers) of video data sent to the subscriber UE for HSPA Radio Access Type for laptops.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for HSPA Radio Access Type for laptops.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download all videos for HSPA Radio Access Type for laptops.
Total Video Object Count	The total number of video objects for HSPA Radio Access Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for HSPA Radio Access Type for laptops.
Average Delivery Bit Rate	The average delivery bit rate for HSPA Radio Access Type for laptops.
Percentage of Video Downloaded	The average percentage (in terms of bytes) of video files downloaded for HSPA Radio Access Type for laptops.

Field	Description
Radio Type CDMA	
Total Content Size of the Videos	The total size in payload bytes (HTTP content length) of the video clips for CDMA Radio Access Type for laptops.
Total Duration of the Videos	The total duration of the video clips, in seconds, for CDMA Radio Access Type for laptops.
Total Bytes Sent to the User	The total payload bytes (excluding IP and TCP headers) of video data sent to the subscriber UE for CDMA Radio Access Type for laptops.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for CDMA Radio Access Type for laptops.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download all videos for CDMA Radio Access Type for laptops.
Total Video Object Count	The total number of video objects for CDMA Radio Access Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for CDMA Radio Access Type for laptops.
Average Delivery Bit Rate	The average delivery bit rate for CDMA Radio Access Type for laptops.
Percentage of Video Downloaded	The average percentage (in terms of bytes) of video files downloaded for video for CDMA Radio Access Type for laptops.
Radio Type WLAN	
Total Content Size of the Videos	The total size in payload bytes (HTTP content length) of the video clips for WLAN Radio Access Type for laptops.
Total Duration of the Videos	The total duration of the video clips, in seconds, for WLAN Radio Access Type for laptops.
Total Bytes Sent to the User	The total payload bytes (excluding IP and TCP headers) of video data sent to the subscriber UE for WLAN Radio Access Type for laptops.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for WLAN Radio Access Type for laptops.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download all videos for WLAN Radio Access Type for laptops.
Total Video Object Count	The total number of video objects for WLAN Radio Access Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for WLAN Radio Access Type for laptops.
Average Delivery Bit Rate	The average delivery bit rate for WLAN Radio Access Type for laptops.
Percentage of Video Downloaded	The average percentage (in terms of bytes) of video files downloaded for video for WLAN Radio Access Type for laptops.
Radio Type Others	
Total Content Size of the Videos	The total size in payload bytes (HTTP content length) of the video clips for other Radio Access Type for laptops.

Field	Description
Total Duration of the Videos	The total duration of the video clips, in seconds, for other Radio Access Type for laptops.
Total Bytes Sent to the User	The total payload bytes (excluding IP and TCP headers) of video data sent to the subscriber UE for other Radio Access Type for laptops.
Total Duration of Video Sessions	The total duration, in seconds, of the video sessions for other Radio Access Type for laptops.
Total Number of TCP Flows for Video Sessions	The total number of TCP flows used to download all videos for other Radio Access Type for laptops.
Total Video Object Count	The total number of video objects for other Radio Access Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for other Radio Access Type for laptops.
Average Delivery Bit Rate	The average delivery bit rate for other Radio Access Type for laptops.
Percentage of Video Downloaded	The average percentage (in terms of bytes) of video files downloaded for other Radio Access Type for laptops.
Container Type MP4	
Total Content Size of the Videos	The total size of the video clips in bytes for MP4 Container Type for laptops.
Total Duration of the Videos	The total duration of the video clips, in seconds, for MP4 Container Type for laptops.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for MP4 Container Type for laptops.
Total Video Object Count	The total number of video objects for MP4 Container Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for MP4 Container Type for laptops.
Container Type FLV	
Total Content Size of the Videos	The total size of the video clips in bytes for FLV Container Type for laptops.
Total Duration of the Videos	The total duration of the video clips, in seconds, for FLV Container Type for laptops.
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for FLV Container Type for laptops.
Total Video Object Count	The total number of video objects for FLV Container Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for FLV Container Type for laptops.
Container Type Others	
Total Content Size of the Videos	The total size of the video clips in bytes for other Container Type for laptops.
Total Duration of the Videos	The total duration of the video clips, in seconds, for other Container Type for laptops.

Field	Description
Total Bytes Sent to the User	The total bytes of video data sent to the subscriber UE for other Container Type for laptops.
Total Video Object Count	The total number of video objects for other Container Type for laptops. A video object exists from the creation of the first flow to the deletion of the last flow comprising each video.
Average Video Encoding Bit Rate	The average video encoding bit rate for other Container Type for laptops.

Chapter 69

show administrators

This chapter includes the `show administrators` command output tables.

show administrators

Table 141. show administrators Command Output Descriptions

Field	Description
Administrator/Operator Name	Displays the name of the administrative user currently accessing the system.
Type	Displays the administrative user's type. admin represents an administrator. oper represents an operator.
TTY	Displays a reference for the virtual console device for the CLI instance.
Start Time	Displays the time and date that the administrative user's session started.

show administrators session id

Table 142. show administrators session id Command Output Descriptions

Field	Description
Administrator/Operator Name	Displays the name of the administrative user currently accessing the system.
Login Context	Displays the context in which the CLI user is working.
Remote Addr	Displays the IP address from which the CLI user is accessing the system.
Session ID	Displays the assigned session ID.

Chapter 70

show alarm

This chapter includes the `show alarm` command output tables.

show alarm outstanding all verbose

Table 143. show alarm outstanding all verbose Command Output Descriptions

Field	Description
Severity (Sev)	<p>If an alarm is present, the system will indicate that one of the following alarm levels has been triggered:</p> <ul style="list-style-type: none"> • Minor (MN): This alarm is triggered when a high temperature is detected on a card causing the fan tray to switch to high speed. • Major (MJ): This alarm is triggered on the following conditions: <ul style="list-style-type: none"> • A hardware failure was detected on a card that will cause it to be taken off-line • One of the Power Filter Units has failed or was removed. • One or more of the fans on either the upper or lower fan tray have failed. • Either the upper or lower fan trays have been removed. • Critical (CR): This alarm is triggered when events cause a degradation in service (i.e. the system is supporting a large number of subscribers and Processing Cards are removed thus reducing the amount of available CPU and memory resources).
Object	Describes the object that triggered the alarm event
Event	Describes the event that triggered the alarm condition.
Timestamp	Lists the date and time that the alarm condition was triggered.
Alarm ID	The internal system ID of the alarm.

show alarm statistics

Table 144. show alarm statistics Command Output Descriptions

Field	Description
Current Outstanding Alarms	The alarm conditions that are currently active.
Cumulative Totals	The number of alarms that have occurred since the system was last booted.

Chapter 71

show alcap

This chapter includes the `show alcap` command output tables.

show alcap counters

Table 145. show alcap counters Command Output Descriptions

Field	Description
AAL2 Channels Counters	This group displays the counter statistics of AAL2 channels in ALCAP service.
Number of AAL2 channels in IDLE state	Indicates the total number of AAL2 channels in IDLE state in ALCAP service instance.
Number of AAL2 channels in CONNECTED state	Indicates the total number of AAL2 channels in CONNECTED state in ALCAP service instance.
Number of AAL2 channels in CONNECTING state	Indicates the total number of AAL2 channels in CONNECTING state.
Number of AAL2 channels in RELEASE PENDING state	Indicates the total number of AAL2 channels in RELEASE PENDING state.
Number of AAL2 channels in RESET PENDING state	Indicates the total number of AAL2 channels in RESET PENDING state.
AAL2 Paths Counters	This group displays the counter statistics of AAL2 paths in particular AAL2 channel in ALCAP service.
Number of AAL2 Paths in LOCALLY BLOCKED state	Indicates the total number of AAL2 paths in the AAL2 node that are currently blocked locally.
Number of AAL2 Paths in REMOTE BLOCKED state	Indicates the total number of AAL2 paths in the AAL2 node that are currently blocked by remote peer node.
Number of AAL2 Paths in BLOCKED state	Indicates the total number of AAL2 paths in the AAL2 node that are currently blocked. This includes both, local and remote blocks.
Number of AAL2 Paths in RESET PENDING state	Indicates the total number of AAL2 Paths in RESET PENDING state.

show alcap-service all

Table 146. *show alcap-service all* Command Output Descriptions

Field	Description
Aal2 node	The name of the ALCAP service node in which the ALCAP service is configured.
Aal2 node id	The identity number of the ALCAP node in which ALCAP service is configured.
Point code	Point code of adjacent AAL2 node in SS7 format address.
AESA	Specifies the ATM Endpoint Service Address (AESA) in an ATM (or AAL2) network to map with adjacent AAL2 node. The AESA is based on the generic network service access point (NSAP) format. The ATM connection from HNB-GW terminates at this point.
Total Aal2 Path	Indicates the total number of AAL2 paths configured for this ALCAP service on an AAL2 node.
Total Aal2 Path Blocked	Indicates the total number of AAL2 paths in the AAL2 node that are currently blocked. This includes both, local and remote blocks.
Total Aal2 Path Locally Blocked	Indicates the total number of AAL2 paths in the AAL2 node that are currently blocked locally.
Total Aal2 Path Remote Blocked	Indicates the total number of AAL2 paths in the AAL2 node that are currently blocked by remote peer node.
Aal2 Path info	This group displays the AAL2 path related information.
Aal2 Path id	Indicates the identity number of AAL2 path configured on this AAL2 node under ALCAP service.
ATM Port Bound	Indicates the status if the Aal2 path is bound to a physical ATM port or not.
LPort Id	Indicates the logical port Id identifying an Aal2 path binding to an ATM port.
Path FSM State	Indicates the current state of this AAL2 path FSM. Possible states are: <ul style="list-style-type: none"> • Idle: The Path FSM is in Idle state • Pending Reset Confirm: A path reset procedure is in process and waiting for a conformation from the peer node. • Pending Block Confirm: A path block procedure is in process and waiting for a conformation from the peer node. • Pending Un-Block Confirm: A path Un-block procedure is in process and waiting for a conformation from the peer node. • Pending Reset and Block Confirm: Path reset and path block procedure is in process and waiting for a conformation from the peer node. • Pending Reset and Un-Block Confirm: Path reset and path un-block procedure is in process and waiting for a conformation from the peer node.
Locally Blocked	Indicates whether an AAL2 path on AAL2 node under ALCAP service is locally blocked or not.

■ show alcap-service all

Field	Description
Remote Blocked	Indicates whether an AAL2 path on AAL2 node under ALCAP service is remotely blocked by peer node or not.

show alcap-service full

Table 147. *show alcap-service full* Command Output Descriptions

Field	Description
alcap service	The name of the ALCAP service of which statistics are displayed.
service id	The identity number of the ALCAP service of which statistics are displayed.
Context	Indicates the system context name in which ALCAP service is configured.
state	Indicates the state of the ALCAP service.
self point code	Indicates the address of this ALCAP service in SS7 point code notation.
ss7 routing domain id	Indicates the routing domain id in which ALCAP service is associated.
AAL2 Nodes	This group displays the information related to AAL2 node configured in ALCAP service.
Node name	Indicates the name of the AAL2 node configured in ALCAP service.
Point Code	Indicates the address of AAL2 node in SS7 point code notation.
Path id	Indicates the identity number of AAL2 path configured on this AAL2 node under ALCAP service.
Routes	This group displays the information related to AAL2 routes configured for AAL2 path.
AESA	Specifies the ATM Endpoint Service Address (AESA) in an ATM (or AAL2) network to map with adjacent AAL2 node. The AESA is based on the generic network service access point (NSAP) format. The ATM connection from HNB-GW terminates at this point.
Node id	Indicates the AAL2 node identity number used for routes in AAL2 path FSM.
ERQ timer	Indicates the maximum time, in seconds, configured for Timer_ERQ on the system to wait for response from adjacent AAL2 node before reporting the failure of AAL2 Establish Request procedure. Configurable range is from 5 through 30 seconds and default is 5 seconds.
REL timer	Indicates the maximum time, in seconds, configured for Timer_REL on the system to waits for response from adjacent AAL2 node before reporting the failure of AAL2 Release Request procedure. Configurable range is from 2 through 60 seconds and default is 2 seconds.
RES timer	Indicates the maximum time, in seconds, configured for Timer_RES on the system to waits for response from adjacent AAL2 node before reporting the failure of AAL2 Reset Request procedure. Configurable range is from 2 through 60 seconds and default is 2 seconds.
BLO timer	Indicates the maximum time, in seconds, configured for Timer_BLO on the system to waits for response from adjacent AAL2 node before reporting the failure of AAL2 Path Block procedure. Configurable range is from 2 through 60 seconds and default is 2 seconds.
UBL timer	Indicates the maximum time, in seconds, configured for Timer_UBL on the system to waits for response from adjacent AAL2 node before reporting the failure of AAL2 Path Un-Block procedure. Configurable range is from 2 through 60 seconds and default is 2 seconds.

Field	Description
MOD timer	Indicates the maximum time, in seconds, configured for Timer_MOD on the system to wait for response from adjacent AAL2 node before reporting the failure of AAL2 Path ModifyRequest procedure. Configurable range is from 5 through 30 seconds and default is 5 seconds.
STC long timer	Indicates the configured duration value in milliseconds for STC long timer. This timer is used by the congestion indication procedure. Receipt of a repeated congestion indication from MTP3B before the expiry of this timer is interpreted as the congestion situation. On the other hand, if no congestion indication is received from MTP3B before expiry of this timer, the congestion situation is considered to have improved. Configurable range is from 5000 ms through 10000 ms and default value is 5000 ms.
STC short timer	Indicates the configured duration value in milliseconds for STC long timer. This timer is used by the congestion indication procedure. The role of this timer is to avoid overreacting if multiple congestion indications are received from MTP3B in quick succession. Configurable range is from 300 ms through 600 ms and default value is 300 ms.
Max-reset-retransmission	Indicates maximum number of retries allowed for transmission of RESET message to reset the AAL2 path by ALCAP service. Configurable range is 0 to 4 and default is 1. A "0" value indicates that retransmission of RESET message is disabled.

Chapter 72

show apn

This chapter includes the **show apn** command output tables.

show apn all

Table 148. *show apn all* Command Output Descriptions

Field	Description
access point name (APN)	Indicates the name of the access point name (APN) for which counters are displayed.
authentication context	Name of the system context used for authentication for this APN.
pdp type	Indicates the type of PDP context. Possible types are: <ul style="list-style-type: none"> • IPv4 • IPv6 • PPP
ehrpd access	Specifies whether ehrpd-access option is configured in this APN or not. If enabled, the P-GW excludes IPv6 traffic from being delivered to UEs on the eHRPD network that do not have IPv6 capabilities.
Selection Mode	Indicates the APN selection mode applicable for this APN. Possible selection modes are: <ul style="list-style-type: none"> • Chosen by SGSN • Sent by MS • Subscribed
ip source violation	Indicates whether check for IPv4 source validation violations enabled or not. Possible status are: <ul style="list-style-type: none"> • Checked • Ignored
drop limit	Indicates the IP source-violation drop limit configured for the subscriber. The drop-limit is the number of invalid packets that can be received from a subscriber prior to their session being deleted. Refer to the ip source-violation command in the APN configuration mode.
ip source violation no accounting	The IP source validation violations that were detected but not included in the statistics.
accounting mode	Indicates the accounting mode configured for this APN. Possible modes are: <ul style="list-style-type: none"> • gtp - GTP CDR accounting • none - No accounting • radius-diameter - RADIUS or Diameter accounting
No early PDUs	Specifies whether “ no-early-pdu ” option configured in this APN or not. If “no-early-PDUs” is enabled, the chassis shall not send uplink/downlink data from/to a MS till it receives the Acct-Rsp Start for the same from the AAA device. On receiving the Acct-Rsp, pending PDUs are sent out.

Field	Description
no-interims	Specifies whether “ no-interims ” option configured in this APN or not. If “no-interims” is enabled, the chassis shall not send any interim message to the AAA device.
Bearer Control Mode	Specifies whether Bearer Control Mode is enabled in this APN or not.
max-primary-pdp-contexts	Specifies the maximum primary PDP contexts allowed in this APN.
total-pdp-contexts	Specifies the total primary and secondary PDP contexts allowed in this APN.
primary contexts	Specifies the total primary contexts allowed in this APN.
total contexts	Specifies the total primary and secondary contexts allowed in this APN.
max secondary contexts per-subscriber	Specifies the maximum secondary contexts allowed in this APN for a subscriber.
IMS Authorization	Specifies whether IMS authorization support is enabled in this APN or not.
Credit Control	Specifies whether Diameter pre-paid credit control support is enabled in this APN or not.
Credit Control Service Name	Specifies the name of credit control service configured on the chassis.
Accounting Policy Name	Specifies the name of accounting policy associated with the configured APN. If no accounting policy is associated, this field will display as N/A.
mbms bearer absolute timeout	Indicates the absolute timeout duration in seconds for Multimedia Broadcast-Multicast Service (MBMS) bearer context.
mbms bearer idle timeout	Indicates the idle timeout duration in seconds for Multimedia Broadcast-Multicast Service (MBMS) bearer context.
mbms ue absolute timeout	Indicates the absolute timeout duration in seconds for Multimedia Broadcast-Multicast Service (MBMS) UE context.
local ip	Specifies the local IP address of the interface assigned to this APN.
nexthop gateway addr	Specifies the IP address of the next hop gateway configured in this APN.
primary dns	Indicates the IP address of primary Domain Name Server (DNS).
secondary dns	Indicates the IP address of secondary Domain Name Server (DNS).
primary nbns	Indicates the IP address of primary NetBIOS Name Server (NBNS).
secondary nbns	Indicates the IP address of secondary NetBIOS Name Server (NBNS).
ppp keep alive period	Indicates the duration in seconds to transmit LCP keep-alive packet.
ppp mtu	Indicates the maximum size of transmission units in bytes configured for this APN.
absolute timeout	Indicates the absolute timeout duration in seconds for session configured in this APN.
idle timeout	Indicates the idle timeout duration in seconds for session configured in this APN.
idle-timeout-activity ignore-downlink	Indicates whether idle timeout activity configured in this APN to consider downlink traffic as activity for idle-timeout or not.
long duration timeout	Indicates the timeout duration in seconds for long duration timeout support configured in this APN.

■ show apn all

Field	Description
long dur inactivity time	Indicates the inactivity duration in seconds for long duration timeout support configured in this APN.
long duration action	Indicates the action configured in this APN for long duration timeout support. Possible actions are: <ul style="list-style-type: none"> • Detection • Disconnection
ip header compression	Indicates the IP header compression method configured in this APN for RObust Header Compression (ROHC) support. Supported method is Van Jacobsen (VJ).
ip hide service address	Indicates whether APN is configured to hide service IP address from the subscriber (for security reasons) or not.
ip output access-group	The IPv4 access control list (ACL) configured in this APN for outward traffic.
ip input access-group	The IPv4 access control list (ACL) configured in this APN for inward traffic.
ipv6 output access-group	The IPv6 access control list (ACL) configured in this APN for outward traffic.
ipv6 input access-group	The IPv6 access control list (ACL) configured in this APN for inward traffic.
policy-group in	The traffic policy group configured in this APN for inward traffic.
policy-group out	The traffic policy group configured in this APN for outward traffic.
permit ip multicast	Indicates whether APN is configured to discard or permit the IP multicast.
ppp authentication	Indicates the type of PPP authentication configured for this APN.
eap authentication initial-access-request	Indicates the type of initial access request to be used in Diameter EAP request.
allow noauthentication	Indicates whether PPP session is allowed without authentication in this APN or not.
imsi authentication	Indicates whether PPP session authentication in this APN is configured for IMSI authentication or not.
msisdn authentication	Indicates whether PPP session authentication in this APN is configured for MSISDN authentication or not.
ip destination context	Indicates the name of the configured destination context for this APN.
Rule Base	Indicates the name of the configured rulebase for this APN.
Content-Filtering Policy-Id	Indicates whether inline content filtering policy is configured for this APN or not.
mediation accounting	Indicates whether mediation device is configured for accounting in this APN or not.
mediation-device context	Indicates the name of the system context to use for mediation device for accounting in this APN.
mediation no early PDUs	Specifies whether “ no-early-pdu ” option configured for this subscriber or not. If “no-early-PDUs” is enabled, the chassis shall not send uplink/downlink data from/to a MS till it receives the Acct-Rsp Start for the same from the mediation device. On receiving the Acct-Rsp, pending PDUs are sent out.

Field	Description
mediation no-interims	Specifies whether “ no-interims ” option configured for this subscriber or not. If “no-interims” is enabled, the chassis shall not send any interim message to the mediation device.
mediation delay-GTP-response	Specifies whether “ delay-GTP-response ” option configured for this subscriber or not. When enabled, this option delays the Create PDP Context response until an Accounting Start response is received from the mediation device.
outbound username	Name of the user for outbound traffic.
ip address pools	Indicates the IP address pool used for this APN.
access-link ip-frag	Indicates the IP packet fragmentation setting for access link.
ignore DF-bit data-tunnel	Indicates whether “ignore df-bit” is set for data tunnel or not.
ip allocation type	Specifies the type of IP allocation method used for IP address allocation. Possible types are: <ul style="list-style-type: none"> • DHCP-Proxy • DHCP-Relay • Local • Dynamic • Static
allow user specified ip addr	Indicates whether user specified IP address is allowed or not for IP allocation.
prefer dhcp options	Indicates whether support for DHCP supplied parameters, like DNS/NBNS addresses, in subscriber session is configured for this APN. This support can be enabled with ip address alloc-method dhcp-proxy prefer-dhcp-options command in APN Configuration mode.
3gpp qos to dscp mapping	This group indicates the 3GPP QoS to DSCP mapping information.
qci 1: ef	Indicates the DSCP configured for QCI1 type of traffic.
qci 2: ef	Indicates the DSCP configured for QCI2 type of traffic.
qci 3: af11	Indicates the DSCP configured for QCI3 type of traffic.
qci 4: af11	Indicates the DSCP configured for QCI4 type of traffic.
qci 5: ef	Indicates the DSCP configured for QCI5 type of traffic.
qci 6: ef	Indicates the DSCP configured for QCI6 type of traffic.
qci 7: af21	Indicates the DSCP configured for QCI7 type of traffic.
qci 8: af21	Indicates the DSCP configured for QCI8 type of traffic.
qci 9: be	Indicates the DSCP configured for QCI9 type of traffic.
3GPP Qos to DSCP Mapping based on Alloc. Prio	This group indicates the 3GPP QoS to DSCP mapping information based on allocation priority.
qci 5 (Alloc.P 1): ef	Indicates the DSCP configured for QCI5 type of traffic with allocation priority 1.
qci 5 (Alloc.P 2): ef	Indicates the DSCP configured for QCI5 type of traffic with allocation priority 2.

Field	Description
qci 5 (Alloc.P 3): ef	Indicates the DSCP configured for QCI5 type of traffic with allocation priority 3.
qci 6 (Alloc.P 1): ef	Indicates the DSCP configured for QCI6 type of traffic with allocation priority 1.
qci 6 (Alloc.P 2): ef	Indicates the DSCP configured for QCI6 type of traffic with allocation priority 2.
qci 6 (Alloc.P 3): ef	Indicates the DSCP configured for QCI6 type of traffic with and allocation priority 3.
qci 7 (Alloc.P 1): af21	Indicates the DSCP configured for QCI7 type of traffic with allocation priority 1.
qci 7 (Alloc.P 2): af21	Indicates the DSCP configured for QCI7 type of traffic with allocation priority 2.
qci 7 (Alloc.P 3): af21	Indicates the DSCP configured for QCI7 type of traffic with allocation priority 3.
qci 8 (Alloc.P 1): af21	Indicates the DSCP configured for QCI8 type of traffic with allocation priority 1.
qci 8 (Alloc.P 2): af21	Indicates the DSCP configured for QCI8 type of traffic with allocation priority 2.
qci 8 (Alloc.P 3): af21	Indicates the DSCP configured for QCI8 type of traffic with allocation priority 3.
Copy user-datagram IP TOS	Indicates whether copying of IP TOS octet value from user IPv4 datagrams to IP header of tunnel encapsulation is enabled or not.
APN defined Charging Characteristics	This group displays the APN defined charging characteristics for various types of subscribers.
Home Subscribers	This sub-group displays the APN defined charging characteristics for home subscribers.
Behavior Bits	Indicates the behavior bits configured for home subscribers in APN defined charging characteristics.
Profile Value	Indicates the profile value configured for home subscribers in APN defined charging characteristics.
Visiting Subscribers	This sub-group displays the APN defined charging characteristics for visiting subscribers.
Behavior Bits	Indicates the behavior bits configured for visiting subscribers in APN defined charging characteristics.
Profile Value	Indicates the profile value configured for visiting subscribers in APN defined charging characteristics.
Roaming Subscribers	This sub-group displays the APN defined charging characteristics for roaming subscribers.
Behavior Bits	Indicates the behavior bits configured for roaming subscribers in APN defined charging characteristics.
Profile Value	Indicates the profile value configured for roaming subscribers in APN defined charging characteristics.
All (Home/Visiting/Roaming) Subscribers	This sub-group displays the APN defined charging characteristics for all subscribers (including home, visiting, and roaming).
Behavior Bits	Indicates the behavior bits configured for all subscribers (including home, visiting, and roaming) in APN defined charging characteristics.
Profile Value	Indicates the profile value configured for all subscribers (including home, visiting, and roaming) in APN defined charging characteristics.

Field	Description
Subscribers to use APN defined charging characteristics	Indicates the number of subscriber to use APN defined charging characteristics.
Subscribers to use RADIUS returned charging characteristics	Indicates whether subscribers in this APN are configured to use charging characteristics returned from RADIUS server.
dhcp service name	Specifies the name of the DHCP service configured for IP address allocation.
dhcp context name	Specifies the name of the DHCP context where DHCP service is configured for IP address allocation.
dhcp lease expiry policy	Specifies the DHCP address lease expiry policy. Possible actions are: <ul style="list-style-type: none"> • autoconnect • disconnect
mobile-ip	Specifies the whether Mobile IP is configured in this APN or not.
mobile-ip home-agent	Specifies the IP address of home agent (HA) to use for Mobile IP session in this APN.
mobile-ip alternate-home-agent(s)	Specifies the IP address of alternate home agent (HA) to use for Mobile IP session in this APN.
mobile-ip reverse-tunnel	Specifies the whether Mobile IP reverse tunnel is enabled for Mobile IP session in this APN or not.
mobile-ip mn-aaa-removal-indication	Specifies the whether “mn-aaa-removal-indication” parameter is configured for Mobile IP session in this APN or not.
mobile-ip mn-ha-spi	Specifies the security parameter index (SPI) configured between MN and HA for Mobile IP session in this APN.
mobile-ip mn-ha-hash-algorithm	Specifies the hash algorithm configured for Mobile IP session in this APN. Possible hash algorithms are: <ul style="list-style-type: none"> • hmac-md5 • md5 • rfc2002-md5
proxy-mip	Specifies the whether Proxy-Mobile IP is configured in this APN or not.
proxy-mip null-username static home address	Specifies the whether handling of RRQ to enable the acceptance without NAI extension in this APN is enabled or not.
Tunnel peer load-balancing	Specifies the tunnel peer selection method in this APN for load balancing between tunnel-peers. Possible selection methods are: <ul style="list-style-type: none"> • balanced • prioritized • random
L3-to-L2 tunnel address-policy no-alloc-validate	Specifies whether this APN is configured, to not to allocate or validate subscriber addresses locally for such sessions, it passes the address between remote tunnel terminator to the Mobile Node, or not.

Field	Description
tunnel address-policy alloc-validate	Specifies whether this APN is configured, to allocate addresses for cases in which IP addresses are dynamically assigned, or not.
NPU QoS Traffic Priority	Indicates the configured NPU QoS priority queue for packets facilitated by the APN. Possible priorities are: <ul style="list-style-type: none"> • best-effort • bronze • derive-from-packet-dscp • gold • silver.
APN QoS Attributes	Specifies the QoS attribute configured in this APN.
Newcall Policy	Indicates the policy for action on new calls coming on this APN. Possible actions are: <ul style="list-style-type: none"> • Accept • Reject
SDU Error Ratio	Indicates the QoS attribute reliability class based on Service Data Unit (SDU) Error Ratio attributes configured in this APN.
Residual BER	Indicates the QoS attribute reliability class based on Residual Bit Error Ratio (BER) attributes configured in this APN.
QCI n	Specifies the statistics for use traffic of QoS QCI class along with traffic status. Here n (qci-val) is the QCI for which the negotiate limit is being set, it ranges from 1 to 9.
Downlink Negotiate Limit	Specifies whether traffic data QoS negotiation limit in downlink direction is enabled or not for this class of QoS in this APN. By default it's disabled.
Uplink Negotiate Limit	Specifies whether traffic data QoS negotiation limit in uplink direction is enabled or not for this class of QoS in this APN. By default it's disabled.
Peak Data Rate (in bps)	The peak data rate in bit per seconds for this class of QoS in this APN.
Committed Data Rate(in bps)	The committed data rate in bit per seconds for this class of QoS in this APN.
Downlink Rate Limit	Specifies whether traffic data rate limit in downlink direction is enabled or not for this class of QoS in this APN.
Uplink Rate Limit	Specifies whether traffic data rate limit in uplink direction is enabled or not for this class of QoS in this APN.
Burst Size	This group indicates the static/dynamic burst size in bytes for peak and guaranteed rate limiting for this class of QoS in this APN.
Auto Readjust	Indicates whether auto readjustment of burst size is enabled or not. Possible states are: <ul style="list-style-type: none"> • Enabled • Disabled
Auto Readjust Duration	Indicates the configured auto readjust duration in a seconds. If auto readjust is enabled and no readjust duration is specified the default value is 1 second.

Field	Description
Peak Burst Size(bytes)	Indicates the peak burst size in bytes calculated dynamically by auto readjust duration and rate limit value.
Guaranteed Burst Size(bytes)	Indicates the guaranteed burst size in bytes calculated dynamically by auto readjust duration (seconds) and rate limit value (bytes). This counter is applicable only when auto readjustment is enabled.
Exceed Action	Specifies the action on downlink/uplink data rate when exceeds the allowed rate limit for this class of QoS. Possible actions are: <ul style="list-style-type: none"> • drop: drop the packets. • lower-ip-precedence: transmit the packet after lowering the ip-precedence. • transmit: transmit the packet.
Violate Action	Specifies the action on downlink/uplink data rate violation of allowed rate limit for this class of QoS. Possible actions are: <ul style="list-style-type: none"> • drop: drop the packets. • lower-ip-precedence: transmit the packet after lowering the ip-precedence. • shape: enables the traffic shaping and provides the buffering of user packets when subscriber traffic violates the allowed peak/committed data rate. • shape-transmit-when-buffer-full: enables the traffic shaping and allows the packet to be transmitted when buffer memory is full. • transmit: transmit the packet.
APN-AMBR	Specifies the traffic statistics for APN Maximum Bit Rate.
Downlink Apn Ambr	Specifies whether traffic data QoS negotiation limit in downlink direction is enabled or not for this class of QoS in this APN. By default it's disabled. Possible states are: <ul style="list-style-type: none"> • Enabled • Disabled
Uplink Apn Ambr	Specifies whether traffic data QoS negotiation limit in uplink direction is enabled or not for this class of QoS in this APN. By default it's disabled. Possible states are: <ul style="list-style-type: none"> • Enabled • Disabled
Burst Size	This group indicates the static/dynamic burst size in bytes for peak and guaranteed rate limiting for this class of QoS in this APN.
Auto Readjust	Indicates whether auto readjustment of burst size is enabled or not. Possible states are: <ul style="list-style-type: none"> • Enabled • Disabled
Auto Readjust Duration	Indicates the configured auto readjust duration in a seconds. If auto readjust is enabled and no readjust duration is specified the default value is 1 second.

Field	Description
Violate Action	Specifies the action on downlink/uplink data rate violation of allowed rate limit for this class of QoS. Possible actions are: <ul style="list-style-type: none"> • drop: drop the packets. • lower-ip-precedence: transmit the packet after lowering the ip-precedence. • shape: enables the traffic shaping and provides the buffering of user packets when subscriber traffic violates the allowed peak/committed data rate. • shape-transmit-when-buffer-full: enables the traffic shaping and allows the packet to be transmitted when buffer memory is full. • transmit: transmit the packet.
ppp accept peer ipv6 ifid	Indicates the IPv6 interface id of peer to accept PPP session.
ipv6 init router advt interval	Indicates the initial IPv6 router advertisement interval in seconds for this APN.
ipv6 init router number of advts	Indicates the total number of initial IPv6 router advertisement for this APN.
ipv6 address prefix	Indicates the IPv6 address prefix configured for sessions facilitated by this APN.
ipv6 address prefix pool	Indicates the IPv6 address prefix pool name configured for sessions facilitated by this APN.
ipv6 interface id	Indicates the IPv6 interface id configured for sessions facilitated by this APN.
ipv6 dns primary server	Indicates the IPv6 address of primary DNS server configured for sessions facilitated by this APN.
ipv6 dns secondary server	Indicates the IPv6 address of secondary DNS server configured for sessions facilitated by this APN.
ipv6 egress address filtering	Indicates whether egress address filtering configured in this APN or not to filter out packets not meant for the mobile interface ID.
ipv6 dns proxy	Indicates whether IPv6 DNS proxy server configured for sessions facilitated by this APN or not.
ipv6 minimum link MTU	Indicates the size of packet in bytes configured for access-link MTU for fragment.
Radius Group	Indicates the AAA server group associated with this APN.
Radius Secondary Group	If the secondary Accounting group is configured in the APN configuration, this field displays the corresponding group name. Otherwise, it displays <i>none</i> .
Radius Returned Framed IP Address	This group specifies the action and policy to handle the framed IP address returned from RADIUS server.
Policy	Specifies the policy to handle the framed IP address returned from RADIUS server. Possible actions are: <ul style="list-style-type: none"> • accept-call-when-ms-ip-not-supplied • reject-call-when-ms-ip-not-supplied
Access-flow traffic-validation	Specifies whether traffic validation for access flow is enabled for this APN or not.
Virtual APN Configuration	Indicates whether virtual APN is configured with APN or not.

Field	Description
Preference	Specifies the configured preference value of the rule for the virtual apn. It is an integer value which ranges from 1 to 1000.
Rule-Definition	Specifies the configured rule definition(s) for the virtual apn. Rule definitions include: <ul style="list-style-type: none"> • access-gw-address • bearer-access-service • cc-profile: charging characteristics profile index ranging from 0 to 15 • domain • mcc: mobile country code ranging from 100 to 999 • msisdn-range • rat-type: eutran, gan, geran, hspa, utran, and wlan • roaming-mode: home, roaming, and visiting
Selected-APN	Specifies the access point name (APN) in the VPN context to allow configuration of virtual APN related parameters.
IPv6 Configuration	This group displays the configuration related to IPv6 parameters.
IPv6 initial number of router advertisements	Indicates the total number of initial IPv6 router advertisement for this APN.
IPv6 initial router advertisements interval	Indicates the initial IPv6 router advertisement interval in seconds for this APN.
IPv6 Prefix Pool	Indicates the IPv6 address prefix pool name configured for sessions facilitated by this APN.
IPv6 Egress address filtering	Indicates whether egress address filtering configured in this APN or not to filter out packets not meant for the mobile interface ID.
IPv6 Primary DNS server address	Indicates the IPv6 address of primary DNS server configured for sessions facilitated by this APN.
IPv6 Secondary DNS server address	Indicates the IPv6 address of secondary DNS server configured for sessions facilitated by this APN.
GTPP Group	Displays all the configured GTPP server groups associated with this APN.
GTPP Accounting Context	Specifies the name of all configured GTPP accounting contexts associated with this APN.
Firewall Policy	Indicates whether stateful firewall policy is applicable with this APN or not.
Mobile IPv6 Tunnel MTU	Indicates the configured maximum transmission unit of packet in bytes for Mobile IPv6 tunnel traffic.
Mobile IPv6 Tunnel MTU Exceed Action	Indicates the action to take on packets which exceeds the maximum transmission unit of packet in bytes for Mobile IPv6 tunnel traffic. Possible actions are: <ul style="list-style-type: none"> • Normal processing • Ignore defragment bit • Fragment and forward the packet and notify the sender
Mobile IPv6 Home Agent	Specifies the IPv6 address of home agent (HA) to use for Mobile IP session in this APN.

■ show apn all

Field	Description
Mobile IPv6 Home Link Prefix	Specifies the home link prefix for to use for Mobile IP session in this APN.
Mobile IPv6 Home Address	Specifies the home IPv6 address of subscriber to use for Mobile IP session in this APN.

show apn counter ip-allocation all

Table 149. show apn counter ip-allocation all Command Output Descriptions

Field	Description
APN	Indicates the name of the access point name (APN) for which counters are displayed.
UE PROVID.	Indicates the total number of active sessions using UE provided IP allocation method through this APN.
LOCAL POOL	Indicates the total number of active sessions using Local Pool method for IP allocation through this APN.
AAA	Indicates the total number of active sessions using AAA provided IP allocation method through this APN.
DHCP	This group indicates the total number of active sessions using DHCP method for IP allocation through this APN. Possible groups are: CLIENT: Indicates the number of active sessions using DHCP client method for IP allocation through this APN. RELAY: Indicates the number of active sessions using DHCP relay method for IP allocation through this APN.
PASSTHRU	Indicates the total number of active sessions using PASSTHRU IP allocation method through this APN.

show apn statistics name

Table 150. show apn statistics name Command Output Descriptions

Field	Description
Data Statistics ('uplink'=to PDN, 'downlink'=from PDN):	
uplink bytes	The current total number of bytes sent on the Gi interface for the APN.
downlink bytes	The current total number of bytes received on the Gi interface for the APN.
uplink pkts	The current total number of IP packets sent from the Gi interface for the APN.
downlink pkts	The current total number of IP packets received from the Gi interface for the APN.
uplink pkts dropped	The current total number of IP packets for the APN that were dropped prior to sending over the Gi interface.
downlink pkts dropped	The current total number of IP packets received from the Gi interface for the APN and dropped.
uplink bytes dropped	The current total number of IP bytes for the APN that were dropped prior to sending over the Gi interface.
downlink bytes dropped	The current total number of IP bytes received from the Gi interface for the APN and dropped.
uplink Flow MBR excd byte drop	Number of exceeded uplink bytes dropped due to maximum bit rate.
downlink Flow MBR excd byte drop	Number of exceeded downlink bytes dropped due to maximum bit rate.
uplink Flow MBR excd packet drop	Number of exceeded uplink packets dropped due to maximum bit rate.
downlink Flow MBR excd packet drop	Number of exceeded uplink packets dropped due to maximum bit rate.
uplink Flow GBR excd byte drop	Number of exceeded uplink bytes dropped due to guaranteed bit rate.
downlink Flow GBR excd byte drop	Number of exceeded downlink bytes dropped due to guaranteed bit rate.
uplink Flow GBR excd packet drop	Number of exceeded uplink packets dropped due to guaranteed bit rate.
downlink Flow GBR excd packet drop	Number of exceeded downlink packets dropped due to guaranteed bit rate.
uplink AMBR excd byte drop	Number of exceeded uplink bytes dropped due to APN Maximum bit rate.
downlink AMBR excd byte drop	Number of exceeded downlink bytes dropped due to APN Maximum bit rate.

Field	Description
uplink AMBR excd packet drop	Number of exceeded uplink packets dropped due to APN Maximum bit rate.
downlink AMBR excd packet drop	Number of exceeded downlink packets dropped due to APN Maximum bit rate.
uplink misc byte drop	Number of uplink bytes dropped due to miscellaneous reasons.
downlink misc byte drop	Number of downlink bytes dropped due to miscellaneous reasons.
uplink misc packet drop	Number of uplink packets dropped due to miscellaneous reasons.
downlink misc packet drop	Number of downlink packets dropped due to miscellaneous reasons.
ip bad hdr	The current total number IP packets received and dropped due to bad headers.
ip ttl exceeded	The current total number of IP packets dropped because they were received with TTL values of 0.
ip fragments sent	The current total number of number of times IP packets were fragmented before being sent over the Gi interface.
ip could not fragment	The current total number of IP packets which failed in fragmentation.
ip input acl drop	The current total number IP packets that were received and then dropped due to ACL filtering. NOTE: This counter may increment even if no ACL is configured.
ip output acl drop	The current total number of IP packets that were dropped prior to sending due to ACL filtering.
ip input css down drop	The current total number of IP packets the CSS received and then dropped.
ip output css down drop	The current total number of IP packets that were dropped prior to sending due to CSS filtering.
ip early pdu rcvd	The current total number of early IP packet data units (PDUs) received.
IP bad length trim	
ip source violations	The current total number of IP packets received for which source violations were detected and then dropped.
ip source violations no accounting	The IP packets received for source violations that were detected but not included in the statistics.
ip source violation ignored	The IP source validation violations that were detected and then ignored.
Subscriber Session Statistics	
Default bearers active	The total number of active default bearers.
Dedicated bearers active	The total number of active dedicated bearers.
Default bearers setup	The total number of setup default bearers.
Dedicated bearers setup	The total number of setup dedicated bearers.
Default bearers released	The total number of default bearers released.
Dedicated bearers released	The total number of dedicated bearers released.

■ show apn statistics name

Field	Description
Default bearers rel fail	The total number of default bearer release failed.
Dedicated bearers rel fail	The total number of dedicated bearer release failed.
Default bearers rejected	The total number of default bearers rejected.
Dedicated bearers rejected	The total number of dedicated bearers rejected.
UE-init mod	The total number of UE initiated bearer modifications.
Network-init mod	The total number of network initiated bearer modifications.
UE-init mod fail	The total number of ue initiated modifications failed.
Network-init mod fail	The total number of network initiated modifications failed.
Total PDN-Type stats	
PDN-Type IPv4 sessions active	The total number of pdn ipv4 active sessions.
PDN-Type IPv4 sessions setup	The total number pdn ipv4 setup sessions.
PDN-Type IPv4 sessions released	The total number of pdn ipv4 sessions released.
PDN-Type IPv6 sessions active	The total number of pdn ipv6 active sessions.
PDN-Type IPv6 sessions setup	The total number pdn ipv6 setup sessions.
PDN-Type IPv6 sessions released	The total number pdn ipv6 sessions released.
PDN-Type IPv4v6 sessions active	The total number of pdn ipv4v6 active sessions.
PDN-Type IPv4v6 sessions setup	The total number pdn ipv4v6 setup sessions.
PDN-Type IPv4v6 sessions released	The total number pdn ipv4v6 sessions released.
IP Address Allocation Statistics	
Total IPv4 addr allocated: Local pool add assign	The current total number of PDP contexts facilitated by the APN that were dynamically assigned IP addresses from pools configured locally on the system.
Total IPv4 addr allocated: Static addr assign	The current total number of PDP contexts facilitated by the APN that used static IP address.
Total IPv4 addr allocated: aaa provided addr	The current total number of PDP contexts facilitated by the APN that were dynamically assigned IP addresses from a AAA server.

Field	Description
Total IPv4 addr allocated: skipped ip validation for L3 tunnels	The current total number of PDP contexts facilitated by the APN that were skipped validation for L3 tunnels.
Total IPv4 addr allocated: DHCP proxy assign	The current total number of PDP contexts facilitated by the APN that were dynamically assigned IP addresses by the system using the DHCP client mode.
Total IPv4 addr allocated: DHCP relay assign	The current total number of PDP contexts facilitated by the APN that were dynamically assigned IP addresses by the system using the DHCP relay mode.
Total IPv4 addr allocated: No allocation	The current total number of PDP contexts facilitated by the APN that were not dynamically allocated IP addresses. This counters is relevant for a multicast sessions (MBMS) where IP allocation is not applicable.
Total IPv6 addr allocated: Stateless auto config	The current total number ipv6 address allocation by stateless auto configuration.
Subscriber QoS Statistics	
QCI n: Bearer Active	The current total number of bearers with qci n active. Here n (qci-val) is the QCI for which the negotiate limit is being set, it ranges from 1 to 9.
QCI n: Bearer Setup	The current total number of bearers with qci n setup.
QCI n: Bearer Released	The current total number of bearers with qci n released.
QCI n: Uplink Bytes Forwarded	The current total number of uplink bytes forwarded for qci n.
QCI n: Downlink Bytes Forwarded	The current total number of downlink bytes forwarded for qci n.
QCI n: Uplink Packets Forwarded	The current total number of uplink packets forwarded for qci n.
QCI n: Downlink Packets Forwarded	The current total number of downlink packets forwarded for qci n.
QCI n: Uplink Bytes Dropped	The current total number of uplink bytes dropped for qci n.
QCI n: Downlink Bytes Dropped	The current total number of downlink bytes dropped for qci n.
QCI n: Uplink Packets Dropped	The current total number of uplink packets dropped for qci n.
QCI n: Downlink Packets Dropped	The current total number of downlink packets dropped for qci n.
Session statistics	
current contexts (selected APN(s))	The current total number of PDP contexts facilitated by the APN.

■ show apn statistics name

Field	Description
current contexts (system wide)	The current total number of PDP contexts facilitated by the entire system.
cumulative contexts (selected APN(s))	The cumulative number of PDP contexts facilitated by the APN.
cumulative contexts (system wide)	The cumulative number of PDP contexts facilitated by the entire system.
Current APN context load	The current percent utilization of the APN as function of the APN's configured maximum number of supported PDP contexts and the current total number of PDP contexts facilitated by the APN.
Cumulative APN context load	The cumulative percent utilization of the APN as function of the APN's configured maximum number of supported PDP contexts and the cumulative number of PDP contexts facilitated by the APN.
AAA Counters	
Authentication Counters	
Access-Request Sent	The total number of access requests that were sent.
Access-Request Timeouts	The total number of access request timeouts.
Accounting Counters	
Accounting-Request Sent	The total number of accounting requests that were sent.
Accounting-Response Received	The total number of accounting responses that were received.
Accounting-Request Timeouts	The total number of accounting request timeouts.
RADIUS Acct-Req purged	The total number of RADIUS accounting requests purged.
GTPP Acct-req purged	The total number of GTPP accounting requests purged.
GTPP sec Acct-req purged	The total number of secondary G-CDR accounting requests being processed and purged by this AAAMgr instance for which the GTPP protocol is being used to deliver the accounting message to the Charging Gateway Function (CGF) . It counts total secondary G-CDR accounting requests purged by this AAAMgr instance
GTPP Chrg-req purged	The total number of GTPP charging requests purged.
GTPP sec Chrg-req purged	The total number of secondary eG-CDR charging requests being processed and purged by this AAAMgr instance for which the GTPP protocol is being used to deliver the charging message to the Charging Gateway Function (CGF) . It counts total secondary eG-CDR charging requests purged by this AAAMgr instance

Chapter 73

show asngw-service

This chapter includes the `show asngw-service` command output tables.

show asngw-service all

Table 151. show asngw-service all Command Output Descriptions

Field	Description
Service name	The ASN GW service name.
Context	The context in which the service is configured.
Bind	The bind status.
Max Subscribers	The maximum number of subscribers.
IP address	IP address of ASN GW server where this service is located.
UDP Port	The UDP port number.
Service Status	Status of this service.
Authentication	The authentication mode. Possible modes are: <ul style="list-style-type: none"> • None • User (Single EAP) • Device (Single EAP) • Device-User (Double EAP) • Device-User (Single EAP)
Policy msid-dhcp-chaddr-mismatch	Indicates the status of the policy to handle the calls with mismatched DHCP Client Hardware (MAC) Address (CHADDR) and MSID of the ASN-GW session.
Policy ms-unexpected-network-reentry	Indicates the status of the policy to handle the unexpected network re-entry of an MS.
Policy asngw-initiated-reauth	Indicates the status of the policy to handle the ASN GW initiated reauthorization trigger.
Policy non-anchor-mode	Indicates the status of the policy to handle the ASN GW to accept the session in non-anchor mode.
Newcall Policy	Specify that the new call policy enabled or disabled to handle new calls. Possible values are: <ul style="list-style-type: none"> • NONE • REJECT
Policy Overload	Specify that the session overload policy enabled or disabled to handle new calls. Possible values are: <ul style="list-style-type: none"> • DROP • REJECT
Mobile IP FA context	The name of the context where MIP FA service is configured.
Maximum number of retransmissions	The maximum number of retransmissions.

Field	Description
Retransmission timeout	The retransmission timeout duration.
Setup timeout	The session setup timeout duration.
Active-relay timeout	Indicates the timeout duration for active relay of R4 or R6 messages.
Handover anchor data-path termination timeout	Indicates the timeout duration in seconds to keep the data path registration with previous anchored BS after completion of handover.
Handover anchor data-path pre-registration termination timeout	Indicates the timeout duration in seconds to keep the data path pre-registration termination information with anchored BS after completion of handover.
Handover non-anchor data-path termination timeout	Indicates the timeout duration in seconds to keep the data path registration with non-anchored BS after completion of handover.
Handover non-anchor data-path pre-registration termination timeout	Indicates the timeout duration in seconds to keep the data path pre-registration termination information with non-anchored BS after completion of handover.
Handover max number of data-path pre-registrations	Indicates the maximum number of data paths created during pre-registration for a handover.
Idle-mode entry timeout	Indicates the timeout duration in seconds for a session to enter the idle mode from active mode.
Idle-mode exit timeout	Indicates the timeout duration in seconds for a session to reenter the active mode from idle mode.
Idle-mode timeout	Indicates the total timeout duration in seconds.
Policy transaction-id-validation	Indicates the status of the policy to validate the transaction id.
Policy zero-function-type	Indicates the status of the policy to allow the zero function type of call.
Transaction Id. Seed	Indicates the transaction identifier seed.
Peer ASNGW addresses	Indicates the IP addresses of trusted ASN GW peers for handover.
BS Monitor Config	Indicates the status of BS monitoring support. Possible values are: <ul style="list-style-type: none"> • Enabled • Disabled
Interval	Indicates the configured amount of time in seconds between two ICMP ping message to an ASN BS.
Timeout	Indicates the number of seconds to wait for response from the ASN BS before re-sending the ICMP ping message.
Number of retries	Indicates the number of retries to sent ICMP ping messages to an ASN BS before the ASN BS is declared as dead/unreachable.
MTU size	Indicates the maximum transmission unit size configured in bytes.
Total BSs	Indicates the total number of BSs monitored.
Active BSs	Indicates number of active BSs.
Alive BSs	Indicates number of active and alive BSs.

Field	Description
ICMP Monitored BSs	Indicates the number of BSs which are monitored through ICMP ping messages.
Inactive BSs	Indicates number of inactive BSs.
No Calls BSs	Indicates the total number of BSs which have no active calls or in idle mode.
Going Down BSs	Indicates the total number of BSs which are going down or terminating sessions.
BS	Indicates the IP address of BSs.
Status	Indicates the status of listed BSs.
Maximum Number of Secondary IP Hosts	Indicates the maximum number of secondary hosts connected behind a primary WiMAX CPE under multiple IP host support.
Ran Peer Map Name	The name of the RAN Peer Map this service is using to reconcile base station MAC address received in R6 protocol messages to the actual IPv4 address of the base station.

show asngw-service session all

Table 152. show asngw-service session all Command Output Descriptions

Field	Description
vv	<p>Displays service and session state information. This column provides a code consisting of two characters.</p> <p>From left-to-right, the first character represents the Call Type that the subscriber is using. The possible call types are:</p> <ul style="list-style-type: none"> • A: Anchor • N: Non-Anchor <p>From left-to-right, the second character represents the DP Status. The possible data path status are:</p> <ul style="list-style-type: none"> • A: Active • I: Idle
CALLID	The subscriber's call identification number.
MSID	The subscriber's Mobile Station Identification number.
NAI	The subscriber's Network Access Identifier.
Home Address	The IP address assigned to the subscriber's mobile node for the duration of the session.
Total Non-Anchor ASNGW Sessions	The total number of ASN GW sessions in non-anchor mode.
Total Anchor ASNGW Sessions	The total number of ASN GW sessions in anchor mode.
Total Active ASNGW Sessions	The total number of active ASN GW sessions including anchor and non-anchor mode.
Total Idle ASNGW Sessions	The total number of idle ASN GW sessions including anchor and non-anchor mode.
Total ASNGW Sessions	The total number of ASN GW sessions on chassis including all modes.

show asngw-service session counters

Table 153. show asngw-service session counters Command Output Descriptions

Field	Description
Username	The subscriber's user name.
Callid	The subscriber's call identification number.
MSID	The subscriber's Mobile Station Identification number.
Session Type	Indicates the type of session. Possible type of sessions are: <ul style="list-style-type: none"> • Anchor • Non-Anchor
Initial Network Entry Events	
MS Pre-Attach	Displays the MS pre-attach event statistics.
Attempted	Indicates the total number of attempts made for an event.
Success	Indicates the total number of successful attempts made for an event.
Failures	Indicates the total number of failed attempts made for an event.
Authentications	Displays the authentication event statistics.
EAP	Indicates the total number of authentication/re-authentication attempts failed due to EAP.
Misc. Reason	Indicates the total number of authentication/re-authentication attempts failed due to miscellaneous reasons.
MS Attach	Displays the MS attach event statistics.
DP Registrations	Displays the data path registration event statistics.
Re-Authentications	Displays the re-authentication event statistics.
Handover Events	
Intra ASN-GW Handovers	Displays the intra-ASN GW (inter BS) handover event statistics.
Inter ASN-GW Handovers	Displays the inter-ASN GW handover event statistics.
DP De-Registrations	Displays the data path de-registration event statistics.
Idle Mode entry events	Displays the idle mode entry event statistics.
Idle Mode exit events	Displays the idle mode exit event statistics.
Paging initiation events	Displays the paging initiation event statistics.
Total R6/R4 Control Messages	Displays the statistics of total R4 and R6 control messages.
Sent	Total number of R4/R6 control messages sent.

Field	Description
Retransmissions Sent	Total number of R4/R6 control messages retransmitted.
Received	The total number of R4/R6 control messages received.
Accepted	The total number of R4/R6 control messages received and accepted.
Relayed	The total number of R4/R6 control messages received and relayed.
Denied	The total number of R4/R6 control messages received and denied.
Discarded	The total number of R4/R6 control messages received and discarded.
Badly Formed	The total number of badly formed R4/R6 control messages messages.
Decode Error	The total number of decode errors found in the R4/R6 control messages.
Unspecified Error	The total number of unspecified errors found in the R4/R6 control messages.
Missing Mandatory TLV	The total number of R4/R6 control messages received with missing mandatory TLVs.
TLV Value Invalid	The total number of R4/R6 control messages received with invalid TLV value.
Unknown TLV	The total number of R4/R6 control messages received with unknown TLV value.
Duplicate TLV Found	The total number of R4/R6 control messages received with duplicate TLV value.
No Session Found	The total number of R4/R6 control messages received without session information.
Transaction Id. Error	The total number of R4/R6 control messages received with error in transaction id.
Key Change Success	The total number of R4/R6 control messages received with successful Key Change request.
Key Change Failure	The total number of R4/R6 control messages with failed Key Change request.
MS Initiated Re-Auth	The total number of R4/R6 control messages received with for MS initiated re-authentication.
BS Initiated Re-Auth	The total number of R4/R6 control messages received with for BS initiated re-authentication.
Total R4/R6 Data messages:	Displays the statistics of total R4 and R6 data messages.
GRE Receive:	
Packets Received	The total number of packets received by the system through GRE tunnel.
Bytes Received	The total number of bytes received by the system through GRE tunnel.
Protocol Type Error	The total number of encapsulated packets received through GRE tunnel with protocol type errors.
GRE Key Absent	Total number of GRE tunneled key absent errors received through GRE tunnel.
GRE Checksum Error	Total number of checksum errors that occurred in GRE tunnels received by this system.
Invalid Packet Length	Total number of encapsulated packets received with invalid packet lengths through GRE tunnel.
No Session found	Total number of errors that occurred due to no session being present in received tunnels.
Unspecified Error	Total number of data messages received with errors which are not specified in this table.
GRE Send:	

Field	Description
Packets Sent	The total number of packets sent by the system through GRE tunnel.
Bytes Sent	The total number of bytes sent by the system through GRE tunnel.
Send Error	The total number of errors that occurred while sending replies through GRE tunnel.
Unspecified Error	Total number of data messages sent with errors which are not specified in this table through GRE tunnel.
Total Non-Anchor ASNGW Sessions	The total number of ASN GW sessions in non-anchor mode.
Total Anchor ASNGW Sessions	The total number of ASN GW sessions in anchor mode.
Total ASNGW Sessions	The total number of ASN GW sessions including anchor and non-anchor mode.

show asngw-service session counters verbose

Table 154. show asngw-service session counters verbose Command Output Descriptions

Field	Description
Username	The subscriber's user name.
Callid	The subscriber's call identification number.
MSID	The subscriber's Mobile Station Identification number.
Session Type	Indicates the type of session. Possible type of sessions are: <ul style="list-style-type: none"> Anchor Non-Anchor
Message Groups	
R6 MS Pre-Attachment Request messages	Groups the statistics of the MS pre-attachment request messages on R6 interface.
R6 MS Pre-Attachment Response messages	Groups the statistics of the MS pre-attachment response messages on R6 interface.
R6 MS Pre-Attachment Ack messages	Groups the statistics of the MS pre-attachment ACK messages on R6 interface.
R6 Network Exit MS State Change Request messages	Groups the statistics of the MS state change request messages on network exit R6 interface.
R4 Network Exit MS State Change Request messages	Groups the statistics of the MS state change request messages on network exit R4 interface.
R6 Network Exit MS State Change Response messages	Groups the statistics of the MS state change response messages on network exit R6 interface.
R4 Network Exit MS State Change Response messages	Groups the statistics of the MS state change response messages on network exit R4 interface.
R6 Context Request messages	Groups the statistics of the context request messages on R6 interface.
R4 Context Request messages	Groups the statistics of the context request messages on R4 interface.
R6 Context Report messages	Groups the statistics of the context report messages on R6 interface.
R4 Context Report messages	Groups the statistics of the context report messages on R4 interface.
R6 Context Ack messages	Groups the statistics of the context ACK messages on R6 interface.
R4 Context Ack messages	Groups the statistics of the context ACK messages on R4 interface.
R6 Authentication Relay EAP Transfer messages	Groups the statistics of the EAP authentication relay transfer messages on R6 interface.

Field	Description
R4 Authentication Relay EAP Transfer messages	Groups the statistics of the EAP authentication relay transfer messages on R4 interface.
R6 Authentication Relay EAP Start messages	Groups the statistics of the EAP authentication relay start messages on R6 interface.
R4 Authentication Relay EAP Start messages	Groups the statistics of the EAP authentication relay start messages on R4 interface.
R6 MS Attachment Request messages	Groups the statistics of the MS attachment request messages on R6 interface.
R6 MS Attachment Response messages	Groups the statistics of the MS attachment response messages on R6 interface.
R6 MS Attachment Ack messages	Groups the statistics of the MS attachment ACK messages on R6 interface.
R6 Data-Path Pre-Registration Request messages	Groups the statistics of the data path pre-registration request messages on R6 interface.
R4 Data-Path Pre-Registration Request messages	Groups the statistics of the data path pre-registration request messages on R4 interface.
R6 Data-Path Pre-Registration Response messages	Groups the statistics of the data path pre-registration response messages on R6 interface.
R4 Data-Path Pre-Registration Response messages	Groups the statistics of the data path pre-registration response messages on R4 interface.
R6 Data-Path Pre-Registration Ack messages	Groups the statistics of the data path pre-registration ACK messages on R6 interface.
R4 Data-Path Pre-Registration Ack messages	Groups the statistics of the data path pre-registration ACK messages on R4 interface.
R6 Data-Path Registration Request messages	Groups the statistics of the data path registration request messages on R6 interface.
R4 Data-Path Registration Request messages	Groups the statistics of the data path registration request messages on R4 interface.
R6 Data-Path Registration Response messages	Groups the statistics of the data path registration response messages on R6 interface.
R4 Data-Path Registration Response messages	Groups the statistics of the data path registration response messages on R4 interface.
R6 Data-Path Registration Ack messages	Groups the statistics of the data path registration ACK messages on R6 interface.
R4 Data-Path Registration Ack messages	Groups the statistics of the data path registration ACK messages on R4 interface.
R6 Data-Path De-Registration Request messages	Groups the statistics of the data path de-registration request messages on R6 interface.

Field	Description
R4 Data-Path De-Registration Request messages	Groups the statistics of the data path de-registration request messages on R4 interface.
R6 Data-Path De-Registration Response messages	Groups the statistics of the data path de-registration response messages on R6 interface.
R4 Data-Path De-Registration Response messages	Groups the statistics of the data path de-registration response messages on R4 interface.
R6 Data-Path De-Registration Ack messages	Groups the statistics of the data path de-registration ACK messages on R6 interface.
R4 Data-Path De-Registration Ack messages	Groups the statistics of the data path de-registration ACK messages on R4 interface.
R6 Key Change Directive messages	Groups the statistics of the key change directive messages on R6 interface.
R4 Key Change Directive messages	Groups the statistics of the key change directive messages on R4 interface.
R6 Key Change Ack messages	Groups the statistics of the key change ACK messages on R6 interface.
R4 Key Change Ack messages	Groups the statistics of the key change ACK messages on R4 interface.
R6 Key Change Confirm messages	Groups the statistics of the key change confirm messages on R6 interface.
R4 Key Change Confirm messages	Groups the statistics of the key change confirm messages on R4 interface.
R6 Cmac Key Count Update Msg	Groups the statistics of the Cipher-based Message Authentication Code (CMAC) key count update messages on R6 interface.
R4 Cmac Key Count Update Msg	Groups the statistics of the Cipher-based Message Authentication Code (CMAC) key count update messages on R4 interface.
R6 Cmac Key Count Ack Msg	Groups the statistics of the Cipher-based Message Authentication Code (CMAC) key count ACK messages on R6 interface.
R4 Cmac Key Count Ack Msg	Groups the statistics of the Cipher-based Message Authentication Code (CMAC) key count ACK messages on R4 interface.
R6 Handoff Request Msg	Groups the statistics of the hand-off request messages on R6 interface.
R4 Handoff Request Msg	Groups the statistics of the hand-off request messages on R4 interface.
R6 Handoff Response Msg	Groups the statistics of the hand-off response messages on R6 interface.
R4 Handoff Response Msg	Groups the statistics of the hand-off response messages on R4 interface.
R6 Handoff Ack Msg	Groups the statistics of the hand-off ACK messages on R6 interface.
R4 Handoff Ack Msg	Groups the statistics of the hand-off ACK messages on R4 interface.
R6 Handoff Confirm Msg	Groups the statistics of the hand-off confirm messages on R6 interface.
R4 Handoff Confirm Msg	Groups the statistics of the hand-off confirm messages on R4 interface.

Field	Description
R6 Handoff Complete Msg	Groups the statistics of the hand-off complete messages on R6 interface.
R4 Handoff Complete Msg	Groups the statistics of the hand-off complete messages on R4 interface.
R4 IM Entry State Change Req Msg	Groups the statistics of the idle mode entry state change request messages on R4 interface.
R4 IM Entry State Change Rsp Msg	Groups the statistics of the idle mode entry state change response messages on R4 interface.
R4 IM Entry State Change Ack Msg	Groups the statistics of the idle mode entry state change ACK messages on R4 interface.
R4 Anchor PC Indication Msg	Groups the statistics of anchor paging controller (PC) indication messages on R4 interface.
R4 Anchor PC Ack Msg	Groups the statistics of anchor paging controller (PC) ACK messages on R4 interface.
R4 IM Exit State Change Req Msg	Groups the statistics of the idle mode exit state change request messages on R4 interface.
R4 IM Exit State Change Rsp Msg	Groups the statistics of the idle mode exit state change response messages on R4 interface.
R4 Initiate Paging Req Msg	Groups the statistics of the initiated paging request messages on R4 interface.
R4 Initiate Paging Rsp Msg	Groups the statistics of the initiated paging response messages on R4 interface.
R4 Delete MS Entry Req Msg	Groups the statistics of the request messages to delete the MS entry request on R4 interface.
R4 Delete MS Entry Rsp Msg	Groups the statistics of the messages sent in response of delete message for the MS entry request on R4 interface.
R6 Unknown messages	Groups the statistics of the unknown type of request messages on R6 interface.
R4 Unknown messages	Groups the statistics of the unknown type of request messages on R4 interface.
Message Statistics	
Total Sent	The total number of this type of message sent on specific interface.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Retransmissions Sent	The total number of this type of message re-transmitted on specific interface.
Total Received	The total number of this type of message received on specific interface.
Total Accepted	The total number of this type of message accepted on specific interface.
Total Relayed	The total number of this type of message relayed on specific interface.
Total Denied	The total number of this type of message denied on specific interface.
Total Discarded	The total number of this type of message discarded on specific interface.
Badly Formed	The total number of badly formed this type of message on specific interface.
Decode Error	The total number of this type of message on specific interface with decode error.
Unspecified Error	The total number of this type of message on specific interface with unspecified error.

Field	Description
Missing Mandatory TLV	The total number of this type of message on specific interface with missing mandatory TLVs.
TLV Value Invalid	The total number of this type of message on specific interface with invalid TLV value.
Unknown TLV	The total number of this type of message on specific interface with unknown TLVs.
Duplicate TLV Found	The total number of this type of message on specific interface with duplicate TLVs.
No session Found	The total number of this type of message on specific interface without any session information.
Transaction Id. Error	The total number of this type of message on specific interface. with transaction id error.
Key Change Success	The total number of successful Key Change Confirmation messages.
Key Change Failure	The total number of Key Change Confirmation messages failed.
Out Of Order Packet	The total number of authentication relay EAP transfer/start messages on R6 interface with out-of-order packets.
MS Initiated Re-Auth	The total number of authentication relay EAP start messages on specific interface with MS initiated reauthorization.
BS Initiated Re-Auth	The total number of authentication relay EAP start messages on specific interface with BS initiated reauthorization.
ASNGW Initiated Re-Auth	Total number of the re-authentications initiated from the ASN GW.
Data messages	
GRE R6 Receive	The total number of data message received with through GRE tunnel on R6 interface.
GRE R4 Receive	The total number of data message received through GRE tunnel on R4 interface.
Packets Received	The total number of data packets received/sent through GRE tunnel on R4/R6 interface.
Bytes Received	The total number of data bytes received/sent through GRE tunnel on R4/R6 interface.
Protocol Type Error	The total number of data message received/sent with protocol type error through GRE tunnel on R4/R6 interface.
GRE Key Absent	The total number of data message received/sent without GRE key through GRE tunnel on R4/R6 interface.
GRE Checksum Error	The total number of data message received/sent with checksum error through GRE tunnel on R4/R6 interface.
Invalid Packet Length	The total number of data message received/sent with invalid packet length through GRE tunnel on R4/R6 interface.
No Session found	The total number of data message received/sent without any session information through GRE tunnel on R4/R6 interface.
Unspecified Error	The total number of data message received/sent with unknown error through GRE tunnel on R4/R6 interface.
GRE R6 Send	The total number of data message sent through GRE tunnel on R6 interface.
GRE R4 Send	The total number of data message sent through GRE tunnel on R4 interface.

```
■ show asngw-service session counters verbose
```

Field	Description
Packets Sent	The total number of data packets sent through GRE tunnel on R4/R6 interface.
Send Error	The total number of data message sent with error through GRE tunnel on R4/R6 interface.
Bytes Sent	The total number of data bytes sent through GRE tunnel on R4/R6 interface.

show asngw-service session full

Table 155. show asngw-service session full Command Output Descriptions

Field	Description
Username	The subscriber's user name.
Callid	The subscriber's call identification number.
Pseudoname	The subscriber's pseudo name. It provides the pseudo user name for a WIMAX session if TTLS authentication is used for the call.
MSID	The subscriber's Mobile Station Identification number.
Home Address	The IP address assigned to the subscriber's mobile node for the duration of the session.
ASNGW Service Address	IP address of system where ASN GW service is running.
Session Type	Indicates the type of session. Possible type of sessions are: <ul style="list-style-type: none"> • Anchor • Non-Anchor
DP Status	Indicates the status of data path. Possible data path status are: <ul style="list-style-type: none"> • Active • Idle
Authenticator Address	IP address of the authenticator ASN GW.
Anchor Address	IP address of the anchor ASN GW where subscriber is attached.
Data Path Status	Identifies if the call can carry data over the R6/R4 interface. Idle: the ASN GW is attached to PCLR and is not capable of sending traffic to BS over R6/R4. Active: the IP-GRE tunnels between the ASN GW and the BS are setup and ready to transfer data from the IP network side.
PCLR Address	IP address of PC-LR currently attached to this ASN GW.
CMAC Key Count	Total number of Cipher-based Message Authentication Code (CMAC) key count.
EAP MSK Lifetime	Total lifetime configured for EAP Master Session Key in seconds.
Remaining MSK Lifetime	Remaining lifetime available for EAP Master Session Key in seconds.
Number of Re-authentication	Total number of re-authentications happened for a WiMAX subscriber.

Field	Description
Authentication Mode	The authentication mode. Possible modes are: <ul style="list-style-type: none"> • None • User (Single EAP) • Device (Single EAP) • Device-User (Double EAP) • Device-User (Single EAP)
EAP-Methods	Specifies the EAP authentication method. Possible methods are: <ul style="list-style-type: none"> • EAP-Pre-shared Key (EAP-PSK) • EAP-Transport Layer Security (EAP-TLS) • EAP-Tunneled Transport Layer Security (EAP-TTLS) • EAP-Authentication and Key Agreement (EAP-AKA)
DHCP ChAddr of MS	Client Hardware (MAC) Address (CHADDR) of MS.
Service Flow Information	
SFID	The service flow identifier.
Direction	Direction of the service flow.
SDFID	The service data flow identifier.
PDFID	The packet data flow identifier.
Profile ID	The profile id applicable for service flow.
Peer (*) Address	Specifies the IP address of the trusted peer for handover.
Peer Type	Specifies the type of peer for handover. Possible types are: <ul style="list-style-type: none"> • BS • ASN GW
BSID	Specifies the ASN base station Id.
GRE Key	The Generic Routing Encapsulation (GRE) key.
Tunnel Endpoint	Indicates the IP address of GRE tunnel endpoint.
Total Service flows(unidirectional)	Total number of service flows in both direction.
Total Non-Anchor ASNGW Sessions	The total number of ASN GW sessions in non-anchor mode.
Total Anchor ASNGW Sessions	The total number of ASN GW sessions in anchor mode.
Total Active ASNGW Sessions	The total number of active ASN GW sessions.
Total Idle ASNGW Sessions	The total number of ASN GW sessions in idle mode.
Total ASNGW Sessions	The total number of ASN GW sessions including anchor and non-anchor mode.

show asngw-service session counters function-type data-path

Table 156. show asngw-service session counters function-type data-path Command Output Descriptions

Field	Description
Username	The subscriber's user name.
CALLID	The subscriber's call identification number.
MSID	The subscriber's Mobile Station Identification number.
Data-Path Registration Request Messages:	
Total Sent	The total number of Data-Path Registration Request messages sent.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Total Received	The total number of Data-Path Registration Request messages received.
Total Denied	The total number of Data-Path Registration Request messages denied.
Total Discarded	The total number of Data-Path Registration Request messages discarded.
Badly Formed	The total number of badly formed Data-Path Registration Request messages.
Decode Error	The total number of decode errors in the Data-Path Registration Request messages sent.
Unspecified Error	The total number of unspecified errors in the Data-Path Registration Request messages sent.
Missing Mandatory TLV	The total number of missing mandatory TLVs in the Data-Path Registration Request messages sent.
TLV Value Invalid	The total number of Data-Path Registration Request messages sent with invalid TLV value.
Unknown TLV	The total number of Data-Path Registration Request messages sent with unknown TLV.
Duplicate TLV Found	The total number of Data-Path Registration Request messages sent with duplicate TLV.
No Session Found	The total number of Data-Path Registration Request messages sent without session information.
Data-Path Registration Response Messages:	
Total Sent	The total number of Data-Path Registration Response messages sent.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Total Received	The total number of Data-Path Registration Response messages received.
Total Denied	The total number of Data-Path Registration Response messages denied.
Total Discarded	The total number of Data-Path Registration Response messages discarded.
Badly Formed	The total number of badly formed Data-Path Registration Response messages.

Field	Description
Decode Error	The total number of decode errors in the Data-Path Registration Response messages sent.
Unspecified Error	The total number of unspecified errors in the Data-Path Registration Response messages sent.
Missing Mandatory TLV	The total number of missing mandatory TLVs in the Data-Path Registration Response messages sent.
TLV Value Invalid	The total number of Data-Path Registration Response messages sent with invalid TLV value.
Unknown TLV	The total number of Data-Path Registration Response messages sent with unknown TLV.
Duplicate TLV Found	The total number of Data-Path Registration Response messages sent with duplicate TLV.
No Session Found	The total number of Data-Path Registration Response messages sent without session information.
Data-Path Registration Ack Messages:	
Total Sent	The total number of Data-Path Registration Request Ack messages sent.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Total Received	The total number of Data-Path Registration Request Ack messages received.
Total Denied	The total number of Data-Path Registration Request Ack messages denied.
Total Discarded	The total number of Data-Path Registration Request Ack messages discarded.
Badly Formed	The total number of badly formed Data-Path Registration Request Ack messages.
Decode Error	The total number of decode errors in the Data-Path Registration Request Ack messages sent.
Unspecified Error	The total number of unspecified errors in the Data-Path Registration Request Ack messages sent.
Missing Mandatory TLV	The total number of missing mandatory TLVs in the Data-Path Registration Request Ack messages sent.
TLV Value Invalid	The total number of Data-Path Registration Request Ack messages sent with invalid TLV value.
Unknown TLV	The total number of Data-Path Registration Request Ack messages sent with unknown TLV.
Duplicate TLV Found	The total number of Data-Path Registration Request Ack messages sent with duplicate TLV.
No Session Found	The total number of Data-Path Registration Request Ack messages sent without session found.
Data-Path De-Registration Request Messages:	
Total Sent	The total number of Data-Path De-Registration Request messages sent.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Total Received	The total number of Data-Path De-Registration Request messages received.
Total Denied	The total number of Data-Path De-Registration Request messages denied.
Total Discarded	The total number of Data-Path De-Registration Request messages discarded.
Badly Formed	The total number of badly formed Data-Path De-Registration Request messages.

Field	Description
Decode Error	The total number of decode errors in the Data-Path De-Registration Request messages sent.
Unspecified Error	The total number of unspecified errors in the Data-Path De-Registration Request messages sent.
Missing Mandatory TLV	The total number of missing mandatory TLVs in the Data-Path De-Registration Request messages sent.
TLV Value Invalid	The total number of Data-Path De-Registration Request messages sent with invalid TLV value.
Unknown TLV	The total number of Data-Path De-Registration Request messages sent with unknown TLV.
Duplicate TLV Found	The total number of Data-Path De-Registration Request messages sent with duplicate TLV.
No Session Found	The total number of Data-Path De-Registration Request messages sent without session information.
Data-Path De-Registration Response Messages:	
Total Sent	The total number of Data-Path De-Registration Response messages sent.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Total Received	The total number of Data-Path De-Registration Response messages received.
Total Denied	The total number of Data-Path De-Registration Response messages denied.
Total Discarded	The total number of Data-Path De-Registration Response messages discarded.
Badly Formed	The total number of badly formed Data-Path De-Registration Response messages.
Decode Error	The total number of decode errors in the Data-Path De-Registration Response messages sent.
Unspecified Error	The total number of unspecified errors in the Data-Path De-Registration Response messages sent.
Missing Mandatory TLV	The total number of missing mandatory TLVs in the Data-Path De-Registration Response messages sent.
TLV Value Invalid	The total number of Data-Path De-Registration Response messages sent with invalid TLV value.
Unknown TLV	The total number of Data-Path De-Registration Response messages sent with unknown TLV.
Duplicate TLV Found	The total number of Data-Path De-Registration Response messages sent with duplicate TLV.
No Session Found	The total number of Data-Path De-Registration Response messages sent without session information.
Total ASNGW Sessions	The total number of ASNGW messages.

show asngw-service session peer-address

Table 157. show asngw-service session peer-address Command Output Descriptions

Field	Description
vv	<p>Displays service and session state information. This column provides a code consisting of two characters.</p> <p>From left-to-right, the first character represents the Call Type that the subscriber is using. The possible call types are:</p> <ul style="list-style-type: none"> • A: Anchor • N: Non-Anchor <p>From left-to-right, the second character represents the DP Status. The possible data path status are:</p> <ul style="list-style-type: none"> • A: Active • I: Idle
CALLID	The subscriber's call identification number.
MSID	The subscriber's Mobile Station Identification number.
NAI	The subscriber's Network Access Identifier.
Home Address	The IP address assigned to the subscriber's mobile node for the duration of the session.
Total Non-Anchor ASNGW Sessions	The total number of ASN GW sessions in non-anchor mode.
Total Anchor ASNGW Sessions	The total number of ASN GW sessions in anchor mode.
Total Active ASNGW Sessions	The total number of active ASN GW sessions including anchor and non-anchor mode.
Total Idle ASNGW Sessions	The total number of idle ASN GW sessions including anchor and non-anchor mode.
Total ASNGW Sessions	The total number of ASN GW sessions on chassis including all modes.

show asngw-service session summary

Table 158. show asngw-service session summary Command Output Descriptions

Field	Description
Total Non-Anchor ASNGW Sessions	The total number of ASN GW sessions in non-anchor mode.
Total Anchor ASNGW Sessions	The total number of ASN GW sessions in anchor mode.
Total Active ASNGW Sessions	The total number of active ASN GW sessions including anchor and non-anchor mode.
Total Idle ASNGW Sessions	The total number of idle ASN GW sessions including anchor and non-anchor mode.
Total ASNGW Sessions	The total number of ASN GW sessions on chassis including all modes.

show asngw-service statistics

Table 159. show asngw-service statistics Command Output Descriptions

Field	Description
Initial Network Entry Events	
MS Pre-Attach	Displays the MS pre-attach event statistics.
Attempted	Indicates the total number of attempts made for an event.
Success	Indicates the total number of successful attempts made for an event.
Failures	Indicates the total number of failed attempts made for an event.
Authentications	Displays the authentication event statistics.
EAP	Indicates the total number of authentication/re-authentication attempts failed due to EAP.
Misc. Reason	Indicates the total number of authentication/re-authentication attempts failed due to miscellaneous reasons.
MS Attach	Displays the MS attach event statistics.
Re-Authentications	Displays the re-authentication event statistics.
Handover Events	
Intra ASN-GW Handovers	Displays the intra-ASN GW (inter BS) handover event statistics.
Inter ASN-GW Handovers	Displays the inter-ASN GW handover event statistics.
DP Pre-registration	Displays the data path pre-registration event statistics.
DP Registration	Displays the data path registration event statistics.
DP De-Registration	Displays the data path de-registration event statistics.
Idle Mode entry events	Displays the idle mode entry event statistics.
Idle Mode exit events	Displays the idle mode exit event statistics.
Paging initiation events	Displays the paging initiation event statistics.
Total Disconnects	Displays the reason statistics for the disconnection of session.
MSK Lifetime Expiry	Indicates the total number of disconnects due to Master Session Key lifetime expiry.
Auth Failures	Indicates the total number of disconnects due to authentication failure.
Admin Drops	Indicates the total number of disconnects due to administrator intervention.
De-registrations	Indicates the total number of disconnects due to de-registration request initiation.
Other Reasons	Indicates the total number of disconnects due to unspecified reasons.

Field	Description
Total R6/R4 Control Messages	Displays the statistics of total R4 and R6 control messages.
Sent	Total number of R4/R6 control messages sent.
Retransmissions Sent	Total number of R4/R6 control messages retransmitted.
Received	Total number of R4/R6 control messages received.
Accepted	Total number of R4/R6 control messages received and accepted.
Relayed	Total number of R4/R6 control messages received and relayed.
Denied	Total number of R4/R6 control messages received and denied.
Discarded	Total number of R4/R6 control messages received and discarded.
Badly Formed	Total number of badly formed R4/R6 control messages.
Decode Error	Total number of decode errors found in the R4/R6 control messages.
Unspecified Error	Total number of unspecified errors found in the R4/R6 control messages.
Missing Mandatory TLV	Total number of R4/R6 control messages received with missing mandatory TLVs.
TLV Value Invalid	Total number of R4/R6 control messages received with invalid TLV value.
Unknown TLV	Total number of R4/R6 control messages received with unknown TLV value.
Duplicate TLV Found	Total number of R4/R6 control messages received with duplicate TLV value.
No Session Found	Total number of R4/R6 control messages received without session information.
Transaction Id. Error	Total number of R4/R6 control messages received with error in transaction id.
Key Change Success	Total number of R4/R6 control messages received with successful Key Change request.
Key Change Failures	Total number of R4/R6 control messages with failed Key Change request.
MS Initiated Re-Auth	Total number of R4/R6 control messages received with for MS initiated re-authentication.
BS Initiated Re-Auth	Total number of R4/R6 control messages received with for BS initiated re-authentication.
ASNGW Initiated Re-Auth	Total number of the re-authentications initiated from the ASN GW.
Total R4/R6 Data messages:	Displays the statistics of total R4 and R6 data messages.
GRE Receive:	
Total Packets Received	Total number of packets received by the system through GRE tunnel.
Total Bytes Received	Total number of bytes received by the system through GRE tunnel.
Protocol Type Error	Total number of encapsulated packets received through GRE tunnel with protocol type errors.
GRE Key Absent	Total number of GRE tunneled key absent errors received through GRE tunnel.
GRE Checksum Error	Total number of checksum errors that occurred in GRE tunnels received by this system.
Invalid Packet Length	Total number of encapsulated packets received with invalid packet lengths through GRE tunnel.
No Session found	Total number of errors that occurred due to no session being present in received tunnels.

Field	Description
Unspecified Error	Total number of data messages received with errors which are not specified in this table.
GRE Send:	
Total Packets Sent	Total number of packets sent by the system through GRE tunnel.
Total Bytes Sent	Total number of bytes sent by the system through GRE tunnel.
Send Error	Total number of errors that occurred while sending replies through GRE tunnel.
Unspecified Error	Total number of data messages sent with errors which are not specified in this table through GRE tunnel.
Total Sessions Connected	Historical count of the total number of ASNGW sessions setup on a per-service and a per-chassis basis.

show asngw-service statistics function-type ms-state-change

Table 160. show asngw-service statistics function-type ms-state-change Command Output Descriptions

Field	Description
Network Entry MS State Change Request Messages:	
Total Sent	The total number of Network Entry MS State Change Request messages sent.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Total Received	The total number of Network Entry MS State Change Request messages received.
Total Denied	The total number of Network Entry MS State Change Request messages denied.
Total Discarded	The total number of Network Entry MS State Change Request messages discarded.
Badly Formed	The total number of badly formed Network Entry MS State Change Request messages.
Decode Error	The total number of decode errors in the Network Entry MS State Change Request messages sent.
Unspecified Error	The total number of unspecified errors in the Network Entry MS State Change Request messages sent.
Missing Mandatory TLV	The total number of missing mandatory TLVs in the Network Entry MS State Change Request messages sent.
TLV Value Invalid	The total number of Network Entry MS State Change Request messages sent with invalid TLV value.
Unknown TLV	The total number of Network Entry MS State Change Request messages sent with unknown TLV.
Duplicate TLV Found	The total number of Network Entry MS State Change Request messages sent with duplicate TLV.
No Session Found	The total number of Network Entry MS State Change Request messages sent without session information.
Network Entry MS State Change Response Messages:	
Sent	The total number of Network Entry MS State Change Response messages sent.
Total Received	The total number of Network Entry MS State Change Response messages received.
Total Denied	The total number of Network Entry MS State Change Response messages denied.
Total Discarded	The total number of Network Entry MS State Change Response messages discarded.
Badly Formed	The total number of badly formed Network Entry MS State Change Response messages.
Decode Error	The total number of decode errors in the Network Entry MS State Change Response messages sent.
Unspecified Error	The total number of unspecified errors in the Network Entry MS State Change Response messages sent.
Missing Mandatory TLV	The total number of missing mandatory TLVs in the Network Entry MS State Change Response messages sent.
TLV Value Invalid	The total number of Network Entry MS State Change Response messages sent with invalid TLV value.

Field	Description
Unknown TLV	The total number of Network Entry MS State Change Response messages sent with unknown TLV.
Duplicate TLV Found	The total number of Network Entry MS State Change Response messages sent with duplicate TLV.
No Session Found	The total number of Network Entry MS State Change Response messages sent without session information.
Network Entry MS State Change Directive Messages:	
Total Sent	The total number of Network Entry MS State Change Directive messages sent.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Total Received	The total number of Network Entry MS State Change Directive messages received.
Total Denied	The total number of Network Entry MS State Change Directive messages denied.
Total Discarded	The total number of Network Entry MS State Change Directive messages discarded.
Badly Formed	The total number of badly formed Network Entry MS State Change Directive messages.
Decode Error	The total number of decode errors in the Network Entry MS State Change Directive messages sent.
Unspecified Error	The total number of unspecified errors in the Network Entry MS State Change Directive messages sent.
Missing Mandatory TLV	The total number of missing mandatory TLVs in the Network Entry MS State Change Directive messages sent.
TLV Value Invalid	The total number of Network Entry MS State Change Directive messages sent with invalid TLV value.
Unknown TLV	The total number of Network Entry MS State Change Directive messages sent with unknown TLV.
Duplicate TLV Found	The total number of Network Entry MS State Change Directive messages sent with duplicate TLV.
No Session Found	The total number of Network Entry MS State Change Directive Request messages sent without session information.
Network Entry MS State Change Ack Messages:	
Total Sent	The total number of Network Entry MS State Change Ack messages sent.
Total Received	The total number of Network Entry MS State Change Ack messages received.
Total Denied	The total number of Network Entry MS State Change Ack messages denied.
Total Discarded	The total number of Network Entry MS State Change Ack messages discarded.
Badly Formed	The total number of badly formed Network Entry MS State Change Ack messages.
Decode Error	The total number of decode errors in the Network Entry MS State Change Ack messages sent.
Unspecified Error	The total number of unspecified errors in the Network Entry MS State Change Ack messages sent.
Missing Mandatory TLV	The total number of missing mandatory TLVs in the Network Entry MS State Change Ack messages sent.
TLV Value Invalid	The total number of Network Entry MS State Change Ack messages sent with invalid TLV value.
Unknown TLV	The total number of Network Entry MS State Change Ack messages sent with unknown TLV.

```
■ show asngw-service statistics function-type ms-state-change

Table 161. show asngw-service statistics verbose Command Output Descriptions

Field	Description
Message Groups	
R6 MS Pre-Attachment Request messages	Groups the statistics of the MS pre-attachment request messages on R6 interface.
R6 MS Pre-Attachment Response messages	Groups the statistics of the MS pre-attachment response messages on R6 interface.
R6 MS Pre-Attachment Ack messages	Groups the statistics of the MS pre-attachment ACK messages on R6 interface.
R6 Network Exit MS State Change Request messages	Groups the statistics of the MS state change request messages on network exit R6 interface.
R4 Network Exit MS State Change Request messages	Groups the statistics of the MS state change request messages on network exit R4 interface.
R6 Network Exit MS State Change Response messages	Groups the statistics of the MS state change response messages on network exit R6 interface.
R4 Network Exit MS State Change Response messages	Groups the statistics of the MS state change response messages on network exit R4 interface.
R6 Context Request messages	Groups the statistics of the context request messages on R6 interface.
R4 Context Request messages	Groups the statistics of the context request messages on R4 interface.
R6 Context Report messages	Groups the statistics of the context report messages on R6 interface.
R4 Context Report messages	Groups the statistics of the context report messages on R4 interface.
R6 Context Ack messages	Groups the statistics of the context ACK messages on R6 interface.
R4 Context Ack messages	Groups the statistics of the context ACK messages on R4 interface.
R6 Authentication Relay EAP Transfer messages	Groups the statistics of the EAP authentication relay transfer messages on R6 interface.
R4 Authentication Relay EAP Transfer messages	Groups the statistics of the EAP authentication relay transfer messages on R4 interface.
R6 Authentication Relay EAP Start messages	Groups the statistics of the EAP authentication relay start messages on R6 interface.
R4 Authentication Relay EAP Start messages	Groups the statistics of the EAP authentication relay start messages on R4 interface.
R6 MS Attachment Request messages	Groups the statistics of the MS attachment request messages on R6 interface.

■ show asngw-service statistics verbose

Field	Description
R6 MS Attachment Response messages	Groups the statistics of the MS attachment response messages on R6 interface.
R6 MS Attachment Ack messages	Groups the statistics of the MS attachment ACK messages on R6 interface.
R6 Data-Path Pre-Registration Request messages	Groups the statistics of the data path pre-registration request messages on R6 interface.
R4 Data-Path Pre-Registration Request messages	Groups the statistics of the data path pre-registration request messages on R4 interface.
R6 Data-Path Pre-Registration Response messages	Groups the statistics of the data path pre-registration response messages on R6 interface.
R4 Data-Path Pre-Registration Response messages	Groups the statistics of the data path pre-registration response messages on R4 interface.
R6 Data-Path Pre-Registration Ack messages	Groups the statistics of the data path pre-registration ACK messages on R6 interface.
R4 Data-Path Pre-Registration Ack messages	Groups the statistics of the data path pre-registration ACK messages on R4 interface.
R6 Data-Path Registration Request messages	Groups the statistics of the data path registration request messages on R6 interface.
R4 Data-Path Registration Request messages	Groups the statistics of the data path registration request messages on R4 interface.
R6 Data-Path Registration Response messages	Groups the statistics of the data path registration response messages on R6 interface.
R4 Data-Path Registration Response messages	Groups the statistics of the data path registration response messages on R4 interface.
R6 Data-Path Registration Ack messages	Groups the statistics of the data path registration ACK messages on R6 interface.
R4 Data-Path Registration Ack messages	Groups the statistics of the data path registration ACK messages on R4 interface.
R6 Data-Path De-Registration Request messages	Groups the statistics of the data path de-registration request messages on R6 interface.
R4 Data-Path De-Registration Request messages	Groups the statistics of the data path de-registration request messages on R4 interface.
R6 Data-Path De-Registration Response messages	Groups the statistics of the data path de-registration response messages on R6 interface.
R4 Data-Path De-Registration Response messages	Groups the statistics of the data path de-registration response messages on R4 interface.
R6 Data-Path De-Registration Ack messages	Groups the statistics of the data path de-registration ACK messages on R6 interface.
R4 Data-Path De-Registration Ack messages	Groups the statistics of the data path de-registration ACK messages on R4 interface.

Field	Description
R6 Key Change Directive messages	Groups the statistics of the key change directive messages on R6 interface.
R4 Key Change Directive messages	Groups the statistics of the key change directive messages on R4 interface.
R6 Key Change Ack messages	Groups the statistics of the key change ACK messages on R6 interface.
R4 Key Change Ack messages	Groups the statistics of the key change ACK messages on R4 interface.
R6 Key Change Confirm messages	Groups the statistics of the key change confirm messages on R6 interface.
R4 Key Change Confirm messages	Groups the statistics of the key change confirm messages on R4 interface.
R6 Cmac Key Count Update Msg	Groups the statistics of the Cipher-based Message Authentication Code (CMAC) key count update messages on R6 interface.
R4 Cmac Key Count Update Msg	Groups the statistics of the Cipher-based Message Authentication Code (CMAC) key count update messages on R4 interface.
R6 Cmac Key Count Ack Msg	Groups the statistics of the Cipher-based Message Authentication Code (CMAC) key count ACK messages on R6 interface.
R4 Cmac Key Count Ack Msg	Groups the statistics of the Cipher-based Message Authentication Code (CMAC) key count ACK messages on R46 interface.
R6 Handoff Request Msg	Groups the statistics of the hand-off request messages on R6 interface.
R4 Handoff Request Msg	Groups the statistics of the hand-off request messages on R4 interface.
R6 Handoff Response Msg	Groups the statistics of the hand-off response messages on R6 interface.
R4 Handoff Response Msg	Groups the statistics of the hand-off response messages on R4 interface.
R6 Handoff Ack Msg	Groups the statistics of the hand-off ACK messages on R6 interface.
R4 Handoff Ack Msg	Groups the statistics of the hand-off ACK messages on R4 interface.
R6 Handoff Confirm Msg	Groups the statistics of the hand-off confirm messages on R6 interface.
R4 Handoff Confirm Msg	Groups the statistics of the hand-off confirm messages on R4 interface.
R6 Handoff Complete Msg	Groups the statistics of the hand-off complete messages on R6 interface.
R4 Handoff Complete Msg	Groups the statistics of the hand-off complete messages on R4 interface.
R4 IM Entry State Change Req Msg	Groups the statistics of the idle mode entry state change request messages on R4 interface.
R4 IM Entry State Change Rsp Msg	Groups the statistics of the idle mode entry state change response messages on R4 interface.
R4 IM Entry State Change Ack Msg	Groups the statistics of the idle mode entry state change ACK messages on R4 interface.
R4 Anchor PC Indication Msg	Groups the statistics of anchor paging controller (PC) indication messages on R4 interface.
R4 Anchor PC Ack Msg	Groups the statistics of anchor paging controller (PC) ACK messages on R4 interface.

Field	Description
R4 IM Exit State Change Req Msg	Groups the statistics of the idle mode exit state change request messages on R4 interface.
R4 IM Exit State Change Rsp Msg	Groups the statistics of the idle mode exit state change response messages on R4 interface.
R4 Initiate Paging Req Msg	Groups the statistics of the initiated paging request messages on R4 interface.
R4 Initiate Paging Rsp Msg	Groups the statistics of the initiated paging response messages on R4 interface.
R4 Delete MS Entry Req Msg	Groups the statistics of the request messages to delete the MS entry request on R4 interface.
R4 Delete MS Entry Rsp Msg	Groups the statistics of the messages sent in response of delete message for the MS entry request on R4 interface.
R6 Unknown messages	Groups the statistics of the unknown type of request messages on R6 interface.
R4 Unknown messages	Groups the statistics of the unknown type of request messages on R4 interface.
Message Statistics	
Total Sent	The total number of this type of message sent on specific interface.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Retransmissions Sent	The total number of this type of message re-transmitted on specific interface.
Total Received	The total number of this type of message received on specific interface.
Total Accepted	The total number of this type of message accepted on specific interface.
Total Relayed	The total number of this type of message relayed on specific interface.
Total Denied	The total number of this type of message denied on specific interface.
Total Discarded	The total number of this type of message discarded on specific interface.
Badly Formed	The total number of badly formed this type of message on specific interface.
Decode Error	The total number of this type of message on specific interface with decode error.
Unspecified Error	The total number of this type of message on specific interface with unspecified error.
Missing Mandatory TLV	The total number of this type of message on specific interface with missing mandatory TLVs.
TLV Value Invalid	The total number of this type of message unspecific interface with invalid TLV value.
Unknown TLV	The total number of this type of message on specific interface with unknown TLVs.
Duplicate TLV Found	The total number of this type of message on specific interface with duplicate TLVs.
No session Found	The total number of this type of message on specific interface without any session information.
Transaction Id. Error	The total number of this type of message on specific interface. with transaction id error.
Key Change Success	The total number of successful Key Change Confirmation messages.
Key Change Failure	The total number of Key Change Confirmation messages failed.

Field	Description
Out Of Order Packet	The total number of authentication relay EAP transfer/start messages on R6 interface with out-of-order packets.
MS Initiated Re-Auth	The total number of authentication relay EAP start messages on specific interface with MS initiated reauthorization.
BS Initiated Re-Auth	The total number of authentication relay EAP start messages on specific interface with BS initiated reauthorization.
Data messages	
GRE R6 Receive	The total number of data message received with through GRE tunnel on R6 interface.
GRE R4 Receive	The total number of data message received through GRE tunnel on R4 interface.
Packets Received	The total number of data packets received/sent through GRE tunnel on R4/R6 interface.
Bytes Received	The total number of data bytes received/sent through GRE tunnel on R4/R6 interface.
Protocol Type Error	The total number of data message received/sent with protocol type error through GRE tunnel on R4/R6 interface.
GRE Key Absent	The total number of data message received/sent without GRE key through GRE tunnel on R4/R6 interface.
GRE Checksum Error	The total number of data message received/sent with checksum error through GRE tunnel on R4/R6 interface.
Invalid Packet Length	The total number of data message received/sent with invalid packet length through GRE tunnel on R4/R6 interface.
No Session found	The total number of data message received/sent without any session information through GRE tunnel on R4/R6 interface.
Unspecified Error	The total number of data message received/sent with unknown error through GRE tunnel on R4/R6 interface.
GRE R6 Send	The total number of data message sent through GRE tunnel on R6 interface.
GRE R4 Send	The total number of data message sent through GRE tunnel on R4 interface.
Packets Sent	The total number of data packets sent through GRE tunnel on R4/R6 interface.
Send Error	The total number of data message sent with error through GRE tunnel on R4/R6 interface.
Bytes Sent	The total number of data bytes sent through GRE tunnel on R4/R6 interface.

Chapter 74

show asnpc-service

This chapter includes the `show asnpc-service` command output tables.

show asnpc-service all

Table 162. show asnpc-service all Command Output Descriptions

Field	Description
Service name	The ASN GW service name.
Context	The context in which the service is configured.
Anchor PC ID	The anchor paging controller identifier.
Bind	The bind status.
Max Subscribers	The maximum number of subscribers.
IP address	IP address of ASN GW server where this service is located.
UDP Port	The UDP port number.
Service Status	Status of this service.
Maximum number of retransmissions	The maximum number of retransmissions.
Maximum number of paging-announce retransmissions	The maximum number of paging-announce retransmissions.
Retransmission timeout	The retransmission timeout duration.
Setup timeout	The session setup timeout duration.
Active-relay timeout	Indicates the timeout duration for active relay of R4 or R6 messages.
Paging-announce timeout	Indicates the paging announce timeout duration in seconds.
Paging-announce retransmission timeout	Indicates the paging announce retransmission timeout duration in seconds.
Policy transaction-id-validation	Possible values are: <ul style="list-style-type: none"> • ALLOW: Enforce tid validation procedure as per NWG specification, section 3.1. • DISALLOW: Do not enforce tid validation procedure as per NWG specification, section 3.1.
Policy zero-function-type	Possible values are: <ul style="list-style-type: none"> • ALLOW: If configured, function type is not considered for transaction id generation/validation. • DISALLOW: If configured, function type is considered for transaction id generation/validation.
Transaction Id. Seed	If configured, initial value of tid is set to this configured value, otherwise, initial value of tid is set to a random number.
Peer ASNGW address	The list of ASN GW IP addresses with which the PCLR is permitted to interact.

Field	Description
Number of Paging Groups configured	The total number of paging groups configured for this service.
Paging Group	The paging group ID associated with this service.
Paging Offset	The offsets configured for the Paging Group.
Number of MSIDs	The current total number of MNs assigned/using the offset.

show asnpc-service session all

Table 163. show asnpc-service session all Command Output Descriptions

Field	Description
CALLID	The subscriber's call identification number.
MSID	The subscriber's Mobile Station Identification number.
BS/PA Address	IP address of the base-station or paging agent.
Session Type	Indicates the type of ASN PC session. Possible type of sessions are: <ul style="list-style-type: none">• Anchor• Non-anchor
Total ASNPC Sessions	The total number of ASN PC sessions on chassis including all modes.

show asnpc-service session full

Table 164. show asnpc-service session all Command Output Descriptions

Field	Description
Username	The subscriber's user name.
Callid	The subscriber's call identification number.
MSID	The subscriber's Mobile Station Identification number.
ASNPC Service Address	IP address of system where ASN PC service is running.
BS/PA Address	IP address of the base-station or paging agent.
BS ID	The identifier of base station. Generally it is MAC address of the BS.
Authenticator Address	IP address of the authenticator ASN GW.
DPF/ASNGW Address	IP address of the system where data path function/ASN GW service is running.
Idle-mode timeout	Indicates the total configured timeout duration in seconds for an MS to enter the idle mode from active mode.
Remaining Idle Mode Timeout	Indicates the remaining timeout duration in seconds for an MS to enter the idle mode from active mode.
Paging Information	
Paging Cycle	Indicates the number of paging cycles happened in this ASN PC service session.
Paging Offset	Indicates the paging offset for paging announce.
Paging Group ID	Indicates the paging group identifier which contains the group of paging agents bounded with this paging controller session.
Paging Interval	Interval time in seconds between two paging announces.
MS Information	
Idle Mode Authorization Indication	Indicates the idle mode authorization status.
SA Descriptor Information	Indicates the Security Association description information. SA descriptor is a compound attribute whose sub-attributes describe the properties of a Security Association (SA). These properties include the SA ID, the SA type, the SA service type, and the cryptographic suite employed within the SA.
SA ID	Indicates the identifier for the security association.
SA Type	Indicates the types of security association. Possible values are:

Field	Description
Cryptographic Suite	Indicates the cryptographic suite employed within the security association. Possible values are: <ul style="list-style-type: none"> • 0: Primary SA • 1: Static SA • 3: Dynamic SA • 4: Group SA • 5: MBS SA
SA Service Type	Indicates the service types of the corresponding SA type. Possible values are: <ul style="list-style-type: none"> • 0: Unicast service • 1: Group multicast service • 2: MBS service <p>Note that this shall be defined only when SA type is Static SA or Dynamic SA.</p>
SA Index	Indicates the index of security association.
Older/Newer TEK Parameters	Indicates the older or newer Traffic Encryption Key (TEK) parameters involved.
TEK TLV (in hex)	Indicates the TEK total length value in hexadecimal.
TEK Sequence Number	Indicates the TEK sequence number.
TEK Lifetime	Indicates the TEK lifetime in seconds.
PN Counter	Indicates the packet number counter in downlink direction that are used for encryption and decryption by the Base Station.
RxPN Counter	Indicates the packet number counter in uplink direction that are used for encryption and decryption by the Base Station.
Total ASNPC Sessions	The total number of ASN PC sessions on chassis including all modes.

show asnpc-service session counters verbose

Table 165. show asnpc-service session counters verbose Command Output Descriptions

Field	Description
Username	The subscriber's user name.
Callid	The subscriber's call identification number.
MSID	The subscriber's Mobile Station Identification number.
Message Groups	
R6 Idle Mode Entry MS State Change Request Msg	Groups the statistics of the Idle Mode Entry MS State Change Request messages on R6 interface.
R6 Idle Mode Entry MS State Change Response Msg	Groups the statistics of the Idle Mode Entry MS State Change Response messages on R6 interface.
R6 Idle Mode Entry MS State Change Ack Msg	Groups the statistics of the Idle Mode Entry MS State Change Ack messages on R6 interface.
R6 Idle Mode Exit MS State Change Request Msg	Groups the statistics of the Idle Mode Exit MS State Change Request messages on R6 interface.
R6 Idle Mode Exit MS State Change Response Msg	Groups the statistics of the Idle Mode Exit MS State Change Response messages on R6 interface.
R6 Location Update Request Msg	Groups the statistics of the Location Update Request messages on R6 interface.
R6 Location Update Response Msg	Groups the statistics of the Location Update Response messages on R6 interface.
R6 Location Update Confirm Msg	Groups the statistics of the Location Update Confirm messages on R6 interface.
R6 Paging Announce Msg	Groups the statistics of the Paging Announce messages on R6 interface.
R4 Idle Mode Entry MS State Change Request Msg	Groups the statistics of the Idle Mode Entry MS State Change Request messages on R4 interface.
R4 Idle Mode Entry MS State Change Response Msg	Groups the statistics of the Idle Mode Entry MS State Change Response messages on R4 interface.
R4 Idle Mode Entry MS State Change Ack Msg	Groups the statistics of the Idle Mode Entry MS State Change Ack messages on R4 interface.
R4 Idle Mode Exit MS State Change Request Msg	Groups the statistics of the Idle Mode Exit MS State Change Request messages on R4 interface.
R4 Idle Mode Exit MS State Change Response Msg	Groups the statistics of the Idle Mode Exit MS State Change Response messages on R4 interface.

Field	Description
R4 Network Exit MS State Change Request Msg	Groups the statistics of the Network Exit MS State Change Request messages on R4 interface.
R4 Network Exit MS State Change Response Msg	Groups the statistics of the Network Exit MS State Change Response messages on R4 interface.
R4 Delete MS Entry Request Msg	Groups the statistics of the Delete MS Entry Request messages on R4 interface.
R4 Delete MS Entry Response Msg	Groups the statistics of the Delete MS Entry Response messages on R4 interface.
R4 Initiate Paging Request Msg	Groups the statistics of the Initiate Paging Request messages on R4 interface.
R4 Initiate Paging Response Msg	Groups the statistics of the Initiate Paging Response messages on R4 interface.
R4 Anchor PC Ind Msg	Groups the statistics of the Anchor Paging Controller Indicator messages on R4 interface.
R4 Anchor PC Ack Msg	Groups the statistics of the Anchor Paging Controller Ack messages on R4 interface.
R4 Context Request Msg	Groups the statistics of the Context Request messages on R4 interface.
R4 Context Report Msg	Groups the statistics of the Context Report messages on R4 interface.
R6/R4 Unknown Messages	Groups the statistics of the Unknown type of messages on R6 and/or R4 interface.
Message Statistics	
Total Sent	The total number of this type of message sent on specific interface.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Retransmissions Sent	The total number of this type of message re-transmitted on specific interface.
Total Received	The total number of this type of message received on specific interface.
Total Accepted	The total number of this type of message accepted on specific interface.
Total Relayed	The total number of this type of message relayed on specific interface.
Total Denied	The total number of this type of message denied on specific interface.
Total Discarded	The total number of this type of message discarded on specific interface.
Badly Formed	The total number of badly formed this type of message on specific interface.
Decode Error	The total number of this type of message on specific interface with decode error.
Unspecified Error	The total number of this type of message on specific interface with unspecified error.
Paging Config Error	The total number of this type of errors messages on specified interface occurred. This error occurs when paging node id (BS id) is not configured in configured paging groups.
Missing Mandatory TLV	The total number of this type of message on specific interface with missing mandatory TLVs.
TLV Value Invalid	The total number of this type of message on specific interface with invalid TLV value.
Unknown TLV	The total number of this type of message on specific interface with unknown TLVs.
Duplicate TLV Found	The total number of this type of message on specific interface with duplicate TLVs.

Field	Description
No session Found	The total number of this type of message on specific interface without any session information.
Transaction Id. Error	The total number of this type of message on specific interface. with transaction id error.
Data messages	
GRE R6 Receive	The total number of data message received with through GRE tunnel on R6 interface.
GRE R4 Receive	The total number of data message received through GRE tunnel on R4 interface.
Packets Received	The total number of data packets received/sent through GRE tunnel on R4/R6 interface.
Bytes Received	The total number of data bytes received/sent through GRE tunnel on R4/R6 interface.
Protocol Type Error	The total number of data message received/sent with protocol type error through GRE tunnel on R4/R6 interface.
GRE Key Absent	The total number of data message received/sent without GRE key through GRE tunnel on R4/R6 interface.
GRE Checksum Error	The total number of data message received/sent with checksum error through GRE tunnel on R4/R6 interface.
Invalid Packet Length	The total number of data message received/sent with invalid packet length through GRE tunnel on R4/R6 interface.
No Session found	The total number of data message received/sent without any session information through GRE tunnel on R4/R6 interface.
Unspecified Error	The total number of data message received/sent with unknown error through GRE tunnel on R4/R6 interface.
GRE R6 Send	The total number of data message sent through GRE tunnel on R6 interface.
GRE R4 Send	The total number of data message sent through GRE tunnel on R4 interface.
Packets Sent	The total number of data packets sent through GRE tunnel on R4/R6 interface.
Send Error	The total number of data message sent with error through GRE tunnel on R4/R6 interface.
Bytes Sent	The total number of data bytes sent through GRE tunnel on R4/R6 interface.

show asnpc-service statistics verbose

Table 166. show asnpc-service statistics verbose Command Output Descriptions

Field	Description
Message Groups	
R6 Idle Mode Entry MS State Change Request Msg	Groups the statistics of the Idle Mode Entry MS State Change Request messages on R6 interface.
R6 Idle Mode Entry MS State Change Response Msg	Groups the statistics of the Idle Mode Entry MS State Change Response messages on R6 interface.
R6 Idle Mode Entry MS State Change Ack Msg	Groups the statistics of the Idle Mode Entry MS State Change Ack messages on R6 interface.
R6 Idle Mode Exit MS State Change Request Msg	Groups the statistics of the Idle Mode Exit MS State Change Request messages on R6 interface.
R6 Idle Mode Exit MS State Change Response Msg	Groups the statistics of the Idle Mode Exit MS State Change Response messages on R6 interface.
R6 Location Update Request Msg	Groups the statistics of the Location Update Request messages on R6 interface.
R6 Location Update Response Msg	Groups the statistics of the Location Update Response messages on R6 interface.
R6 Location Update Confirm Msg	Groups the statistics of the Location Update Confirm messages on R6 interface.
R6 Paging Announce Msg	Groups the statistics of the Paging Announce messages on R6 interface.
R4 Idle Mode Entry MS State Change Request Msg	Groups the statistics of the Idle Mode Entry MS State Change Request messages on R4 interface.
R4 Idle Mode Entry MS State Change Response Msg	Groups the statistics of the Idle Mode Entry MS State Change Response messages on R4 interface.
R4 Idle Mode Entry MS State Change Ack Msg	Groups the statistics of the Idle Mode Entry MS State Change Ack messages on R4 interface.
R4 Idle Mode Exit MS State Change Request Msg	Groups the statistics of the Idle Mode Exit MS State Change Request messages on R4 interface.
R4 Idle Mode Exit MS State Change Response Msg	Groups the statistics of the Idle Mode Exit MS State Change Response messages on R4 interface.
R4 Initiate Paging Request Msg	Groups the statistics of the Initiate Paging Request messages on R4 interface.
R4 Initiate Paging Response Msg	Groups the statistics of the Initiate Paging Response messages on R4 interface.
R4 Location Update Request Msg	Groups the statistics of the Location Update Request messages on R4 interface.

Field	Description
R4 Location Update Response Msg	Groups the statistics of the Location Update Response messages on R4 interface.
R4 Location Update Confirm Msg	Groups the statistics of the Location Update Confirm messages on R4 interface.
R4 Network Exit MS State Change Request Msg	Groups the statistics of the Network Exit MS State Change Request messages on R4 interface.
R4 Network Exit MS State Change Response Msg	Groups the statistics of the Network Exit MS State Change Response messages on R4 interface.
R4 Delete MS Entry Request Msg	Groups the statistics of the Delete MS Entry Request messages on R4 interface.
R4 Delete MS Entry Response Msg	Groups the statistics of the Delete MS Entry Response messages on R4 interface.
R4 Anchor PC Ind Msg	Groups the statistics of the Anchor Paging Controller Indicator messages on R4 interface.
R4 Anchor PC Ack Msg	Groups the statistics of the Anchor Paging Controller Ack messages on R4 interface.
R4 PC Relocation Ind Msg	Groups the statistics of the PC Relocation Ind messages on the R4 interface.
R4 PC Relocation Ack Msg	Groups the statistics of the PC Relocation Ack messages on the R4 interface.
R4 Context Request Msg	Groups the statistics of the Context Request messages on R4 interface.
R4 Context Report Msg	Groups the statistics of the Context Report messages on R4 interface.
R4 CMAC Key Count Update Msg	Groups the statistics of the CMAC Key Count Update messages on the R4 interface.
R4 CMAC Key Count Ack Msg	Groups the statistics of the CMAC Key Count Ack messages on the R4 interface.
R6/R4 Unknown Messages	Groups the statistics of the Unknown type of messages on R6 and/or R4 interface.
Message Statistics	
Total Sent	The total number of this type of message sent on specific interface.
Total Send Failures	The total number of failures occurred during transaction id generation and message not sent for specific interface. This counter is used to count the error while sending the R6/R4 packets.
Retransmissions Sent	The total number of this type of message re-transmitted on specific interface.
Total Received	The total number of this type of message received on specific interface.
Total Accepted	The total number of this type of message accepted on specific interface.
Total Relayed	The total number of this type of message relayed on specific interface.
Total Denied	The total number of this type of message denied on specific interface.
Total Discarded	The total number of this type of message discarded on specific interface.
Badly Formed	The total number of badly formed this type of message on specific interface.
Decode Error	The total number of this type of message on specific interface with decode error.

Field	Description
Unspecified Error	The total number of this type of message on specific interface with unspecified error.
Missing Mandatory TLV	The total number of this type of message on specific interface with missing mandatory TLVs.
TLV Value Invalid	The total number of this type of message on specific interface with invalid TLV value.
Unknown TLV	The total number of this type of message on specific interface with unknown TLVs.
Duplicate TLV Found	The total number of this type of message on specific interface with duplicate TLVs.
No session Found	The total number of this type of message on specific interface without any session information.
Transaction Id. Error	The total number of this type of message on specific interface. with transaction id error.

Chapter 75

show bcmcs

This chapter includes the `show bcmcs` command output tables.

show bcmcs counters all

Table 167. *show bcmcs counters all* Command Output Descriptions

Field	Description
Username	BCMCS group username for this output.
Callid	Call ID for this output.
Flow-id	Flow ID for this output.
BCMCS Service Request/Reply	
Renew SRQ Accepted	The total number of service request renewals accepted.
Discarded	The total number of service request renewals discarded.
Response Send Error	The total number of service replies for which errors were experienced during transmission.
BCMCS Registration Request/Reply	
Renew RRQ Accepted	The total number of registration request renewals accepted.
Discarded	The total number of registration request renewals discarded.
Response Send Error	The total number of registration replies for which errors were experienced during transmission.
BCMCS Registration Update/Ack	
Initial Update Transmitted	The total number of registration updates that have been transmitted.
Update Retransmitted	The total number of registration updates that have been re-transmitted.
Denied	The total number of registration updates that have been denied by the PCF.
Not Acknowledged	The total number of registration updates and/or acknowledgements that have not been acknowledged by the PCF.
Reg Ack Received	The total number of registration acknowledgements that have been received.
Reg Ack Discarded	The total number of registration acknowledgements that have been discarded.
Update Send Error	The total number of registration updates for which errors were experienced during transmission.
BCMCS Registration Update Send Reason	
Lifetime Expiry	The total number of registration updates that were sent due to the expiration of a lifetime timer during a subscriber session.
Upper Layer Initiated	The total number of registration updates that were initiated by upper processing layers.
Other Reasons	The total number of registration updates that were sent due to reasons other than those listed here.

Field	Description
Session Manager Exited	The total number of registration updates that were sent due to the termination of Session Manager tasks. NOTE: If any data is reported for this field, there may be an issue with either the software or hardware. If you continue to experience problems, refer to the System Administration and Administration Reference for information on troubleshooting the problem.
BCMCS Registration Update Denied	
Reason Unspecified	The total number of denied registration updates that were sent with a reply code of 80H (Registration Denied - reason unspecified).
Admin Prohibited	The total number of denied registration updates that were sent with a reply code of 81H (Registration Denied - administratively prohibited).
BSN Failed Authentication	The total number of denied registration updates due to authentication failure by the mobile node.
Identification Mismatch	The total number of denied registration updates that were sent with a reply code of 85H (Registration Denied - identification mismatch).
Poorly Formed Update	The total number of denied registration updates that were sent with a reply code of 86H (Registration Denied - poorly formed request).
GRE Send	
Total Packets Sent	Indicates the total number of Generic Routing Encapsulation (GRE) packets transmitted.
Total Bytes Sent	Indicates the total number of Generic Routing Encapsulation (GRE) bytes transmitted.
Total BCMCS Sessions matching specified criteria	Total number of sessions matching specified criteria.

show bcmcs statistics

Table 168. *show bcmcs statistics* Command Output Descriptions

Field	Description
Session Stats	
Total Sessions Current	Indicates the total number of sessions that are in progress. These could be either active, dormant, being set up, or being disconnected.
Current Flow-id session	Indicates the number of flow-id sessions in progress. These could be active, dormant, being set up or being disconnected.
Current Pgm-Id Session	Indicates the number of program-id sessions in progress. These could be active, dormant, being set up or being disconnected.
Total Setup	Indicates the total number of sessions that have been successfully set up since system started.
Total Released	Indicates the total number of sessions that have successfully been disconnected.
Total Setup Flow-Id	Indicates the total number of flow-id sessions that have been successfully set up since the system was started.
Total Setup Program-Id	Indicates the total number of program-id sessions that have been successfully set up since the system was started.
Session Releases	
De-registered	Indicates the total number of sessions that were disconnected through a normal de-registration process.
Lifetime Expiry	Indicates the total number of sessions that were disconnected due to the expiration of their lifetime timer.
PPP Layer Command	Indicates the number of sessions disconnected due to PPP initiating a tear-down.
PCF-Monitor Fail	The total number of sessions disconnected because the PCF monitor function detected that the PCF was down.
GRE Key Mismatch	The total number of sessions disconnected because the GRE key changed for a session.
Other Reasons	Indicates the number of sessions disconnected due to reasons other than those listed here.
BCMCS Service Request/Response	
Total SRQ/Renew/Dereg RX	The total number of service requests, renewals, and de-registrations received.
Total Accept	The total number of service requests that have been received and accepted.
Total Denied	Total number of service requests that have been received and denied.
Total Discard	Total number of service requests that have been received and discarded.
Init SRQ RX	The total number of initial setup or start service requests that have been received.
Init SRQ Accept	The total number of initial setup or start service requests that have been received and accepted.

Field	Description
Init SRQ Denied	The total number of initial setup or start service requests that have been received and denied.
Init SRQ Discard	The total number of initial setup or start service requests that have been received and discarded.
Renew SRQ RX	The total number of service request renewals received.
Renew SRQ Accept	The total number of service request renewals received and accepted.
Renew SRQ Denied	The total number of service request renewals received and denied.
Renew SRQ Discard	The total number of service request renewals received discarded.
Dereg SRQ RX	The total number of de-registration requests that have been received.
Dereg SRQ Accept	The total number of de-registration requests that have been received and accepted.
Dereg SRQ Denied	The total number of de-registration requests that have been received and denied.
Dereg SRQ Discard	The total number of de-registration requests that have been received and discarded.
Response Send Error	Indicates the total number of registration replies for which errors were experienced during transmission.
BCMCS Service Request Denied	
Requests Accepted	Indicates the total number of service requests that were denied based on the number of requests accepted.
Unspecified Reason	Indicates the total number of service requests that were denied for unspecified reasons.
PCF Failed Auth	Indicates the total number of service requests that were denied due to mobile node authentication failure.
Identification Mismatch	Indicates the total number of service requests that were denied due to an identification mismatch.
Unknown BSN	Indicates the total number of service requests that were denied due to an unknown BSN address.
BCMCS SRQ Denied - Insufficient Resource Reasons	
No Session Manager	Indicates the total number of service requests that were denied due to the lack of available Session Manager tasks. This may occur when the system is booting up in the event that a Session Manager task terminated unexpectedly.
No Memory	Indicates the total number of service requests that were denied due to insufficient memory.
Session Managers Retried	Indicates that the system unsuccessfully attempted to try multiple Session Manager tasks to establish a session.
Input-Q Exceeded	Indicates that the queue in which incoming calls are kept prior to being processed exceeded its capacity.
BCMCS SRQ Denied - Poorly Formed Request Reasons	
Session Already Dormant	The number of SRQs that had Active Stop for a session that was already dormant.
Already Active	The number of SRQs that had Active Start for a session that was already active.
Other Reasons	The number of SRQs denied due to other reasons for a badly formed SRQ.
BCMCS SRQ Denied - Overload/Congestion Control	

Field	Description
Admin Prohibited (reject)	SRQs denied due to congestion control mechanism.
Unknown BSN (redirect)	SRQs denied due to congestion control mechanism.
BCMCS Registration Request/Reply	
Total RRQ/Renew/Dereg RX	The total number of registration requests, renewals, and de-registrations received.
Total Accept	The total number of registration requests that have been accepted.
Total Denied	The total number of registration requests that have been rejected.
Total Discard	The total number of registration requests that have been discarded.
Init RRQ RX	The total number of initial registration requests that have been received.
Init RRQ Accept	The total number of initial registration requests received and accepted.
Init RRQ Denied	The total number of initial registration requests received and rejected.
Init RRQ Discard	The total number of initial registration requests that have been received and discarded.
Renew RRQ RX	The total number of registration request renewals received.
Renew RRX Accept	The total number of registration request renewals received and accepted.
Renew Actv Start Accept	The total number of RRQ renewals with an Active Start record received and accepted.
Renew Actv Stop Accept	The total number of RRQ renewals with an Active Stop record received and accepted.
Renew RRQ Denied	The total number of registration request renewals received and rejected.
Renew RRQ Discard	The total number of registration request renewals received and discarded.
Dereg RRQ RX	The total number of de-registration requests that have been received.
Dereg RRQ Accept	The total number of de-registration requests received and accepted.
Dereg Active Stop Accept	The total number of de-registration requests with an active stop that were accepted.
Dereg RRQ Denied	The total number of de-registration requests received and rejected.
Dereg RRQ Discard	The total number of de-registration requests received and discarded.
Reply Send Error	Indicates the total number of registration replies for which errors were experienced during transmission.
BCMCS Registration Request Denied	
Unspecified Reason	Indicates the total number of registration requests that were denied using reply code of 80H (Registration Denied - reason unspecified).
Admin Prohibited	Indicates the total number of registration requests that were denied using reply code of 81H (Registration Denied - administratively prohibited).

Field	Description
Insufficient Resources	Indicates the total number of registration requests that were denied using reply code of 82H (Registration Denied - insufficient resources).
PCF Failed Auth	Indicates the total number of registration requests that were denied using reply code of 83H (Registration Denied - mobile node failed authentication).
Identification Mismatch	Indicates the total number of registration requests that were denied using reply code of 85H (Registration Denied - identification mismatch).
Poorly Formed Request	Indicates the total number of registration requests that were denied using reply code of 86H (Registration Denied - poorly formed request).
Unknown BSN Address	Indicates the total number of registration requests that were denied due to an unknown BSN address.
Reverse Tunnel Unavail	Indicates the total number of registration requests that were denied using reply code of 89H (Registration Denied - requested reverse tunnel unavailable).
Reverse Tunnel Required	Indicates the total number of registration requests that were denied using reply code of 8AH (Registration Denied - reverse tunnel is mandatory and "T"-bit not set).
Unrecognized Vendor Id	Indicates the total number of registration requests that were denied using reply code of 8DH (Registration Denied - unsupported vendor ID or unable to interpret data in the CVSE).
Session Already Closed	Renew and RRQ denied due to the session not present in the PDSN Dereq. Error code 0x8e.
BCMCS RRQ Denied - Insufficient Resource Reasons	
No Session Manager	Indicates the total number of registration requests that were denied due to the lack of available Session Manager tasks. This may occur when the system is booting up in the event that a Session Manager task terminated unexpectedly.
No Memory	Indicates the total number of registration requests that were denied due to insufficient memory.
Session Managers Retried	Indicates that the system unsuccessfully attempted to try multiple Session Manager tasks to establish a session.
Input-Q Exceeded	Indicates that the queue in which incoming calls are kept prior to being processed exceeded its capacity.
BCMCS RRQ Denied - Poorly Formed Request Reasons	
Session Already Dormant	The number of RRQs that had Active Stop for a session that was already dormant.
Already Active	The number of RRQs that had Active Start for a session that was already active.
Other Reasons	The number of RRQs denied due to other reasons for a badly formed RRQ.
BCMCS RRQ Denied - Overload/Congestion Control	
Admin Prohibited (reject)	RRQs denied with error code 0x81h due to congestion control mechanism.
Unknown BSN (redirect)	RRQs denied with error code 0x88 due to congestion control mechanism.
BCMCS Registration Update/Ack	

Field	Description
Reg Update Transmitted	Indicates the total number of registration updates that were transmitted.
Accepted	Indicates the total number of registration updates that were accepted by the PCF.
Denied	Indicates the total number of registration updates that were denied.
Not Acknowledged	Indicates the total number of registration updates that were not acknowledged.
Initial Update TX	Indicates the total number of initial registration updates that were transmitted.
Update Retransmitted	Indicates the total number of registration updates that were re-transmitted.
Reg Ack Received	Indicates the total number of registration acknowledgements that were received.
Reg Ack Discarded	Indicates the total number of registration acknowledgements that were discarded.
Update Send Error	Indicates the total number of registration updates for which errors were experienced during transmission.
BCMCS Registration Update Send Reason	
Lifetime Expiry	Indicates the total number of registration updates that were sent due to the expiration of a lifetime timer during a subscriber session.
Other Reasons	Indicates the total number of registration updates that were sent due to reasons other than those listed here.
Upper Layer Initiated	Indicates the total number of registration updates that were initiated by upper processing layers.
Session Manager Exited	Indicates the number of registration updates that were sent due to the termination of a Session Manager task.
BCMCS Registration Update Denied	
Reason Unspecified	Indicates the total number of denied registration updates that were sent with a reply code of 80H (Registration Denied - reason unspecified).
Admin Prohibited	Indicates the total number of denied registration updates that were sent with a reply code of 81H (Registration Denied - administratively prohibited).
BSN Failed Auth	Indicates the total number of denied registration updates that were sent due to failed authentication by the mobile node.
Identification Mismatch	Indicates the total number of denied registration updates that were sent with a reply code of 85H (Registration Denied - identification mismatch).
Poorly Formed Updated	Indicates the total number of denied registration updates that were sent with a reply code of 86H (Registration Denied - poorly formed request).
BCMCS Registration Ack Discard Reasons	
Session Absent	Indicates the total number of registration acknowledgements that were discarded due to the session having been already ended because the acknowledgement was late.
No Memory	Indicates the total number of registration acknowledgements that were discarded due to insufficient memory.

Field	Description
Malformed	Indicates the total number of registration acknowledgements that were discarded due to being poorly formed.
Auth Failure	Indicates the total number of registration acknowledgements that were discarded due to the mobile node failing authentication.
Internal Bounce Error	Indicates that an internal communication message between an A11 Manager task and a Session Manager task bounced (was not successfully sent).
Input-Q Exceeded	Indicates the number of times that the queue in which incoming calls are kept prior to being processed exceeded its capacity.
Mismatched Id	Indicates the total number of discarded registration acknowledgements due to reply code 85H (Registration Denied - identification mismatch).
Invalid Packet Length	Indicates the total number of registration acknowledgements that were discarded due to having an invalid packet length.
Misc Reasons	Indicates the number of registration acknowledgements that were discarded due to reasons other than those listed here.
GRE Send	
Total Packets Sent	Indicates the total number of Generic Routing Encapsulation (GRE) packets transmitted.
Total Bytes Sent	Indicates the total number of Generic Routing Encapsulation (GRE) bytes transmitted.

Chapter 76

show bssap

This chapter includes the `show bssap` command output tables.

show bssap+ statistics

Table 169. show bssap+ statistics Command Output Descriptions

Field	Description
Bssap+ Statistics	Base station system application part plus related statistics.
Number of Subscribers in Gs-Associated State	Total number of subscriber in Gs associated state or using Gs interface for connectivity between SGSN and VLR.
Number of Associated Vlrs	Total number of VLRs associated with this BSSAP+ application.
Alert Req Rcvd	Total number of alert request messages received by BSSAP+ application from VLR.
Alert Ack Sent	Total number of acknowledge messages sent by BSSAP+ application in response to alert requests messages.
Alert Rej Sent	Total number of messages sent by BSSAP+ application to reject the alert requests.
Location Upd Req Sent	Total number of location update request messages sent by BSSAP+ application.
Location Upd Acc Rcvd	Total number of location update accept messages sent by BSSAP+ application from VLR.
Location Upd Rej Rcvd	Total number of messages sent by BSSAP+ application to reject the location update requests from VLR.
GPRS Detach Ind Sent	Total number of GPRS detach indication messages sent by BSSAP+ application.
GPRS Detach Ack Rcvd	Total number of acknowledge messages received by BSSAP+ application in response to GPRS detach indication messages sent to VLR.
IMSI Detach Ind Sent	Total number of IMSI detach indication messages sent by BSSAP+ application to VLR.
IMSI Detach Ack Rcvd	Total number of acknowledge messages received by BSSAP+ application in response to IMSI detach indication messages sent to VLR.
Mobile Status Rcvd	Total number of mobile status messages received by BSSAP+ application from VLR.
Mobile Status Sent	Total number of mobile status messages sent by BSSAP+ application to VLR.
Paging Req Rcvd	Total number of paging request messages received by BSSAP+ application from VLR.
Paging Rej Sent	Total number of messages sent by BSSAP+ application to reject the received paging request messages from VLR.
MS Unreachable Sent	Total number of messages sent by BSSAP+ application to indicate that mobile is unreachable to VLR.
TMSI Reloc Comp Sent	Total number of messages sent by BSSAP+ application with TMSI relocation components to VLR.
MS Info Req Rcvd	Total number of MS information request messages received by BSSAP+ application from VLR.

Field	Description
MS Info Rsp Sent	Total number of response messages sent by BSSAP+ application in response to MS information request messages from VLR.
MM Info Req Rcvd	Total number of mobility management (MM) information request messages received by BSSAP+ application from VLR.
MS Activity Ind Sent	Total number of MS activity indication messages sent by BSSAP+ application to VLR.
Reset Ind Rcvd	Total number of reset indicator messages received by BSSAP+ application from VLR.
Reset Ack Sent	Total number of acknowledge messages sent by BSSAP+ application in response to reset indicator message received from VLR.
Reset Ind Sent	Total number of reset indicator messages sent by BSSAP+ application to VLR.
Reset Ack Rcvd	Total number of acknowledge messages received by BSSAP+ application in response to reset indicator message sent to VLR.
Downlink Tnnl Req Rcvd	Total number of downlink tunnel request messages received by BSSAP+ application from VLR.
Uplink Tnnl Req Sent	Total number of uplink tunnel request messages sent by BSSAP+ application to VLR.

Chapter 77

show bulkstats data

Table 170. show bulkstats data Command Output Descriptions

Field	Description
Bulk Statistics Server Configuration:	
Server State	Indicates the server state—enabled/disabled.
File Limit	Indicates the file size limit in KBs.
Sample Interval	Indicates the sampling interval.
Transfer Interval	Indicates the transfer interval.
Receiver Mode	Indicates the receiver mode.
Local File Storage	Indicates the local file storage.
Historical Data Collection	Indicates the Historical Data Collection state—enabled/disabled.
Bulk Statistics Server Statistics:	
Records awaiting transmission	Indicates the number of records awaiting transmission.
Bytes awaiting transmission	Indicates the number of bytes awaiting transmissions.
Total records collected	Indicates the total number of records collected.
Total bytes collected	Indicates the total number of bytes collected.
Total records transmitted	Indicates the total number of records transmitted.
Total bytes transmitted	Indicates the total number of bytes transmitted.
Total records discarded	Indicates the total number of records discarded.
Total bytes discarded	Indicates the total number of bytes discarded.
Last collection time required	Indicates the last collection time required.
Last transfer time required	Indicates the last transfer time required.
No successful data transfers	Indicates successful data transfers.
No attempted data transfers	Indicates attempted data transfers.
Fine n	
Remote File Format	The remote file format—for example, %date%-%time%

Field	Description
File Header	The file's header.
File Footer	The file's footer.
No bulkstats receivers	Indicates the total number of Bulk Statistics collection servers configured.
File Statistics:	
Records awaiting transmission	Indicates the number of records awaiting transmission.
Bytes awaiting transmission	Indicates the number of bytes awaiting transmissions.
Total records collected	Indicates the total number of records collected.
Total bytes collected	Indicates the total number of bytes collected.
Total records transmitted	Indicates the total number of records transmitted.
Total bytes transmitted	Indicates the total number of bytes transmitted.
Total records discarded	Indicates the total number of records discarded.
Total bytes discarded	Indicates the total number of bytes discarded.
Last transfer time required	Indicates the last transfer time required.
No successful data transfers	Indicates successful data transfers.
No attempted data transfers	Indicates attempted data transfers.

Chapter 78

show cae-group server name

Table 171. show cae-group server name Command Output Descriptions

Field	Description
Server	The name of the CAE.
IP	The IPv4 address of the CAE.
State	The current state of the CAE, which can be Init (Initializing), Up, Down, or Tmout (Timed Out).
Hit Count	The number of HTTP GET requests sent to this CAE. A single video may contain multiple HTTP GET requests from the UE.
Timeout Consecutive (Cumulative)	The number of current consecutive timeouts that have occurred on the keep-alive heartbeat. This counter is reset to 0 if the Mobile Video Gateway is receiving no responses from the CAE. (Cumulative) is the total number of timeouts that have occurred since the last reset (clear) of the statistics for this CAE.
Last Failure	The duration of time since the CAE state was last transitioned to Down.
CAE-Group	The CAE group that contains the CAE.

Chapter 79

show call-control-profile

This chapter describes the output of the `show call-control-profile` command.

show call-control-profile full name

This command displays the detailed configuration for a specifically named call control profile.

Table 172. show call-control-profile full name Command Output Descriptions

Field	Description
Call Control Profile Name	The name of the call control profile you chose to view.
GPRS Attach All	Indicates whether the call control profile allows or restricts attaches of all subscribers using the GPRS access type.
GPRS Attach All Failure Code	The configured GMM failure code to be sent in reject messages to GPRS mobile subscribers attempting to attach.
UMTS Attach All	Indicates whether the call control profile allows or restricts attaches of all subscribers using the UMTS access type.
UMTS Attach All Failure Code	The configured GMM failure code to be sent in reject messages to UMTS mobile subscribers attempting to attach.
GPRS RAU Intra All	Indicates whether the call control profile is configure to allow or restrict mobile subscribers with GPRS access-type extensions from the intra-SGSN RAU procedure.
GPRS RAU Intra All Failure Code	The configured GMM failure cause code that identifies the reason an intra-SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the GPRS mobile subscriber.
UMTS RAU Intra All	Indicates whether the call control profile is configure to allow or restrict mobile subscribers with UMTS access-type extensions from the intra-RAU procedure.
UMTS RAU Intra All Failure Code	The configured GMM failure cause code that identifies the reason an intra-SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the UMTS mobile subscriber.
GPRS RAU Inter-PLMN All	Indicates whether the call control profile is configure to allow or restrict mobile subscribers with GPRS access-type extensions from triggering RAUs between different PLMNs.
GPRS RAU Inter-PLMN All Failure Code	The configured GMM failure cause code that identifies the reason an RAU does not occur between different PLMNs. This GMM cause code will be sent in the reject message to the GPRS mobile subscriber.
UMTS RAU Inter-PLMN All	Indicates whether the call control profile is configure to allow or restrict mobile subscribers with UMTS access-type extensions from triggering RAUs between different PLMNs.
UMTS RAU Inter-PLMN All Failure Code	The configured GMM failure cause code that identifies the reason an RAU does not occur between different PLMNs. This GMM cause code will be sent in the reject message to the UMTS mobile subscriber.
GPRS RAU Inter All	Indicates whether the call control profile is configure to allow or restrict mobile subscribers with GPRS access-type extensions from the inter-SGSN RAU procedure.

Field	Description
GPRS RAU Inter All Failure Code	The configured GMM failure cause code that identifies the reason an inter-SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the GPRS mobile subscriber.
UMTS RAU Inter All	Indicates whether the call control profile is configure to allow or restrict mobile subscribers with UMTS access-type extensions from the inter-RAU procedure.
UMTS RAU Inter All Failure Code	The configured GMM failure cause code that identifies the reason an inter-SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the UMTS mobile subscriber.
Failure Code For Peer Sgsn Address Resolution Failure	The configured GMM failure cause code that indicates that the SGSN cannot resolve the IP address for a peer SGSN. This GMM cause code will be sent in the reject message to the mobile subscriber.
GPRS SMS MO All	Indicates whether the call control profile allows or restricts mobile-originated SMS messages from subscribers using the GPRS access type.
GPRS SMS MO All Failure Code	The configured GMM failure cause code that indicates that mobile-originated SMS messages from GPRS subscribers are not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
UMTS SMS MO All	Indicates whether the call control profile allows or restricts mobile-originated SMS messages from subscribers using the UMTS access type.
UMTS SMS MO All Failure Code	The configured GMM failure cause code that indicates that mobile-originated SMS messages from UMTS subscribers are not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
GPRS SMS MT All	Indicates whether the call control profile allows or restricts mobile-terminated SMS messages to subscribers using the GPRS access type.
GPRS SMS MT All Failure Code	The configured GMM failure cause code that indicates that mobile-terminated SMS messages to GPRS subscribers are not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
UMTS SMS MT All	Indicates whether the call control profile allows or restricts mobile-terminated SMS messages to subscribers using the UMTS access type.
UMTS SMS MT All Failure Code	The configured GMM failure cause code that indicates that mobile-terminated SMS messages to UMTS subscribers are not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
GPRS Primary PDP Context Activation All	Indicates whether primary PDP context activation is allowed for GPRS mobile subscribers.
GPRS Secondary PDP Context Activation All	Indicates whether secondary PDP context activation is allowed for GPRS mobile subscribers.
GPRS PDP Context Activation All Failure Code	The configured GMM failure cause code that indicates that PDP context activation by GPRS subscribers is not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
UMTS Primary PDP Context Activation All	Indicates whether primary PDP context activation is allowed for UMTS mobile subscribers.

■ show call-control-profile full name

Field	Description
UMTS Secondary PDP Context Activation All	Indicates whether secondary PDP context activation is allowed for UMTS mobile subscribers.
UMTS PDP Context Activation All Failure Code	The configured GMM failure cause code that indicates that PDP context activation by UMTS subscribers is not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
GPRS Nw Init Primary PDP Context Activation All	Indicates whether network-initiated primary PDP context activation is allowed for GPRS mobile subscribers.
GPRS Nw Init Primary PDP Ctxt Activation All Failure Code	The configured GMM failure cause code that indicates that network-initiated primary PDP context activation by GPRS subscribers is not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
GPRS Nw Init Secondary PDP Ctxt Activation All	Indicates whether network-initiated secondary PDP context activation is allowed for GPRS mobile subscribers.
GPRS Nw Init Secondary PDP Ctxt Activation All Failure Code	The configured GMM failure cause code that indicates that network-initiated secondary PDP context activation by GPRS subscribers is not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
UMTS Nw Init Primary PDP Context Activation All	Indicates whether network-initiated primary PDP context activation is allowed for UMTS mobile subscribers.
UMTS Nw Init Primary PDP Ctxt Activation All Failure Code	The configured GMM failure cause code that indicates that network-initiated primary PDP context activation by UMTS subscribers is not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
UMTS Nw Init Secondary PDP Ctxt Activation All	Indicates whether network-initiated secondary PDP context activation is allowed for UMTS mobile subscribers.
UMTS Nw Init Secondary PDP Ctxt Activation All Failure Code	The configured GMM failure cause code that indicates that network-initiated secondary PDP context activation by UMTS subscribers is not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
SRNS Intra All	Indicates whether intra-SRNS (Serving Radio Network Subsystem) relocation is allowed for mobile subscribers.
SRNS Intra All Failure Code	The configured GMM failure cause code that indicates that intra-SRNS relocation is not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
SRNS Inter All	Indicates whether inter-SRNS relocation is allowed for mobile subscribers.
SRNS Inter All Failure Code	The configured GMM failure cause code that indicates that inter-SRNS relocation is not permitted. This GMM cause code will be sent in the reject message to the mobile subscriber.
Sgtp-service Context	The name of the context that has the applicable SGTP service for this call control profile associated with it.
Service	The name of the SGTP service associated with the context.
Authentication All-Events	Indicates whether authentication for all events (attaches, activates, and so forth) has been enabled or disabled.
Authentication Attach	Indicates whether authentication for an Attach with a local P-TMSI or Attaches with an IMSI has been enabled or disabled.

Field	Description
Authentication Attach (Inter RAT)	Indicates whether Attach message authentication has been enabled or disabled for re-authorizing subscribers on a change in Radio Access Type (RAT) of the subscriber's node.
Authentication Attach (Gprs only)	Indicates whether Attach message authentication has been enabled or disabled for calls from GPRS mobile subscribers.
Authentication Attach (Combined)	Indicates whether authentication for combined GPRS/IMSI Attaches has been enabled or disabled.
Authentication Activate	Indicates whether authentication for activate requests has been enabled or disabled.
Authentication Service Request	Indicates whether authentication for all service requests has been enabled or disabled.
Authentication Service Request (Signaling)	Indicates whether authentication for signaling service requests has been enabled or disabled.
Authentication Service Request (Data)	Indicates whether authentication for data service requests has been enabled or disabled.
Authentication Service Request (Page Response)	Indicates whether authentication for page response service requests has been enabled or disabled.
Authentication RAU	Indicates whether authentication for routing area updates has been enabled or disabled.
Authentication RAU (Periodic)	Indicates whether authentication for periodic RAU Requests has been enabled or disabled.
Authentication RAU (Ra update)	Indicates whether authentication for RA update RAU Requests has been enabled or disabled.
Authentication RAU (Ra update with Local Ptmsi)	Indicates whether authentication for RA update using the local P-TMSI type of RAU Requests has been enabled or disabled.
Authentication RAU (Ra update with Foreign Ptmsi)	Indicates whether authentication for RA update using foreign P-TMSI type of RAU Requests has been enabled or disabled.
Authentication RAU (Imsi Combined Update)	Indicates whether authentication for RA update RAU Requests using the inter-RAT P-TMSI has been enabled or disabled.
Authentication RAU (Combined Update)	Indicates whether authentication for RAU Requests using the local P-TMSI has been enabled or disabled.
Authentication RAU (Combined Update IRAT PTMSI)	Indicates whether authentication for RAU Requests using inter-RAT and the local P-TMSI has been enabled or disabled.
Authentication RAU (Imsi Combined Update)	Indicates whether authentication for RAU Requests using IMSI and local P-TMSI values has been enabled or disabled.
Authentication RAU (Imsi Combined Update IRAT PTMSI)	Indicates whether authentication for RAU Requests using IMSI values, inter-RAT, and the local P-TMSI has been enabled or disabled.
Authentication Detach	Indicates whether authentication for Detach Requests has been enabled or disabled.
Authentication SMS	Indicates whether authentication for all SMS messages has been enabled or disabled.
Authentication SMS (MO-SMS)	Indicates whether authentication for mobile-originated SMS messages has been enabled or disabled.
Authentication SMS (MT-SMS)	Indicates whether authentication for mobile-terminated SMS messages has been enabled or disabled.

■ show call-control-profile full name

Field	Description
Regional Subscription Restriction Failure Code Value	The configured GMM failure cause code that indicates that mobile subscriber lacks the required subscription to place calls to the region. This GMM cause code will be sent in the reject message to the mobile subscriber.
ARD-Checking	Indicates whether access restriction data (ARD) checking in incoming subscriber data (ISD) messages has been enabled or disabled.
ARD Failure Code	The configured GMM failure cause code that indicates the incoming subscriber data has failed ARD checking. This GMM cause code will be sent in the reject message to the mobile subscriber.
Zone-Code Check	Indicates whether zone code checking has been enabled or disabled.
Usage of Auth Vectors From Old Sgsn	Indicates whether the ability of an SGSN to receive authorization vectors from other SGSNs has been enabled or disabled.
Order of Preference for Integrity Algorithm is	The integrity algorithm that receives first priority.
Order of Preference for Encryption Algorithm is	The encryption algorithm that receives first priority.
Order of Preference for Gprs Ciphering Algorithm is	The GPRS ciphering algorithm that receives first priority.
PTMSI-signature allocation	Indicates whether P-TMSI signature allocation has been enabled or disabled.
PTMSI-Signature-Realloc Interval value UMTS	The time interval (in minutes) for skipping the P-TMSI signature service/RAU/attach request message procedure for UMTS mobile subscribers.
PTMSI-Signature-Realloc Interval value GPRS	The time interval (in minutes) for skipping the P-TMSI signature service/RAU/attach request message procedure for GPRS mobile subscribers.
PTMSI-Signature-Realloc Frequency value UMTS	How many times P-TMSI signature reallocation for service requests can be skipped for UMTS mobile subscribers.
PTMSI-Signature-Realloc Frequency value GPRS	How many times P-TMSI signature reallocation for service requests can be skipped for GPRS mobile subscribers.
PTMSI-Signature-Realloc Attach Frequency value UMTS	How many times P-TMSI signature reallocation for Attach requests can be skipped for UMTS mobile subscribers.
PTMSI-Signature-Realloc Attach Frequency value GPRS	How many times P-TMSI signature reallocation for Attach requests can be skipped for GPRS mobile subscribers.
PTMSI-Signature-Realloc RAU (Generic) Frequency value UMTS	How many times P-TMSI signature reallocation for routing area updates can be skipped for UMTS mobile subscribers.
PTMSI-Signature-Realloc RAU (Generic) Frequency value GPRS	How many times P-TMSI signature reallocation for routing area updates can be skipped for GPRS mobile subscribers.
PTMSI-Signature-Realloc RAU Periodic Frequency value UMTS	How many times P-TMSI signature reallocation for periodic routing area updates can be skipped for UMTS mobile subscribers.
PTMSI-Signature-Realloc RAU Periodic Frequency value GPRS	How many times P-TMSI signature reallocation for periodic routing area updates can be skipped for GPRS mobile subscribers.

Field	Description
PTMSI-Signature-Realloc RAU RA Update Frequency value UMTS	How many times P-TMSI signature reallocation for routing area update RA updates can be skipped for UMTS mobile subscribers.
PTMSI-Signature-Realloc RAU RA Update Frequency value GPRS	How many times P-TMSI signature reallocation for routing area update RA updates can be skipped for GPRS mobile subscribers.
PTMSI-Signature-Realloc RAU Combined Update Frequency value UMTS	How many times P-TMSI signature reallocation for combined requests can be skipped for UMTS mobile subscribers.
PTMSI-Signature-Realloc RAU Combined Update Frequency value GPRS	How many times P-TMSI signature reallocation for combined requests can be skipped for GPRS mobile subscribers.
PTMSI-Signature-Realloc RAU Imsi Combined Update Frequency value UMTS	How many times P-TMSI signature reallocation for combined RAU updates with IMSI values can be skipped for UMTS mobile subscribers.
PTMSI-Signature-Realloc RAU Imsi Combined Update Frequency value GPRS	How many times P-TMSI signature reallocation for combined RAU updates with IMSI values can be skipped for GPRS mobile subscribers.
PTMSI-Signature-Realloc PtmSI-Reallocation-Cmd Update Frequency value UMTS	How many times P-TMSI signature reallocation during PTMSI reallocation can be skipped for UMTS mobile subscribers.
PTMSI-Signature-Realloc PtmSI-Reallocation-Cmd Update Frequency value GPRS	How many times P-TMSI signature reallocation during PTMSI reallocation can be skipped for GPRS mobile subscribers.
PTMSI-Realloc Attach	Indicates whether P-TMSI reallocation has been enabled or disabled.
PTMSI-Realloc Interval	The time interval (in minutes) for skipping the P-TMSI reallocation during the service/RAU/attach request message procedure.
PTMSI-Realloc Frequency	How many times P-TMSI reallocation can be skipped during service/RAU/attach request message procedure.
PTMSI-Realloc RAU	Indicates whether P-TMSI reallocation during routing area updates has been enabled or disabled.
PTMSI-Realloc RAU (Periodic)	Indicates whether P-TMSI reallocation during periodic routing area updates has been enabled or disabled.
PTMSI-Realloc RAU (Periodic) Frequency value	How many times P-TMSI reallocation can be skipped during the periodic RAU message procedure.
PTMSI-Realloc RAU (Ra-Update)	Indicates whether P-TMSI reallocation during the RA update RAU request procedure has been enabled or disabled.
PTMSI-Realloc RAU (Ra-Update) Frequency	How many times P-TMSI reallocation can be skipped during the RA update RAU message procedure.
PTMSI-Realloc RAU (Combined-Update)	Indicates whether P-TMSI reallocation during the RAU combined update procedure has been enabled or disabled.

■ show call-control-profile full name

Field	Description
PTMSI-Realloc RAU (Combined-Update) Frequency	How many times P-TMSI reallocation can be skipped during the RAU combined update message procedure.
PTMSI-Realloc RAU (Combined-Update with IMSI attach)	Indicates whether P-TMSI reallocation during the RAU combined update with IMSI procedure has been enabled or disabled.
PTMSI-Realloc RAU (Combined-Update with IMSI) Frequency	How many times P-TMSI reallocation can be skipped during the RAU combined update with IMSI message procedure.
PTMSI-Realloc Service Request (Signalling)	Indicates whether P-TMSI reallocation during signaling service requests has been enabled or disabled.
PTMSI-Realloc Service Request (Signalling) Freq	How many times P-TMSI reallocation can be skipped during the signaling service request message procedure.
PTMSI-Realloc Service Request (Data)	Indicates whether P-TMSI reallocation during data service requests has been enabled or disabled.
PTMSI-Realloc Service Request (Data) Freq	How many times P-TMSI reallocation can be skipped during the data service request message procedure.
PTMSI-Realloc Service Request (Page Response)	Indicates whether P-TMSI reallocation during page response service requests has been enabled or disabled.
PTMSI-Realloc Service Request (Page Response) Freq	How many times P-TMSI reallocation can be skipped during the page response service request message procedure.
Inactivity detection for establishing pdp contexts	Indicates whether an SGSN will be periodic polled to verify that it can accept requests to establish a PDP context.
Inactivity detection for establishing pdp contexts - Timer	The timeout value in milliseconds for determining that a SGSN is unresponsive.
Inactivity detection for establishing pdp contexts - Action	The action to be taken if a SGSN is declared unresponsive.
Monitor Re-attaches after Inactivity Detach	Indicates whether the SGSN will be monitored to determine if it has become responsive again after an inactivity timeout and detach.
Charging Characteristics Prefer Local	When enabled, indicates whether the call-control profile prefers the charging characteristics settings from the call control profile instead of the charging characteristics received from the HLR.
Charging Characteristics Behavior	The behavior bit in charging characteristics provided by the call control profile when the HLR does not provide a value.
Charging Characteristics Profile-Index	The charging characteristics profile index specified by the call control profile, such as 4 for prepaid billing or 8 for normal billing.
Charging Characteristics Behavior No Records	The behavior bit in charging characteristics that is used to determine that no accounting records will be generated.

Field	Description
APN restriction	If this feature is enable, the SGSN sends the maximum APN restriction value in every CPC Request message sent to the GGSN
UMTS Gmm-Information	When this feature is enabled, indicates that GPRS mobility management (GMM) parameters will be included in message to UMTS mobile subscribers.
GPRS Gmm-Information	When this feature is enabled, indicates that GMM parameters will be included in message to GPRS mobile subscribers.
User Equipment Identity Retrieval	Indicates whether International Mobile Equipment Identity (IMEI) or software version (SV) retrieval and validation has been enabled or disabled.
MAP UGL Message. Include Access Type Private Extension	The specific access-type private extension included in GPRS Location Update (GLU) request MAP messages.
MAP UGL Message. Include IMEISV	The specific International Mobile equipment Identity-Software Version (IMEI-SV) information included in GLU request MAP messages.
Reuse of authentication triplets	Indicates whether the reuse of authentication triplets in the event of a failure has been enabled or disabled.
Re-Authentication	Indicates whether the re-authentication feature, which instructs the SGSN to retry authentication with another RAND in situations where failure of the first authentication has occurred, has been enabled or disabled.
Direct Tunnel	Indicates if the SGSN allows direct tunneling if the direct tunneling is supported by destination node.
GTPU Fast Path	Indicates whether Fast Path support for network processing unit (NPU) processing of GTP-U packets of user sessions has been enabled or disabled.
Super Charger	Indicates whether the SGSN's ability to work with a super-charged network is enabled or disabled. By enabling the super charger functionality for 2G or 3G connections controlled by an operator policy, the SGSN changes the hand-off and location update procedures to reduce signaling traffic management.
Sending Radio Access Technology (RAT) IE	When this feature is enabled, the SGSN sends RAT information elements (IEs) within GTP messages.
Sending User Location Information (ULI) IE	When this feature is enabled, the SGSN sends ULI IEs within GTP messages.
Sending IMEISV IE	When this feature is enabled, the SGSN includes the IMEISV values of the mobile subscriber when sending GTP messages of the type "Create PDP Context Request".
Derive IMEISV from IMEI	When this feature is enabled, the SGSN sends the IMEI to the GGSN as an IMEI-SV.
Sending MS Time Zone IE	When this feature is enabled, the SGSN sends the mobile subscribers timezone IE in GTP messages of the type "Create PDP Request" and "Update PDPContext Request".
Treat as HPLMN	When this feature is enabled, the MME or SGSN treats an IMSI series as coming from the home PLMN.
Location Reporting for UMTS	When this feature is enabled, the MME can query and receive UE location reports from an eNodeB.
Location Reporting for GPRS	When this feature is enabled, the MME can query and receive UE location reports from an eNodeB.

■ show call-control-profile full name

Field	Description
Network Feature Support	
IMS Voice Over PS	Indicates whether IMS Voice over Packet-Switched information element (IE) is supported as part of the MME (Network) Feature
Qos	Indicates the transmission of quality of service (QoS) parameters has been enabled or disabled.
AMBR	Indicates whether an aggregate maximum bit rate (AMBR) will be enforced for user equipment.
Gn/Gp ARP	Indicates whether Gn-Gp pre-release 8 ARP and pre-emption parameters will be enforced or not.
High Priority (H) (Default)	The high-priority (address retention protocol) ARP value used for QoS.
Medium Priority (M) (Default)	The medium-priority ARP value used for QoS.
Gn/Gp Pre-Emption Capabilities (Default)	The pre-emption capability criteria for PDP contexts imported from an SGSN on Gn/Gp interfaces.
Gn/Gp Pre-Emption Vulnerabilities (Default)	The pre-emption vulnerability criteria for PDP contexts imported from an SGSN on Gn/Gp interfaces.

Chapter 80

show card

This chapter includes the `show card` command output tables.

show card diag

Table 173. show card diag Command Output Descriptions

Field	Description
Counters	<p>Displays boot counter information for the card. The following counters are reported:</p> <ul style="list-style-type: none"> • Successful warm boots: Warm boots occur upon a software reset of the card. • Successful cold boots: Cold boots occur when the card experiences a hardware reboot. • Total boot attempts: This is the sum of successful and unsuccessful warm and cold boots. If this number is not equal to the total number of successful warm boots and the number of successful cold boots, then boot failures have occurred. This situation may indicate a problem with this card that requires further investigation. • In Service Date: Timestamp indicating when this card was placed in service. <p>Each of the above counters provide a timestamp indicating the most recent occurrence. NOTE: Counters are displayed for line card diagnostics.</p>
Status	<p>Status is reported for the following items:</p> <ul style="list-style-type: none"> • IDEEPROM Magic Number: Indicates whether or not the device map has been initialized. The ID EEPROM device stores hardware, diagnostic and software configuration data. • Boot Mode: Displays the current boot mode. – Normal (boot to StarOS, default mode), Extended diagnostics or Diagnostic CLI. • Card Diagnostics: Indicates the current status of the card's internal diagnostics. The two possible states are: Pass (all diagnostics passed) and Failed one or more diagnostics did not pass). • Current Failure: Indicates any failure that is currently being reported by this card. If no failures were detected, this item will display None. • Last Failure: Indicates the last failure reported by this card since its event log was last cleared. • Card Usable: Indicates whether or not the card is usable. "Usability" is based on the operational state of the card (active, standby, or offline), whether or not the Administrative state is enabled (the card is configured for use via software), and whether or not the card's interlock switch is locked. Either a Yes or a No will be displayed.
Boot/Diag Log (ASR 5000 only)	<p>Displays the contents of the boot and diagnostics log. NOTE: The boot and diagnostic log contents are displayed for line card diagnostics.</p>
Error Log (ASR 5000 only)	<p>Displays the contents of the error log. NOTE: The error log contents are displayed for line card diagnostics.</p>
Current Environment	<p>Displays the results for the following measurements:</p> <ul style="list-style-type: none"> • Temperature measurements: Indicates the current operating temperatures and provides the maximum safe temperature for comparison. • Voltage measurements: Indicates the current input status for the various DC sources and provides the acceptable upper and lower limits for comparison.

show card hardware

Table 174. show card hardware Command Output Descriptions

Field	Applicable Card(s)	Description
Card slot#	All	Displays the card slot number.
Card Type	All	Indicates the type of card installed.
Card Description	All	Displays the card acronym,
Part Number	ASR 5000 Starent Part Number	Displays the Starent part number.
Serial Number	ASR 5000 Starent Part Number	Displays the Starent serial number.
CLEI	ASR 5000 cards only	Displays the COMMON LANGUAGE Equipment Code registered for this card.
UDI Serial Number	All	Displays the UDI (Unique Device Identifier) serial number.
UDI Product ID	All	Displays the UDI version identifier.
UDI Version ID	All	Displays the UDI version identifier.
UDI Top Assem Num	All	Displays the UDI top assembly number.
UDI TAN Revision	All	Displays the revision level for the top assembly number (TAN).
UDI Deviation number	ASR 5000 cards only	Displays the deviation number.
Switch Fabric Nodes	ASR 5000 cards only	Displays the current methodology used for the switch fabric.
Card Programmables	All	Indicates whether or not the firmware running on this card is up to date.

IMPORTANT: The output of this command will also display other types of information relative to the CPUs and firmware running on the specific card types. This information varies based on the platform type.

show card info

Table 175. show card info Command Output Descriptions

Field	Applicable Card(s)	Description
Slot Type	All	Displays the acronym for the card type.
Card Type	All	Indicates the type of card installed.
Operational State	All	Displays the operational state of the card. The possible operational states are: <ul style="list-style-type: none"> • Active: Indicates that the card is an active component that will be used to process subscriber data sessions. • Standby: Indicates that the card is a redundant component. Redundant components will become active through manual configuration or automatically should a failure occur. • Offline: Indicates that the card is installed but is not ready to process subscriber data sessions. This could be due to the fact that it is not completely installed (i.e. the card interlock switch is not locked, refer to the System Installation Guide for information on installing cards in the system) or that its processes have been halted.
Desired Mode	ASR 5000 Processing Cards, SPIOs, and line cards only	Displays the configured mode of the card. Through software configuration the card could be placed into either the active or standby mode.
Last State Change	All	Displays the time of the last operational state change for the card.
Administrative State	All	Indicates whether or not the card has been configured for use via software. If it has been configured, Enabled will be displayed. If not, Disabled will be displayed.
Card Lock	All	Displays whether or not the card's interlock switch is Locked or Unlocked.
Halt Issued	All	Displays whether or not this card was the target of a halt command issued by an administrator or operator. The halt command stops all tasks and processes running on the card. If the card has been halted, a Yes will be displayed. If not, a No will be displayed.
Reboot Pending	All	Displays whether or not the card will be undergoing a reboot. If the card is being rebooted, a Yes will be displayed. If not, a No will be displayed.

Field	Applicable Card(s)	Description
Upgrade In Progress	Management and packet processing cards	<p>Indicates whether an upgrade is in progress.</p> <p>The following operations are not allowed while a card is upgrading:</p> <ul style="list-style-type: none"> • change card [no] shutdown (config) • change card active (config) • change card redundancy (config) • card halt (exec) • card reboot (exec) • start an online upgrade <p>Level unlock operations are ignored while a card is upgrading.</p>
Card Usable	All	Indicates whether or not the card is usable. “Usability” is based on the operational state of the card (active, standby, or offline), whether or not the Administrative state is enabled (the SMC can communicate with it), and whether or not the card’s interlock switch is locked. Either a Yes or a No will be displayed.
Single Point of Failure	All	Displays whether or not the component is a single point of failure (SPOF) in the system. If the component is a SPOF, then a Yes will appear in this column. If not, a No will be displayed.
Attachments	ASR 5000 management and processing cards	Displays the slot number and card type(s) that this card is associated with. For example, if this information is being displayed for a Processing Card, then the line card(s) that the Processing Card is associated with will be displayed.
Temperature	All	Indicates the current operating temperature and provides the maximum safe temperature for comparison.
Voltages	All	<p>Indicates whether the power levels that the card is receiving are within acceptable limits.</p> <p>Every card in the system has at least two power inputs. If all of the power inputs are within specification, a Good will be displayed. If even one of these inputs is out of the acceptable range, then a Bad ***ALARM*** will be displayed.</p>
Card LEDs	All	<p>Displays the state of the Run/Fail, Active, and Standby light emitting diodes (LEDs) on the front panels of each of the cards. The LEDs will be displayed as either Green, Red, or Off.</p> <ul style="list-style-type: none"> • Run/Fail LED: Green is normal, Red or Off indicate a problem. <p>NOTE: If the Run/Fail LED is either Red or Off, refer to System Administration and Configuration Guide for information on troubleshooting the problem.</p> <ul style="list-style-type: none"> • Active: Green indicates that the card is in active mode. Off indicates that the card is in standby mode. • Standby LED: Green indicates that the card is in standby mode. Off indicates that the card is in active mode.

Field	Applicable Card(s)	Description
System LEDs	ASR 5000 SMC	<p>Displays the state of the Status and Service LEDs on the SMC. The Status LED will be displayed as either Green, Red, or Off. The Service LED will be displayed as either Amber, or Off.</p> <ul style="list-style-type: none">• Status LED: Green is normal, Red or Off indicate a problem. <p>NOTE: If the Run/Fail LED is either Red or Off, refer to System Administration and Configuration Guide for information on troubleshooting the problem.</p> <ul style="list-style-type: none">• Service LED: Amber indicates that maintenance is needed. Off indicates that no maintenance is necessary. <p>NOTE: If the Status LED is Amber, refer to System Administration and Configuration Guide for information on troubleshooting the problem.</p>
CPU 0 through 3	Management and packet processing cards	Displays how the CPUs on the card are being used.

show card mappings

Table 176. show card mappings Command Output Descriptions

Field	Description
Slot (left-most column)	Displays the chassis slot number and the type of line card installed.
Mapping	<p>Displays the mapping or communication path from the line card to the application card. The possible mappings are:</p> <ul style="list-style-type: none"> • Direct: The line card is operating in conjunction with the application card installed directly in front of it. • <p>NOTE: Cross mappings only occur if the SMC that the SPIO was formerly operating behind became disabled (either automatically due to an error, or through manual configuration).</p> <ul style="list-style-type: none"> • RCC 40: A line card (non-SPIO) installed in chassis slots 17 through 23 or 26 through 32 is operating in conjunction with a Processing Card installed in a slot that is not directly in front via the RCC in slot 40. • RCC 41: A line card (non-SPIO) installed in chassis slots 33 through 39 or 42 through 48 is operating in conjunction with a Processing Card installed in a slot that is not directly in front via the RCC in slot 41. <p>NOTE: RCC 40 and RCC 41 mappings will only occur if the Processing Card that the line card was formerly operating behind became disabled (either automatically due to an error, or through manual configuration).</p>
Slot (right-most column)	Displays the chassis slot number and the type of application card installed.

show card table

Table 177. show card table Command Output Descriptions

Field	Description
Slot	Displays the chassis slot number and card type acronym.
Card Type	Displays the type of card installed.
Oper State	Displays the operational state of the card. The possible operational states are: <ul style="list-style-type: none"> • Active: Indicates that the card is an active component that will be used to process subscriber data sessions. • Standby: Indicates that the card is a redundant component. Redundant components will become active through manual configuration or automatically should a failure occur. • Offline: Indicates that the card is installed but is not ready to process subscriber data sessions. This could be due to the fact that it is not completely installed (i.e. the card interlock switch is not locked, refer to the System Installation Guide for information on installing cards in the system) or that its processes have been halted.
SPOF	Displays whether or not the component is a single point of failure (SPOF) in the system. If the component is a SPOF, then a Yes will appear in this column. If not, a No will be displayed.
Attach	This column is valid only for the ASR 5000 platform. It displays the line card that the Processing Cards and SMCs are using for network access. This column will only be populated for the RCCs in the event that tasks and processes were migrated from an active Processing Card to a standby Processing Card. The RCC creates a path from the standby Processing Card to the line cards.

Chapter 81

show certificate

Table 178. show certificate Command Output Descriptions

Field	Description
Name	Certificate name
Data	Data output varies with content at the time of certificate creation but will include: X.509 version number Serial number Algorithm type Issuing authority Valid dates Public key encrypted data

Chapter 82

show content-filtering

This chapter includes the `show content-filtering` command output tables.

show content-filtering category database

Table 179. show content-filtering category database active verbose Command Output Descriptions

Field	Description
Database Status	Indicates latest status of rating databases. Possible status are: <ul style="list-style-type: none"> • OK: Indicates all SRDB tasks are running and database is good. • ERROR-Database Corrupt: Indicates all SRDB tasks are running and database is bad or corrupt. • ERROR-No database at specified pathname: Indicates all SRDB tasks are running and database is not available at specified path/location/directory. • MERGING: Displayed during merging of the incremental database with full OPTCMDB database. • LOADING: Displayed during loading of the database. • n/a: Indicates that specified database is not loaded and its status is unknown.
Path	Path specified to base location or folder for Static Rating Databases (SRDB). It may have one of the following flags: <ul style="list-style-type: none"> • *ACTIVE*: Indicates database is valid and good. • *NOT LODAED*: Indicates that there is an error in database.
Last Upgrade Status	Status of last attempt of rating database upgrade. Possible status are: <ul style="list-style-type: none"> • Successful: Displayed after the upgrade is completed successfully. • Failure: Displayed in case of failure system will rollback to previous database. • n/a: Displayed in case of first time loading of database.
Type	Type of SRDB with checksum. Type of SRDB may be Full or Incremental.
Version	Latest version status of SRDB.
Creation Time	Time of creation of SRDB in DAY MM DD HH:MM:SS YYYY format.
Hostname	Host server name where SRDB base directory existing.
Comment	User defined remarks/description about database.
Last Access Time	Date and time in DAY MM DD HH:MM:SS YYYY format when database was last accessed.
Last Modified Time	Date and time in DAY MM DD HH:MM:SS YYYY format when database was last modified.
Last Status Change Time	Date and time in DAY MM DD HH:MM:SS YYYY format when status of access time or modified time was changed.

show content-filtering category database all

Table 180. show content-filtering category database all Command Output Descriptions

Field	Description
Content Filtering Static Rating Databases:	
Last Upgrade Status	Status of the last attempt of rating database upgrade. Possible statuses are: <ul style="list-style-type: none"> • Success: Displayed after the upgrade is completed successfully. • Failure: Displayed in case the full upgrade failed. System will rollback to previous database. • n/a: Displayed in case of first time loading of database.
Path	Path specified to base location or folder for Static Rating Databases (SRDB). It may have one of the following flags: <ul style="list-style-type: none"> • *ACTIVE*: to indicate database is valid and good. • *NOT LODAED*: to indicate that there is an error in database.
Database Status	Latest status of rating databases. Possible status are: <ul style="list-style-type: none"> • OK: Indicates all SRDB tasks are running and database is good. • ERROR-Database Corrupt: Indicates all SRDB tasks are running and database is bad or corrupt. • ERROR-No database at specified pathname: Indicates all SRDB tasks are running and database is not available at specified path/location/directory. • MERGING: Displayed during merging of the incremental database with full OPTCMDB database. • LOADING: Displayed during loading of the database. • n/a: Indicates that specified database is not loaded and its status is unknown.

show content-filtering category database facility srdbmgr all

Table 181. show content-filtering category database facility srdbmgr all Command Output Descriptions

Field	Description
Content Filtering SRDB Instance Based Database Configuration:	
SRDB Instance	Indicates the running Static Rating Database (SRDB) Manager instance number.
DB Load Status	Indicates the database load status.
DB Version	Indicates the version of loaded database.
Volume	Indicates the database volume number.
Number of URLs	Indicates the number of URLs available in specific volume of database.
Number of Blocks/Page	Indicates the average number of blocks per page rated in URLs available in specific volume of database.
The following indicate Dynamic Content Filtering statistics at SRDB level:	
Dynamic SRDB Instance	Indicates the running Dynamic SRDB Manager instance number.
RaterPkg Load Status	Indicates the Dynamic Rater Package load status: <ul style="list-style-type: none"> • Loaded • Not-loaded
Number of Model files	Indicates the number of model files (used for language detection and category recognition) available.
Standby Dynamic SRDB Instance	Indicates standby Dynamic SRDB instance number.
RaterPkg Load Status	Indicates the Dynamic Rater Package load status: <ul style="list-style-type: none"> • Loaded • Not-loaded
Number of Model files	Indicates the number of model files (used for language detection and category recognition) available.

show content-filtering category policy-id id

Table 182. show content-filtering category policy-id Command Output Descriptions

Field	Description
Service Name	The content filtering service name.
Content Filtering Policy	The content filtering policy ID, and description, if set.
Content filtering Categories:	
Category	Category of the content rated.
Priority	Priority of the CF Category in the CF Policy.
Action	Action taken for the indicated result of CF analysis.
Content Insert	The content string inserted in place of message returned from prohibited or restricted site or content server.
Redirect	The URL to redirect subscriber.
EDR	The EDR file format name to generate separate CF EDRs based on action and content category.
Timeout Action	The timeout end condition if rating cannot be performed.
Discarded-Flow-Content-ID	The content ID for the discarded flows. If not configured, this field is not displayed.

show content-filtering category statistics

Table 183. show content-filtering category statistics Command Output Descriptions

Field	Description
Service Name	Name of the Content Filtering service.
Content Filtering status	Status of the current Content Filtering service.
Overall Status	Indicates capability of the system to perform Content Filtering service.
Content Filtering Statistics	Indicates the Content Filtering statistics group information.
Static Rating	Information on static rating content-filtering.
SRDB Request Count	Total number of requests received.
SRDB Response Total	Total number of responses sent for requests.
SRDB Response Successful	Total number of responses for successful requests.
SRDB Response Not Rated	Total number of responses for requests without rating.
SRDB Response Not in DB	Total number of responses for unknown or undefined requests.
Number of Incremental DB Received	Total number of incremental rating database received by the Content Filtering subsystem.
Number of Successful Incremental Upgrade Performed	Total number of incremental upgrades performed successfully with incremental rating database.
Number of Full DB Received	Total number of full rating database received by the Content Filtering subsystem.
Number of Successful Full Upgrade Performed	Total number of full upgrades performed successfully with incremental rating database.
Time Since Last Upgrade (dd:hh:mm:ss)	Time since last upgraded, full or incremental, performed.

show content-filtering category statistics facility srdbmgr all

Table 184. show content-filtering category statistics facility srdbmgr all Command Output Descriptions

Field	Description
Content Filtering status	Indicates Content Filtering service status.
Overall Status	Indicates the system's ability to perform content filtering.
Dynamic Content Filtering status	Indicates Dynamic Content Filtering service status.
Overall Status	Indicates the system's ability to perform dynamic content filtering.
Content Filtering SRDB Instance Based Statistics	Indicates the group statistics of content filtering based on Static Rating Database Manager instance.
Instance Number	Indicates the SRDB Manager's instance number.
Static Rating:	
Request Count	Total number of requests received.
Response Total	Total number of responses sent for requests.
Response Successful	Total number of responses for successful requests.
Response Not Rated	Total number of responses for requests without rating.
Response Not in DB	Total number of responses for unknown or undefined requests.
Average Ratings/sec	Indicates the average ratings performed per second.
Number of URLs rated by domain	Total number of URLs rated with given domain.
Dynamic Content Filtering SRDB Instance Based Statistics:	
Instance Number	Indicates the instance number of SRDB manager.
Dynamic Rating:	
Request Count	Total number of requests received.
Response Total	Total number of responses sent for requests.
Response Successful	Total number of responses for successful requests.
Response Not Rated	Total number of responses for requests without rating.
Histogram based on URL length	Indicates the histogram statistics of URLs grouped by length of URL.
Histogram for number of URLs hit per SN category (sorted on no. of URLs):	Indicates the specific category and the number of URLs hit per category. If, during runtime, an x-category was added, the x-category is also displayed.

show content-filtering category url <url> policy-id <id> verbose

Table 185. show content-filtering category url <url> policy-id <id> verbose Command Output Descriptions

Field	Description
URL	The URL path for Static Rating Category Database.
URL Root Domain	The URL's root domain information.
URL OPTCMDB Volume	The Optimized Content Rating Master Database (OPTCMDB) volume and version.
URL Hash	Indicates the URL hash in URL OPTCMDB.
Domain Used For Rating	Indicates whether domain name is used for URL rating. Possible values are: <ul style="list-style-type: none"> • TRUE • FALSE
URL Category	The URL's category.
Action Configured	Indicates the action configured.  IMPORTANT: In case of multiple categories, the action configured for a category with highest priority is displayed. If Dynamic Content Filtering is enabled, the action configured for DYNAM and UNKNOW is displayed as Dynamic (i.e. the URL is sent for Dynamic categorization). In case more than one category is returned with DYNAM and if it is configured with higher priority then, that action will be shown.
Content Insertion String	Indicates the content insertion string.  IMPORTANT: This field is displayed only if Dynamic CF is not enabled.
Redirect URL	Indicates the redirected URL.

show content-filtering server-group name

Table 186. show content-filtering server-group name Command Output Descriptions

Field	Description
Content Filtering Group	The name of the Content Filtering Server Group (CFSG).
Context	The name of the content in which CFSG is configure.
Origin Address	IP address of the origin endpoint or ICAP client.
ICAP Address(Port)	IP address and port number of ICAP server with in CF Server Group.
Max Outstanding	Total number of unanswered outstanding messages to this ICAP server.
Failure Action	Displays the action taken on connection failure.
Response Timeout	Displays the configured response-timeout duration to wait for response.
Connection Retry Timeout	Displays the configured connection retry timeout duration to check the TCP connection status between ICAP sever and client.
Dictionary	Specifies the configured dictionary to use for encoding the requests to the server(s).
Deny Message	Specifies the configured text string message that is returned to the subscriber in a deny response.

show content-filtering server-group statistics

Table 187. show content-filtering server-group statistics Command Output Descriptions

Field	Description
Content Filtering Group	The name of the Content Filtering Server Group (CFSG).
Connection Statistics	Displays the ICAP connection related statistics.
Current Open Connections	Total number of open connections.
Connection DHOST requests	Total number of DHOST requests.
Successfull Connections	Total number of successful connections.
Connections DHOST remove	Total number of connections removed from DHOST.
Connection SHUTDOWN req	Total number of requests for SHUTDOWN.
ACF Unreachable(read)	Total number of attempts for Active Content Filter server (ICAP server) to read.
ACF Unreachable(write)	Total number of attempts for Active Content Filter server (ICAP server) to write.
Reconnect attempts	Total number of reconnect attempts for ACF server (ICAP server).
Connection Timeout	Total number of connections timeout after reconnect attempts for ACF server (ICAP server).
Connection Failure Statistics	Displays connection failure statistics.
Connection DHOST errors	Total number of connection DHOST errors in connection.
Connection CONNECT error	Total number of connection CONNECT errors in connection.
Socket open errors	Total number of errors due to SOCKET open in connection.
Connection bind errors	Total number of BIND errors in connection.
Connection setvr errors	Total number of SETVER errors in connection.
Connection NONBLOCK errors	Total number of NONBLOCK errors in connection.
Connection SHUTDOWN errors	Total number of SHUTDOWN errors in connection.
Incomplete 3-way handshaking	Total number of errors due to incomplete 3-way handshaking in TCP connection.
ACF Statistics	Displays Active Content Filter (ICAP server) statistics.
ACF Requests Created	Total number of requests created for ACF.
Response Timeout	Total number of response timeout for requests to ACF.
Write request success	Total number of successful WRITE requests.
Write request failed	Total number of failed WRITE requests.
Read response success	Total number of successful READ response.

Field	Description
Read response failed	Total number of failed READ response.
HTTP Permit	Total number of HTTP URLs permitted from ACF.
WAP Permit	Total number of WAP URLs permitted from ACF.
HTTP Denny	Total number of HTTP URLs denied from ACF.
WAP Denny	Total number of WAP URLs denied from ACF.
HTTP Redirect	Total number of HTTP URLs redirected from ACF.
WAP Redirect	Total number of WAP URLs redirected from ACF.
Invalid ACTION	Total number of invalid ACTION message from ACF.
Redirect URL not defined	Total number of errors due to undefined redirect URL.
Buffer List Empty	Total number of errors due to empty buffer list.
Failure action Permit	Total number of connections permitted after connection failure.
Failure action Deny	Total number of connections denied after connection failure.
Failure action Discard	Total number of connections discarded after connection failure.
Failure action Terminate	Total number of connections terminated after connection failure.
Failure actions taken	Total number of actions taken after failure in connection failure.
Num pkts dropped for DENY	Total number of packets dropped after denying the connection due to failure in connection.
Num pkts dropped for REDIRECT	Total number of packets dropped after redirecting the connection due to failure in connection.
Num pkts dropped for DENY Timeout action	Total number of packets dropped after denying the connection due to timeout action.
Num pkts dropped for REDIRECT Timeout action	Total number of packets dropped after redirecting the connection due to timeout action.
ACF Resp Parse Statistics	Displays the statistics related to ACF response parsing.
Parse ACF resp success	Total number of successful ACF parse response.
Parse ACF resp ver err	Total number of successful ACF parse response version error.
Misc Statistics	Displays the miscellaneous statistics.
Total pkts sent	Total number of packets sent through ICAP connection.
Invalid ACF group config	Total number of errors due to invalid CF Server Group (Active Content Filter server groups) configuration.
Invalid bind address	Total number of errors due to invalid binding address configuration.
Invalid ICAP address	Total number of errors due to invalid ICAP server addresses.

Chapter 83

show congestion-control

This chapter includes the `show congestion-control` command output tables.

show congestion-control statistics a11mgr instance

Table 188. show congestion-control statistics a11mgr instance Command Output Descriptions

Field	Description
Current congestion status	The current congestion control state as “Cleared” or “Applied”.
Congestion applied	Displays the number of times the system invoked a congestion control policy for the specified service type.
Congestion Control Resource Limits	Indicates the congestion control threshold that was triggered. For more information, refer to the congestion-control threshold command in the Global Configuration Mode chapter of the <i>Command Line Interface Reference</i> .

show congestion-control statistics asngwmgr instance

Table 189. show congestion-control statistics asngwmgr instance Command Output Descriptions

Field	Description
Current congestion status	The current congestion control state as “Cleared” or “Applied”.
Congestion applied	Displays the number of times the system invoked a congestion control policy for the specified service type.
Congestion Control Resource Limits	Indicates the congestion control threshold that was triggered. For more information, refer to the congestion-control threshold command in the Global Configuration Mode chapter of the <i>Command Line Interface Reference</i> .
system cpu use exceeded	Indicates the number of time the ASNGW Manager exceeded the system CPU usage limit.
service cpu use exceeded	Indicates the number of time the ASNGW Manager exceeded the CPU usage limit specified for this service.
system memory use exceeded	Indicates the number of time the ASNGW Manager exceeded the allocated system memory usage limit.
port rx use exceeded	Indicates the number of time the ASNGW Manager exceeded the Rx port usage limit.
port tx use exceeded	Indicates the number of time the ASNGW Manager exceeded the Tx port usage limit.
port specific rx use exceeded	Indicates the number of time the ASNGW Manager exceeded the Rx port usage limit for a specific port number.
port specific tx use exceeded	Indicates the number of time the ASNGW Manager exceeded the Tx port usage limit for a specific port number.
max sess use exceeded	Indicates the number of time the ASNGW Manager exceeded the maximum session usage limit for a service.
license use exceeded	Indicates the number of time the ASNGW Manager exceeded the maximum license usage limit.
msg queue size use exceeded	Indicates the number of time the ASNGW Manager exceeded the message queue size usage.
msg queue wait time exceeded	Indicates the number of time the ASNGW Manager exceeded the message queue wait time.
license threshold exceeded	Indicates the number of time the ASNGW Manager exceeded the license threshold limit.
max sess threshold exceeded	Indicates the number of time the ASNGW Manager exceeded the maximum session threshold limit.
Sessions disconnected due to overload disconnect	Indicates the total number of sessions disconnected due to overload.

Chapter 84

show context all

Table 190. show context all Command Output Descriptions

Field	Description
Context Name	The name of a configured context.
Context ID	The system ID of the context.
State	The current state of the context. The possible states are: Active: The VPN Manager task is running and is ready to respond to the requests. Initializing: The Context is configured but not yet started. The VPN Controller knows about it and is in the process of starting the VPN Manager. In other words, the VPN Manager services are not available yet. Inactive: The VPN Manager is configured but either the task is not running yet or the VPN Manager has just crashed and the restart process is going on.

Chapter 85

show cpu table

Table 191. show cpu table Command Output Descriptions

Field	Description
CPU	Displays the number of the CPU in the format <i>slot_number/cpu_number</i> .
State	Indicates the CPU state as one of the following: Active: The CPU is active and available for session processing. Sndby: The CPU is on standby.
Load	Indicates the CPU load for the following time intervals: Now: Current load 5min: Load within the last 5 minutes 15min: Load within the last 15 minutes
CPU-Usage	Indicates the CPU usage as a percentage for the following time intervals: Now: Current usage 5min: Usage within the last 5 minutes 15min: Usage within the last 15 minutes
Memory	Indicates the memory usage for the following time intervals: Now: Current usage 5min: Usage within the last 5 minutes 15min: Usage within the last 15 minutes In addition, the total memory available on the CPU is displayed. The PSC has two CPUs, the main CPU (CPU 0) contains 16 GB of memory. The second CPU is contained within the card's NPU and provides an additional 512 MB of memory. The PSC2 has two CPUs, the main CPU (CPU 0) contains 32 GB of memory.

Chapter 86

show crypto

This chapter includes the `show crypto` command output tables.

show crypto ikev2-ikesa security-associations summary

Table 192. show crypto ikev2-ikesa security-associations summary Command Output Descriptions

Field	Description
Mgr ID	SA Manager ID number
VPN	SA VPN number
Local IPsec GW	Local default gateway IP address
Port	UDP port number
Remote IPsec GW	Remote default gateway IP address
Port	UDP port number
State	Authentication state <ul style="list-style-type: none"> • I = Initiator • R = Responder
Lifetime/Remaining	Originally configured lifetime for the SA in seconds/number of seconds left in this lifetime.

show crypto ipsec security-associations

Field	Description
Map Name	The name of the crypto map facilitating the security association.
Local Address	The IP address of the interface on the security gateway facilitating the security association.
Current Peer	The IP address of the interface on the peer gateway facilitating the security association.
Crypto Type	The type of crypto map facilitating the security association, which can be: <ul style="list-style-type: none"> • Dynamic Map • IKEv1 Map • IKEv2 Map • Manual Map
SA State	The state of the security association, which can be: <ul style="list-style-type: none"> • Established • Partially Established • No SAs
IPSec Manager	The identifying number of the IPSec manager facilitating the security association.
Rekeying	The state of rekeying for the security association, which can be: <ul style="list-style-type: none"> • Enabled • Disabled
Redundancy Status	The state of the security association, which can be: <ul style="list-style-type: none"> • Original Tunnel: No failure has occurred. • Recovered Session: A failure has occurred and a recovered session has been created.
Allocated Address	The IP address allocated to the Network Access Identifiers (NAIs) of the users.
Phase 1	The NAI used in Phase 1 authentication.
Phase 2	The NAI used in Phase 2 authentication.
Encoded	The number of packets and bytes of data that have been encoded for the security association.
Encoded Errors	The number of errors that occurred while the packets were being encoded.
Decoded	The number of packets and bytes of data that have been decoded for the security association.
Decoded Errors	The number of errors that occurred while the packets were being decoded.
Authentication Errors	The number of errors that occurred during authentication.
Replay Errors	The number of replay errors that occurred.
Too short Errors	The number of too short errors that occurred.

Field	Description
IPSec SA	
Diffie-Hellman Group	The number of the Diffie-Hellman group to which the security association belongs.
Outbound esp sas	
spi	The Security Parameter Index (SPI) of the outbound ESP security association.
transform	
hmac	The keyed-Hash Message Authentication Code used for the outbound ESP security association, which can be: <ul style="list-style-type: none"> • sha1-96 • md5-96
cipher	The cipher used for the outbound ESP security association, which can be: <ul style="list-style-type: none"> • null • des • 3des • aes-cbc-128 • aes-cbc-256
negotiated soft lifetime (kb/sec)	The soft lifetime in kilobits and/or seconds for the outbound ESP security association, created when a successful rekey has occurred. The soft lifetime is used to warn that the security association is about to expire, allowing the security gateway to create a new lifetime prior to the expiration of the hard lifetime.
remaining soft lifetime (kb/sec)	The remaining soft lifetime in kilobits and/or seconds.
negotiated hard lifetime (kb/sec)	The hard lifetime in kilobits and/or seconds for the outbound ESP security association. The hard lifetime is the number of kilobits and/or seconds used before the security association expires.
remaining hard lifetime (kb/sec)	The remaining hard lifetime in kilobits and/or seconds.
Encoded	The number of encoded packets and bytes of data for the outbound ESP security association.
Encoded Errors	The number of errors that occurred while the packets were being encoded.
Inbound esp sas	
spi	The Security Parameter Index (SPI) of the inbound ESP security association.
transform	
hmac	The keyed-Hash Message Authentication Code used for the inbound ESP security association, which can be: <ul style="list-style-type: none"> • sha1-96 • md5-96

Field	Description
cipher	The cipher used for the inbound ESP security association, which can be: <ul style="list-style-type: none"> • null • des • 3des • aes-cbc-128 • aes-cbc-256
negotiated soft lifetime (kb/sec)	The soft lifetime in kilobits and/or seconds for the inbound ESP security association, created when a successful rekey has occurred. The soft lifetime is used to warn that the security association is about to expire, allowing the security gateway to create a new lifetime prior to the expiration of the hard lifetime.
remaining soft lifetime (kb/sec)	The remaining soft lifetime in kilobits and/or seconds.
negotiated hard lifetime (kb/sec)	The hard lifetime in kilobits and/or seconds for the inbound ESP security association. The hard lifetime is the number of kilobits and/or seconds used before the security association expires.
remaining hard lifetime (kb/sec)	The remaining hard lifetime in kilobits and/or seconds.
Decoded	The number of packets and bytes of data that have been decoded for the inbound ESP security association.
Decoded Errors	The number of errors that occurred while the packets were being decoded.
Authentication Errors	The number of errors that occurred during authentication.
Replay Errors	The number of replay errors that occurred.
Too short Errors	The number of too short errors that occurred.

show crypto ipsec security-associations statistics

Table 193. show crypto ipsec security-associations statistics Command Output Descriptions

Field	Description
Map Name	The name of the crypto map for which statistics are being displayed.
Application Map Name	The application map name that concatenates the following: <ul style="list-style-type: none"> • Application Supported: MIP or L2TP • Local Address: The IP address of the interface on the system facilitating the security association (SA). • Peer Address: The IP address of the peer security gateway facilitating the SA. • Traffic Type: Control, GRE encapsulated data, or IP/IP (IP-in-IP) encapsulated data <p>NOTE: When a crypto map does not have any IPSec SAs established yet, i.e. No IKE negotiation has taken place OR the tunnel had been brought down after inactivity during the entire lifetime of the SAs, is marked as "Security Association is not established!"</p>
local addr	The IP address of the interface on the system facilitating the security association (SA).
ACL	For ISAKMP or manual crypto maps, this is the name of the access control list (ACL) that is matched to the crypto map.
current peer	The IP address of the peer security gateway facilitating the SA.
Tunnel is keyed 1 times.	The number of times the tunnel was keyed. In this example, the tunnel was keyed once.
Encoded	The number of packets and bytes that have been encoded for the SA.
Encode Errors	The number of errors that have occurred while encoding packets.
Decoded	The number of packets and bytes that have been decoded for the SA.
Decode Errors	The number of errors that have occurred while decoding packets.
Authentication Errors	The number of errors that occurred during the system/security gateway authentication process.
Replay Errors	The number of replay errors that occurred for the SA.
outbound esp sas	
spi	The outbound (from the system to the security gateway) security parameter index (SPI) used for the Encapsulating Security Payload protocol.
transform	The protocols configured for the transform set used by the crypto map for outbound tunnels.
negotiated soft lifetime (kb/sec)	The soft lifetime negotiated by the system and the security gateway for outbound SAs. The lifetime is measured in terms kilobytes (kb) and/or seconds (sec). The soft lifetime is used to warn that the SA is about to expire allowing the systems to negotiate a new lifetime prior to the expiration of the hard lifetime.
remaining soft lifetime (kb/sec)	The amount of kilobytes and/or seconds remaining to the soft lifetime from what was initially negotiated.

Field	Description
negotiated hard lifetime (kb/sec)	The hard lifetime negotiated by the system and the security gateway for outbound SAs. The lifetime is measured in terms kilobytes (kb) and/or seconds (sec). The hard lifetime that dictates the maximum duration for the SA before its termination.
remaining hard lifetime (kb/sec)	The amount of kilobytes and/or seconds remaining to the hard lifetime from what was initially negotiated.
Encoded	The number of packets and bytes that have been encoded for the SA.
Encode Errors	The number of errors that have occurred while encoding packets.
inbound esp sas	
spi	The inbound (from the system to the security gateway) security parameter index (SPI) used for the Encapsulating Security Payload protocol.
transform	The protocols configured for the transform set used by the crypto map for inbound tunnels.
negotiated soft lifetime (kb/sec)	The soft lifetime negotiated by the system and the security gateway for inbound SAs. The lifetime is measured in terms kilobytes (kb) and/or seconds (sec). The soft lifetime is used to warn that the SA is about to expire allowing the systems to negotiate a new lifetime prior to the expiration of the hard lifetime.
remaining soft lifetime (kb/sec)	The amount of kilobytes and/or seconds remaining to the soft lifetime from what was initially negotiated.
negotiated hard lifetime (kb/sec)	The hard lifetime negotiated by the system and the security gateway for inbound SAs. The lifetime is measured in terms kilobytes (kb) and/or seconds (sec). The hard lifetime that dictates the maximum duration for the SA before its termination.
remaining hard lifetime (kb/sec)	The amount of kilobytes and/or seconds remaining to the hard lifetime from what was initially negotiated.
Decoded	The number of packets and bytes that have been decoded for the SA.
Decode Errors	The number of errors that have occurred while decoding packets.
Authentication Errors	The number of errors that occurred during the system/security gateway authentication process.
Replay Errors	The number of replay errors that occurred for the SA.
Too Short Errors	The number of too short errors that occurred for the SA.
ISAKMP sessions established for this tunnel	The total number of sessions successfully connected by this SA.
ISAKMP sessions failed for this tunnel	The total number of sessions that failed to be connected by this SA.
ISAKMP for this tunnel	NOTE: These items are displayed for the life of the ISAKMP SA.
Phase1 Completed as Responder	Indicates the state of the Phase 1 IPSec negotiation stage and role of the system (either responder or initiator).
Statistics	Displays statistics for the ISAKMP SA.
IN	The number of packets/bytes received.

Field	Description
OUT	The number of packets/bytes transmitted.
1 Phase2 negotiations	The number of negotiations that have taken place in Phase 2.
Negotiated Hard lifetime	The hard lifetime negotiated by the system and the security gateway for inbound SAs. The lifetime is measured in terms kilobytes (kb) and/or seconds (sec). The hard lifetime that dictates the maximum duration for the SA before its termination.

show crypto ipsec security-associations summary

Table 194. show crypto ipsec security-associations summary Command Output Descriptions

Field	Description
vvv	<p>The first value (v) indicates the state of the security association (SA State), which can be:</p> <ul style="list-style-type: none"> • E: Established • P: Partially Established • N: No SAs <p>The second value (v) indicates the state of rekeying (Rekey/Keepalive), which can be:</p> <ul style="list-style-type: none"> • D: Rekey Disabled • E: Rekey Enabled/No Keepalive • K: Rekey Enabled/Keepalive <p>The third value (v) indicates the type of crypto map (Crypto Type) facilitating the security association, which can be:</p> <ul style="list-style-type: none"> • D: Dynamic Map • I: IKEv1 Map • J: IKEv2 Map • M: Manual Map
Map Name	The name of the crypto map facilitating the security association.
Rekeys	The number of rekeys that occurred for the security association.
En Pkts	The number of packets that have been encrypted and transmitted over the security association.
De Pkts	The number of packets that have been received over the security association and decrypted.

show crypto isakmp keys

Table 195. show crypto isakmp keys Command Output Descriptions

Field	Description
Peer IP Address	The IP address of the security gateway(s).
Preshared Key	The pre-shared key(s) (in Hex) exchanged by the security gateway.

show crypto isakmp security-associations

Table 196. show crypto isakmp security-associations Command Output Descriptions

Field	Description
Local IPSec GW	The IP address of the local IPSec gateway.
Remote IPSec GW	The IP address of the remote IPSec gateway.
State	<p>This displays the state of the SA.</p> <p>The two letters at the beginning of the state define the IKE mode as follows:</p> <ul style="list-style-type: none"> • MM - Main Mode • QM - Quick Mode • AM - Aggressive Mode <p>The letter in parentheses () at the end of the state, describe where the state message was initiated as follows:</p> <ul style="list-style-type: none"> • I - Initiator • R - Responder
Lifetime	The lifetime (time) the security association is active and amount of time remaining.

show crypto managers

Table 197. show crypto managers Command Output Descriptions

Field	Description
Total IKEv2 Invalid-MsgId Notify Sent	An invalid KE Payload was received and the receiver sent back a NOTIFY payload to indicate this. This is the number of times a NOTIFY payload was sent to indicate this error condition.
Total IKEv2 Invalid-MsgId Notify Received	A NOTIFY Payload was received indicating that the KE which had been previously sent to the peer was deemed invalid by the peer.
Total IKEv2 Invalid-KE Notify Sent	An IKE packet was received for which the message-id is invalid. A NOTIFY payload was sent to the peer to indicate that the received message-id was invalid. This maintains the count of the number of times that such a NOTIFY payload was sent.
Total IKEv2 Invalid-KE Notify Received	A NOTIFY payload was received indicating that the message-id which had been previously sent to the peer was deemed invalid by the peer.
Total IKEv2 No-Prop-Chosen Notify Sent	The receiver could not accept the protocol proposal which was sent. A NOTIFY payload was sent back to indicate this. This maintains the count of the number of times such a NOTIFY payload was sent.
Total IKEv2 No-Prop-Chosen Notify Received	A NOTIFY payload was received indicating that the proposals which had been previously sent to the peer could not be accepted.

show crypto managers instance

Table 198. show crypto managers instance Command Output Descriptions

Field	Description
IKEv2 DoS Cookie-Challenge Status	Denial of Service status. <ul style="list-style-type: none"> • On • Off
Certificate Information	<p>For non-expired certificates:</p> <ul style="list-style-type: none"> • Serial number: <i><string></i> • Monitoring Timer: Running • Status: Not Expired • Next Timer <i><datetime></i> • Expiry: <i><datetime></i> <p>For expired certificates</p> <ul style="list-style-type: none"> • Serial number: <i><string></i> • Monitorinig Timer: Stopped • Status: Expired • Next Timer: Not Scheduled • Expiry: <i><datetime></i>
IKEv2 Statistics	This displays the IKEv2 statistics for this manager instance
Current IKEv2 SAs	The total number of all IKEv2 SAs for this manager instance
Current half-open IKEv2 SAs	The number of IKEv2 SAs in half-open state for this manager instance
Current Connecting IKEv2 SAs	The number of IKEv2 SAs trying to connect for this manager instance
Current Established IKEv2 SAs	The number of established IKEv2 SAs for this manager instance
Internal Failure Sent	Indicates an internal failiure in ipsecmgr or dcarmgr and a Notify message was sent to the peer.

show crypto managers summary

Table 199. show crypto managers summary Command Output Descriptions

Field	Description
demux-stats	Display sessions demux statistics on each IPsec Manager.
distribution	Display IPsec Manager distribution info.
handoff-stats	Display IKE request handoff Statistics on each IPsec Manager.
ike-stats	Display IKE statistics on each IPsec Manager.
ikev2-stats	Display IKEv2 statistics on each IPsec Manager.
ipsec-sa-stats	Display IPsec SA statistics on each IPsec Manager.

show crypto map summary

Table 200. show crypto map summary Command Output Descriptions

Field	Description
Total Crypto maps	The total number of crypto maps of all types.
Configured maps	The total number of configured crypto maps.
Service maps	The total number of service maps. There is one map per service.
Subscriber maps	The total number of subscriber maps.
Map Types	
ipsec-dynamic	The total number of dynamic IPsec tunnel crypto maps.
ipsec-L2tp	The total number of L2TP IPsec tunnel crypto maps.
ipsec-ikev1	The total number of IKEv1 IPsec tunnel crypto maps.
ipsec-manual	The total number of manual (static) IPsec tunnel crypto maps.
ipsec-ikev2-subscriber	The total number of IKEv2 subscriber tunnel crypto maps.
ipsec-mobile-ip	The total number of mobile IP IPsec tunnel crypto maps.
IKEv2 SA	
Cipher null	The total number of IKEv2 security associations using the block cipher NULL. All IKEv2 security association protected traffic is sent in the clear.
Cipher des	The total number of IKEv2 security associations using the block cipher Data Encryption Standard in Cypher Block Chaining (CBC) mode.
Cipher 3des	The total number of IKEv2 security associations using the block cipher Triple Data Encryption Standard in Cypher Block Chaining (CBC) mode.
Cipher aes-cbc-128	The total number of IKEv2 security associations using the block cipher Advanced Encryption Standard with a 128-bit key in Cypher Block Chaining (CBC) mode.
Cipher aes-cbc-256	The total number of IKEv2 security associations using the block cipher Advanced Encryption Standard with a 256-bit key in Cypher Block Chaining (CBC) mode.
PRF sha1	The total number of IKEv2 security associations using the IKE pseudo-random function (PRF) with the cryptographic hash function Secure Hash Algorithm-1.
PRF md5	The total number of IKEv2 security associations using the IKE pseudo-random function (PRF) with the cryptographic hash function Message Digest 5.
HMAC sha1	The total number of IKEv2 security associations using a keyed-Hash Message Authentication Code (HMAC) with the cryptographic hash function Secure Hash Algorithm-1 truncated to 96 bits.

Field	Description
HMAC md5	The total number of IKEv2 security associations using a keyed-Hash Message Authentication Code (HMAC) with the cryptographic hash function Message Digest 5 truncated to 96 bits.
DH Group 1	The total number of IKEv2 security associations using Diffie-Hellman Group 1 security (the lowest security level). DH Group 1 provides 768 bits of key exchange cryptographic strength. This is a modular exponential (MODP) DH group.
DH Group 2	The total number of IKEv2 security associations using Diffie-Hellman Group 2 security. DH Group 2 (the default) provides 1024 bits of key exchange cryptographic strength. This is a modular exponential (MODP) DH group.
DH Group 5	The total number of IKEv2 security associations using Diffie-Hellman Group 5 security. DH Group 5 provides 1536 bits of key exchange cryptographic strength. This is a modular exponential (MODP) DH group.
DH Group 14	The total number of IKEv2 security associations using Diffie-Hellman Group 14 security (the highest security level). DH Group 14 provides 2048 bits of key exchange cryptographic strength. This is a modular exponential (MODP) DH group.
IPSec SA	
Protocol esp	The total number of IPsec security associations using Encapsulating Security Payload (ESP) protocol.
Protocol ah	The total number of IPsec security associations using Authentication Header (AH) protocol.
Cipher null	The total number of IPsec security associations using the block cipher NULL. All IKEv2 IPsec security association derived traffic is sent in the clear.
Cipher des	The total number of IPsec security associations using the block cipher Data Encryption Standard in Cypher Block Chaining (CBC) mode.
Cipher 3des	The total number of IPsec security associations using the block cipher Triple Data Encryption Standard in Cypher Block Chaining (CBC) mode.
Cipher aes-cbc-128	The total number of IPsec security associations using the block cipher Advanced Encryption Standard with a 128-bit key in Cypher Block Chaining (CBC) mode.
Cipher aes-cbc-256	The total number of IPsec security associations using the block cipher Advanced Encryption Standard with a 256-bit key in Cypher Block Chaining (CBC) mode.
HMAC sha1-96	The total number of IPsec security associations using a keyed-Hash Message Authentication Code (HMAC) with the cryptographic hash function Secure Hash Algorithm-1 truncated to 96 bits (the default).
HMAC md5-96	The total number of IPsec security associations using a keyed-Hash Message Authentication Code (HMAC) with the cryptographic hash function Message Digest 5 truncated to 96 bits.
DH Group 1	The total number of IPsec security associations using Diffie-Hellman Group 1 security (the lowest security level). DH Group 1 provides 768 bits of key exchange cryptographic strength. This is a modular exponential (MODP) DH group.
DH Group 2	The total number of IPsec security associations using Diffie-Hellman Group 2 security. DH Group 2 (the default) provides 1024 bits of key exchange cryptographic strength. This is a modular exponential (MODP) DH group.
DH Group 5	The total number of IPsec security associations using Diffie-Hellman Group 5 security. DH Group 5 provides 1536 bits of key exchange cryptographic strength. This is a modular exponential (MODP) DH group.

Field	Description
DH Group 14	The total number of IPsec security associations using Diffie-Hellman Group 14 security (the highest security level). DH Group 14 provides 2048 bits of key exchange cryptographic strength. This is a modular exponential (MODP) DH group.

show crypto statistics

Table 201. show crypto statistics Command Output Descriptions

Field	Description
Combined ipsec statistics for context <context-name>	The name of the system context for which statistics are displayed.
Transmit Statistics	
ESP Encode	The total number of packets and bytes that were transmitted having been encoded for the SA using the Encapsulating Security Payload (ESP) protocol.
AH Encode	The total number of packets and bytes that were transmitted having been encoded for the SA using the Authentication Header (AH) protocol.
Transmit Error Counters	
Encode Packets	The total number of packets which have errors while encoding.
Encode Bytes	The total number of bytes which have errors while encoding.
Receive Statistics	
ESP Decode	The total number of packets and bytes that were received having been encoded for the SA using the Encapsulating Security Payload (ESP) protocol.
AH Decode	The total number of packets and bytes that were received having been encoded for the SA using the Authentication Header (AH) protocol.
Receive Error Counters	
Decode Packets	The total number of packets which have errors while decoding.
Decode Bytes	The total number of bytes which have errors while encoding.
Replay Packets	The total number of packets which have been replayed.
Replay Bytes	The total number of bytes which have been replayed.
Combined Control Statistics for Context	The name of the system context for which statistics are displayed.
IKE Flow Counts	
IKE Gateway Flows	The number of UDP flows, incremented when UDP flows are allocated and decremented when UDP flows are freed.
IKE Session Flows	The number of cookie flows, incremented when cookie flows are allocated and decremented when cookie flows are freed.
Transmit Statistics	
IKE Packets	The total number of total IKE packets transmitted.
Receive Statistics	

Field	Description
IKE Packets Received	The total number of IKE packets received.
New IKE Req	The total number of IKE packets sent for new IKE requests.
Gateway Flow Packets	The total number of UDP flow packets received.
Session Flow Packets	The total number of cookie flow packets received.
Rekey Statistics	
IKE Rekeys	The total number of times the IKE SAs negotiated during phase 1 of the IPsec negotiation have been rekeyed. This field is for IKEv1 only and it will be 0 for IKEv2.
Dead Peer Detection (DPD) Statistics	
Req Sent	The total number of DPD R-U-THERE packets sent.
Rsp Rcvd	The total number of DPD R-U-THERE-ACK packets received.
Req Rcvd	The total number of DPD R-U-THERE packets received.
Rsp Sent	The total number of DPD R-U-THERE-ACK packets sent.
Disconnects	The total number of DPD disconnects that occurred between the peers.
Timeouts	The total number of ISAKMP DPD protocol messages that have exceeded their configured timeout period.
NAT-T Statistics	
Keepalives Sent	The total number of NATT keepalive packets sent.
Keepalives Rcvd	The total number of NATT keepalive packets received.
Detailed IKE Statistics	
Active IKE SAs	The total number of SAs: <ul style="list-style-type: none"> • Initiated • Responded.
Total IKE SAs	The total number of SAs (cumulative history): <ul style="list-style-type: none"> • Initiated • Responded.
Total Attempts	The total cumulative attempts made to establish SAs: <ul style="list-style-type: none"> • Initiated • Responded.
Total IKE SA Deletes	<ul style="list-style-type: none"> • Req Sent • Rsp Rcvd • Req Rcvd • Rsp Sent
Total Packets In	The total cumulative IKE packets received.

Field	Description
Total Packets Out	The total cumulative IKE packets sent.
Total Octets In	The total cumulative IKE octets received.
Total Octets Out	The total cumulative IKE octets sent.
Establishment Failure Statistics	
Initiation Neg Error	The total number of initiated negotiations that failed because of errors.
Initiation Neg Time Out	The total number of initiated negotiations that failed because of timeouts (no response).
Response Neg Error	The total number of responded negotiations that failed because of errors.
Congestion Reject	The total number of packets which were rejected due to congestion control.
Congestion Drop	The total number of packets which were dropped due to congestion control.
Total Cookie Error	Total errors in cookie challenge. Refer to the detailed counters in IKEv2 section.
IKEv2 Statistics	
Current state:	<ul style="list-style-type: none"> • Current IKEv2 SAs • Current half-open IKEv2 SAs • Current connecting IKEv2 SAs • Current established IKEv2 SAs • Current child SAs
IKEv2 Timer Stats	<ul style="list-style-type: none"> • Total IKESA Retrans expirations • Total IKESA Setup expirations (no exchange) • Total IKESA Setup expirations • Total IKESA Lifetime (soft) expirations • Total IKESA Lifetime (hard) expirations • Total TSELSA Lifetime (soft) expirations • Total TSELSA Lifetime (hard) expirations
IKEv2 Exchanges dropped	<ul style="list-style-type: none"> • Total IKEv2 Resp Pkts Drop - No IKESA • Total invalid resp • Total non-init exch drop--no IKESA • Total invalid message ID • Total invalid major version • Total IKESA error • Total unknown critical payload

Field	Description
IKEv2 Cookie Statistics	<ul style="list-style-type: none"> • Total cookie notify packets sent • Total cookie notify packets received • Total cookie notify match • Total cookie notify not match
IKEv2 Rekey Statistics	<ul style="list-style-type: none"> • Total IKESA Rekey sent • Total IKESA Rekey received • Total IKESA Rekey ignored • Total ChildSA Rekey sent • Total ChildSA Rekey received • Total ChildSA Rekey ignored
IKEv2 MOBIKE Statistics	<ul style="list-style-type: none"> • Total MOBIKE notify sent • Total MOBIKE received • Total Mobike ignored
IKEv2 Misc Statistics	<ul style="list-style-type: none"> • Total SA create failure • Total SA flow operation failure • Total NAT Keepalive received • Total Invalid-KE notify sent • Total Invalid-KE notify received • Total Invalid-msgID notify received • Total No-Prop-Chosen notify sent • Total No-Prop-Chosen notify received

Field	Description
IKEv2 Exchange Decode failure statistics	<ul style="list-style-type: none"> • Total pkts failure • Total internal errors • Total invalid IP HDR • Total invalid UDR HDR • Total invalid IKE HDR • Total invalid IKE HDR payload • Total invalid IKE HDR MJ ve • Total invalid IKE HDR MN verr • Total invalid IKE HDR exchange type • Total invalid IKE HDR Rsvd flag • Total invalid IKE HDR length • Total invalid payload syntax • Total invalid payload len • Total unknown crit payload • Total too many payloads • Total invalid SA payload len • Total invalid SA proposal HDR • Total invalid SA proposal HDR Reserved • Total too many transforms • Total invalid SA proposal HDR len • Total too many proposals • Total invalid protocol ID • Total invalid first SA proposal num • Total invalid SA proposal num • Total invalid transform len • Total invalid transform HDR • Total invalid transform HDR Rsvd • Total invalid transform type • Total invalid transform ID

Field	Description
IKEv2 Exchange Decode failure statistics (continued)	<ul style="list-style-type: none"> • Total invalid KE payload len • Total invalid KE DH Group len • Total invalid ID payload type • Total invalid ID payload len • Total invalid KE DH group • Total invalid KE DH groups • Total invalid Transform ID • Total invalid auth payload len • Total invalid nonce payload len • Total invalid notify payload len • Total invalid notify payload SPI size • Total Invalid Notify payload Proto ID • Total invalid notify payload NATT • Total invalid notify payload Cookie • Total Invalid notify payload Rekey • Total invalid notify payload NATT • Total invalid notify payload Cookie • Total invalid notify payload Rekey • Total invalid EAP payload len • Total invalid CP payload len • Total invalid CP payload attr len • Total invalid payload unknown attr • Total invalid Encrypted Payload len • Total invalid TS payload len • Total invalid TS payload Rsvd • Total invalid TS payload TS-type • Total unsupported crit payload • Total unsupported cert payload • Total unsupported Auth method

Field	Description
IKEv2 Exchange Decode failure statistics (continued)	<ul style="list-style-type: none"> • Total unsupported SA payload Prot AH • Total unsupported Notify Prot AH • Total unsupported payload Crit VID • Total unsupported TS payload TS_Type • Total unsupported method • Total unknown error
IKEv2 Decrypt Failure statistics	<ul style="list-style-type: none"> • Total Pkts failure • Total HMAC mismatch • Total pad length error
IKEv2 Xchg statistics	<ul style="list-style-type: none"> • Total Bad Msg ID • Total bad response • Total stale message ID • Total unknown error • Total state lookup failure

show crypto statistics ikev2 service-name

Table 202. show crypto statistics IKEv2 service-name Command Output Descriptions

Field	Description
Flow Counts	
Current UDP flows	The total number of UDP port based flows in the data path.
Current Cookie flows	The total number of cookie challenge based flows in the data path.
Transmit Statistics	
IKE Packets	The total number of total IKE packets transmitted.
Receive Statistics	
IKE Packets Received	The total number of IKE packets received.
New IKE Requests	The total number of IKE packets sent for new IKE requests.
UDP flow Packets	The total number of packets that matched the UDP flow.
Cookie flow Packets	The total number of packets that matched the cookie flow.
Rekey Statistics	
IKE Rekeys	The total number of successful IKE_SA rekeys.
Dead Peer Detection (DPD) Statistics	
Requests sent	The total number of DPD R-U-THERE packets sent.
Replies received	The total number of DPD R-U-THERE-ACK packets received.
Requests received	The total number of DPD R-U-THERE packets received.
Replies sent	The total number of DPD R-U-THERE-ACK packets sent.
Collisions	The total number of events that IKEv2 keepalive exchanges occur simultaneously from the PDIF and the MS.
Disconnects	The total number of DPD disconnects that occurred between the peers.
Timeouts	The total number of DPD protocol messages that have exceeded their configured timeout period.
NAT-T Statistics	
Keepalives sent	The total number of NAT-T keepalive packets sent.
Detailed IKE Statistics	
Active IKE SAs	The total number of IKE SAs.
Initiated	The total number of the active SAs initiated locally.

```
show crypto statistics ikev2 service-name
```

Field	Description
Responded	The total number of the active SAs responded.
Total IKE SAs so far	The total number of SAs (cumulative history).
Initiated	The total cumulative IKE SAs initiated locally.
Responded	The total cumulative IKE SAs responded to.
Total attempts so far	The total cumulative attempts made to establish SAs.
Initiated	The total number of SA establishment attempts initiated locally.
Responded	The total number of SA establishment attempts responded to.
Total deletes so far	The total cumulative deletes so far.
Requests received	The total number of requests received.
Requests sent	The total number of requests sent.
Replies received	The total number of replies received.
Replies sent	The total number of replies sent.
Total packets in	The total cumulative IKEv2 packets received.
Total packets out	The total cumulative IKEv2 packets sent.
Total octets in	The total cumulative IKEv2 octets received.
Total octets out	The total cumulative IKEv2 octets sent.
Failed initiated negotiations with errors	The total number of initiated negotiations that failed because of errors.
Failed initiated negotiations with time out:	The total number of initiated negotiations that failed because of timeouts (no response).
Failed responded negotiations with errors	The total number of responded negotiations that failed because of errors.
Total cookie errors	The total number of cookie errors encountered.
Congestion rejects	The total number of packets rejected due to congestion.
Congestion drops	The total number of packets dropped due to congestion.
Total Unknown Exchange SPI	The total number of unknown exchange SPIs.
IKEv2 Detail Statistics	
Current State	
Current IKEv2 SAs	The number of current IKEv2 SAs.

Field	Description
Current Half-Open IKEv2 SAs	The number of IKEv2 SAs in a half-open state.
Current Connecting IKEv2 SAs	The number of IKEv2 SAs currently connecting.
Current Established IKEv2 SAs	The number of established IKEv2 SAs.
Current Child SAs	The number of current child SAs.
Total IKEv2 Timer Statistics	
IKESA Retrans Expirations	The total number of retransmission expirations.
IKESA Setup Expirations (no Xchg)	The number of IKESA setups that expired with no exchange.
IKESA Setup Expirations	The total number of IKESA Session setups expired.
IKESA Lifetime (Soft) Expirations	The number of IKESA soft lifetime timer expirations.
IKESA Lifetime (Hard) Expirations	The number of IKESA hard lifetime timer expirations.
CHILD_SA Setup Expirations (no Xchg)	The number of Child SA setups that expired with no exchange.
CHILD_SA Lifetime (Soft) Expirations	The number of Child SA soft lifetime timer expirations.
CHILD_SA Lifetime (Hard) Expirations	The number of Child SA hard lifetime timer expirations.
Total IKEv2 Multiple Authentication Statistics	
Phase 1 Auth Successes	The number of multi-auth Phase 1 EAP authentication successes.
Phase 1 Auth Failures	The number of multi-auth Phase 1 EAP authentication failures.
Phase 1 Auth Req Sent	The number of multi-auth Phase 1 EAP authentication requests sent.
Phase 1 Auth Resp Rcvd	The number of multi-auth Phase 1 EAP authentication responses received.
Phase 2 Auth Successes	The number of multi-auth Phase 2 EAP authentication successes.

■ show crypto statistics ikev2 service-name

Field	Description
Phase 2 Auth Failures	The number of multi-auth Phase 2 EAP authentication failures.
Phase 2 Auth Req Sent	The number of multi-auth Phase 2 EAP authentication requests sent.
Phase 2 Auth Resp Rcvd	The number of multi-auth Phase 2 EAP authentication responses received.
Phase 2 Auth MD5 Successes	The number of multi-auth Phase 2 EAP authentication with MD5 successes.
Phase 2 Auth MD5 Failures	The number of multi-auth Phase 2 EAP authentication with MD5 failures.
Phase 2 Auth GTC Successes	The number of multi-auth Phase 2 EAP authentication with GTC mode successes.
Phase 2 Auth GTC Failures	The number of multi-auth Phase 2 EAP authentication with GTC mode failures.
Hash match failures	The number of hash match failures.
Signing failures	The number of signing failures.
MSK missing at phase 1 comp	The number of EAP Master Session Keys (MSK) not found.
Miss Another Auth Follows	The number of missed authentications that follow.
Total IKEv2 Exchanges Dropped	
Resp Pkts Drop - No IKESA	The number of IKEv2 response packets dropped without an IKEv2 SA being created.
Invalid Resp	The total number of invalid response messages.
Non-Init Exch Drop - No IKESA	The total number of IKEv2 exchanges dropped without an IKEv2 SA being created.
Invalid MSG ID	The total number of sessions dropped due to packets with invalid MSG ID.
Invalid Major Version	The total number of sessions dropped due to packets with invalid major version.
IKESA error	The total number of IKESA error messages.
Unknown Crit Payload	The total number of unknown critical payload messages.
Retransmitted request	IKEV2 Stack does not process the packets in the order they are received. New packets are queued if any packet is under processing. After completing the processing, stack consider processing the packets queue first instead of taking the latest packet received from network directly and leaving the packets in queue for later. And if any message is received with same message ID which is currently under processing, then that message will be discarded as retransmitted message received. The count for such request is 'Retransmitted Request'.

Field	Description
Total IKEv2 Notify Statistics	
Cookie Notify Sent	The total number of IKEv2 Denial of Service (DoS) cookie notify packets sent.
Cookie Notify Received	The total number of IKEv2 DoS cookie notify packets received.
Cookie Notify Match	The total number of IKEv2 DoS cookie notify messages that match.
Cookie Notify Not Match	The total number of IKEv2 DoS cookie notify messages that do not match.
Multi Auth Supported	The total number of multiple authentications supported.
Another Auth Follows	The total number of authentications that follow.
Total IKEv2 Rekey Statistics	
IKESA Rekey Sent	The total number of IKESA Rekey Request messages sent.
IKESA Rekey Rcvd	The total number of IKESA Rekey Request messages received.
IKESA Rekey Ignored	The total number of IKESA Rekey messages ignored.
ChildSA Rekey Req Sent	The total number of Child SA Rekey Request messages sent.
ChildSA Rekey Req Rcvd	The total number of Child SA Rekey Request messages received.
ChildSA Rekey Rsp Sent	The total number of Child SA Rekey Response messages sent.
ChildSA Rekey Rsp Rcvd	The total number of Child SA Rekey Response messages received.
ChildSA Rekey Ignored	The total number of Child SA Rekey messages ignored.
Total IKEv2 MOBIKE Statistics	
MOBIKE Notify Sent	The total number of MOBIKE notify messages sent. MOBIKE is not supported. All MOBIKE messages are treated as if they were never received.
MOBIKE Rcvd	The total number of MOBIKE packets received.
MOBIKE Ignored	The total number of MOBIKE packets dropped.
Total IKEv2 Misc Statistics	
SA Create Failure	The total number of SA creations failed.
SA Flow Operation Failure	The total number of SA flow operations failed.

■ show crypto statistics ikev2 service-name

Field	Description
Total IKEv2 Notify Payload Sent Statistics	
Invalid KE Payload	The total number of IKEv2 NOTIFY payloads sent of the NOTIFY type Invalid KE Payload.
Invalid Major Version	The total number of IKEv2 NOTIFY payloads sent of the NOTIFY type Invalid Major Version.
Invalid Message ID	The total number of IKEv2 NOTIFY payloads sent of the NOTIFY type Invalid Message ID.
Invalid Syntax	The total number of IKEv2 NOTIFY payloads sent of the NOTIFY type Invalid Syntax.
No Additional SAs	The total number of IKEv2 NOTIFY payloads sent of the NOTIFY type No Additional SAs.
No Proposal Chosen	The total number of IKEv2 NOTIFY payloads sent of the NOTIFY type No Proposal Chosen.
TS Unacceptable	The total number of IKEv2 NOTIFY payloads sent of the NOTIFY type TS Unacceptable.
Unsupported Critical Payload	The total number of IKEv2 NOTIFY payloads sent of the NOTIFY type Unsupported Critical Payload.
Internal Failure Sent	The total number of IKEv2 NOTIFY payloads sent of the NOTIFY type Internal Failure Sent.
Total IKEv2 Notify Payload Received Statistics	
Invalid KE Payload	The total number of IKEv2 NOTIFY payloads received of the NOTIFY type Invalid KE Payload.
Invalid Major Version	The total number of IKEv2 NOTIFY payloads received of the NOTIFY type Invalid Major Version.
Invalid Message ID	The total number of IKEv2 NOTIFY payloads received of the NOTIFY type Invalid Message ID.
Invalid Syntax	The total number of IKEv2 NOTIFY payloads received of the NOTIFY type Invalid Syntax.
No Additional SAs	The total number of IKEv2 NOTIFY payloads received of the NOTIFY type No Additional SAs.
No Proposal Chosen	The total number of IKEv2 NOTIFY payloads received of the NOTIFY type No Proposal Chosen.
TS Unacceptable	The total number of IKEv2 NOTIFY payloads received of the NOTIFY type TS Unacceptable.
Unsupported Critical Payload	The total number of IKEv2 NOTIFY payloads received of the NOTIFY type Unsupported Critical Payload.
IKEv2 Exchange Decode Failure Statistics	
Packet Failures	The number of IKEv2 packets that fail to decode.
Internal Errors	The total number of failures due to internal errors.
Invalid IP HDR	The total number of failures due to an invalid IP header.
Invalid UDP HDR	The total number of failures due to an invalid UDP header.
Invalid IKE HDR	The total number of failures due to an invalid IKE header.
Invalid IKE HDR Payload	The total number of failures due to an invalid IKE header payload.
Invalid IKE HDR Init SPI	The total number of failures due to an invalid IKE header initiator security parameter index.

Field	Description
Invalid IKE HDR Resp SPI	The total number of failures due to an invalid IKE header responder security parameter index.
Invalid IKE HDR Major Ver	The total number of failures due to an invalid IKE header major version.
Invalid IKE HDR Minor Ver	The total number of failures due to an invalid IKE header minor version.
Invalid IKE HDR Xchg Type	The total number of failures due to an invalid IKE header exchange type.
Invalid IKE HDR Rcvd Flag	The total number of failures due to an invalid IKE header received flags.
Invalid IKE HDR Len	The total number of failures due to an invalid IKE header length.
Invalid Syntax	The total number of failures due to an invalid syntax.
Invalid Payload Syntax	The total number of failures due to an invalid payload syntax.
Invalid Payload Len	The total number of failures due to an invalid payload length.
Unknown Crit Payload	The total number of failures due to an unknown critical payload.
Too many payloads	The total number of failures due to many payloads.
Invalid SA Payload Len	The total number of failures due to an invalid SA payload length.
Invalid SA Proposal HDR	The total number of failures due to an invalid SA proposal header.
Invalid SA Proposal HDR Rcvd	The total number of failures due to an invalid SA proposal header received.
Too many transforms	The total number of failures due to many transform-sets in the SA payload.
Invalid SA Proposal HDR Len	The total number of failures due to an invalid SA proposal header length.
Too many proposals	The total number of failures due to many proposals in SA payload.
Invalid first SA Proposal num	The total number of failures due to an invalid first SA proposal number.
Invalid SA Proposal ID	The total number of failures due to an invalid Protocol ID in SA payload.
Invalid SA Proposal num	The total number of failures due to an invalid SA proposal number.
Invalid Transform Len	The total number of failures due to an invalid transform-set length.

Field	Description
Invalid Transform HDR	The total number of failures due to an invalid transform-set header.
Invalid Transform HDR Rcvd	The total number of failures due to an invalid transform-set header received.
Invalid Transform Type	The total number of failures due to an invalid transform-set type.
Invalid Transform ID	The total number of failures due to an invalid transform-set ID.
Invalid KE Payload Len	The total number of failures due to an invalid key exchange payload length.
Invalid KE DH Group	The total number of failures due to an invalid key exchange Diffie-Hellman group number.
Invalid KE DH Group Len	The total number of failures due to an invalid ID payload length.
Invalid ID Payload Len	The total number of failures due to an invalid ID payload length.
Invalid ID Payload Type	The total number of failures due to an invalid ID payload type.
Invalid Auth Payload Len	The total number of failures due to an invalid authorization payload length.
Invalid Nonce Payload Len	The total number of failures due to an invalid nonce payload length.
Invalid Notify Payload Len	The total number of failures due to an invalid notify payload length.
Invalid Notify Payload SPI Len	The total number of failures due to an invalid notify payload security parameter index size.
Invalid Notify Payload NAT	The total number of failures due to an invalid notify payload Network Address Translation-Traversal.
Invalid Notify payload Proto Id	The total number of failures due to an invalid notify payload protocol ID.
Invalid EAP Payload len	The total number of failures due to an invalid Encapsulation Authentication Protocol payload length.
Invalid Notify Payload Rekey	The total number of failures due to an invalid notify payload rekey.
Invalid CP Payload len	The total number of failures due to an invalid CP payload length.
Invalid Notify Payload Cookie	The total number of failures due to an invalid notify payload cookie.

Field	Description
Invalid TS Payload len	The total number of failures due to an invalid transform-set payload length.
Invalid CP Payload Attr Len	The total number of failures due to an invalid CP payload unknown attribute length.
Invalid TS Payload Rcvd	The total number of failures due to an invalid transform-set payload received.
Invalid Encrypted Payload Len	The total number of failures due to an invalid encrypted payload length.
Invalid TS payload TS-Type	The total number of failures due to an invalid transform-set payload transform-set type.
Unsupported Crit Payload	The total number of failures due to an unsupported critical payload.
Unsupported Cert Payload	The total number of failures due to an unsupported certified payload.
Unsupported Notify Prot AH	The total number of failures due to an unsupported notify payload protocol Authentication Header.
Unsupported Auth method	The total number of failures due to an unsupported authentication method.
Unsupported Payload Crit VID	The total number of failures due to an unsupported payload critical V-LAN ID.
Unsupported method	The total number of failures due to an unsupported method.
Unknown Error	The total number of failures due to an unknown error.
Unsupported SA Payload Prot AH	The total number of failures due to an unsupported SA payload protocol Authentication Header.
Unsupported TS payload TS-Num	The total number of failures due to an unsupported transform-set payload number.
Unsupported TS Payload TS-Type	The total number of failures due to an unsupported transform-set payload transform-set-type.
Unsupported TS Payload TS-Prot	The total number of failures due to an unsupported transform-set payload protocol.
Unsupported CP Payload No IP Attr	The total number of failures due to an invalid CP because of no available IP attribute.
Invalid CP Payload UNK ATTR	The total number of failures due to an invalid CP because of an unknown attribute.
Total IKEv2 Decrypt Failure Statistics	
Packets Failure	The total number of session failures due to packets that failed to decrypt.
HMAC mismatch	The total number of session failures due to a HMAC mismatch.

■ show crypto statistics ikev2 service-name

Field	Description
Pad length error	The total number of failures due to a pad length error in the packet.
Total IKEv2 Xchg Statistics	
Bad Msg Id	The total number of session failures due to a bad message ID.
Bad Response	The total number of session failures due to a bad response.
Stale Msg ID	The total number of session failures due to a stale message ID.
Unknown error	The total number of session failures due to unknown errors.
Stale Lookup Failure	The total number of session failures due to a stale lookup failure.
Combined Crypto map Statistics	
Current Tunnels	The number of tunnels currently connected by the SA.
Current Tunnels Established	The number of tunnels successfully connected by the SA.
IKE Fails	The total number of tunnels that failed to be connected by the SA.
Total Tunnels	The total number of tunnels connected by the SA.
Total Tunnels Established	The total number of tunnels successfully connected by the SA.
Call Req Rejects	The total number of call request reject messages.

Chapter 87

show cs-network

This chapter includes the `show cs-network` command output tables.

show cs-network all status

Table 203. show cs-network all status Command Output Descriptions

Field	Description
CS Network name	Indicates the name of the Circuit Switched (CS) network instance for which status is displayed.
Associated SCCP-Network	Indicates the name of the Signalling Connection Control Part (SCCP) network service instance which is associated with the referenced CS network instance.
Associated Alcap-Service	Indicates the name of the Access Link Control Application Protocol (ALCAP) service instance which is associated with the referenced CS network instance.
Alcap Context Name	Indicates the name of the context in which ALCAP service instance is configured.
Associated RTP Pool	Indicates the name of the RTP IP pool configured and associated with the referenced CS network instance for RTP stream management.
RTP Pool Context Name	Indicates the name of the context in which RTP IP pool is configured for RTP stream management.
MSC Point Code	Indicates the address of MSC in SS7 point code notation which is serving the referenced CS network instance.
Status	Indicates the status of MSC which is serving the referenced CS network instance.
Network Status	Indicates the status of network in which the referenced CS network instance is placed.
RTP IP Addresses	Indicates the session manager instances and associated IP pools with them for RTP stream management support.
NRI	Indicates the Network Resource Identification (NRI) bit configuration status for the referenced CS network.
IDNNS	Indicates the Intra-Domain NAS Node Selector (IDNNS) configuration status for the referenced CS network to transport the NRI value.
Lac range <nnn> to <nnn> MSC Point-code <x.x.x>	Indicates the mapping configured between MSC point-code and range of LAC for multiple MSC selection without Iu-Flex in CS network.
CORE NODE MAP	Indicates the core node mapping configuration status for the referenced CS network.
Ranap Reset Ack Timer	The timer value, in seconds, that defines how long the HNB-GW waits for a RESET ACK message from the MSC after transmitting a RESET message. This setting is used only if the HNB-GW Initiated RANAP Reset function is enabled.
Ranap Reset Maximum Retransmissions	Sets the maximum number of retries allowed for the HNB-GW to transmit a RANAP RESET message to the MSC if the RESET ACK timer expires. This setting is used only if the HNB-GW Initiated RANAP Reset function is enabled.
Ranap Reset Guard Timer	The timer that the HNB-GW starts after receiving a RESET message from the CS core network. While this timer is running, the HNB-GW discards any new RESET messages that it receives.

Field	Description
Global RNC-Id	This group displays the information related to global Radio Network Controller settings for use by the CS core network for HNB-GW service(s) on a chassis. It is configured under the PLMN-ID.
MCC	The Mobile Country Code defined for use with this HNB-GW service. It consists of the first 3 digits of the Available Radio Network PLMN ID.
MNC	The Mobile Network Code defined for use with this HNB-GW service. It consists of the last 3 digits of the Available Radio Network PLMN ID.
Id	The Radio Network Controller ID provided to HNBs for use by the CS core network for this HNB-GW service. It is configured under the PLMN-ID

Chapter 88

show cscf

This chapter includes the `show cscf` command output tables.

show cscf nat media mapping all

Table 204. show cscf nat media mapping all Command Output Descriptions

Field	Description
UE-Origin	The IP address and port number of the UE origin.
UE-Destination	The IP address and port number of the UE destination.
Nwk-Origin	The IP address and port number of the network origin.
Nwk-Destination	The IP address and port number of the network destination.
Nwk-Core-context	The context in which the network core configuration resides.
UE-Access-context	The context in which the UE access configuration resides.

show cscf peer-servers full

Table 205. show cscf peer-servers full Command Output Descriptions

Field	Description
Peer-Server name	The name of the peer server group.
Context	The context in which the peer server group configuration resides.
Server type	The type of servers in the peer server group.
Hunting-method	The hunting method used by the servers in the peer server group.
server	The name of the peer server.
Address	The IP address of the peer server expressed in IPv4 or IPv6 dotted decimal notation.
domain	The domain name of the peer server.
Monitor status	The monitoring status of the peer servers as determined by the CLI command Enabled/Disabled.
monitor-interval (seconds)	The time period, in seconds, between monitor intervals.
monitor-message	The SIP message (OPTIONS) to be sent after each monitoring interval.
monitor-response-timer (seconds)	The response wait timer, in seconds, for each monitor message.
Server mode	The mode of the peer server as determined by the CLI command Active/Standby.
Server status	The status of the peer server. Possible statuses are: <ul style="list-style-type: none"> • OUT_OF_SERVICE — Peer server mode changed to standby through CLI command. • AVAILABLE — Peer server mode is Active and peer server sends response to monitor message. • UNAVAILABLE — Peer server mode is Active, however, peer server does not send response to monitor message.
Network session template	Binds the nw-session-template name with the peer server.
IMS Capable	Indicates if the peer server is ims-capable or not.
Request Rx	The number of requests received by the sip-as peer server from S-CSCF during load balancing.

show cscf service li-packet-cable statistics

Refer to the *ASR 5000 Lawful Intercept Configuration Guide* for descriptions of these statistics.

show cscf service statistics name <service_name> all

Table 206. show cscf service statistics name <service_name> all Command Output Descriptions

Field	Description
CSCF Service	The name of the service and context.
CSCF Active Subscriptions	
Originating	The total current number of active subscriptions originating on this service.
Terminating (UE originated)	The total current number of UE-originated active subscriptions terminating on this service.
Terminating (PCSCF Originated)	The total current number of Proxy CSCF-originated active subscriptions terminating on this service.
Terminating (AS Originated)	The total current number of AS-originated active subscriptions terminating on this service.
Proxied	The total current number of active subscriptions proxied on this service.
CSCF Calls	
Total CallSetupAttempts Rx	The total current number of call setup attempts received by this service.
Total CallSetupAttempts Tx	The total current number of call setup attempts transmitted by this service.
Total CallSetupSuccess Rx	The total current number of successful call setups received by this service.
Total CallSetupSuccess Tx	The total current number of call setups successfully transmitted by this service.
Total CallSetupFailures Rx	The total current number of call setup failures received by this service.
Total CallSetupFailures Tx	The total current number of failed call setups transmitted by this service.
Total 3xx Responses Rx	The total current number of 3xx responses received by this service.
Total 3xx Responses Tx	The total current number of 3xx responses transmitted by this service.
Total 402 Payment Required Rx	The total current number of 402 Payment Required responses received by this service.
Total 402 Payment Required Tx	The total current number of 402 Payment Required responses transmitted by this service.
Total 403 Forbidden Rx	The total current number of 403 Forbidden responses received by this service.
Total 403 Forbidden Tx	The total current number of 403 Forbidden responses transmitted by this service.
Total 404 Not Found Rx	The total current number of 404 Not Found responses received by this service.
Total 404 Not FoundTx	The total current number of 404 Not Found responses transmitted by this service.
Total 405 Method Not Allowed Rx	The total current number of 405 Method Not Allowed responses received by this service.

```
show cscf service statistics name <service_name> all
```

Field	Description
Total 405 Method Not AllowedTx	The total current number of 405 Method Not Allowed responses transmitted by this service.
Total 407 Proxy Auth Required Rx	The total current number of 407 Proxy Auth Required responses received by this service.
Total 407 Proxy Auth Required Tx	The total current number of 407 Proxy Auth Required responses transmitted by this service.
Total 408 Request Timeout Rx	The total current number of 408 Request Timeout responses received by this service.
Total 408 Request Timeout Tx	The total current number of 408 Request Timeout responses transmitted by this service.
Total 420 Bad Extension Rx	The total current number of 420 Bad Extension responses received by this service.
Total 420 Bad Extension Tx	The total current number of 420 Bad Extension responses transmitted by this service.
Total 421 Extension Required Rx	The total current number of 421 Extension Required responses received by this service.
Total 421 Extension Required Tx	The total current number of 421 Extension Required responses transmitted by this service.
Total 480 Temp Not Available Rx	The total current number of 480 Temp Not Available responses received by this service.
Total 480 Temp Not Available Tx	The total current number of 480 Temp Not Available responses transmitted by this service.
Total 486 Busy Here Rx	The total current number of 486 Busy Here responses received by this service.
Total 486 Busy Here Tx	The total current number of 486 Busy Here responses transmitted by this service.
Total 487 Request Cancel Rx	The total current number of 487 Request Cancel responses received by this service.
Total 487 Request Cancel Tx	The total current number of 487 Request Cancel responses transmitted by this service.
Total 488 Not Acceptable Media Rx	The total current number of 488 Not Acceptable Media responses received by this service.
Total 488 Not Acceptable Media Tx	The total current number of 488 Not Acceptable Media responses transmitted by this service.
Total 4xx Responses Rx	The total current number of 4xx responses received by this service.
Total 4xx Responses Tx	The total current number of 4xx responses transmitted by this service.
Total 5xx Responses Rx	The total current number of 5xx responses received by this service.
Total 5xx Responses Tx	The total current number of 5xx responses transmitted by this service.
Total 500 Internal Error Rx	The total current number of 500 Internal Error responses received by this service.
Total 500 Internal Error Tx	The total current number of 500 Internal Error responses transmitted by this service.
Total 503 Service Unavailable Rx	The total current number of 503 Service Unavailable responses received by this service.

Field	Description
Total 503 Service Unavailable Tx	The total current number of 503 Service Unavailable responses transmitted by this service.
Total 6xx Responses Rx	The total current number of 6xx responses received by this service.
Total 6xx Responses Tx	The total current number of 6xx responses transmitted by this service.
Total CallReleaseAttempts Rx	The total current number of call release attempts received by this service.
Total CallReleaseAttempts Tx	The total current number of call release attempts transmitted by this service.
Total CallReleaseSuccess Rx	The total current number of call releases successfully received by this service.
Total CallReleaseSuccess Tx	The total current number of successful call releases transmitted by this service.
Total CallReleaseFailures Rx	The total current number of call release failures received by this service.
Total CallReleaseFailures Tx	The total current number of failed call releases transmitted by this service.
Total Call Attempts Challenged	The total current number of call attempts challenged on this service.
Total Session Timer Expires	The total current number of sessions on this service with expired timers.
Total Call Rejects from PCRF/PDF	The total current number of calls rejected by the PCRF/PDF from this service.
Total Call Rejects from Proxy (local)	The total current number of calls rejected by the local proxy from this service.
Total Too Large SIP Messages	The total current number of too large SIP messages on this service.
Total HSS Accesses	The total current number of HSS accesses by this service.
Total Emergency Calls	The total current number of emergency calls made through this service.
Total Toll Free Calls	The total current number of toll-free calls made through this service.
Total Premium Service Calls	The total current number of premium-service calls made through this service.
Total International Calls	The total current number of international calls made through this service.
Total LongDistance Calls	The total current number of long distance calls made through this service.
Total Operator Assisted Calls	The total current number of operator-assisted calls made through this service.
Total Directory Assisted Calls	The total current number of directory-assisted calls made through this service.
Total Media (audio) Loss Call Releases	The total current number of media (audio) loss call releases by this service.
Total RTP Packets Sent	The total current number of RTP packets sent by this service.
Total RTP Packets Received	The total current number of RTP packets received by this service.
Total MSRP Packets Sent	The total current number of MSRP TCP packets sent by this service.

```
show cscf service statistics name <service_name> all
```

Field	Description
Total MSRP Packets Received	The total current number of MSRP TCP packets received by this service.
Total RTCP Packets Sent	The total current number of RTCP packets sent by this service.
Total RTCP Packets Received	The total current number of RTCP packets received by this service.
Total Call Releases initiated by UE	The total current number of UE-initiated call releases. <ul style="list-style-type: none"> For P-CSCF, the number of BYE initiated by UE. For S-CSCF, the number of BYE received from P-CSCF (initiated by UE/P-CSCF).
Total Call Releases initiated by Network	The total current number of network-initiated call releases. <ul style="list-style-type: none"> For P-CSCF, the number of BYE received from S-CSCF. For S-CSCF, the number of BYE received from AS, etc.
Total Call Releases initiated by Radio Loss	The total current number of Radio Loss-initiated call releases; the number of BYE originated by P-CSCF due to radio coverage loss of UE.
Total Call Releases initiated by CSCF (Local)	The total current number of CSCF (Local)-initiated call releases; the number of BYE originated by CSCF due to CLI, radio loss, network-initiated de-registration, and internal processing failure.
Total Calls rejected due to Concurrent Call limit exceeded	The total current number of calls rejected due to concurrent call limit exceeded by this service.
CSCF Congestion Control Statistics	
Registration Attempts Rejected	The total current number of registration (SIP REGISTER message) attempts rejected by CSCF service due to congestion trigger.
Re-Registration Attempts Rejected	The total current number of re-registration (SIP REGISTER message) attempts rejected by CSCF service due to congestion trigger.
Call Setup Attempts Rejected	The total current number of call setup attempts (SIP INVITE) rejected by CSCF service due to congestion trigger.
Message Attempts Rejected	The total current number of SIP MESSAGE requests rejected by CSCF service due to congestion trigger.
Subscription Attempts Rejected	The total current number of SIP SUBSCRIBE requests rejected by CSCF service due to congestion trigger.
Notification Attempts Rejected	The total current number of SIP NOTIFY requests rejected by CSCF service due to congestion trigger.
Publish Attempts Rejected	The total current number of SIP PUBLISH attempts rejected by CSCF service due to congestion trigger.
Other SIP Message Attempts Rejected	The total current number of other SIP requests (excepts those mentioned above) rejected by CSCF service due to congestion trigger.
Messages dropped due to congestion	The total current number of SIP messages dropped by CSCF service due to congestion trigger.

Field	Description
TCP packets dropped due to congestion	The total current number of TCP packets dropped by CSCF service due to congestion trigger.
Number of times congestion applied	The number of times the sessmgr congestion control is triggered. This value is collected from all sessmgrs running the CSCF service.
Number of times congestion cleared	The number of times the sessmgr congestion control is cleared. This value is collected from all sessmgrs running the CSCF service.
CSCF MESSAGE Statistics	
Message Attempts Received	The total current number of message attempts received by this service.
Message Attempts Transmitted	The total current number of message attempts transmitted by this service.
Message Success Received	The total current number of successful messages received by this service.
Message Success Transmitted	The total current number of messages successfully transmitted by this service.
Message Failures Received	The total current number of message failures received by this service.
Message Failures Transmitted	The total current number of failed messages transmitted by this service.
3xx Response Received	The total current number of 3xx Response messages received on this service.
3xx Response Transmitted	The total current number of 3xx Response messages transmitted by this service.
400 Bad Request Received	The total current number of 400 Bad Request messages received on this service.
400 Bad Request Transmitted	The total current number of 400 Bad Request messages transmitted by this service.
403 Forbidden Received	The total current number of 403 Forbidden messages received on this service.
403 Forbidden Transmitted	The total current number of 403 Forbidden messages transmitted by this service.
404 Not Found Received	The total current number of 404 Not Found messages received on this service.
404 Not Found Transmitted	The total current number of 404 Not Found messages transmitted by this service.
413 Request Entity Too Large	The total current number of 413 Request Entity Too Large messages received on this service.
413 Request Entity Too Large	The total current number of 413 Request Entity Too Large messages transmitted by this service.
415 Unsupport Media Type Received	The total current number of 415 Unsupport Media Type messages received on this service.
415 Unsupport Media Type Transmitted	The total current number of 415 Unsupport Media Type messages transmitted by this service.
416 Unsupport URI Scheme Received	The total current number of 416 Unsupport URI Scheme messages received on this service.
416 Unsupport URI Scheme Transmitted	The total current number of 416 Unsupport URI Scheme messages transmitted by this service.
420 Bad Extension Received	The total current number of 420 Bad Extension messages received on this service.

```
show cscf service statistics name <service_name> all
```

Field	Description
420 Bad Extension Transmitted	The total current number of 420 Bad Extension messages transmitted by this service.
421 Extension Required Received	The total current number of 421 Extension Required messages received on this service.
421 Extension Required Transmitted	The total current number of 421 Extension Required messages transmitted by this service.
480 Temp Not Available Received	The total current number of 480 Temp Not Available messages received on this service.
480 Temp Not Available Transmitted	The total current number of 480 Temp Not Available messages transmitted by this service.
488 Not Acceptable Media Received	The total current number of 488 Not Acceptable Media messages received on this service.
488 Not Acceptable Media Transmitted	The total current number of 488 Not Acceptable Media messages transmitted by this service.
4xx Response Received	The total current number of 4xx Response messages received on this service.
4xx Response Transmitted	The total current number of 4xx Response messages transmitted by this service.
500 Internal Error Received	The total current number of 500 Internal Error messages received on this service.
500 Internal Error Transmitted	The total current number of 500 Internal Error messages transmitted by this service.
513 Message Too Large Received	The total current number of 513 Message Too Large messages received on this service.
513 Message Too Large Transmitted	The total current number of 513 Message Too Large messages transmitted by this service.
5xx Response Received	The total current number of 5xx Response messages received on this service.
5xx Response Transmitted	The total current number of 5xx Response messages transmitted by this service.
6xx Response Received	The total current number of 6xx Response messages received on this service.
6xx Response Transmitted	The total current number of 6xx Response messages transmitted by this service.
CSCF Performance	
Invite Processing Time	Minimum and maximum time (in ms) required to process an INVITE message (time elapsed between the INVITE entering the proxy and the INVITE forwarded out of the proxy).
First Response Time	Minimum and maximum time (in ms) between sending an INVITE message out of the proxy and the first response received for the INVITE (any 1xx).
Post Dial Delay	Minimum and maximum time (in ms) between sending an INVITE message out of the proxy and receiving the ringing message or any final response to the INVITE.
Session Setup Delay	Minimum and maximum time (in ms) between when an INVITE message was received by the proxy and a 200 OK (invite) sent out of the proxy.

Field	Description
Post Answer Delay	Minimum and maximum time (in ms) between a 200 OK INVITE message received by the proxy and the ACK message (for invite) sent out of the proxy.
Session Release Delay	Minimum and maximum time (in ms) between when a BYE message is received by the proxy and a 200 OK BYE is sent out of the proxy.
CSCF Registrations	
Current Registered Users	The current number of users registered to this service.
Current Secure Connections	The current number of secure connections to this service.
Current Unsecure Connections	The current number of unsecure connections to this service.
Total Failed Authentications	The total current number of failed authentications for this service.
Total Registration Expires	The total current number of expired registrations on this service.
Total Registration from Roaming UE	The total number of registrations from Roaming UE.
Total Successful Registration from Roaming UE	The total number 200 ok to registrations from Roaming UE.
Total Failed Registration from Roaming UE	The total number of failed registrations from Roaming UE.
Total 403 response to Registration from Roaming UE	The total number of 403 response to registration from Roaming UE.
Total Re-Registration from Roaming UE	The total number of re-registration from Roaming UE.
Total Successful Re-Registration from Roaming UE	The total number 200 ok to re-registrations from Roaming UE.
Total Failed Re-Registration from Roaming UE	The total number of failed re-registrations from Roaming UE.
Total 403 response to Re-Registration from Roaming UE	The total number of 403 response to re-registration from Roaming UE.
Total De-Registration from Roaming UE	The total number of de-registration from Roaming UE.
Total Successful De-Registration from Roaming UE	The total number 200 ok to de-registrations from Roaming UE.
Total Failed De-Registration from Roaming UE	The total number of failed de-registrations from Roaming UE.

■ show cscf service statistics name <service_name> all

Field	Description
Total 403 response to De-Registration from Roaming UE	The total number of 403 response to de-registration from Roaming UE.
Total De-registrations initiated by UE	The total current number of UE-initiated de-registration requests on this service.
Total De-registrations initiated by Network	The total current number of network-initiated de-registration requests received by P-CSCF from S-CSCF or by S-CSCF/SIP Proxy from internal/HSS trigger on this service.
Total Secure Registrations	The total current number of secure registrations on this service.
Total Failed Secure Registrations	The total current number of failed secure registrations on this service.
Registration Statistics	
Registration Attempts Received	The total current number of registration attempts received on this service.
Registration Attempts Transmitted	The total current number of registration attempts transmitted by this service.
Registration Success Received	The total current number of registration successes received on this service.
Registration Success Transmitted	The total current number of registration successes transmitted by this service.
Registration Failures Received	The total current number of registration failures received on this service.
Registration Failures Transmitted	The total current number of registration failures transmitted by this service.
401 Unauthorized (Registration) Received	The total current number of 401 Unauthorized responses to registration received on this service.
401 Unauthorized (Registration) Transmitted	The total current number of 401 Unauthorized responses to registration transmitted by this service.
403 Forbidden (Registration) Received	The total current number of 403 Forbidden responses to registration received on this service.
403 Forbidden (Registration) Transmitted	The total current number of 403 Forbidden responses to registration transmitted by this service.
404 Not Found (Registration) Received	The total current number of 404 Not Found responses to registration received on this service.
404 Not Found (Registration) Transmitted	The total current number of 404 Not Found responses to registration transmitted by this service.
420 Bad Extension (Registration) Received	The total current number of 420 Bad Extension responses to registration received on this service.
420 Bad Extension (Registration) Transmitted	The total current number of 420 Bad Extension responses to registration transmitted by this service.

Field	Description
439 First HopLackOb (Registration) Received	The total current number of 439 First Hop Lack Outbound responses to registration received on this service.
439 First HopLackOb (Registration) Transmitted	The total current number of 439 First Hop Lack Outbound responses to registration transmitted by this service.
4xx Responses (Registration) Received	The total current number of 4xx responses to registration received on this service.
4xx Responses (Registration) Transmitted	The total current number of 4xx responses to registration transmitted by this service.
500 Internal Error (Registration) Received	The total current number of 500 Internal Error responses to registration received on this service.
500 Internal Error (Registration) Transmitted	The total current number of 500 Internal Error responses to registration transmitted by this service.
5xx Responses (Registration) Received	The total current number of 5xx responses to registration received on this service.
5xx Responses (Registration) Transmitted	The total current number of 5xx responses to registration transmitted by this service.
6xx Responses (Registration) Received	The total current number of 6xx responses to registration received on this service.
6xx Responses (Registration) Transmitted	The total current number of 6xx responses to registration transmitted by this service.
Re-Registration Statistics	
Re-Registration Attempts Received	The total current number of re-registration attempts received on this service.
Re-Registration Attempts Transmitted	The total current number of re-registration attempts transmitted by this service.
Re-Registration Success Received	The total current number of re-registration successes received on this service.
Re-Registration Success Transmitted	The total current number of re-registration successes transmitted by this service.
Re-Registration Failures Received	The total current number of re-registration failures received on this service.
Re-Registration Failures Transmitted	The total current number of re-registration failures transmitted by this service.
401 Unauthorized (Re-Registration) Received	The total current number of 401 Unauthorized responses to re-registration received on this service.
401 Unauthorized (Re-Registration) Transmitted	The total current number of 401 Unauthorized responses to re-registration transmitted by this service.
403 Forbidden (Re-Registration) Received	The total current number of 403 Forbidden responses to re-registration received on this service.

```
show cscf service statistics name <service_name> all
```

Field	Description
403 Forbidden (Re-Registration) Transmitted	The total current number of 403 Forbidden responses to re-registration transmitted by this service.
404 Not Found (Re-Registration) Received	The total current number of 404 Not Found responses to re-registration received on this service.
404 Not Found (Re-Registration) Transmitted	The total current number of 404 Not Found responses to re-registration transmitted by this service.
420 Bad Extension (Re-Registration) Received	The total current number of 420 Bad Extension responses to re-registration received on this service.
420 Bad Extension (Re-Registration) Transmitted	The total current number of 420 Bad Extension responses to re-registration transmitted by this service.
439 First HopLackOb (Re-Registration) Received	The total current number of 439 First Hop Lack Outbound responses to re-registration received on this service.
439 First HopLackOb (Re-Registration) Transmitted	The total current number of 439 First Hop Lack Outbound responses to re-registration transmitted by this service.
4xx Responses (Re-Registration) Received	The total current number of 4xx responses to re-registration received on this service.
4xx Responses (Re-Registration) Transmitted	The total current number of 4xx responses to re-registration transmitted by this service.
500 Internal Error (Re-Registration) Received	The total current number of 500 Internal Error responses to re-registration received on this service.
500 Internal Error (Re-Registration) Transmitted	The total current number of 500 Internal Error responses to re-registration transmitted by this service.
5xx Responses (Re-Registration) Received	The total current number of 5xx responses to re-registration received on this service.
5xx Responses (Re-Registration) Transmitted	The total current number of 5xx responses to re-registration transmitted by this service.
6xx Responses (Re-Registration) Received	The total current number of 6xx responses to re-registration received on this service.
6xx Responses (Re-Registration) Transmitted	The total current number of 6xx responses to re-registration transmitted by this service.
De-Registration Statistics	
De-Registration Attempts Received	The total current number of de-registration attempts received on this service.
De-Registration Attempts Transmitted	The total current number of de-registration attempts transmitted by this service.
De-Registration Success Received	The total current number of de-registration successes received on this service.
De-Registration Success Transmitted	The total current number of de-registration successes transmitted by this service.

Field	Description
De-Registration Failures Received	The total current number of de-registration failures received on this service.
De-Registration Failures Transmitted	The total current number of de-registration failures transmitted by this service.
401 Unauthorized (De-Registration) Received	The total current number of 401 Unauthorized responses to de-registration received on this service.
401 Unauthorized (De-Registration) Transmitted	The total current number of 401 Unauthorized responses to de-registration transmitted by this service.
403 Forbidden (De-Registration) Received	The total current number of 403 Forbidden responses to de-registration received on this service.
403 Forbidden (De-Registration) Transmitted	The total current number of 403 Forbidden responses to de-registration transmitted by this service.
404 Not Found (De-Registration) Received	The total current number of 404 Not Found responses to de-registration received on this service.
404 Not Found (De-Registration) Transmitted	The total current number of 404 Not Found responses to de-registration transmitted by this service.
420 Bad Extension (De-Registration) Received	The total current number of 420 Bad Extension responses to de-registration received on this service.
420 Bad Extension (De-Registration) Transmitted	The total current number of 420 Bad Extension responses to de-registration transmitted by this service.
439 First HopLackOb (De-Registration) Received	The total current number of 439 First Hop Lack Outbound responses to de-registration received on this service.
439 First HopLackOb (De-Registration) Transmitted	The total current number of 439 First Hop Lack Outbound responses to de-registration transmitted by this service.
4xx Responses (De-Registration) Received	The total current number of 4xx responses to de-registration received on this service.
4xx Responses (De-Registration) Transmitted	The total current number of 4xx responses to de-registration transmitted by this service.
500 Internal Error (De-Registration) Received	The total current number of 500 Internal Error responses to de-registration received on this service.
500 Internal Error (De-Registration) Transmitted	The total current number of 500 Internal Error responses to de-registration transmitted by this service.
5xx Responses (Re-Registration) Received	The total current number of 5xx responses to de-registration received on this service.
5xx Responses (De-Registration) Transmitted	The total current number of 5xx responses to de-registration transmitted by this service.
6xx Responses (De-Registration) Received	The total current number of 6xx responses to de-registration received on this service.

```
show cscf service statistics name <service_name> all
```

Field	Description
6xx Responses (De-Registration) Transmitted	The total current number of 6xx responses to de-registration transmitted by this service.
Unclassified Requests (Registration) Received	The total current number of unclassified request responses to registration received on this service.
4XX Responses (Unclassified Requests) Transmitted	The total current number of 4XX responses (Unclassified Requests) transmitted by this service.
5XX Responses (Unclassified Requests) Transmitted	The total current number of 5XX Responses (Unclassified Requests) transmitted by this service.
IP-Security Statistics	
Total Secure Connection	The total number of subscribers with secure connections on this service.
Total Unsecure Connection	The total number of subscribers with unsecure connections on this service.
Total Security Association Rejects	The total number of security association rejections on this service.
Total Secure Registrations	The total number of secure registrations on this service.
Total Secure Re-registrations	The total number of secure re-registrations on this service.
Total Secure De-registrations	The total number of secure de-registrations on this service.
Total Emergency Registrations	The total number of emergency registrations on this service.
Total Failed Secure Registrations	The total number of failed secure registrations on this service.
Total IP-Sec Packets Received	The total number of IPSec packets received on this service.
Total IP-Sec Packets Transmitted	The total number of IPSec packets transmitted by this service.
Total IP-Sec Octets Received	The total number of IPSec octets received on this service.
Total IP-Sec Octets Transmitted	The total number of IPSec octets transmitted by this service.
Total Registration Rejects Due to Sec-Agree	The total number of registration rejections due to security agreement on this service.
Total Registration Rejects Due to Algorithm Mismatch	The total number of registration rejections due to algorithm mismatch on this service.
Total Messages Dropped Due to Error	The total number of messages dropped due to error on this service.
Total Messages With Incorrect Security Verify	The total number of messages with incorrect security verification on this service.
MSRP TCP Connection Statistics	
Total TCP Subscribers	The total number of subscribers having TCP connections for MSRP Signaling on this service.

Field	Description
Active Connections	The total number of active TCP connections for MSRP Signaling on this service.
Total Connections Closed	The total number of TCP connections for MSRP Signaling closed on this service.
Total Successful Outgoing Connections	The total number of successful outgoing TCP connections for MSRP Signaling on this service.
Total Failed Outgoing Connections	The total number of failed outgoing TCP connections for MSRP Signaling on this service.
Total Successful Incoming Connections	The total number of successful incoming TCP connections for MSRP Signaling on this service.
Total Failed Incoming Connections	The total number of failed incoming TCP connections for MSRP Signaling on this service.
Total Packets Sent	The total number of TCP/IP packets transmitted by CSCF service.
Total Packets Received	The total number of TCP/IP packets received by CSCF service.
Total Bytes Sent	The total number of bytes transmitted.
Total Bytes Received	The total number of bytes received.
Others	
Current CSCF Sessions	The number of currently active CSCF sessions existing on this service.
Total CSCF Sessions	Total number of CSCF sessions created so far for originating/proxying SIP messages. This counter should not include CSCF sessions created for internal processing, like ROUTE REQUEST. Also, this counter should not get incremented for REGISTER requests received by S-CSCF as it acts as registrar and S-CSCF callleg itself can handle this.
Total TCP Subscribers	Total number of subscribers with an active TCP connection (MSRP, SIP, or both) existing on this service.
Active TCP Connections	Total number of currently active TCP connections for both MSRP and SIP existing on this service.
Current IPsec TCP Connections	Total number of currently active IPsec TCP connections existing on this service.
405 Method Not Allowed Rejections	Total number of 405 Method Not Allowed Rejections existing on this service.
SigComp Statistics	
Total Requests Compressed	The total number of SIP request messages compressed by this service.
Total Requests Decompressed	The total number of SIP request messages decompressed by this service.
Total Responses Compressed	The total number of SIP response messages compressed by this service.
Total Responses Decompressed	The total number of SIP response messages decompressed by this service.
Total NACK Packets Received	The total number of NACK (negative acknowledgement) packets received by this service.

```
show cscf service statistics name <service_name> all
```

Field	Description
Total NACK Packets Transmitted	The total number of NACK (negative acknowledgement) packets transmitted by this service.
Total Compression Failures	The current total number of compression failures that occurred in this service.
Total Decompression Failures	The current total number of decompression failures that occurred in this service.
SigComp Effectiveness Ratio results in this section are derived using the following formula: $(S_b - S_a) * 100 / (S_b)$ where S_b = the size of the message before compression and S_a = the size of the message after compression.	
Best compression ratio (Outgoing message)	The current best compression ratio achieved for messages sent by this service.
Worst compression ratio (Outgoing message)	The current worst compression ratio achieved for messages sent by this service. Usually this will be a negative value indicating that the message had expanded instead of compressed.
Average compression ratio (Outgoing message)	The running average compression of messages sent by this service. The average is derived using the following formula: $(S(S_b) - S(S_a)) * 100 / (S(S_b))$.
Best compression ratio (Incoming message)	The current best compression ratio achieved for messages received by this service.
Worst compression ratio (Incoming message)	The current worst compression ratio achieved for messages received by this service. Usually this will be a negative value indicating that the message had expanded instead of compressed.
Average compression ratio (Incoming message)	The running average compression of messages received by this service. The average is derived using the following formula: $(S(S_b) - S(S_a)) * 100 / (S(S_b))$.
SIP TCP Connection Statistics	
Total TCP Subscribers	The total number of subscribers having TCP connections for SIP Signaling on this service.
Active Connections	The total number of active TCP connections for SIP Signaling on this service.
Total Connections Closed	The total number of TCP connections for SIP Signaling closed on this service.
Total Successful Outgoing Connections	The total number of successful outgoing TCP connections for SIP Signaling on this service.
Total Failed Outgoing Connections	The total number of failed outgoing TCP connections for SIP Signaling on this service.
Total Successful Incoming Connections	The total number of successful incoming TCP connections for SIP Signaling on this service.
Total Failed Incoming Connections	The total number of failed incoming TCP connections for SIP Signaling on this service.
Total Migrated Connections	The total number of TCP connections migrated from Cscfmgr to Sessmgr for load balancing.
Total Packets Sent	The total number of TCP/IP packets transmitted by CSCF service.
Total Packets Received	The total number of TCP/IP packets received by CSCF service.
Total Bytes Sent	The total number of bytes transmitted.

Field	Description
Total Bytes Received	The total number of bytes received.
Subscription Package	
Subscription Attempts Received	The total current number of subscription attempts received on this service.
Subscription Attempts Transmitted	The total current number of subscription attempts transmitted by this service.
Subscription Success Received	The total current number of subscription successes received on this service.
Subscription Success Transmitted	The total current number of subscription successes transmitted by this service.
Subscription Failures Received	The total current number of subscription failures received on this service.
Subscription Failures Transmitted	The total current number of subscription failures transmitted by this service.
200 OK (Subscription) Received	The total current number of 200 OK responses to registration received on this service.
200 OK (Subscription) Transmitted	The total current number of 200 OK responses to registration transmitted by this service.
202 Accepted (Subscription) Received	The total current number of 202 Accepted responses to registration received on this service.
202 Accepted (Subscription) Transmitted	The total current number of 202 Accepted responses to registration transmitted by this service.
400 Bad Request (Subscription) Received	The total current number of 400 Bad Request responses to registration received on this service.
400 Bad Request (Subscription) Transmitted	The total current number of 400 Bad Request responses to registration transmitted by this service.
403 Forbidden (Subscription) Received	The total current number of 403 Forbidden responses to registration received on this service.
403 Forbidden (Subscription) Transmitted	The total current number of 403 Forbidden responses to registration transmitted by this service.
481 Trans Does Not Exist (Subscription) Received	The total current number of 481 Trans Does Not Exist responses to registration received on this service.
481 Trans Does Not Exist (Subscription) Transmitted	The total current number of 481 Trans Does Not Exist responses to registration transmitted by this service.
489 Bad Event (Subscription) Received	The total current number of 489 Bad Event responses to registration received on this service.
489 Bad Event (Subscription) Transmitted	The total current number of 489 Bad Event responses to registration transmitted by this service.

```
show cscf service statistics name <service_name> all
```

Field	Description
500 Internal Error (Subscription) Received	The total current number of 500 Internal Error responses to registration received on this service.
500 Internal Error (Subscription) Transmitted	The total current number of 500 Internal Error responses to registration transmitted by this service.
Re-Subscription Attempts Received	The total current number of re-subscription attempts received on this service.
Re-Subscription Attempts Transmitted	The total current number of re-subscription attempts transmitted by this service.
Re-Subscription Success Received	The total current number of re-subscription successes received on this service.
Re-Subscription Success Transmitted	The total current number of re-subscription successes transmitted by this service.
Re-Subscription Failures Received	The total current number of re-subscription failures received on this service.
Re-Subscription Failures Transmitted	The total current number of re-subscription failures transmitted by this service.
200 OK (Re-Subscription) Received	The total current number of 200 OK responses to re-registration received on this service.
200 OK (Re-Subscription) Transmitted	The total current number of 200 OK responses to re-registration transmitted by this service.
202 Accepted (Re-Subscription) Received	The total current number of 202 Accepted responses to re-registration received on this service.
202 Accepted (Re-Subscription) Transmitted	The total current number of 202 Accepted responses to re-registration transmitted by this service.
400 Bad Request (Re-Subscription) Received	The total current number of 400 Bad Request responses to re-registration received on this service.
400 Bad Request (Re-Subscription) Transmitted	The total current number of 400 Bad Request responses to re-registration transmitted by this service.
403 Forbidden (Re-Subscription) Received	The total current number of 403 Forbidden responses to re-registration received on this service.
403 Forbidden (Re-Subscription) Transmitted	The total current number of 403 Forbidden responses to re-registration transmitted by this service.
481 Trans Does Not Exist (Re-Subscription) Received	The total current number of 481 Trans Does Not Exist responses to re-registration received on this service.
481 Trans Does Not Exist (Re-Subscription) Transmitted	The total current number of 481 Trans Does Not Exist responses to re-registration transmitted by this service.
489 Bad Event (Re-Subscription) Received	The total current number of 489 Bad Event responses to re-registration received on this service.

Field	Description
489 Bad Event (Re-Subscription) Transmitted	The total current number of 489 Bad Event responses to re-registration transmitted by this service.
500 Internal Error (Re-Subscription) Received	The total current number of 500 Internal Error responses to re-registration received on this service.
500 Internal Error (Re-Subscription) Transmitted	The total current number of 500 Internal Error responses to re-registration transmitted by this service.
Un-Subscription Attempts Received	The total current number of un-subscription attempts received on this service.
Un-Subscription Attempts Transmitted	The total current number of un-subscription attempts transmitted by this service.
Un-Subscription Success Received	The total current number of un-subscription successes received on this service.
Un-Subscription Success Transmitted	The total current number of un-subscription successes transmitted by this service.
Un-Subscription Failures Received	The total current number of un-subscription failures received on this service.
Un-Subscription Failures Transmitted	The total current number of un-subscription failures transmitted by this service.
200 OK (Un-Subscription) Received	The total current number of 200 OK responses to un-registration received on this service.
200 OK (Un-Subscription) Transmitted	The total current number of 200 OK responses to un-registration transmitted by this service.
202 Accepted (Un-Subscription) Received	The total current number of 202 Accepted responses to un-registration received on this service.
202 Accepted (Un-Subscription) Transmitted	The total current number of 202 Accepted responses to un-registration transmitted by this service.
400 Bad Request (Un-Subscription) Received	The total current number of 400 Bad Request responses to un-registration received on this service.
400 Bad Request (Un-Subscription) Transmitted	The total current number of 400 Bad Request responses to un-registration transmitted by this service.
403 Forbidden (Un-Subscription) Received	The total current number of 403 Forbidden responses to un-registration received on this service.
403 Forbidden (Un-Subscription) Transmitted	The total current number of 403 Forbidden responses to un-registration transmitted by this service.
481 Trans Does Not Exist (Un-Subscription) Received	The total current number of 481 Trans Does Not Exist responses to un-registration received on this service.
481 Trans Does Not Exist (Un-Subscription) Transmitted	The total current number of 481 Trans Does Not Exist responses to un-registration transmitted by this service.

```
show cscf service statistics name <service_name> all
```

Field	Description
489 Bad Event (Un-Subscription) Received	The total current number of 489 Bad Event responses to un-registration received on this service.
489 Bad Event (Un-Subscription) Transmitted	The total current number of 489 Bad Event responses to un-registration transmitted by this service.
500 Internal Error (Un-Subscription) Received	The total current number of 500 Internal Error responses to un-registration received on this service.
500 Internal Error (Un-Subscription) Transmitted	The total current number of 500 Internal Error responses to un-registration transmitted by this service.
Notify Attempts Received	The total current number of notify attempts received on this service.
Notify Attempts Transmitted	The total current number of notify attempts transmitted by this service.
Notify Success Received	The total current number of notify successes received on this service.
Notify Success Transmitted	The total current number of notify successes transmitted by this service.
Notify Failures Received	The total current number of notify failures received on this service.
Notify Failures Transmitted	The total current number of notify failures transmitted by this service.
Publish Attempts Received	The total current number of publish attempts received on this service.
Publish Attempts Transmitted	The total current number of publish attempts transmitted by this service.
Publish Success Received	The total current number of publish successes received on this service.
Publish Success Transmitted	The total current number of publish successes transmitted by this service.
Publish Failures Received	The total current number of publish failures received on this service.
Publish Failures Transmitted	The total current number of publish failures transmitted by this service.
Un-Publish Attempts Received	The total current number of un-publish attempts received on this service.
Un-Publish Attempts Transmitted	The total current number of un-publish attempts transmitted by this service.
Un-Publish Success Received	The total current number of un-publish successes received on this service.
Un-Publish Success Transmitted	The total current number of un-publish successes transmitted by this service.
Un-Publish Failures Received	The total current number of un-publish failures received on this service.
Un-Publish Failures Transmitted	The total current number of un-publish failures transmitted by this service.
TCP Connection Statistics	
Active IP-Sec Connections	The total number of active IPSec TCP connections on this service.
Total IP-Sec Connections Closed	The total number of IPSec TCP connections closed on this service.

Field	Description
Total Successful IP-Sec Outgoing Connections	The total number of successful outgoing IPsec TCP connections on this service.
Total Failed IP-Sec Outgoing Connections	The total number of failed outgoing IPsec TCP connections on this service.
Total Successful IP-Sec Incoming Connections	The total number of successful incoming IPsec TCP connections on this service.
Total Failed IP-Sec Incoming Connections	The total number of failed incoming IPsec TCP connections on this service.

show cscf sessions counters

Table 207. show cscf sessions counters Command Output Descriptions

Field	Description
Interval	
<200ms	The number of sessions that had a duration of less than 200 millisecond.
200..400ms	The number of sessions that had a duration between 200 and 400 milliseconds.
400..600ms	The number of sessions that had a duration between 400 and 600 milliseconds.
600..800ms	The number of sessions that had a duration between 600 and 800 milliseconds.
800..1000ms	The number of sessions that had a duration between 800 and 1000 milliseconds.
1000..1200ms	The number of sessions that had a duration between 1000 and 1200 milliseconds.
1200..1400ms	The number of sessions that had a duration between 1200 and 1400 milliseconds.
1400..1600ms	The number of sessions that had a duration between 1400 and 1600 milliseconds.
1600..1800ms	The number of sessions that had a duration between 1600 and 1800 milliseconds.
1800..2000ms	The number of sessions that had a duration between 1800 and 2000 milliseconds.
2000..2200ms	The number of sessions that had a duration between 2000 and 2200 milliseconds.
2200..2400ms	The number of sessions that had a duration between 2200 and 2400 milliseconds.
2400..2600ms	The number of sessions that had a duration between 2400 and 2600 milliseconds.
2600..2800ms	The number of sessions that had a duration between 2600 and 2800 milliseconds.
2800..3000ms	The number of sessions that had a duration between 2800 and 3000 milliseconds.
3..5sec	The number of sessions that had a duration between three and five seconds.
5..7sec	The number of sessions that had a duration between five and seven seconds.
7..9sec	The number of sessions that had a duration between seven and nine seconds.
9..11sec	The number of sessions that had a duration between nine and 11 seconds.
11..13sec	The number of sessions that had a duration between 11 and 13 seconds.
13..15sec	The number of sessions that had a duration between 13 and 15 seconds.
15..17sec	The number of sessions that had a duration between 15 and 17 seconds.
17..19sec	The number of sessions that had a duration between 17 and 19 seconds.
19..21sec	The number of sessions that had a duration between 19 and 21 seconds.
>21sec	The number of sessions that had a duration of more than 21 seconds.

Field	Description
Count The following provide total counts for each session type per specified interval.	
Invite Processing Time	Time required to process an INVITE message (time elapsed between the INVITE entering the proxy and the INVITE forwarded out of the proxy).
First Response Delay	Time between sending an INVITE message out of the proxy and the first response received for the INVITE (any 1xx).
Post Dial Delay	Time between sending an INVITE message out of the proxy and receiving the ringing message or any final response to the INVITE.
Session Setup Delay	Time between when an INVITE message was received by the proxy and a 200 OK (invite) sent out of the proxy.
Post Answer Delay	Time between a 200 OK INVITE message received by the proxy and the ACK message (for invite) sent out of the proxy.
Session Release Delay	Time between when a BYE message is received by the proxy and a 200 OK BYE is sent out of the proxy.

show cscf sessions duration

Table 208. show cscf sessions duration Command Output Descriptions

Field	Description
<1s	The number of sessions that had a duration of less than one second.
01..10sec	The number of sessions that had a duration between one and 10 seconds.
10..30sec	The number of sessions that had a duration between 10 and 30 seconds.
30..60sec	The number of sessions that had a duration between 30 and 60 seconds.
01..03min	The number of sessions that had a duration between one and three minutes.
03..05min	The number of sessions that had a duration between three and five minutes.
05..07min	The number of sessions that had a duration between five and seven minutes.
07..09min	The number of sessions that had a duration between seven and nine minutes.
09..11min	The number of sessions that had a duration between nine and 11 minutes.
11..13min	The number of sessions that had a duration between 11 and 13 minutes.
13..15min	The number of sessions that had a duration between 13 and 15 minutes.
15..17min	The number of sessions that had a duration between 15 and 17 minutes.
17..19min	The number of sessions that had a duration between 17 and 19 minutes.
19..21min	The number of sessions that had a duration between 19 and 21 minutes.
21..23min	The number of sessions that had a duration between 21 and 23 minutes.
23..25min	The number of sessions that had a duration between 23 and 25 minutes.
25..27min	The number of sessions that had a duration between 25 and 27 minutes.
27..29min	The number of sessions that had a duration between 27 and 29 minutes.
29..60min	The number of sessions that had a duration between 29 and 60 minutes.
>60min	The number of sessions that had a duration of more than 60 minutes.
<1hr	The number of sessions that had a duration of less than one hour.
1..2hrs	The number of sessions that had a duration between one and two hours.
2..3hrs	The number of sessions that had a duration between two and three hours.
3..4hrs	The number of sessions that had a duration between three and four hours.
4..5hrs	The number of sessions that had a duration between four and five hours.
5..6hrs	The number of sessions that had a duration between five and six hours.

Field	Description
6..7hrs	The number of sessions that had a duration between six and seven hours.
7..8hrs	The number of sessions that had a duration between seven and eight hours.
8..9hrs	The number of sessions that had a duration between eight and nine hours.
9..10hrs	The number of sessions that had a duration between nine and 10 hours.
>10hrs	The number of sessions that had a duration of more than 10 hours.

show cscf sip statistics

Table 209. show cscf sip statistics Command Output Descriptions

Field	Description
CSCF Service	The name of the service and context.
Peer IP Address	The IP address of the peer server expressed in IPv4 or IPv6 dotted decimal notation.
SIP Request Statistics	
Register	The total number of SIP Register requests received (Rx) or transmitted (Tx) by this service.
Invite	The total number of INVITE requests received (Rx) or transmitted (Tx) by this service.
Ack	The total number of ACK requests received (Rx) or transmitted (Tx) by this service.
Bye	The total number of Bye requests received (Rx) or transmitted (Tx) by this service.
Info	The total number of Info requests received (Rx) or transmitted (Tx) by this service.
Prack	The total number of PRACK requests received (Rx) or transmitted (Tx) by this service.
Refer	The total number of Refer requests received (Rx) or transmitted (Tx) by this service.
Cancel	The total number of Cancel requests received (Rx) or transmitted (Tx) by this service.
Notify	The total number of Notify requests received (Rx) or transmitted (Tx) by this service.
Update	The total number of Update requests received (Rx) or transmitted (Tx) by this service.
Message	The total number of Message requests received (Rx) or transmitted (Tx) by this service.
Options	The total number of Options requests received (Rx) or transmitted (Tx) by this service.
Publish	The total number of Publish requests received (Rx) or transmitted (Tx) by this service.
Subscribe	The total number of Subscribe requests received (Rx) or transmitted (Tx) by this service.
Notify	The total number of Notify requests received (Rx) or transmitted (Tx) by this service.
SIP Response Statistics	
100 Trying	The total number of 100 Trying responses received (Rx) or transmitted (Tx) by this service.
180 Ringing	The total number of 180 Ringing responses received (Rx) or transmitted (Tx) by this service.
181 Forwarding	The total number of 181 Forwarded responses received (Rx) or transmitted (Tx) by this service.
182 Queued	The total number of 182 Queued responses received (Rx) or transmitted (Tx) by this service.
183 Progress	The total number of 183 Progress responses received (Rx) or transmitted (Tx) by this service.

Field	Description
200 Ok (Register)	The total number of 200 OK Register responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Invite)	The total number of 200 OK Invite responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Bye)	The total number of 200 OK Bye responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Info)	The total number of 200 OK Info responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Prack)	The total number of 200 OK PRACK responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Refer)	The total number of 200 OK Refer responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Cancel)	The total number of 200 OK Cancel responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Notify)	The total number of 200 OK Notify responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Update)	The total number of 200 OK Update responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Message)	The total number of 200 OK Message responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Options)	The total number of 200 OK Options responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Publish)	The total number of 200 OK Publish responses received (Rx) or transmitted (Tx) by this service.
200 Ok (Subscribe)	The total number of 200 OK Subscribe responses received (Rx) or transmitted (Tx) by this service.
202 Accepted (Refer)	The total number of 202 Accepted Refer responses received (Rx) or transmitted (Tx) by this service.
202 Accepted (Subscribe)	The total number of 202 Accepted Subscribe responses received (Rx) or transmitted (Tx) by this service.
300 Multiple Choices	The total number of Multiple Choices responses received (Rx) or transmitted (Tx) by this service.
301 Moved Permanently	The total number of Moved Permanently responses received (Rx) or transmitted (Tx) by this service.
302 Moved Temporarily	The total number of Moved Temporarily responses received (Rx) or transmitted (Tx) by this service.
305 Use Proxy	The total number of Use Proxy responses received (Rx) or transmitted (Tx) by this service.

Field	Description
380 Alternative Service	The total number of Alternative Service responses received (Rx) or transmitted (Tx) by this service.
400 Bad Request	The total number of 400 Bad Request errors received (Rx) or transmitted (Tx) by this service.
401 Unauthorized	The total number of 401 Unauthorized errors received (Rx) or transmitted (Tx) by this service.
403 Forbidden	The total number of 403 Forbidden errors received (Rx) or transmitted (Tx) by this service.
404 Not Found	The total number of 404 Not Found errors received (Rx) or transmitted (Tx) by this service.
405 Method Not Allowed	The total number of 405 Method Not Allowed errors received (Rx) or transmitted (Tx) by this service.
406 Not Acceptable	The total number of 406 Not Acceptable errors received (Rx) or transmitted (Tx) by this service.
407 Proxy Auth Required	The total number of 407 Proxy Auth Required errors received (Rx) or transmitted (Tx) by this service.
408 Request Timeout	The total number of 408 Request Timeout errors received (Rx) or transmitted (Tx) by this service.
410 Gone	The total number of 410 Gone errors received (Rx) or transmitted (Tx) by this service.
412 Conditional Req Fail	The total number of 412 Conditional Request Fail errors received (Rx) or transmitted (Tx) by this service.
413 Req Entity Too Large	The total number of 413 Request Entity Too Large errors received (Rx) or transmitted (Tx) by this service.
414 Req URI Too Long	The total number of 414 Request URI Too Long errors received (Rx) or transmitted (Tx) by this service.
415 Unsupport Media Type	The total number of 415 Unsupported Media Type errors received (Rx) or transmitted (Tx) by this service.
416 Unsupport URI Scheme	The total number of 416 Unsupported URI Scheme errors received (Rx) or transmitted (Tx) by this service.
420 Bad Extension	The total number of 420 Bad Extension errors received (Rx) or transmitted (Tx) by this service.
421 Extension Required	The total number of 421 Extension Required errors received (Rx) or transmitted (Tx) by this service.
423 Interval Too Brief	The total number of 423 Interval Too Brief errors received (Rx) or transmitted (Tx) by this service.
480 Temp Not Available	The total number of 480 Temp Not Available errors received (Rx) or transmitted (Tx) by this service.
481 Trans Does Not Exist	The total number of 481 Transaction Does Not Exist errors received (Rx) or transmitted (Tx) by this service.

Field	Description
482 Loop Detected	The total number of 482 Loop Detected errors received (Rx) or transmitted (Tx) by this service.
483 Too Many Hops	The total number of 483 Too Many Hops errors received (Rx) or transmitted (Tx) by this service.
484 Address Incomplete	The total number of 484 Address Incomplete errors received (Rx) or transmitted (Tx) by this service.
485 Ambiguous	The total number of 485 Ambiguous errors received (Rx) or transmitted (Tx) by this service.
486 Busy Here	The total number of 486 Busy Here errors received (Rx) or transmitted (Tx) by this service.
487 Request Cancel	The total number of 487 Request Cancel errors received (Rx) or transmitted (Tx) by this service.
488 Not Acceptable Media	The total number of 488 Not Acceptable Media errors received (Rx) or transmitted (Tx) by this service.
489 Bad Event	The total number of 489 Bad Event errors received (Rx) or transmitted (Tx) by this service.
491 Request Pending	The total number of 491 Request Pending errors received (Rx) or transmitted (Tx) by this service.
493 Undecipherable	The total number of 493 Undecipherable errors received (Rx) or transmitted (Tx) by this service.
500 Internal Error	The total number of 500 Internal Error errors received (Rx) or transmitted (Tx) by this service.
501 Not Implemented	The total number of 501 Not Implemented errors received (Rx) or transmitted (Tx) by this service.
502 Bad Gateway	The total number of 502 Bad Gateway errors received (Rx) or transmitted (Tx) by this service.
503 Service Unavailable	The total number of 503 Service Unavailable errors received (Rx) or transmitted (Tx) by this service.
504 Gateway Timeout	The total number of 504 Gateway Timeout errors received (Rx) or transmitted (Tx) by this service.
505 Bad SIP Version	The total number of 505 Bad SIP Version errors received (Rx) or transmitted (Tx) by this service.
513 Message Too Large	The total number of 513 Message Too Large errors received (Rx) or transmitted (Tx) by this service.
580 Precondition Failure	The total number of 580 Precondition Failure errors received (Rx) or transmitted (Tx) by this service.
600 Busy Everywhere	The total number of 600 Busy Everywhere errors received (Rx) or transmitted (Tx) by this service.
603 Decline	The total number of 603 Decline errors received (Rx) or transmitted (Tx) by this service.

Field	Description
604 Not Exist Anywhere	The total number of 604 Not Exist Anywhere errors received (Rx) or transmitted (Tx) by this service.
606 Not Acceptable	The total number of 606 Not Acceptable errors received (Rx) or transmitted (Tx) by this service.
Total Invalid Messages	The total number of SIP Invalid Messages received (Rx) or transmitted (Tx) by this service.
Total Messages	The total number of SIP Messages received (Rx) or transmitted (Tx) by this service.
TCP Request	The total number of SIP requests received (Rx) or transmitted (Tx) over TCP by this service.
TCP Response	The total number of SIP responses received (Rx) or transmitted (Tx) over TCP by this service.
Auto switch to TCP on MTU size limit	The total number of times CSCF switched from UDP to TCP because of message size larger than MTU.

show cscf tcp connections

Table 210. show cscf tcp connections Command Output Descriptions

Field	Description
TCP Connection Details	
LocalIp	The local IP address, expressed in IPv4 or IPv6 dotted decimal notation, of the TCP connection.
Local Port	The local port number of the TCP connection.
RemoteIp	The remote IP address, expressed in IPv4 or IPv6 dotted decimal notation, of the TCP connection.
Remote Port	The remote port number of the TCP connection.
Facility	Facility type for which connection details have to be retrieved—CscfMgr or SessMgr.
Instance	The instance number of the facility that the connection belongs to.
SockDesc	The socket descriptor id.
State	The state of the connection. TCP states are: <ul style="list-style-type: none"> • CLOSED • LISTEN • SYNCSNT • SYNCRVD • ESTABLISHED • CLOSEWAIT • FINWAIT1 • CLOSING • LASTACK • FINWAIT2 • TIMEWAIT • INVALID
BytesInRecvQueue	Data size in the receive queue, in bytes.
BytesInSendQueue	Data size in the send queue, in bytes.
RecvQueueSize	Size of the receive queue, in bytes.
SendQueueSize	Size of the send queue, in bytes.
MaxSendWind	Maximum send window seen so far.
SndUna	Send unacknowledged sequence value.
SndNext	Send next sequence value.

Field	Description
MaxSndNext	Highest sequence number sent.
Iss	Initial send sequence number.
Irs	Initial receive sequence number.
Rto	Retransmission timeout.
SndWL1	Send segment sequence number used for last window update.
SndWL2	Send segment acknowledgment number used for last window update.
MaxSndWind	Maximum send window seen so far.
RecvNxt	Receive next sequence.
RecvWind	Receive window sequence.
RecvAdv	Sequence number of right edge of advertised window.
CWind	Send congestion window.
Ssthresh	Send slow start threshold size.
BackLog	Back logs.
DupAck	Duplicate ACKs.
RetransSegments	Number of retransmitted segments.
AckAfterRetrans	Number of non duplicate acks after duplicate ACK.
TcpFlags	TCP flags.
Total TCP sockets	The total number of TCP sockets.

Chapter 89

show dhcp

This chapter includes the **show dhcp** command output tables.

show dhcp call-id

Table 211. show dhcp call-id Command Output Descriptions

Field	Description
Session Counters	
Total Current	The total number of currently active sessions on the system that received DHCP-assigned IP addresses.
DHCP Proxy	The total number of currently active sessions that were assigned IP addresses using the DHCP Proxy method.
DHCP Messages	
DISCOVER TX	The number of DHCPDISCOVER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER retransmitted	The number of DHCPDISCOVER messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER relayed	The number of DHCPDISCOVER messages relayed by the system to the mobile as part of the DHCP Relay method.
OFFER RX	The number of DHCPOFFER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER Discarded	The number of DHCPOFFER messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER relayed	The number of DHCPOFFER messages relayed by the system to the mobile as part of the DHCP Relay method.
REQUEST TX	The number of DHCPREQUEST messages sent by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST retransmitted	The number of DHCPREQUEST messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST relayed	The number of DHCPREQUEST messages relayed by the system to the mobile as part of the DHCP Relay method.
ACK RX	The number of DHCPACK messages received from the DHCP server as part of the DHCP Proxy method.
ACK for INFORM	The number of acknowledgements received for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.
ACK relayed	The number of DHCPACK messages relayed by the system to the mobile as part of the DHCP Relay method.
NAK RX	The number of DHCPNAK messages received from the DHCP server as part of the DHCP Proxy method.
NAK for INFORM	The number of number of negative acknowledgements for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.
NAK relayed	The number of DHCPNAK messages relayed by the system to the mobile as part of the DHCP Relay method.

Field	Description
DECLINE relayed	The number of DHCPDECLINE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
RELEASE relayed	The number of DHCPRELEASE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
INFORM relayed	The number of DHCPINFORM messages relayed by the system to the DHCP server on behalf of the mobile as part of the DHCP Relay method.
DHCP OFFER Discard Reasons: (dhcp-proxy)	
Parse error	The number of DHCPOFFER messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
Lease less than min	The number of DHCPOFFER messages discarded by the system due to the offered lease time being less than the minimum acceptable value configured on the system.
Lease greater than max	The number of DHCPOFFER messages discarded by the system due to the offered lease time being greater than the maximum acceptable value configured on the system.
IP Validation failed	The number of DHCPOFFER messages discarded by the system due to a failure with the validation of the IP address. This occurs because the IP address returned by DHCP Server is not present in the static pool in the destination context.
XID mismatch:	The number of DHCPOFFER messages discarded by the system due to an XID mismatch.
DHCP ACK Discard Reasons: (dhcp-proxy)	
Parse error	The number of DHCPACK messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
XID mismatch:	The number of DHCPACK messages discarded by the system due to an XID mismatch.
DHCP DECLINE Reasons: (dhcp-proxy)	
IP mismatch	The number of DHCP DECLINE messages sent by the system due to a mismatch in the IP address returned in the OFFER and the IP address returned in ACK. A DECLINE message is sent for the IP address sent in the OFFER.
IP Lease Renewals	The number of address lease renewal requests successfully processed.
DHCP Call Type	Type of DHCP call.

Field	Description
DHCP State	Status of DHCP call. <ul style="list-style-type: none">• Bound : Call Established• Renewing: Call renewing after expiry of leased time.• Rebinding: Making call for same call id after expiry of
Lease time received	Time in seconds allotted for a specific call-Id.
Lease time remaining	Time in seconds available for a specific call-Id.

show dhcp chaddr

Table 212. show dhcp chaddr Command Output Descriptions

Field	Description
User Name	The user name associated with this session.
User Address	The IP address of the user's PDP context in dotted decimal notation.
DHCP Service	The DHCP service name.
Server Address	The server address.
DHCP Call Type	The DHCP call type.
DHCP State	The DHCP state.
Lease time received	The IP address lease time received.
Lease time remaining	The IP address lease time remaining.
Total DHCP sessions matching specified criteria	The total number of DHCP sessions matching specified criteria.

show dhcp dhcp-service

Table 213. show dhcp dhcp-service Command Output Descriptions

Field	Description
Session Counters	
Total Current	The total number of currently active PDP contexts on the system that received DHCP-assigned IP addresses as facilitated by the specified criteria.
DHCP Proxy	The total number of PDP contexts that were assigned IP addresses using the DHCP Proxy method.
DHCP Relay Agent	The total number of PDP contexts that were assigned IP addresses using the DHCP Relay method.
DHCP Messages	
DISCOVER TX	The number of DHCPDISCOVER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER retransmitted	The number of DHCPDISCOVER messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER relayed	The number of DHCPDISCOVER messages relayed by the system to the mobile as part of the DHCP Relay method.
OFFER RX	The number of DHCPOFFER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER Discarded	The number of DHCPOFFER messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER relayed	The number of DHCPOFFER messages relayed by the system to the mobile as part of the DHCP Relay method.
REQUEST TX	The number of DHCPREQUEST messages sent by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST retransmitted	The number of DHCPREQUEST messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST relayed	The number of DHCPREQUEST messages relayed by the system to the mobile as part of the DHCP Relay method.
ACK RX	The number of DHCPACK messages received from the DHCP server as part of the DHCP Proxy method.
ACK for INFORM	The number of acknowledgements received for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.
ACK relayed	The number of DHCPACK messages relayed by the system to the mobile as part of the DHCP Relay method.
NAK RX	The number of DHCPNAK messages received from the DHCP server as part of the DHCP Proxy method.
NAK for INFORM	The number of negative acknowledgements for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.

Field	Description
NAK relayed	The number of DHCPNAK messages relayed by the system to the mobile as part of the DHCP Relay method.
DECLINE relayed	The number of DHCPDECLINE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
RELEASE relayed	The number of DHCPRELEASE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
INFORM relayed	The number of DHCPINFORM messages relayed by the system to the DHCP server on behalf of the mobile as part of the DHCP Relay method.
DHCP OFFER Discard Reasons	
Parse error	The number of DHCPOFFER messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
Lease less than min	The number of DHCPOFFER messages discarded by the system due to the offered lease time being less than the minimum acceptable value configured on the system.
Lease greater than max	The number of DHCPOFFER messages discarded by the system due to the offered lease time being greater than the maximum acceptable value configured on the system.
IP Validation failed	The number of DHCPOFFER messages discarded by the system due to a failure with the validation of the IP address. This occurs because the IP address returned by DHCP Server is not present in the static pool in the destination context.
DHCP ACK Discard Reasons: (dhcp-proxy)	
Parse error	The number of DHCPACK messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
DHCP DECLINE Reasons: (dhcp-proxy)	
IP mismatch	The number of DHCPDECLINE messages sent by the system due to a mismatch in the IP address returned in the OFFER and the IP address returned in ACK. A DECLINE message is sent for the IP address sent in the OFFER.
IP Lease Renewals	The number of address lease renewal requests successfully processed.

show dhcp msid

Table 214. show dhcp msid Command Output Descriptions

Field	Description
User Name	The user name associated with this session.
User Address	IP address of the user's PDP context in dotted decimal notation.
DHCP Service	The DHCP service name.
Server Address	The server address.
DHCP Chaddr of MS	The Client Hardware (MAC) Address (CHADDR) of MS.
DHCP Call Type	The DHCP call type.
DHCP State	The DHCP state.
Lease time received	The IP address lease time received.
Lease time remaining	The IP address lease time remaining.
Total DHCP sessions matching specified criteria	The total number of DHCP sessions matching specified criteria.

show dhcp full msid

Table 215. show dhcp full msid Command Output Descriptions

Field	Description
User Name	The user name associated with this session.
User Address	IP address of the user's PDP context in dotted decimal notation.
DHCP Service	The DHCP service name.
Server Address	The server address.
DHCP Call Type	The DHCP call type.
DHCP State	The DHCP status.
Lease time received	Time allotted in seconds.
Lease time remaining	Time available in seconds.
DHCP Messages:	
DISCOVER TX	The number of DHCPDISCOVER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER retransmitted	The number of DHCPDISCOVER messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER RX	The number of DHCPDISCOVER messages received by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER retried RX	The number of retried DHCPDISCOVER messages received by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER relayed	The number of DHCPDISCOVER messages relayed by the system to the mobile as part of the DHCP Relay method.
OFFER RX	The number of DHCPOFFER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER Discarded	The number of DHCPOFFER messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER TX	The number of DHCPREQUEST messages sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER relayed	The number of DHCPOFFER messages relayed by the system to the mobile as part of the DHCP Relay method.
REQUEST TX	The number of DHCPREQUEST messages sent by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST retransmitted	The number of DHCPREQUEST messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.

Field	Description
REQUEST RX	The number of DHCPREQUEST messages received by the system as part of the DHCP Proxy method.
REQUEST renewal RX	The number of DHCPREQUEST renewal messages received by the system as part of the DHCP Proxy method.
REQUEST relayed	The number of DHCPREQUEST messages relayed by the system to the mobile as part of the DHCP Relay method.
ACK RX	The number of DHCPACK messages received from the DHCP server as part of the DHCP Proxy method.
ACK for INFORM	The number of acknowledgements received for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.
ACK TX	The number of DHCPACK messages send to the DHCP server as part of the DHCP Proxy method.
ACK Renewing TX	The number of DHCPACK messages renewed from the DHCP server as part of the DHCP Proxy method.
ACK relayed	The number of DHCPACK messages relayed by the system to the mobile as part of the DHCP Relay method.
NAK RX	The number of DHCPNAK messages received from the DHCP server as part of the DHCP Proxy method.
NAK for INFORM	The number of number of negative acknowledgements for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.
NAK TX	The number of DHCPNAK messages sent to the DHCP server as part of the DHCP Proxy method.
NAK relayed	The number of DHCPNAK messages relayed by the system to the mobile as part of the DHCP Relay method.
DECLINE relayed	The number of DHCPDECLINE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
RELEASE relayed	The number of DHCPRELEASE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
INFORM relayed	The number of DHCPINFORM messages relayed by the system to the DHCP server on behalf of the mobile as part of the DHCP Relay method.
DHCP OFFER Discard Reasons: (dhcp-proxy)	
Parse error	The number of DHCPPOFFER messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
Lease less than min	The number of DHCPPOFFER messages discarded by the system due to the offered lease time being less than the minimum acceptable value configured on the system.

Field	Description
Lease greater than max	The number of DHCPOFFER messages discarded by the system due to the offered lease time being greater than the maximum acceptable value configured on the system.
IP Validation failed	The number of DHCPOFFER messages discarded by the system due to a failure with the validation of the IP address. This occurs because the IP address returned by DHCP Server is not present in the static pool in the destination context.
DHCP ACK Discard Reasons: (dhcp-proxy)	
Parse error	The number of DHCPACK messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
DHCP DECLINE Reasons: (dhcp-proxy)	
IP mismatch	The number of DHCP DECLINE messages sent by the system due to a mismatch in the IP address returned in the OFFER and the IP address returned in ACK. A DECLINE message is sent for the IP address sent in the OFFER.
IP Lease Renewals	The number of address lease renewal requests successfully processed.
Session Counters:	
Total Current	The total number of currently active sessions on the system that received DHCP-assigned IP addresses.
DHCP Proxy	The total number of sessions that were assigned IP addresses using the DHCP Proxy method.
DHCP Relay Agent	The total number of sessions that were assigned IP addresses using the DHCP Relay method.
DHCP Server	The DHCP server's IP address.
Total DHCP sessions matching specified criteria	The total number of DHCP sessions matching the specified criteria.

show dhcp status

Table 216. show dhcp status Command Output Descriptions

Field	Description
DHCP Type	Indicates the type of DHCP service active. Possible types are: <ul style="list-style-type: none"> • (P) - DHCP Proxy • (R) - DHCP Relay • (S) - DHCP Server • (u) - unknown call
Lease State	The lease state for the DHCP service.
DHCP Service	The name of the DHCP service.
DHCP Server	The IP address of DHCP server.
Status	Indicates the status of the DHCP server. Possible status are: <ul style="list-style-type: none"> • Up • Active
Current Leased Address	The total number of DHCP Relay-assigned IP addresses currently leased to this service.
Total Leased Address	The total number of DHCP Relay-assigned IP addresses available for this service.

show dhcp-service

Table 217. show dhcp-service name Command Output Descriptions

Field	Description
Service name	The DHCP service name.
Context	The context name.
Bind	Indicates the bind status.
Local IP Address	The IP address of DHCP server.
Next Hop Address	Indicates the nexthop-forwarding address configured in DHCP service for MPLS traffic.
DHCP Subnet mask used	Indicates the host mask.
MPLS-label	Indicates the MPLS labels configured in DHCP service for MPLS traffic.
Service Status	Indicates the service status, whether started or not.
Retransmission Timeout	The retransmission timeout period that must pass with no response before the system re-attempts to communicate with the DHCP server, in milliseconds.
Max Retransmissions	The maximum number of times that the system attempts to communicate with unresponsive DHCP server before it is considered a failure.
Lease Time	The lease time, in seconds.
Minimum Lease Duration	The minimum allowable lease duration accepted in responses from DHCP servers, in seconds.
Maximum Lease Duration	The maximum allowable lease duration accepted in responses from DHCP servers, in seconds.
DHCP Dead Time	The DHCP deadtime, in seconds, indicating the time period that the system waits prior to re-communicating with a DHCP server that was previously marked as down.
DHCP Dead consecutive Failure	The number of consecutive failures for the to be declared dead.
DHCP T1 Threshold Timer	The DHCP T1 threshold timer indicating the percentage of the allocated IP address lease time at which the DHCP call-line state is changed to “RENEWING”.
DHCP T2 Threshold Timer	The DHCP T2 threshold timer indicating the percentage of the allocated IP address lease time at which the DHCP call-line state is changed to “REBINDING”.
DHCP Client Identifier	Indicates the behavior relating to inclusion of client identifier DHCP option in DHCP messages. Possible values are: <ul style="list-style-type: none"> • msisdh • none.

Field	Description
DHCP Algorithm	The algorithm used to select DHCP servers with which to communicate when multiple servers are configured.
DHCP Servers configured	The IP address and priority information of the DHCP servers configured.
VRF Name	Indicates the name of the virtual routing and forwarding context instance associated with this DHCP service. Note: For DHCP over MPLS feature to work in StarOS 9.0 onward VRF context must be associated in DHCP service. Without this association the DHCP service using MPLS labels will not be started.
Input	Indicates the MPLS labels configured in DHCP service for inward MPLS traffic. Note: For DHCP over MPLS feature to work in StarOS 9.0 onward VRF context must be associated in DHCP service. Without this association the DHCP service using MPLS labels will not be started.
Output	Indicates the MPLS labels configured in DHCP service for outward MPLS traffic.
DHCP server rapid-commit	Indicates if the rapid commit option is enabled/disabled for DHCP server.
DHCP client rapid-commit	Indicates if the rapid commit option is enabled/disabled for DHCP clients.
DHCP server check msg size	Indicates if the checking of message size is enabled/disabled for DHCP messages sent from server to client.
DHCP relay agent option	Indicates if the DHCP relay agent option is enabled/disabled.
DHCP chaddr validation	Indicates the behavior of the client hardware address (chaddr) validation in DHCP messages.

show dhcp statistics

Table 218. show dhcp statistics Command Output Descriptions

Field	Description
Session Stats	
Total Current	The total number of currently active sessions on the system that received DHCP-assigned IP addresses.
DHCP Proxy	The total number of currently active sessions that were assigned IP addresses using the DHCP Proxy method.
DHCP Relay Agent	The total number of currently active sessions that were assigned IP addresses using the DHCP Relay method.
DHCP Server	The total number of currently active sessions that were assigned IP addresses using the DHCP Server.
Total Setup	The cumulative total number of sessions facilitated by the system that received DHCP-assigned IP addresses.
DHCP Proxy	The cumulative total number of sessions facilitated by the system that were assigned IP addresses using the DHCP Proxy method.
DHCP Relay Agent	The cumulative total number of sessions facilitated by the system that were assigned IP addresses using the DHCP Relay method.
DHCP Server	The cumulative total number of sessions facilitated by the system that were assigned IP addresses using the DHCP Server.
Total Released	The total number of IP addresses that have been returned to the DHCP server(s).
Session Release Reasons: (dhcp-proxy)	
Admin Releases	The number of DHCP Proxy-assigned IP addresses released due to administrative intervention.
Bearer Call Terminated	The number of DHCP Proxy-assigned IP addresses released due to session termination.
Lease Exp Policy	The number of DHCP Proxy-assigned IP addresses released due to the expiration of the address lease policy.
Lease Renew Failure	The number of DHCP Proxy-assigned IP addresses released due to a failure experienced during lease renewal.
IP Address mismatch	The number of DHCP Proxy-assigned IP addresses released due to the offering of an invalid IP address.
Lease time mismatch	The number of DHCP Proxy-assigned IP addresses released due to the offering of an unacceptable lease time.
Chaddr mismatch	The number of DHCP Proxy-assigned IP addresses released due to the mis-match in client hardware address (MAC) or unknown/invalid client hardware address.
Client-identifier mis-match	The number of DHCP Proxy-assigned IP addresses released due to the mis-match in client id or unknown/invalid client id.

■ show dhcp statistics

Field	Description
Other Reasons	The number of DHCP Proxy-assigned IP addresses released due to reasons other than those listed here.
Session Release Reasons: (dhcp-relay)	
Admin Releases	The number of DHCP Relay-assigned IP addresses released due to administrative intervention.
Bearer Call Terminated	The number of DHCP Relay-assigned IP addresses released due to session termination.
Lease Timed-out	The number of DHCP Relay-assigned IP addresses released due to the expiration of the address lease.
Other Reasons	The number of DHCP Relay-assigned IP addresses released due to reasons other than those listed here.
Session Release Reasons: (dhcp-local-server)	
Admin Releases	The number of DHCP local-server-assigned IP addresses released due to administrative intervention.
Bearer Call Terminated	The number of DHCP local-server-assigned IP addresses released due to session termination.
Lease Timed-out	The number of DHCP local-server-assigned IP addresses released due to the expiration of the address lease.
Other Reasons	The number of DHCP local-server-assigned IP addresses released due to reasons other than those listed here.
DHCP Messages	
DISCOVER TX	The number of DHCPDISCOVER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER retransmitted	The number of DHCPDISCOVER messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER RX	The number of DHCPDISCOVER messages received by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER retried RX	The number of retried DHCPDISCOVER messages received by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER relayed	The number of DHCPDISCOVER messages relayed by the system to the mobile as part of the DHCP Relay method.
DISCOVER retransmitted relayed	The number of retransmitted DHCPDISCOVER messages relayed by the system to the mobile as part of the DHCP Relay method.
OFFER RX	The number of DHCPOFFER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER Discarded	The number of DHCPOFFER messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER relayed	The number of DHCPOFFER messages relayed by the system to the mobile as part of the DHCP Relay method.
REQUEST TX	The number of DHCPREQUEST messages sent by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST retransmitted	The number of DHCPREQUEST messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.

Field	Description
REQUEST relayed	The number of DHCPREQUEST messages relayed by the system to the mobile as part of the DHCP Relay method.
REQUEST renewing relayed	The number of DHCPREQUEST renewal messages relayed by the system to the mobile as part of the DHCP Relay method.
ACK RX	The number of DHCPACK messages received from the DHCP server as part of the DHCP Proxy method.
ACK for INFORM	The number of acknowledgements received for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.
ACK Renewing RX	The number of DHCPACK renewal messages received from the DHCP server as part of the DHCP Proxy method.
ACK TX	The number of DHCPACK messages sent to the DHCP server as part of the DHCP Proxy method.
ACK Renewing TX	The number of DHCPACK renewal messages sent to the DHCP server as part of the DHCP Proxy method.
ACK relayed	The number of DHCPACK messages relayed by the system to the mobile as part of the DHCP Relay method.
ACK renewing relayed	The number of DHCPACK renewal messages relayed by the system to the mobile as part of the DHCP Relay method.
NAK RX	The number of DHCPNAK messages received from the DHCP server as part of the DHCP Proxy method.
NAK for INFORM	The number of number of negative acknowledgements for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.
NAK TX	The number of DHCPNAK messages sent to the DHCP server as part of the DHCP Proxy method.
NAK relayed	The number of DHCPNAK messages relayed by the system to the mobile as part of the DHCP Relay method.
DECLINE TX	The number of DHCPDECLINE messages sent by the system to the DHCP server as part of the DHCP Proxy method.
DECLINE RX	The number of DHCPDECLINE messages received from the DHCP server as part of the DHCP Proxy method.
DECLINE relayed	The number of DHCPDECLINE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
RELEASE TX	The number of DHCPRELEASE messages sent by the system to the DHCP server as part of the DHCP Proxy method.
RELEASE RX	The number of DHCPRELEASE messages received from the DHCP server as part of the DHCP Proxy method.
RELEASE relayed	The number of DHCPRELEASE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
RELEASE for relay call	The number of DHCPRELEASE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
INFORM TX	The number of DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.

Field	Description
INFORM retransmitted	The number of DHCPINFORM messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
INFORM RX	The number of DHCPINFORM messages received from the DHCP server as part of the DHCP Proxy method.
INFORM relayed	The number of DHCPINFORM messages relayed by the system to the DHCP server on behalf of the mobile as part of the DHCP Relay method.
DHCP OFFER Discard Reasons:	
Parse error	The number of DHCPOFFER messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
Lease less than min	The number of DHCPOFFER messages discarded by the system due to the offered lease time being less than the minimum acceptable value configured on the system.
Lease greater than max	The number of DHCPOFFER messages discarded by the system due to the offered lease time being greater than the maximum acceptable value configured on the system.
IP Validation failed	The number of DHCPOFFER messages discarded by the system due to a failure with the validation of the IP address. This occurs because the IP address returned by DHCP Server is not present in the static pool in the destination context.
XID mismatch:	The number of DHCPOFFER messages discarded by the system due to an XID mismatch.
DHCP ACK Discard Reasons:	
Parse error	The number of DHCPACK messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
XID mismatch:	The number of DHCPACK messages discarded by the system due to an XID mismatch.
DHCP DECLINE Reasons: (dhcp-proxy)	
IP mismatch	The number of DHCPDECLINE messages sent by the system due to a mismatch in the IP address returned in the OFFER and the IP address returned in ACK. A DECLINE message is sent for the IP address sent in the OFFER.
DHCP DISCOVER Discard Reasons:	

Field	Description
Parse error	The number of DHCPDISCOVER messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
DHCP REQUEST Discard Reasons:	
Parse error	The number of DHCPREQUEST messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
DHCP RELEASE Discard Reasons:	
Parse error	The number of DHCPRELEASE messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
Renewal Statistics: (dhcp-proxy)	
IP Lease Renewals	The number of address lease renewal requests successfully processed.
Failed IP Lease Renewals	The number of address lease renewal requests for which failures occurred. This is the sum of the following errors: <ul style="list-style-type: none"> • No reply from server • Server NAK • IP address mis-match • Lease mismatch
No reply from server	The number of address lease renewal requests made for which there was no reply from the DHCP server within the stipulated time. The time required to wait for the server's response is described in RFC 2131, section 4.4.5.
Server NAK	The number of address lease renewal requests for which a negative acknowledgement was received from the server.
IP address mis-match	The number of address lease renewal requests for which there was an IP address mis-match condition- the IP Addresses assigned to the client (in the first ACK) and the IP address returned in the successive ACK (in response to lease renewal DHCP REQUEST) did not match.

Field	Description
Lease mis-match	The number of address lease renewal requests for which there was a lease time mis-match condition- to be lease returned in the first ACK was within the limits of the DHCP Service Configuration parameters, but the lease returned in the ACK (in response to lease renewal DHCP REQUEST) did not match.

show dhcp username

Table 219. show dhcp username Command Output Descriptions

Field	Description
User Name	The user name associated with this session.
User Address	IP address of the user's PDP context in dotted decimal notation.
DHCP Service	The DHCP service name.
Server Address	The server address.
DHCP Call Type	The DHCP call type.
DHCP State	The DHCP state.
Lease time received	The IP address lease time received.
Lease time remaining	The IP address lease time remaining.
Total DHCP sessions matching specified criteria	The total number of DHCP sessions matching specified criteria.

show dhcp full username

Table 220. show dhcp full username Command Output Descriptions

Field	Description
User Name	The user name associated with this session.
User Address	IP address of the user's PDP context in dotted decimal notation.
DHCP Service	The DHCP service name.
Server Address	The server address.
DHCP Chaddr of MS	The Client Hardware (MAC) Address (CHADDR) of MS.
Primary DNS Address	Specifies the primary Domain Name Server (DNS) IP address in IPv4 notation. NOTE: This is the DNS/NBNS value received from the DHCP server for the particular subscriber session sent to the subscriber in a GTP Create PDP Context Response message. If the DNS/NBNS value received from DHCP is not sent to the subscriber, nothing will be displayed.
Secondary DNS Address	Specifies the secondary Domain Name Server (DNS) IP address in IPv4 notation. NOTE: This is the DNS/NBNS value received from the DHCP server for the particular subscriber session sent to the subscriber in a GTP Create PDP Context Response message. If the DNS/NBNS value received from DHCP is not sent to the subscriber, nothing will be displayed.
Primary NBNS Address	Specifies the primary NetBIOS Name Server (NBNS) IP address in IPv4 notation. NOTE: This is the DNS/NBNS value received from the DHCP server for the particular subscriber session sent to the subscriber in a GTP Create PDP Context Response message. If the DNS/NBNS value received from DHCP is not sent to the subscriber, nothing will be displayed.
Secondary NBNS Address	Specifies the secondary NetBIOS Name Server (NBNS) IP address in IPv4 notation. NOTE: This is the DNS/NBNS value received from the DHCP server for the particular subscriber session sent to the subscriber in a GTP Create PDP Context Response message. If the DNS/NBNS value received from DHCP is not sent to the subscriber, nothing will be displayed.
DHCP Call Type	The DHCP call type.
DHCP State	The DHCP state.
Lease time received	The IP address lease time received.
Lease time remaining	The IP address lease time remaining.
DHCP Messages:	
DISCOVER TX	The number of DHCPDISCOVER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER retransmitted	The number of DHCPDISCOVER messages retransmitted by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER RX	The number of DHCPDISCOVER messages received by the system to the DHCP server as part of the DHCP Proxy method.

Field	Description
DISCOVER retried RX	The number of retried DHCPDISCOVER messages received by the system to the DHCP server as part of the DHCP Proxy method.
DISCOVER relayed	The number of DHCPDISCOVER messages relayed by the system to the DHCP server as part of the DHCP Proxy method.
OFFER RX	The number of DHCPOFFER messages received by the system to the DHCP server as part of the DHCP Proxy method.
OFFER Discarded	The number of DHCPOFFER messages discarded by the system to the DHCP server as part of the DHCP Proxy method.
OFFER TX	The number of DHCPOFFER messages sent by the system to the DHCP server as part of the DHCP Proxy method.
OFFER relayed	The number of DHCPOFFER messages relayed by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST TX	The number of DHCPREQUEST messages sent by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST retransmitted	The number of DHCPREQUEST messages re-sent by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST RX	The number of DHCPREQUEST messages received by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST renewal RX	The number of DHCPREQUEST renewal messages received by the system to the DHCP server as part of the DHCP Proxy method.
REQUEST relayed	The number of DHCPREQUEST messages relayed by the system to the DHCP server as part of the DHCP Proxy method.
ACK RX	The number of DHCPACK messages received from the DHCP server as part of the DHCP Proxy method.
ACK for INFORM	The number of acknowledgements received for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.
ACK TX	The number of DHCPACK messages sent to the DHCP server as part of the DHCP Proxy method.
ACK Renewing TX	The number of DHCPACK renewal messages sent to the DHCP server as part of the DHCP Proxy method.
ACK relayed	The number of DHCPACK messages relayed by the system to the mobile as part of the DHCP Relay method.
NAK RX	The number of DHCPNAK messages received from the DHCP server as part of the DHCP Proxy method.
NAK for INFORM	The number of negative acknowledgements for DHCPINFORM messages sent by the system to the DHCP server as part of the DHCP Proxy method.
NAK TX	The number of DHCPNAK messages sent to the DHCP server as part of the DHCP Proxy method.
NAK relayed	The number of DHCPNAK messages relayed by the system to the mobile as part of the DHCP Relay method.

Field	Description
DECLINE relayed	The number of DHCPDECLINE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
RELEASE relayed	The number of DHCPRELEASE messages relayed by the system to the DHCP server as part of the DHCP Relay method.
INFORM relayed	The number of DHCPINFORM messages relayed by the system to the DHCP server on behalf of the mobile as part of the DHCP Relay method.
DHCP OFFER Discard Reasons: (dhcp-proxy)	
Parse error	The number of DHCPPOFFER messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
Lease less than min	The number of DHCPPOFFER messages discarded by the system due to the offered lease time being less than the minimum acceptable value configured on the system.
Lease greater than max	The number of DHCPPOFFER messages discarded by the system due to the offered lease time being greater than the maximum acceptable value configured on the system.
IP Validation failed	The number of DHCPPOFFER messages discarded by the system due to a failure with the validation of the IP address. This occurs because the IP address returned by DHCP Server is not present in the static pool in the destination context.
DHCP ACK Discard Reasons: (dhcp-proxy)	
Parse error	The number of DHCPACK messages discarded by the system due to parsing errors in the OFFER message such as: <ul style="list-style-type: none"> • "magic cookie invalid" • missing "end" option • "xid" does not match xid of any outstanding requests • the message is a "short message"
DHCP DECLINE Reasons: (dhcp-proxy)	
IP mismatch	The number of DHCPDECLINE messages sent by the system due to a mismatch in the IP address returned in the OFFER and the IP address returned in ACK. A DECLINE message is sent for the IP address sent in the OFFER.
IP Lease Renewals	The number of address lease renewal requests successfully processed.
Session Counters	
Total Current	The total number of currently active sessions on the system that received DHCP-assigned IP addresses.
DHCP Proxy	The total number of currently active sessions that were assigned IP addresses using the DHCP Proxy method.
DHCP Relay Agent	The total number of sessions that were assigned IP addresses using the DHCP Relay method.

Field	Description
DHCP Server	The DHCP server's IP address.
Total DHCP sessions matching specified criteria	The total number of DHCP sessions matching specified criteria.

Chapter 90

show diameter

This chapter includes the `show diameter` command output tables.

show diameter aaa-statistics

Table 221. show diameter aaa-statistics Command Output Descriptions

Field	Description
Authentication Servers Summary	
Message Stats	Total Diameter session message statistics.
Total MA Requests	Total number of Multimedia-Auth-Requests.
Total MA Answers	Total number of Multimedia-Auth-Answers.
MAR - Retries	Total number of Multimedia-Auth-Request retries.
MAA Timeouts	Total number of Multimedia-Auth-Answer timeouts.
MAA - Dropped	Total number of Multimedia-Auth-Answer dropped.
Total SA Requests	Total number of Server-Assignment-Requests.
Total SA Answers	Total number of Server-Assignment-Answers.
SAR - Retries	Total number of Server-Assignment-Request retries.
SAA Timeouts	Total number of Server-Assignment-Answer timeouts.
SAA - Dropped	Total number of Server-Assignment-Answers dropped.
Total UA Requests	Total number of User-Authorization-Requests.
Total UA Answers	Total number of User-Authorization-Answers.
UAR - Retries	Total number of User-Authorization-Request retries.
UAA Timeouts	Total number of User-Authorization-Answer timeouts.
UAA - Dropped	Total number of User-Authorization-Answers dropped.
Total LI Requests	Total number of Location-Info-Requests.
Total LI Answers	Total number of Location-Info-Answers.
LIR - Retries	Total number of Location-Info-Request retries.
LIA Timeouts	Total number of Location-Info-Answer timeouts.
LIA - Dropped	Total number of Location-Info-Answers dropped.
Total RT Requests	Total number of Registration-Termination-Requests.
Total RT Answers	Total number of Registration-Termination-Answers.
RTR - Rejected	Total number of Registration-Termination-Requests rejected.
Total PP Requests	Total number of Push-Profile-Requests.

Field	Description
Total PP Answers	Total number of Push-Profile-Answers.
PPR - Rejected	Total number of Push-Profile-Requests rejected.
Total DE Requests	Total number of Diameter-EAP-Requests.
Total DE Answers	Total number of Diameter-EAP-Answers.
DEA - Accept	Total number of Diameter-EAP-Answers accepted.
DEA - Reject	Total number of Diameter-EAP-Answers rejected.
DER - Retries	Total number of Diameter-EAP-Request retries.
DEA Timeouts	Total number of Diameter-EAP-Answer timeouts.
DEA - Dropped	Total number of Diameter-EAP-Answer dropped.
Total AA Requests	Indicates the total number of AA (Authentication and/or Authorization) Request messages sent by P-GW on S6b interface to AAA Server/Proxy.
Total AA Answers	Indicates the total number of AA (Authentication and/or Authorization) Answer messages received by P-GW on S6b interface from AAA Server/Proxy.
AAR - Retries	Indicates the total number of AAR (AA Request) messages retransmitted by P-GW on S6b interface to AAA Server/Proxy.
AAA Timeouts	Indicates the total number of AAA (AA Answer) messages timed-out due to no response from AAA Server/Proxy.
AAA - Dropped	Indicates the total number of AAA (AA Answer) messages dropped due any reason from AAA Server/Proxy.
ASR	Total number of Abort-Session-Requests.
ASA	Total number of Abort-Session-Answers.
RAR	Total number of Re-Auth-Requests.
RAA	Total number of Re-Auth-Answers.
STR	Total number of Session-Termination-Requests.
STA	Total number of Session-Termination-Answers.
STR - Retries	Total number of Session-Termination-Request retries.
DE Message Error Stats	
Diameter Protocol Errs	Total number of Diameter protocol errors.
Bad Answers	Total number of bad answers.
Unknown Session Reqs	Total number of unknown session requests.
Unknown Command Code	Total number of unknown command codes.
Request Timeouts	Total number of request timeouts.
Parse Errors	Total number of parse errors.

Field	Description
Request Retries	Total number of request retries.
Session Stats	Diameter Session Statistics.
Total Sessions	Total number of sessions.
Freed Sessions	Total number of freed sessions.
Session Timeouts	Total number of session timeouts.
Active Sessions	Total number of active sessions.
STR Termination Cause Stats	Session-Termination-Request termination cause statistics.
Diameter Logout	Total number of Session-Termination-Request terminations due to Diameter logouts.
Service Not Provided	Total number of Session-Termination-Request terminations due to service not provided.
Bad Answer	Total number of Session-Termination-Request terminations due to bad answers.
Administrative	Total number of Session-Termination-Request terminations due to administrative reasons.
Link Broken	Total number of Session-Termination-Request terminations due to links broken.
Auth Expired	Total number of Session-Termination-Request terminations due to auth expiry.
User Moved	Total number of Session-Termination-Request terminations due to user moves.
Session Timeout	Total number of Session-Termination-Request terminations due to session timeouts.
User Request	Total number of Session-Termination-Request terminations due to user requests.
Lost Carrier	Total number of Session-Termination-Request terminations due to lost carriers.
Lost Service	Total number of Session-Termination-Request terminations due to lost service.
Idle Timeout	Total number of Session-Termination-Request terminations due to idle timeouts.
NAS Session Timeout	Total number of Session-Termination-Request terminations due to NAS session timeouts.
Admin Reset	Total number of Session-Termination-Request terminations due to admin resetting.
Admin Reboot	Total number of Session-Termination-Request terminations due to admin reboots.
Port Error	Total number of Session-Termination-Request terminations due to port errors.
NAS Error	Total number of Session-Termination-Request terminations due to NAS errors.
NAS Request	Total number of Session-Termination-Request terminations due to NAS requests.
NAS Reboot	Total number of Session-Termination-Request terminations due to NAS reboots.
Port Unneeded	Total number of Session-Termination-Request terminations due to unneeded ports.
Port Preempted	Total number of Session-Termination-Request terminations due to preempted ports.
Port Suspended	Total number of Session-Termination-Request terminations due to suspended ports.
Service Unavailable	Total number of Session-Termination-Request terminations due to unavailable service.
Callback	Total number of Session-Termination-Request terminations due to callback.

Field	Description
User Error	Total number of Session-Termination-Request terminations due to user errors.
Host Request	Total number of Session-Termination-Request terminations due to host requests.
Accounting Servers Summary	
Message Stats	Accounting message statistics.
Total AC Requests	Total number of AC-Requests.
Total AC Answers	Total number of AC-Answers.
ACR-Start	Total number of AC-Request starts.
ACA-Start	Total number of AC-Answer starts.
ACR-Start Retries	Total number of AC-Request start retries.
ACA-Start Timeouts	Total number of AC-Answer timeouts.
ACR-Interim	Total number of AC-Request interim.
ACA-Interim	Total number of AC-Answer interim.
ACR-Interim Retries	Total number of AC-Request interim retries.
ACA-Interim Timeouts	Total number of AC-Answer interim timeouts.
ACR-Event	Total number of AC-Request events.
ACA-Event	Total number of AC-Answer events.
ACR-Stop	Total number of AC-Request stops.
ACA-Stop	Total number of AC-Answer stops.
ACR-Stop Retries	Total number of AC-Request stop retries.
ACA-Stop Timeouts	Total number of AC-Answer stop timeouts.
ACA-Dropped	Total number of AC-Answers dropped.
AC Message Error Stats	Accounting message error statistics.
Diameter Protocol Errs	Total number of Diameter protocol errors.
Bad Answers	Total number of bad answers.
Unknown Session Reqs	Total number of unknown session requests.
Unknown Command Code	Total number of unknown command codes.
Request Timeouts	Total number of request timeouts.
Parse Errors	Total number of parse errors.
Request Retries	Total number of request retries.

show diameter authentication servers

Table 222.show diameter authentication servers Command Output Descriptions

Field	Description
Context Name	Name of the context in which the Diameter servers are configured.
AAA Group	Name of the AAA group.
Endpoint	Name of the Diameter endpoint.
Peer	Name of the Diameter server host.
No of Instance in UP state	The number of instances between Diameter server and AAA Manager in up state.
No of Instance in DOWN state	The number of instances between Diameter server and AAA Manager in down state.
Priority	The relative priority of this server considered when the system is selecting which Diameter server to use. Lower number has higher priority.
Message Sent/Queued	The number of messages sent/queued from Diameter server to AAA Manager.

show diameter endpoints all

Table 223. show diameter endpoints all Command Output Descriptions

Field	Description
Context	Name of the configured context.
Endpoint	Name of the endpoint.
Realm	Domain (Realm) name for subscriber.
Task	Task running on ACSMgr or AAAMgr.
CPU	Indicates the Card and CPU number.
Application	Indicates the application running on ACSMgr or AAAMgr.
Total endpoints matching specified criteria	Indicates the total number of matching endpoints.

show diameter message-queue counters outbound endpoint

Table 224. show diameter message-queue counters outbound endpoint Command Output Descriptions

Field	Description
Context	Name of the configured context.
Endpoint	Name of the endpoint.
Peer Host	Name of the peer host.
Peer Realm	Name of the peer realm.
Accounting-Answer	The number of outbound Accounting-Answer messages for the specified endpoint.
Accounting-Request	The number of outbound Accounting-Request messages for the specified endpoint.
Abort-Session-Answer	The number of outbound Abort-Session-Answer messages for the specified endpoint.
Abort-Session-Request	The number of outbound Abort-Session-Request messages for the specified endpoint.
Authorization-Authentication-Ans	The number of outbound Authorization-Authentication-Ans messages for the specified endpoint.
Authorization-Authentication-Req	The number of outbound Authorization-Authentication-Req messages for the specified endpoint.
Capabilities-Exchange-Answer	The number of outbound Capabilities-Exchange-Answer messages for the specified endpoint.
Capabilities-Exchange-Request	The number of outbound Capabilities-Exchange-Request messages for the specified endpoint.
Credit-Control-Answer	The number of outbound Credit-Control-Answer messages for the specified endpoint.
Credit-Control-Request	The number of outbound Credit-Control-Request messages for the specified endpoint.
Device-Watchdog-Answer	The number of outbound Device-Watchdog-Answer messages for the specified endpoint.
Device-Watchdog-Request	The number of outbound Device-Watchdog-Request messages for the specified endpoint.
Diameter-EAP-Answer	The number of outbound Diameter-EAP-Answer messages for the specified endpoint.
Diameter-EAP-Request	The number of outbound Diameter-EAP-Request messages for the specified endpoint.
Disconnect-Peer-Answer	The number of outbound Disconnect-Peer-Answer messages for the specified endpoint.
Disconnect-Peer-Request	The number of outbound Disconnect-Peer-Request messages for the specified endpoint.
Location-Info-Answer	The number of outbound Location-Info-Answer messages for the specified endpoint.
Location-Info-Request	The number of outbound Location-Info-Request messages for the specified endpoint.
Multimedia-Auth-Answer	The number of outbound Multimedia-Auth-Answer messages for the specified endpoint.
Multimedia-Auth-Request	The number of outbound Multimedia-Auth-Request messages for the specified endpoint.

Field	Description
Profile-Update-Answer	The number of outbound Profile-Update-Answer messages for the specified endpoint.
Profile-Update-Request	The number of outbound Profile-Update-Request messages for the specified endpoint.
Push-Profile-Answer	The number of outbound Push-Profile-Answer messages for the specified endpoint.
Push-Profile-Request	The number of outbound Push-Profile-Request messages for the specified endpoint.
Re-Auth-Answer	The number of outbound Re-Auth-Answer messages for the specified endpoint.
Re-Auth-Request	The number of outbound Re-Auth-Request messages for the specified endpoint.
Registration-Termination-Answer	The number of outbound Registration-Termination-Answer messages for the specified endpoint.
Registration-Termination-Request	The number of outbound Registration-Termination-Request messages for the specified endpoint.
Server-Assignment-Answer	The number of outbound Server-Assignment-Answer messages for the specified endpoint.
Server-Assignment-Request	The number of outbound Server-Assignment-Request messages for the specified endpoint.
Session-Termination-Answer	The number of outbound Session-Termination-Answer messages for the specified endpoint.
Session-Termination-Request	The number of outbound Session-Termination-Request messages for the specified endpoint.
User-Authorization-Answer	The number of outbound User-Authorization-Answer messages for the specified endpoint.
User-Authorization-Request	The number of outbound User-Authorization-Request messages for the specified endpoint.
User-Data-Answer	The number of outbound User-Data-Answer messages for the specified endpoint.
User-Data-Request	The number of outbound User-Data-Request messages for the specified endpoint.
Total peers matching specified criteria	Indicates the total number of matching peers.

show diameter peers full all

Table 225. show diameter peers full all Command Output Descriptions

Field	Description
Context	Name of the context.
Endpoint	Name of the endpoint.
Inbound listening sockets	Displays listening Diameter interface:ports information when origin-host is configured as of “accept-inbound” connection type. If no inbound sockets are present these fields are not displayed.
Local Host	Name of the local host.
Local Address	IP address and port number of the local host.
Endpoint	Name of the endpoint.
Task	The task instance running on ACSMgr or AAAMgr.
Peer Hostname	Name of the peer host.
Local Hostname	Name of the local host.
Peer Realm	Peer domain (realm) name for Subscriber.
Local Realm	Local domain (realm) name for Subscriber.
Peer Address	Address of peer domain (realm).
Local Address	Address of local domain (realm).
State	Indicates the connection status.
CPU	The Card and CPU number.
Messages Out/Queued	The number of messages sent out/queued. <div style="text-align: center;">  IMPORTANT: Release 12.0 onwards, this statistic will not indicate the count of outstanding messages for Diameter proxy peers. </div>
Task	The task running on ACSMgr or AAAMgr.
Supported Vendor IDs	The supported vendor IDs.
Admin Status	Indicates the admin status. Whether the user can administratively disable a peer while still preserving its configuration.
DPR Disconnect	Disconnect-Peer-Request disconnect cause.
Total peers matching specified criteria	The total number of peers matching the criteria.

show diameter statistics

Table 226. show diameter statistics Command Output Descriptions

Field	Description
Connection statistics	
Connection attempts	The total number of connections attempted.
Connection failures	The total number of connections failed.
Connection reads	The total number of connections read.
Connection starts	The total number of connections started.
Connection disconnects	The total number of connections disconnected
Connection closes	The total number of connections closes.
Connection DHOST requests	The total number of connections with DHOST requested.
Connection DHOST removes	The total number of connections with DHOST removed.
Connection Timeouts	The total number of connections timed out.
Tc Expire Connection Attempts	The total number of connections attempted due to Tc timer expired. Note: The Tc timer controls the frequency that transport connection attempts are done to a peer with whom no active transport connection exists.
Tw Expire Connection Closes	The total number of connections closed due to Tw timer expired.
Tx Expire	On the expiry of application level timer (Tx/Pending timeout), the application like Gy and Gx will decide what failure handling has to be taken for the message sent to the server. This stats will be incremented if this application level Tx timer expires.
Application initiated Retries	If the application determines a failure on one connection on which the request message was sent to, it will retry the message to an alternate server if available. This stats will be used if the application decides to retry the message to alternate server.
Connection failure statistics	
Connection bind errors	The total number of connections failed during binding errors.
Connection connect errors	The total number of connections failed during connect errors.
Connection address errors	The total number of connections failed due to address errors.

Field	Description
Connection misc errors	The total number of connections failed due to other errors not mentioned in output.
Connection DHOST errors	The total number of connections failed due to DHOST errors.
Capabilities Exchange Request and Answers statistics	
Connection CER sent	The total number of Capabilities Exchange Request (CER) messages sent for connection.
Connection CER send errors	The total number of connections failed due to errors during CER messages sent.
CERs received	The total number of CER messages received.
Connection CER create failures	The total number of connections failed during CER message creation.
CEAs received	The total number of Capabilities Exchange Answer (CEA) messages received.
CEA AVPs unknown	The total number of unknown Attribute Value Pairs (AVPs) related to CEA message.
CEA Application ID mismatch	The total number of CEA Application ID mismatch.
Read CEA Messages	The total number of READ messages for CEA.
Read CEA Messages Unexpected	The total number of unexpected READ messages for CEA.
Read CEA Missing	The total number of missing READ messages for CEA.
Read CEA Negotiation Failure	The total number of failures in READ messages negotiation for CEA.
Read CER Messages	The total number of READ messages for CER.
Read CER Messages Unexpected	The total number of unexpected READ messages for CER.
Read CER Missing	The total number of missing READ messages for CER.
Tw Expire Waiting for CEA	The total number of CEAs waiting for answer due to Tw timer expired. NOTE: The Tw timer controls the changing of a peer to the SUSPECT state when no answer is received to a watchdog request.
Device Watchdog Requests and Answers statistics	
DWA attempts	The total number of attempts for Device Watchdog Answer (DWA).
DWA handle allocation failures	The total number of failures to handle allocation of DWA.
DWAs sent	The total number of DWA messages sent.
DWR send errors	The total number of errors while sending DWR messages.

Field	Description
Read DWA Messages	The total number of READ messages for DWA.
Read DWA Messages Unexpected	The total number of unexpected READ messages for DWA.
Read DWR Messages	The total number of missing READ messages for DWR.
Tw Expire Send DWR	The total number of DWRs sent due to Tw timer expired.
Send DWR Attempts	The total number of attempts to send 'DWR Sent' messages.
Send DWR Send Errors	The total number of errors while sending 'DWR Sent' messages.
Send DWR Calls	The total number of calls for 'DWR Sent' messages.
Send DWR MH Errors	The total number of message handling errors for 'DWR Sent' messages.
Disconnect Peer Request and Answers statistics	
DPRs Sent	If the diameter base protocol decides to close a connection, it will send a Disconnect-Peer-Request (DPR) to the server to notify the reason for disconnection. This statistics will be incremented when diameter base protocol sends a DPR to the system.
DPAs Received	This statistics will be incremented for the reception of Answer message the server responded for the Disconnect-Peer-Request that was sent earlier.
DPR attempts	This statistics will be incremented when the diabase base protocol decides to send a Disconnect-Peer-Answer to the server as a response to the Disconnect-Peer-Request that was sent earlier. This will be the same as "DPAs Sent" statistics if there is no failure in sending the DPA out.
DPAs Sent	This statistics will be incremented if a Disconnect-Peer-Answer is sent to the server as a response to the Disconnect-Peer-Request that was sent earlier. This will happen in case of server initiated connection closure. This will be the same as "DPR attempts" statistics if there is no failure in sending the DPA out.
DPR send errors	When a DPR is sent out for connection closure and if the sending of DPR is failed due to some connection issue, this statistics will be incremented.
DPA Message handle allocation	When a DPA is sent out for connection closure and if the sending of DPA is failed due to failure in creating the DPA message, this statistics will be incremented.
DPR error immclose	When a DPA is sent out for connection closure and if the sending of DPA is failed due to failure in creating the DPA message, the connection will be closed immediately. This statistics is incremented for those immediate closures without sending a DPA.
Read DPR Messages	This statistics will be incremented when the DPR request received from the server is successfully parsed.
DPA No Host Error	This statistics will be incremented if a DPR message is received without including Origin-Host AVP.
Create Messages statistics	
Calls	The total number of calls for 'Create' message.

Field	Description
Success	The total number of messages successful for 'Create' message.
Routed	The total number of messages routed for 'Create' message.
Directed	The total number of messages directed for 'Create' message.
Buffer Errors	The total number of errors for 'Create' message buffer.
Peer Never Up Errors	The total number of errors due to peer failure for 'Create' message.
Window Errors	The total number of errors due to 'Create' message window.
Unsupported Application Errors	The total number of errors due to unsupported applications for 'Create' message.
Message Parse statistics	
Message Pool Expand Attempts	The total number of attempts for message pool expansion.
Buffer Expand Attempts	The total number of attempts for buffer expansion.
Calls	The total number of calls for message parsing.
Too Many AVP Errors	The total number of message parsed having excessive AVP errors.
Header Errors	The total number of message parsed having header errors.
AVP Unknown Errors	The total number of message parsed having unknown AVP errors (errors not listed here).
Runt Errors	The total number of message parsed having runtime errors.
AVP Header Errors	The total number of message parsed having AVP header errors.
Message Protocol Error	The total number of message parsed having protocol errors.
Mand AVP Unknown Errors	The total number of message parsed having unknown errors for mandatory AVP.
Message aborts	The total number of message aborted during parsing.
Send Message statistics	
Calls	The total number of calls for 'Send' message.
Truncated Errors	The total number of truncated errors for 'Send' message.
Read Statistics	
Read Bytes	The total number of bytes read.
Read Messages Total	The total number of 'Read' messages.
Requests Read	The total number of requests for 'Read' messages.

Field	Description
Requests Timed Out	The total number of requests timed out for 'Read' messages.
Answers Read	The total number of answers read for 'Read' messages.
Answers Timed Out	The total number of answers timed out for 'Read' messages.
Read Application Messages	The total number of 'Read application' messages.
Unexpected Answers Read	The total number of unexpected answers for 'Read' messages.
Read Parse statistics	
Begin	The total number of parsing begins for 'Read' message.
E2E Errors	The total number of End-to-End (E2E) errors during parsing of 'Read' message.
Success	The total number of successful parsing of 'Read' message.
Application ID Errors	The total number of errors with Application Id during parsing of 'Read' message.
Command/Flag Errors	The total number of command or flag errors during parsing of 'Read' message.
Diameter Protocol Errors	The total number of Diameter protocol errors during parsing of 'Read' message.
Errors	The total number of errors during parsing of 'Read' message.
Length Padding Errors	The total number of 'Length Padding' errors during parsing of 'Read' message.
H2H Errors	The total number of Host-to-Host (H2H) errors during parsing of 'Read' message.
Length Too Long	The total number of message parsed having excessive length of 'Read' message.
Command Unknown	The total number of message parsed having unknown command in 'Read' message.
Length Sanity Errors	The total number of message parsed having invalid length of 'Read' message.
Length-v-SCTP EOR Errors	The total number of "Length-v-SCTP EOR" errors during parsing of "Read" message.
SCTP Missing EOR Errors	The total number of "SCTP Missing EOR" errors during parsing of "Read" message.
Write statistics	
total	The total number of calls for 'Write' message.
while OPEN	The total number of calls for 'Write' message while connection is OPEN.
while IDLE	The total number of calls for 'Write' message while connection is IDLE.
in other states	The total number of calls for 'Write' message while connection state is other than OPEN or IDLE state.
backpressure events	The total number of Write messages over the maximum number of outstanding messages to queue.

Field	Description
Written bytes	The total number of bytes written.
iterations	The total number of write iterations.
Written messages	The total number of messages written.
EOFs	The total number of 'Write' messages with End-of-File (EOFs).
errors	The total number of 'Write' message with errors.
Peer Calls statistics	
Open Calls	The total number of calls to open a peer.
Close Calls	The total number of calls to close a peer.
Open New Peer	The total number of calls to open a new peer.
Open Unknown Peer Errors	The total number of calls to open an unknown peer.
Open Misses	The total number of missed attempts to open a peer.
Route statistics	
Adds	The total number of routes added.
Expires	The total number of routes expired.
Hits	The total number of hits to a route.
Misses	The total number of routes missed.
Indirects	The total number of indirect route.
Installs	The total number of redirected routes installed.
Dynamic Route statistics	
Adds	The total number of dynamic routes added.
Add Failures	The total number of failures in adding dynamic routes.
Removes	The total number of dynamic routes removed.
Hits	The total number of hits to a dynamic route.
Expires	The total number of dynamic routes expired.
Latency statistics	
Last Round Trip Time (ms)	The last round trip time, in milliseconds.
Average Round Trip Time (ms)	The average round trip time in milliseconds.
Redirect Host Usage:	
Redirected Host	The number of times the host is redirected.

Field	Description
Redirect Not Cached	The number of times the redirected host is not cached.
Redirect All Session	The number of times all messages within the session are sent to Redirect-Host.
Redirect All Realm	The number of times all messages destined to Realm are sent to Redirect-Host.
Redirect Realm and Application	The number of times the messages for application requested to Realm are sent to Redirect-Host.
Redirect All Application	The number of times all messages for application are sent to Redirect-Host.
Redirect All Host	The number of times the messages sent to Redirect-Host AVP value instead of Redirect-Host value sent by the host.
Redirect All User	The number of times the message for user sent to Redirect-Host value.
Diameter DNS Statistics	
DNS Init	The total number of times an application (diabase/proxy) initialized an instance of a DNS library.
DNS De-Init	The total number of times an application (diabase/proxy) closed an instance of a DNS library.
VPN Init Request	The total number of init request messages sent to VPN managers from a library.
VPN Init Response	The total number of init response messages received from the VPN managers to a library.
VPN Init Success	The total number of init success messages received from the VPN managers to a library.
VPN Init Timeout	The total number of failed init responses received from the VPN managers to a library due to a timeout.
DNS A Requests	The total number of A-type (IPv4) requests sent to the VPN from the library.
DNS A Responses	The total number of A-type (IPv4) responses received by the library from the VPN.
DNS A Hits	The total number of A-type (IPv4) responses received by the library from the VPN with valid addresses.
DNS A Timeouts	The total number of A-type (IPv4) response failures due to timeout.
DNS AAAA Requests	The total number of AAAA-type (IPv6) requests sent to the VPN from the library.
DNS AAAA Responses	The total number of AAAA-type (IPv6) responses received by the library from the VPN.
DNS AAAA Hits	The total number of AAAA-type (IPv6) responses received by the library from the VPN with valid addresses.
DNS AAAA Timeouts	The total number of AAAA-type (IPv6) response failures due to timeout.
DNS NAPTR Requests	The total number of Naming Authority Pointer requests sent to the VPN from the library.
DNS NAPTR Responses	The total number of Naming Authority Pointer responses received by the library from the VPN.
DNS NAPTR Hits	The total number of Naming Authority Pointer responses received by the library from the VPN with valid URIs.

Field	Description
DNS NAPTR Timeouts	The total number of Naming Authority Pointer response failures due to timeout.
DNS SRV Requests	The total number of Service Locator requests sent to the VPN from the library.
DNS SRV Responses	The total number of Service Locator responses received by the library from the VPN.
DNS SRV Hits	The total number of Service Locator responses received by the library from the VPN with valid locations.
DNS SRV Timeouts	The total number of Service Locator response failures due to timeout.
A Type App Request	The total number of A-type requests made by the application to the library. Single application request can result in multiple library to VPN manager requests and vice versa.
AAAA Type App Request	The total number of AAAA-type requests made by the application to the library. Single application request can result in multiple library to VPN manager requests and vice versa.
