THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

Modifications to this product not authorized by Cisco could void the FCC approval and negate your authority to operate the product.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Cisco and the Cisco Logo are trademarks of Cisco Systems, Inc. and/or its affiliates in the U.S. and other countries. A listing of Cisco's trademarks can be found at www.cisco.com/go/trademarks. Third party trademarks mentioned are the property of their respective owners. The use of the word partner does not imply a partnership relationship between Cisco and any other company.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

About this Guide

This document pertains to the features and functionality that run on and/or that are related to the Cisco® ASR 5x00 Chassis.

This preface includes the following sections:

- Conventions Used
- Contacting Customer Support
- Additional Information

Conventions Used

The following tables describe the conventions used throughout this documentation.

Icon	Notice Type	Description
	Information Note	Provides information about important features or instructions.
	Caution	Alerts you of potential damage to a program, device, or system.
	Warning	Alerts you of potential personal injury or fatality. May also alert you of potential electrical hazards.
	Electrostatic Discharge (ESD)	Warns you to take proper grounding precautions before handling ESD sensitive components or devices.

Typeface Conventions	Description
Text represented as a `screen display`	This typeface represents text that appears on your terminal screen, for example: `Login:`
Text represented as **`commands`**	This typeface represents commands that you enter at the CLI, for example: **`show ip access-list`** This document always gives the full form of a command in lowercase letters. Commands are not case sensitive.
Text represented as a **`command`** *`variable`*	This typeface represents a variable that is part of a command, for example: **`show card`** *`slot_number`* *`slot_number`* is a variable representing the desired chassis slot number.
Text represented as menu or sub-menu names	This typeface represents menus and sub-menus that you access within a software application, for example: Click the **File** menu, then click **New**.

Command Syntax Conventions	Description
{ **`keyword`** or *`variable`* }	Required keywords and variables are surrounded by braces. They must be entered as part of the command syntax.
[**`keyword`** or *`variable`*]	Optional keywords or variables that may or may not be used are surrounded by brackets.

Command Syntax Conventions	Description
|	Some commands support alternative variables. These "options" are documented within braces or brackets by separating each variable with a vertical bar. These variables can be used in conjunction with required or optional keywords or variables. For example: **{ nonce | timestamp }** OR [**count** *number_of_packets* | **size** *number_of_bytes*]

Contacting Customer Support

Go to http://www.cisco.com/cisco/web/support/ to submit a service request. A valid Cisco account (username and password) is required to access this site. Please contact your Cisco account representative for additional information.

Additional Information

Refer to the following guides for supplemental information about the system:

- *Command Line Interface Reference*
- *Statistics and Counters Reference*
- *Thresholding Configuration Guide*
- *SNMP MIB Reference*
- *Cisco Web Element Manager Installation and Administration Guide*
- Product-specific and feature-specific administration guides
- *Release Notes* that accompany updates and upgrades to StarOS

Chapter 1
Command Line Interface Overview

This chapter describes the numerous features in the command line interface (CLI). It includes information about the architecture of the CLI, its command modes and user privileges, how to obtain help within the CLI, and other key items.

The operating system controls the overall system logic, control processes, and the CLI. The CLI is a multi-threaded user interface that allows you to manipulate, configure, control, and query the hardware and software components that make up the system and its hosted services. In addition, the CLI can host multiple instances of management and service configuration sessions. This allows multiple users to simultaneously access and manage multiple hosted services.

This section provides the following information about the CLI:

- CLI Structure
- CLI Command Modes
- CLI Administrative Users
- CLI Contexts
- Understanding the CLI Command Prompt
- CLI Command Syntax
- Entering and Viewing CLI Commands
- Obtaining CLI Help
- Exiting the CLI and CLI Command Modes
- Accessing the CLI
- IP Address Notation
- Alphanumeric Strings

CLI Structure

CLI commands are strings of commands or keywords and user-specified arguments that set or modify specific parameters of the system. Commands are grouped by function and the various command modes with which they are associated.

The structure of the CLI is hierarchical. All users begin at a specific entry point into the system, called the Exec (Execute) Mode, and then navigate through the CLI according to their defined user privileges (access level) by using other command modes.

CLI Command Modes

There are two primary CLI command modes:

- **Exec (Execute) Mode:** The Exec Mode is the lowest level in the CLI. The Exec Mode is where you execute basic commands such as **show** and **ping**. When you log into the CLI, you are placed in this mode by default.
- **Config (Configuration) Mode:** The Config mode is accessible only by users with administrator and security administrator privileges. If you are an administrative user, in this mode you can add and configure contexts and access the configuration sub-modes to configure protocols, interfaces, ports, services, subscribers, and other service-related items.

The entry point into the CLI is called Exec Mode. In the initial CLI login, all users are placed into the default local context, which is the CLI's default management context. From this context, administrative users can access the Config Mode and define multiple service contexts.

Refer to the mode entry-path diagrams at the beginning of each mode chapter in the *Command Line Interface Reference*.

Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

CLI Administrative Users

This section contains information on the administrative user types and privileges supported by the system.

Administrative User Types

There are two types of administrative users supported by the system:

- **Context-level administrative users:** This user type is configured at the context-level and relies on the AAA subsystems for validating user names and passwords during login. This is true for both administrative user accounts configured locally through a configuration file or on an external RADIUS server. Passwords for these user types are assigned once and are accessible in the configuration file.
- **Local-users:** This user type provides support for ANSI T1.276-2003 password security protection. Local-user account information, such as passwords, password history, and lockout states, is maintained in non-volatile memory on the CompactFlash module and in the Shared Configuration Task (SCT). This information is maintained in a separate file, not in configuration files used by the system. As such, the configured local-user accounts are not visible with the rest of the system configuration.

Local-user and context-level administrative accounts can be used in parallel. However, a mechanism is provided to de-activate context-level administrative user accounts, thereby providing access only to local-user accounts.

Authenticating Administrative Users with RADIUS

To authorize users via RADIUS, you must include two RADIUS attributes in the RADIUS Access-Accept message:

- RFC 2865 standard Service-Type
- Starent Vendor-Specific Attribute (VSA) SN-Admin-Permission or SN1-Admin-Permission.

The possible values for SN-Admin-Permission / SN1-Admin-Permission AVP are as follows:

- None = 0
- CLI = 1
- FTP = 2
- CLI-FTP = 3
- Intercept = 4
- CLI-Intercept = 5
- CLI-Intercept-FTP = 7
- ECS = 8
- CLI-ECS = 9
- CLI-FTP-ECS = 11
- CLI-Intercept-ECS = 13
- CLI-Intercept-FTP-ECS = 15

The default value is 1 (CLI).

RADIUS Mapping System

RADIUS server configuration depends on the type of server used and the instructions distributed by the server manufacturer. The following table shows the supported attribute/value mapping system that is constant, regardless of server manufacturer or model:

Table 1. RADIUS Attribute/Value Mapping System

Attribute	Value
Framed	2
Administrative (Administrator)	6
NAS_Prompt	7
Authenticate_Only	8
Authorize_Only	17
Inspector	19650516
Security_Admin	19660618

RADIUS Privileges

There are four RADIUS privilege roles. The following table shows the relationship between the privilege roles in the CLI configuration and RADIUS Service-Type.

Table 2. CLI Privilege Roles and RADIUS Service Types

CLI Configuration Parameter	RADIUS Service Type	show admin Type
administrator	Security_Admin (19660618)	admin
config_administrator	Administrative (6)	cfgadm
operator	NAS_Prompt (7)	oper
inspector	Inspector (19650516)	inspect

Administrative User Privileges

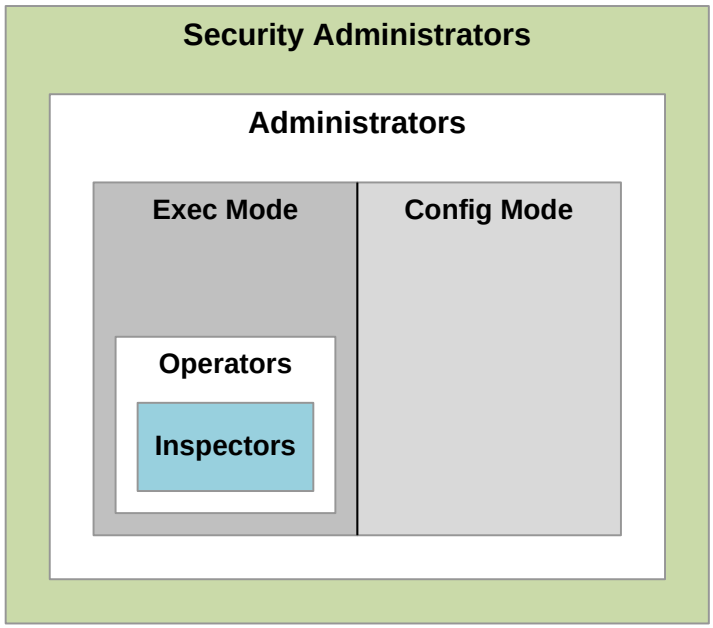
Regardless of the administrative user type, the system supports four user privilege levels:

- **Inspector**: Inspectors are limited to a small number of read-only Exec Mode commands. The bulk of these are show commands for viewing a variety of statistics and conditions. The Inspector cannot execute show configuration commands and does not have the privilege to enter the Config Mode.

- **Operator**: Operators have read-only privileges to a larger subset of the Exec Mode commands. They can execute all commands that are part of the inspector mode, plus some system monitoring, statistic, and fault management functions. Operators do not have the ability to enter the Config Mode.
- **Administrator**: Administrators have read-write privileges and can execute any command in the CLI except for a few security-related commands that can only be configured by Security Administrators. Administrators can configure or modify system settings and can execute all system commands, including those available to the Operators and Inspectors.
- **Security Administrator**: Security Administrators have read-write privileges and can execute all CLI commands, including those available to Administrators, Operators, and Inspectors.

The following figure represents how user privileges are defined in the CLI configuration modes.

Figure 1. User Privileges



Though the privilege levels are the same regardless of user type, the corresponding user type names differ slightly. The following table displays the privilege level to administrative user type mappings:

Table 3. User Privilege to User Type Mapping

User Type as Defined by T1.276-2003	Local-User Level User	Context-Level User
System Security Administrator	Security Administrator	Administrator
Application Security Administrator	Security Administrator	Administrator
System Administrator	Administrator	Config-Administrator
Application Administrator	Administrator	Config-Administrator
Application User/Operator	Operator	Operator
not applicable	Inspector	Inspector

Configure context-level administrative users in the Context Configuration Mode with the **administrator**, **config-administrator**, **operator**, and **inspector** commands.

Configure local-user administrative users at the Global Configuration Mode with the **local-user username** command.

You can further refine administrative levels to include access to certain features with the following feature-use administrative user options:

- **Lawful Intercept (LI) Administrative User:** To configure and manage LI-related issues, configure at least one administrative user account with LI functionality privileges.

Important: This privilege is available only for context-level administrative users. In addition, to ensure security in accordance with the standards, LI administrative users must access the system through the Secure Shell Protocol (SSH).

- **Enhanced Charging Service (ECS) Administrative User:** To log in and execute ECS-related commands, configure at least one administrative user account with ECS functionality privileges.

All system users can be configured within any context. However, it is recommended that you configure users in the system's management context called local. Refer to sections later in this chapter for additional information about contexts.

Allowed Commands per User Type

With the exception of security administrators, all other management users are limited to a subset of the entire command list. This section defines the commands allowed for each management user type.

Inspector Mode Commands

In the Exec Mode, system inspectors can access the following commands:

- **abort**
- **autoconfirm**
- **context**
- **crypto-group**
- **default terminal**
- **exit**
- **help**
- **logs checkpoint**
- **no logging active**
- **no logging trace**
- **no reveal disabled commands**
- **no timestamps**
- **no autoconfirm**
- **ping**

- **reveal disabled commands**
- **show** (except **show snmp communities** and **show snmp transports**)
- **sleep**
- **start crypto security-association**
- **terminal length**
- **terminal width**
- **timestamps**
- **traceroute**

Operator Mode Commands

In the Exec Mode, system operators can access all inspector mode commands plus the following commands:

- **aaa test**
- **alarm cutoff**
- **bulkstats force**
- **card**
- **clear** (a subset of all **clear** command variations)
- **debug**
- **dhcp test**
- **gtpc test**
- **gtpp interim**
- **gtpp test**
- **gtpu test**
- **gtpv0 test**
- **host**
- **logging active**
- **logging filter**
- **logging trace**
- **monitor protocol**
- **monitor subscriber**
- **newcall**
- **no card**
- **no debug**
- **no newcall policy**
- **port**
- **ppp echo-test**
- **radius interim accounting**
- **radius test**

- **rlogin**
- **show access-group**
- **show access-list**
- **show access-flow**
- **show access statistics**
- **show configuration**
- **show snmp transports**
- **ssh**
- **telnet**
- **test alarm**

Administrator Mode Commands

Administrators can access all system commands except:

- Context Configuration Mode:
  - **config-administrator**
  - **operator**
  - **inspector**
  - **administrator**
- Global Configuration Mode:
  - **snmp community**
  - **snmp user**
  - **local-user**
  - **suspend local-user**
- Exec Mode:
  - **show snmp communities**
  - **clear** (all **clear** command variations)
  - **show local-user**
  - **password change local-user**

Security Administrator Mode Commands

Security administrators can access all system commands.

CLI Contexts

A context is a group of configuration parameters that apply to the ports, interfaces, and protocols supported by the system. You can configure multiple contexts on the system, each of which resides as a separate, logically independent instance on the same physical device. The CLI can host multiple contexts within a single physical device. This allows wireless service providers to use the same system to support:

- Different levels of service
- Multiple wholesale or enterprise customers or customer groups
- Different classes of customers based on defined Class of Service (CoS) parameters
- IP address pools across multiple contexts, thus saving IP address allocation
- Enhanced security

Each defined context operates independently from any other context(s) in the system. Each context contains its own CLI instance, IP routing tables, access filters, compression methods, and other configured data.

By default, a single system-wide context called local, is used exclusively for the management of the system. Think of the local context as the root directory of the system, since you can define and access all other contexts from this point. You cannot delete the local context. From this location in the CLI, you can:

- Create and configure other service contexts that contain different service configurations
- Configure system-wide services such as CORBA and SNMP management interfaces, physical management ports, system messages, and others

Important: The system requires that you define at least one context in addition to the Local context. This isolates system management functions from application or service functions.

Administrative users add contexts through the Global Configuration Mode. A substantial advantage of configuring numerous service contexts is that it allows operators to broadly distribute different subscribers across the system. This greatly enhances the performance of the system and minimizes the loss of sessions should a failure occur.

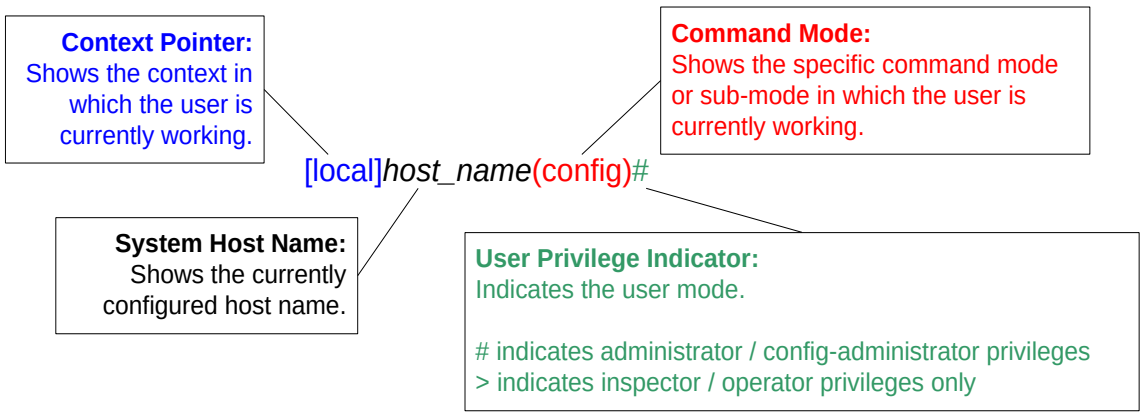
Understanding the CLI Command Prompt

The CLI provides an intuitive command prompt that informs you of:

- Exactly where you are located within the CLI
- The command mode you are using
- Your user privilege level.

The following figure shows the various components of the command prompt.

Figure 2. CLI Command Prompt



CLI Command Syntax

This section describes the components of the CLI command syntax that you should be familiar with prior to using the CLI. These include:

- **Commands**: Specific words that precede, or initiate, a specific function.
- **Keywords**: Specific words that follow a command to more clearly dictate the command's function.
- **Variables**: Alphanumeric values that are user-supplied as part of the command syntax. Sometimes referred to as arguments, these terms further specify the command function.
- **Repetitive keywords (+)**: Specific keyword, that when followed by a plus (+) sign, indicates that more than one of the keywords can be entered within a single command.

Example

In the following example, and *slot_number* are the command variables for the **info** keyword:

show port info *slot_number***/**

/*slot_number* is a variable representing a particular slot/ (1 through 48).

Entering and Viewing CLI Commands

This section describes various methods for entering commands into the CLI.

Typing each command keyword, argument, and variable can be time-consuming and increase your chance of making mistakes. The CLI therefore, supports the following features to assist you in entering commands quickly and more accurately. Other features allow you to view the display and review previously entered commands.

Entering Partial CLI Commands

In all of the modes, the CLI recognizes partially-typed commands and keywords, as long as you enter enough characters for the command to be unambiguously recognized by the system. If you do not enter enough characters for the system to recognize a unique command or keyword, it returns a message listing all possible matches for the partial entry.

Example

If you enter the partial command **conf** and press <**Enter**>, you enter the Global Configuration Mode. If you were to enter only **co**, the system would respond with the message:

```
Ambiguous Command
```

CLI Command Auto-completion

Use the command auto-completion feature to automatically complete unique CLI commands. Press the <**Tab**> key after entering enough characters to enable this feature.

Example

```
[local]host_name# sho<Tab>

[local]host_name# show
```

If you do not enter enough characters to allow the CLI to determine the appropriate command to use, the CLI displays all commands that match the characters you entered with auto-completion:

Example

```
[local]host_name# sh<Tab>

show     shutdown

[local]host_name#
```

Enter a question mark (?) after a partial command to display all of the possible matching commands, and their related help text.

Example

```
[local]host_name# sh?

show - Displays information based on a specified argument

shutdown - Terminates execution of all tasks within the entire chassis
```

```
[local]host_name#
```

Using CLI Auto-Pagination

When you enter commands whose expected results exceed the terminal window's vertical display, the auto-pagination function pauses the display each time the terminal window reaches its display limit. Press any key to display the next screen of results.

By default, auto-pagination functionality is disabled. To enable auto-pagination, type the pipe command: **`| more`**

```
[local]host_name# show configuration | more
```

Important: When auto-pagination is enabled, if a command's output exceeds the terminal window's vertical display parameters, you can exit by entering "**q**". This returns you to the CLI prompt.

Using CLI Autoconfirmation

By default, the system is configured to prompt all administrative users with a confirmation prior to executing certain commands. This functionality serves two purposes:

- Helps ensure that you do not execute an unwanted configuration change.

Example

Saving a configuration:

```
[local]host_name# save configuration

Are you sure ? [Yes | No]:
```

- Indicates potential misspellings of names during configuration. The first time you configure an element name (context, subscribers, services, etc.), the prompt is displayed. The prompt is not displayed for subsequent entries of the name. Therefore, if you see the confirmation prompt after entering the name of a previously configured element, it is likely that you misspelled the name.

Examples

You create context named *newcontext*:

```
[local]host_name(config)# context newcontext

Are you sure ? [Yes | No]: yes

[newcontext]host_name(config-ctx)#
```

You revisit the context named "newcontext":

```
[local]host_name(config)# context newcontext

[newcontext]host_name(config-ctx)#
```

On another occasion, you misspell the context named "newcontext":

```
[local]host_name(config)# context mewcontext
```

```
Are you sure ? [Yes | No]:n

Action aborted

[local]host_name(config)#
```

After aborting the above action, you can again revisit "newcontext":

```
[local]host_name(config)# context newcontext

[newcontext]host_name(config-ctx)#
```

You can control CLI autoconfirmation at the following levels:

- **Specific administrative user sessions:** To enable or disable autoconfirmation, use the [no] autoconfirm commands while in the Exec Mode.
- **All Future Sessions:** To disable or re-enable autoconfirmation for all future sessions, use the **[no] autoconfirm** commands while in the Global Configuration Mode.
- **For specific commands:** Disable autoconfirmation for various commands that support the **-noconfirm** keyword, such as the save configuration or card reboot commands.

Regulating the Command Output

For many CLI commands, you can use **| grep** and/or **| more** keywords to regulate or control the command's output.

Use the **| grep** keyword to filter through a command's output for certain expressions or patterns. Only those portions of the output that contain or exclude the pattern are displayed. The **| grep** has the following syntax:

| grep [-i | -v | --ignore-case | --invert-match] *expression*

Table 4. grep Keywords

Alternative Keyword	Description
-i	Specifies the filtering of the command's output for a particular expression while ignoring case. Lower case matches the same as upper case.
-v	Specifies the filtering of the command's output for everything excluding a particular expression.
--ignore-case	The long form of the **-i** option.
--invert-match	The long form of the **-v** option.
expression	Specifies the character pattern to find in the command's output.

Use the **| more** keyword to pause the terminal each time the terminal window reaches its display limit. Press any key to display the next screen. The function of this keyword is identical to the **autoless** command, except that you must manually enter it on a command-by-command basis.

Viewing Command History

To view a history of all commands line by line, simply scroll up or down with the <**up arrow**> and <**down arrow**> cursor keys on the keyboard.

The operating system supports EMACS-style text editing commands. This standard UNIX text editor format allows you to use keyboard-based shortcut keys for maneuvering around the CLI. The following table lists these available shortcut keys.

Table 5. EMACS Shortcut Keystrokes

Shortcut Keys	Description
<Ctrl + p> and <up arrow>	Recalls previous command in the command history
<Ctrl + n> and <down arrow>	Recalls next command in the command history
<Ctrl + f> and <right arrow>	Moves cursor forward by one character in command line
<Ctrl + b> and <left arrow>	Moves cursor backward by one character in command line
<Esc> + <f>	Moves cursor forward by one word in command line
<Esc> + <b>	Moves cursor backward by one word in command line
<Ctrl> + <a>	Moves cursor to the beginning of the command line
<Ctrl> + <e>	Moves cursor to the end of the command line
<Ctrl> + <k>	Deletes the current command line from the insertion point to the end of the line
<Ctrl> + <u>	Deletes the current command line from the insertion point to the beginning of the line
<Ctrl> + <d>	Deletes a single character in the current command line
<Esc> + <d>	Deletes a word in the current command line
<Ctrl> + <c>	Quits editing the current line
<Ctrl> + <l>	Refreshes the display
<Ctrl> + <t>	Transposes (or switches) the two characters surrounding the insertion point

Obtaining CLI Help

The CLI provides context-sensitive help for every command token and keyword available to you. To obtain, use one of these methods:

- **Command Help:** Command help provides assistance for a specific command. Type a question mark (?) at the end of the specific command to accesses help.

Example

```
[local]host_name# test?

test - Performs test on followed mechanism
```

- **Keyword Help:** Keyword help provides assistance in determining the next keyword, argument, or option to use in the command syntax. Enter the command keyword, enter a space, and then type a question mark (?).

Example

```
[local]host_name# test alarm ?

audible - Tests internal audible alarm buzzer on SPC

central-office - Tests specified central office alarm relays on SPIO card

<cr> - newline
```

- **Variable Help:** Variable help provides the correct format, value, or information type for each variable that is part of the command syntax. For commands with variables, enter the command keyword, enter a space, and then type a question mark (?).

Example

```
[local]host_name# show card info ?

<Enter card number as an integer ranging 1 to 48> | - Pipeline <cr> -
Carriage Return or <Enter> key
```

Exiting the CLI and CLI Command Modes

A CLI session is defined as the successful login into the CLI. When you establish a CLI session, you are placed into the system's Exec Mode. Depending upon your user privilege level, you can:

- Use the *local* context to perform system management functions
- Move to an assigned context and work in Exec Mode
- Move to an assigned context as an administrative user and work in Global Configuration Mode or other configuration sub-mode

This section addresses how to properly exit the various modes and the CLI.

Exiting Configuration Sub-modes

To exit a configuration sub-mode and return to the next highest configuration sub-mode or Global Configuration Mode, type the exit command at the system prompt.

Example

```
[context_name]host_name(config-ctx)# exit

[local]host_name(config)#
```

Important: The CLI supports implicit mode-exits when using configuration files. Therefore, configuration files do not have to contain all of the required exit commands for you to leave various sub-config modes.

To exit a sub-mode and return to the Exec Mode, enter the **end** command.

Example

```
[local]host_name(config-ctx)# end

[local]host_name#
```

Exiting Global Configuration Mode

To exit Global Configuration Mode, and return to the Exec Mode prompt, type the **exit** command at the prompt.

Ending a CLI Session

To end a CLI session and exit the CLI, type the **exit** command at the *local* Exec Mode prompt.

Accessing the CLI

Access the CLI through the following methods:

- Local login through a Console port using the RS-232 serial cable supplied with the card
- Remote login using Telnet and Secure Shell (SSH) access to the CLI through any IP interface on the system. You can use remote login methods only after the system has been configured to support the various access methods.

Important: Even though you can access the CLI remotely through any available IP interface, it is recommended that management traffic be isolated from network traffic by using one of the SPIO card management interfaces.

Multiple CLI sessions are supported, but the number of sessions is dependent on the amount of available memory. The Resource Manager reserves enough resources so that as a minimum, 15 CLI sessions are assured. One of the CLI sessions is always reserved for use exclusively by a CLI session on an SPIO console interface. Additional CLI sessions beyond the pre-reserved set are permitted if sufficient SMC resources are available. If the Resource Manager is unable to reserve additional resources, you are prompted whether to allow the system to create the new CLI session, even without the reserved resources.

Accessing the CLI Locally Using the Console Port

This section provides instructions for accessing the CLI locally through the console port on the SPIO.

Access the console port with the RJ-45-to-DB-9 serial (EIA-232) cable that is shipped with the Switch Processor Input/Output (SPIO) card. Connect to a workstation that has a communications application that accesses the workstation's serial port, such as Minicom for Linux or HyperTerminal® for MicroSoft Windows®.

Each of the two SPIO Line Cards installed in the system provides a console port for accessing the CLI. The CLI is only accessible from the SPIO that is active—typically the SPIO that is installed in chassis slot 24.

For normal operation, the SMC in chassis slot 8 serves as the active processing card for the system. The SPIO that corresponds to this SMC is installed in slot 24. For the processing card in chassis slot 9, the corresponding SPIO is installed in slot 25.

Important: In the event of an SMC switchover, in which processes are switched from the card in slot 8 that was previously active to the redundant card in slot 9, the SPIO in slot 24 continues to serve as the active SPIO. Therefore, the console port is still accessible through that SPIO.

Follow the instructions below to connect to the console port.

1. Connect the RJ-45 end of the cable to the port labeled *Console*.
2. Connect the DB-9 end of the cable to the serial port on the workstation.
3. Configure the communications application to support the following:

Parameter	Setting
Baud Rate	115,200 bps
Data Bits	8

Parameter	Setting
Parity	None
Stop Bits	1
Flow Control	None

Important: To change the configuration defined in the table above, modify the **`terminal`** command located in the Global Configuration Mode.

4. At the terminal window, press **Enter**.
5. If no configuration file is present (that is, this is the first time the system is powered), the CLI prompts you as to whether or not you want to use the Quick Setup Wizard. If the system was configured previously, you are prompted to enter a username and password.

Remotely Accessing the CLI

To remotely access the CLI through a defined management interface, you must first configure the remote access method (such as Telnet or SSH).

You can find examples of how to configure this in the *Getting Started* chapter in the *System Administration Guide*.

IP Address Notation

When configuring a port interface via the CLI you may be required to enter an IP address. The CLI always accepts an IPv4 address, and in some cases accepts an IPv6 address as an alternative.

For some configuration commands, the CLI also accepts CIDR notation when entering an IP address. Always view the online Help for the CLI command to verify acceptable forms of IP address notation.

IPv4 Dotted-Decimal Notation

An Internet Protocol Version 4 (IPv4) address consists of 32 bits divided into four octets. These four octets are written in decimal numbers, ranging from 0 to 255, and are concatenated as a character string with full stop delimiters (dots) between each number.

For example, the address of the loopback interface, usually assigned the host name localhost, is 127.0.0.1. It consists of the four binary octets 01111111, 00000000, 00000000, and 00000001, forming the full 32-bit address.

IPv4 allows 32 bits for an Internet Protocol address and can, therefore, support 4,294,967,296 addresses

IPv6 Colon-Separated Notation

An Internet Protocol Version 6 (IPv6) address has two logical parts: a 64-bit network prefix, and a 64-bit host address part. An IPv6 address is represented by eight groups of 16-bit hexadecimal values separated by colons (:).

A typical example of a full IPv6 address is 2001:0db8:85a3:0000:0000:8a2e:0370:7334

The hexadecimal digits are case-insensitive.

The 128-bit IPv6 address can be abbreviated with the following rules:

- Leading zeroes within a 16-bit value may be omitted. For example, the address fe80:0000:0000:0000:0202:b3ff:fe1e:8329 may be written as fe80:0:0:0:202:b3ff:fe1e:8329
- One group of consecutive zeroes within an address may be replaced by a double colon. For example, fe80:0:0:0:202:b3ff:fe1e:8329 becomes fe80::202:b3ff:fe1e:8329

IPv6 allows 128 bits for an Internet Protocol address and can support 340,282,366,920,938,000,000,000,000,000,000,000,000,000 internet addresses.

CIDR Notation

Classless Inter-Domain Routing (CIDR) notation is a compact specification of an Internet Protocol address and its associated routing prefix. It is used for both IPv4 and IPv6 addressing in networking architectures.

CIDR is a bitwise, prefix-based standard for the interpretation of IP addresses. It facilitates routing by allowing blocks of addresses to be grouped into single routing table entries. These groups (CIDR blocks) share an initial sequence of bits in the binary representation of their IP addresses.

CIDR notation is constructed from the IP address and the prefix size, the latter being the number of leading 1 bits of the routing prefix. The IP address is expressed according to the standards of IPv4 or IPv6. It is followed by a separator character, the slash (/) character, and the prefix size expressed as a decimal number.

The address may denote a single, distinct, interface address or the beginning address of an entire network. In the latter case the CIDR notation specifies the address block allocation of the network. The maximum size of the network is given by the number of addresses that are possible with the remaining, least-significant bits below the prefix. This is often called the host identifier.

For example:

- the address specification 192.168.100.1/24 represents the given IPv4 address and its associated routing prefix 192.168.100.0, or equivalently, its subnet mask 255.255.255.0.
- the IPv4 block 192.168.0.0/22 represents the 1024 IPv4 addresses from 192.168.0.0 to 192.168.3.255.
- the IPv6 block 2001:DB8::/48 represents the IPv6 addresses from 2001:DB8:0:0:0:0:0:0 to 2001:DB8:0:FFFF:FFFF:FFFF:FFFF:FFFF.
- ::1/128 represents the IPv6 loopback address. Its prefix size is 128, the size of the address itself, indicating that this facility consists of only this one address.

The number of addresses of a subnet defined by the mask or prefix can be calculated as 2, in which the address size for IPv4 is 32 and for IPv6 is 128. For example, in IPv4, a mask of /29 gives 8 addresses.

Alphanumeric Strings

Some CLI commands require the entry of an alphanumeric string to define a value. The string is a contiguous collection of alphanumeric characters with a defined minimum and maximum length (number of characters).

Character Set

The alphanumeric character set is a combination of alphabetic (Latin letters) and/or numeric (Arabic digits) characters. The set consists of the numbers 0 to 9, letters A to Z (uppercase) and a to z (lowercase). The underscore character (_) and dash/hyphen (-) are also considered to be members of the alphanumeric set of characters.

Blank spaces (whitespaces or SPACE characters) should mostly be avoided in alphanumeric strings, except in certain ruledef formats, such as time/date stamps.

Do not use any of the following "special" characters in an alphanumeric string except as noted below:

- **&** (ampersand)
- **‘** (apostrophe)
- **< >** (arrow brackets) [see exception below]
- ***** (asterisk) [see wildcard exception below]
- **{ }** (braces)
- **[ ]** (brackets)
- **$** (dollar sign) [see wildcard exception below]
- **!** (exclamation point) [see exception below]
- **( )** [parentheses]
- **%** (percent) [see exception below]
- **#** (pound sign) [see exception below]
- **?** (question mark)
- **'** (quotation mark – single)
- **"** (quotation mark – double)
- **;** (semicolon)
- \ (slash – backward) [see exception below]
- / (slash – forward) [see exception below]
- ~ (tilde)
- | (vertical bar) [see exception below]

The following characters may appear in strings entered in ruledefs, APNs, license keys and other configuration/display parameters:

- **< >** (arrow brackets) [less than or greater than]
- ***** (asterisk) [wildcard]
- **:** (colon)
- **$** (dollar sign) [wildcard]

- **.** (dot)
- = (equals sign)
- **!** (exclamation point)
- **%** (percent)
- / (slash – forward)
- | (vertical bar)

The following characters may be used to delimit the domain from the user name for global AAA functions:

- **@** (at sign)
- **-** (dash or hyphen)
- # (hash or pound sign)
- **%** [percent]
- \ (slash – backward) [must be entered as double slash "\\"]
- / (slash – forward)

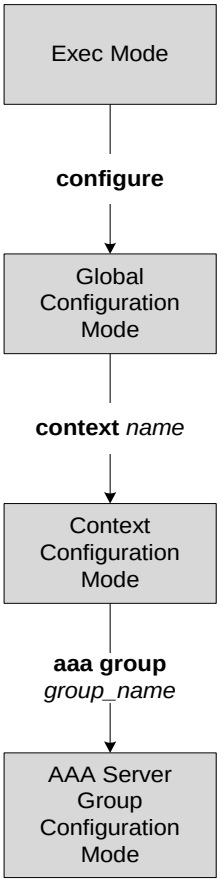
Quoted Strings

If descriptive text requires the use of spaces between words, the string must be entered within double quotation marks (" "). For example:

```
interface "Rack 3 Chassis 1 port 5/2"
```

Chapter 2
AAA Server Group Configuration Mode Commands

The AAA Server Group Configuration Mode is used to create and manage the Diameter/RADIUS server groups within the context or system. AAA server group facilitates management of group (list) of servers at per subscriber/APN/realm level for AAA functionality.



diameter accounting

This command configures Diameter accounting parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter accounting { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus } | endpoint *endpoint_name* **| hd-mode fall-back-to-local | hd-storage-policy** *hd_policy* **| max-retries** *max_retries* **| max-transmissions** *max_transmissions* **| request-timeout** *request_timeout_duration* **| server** *host_name* **priority** *priority* **}**

default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

---

no diameter accounting { endpoint | hd-mode | hd-storage-policy | max-retries | max-transmissions | server *host_name* **}**

endpoint: Removes the configured accounting endpoint, and the default accounting server configured in the default AAA group will be used.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local hard disk drive (HDD) and periodically retries the Diameter server.
hd-storage-policy: Disables use of the specified HD storage policy.
max-retries: Disables the configured retry attempts for Diameter accounting in the current AAA group.
max-transmissions: Disables the configured maximum transmission attempts for Diameter accounting in the current AAA group.
server *host_name*: Removes the configured Diameter host *host_name* from this AAA server group for Diameter accounting.

---

default diameter accounting { dictionary | hd-mode | max-retries | max-transmissions | request-timeout }

dictionary: Sets the context's dictionary as the system default.
hd-mode: Sends records to the Diameter server, if all Diameter servers are down or unreachable, then copies records to the local HDD and periodically retries the Diameter server.
max-retries: Sets the retry attempts for Diameter accounting in the current AAA group to default 0 (disable).
max-transmissions: Sets the configured maximum transmission attempts for Diameter accounting in the current AAA group to default 0 (disable).
request-timeout: Sets the timeout duration, in seconds, for Diameter accounting requests in the current AAA group to default 20.

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom2 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq | rf-plus }

Specifies the Diameter accounting dictionary.
aaa-custom1 ... aaa-custom10: Configures the custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.
nasreq: nasreq dictionary—the dictionary as defined by RFC 3588.
rf-plus: RF Plus dictionary.

endpoint *endpoint_name*

Enables Diameter to be used for accounting, and specifies which Diameter endpoint to use.
endpoint_name must be a string of 1 through 63 characters.

hd-mode fall-back-to-local

Specifies that records be copied to the local HDD if the Diameter server is down or unreachable. CDF/CGF will pull the records through SFTP.

hd-storage-policy *hd_policy*

Associates the specified HD Storage policy with the AAA group.
hd_policy must be the name of a configured HD Storage policy, and must be an alphanumeric string of 1 through 63 characters.
HD Storage policies are configured through the Global Configuration Mode.
This and the **hd-mode** command are used to enable the storage of Rf Diameter Messages to HDD in case all Diameter Servers are down or unreachable.

max-retries *max_retries*

Specifies how many times a Diameter request should be retried with the same server, if the server fails to respond to a request.
max_retries specifies the maximum number of retry attempts, and must be an integer from 1 through 1000.
Default: 0

max-transmissions *max_transmissions*

Specifies the maximum number of transmission attempts for a Diameter request. Use this in conjunction with the **max-retries** *max_retries* option to control how many servers will be attempted to communicate with.
max_transmissions must be an integer from 1 through 1000.
Default: 0

request-timeout *request_timeout_duration*

Specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request.
request_timeout_duration specifies the number of seconds, and must be an integer from 1 through 3600.
Default: 20

server *host_name* **priority** *priority*

Specifies the current context Diameter accounting server's host name and priority.

host_name specifies the Diameter host name, and must be an alphanumeric string of 1 through 63 characters.
priority specifies the relative priority of this Diameter host. The priority is used in server selection. The priority must be an integer from 1 through 1000.

Usage

Use this command to manage the Diameter accounting options according to the Diameter server used for the context.

Example

The following command configures the Diameter accounting dictionary, *aaa-custom10*:

```
diameter accounting dictionary aaa-custom10
```

The following command configures the Diameter endpoint, *EAP1*:

```
diameter accounting endpoint EAP1
```

The following commands configure Diameter accounting options:

```
diameter accounting max-retries 4
```

```
diameter accounting max-transmissions 2
```

```
diameter accounting request-timeout 10
```

```
diameter accounting server svc priority 1
```

diameter authentication

This command configures Diameter authentication parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication { dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 | aaa-custom8 | aaa-custom9 | nasreq } | endpoint *endpoint_name* **| max-retries** *max_retries* **| max-transmissions** *max_transmissions* **| redirect-host-avp { just-primary | primary-then-secondary } | request-timeout** *request_timeout_duration* **| server** *host_name* **priority** *priority* **}**

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

no diameter authentication { endpoint | max-retries | max-transmissions | server *host_name* **}**

---

no diameter authentication { endpoint | max-retries | max-transmissions | server *host_name* **}**

dictionary: Sets the context's dictionary as the system default.
endpoint: Removes the configured authentication endpoint, and the default server configured in default AAA group will be used.
max-retries: Disables the configured retry attempts for Diameter authentication in the current AAA group.
max-transmissions: Disables the configured maximum transmission attempts for Diameter authentication in the current AAA group.
server *host_name*: Removes the configured Diameter host *host_name* from this AAA server group for Diameter authentication.

---

default diameter authentication { dictionary | max-retries | max-transmissions | redirect-host-avp | request-timeout }

max-retries: Sets the retry attempts for Diameter authentication requests in the current AAA group to default 0 (disable).
max-transmissions: Sets the configured maximum transmission attempts for Diameter authentication in the current AAA group to default 0 (disable).
redirect-host-avp: Sets the redirect choice to default (just-primary).
request-timeout: Sets the timeout duration, in seconds, for Diameter authentication requests in the current AAA group to default 20.

dictionary { aaa-custom1 | aaa-custom10 | aaa-custom11 | aaa-custom12 | aaa-custom13 | aaa-custom14 | aaa-custom15 | aaa-custom16 | aaa-custom17 | aaa-custom18 | aaa-custom19 | aaa-custom2 | aaa-custom20 | aaa-custom3 | aaa-custom4 | aaa-custom5 | aaa-custom6 | aaa-custom7 |aaa-custom8 | aaa-custom9 | nasreq }

Specifies the Diameter authentication dictionary.
aaa-custom1 ... aaa-custom8, aaa-custom10 ... aaa-custom20: Configures the custom dictionaries. Even though the CLI syntax supports several custom dictionaries, not necessarily all of them have been defined. If a custom dictionary that has not been implemented is selected, the default dictionary will be used.

Important: **aaa-custom11** dictionary is only available in StarOS 8.1 and later releases. **aaa-custom12** to **aaa-custom20** dictionaries are only available in StarOS 9.0 and later releases.

aaa-custom9: Configures the STa standard dictionary.
nasreq: nasreq dictionary—the dictionary as defined by RFC 3588.

endpoint *endpoint_name*

Enables Diameter to be used for authentication, and specifies which Diameter endpoint to use.
endpoint_name must be an alphanumeric string of 1 through 63 characters.

max-retries *max_retries*

Specifies how many times a Diameter authentication request should be retried with the same server, if the server fails to respond to a request.
max_retries specifies the maximum number of retry attempts, and must be an integer from 1 through 1000.
Default: 0

max-transmissions *max_transmissions*

Specifies the maximum number of transmission attempts for a Diameter authentication request. Use this in conjunction with the "**max-retries** *max_retries*" option to control how many servers will be attempted to communicate with.
max_transmissions specifies the maximum number of transmission attempts, and must be an integer from 1 through 1000.
Default: 0

diameter authentication redirect-host-avp { just-primary | primary-then-secondary }

Specifies whether to use just one returned AVP, or use the first returned AVP as selecting the primary host and the second returned AVP as selecting the secondary host.
just-primary: Redirect only to primary host.
primary-then-secondary: Redirect to primary host, if fails then redirect to the secondary host.
Default: just-primary

request-timeout *request_timeout_duration*

Specifies how long the system will wait for a response from a Diameter server before re-transmitting the request.
request_timeout_duration specifies the number of seconds the system will wait for a response from a Diameter server before re-transmitting the request, and must be an integer from 1 through 3600.
Default: 20 seconds

server *host_name* **priority** *priority*

Specifies the current context Diameter authentication server's host name and priority.
host_name specifies the Diameter authentication server's host name, and must be an alphanumeric string of 1 through 63 characters.
priority specifies the relative priority of this Diameter host. The priority is used in server selection. The priority must be an integer from 1 through 1000.

Usage

Use this command to manage the Diameter authentication options according to the Diameter server used for the context.

Example

The following command configures the Diameter authentication dictionary, *aaa-custom1*:

```
diameter authentication dictionary aaa-custom1
```

The following command configures the Diameter endpoint, *EAP1*:

```
diameter authentication endpoint EAP1
```

The following commands configure Diameter authentication options:

```
diameter authentication max-retries 4

diameter authentication max-transmissions 2

diameter authentication redirect-host-avp primary-then-secondary

diameter authentication server svc priority 1

diameter authentication request-timeout 10
```

diameter authentication failure-handling

This command configures the failure handling for Diameter authentication requests and Diameter Extensible Authentication Protocol (EAP) requests.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } { request-timeout action { continue | retry-and-terminate | terminate } | result-code *start_result_code* **{ [to** *end_result_code* **] action { continue | retry-and-terminate | terminate } } }**

no diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } result-code *start_result_code* **[to** *end_result_code* **]**

default diameter authentication failure-handling { authorization-request | eap-request | eap-termination-request } request-timeout action

---

no

Disables Diameter authentication failure handling.

---

default

Configures the default Diameter authentication failure handling setting.

---

authorization-request

Specifies that failure handling must be performed on Diameter authorization request (AAR/AAA) messages.

---

eap-request

Specifies configuring failure handling for EAP requests.

---

eap-termination-request

Specifies configuring failure handling for EAP termination requests.

---

request-timeout action { continue | retry-and-terminate | terminate }

Specifies the action to be taken for failures:

- **continue**: Continues session
- **retry-and-terminate**: First retries, if it fails then terminates the session
- **terminate**: Terminates session

---

result-code *start_result_code* **[to** *end_result_code* **] action { continue | retry-and-terminate | terminate }**

start_result_code: Specifies the result code number, must be an integer from 1 through 65535.

to *end_result_code*: Specifies the upper limit of a range of result codes. **to** *end_result_code* must be greater than *start_result_code*.

action { continue | retry-and-terminate | terminate }: Specifies the action to be taken for failures:

- **continue**: Continues
- **retry-and-terminate**: First retries, if it fails then terminates
- **terminate**: Terminates

Usage

Use this command to configure error handling for Diameter EAP, EAP-termination, and authorization requests. Specific actions (continue, retry-and-terminate, or terminate) can be associated with each possible result-code. Ranges of result codes can be defined with the same action, or actions can be specific on a per-result code basis.

Example

The following commands configure result codes *5001, 5002, 5004,* and *5005* to use "action continue" and result code *5003* to use "action terminate":

```
diameter authentication failure-handling eap-request result-code 5001 to
5005 action continue

diameter authentication failure-handling eap-request result-code 5003
action terminate
```

diameter dictionary

This command is deprecated and is replaced by the **diameter accounting dictionary** and **diameter authentication dictionary** commands. See the diameter accounting and diameter authentication commands respectively.

end

Exits the current configuration mode and returns to the Exec mode.

Product

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

radius

This command configures basic RADIUS options.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius { deadtime *minutes* **| detect-dead-server { consecutive-failures** *consecutive_failures_count* **| response-timeout** *response_timeout_duration* **} | dictionary** *dictionary* **| max-outstanding** *max_messages* **| max-retries** *max_retries* **| max-transmissions** *max_transmissions* **| probe-message local-service-address** *ipv4/ipv6_address* **| strip-domain { authentication-only | accounting-only } | timeout** *idle_seconds* **}**

default radius { deadtime | detect-dead-server | dictionary | max-outstanding | max-retries | max-transmissions | timeout }

no radius { detect-dead-server | max-transmissions | radius probe-message local-service-address | strip-domain }

no

Removes the specified configuration.

default

Configures default setting for the specified keyword.

dictionary *dictionary*

Specifies which dictionary to use. The following table describes the possible values for *dictionary*:

Dictionary	Description
custom*XX*	These are dictionaries that can be customized to fit your needs. Customization information can be attained by contacting your local service representative. *XX* is the integer value of the custom dictionary.
standard	This dictionary consists only of the attributes specified in RFC 2865, RFC 2866, and RFC 2869.
3gpp	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in 3GPP 32.015.
3gpp2	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835-A.
3gpp2-835	This dictionary consists not only of all of the attributes in the standard dictionary, but also all of the attributes specified in IS-835.

Dictionary	Description
starent-vsa1	This dictionary consists not only of the 3GPP2 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary. ***Important:*** In 12.0 and later releases, no new attributes can be added to the **starent-vsa1** dictionary. If there are any new attributes to be added, these can only be added to the **starent** dictionary. For more information, please contact your Cisco account representative.
starent-vsa1-835	This dictionary consists not only of the 3gpp2-835 dictionary, but also includes Starent Networks vendor-specific attributes (VSAs) as well. The VSAs in this dictionary support a one-byte wide VSA Type field in order to support certain RADIUS applications. The one-byte limit allows support for only 256 VSAs (0 - 255). This is the default dictionary.
starent	This dictionary consists of all of the attributes in the starent-vsa1 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the dictionaries supported by the system.
starent-835	This dictionary consists of all of the attributes in the starent-vsa1-835 dictionary and incorporates additional Starent Networks VSAs by using a two-byte VSA Type field. This dictionary is the master-set of all of the attributes in all of the -835 dictionaries supported by the system.

deadtime *minutes*

Specifies the number of minutes to wait before changing the state of a RADIUS server from "Down" to "Active". *minutes* must be an integer from 0 through 65535.
Default: 10

Important: This parameter should be set to allow enough time to remedy the issue that originally caused the server's state to be changed to "Down". After the deadtime timer expires, the system returns the server's state to "Active" regardless of whether or not the issue has been fixed.

Important: For a complete explanation of RADIUS server states, refer to the *RADIUS Server State Behavior* appendix in the *AAA and GTPP Interface Administration and Reference*.

detect-dead-server { consecutive-failures *consecutive_failures_count* **| keepalive | response-timeout** *response_timeout_duration* **}**

consecutive-failures *consecutive_failures_count*: Specifies the number of consecutive failures, for any AAA Manager, before a server's state is changed from "Active" to "Down". *consecutive_failures_count* must be an integer from 1 through 1000. Default: 4.
keepalive: Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default is disabled.
response-timeout *response_timeout_duration*: Specifies the number of seconds, for any AAA Manager, to wait for a response to any message before a server's state is changed from "Active" to "Down". *response_timeout_duration* must be an integer from 1 through 65535.

Important: If both **consecutive-failures** and **response-timeout** are configured, then both parameters must be met before a server's state is changed to "Down".

Important: The "Active" or "Down" state of a RADIUS server as defined by the system, is based on accessibility and connectivity. For example, if the server is functional but the system has placed it into a "Down" state, it could be the result of a connectivity problem. When a RADIUS server's state is changed to "Down", a trap is sent to the management station and the **deadtime** timer is started.

max-outstanding *max_messages*

Specifies the maximum number of outstanding messages a single AAA Manager instance will queue.
max_messages must be an integer from 1 through 4000.
Default: 256

max-retries *max_retries*

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as "Not Responding", and the detect dead server's consecutive failures count is incremented.
max_retries must be an integer from 0 through 65535.
Default: 5

max-transmissions *max_transmissions*

Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with **max-retries** parameter for each server.
When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted, or once the configured number of maximum transmissions is reached. For example, if three servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried four times (once plus three retries), the secondary server is tried four times, and then a third server is tried four times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.
max_transmissions must be an integer from 1 through 65535.
Default: Disabled

probe-message local-service-address *ipv4/ipv6_address*

radius probe-message: Configures AVPs to be sent in RADIUS authentication probe messages.
local-service-address: Configures the service ip-address to be sent as an AVP in RADIUS authentication probe messages.
ipv4/ipv6_address: Specifies the IP address of the server.
ip_address must be specified in IPv4 dotted-decimal or IPv6 colon-separated notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

strip-domain { authentication-only | accounting-only }

Specifies that the domain must be stripped from the user name prior to authentication or accounting.
By default, strip-domain configuration will be applied to both authentication and accounting messages, if configured.
When the argument **authentication-only** or **accounting-only** is present, **strip-domain** is applied only to the specified RADIUS message types.

timeout *idle_seconds*

Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages.
idle_seconds must be an integer from 1 through 65535.
Default: 3

Usage

Use this command to configure the basic RADIUS parameters according to the RADIUS server used for the context.

Example

The following command configures the RADIUS timeout parameter to *300* seconds.

```
radius timeout 300
```

radius accounting

This command configures the current context's RADIUS accounting parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting { archive [stop-only] | deadtime *minutes* **| detect-dead-server { consecutive-failures** *consecutive_failures_count* **| keepalive | response-timeout** *response_timeout_duration* **} | fire-and-forget | interim interval** *interim_interval* **| max-outstanding** *max_messages* **| max-pdu-size** *octets* **| max-retries** *max_retries* **| max-transmissions** *max_transmissions* **| timeout** *idle_seconds* **}**

default radius accounting { deadtime | detect-dead-server | fire-and-forget | max-outstanding | max-pdu-size | max-retries | max-transmissions | timeout }

no radius accounting { archive | detect-dead-server | fire-and-forget | interim interval | max-transmissions }

no

Removes the specified configuration.

default

Configures the default setting for the specified keyword.

archive [stop-only]

Enables archiving of RADIUS accounting messages in the system after the accounting message has exhausted retries to all available RADIUS accounting servers. All RADIUS accounting messages generated by a session are serially delivered to the RADIUS accounting server. That is, previous RADIUS accounting messages from the same call must be delivered and acknowledged by the RADIUS accounting server before the next RADIUS accounting message is sent to the RADIUS accounting server.
stop-only specifies archiving of only STOP accounting messages.
Default: enabled

deadtime *minutes*

Specifies the number of minutes to wait before changing the state of a RADIUS server from "Down" to "Active".
minutes must be an integer from 0 through 65535.
Default: 10 minutes

Important: This parameter should be set to allow enough time to remedy the issue that originally caused the server's state to be changed to "Down". After the deadtime timer expires, the system returns the server's state to "Active" regardless of whether or not the issue has been fixed.

Important: For a complete explanation of RADIUS server states, refer to the *RADIUS Server State Behavior* Appendix in the *AAA and GTPP Interface Administration and Reference*.

detect-dead-server { consecutive-failures *consecutive_failures_count* **| keepalive | response-timeout** *response_timeout_duration* **}**

consecutive-failures *consecutive_failures_count*: Specifies the number of consecutive failures, for any AAA Manager, before a server's state is changed from "Active" to "Down". *consecutive_failures_count* must be an integer from 1 through 1000. Default: 4
keepalive: Enables the AAA server alive-dead detect mechanism based on sending keepalive authentication messages to all authentication servers. Default: disabled
response-timeout *response_timeout_duration*: Specifies the number of seconds, for any AAA Manager, to wait for a response to any message before a server's state is changed from "Active" to "Down". *response_timeout_duration* must be an integer from 1 through 65535.

Important: If both **consecutive-failures** and **response-timeout** are configured, then both parameters must be met before a server's state is changed to "Down".

Important: The "Active" or "Down" state of a RADIUS server as defined by the system, is based on accessibility and connectivity. For example, if the server is functional but the system has placed it into a "Down" state, it could be the result of a connectivity problem. When a RADIUS server's state is changed to "Down", a trap is sent to the management station and the deadtime timer is started.

Important: For a complete explanation of RADIUS server states, refer to the *RADIUS Server State Behavior* Appendix in the *AAA and GTPP Interface Administration and Reference*.

fire-and-forget

Enables RADIUS Fire-and-Forget accounting for the AAA group.
Default: Disabled
The request sent to the RADIUS accounting server configured under the AAA group with this keyword configured will not expect a response from the server. If the request must be sent to more than one such type of server, the acct-algorithm first-n configuration in the AAA group can be used.
Keepalive feature for server state detection is supported in conjunction since there is no waiting for responses. Archiving in such a AAA group is not supported. If the server is down, the request is sent to the next server in the group. If all the servers in the group are down, the request is deleted.
This CLI is independent of the APN or subscriber profile configuration **aaa secondary-group** *aaa_group_name*.

interim interval *interim_interval*

Specifies the time interval, in seconds, for sending accounting INTERIM-UPDATE records.
interim_interval must be an integer from 50 through 40000000.
Default: Disabled

Important: If RADIUS is used as the accounting protocol for the GGSN product, other commands are used to trigger periodic accounting updates. However, these commands would cause RADIUS STOP/START packets to be sent as opposed to INTERIM-UPDATE packets. Also, note that accounting interim interval settings received from a RADIUS server take precedence over those configured on the system.

max-outstanding *max_messages*

Specifies the maximum number of outstanding messages a single AAA Manager instance will queue.
max_messages must be an integer from 1 through 4000.
Default: 256

max-pdu-size *octets*

Specifies the maximum sized packet data unit which can be accepted/generated, in bytes (octets).
octets must be an integer from 512 through 2048.
Default: 2048

max-retries *max_retries*

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as "Not Responding" and the detect dead server consecutive failures count is incremented.
max_retries must be an integer from 0 through 65535.
Default: 5
Once the maximum number of retries is reached this is considered a single failure for the consecutive failures count for detecting dead servers.

max-transmissions *max_transmissions*

Sets the maximum number of transmissions for a RADIUS accounting message before the message is declared as failed.
max_transmissions must be an integer from 1 through 65535.
Default: Disabled

timeout *timeout_duration*

Specifies the duration to wait for a response from a RADIUS server before retransmitting a request.
timeout_duration must be an integer from 1 through 65535.
Default: 3

Usage

Use this command to configure RADIUS accounting options according to the RADIUS server used for the context.

Example

The following command configures the accounting timeout parameter to *16* seconds.

```
radius accounting timeout 16
```

radius accounting apn-to-be-included

This command specifies the APN name inclusion for RADIUS accounting.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting apn-to-be-included { gi | gn }

default radius accounting apn-to-be-included
```

default

Configures the default setting.

gi

Specifies the use of Gi APN name in RADIUS accounting request. Gi APN represents the APN received in the Create PDP context request message from SGSN.

gn

Specifies the use of Gn APN name in RADIUS accounting request. Gn APN represents the APN selected by the GGSN.

Usage

Use this command to specify the APN name to be included for RADIUS accounting.

Example

The following command configures the gn APN name to be included for RADIUS accounting:

```
radius accounting apn-to-be-included gn
```

radius accounting algorithm

This command specifies the fail-over/load-balancing algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting algorithm { first-n *n* **| first-server | round-robin }**

default radius accounting algorithm

default

Configures the default setting.
Default: **first-server**

first-n *n*

Default: 1 (Disabled)
Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. The full set of accounting data is sent to each of the *n* AAA servers. Response from any one of the servers would suffice to proceed with the call. On receiving an ACK from any one of the servers, all retries are stopped.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the algorithm to select the RADIUS accounting server(s) to which accounting data must be sent.

Example

The following command configures to use the round-robin algorithm for RADIUS accounting server selection:

```
radius accounting algorithm round-robin
```

radius accounting billing-version

This command configures billing-system version of RADIUS accounting servers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting billing-version *version*

default radius accounting billing-version

default

Configures the default setting.
Default: 0

version

Specifies the billing-system version, and must be an integer from 0 through 4294967295.

Usage

Use this command to configure the billing-system version of RADIUS accounting servers.

Example

The following command configures the billing-system version of RADIUS accounting servers as *10*:

```
radius accounting billing-version 10
```

radius accounting gtp trigger-policy

This command configures the RADIUS accounting trigger policy for GTP messages.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting gtp trigger-policy [ standard | ggsn-preservation-mode ]

default radius accounting gtp trigger-policy
```

default

Resets the RADIUS accounting trigger policy to standard behavior for GTP session.

standard

This keyword sets the RADIUS accounting trigger policy to standard behavior which is configured for GTP session for GGSN service.

ggsn-preservation-mode

This keyword sends RADIUS Accounting Start when the GTP message with private extension of preservation mode is received from SGSN.

Important: This is a customer-specific keyword and needs customer-specific license to use this feature. For more information on GGSN preservation mode, refer to the *GGSN Service Configuration Mode Commands* chapter.

Usage

Use this command to set the trigger policy for the AAA accounting for a GTP session.

Example

The following command sets the RADIUS accounting trigger policy for GTP session to standard:

```
default radius accounting gtp trigger-policy
```

radius accounting ha policy

This command configures the RADIUS accounting policy for Home Agent (HA) sessions.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

```
radius accounting ha policy { custom1-aaa-res-mgmt | session-start-stop }

default radius accounting ha policy
```

default

Configures the default setting.

session-start-stop

Specifies sending Accounting Start when the Session is connected, and sending Accounting Stop when the session is disconnected. This is the default behavior.

custom1-aaa-res-mgmt

Accounting Start/Stop messages are generated to assist special resource management done by AAA servers. It is similar to the session-start-stop accounting policy, except for the following differences:

- Accounting Start is also generated during MIP session handoffs.
- No Accounting stop is generated when an existing session is overwritten and the new session continues to use the IP address assigned for the old session.
- Accounting Start is generated when a new call overwrites an existing session.

Usage

Use this command to configure the AAA accounting behavior for an HA session.

Example

The following command configures the HA accounting policy to *custom1-aaa-res-mgmt*:

```
radius accounting ha policy custom1-aaa-res-mgmt
```

radius accounting interim

This command configures the volume of uplink and downlink volume octet counts that trigger RADIUS interim accounting, and configures the time period between the sending of interim accounting records.

Product

GGSN, PDSN, HA, HSGW

Privilege

Security Administrator, Administrator

Syntax

radius accounting interim { interval *interim_interval* **| volume { downlink** *bytes* **uplink** *bytes* **| total** *bytes* **| uplink** *bytes* **downlink** *bytes* **} }**

no radius accounting interim volume

no

Disables RADIUS interim accounting.

interval *interim_interval*

Specifies the time interval, in seconds, between sending interim accounting records. *interim_interval* must be an integer from 50 through 40000000.

volume { downlink *bytes* **uplink** *bytes* **| total** *bytes* **| uplink** *bytes* **downlink** *bytes* **}**

downlink *bytes* **uplink** *bytes*: Specifies the downlink to uplink volume limit, in bytes, for RADIUS Interim accounting. *bytes* must be an integer from 100000 through 4000000000.
total *bytes*: Specifies the total volume limit, in bytes, for RADIUS interim accounting. *bytes* must be an integer from 100000 through 4000000000.
uplink *bytes* **downlink** *bytes*: Specifies the uplink to downlink volume limit, in bytes, for RADIUS interim accounting. *bytes* must be an integer from 100000 through 4000000000.

Usage

Use this command to trigger RADIUS interim accounting based on the volume of uplink and downlink bytes and/or to configure the time interval between the sending of interim accounting records.

Example

The following command triggers RADIUS interim accounting when the total volume of uplink and downlink bytes reaches *110000*:

```
radius accounting interim volume total 110000
```

The following command sets the interval between sending interim accounting records to 3 minutes (180 seconds):

```
radius accounting interim interval 180
```

radius accounting ip remote-address

This command configures IP remote address-based RADIUS accounting parameters.

Product

PDSN, HA

Privilege

Security Administrator, Administrator

Syntax

`[ no ] radius accounting ip remote-address { collection | list` *`list_id`* **`}`**

`no`

Removes the specified configuration.

`collection`

Enables collecting and reporting Remote-Address-Based accounting in RADIUS Accounting. This should be enabled in the AAA Context. It is disabled by default.

`list` *`list_id`*

Enters the Remote Address List Configuration mode. This mode configures a list of remote addresses that can be referenced by the subscriber's profile.
`list_id` must be an integer from 1 through 65535.

Usage

This command is used as part of the Remote Address-based Accounting feature to both configure remote IP address lists and enable the collection of accounting data for the addresses in those lists on a per-subscriber basis.
Individual subscriber can be associated to remote IP address lists through the configuration/specification of an attribute in their local or RADIUS profile. (Refer to the **`radius accounting`** command in the Subscriber Configuration mode.) When configured/specified, accounting data is collected pertaining to the subscriber's communication with any of the remote addresses specified in the list.
Once this functionality is configured on the system and in the subscriber profiles, it must be enabled by executing this command with the collection keyword.

Example

The following command enables collecting and reporting Remote-Address-Based accounting in RADIUS Accounting:

```
radius accounting ip remote-address collection
```

radius accounting keepalive

This command configures the keepalive authentication parameters for the RADIUS accounting server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius accounting keepalive { calling-station-id *id* **| consecutive-response** *consecutive_responses* **| framed-ip-address** *ip_address* **| interval** *seconds* **| retries** *number* **| timeout** *seconds* **| username** *user_name* **}**

default radius accounting keepalive { calling-station-id | consecutive-response | interval | retries | timeout | username }

no radius accounting keepalive framed-ip-address

no

Removes the specified configuration.

default

Configures the default setting for the specified keyword.

calling-station-id *id*

Configures the Calling-Station-Id to be used for the keepalive authentication.
id must be an alphanumeric string of size 1 to 15 characters.
Default: 000000000000000

consecutive-response *consecutive_responses*

Configures the number of consecutive authentication response after which the server is marked as reachable.
consecutive_responses must be an integer from 1 through 10.
Default: 1

framed-ip-address *ip_address*

Configures the framed-ip-address to be used for the keepalive accounting.
ip_address must be specified using IPv4 dotted-decimal notation.

interval *seconds*

Configures the time interval between the two keepalive access requests.
Default: 30 seconds

retries *number*

Configures the number of times the keepalive access request to be sent before marking the server as unreachable.
number must be an integer from 3 through 10.

Default: 3

timeout *timeout_duration*

Configures the time interval between each keepalive access request retries.
timeout_duration must be an integer from 1 through 30.
Default: 3 seconds

username *user_name*

Configures the user name to be used for authentication.
user_name must be an alphanumeric string of 1 through 127 characters.
Default: Test-Username

Usage

Use this command to configure the keepalive authentication parameters for the RADIUS accounting server.

Example

The following command sets the user name for RADIUS keepalive access requests to *Test-Username2*:

```
radius accounting keepalive username Test-Username2
```

The following command sets the number of RADIUS accounting keepalive retries to *4*.

```
radius accounting keepalive retries 4
```

radius accounting pdif trigger-policy

This command configures the policy for generating START/STOP pairs in overflow condition.

Product

PDIF

Privilege

Administrator, Security Administrator

Syntax

```
radius accounting pdif trigger-policy { standard | counter-rollover }

default radius accounting pdif trigger-policy
```

default

The default option configures the “standard” policy.

standard

Applies a policy as defined by the standards.

counter-rollover

If the counter-rollover option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than (2^32 - 1) in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than 2^32 thus ensuring the accuracy of the count. The system may, at its discretion, send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped.

Usage

Used to define the policy for dealing with overflow packet counts.

Example

Use the following example to set the default policy to *standard*.

```
default radius accounting pdif trigger-policy
```

radius accounting rp

This command configures the RADIUS accounting R-P originated call options.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

radius accounting rp { handoff-stop { immediate | wait-active-stop } | tod *minute hour* **| trigger-event { active-handoff | active-start-param-change | active-stop } | trigger-policy { airlink-usage [counter-rollover] | custom [active-handoff | active-start-param-change | active-stop] | standard } | trigger-stop-start }**

no radius accounting rp { tod *minute hour* **| trigger-event { active-handoff | active-start-param-change | active-stop } | trigger-stop-start }**

default radius accounting rp { handoff-stop | trigger-policy }

---

no

Removes the specified configuration.

---

default

Sets the default configuration for the specified keyword.

---

handoff-stop { immediate | wait-active-stop }

Specifies the behavior of generating accounting STOP when handoff occurs.

- **immediate**: Indicates that accounting STOP should be generated immediately on handoff, i.e. not to wait active-stop from the old PCF.
- **wait-active-stop**: Indicates that accounting STOP is generated only when active-stop received from the old PCF when handoff occurs.

Default: **wait-active-stop**

---

tod *minute hour*

Specifies the time of day a RADIUS event is to be generated for accounting. Up to four different times of the day may be specified through individual commands.
minute must be an integer from 0 through 59.
hour must be an integer from 0 through 23.

---

trigger-event { active-handoff | active-start-param-change | active-stop }

active-start-param-change: Enabled
active-stop: Disabled
Configures the events for which a RADIUS event is generated for accounting as one of the following:

- **active-handoff**: Disables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Instead, two R-P events occur (one for the Connection Setup, and the second for the Active-Start)

- **active-start-param-change**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.
- **active-stop**: Disables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

Default: **active-handoff**: Disabled

Important: This keyword has been obsoleted by the **trigger-policy** keyword. Note that if this command is used, if the context configuration is displayed, radius accounting rp configuration is represented in terms of the trigger-policy.

trigger-policy { airlink-usage [counter-rollover] | custom [active-handoff | active-start-param-change | active-stop] | standard }

Default: **airlink-usage**: Disabled
custom:
active-handoff = Disabled
active-start-param-change = Disabled
active-stop = Disabled
standard: Enabled
Configures the overall accounting policy for R-P sessions as one of the following:

- **airlink-usage [counter-rollover]**: Specifies the use of Airlink-Usage RADIUS accounting policy for R-P, which generates a start on Active-Starts, and a stop on Active-Stops.
- If the **counter-rollover** option is enabled, the system generates a STOP/START pair before input/output data octet counts (or input/output data packet counts) become larger than (2^32 - 1) in value. This setting is used to guarantee that a 32-bit octet count in any STOP message has not wrapped to larger than 2^32 thus ensuring the accuracy of the count. The system, may, at its discretion, send the STOP/START pair at any time, so long as it does so before the 32-bit counter has wrapped. Note that a STOP/START pair is never generated unless the subscriber RP session is in the Active state, since octet/packet counts are not accumulated when in the Dormant state.
- **custom**: Specifies the use of custom RADIUS accounting policy for R-P. The custom policy can consist of the following:
- **active-handoff**: Enables a single R-P event (and therefore a RADIUS accounting event) when an Active PCF-to-PFC Handoff occurs. Normally two R-P events will occur (one for the Connection Setup, and the second for the Active-Start)
- **active-start-param-change**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Start is received from the PCF and there has been a parameter change.

  Important: Note that a custom trigger policy with only **active-start-param-change** enabled is identical to the **standard** trigger-policy.

- **active-stop**: Enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF.

  Important: If the **radius accounting rp trigger-policy custom** command is executed without any of the optional keywords, all custom options are disabled.

- **standard**: Specifies the use of Standard RADIUS accounting policy for R-P in accordance with IS-835B.

trigger-stop-start

Specifies that a stop/start RADIUS accounting pair should be sent to the RADIUS server when an applicable R-P event occurs.

Usage

Use this command to configure the events for which a RADIUS event is sent to the server when the accounting procedures vary between servers.

Example

The following command enables an R-P event (and therefore a RADIUS accounting event) when an Active-Stop is received from the PCF:

```
radius accounting rp trigger-event active-stop
```

The following command generates the STOP only when active-stop received from the old PCF when handoff occurs:

```
default radius accounting rp handoff-stop
```

radius accounting server

For accounting, this command configures the RADIUS accounting server(s) in the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius [mediation-device] accounting server *ip_address* **[encrypted] key** *value* **[acct-on { disable | enable }] [acct-off { disable | enable }] [admin-status { disable | enable }] [max** *max_messages* **] [max-rate** *max_value* **] [oldports] [port** *port_number* **] [priority** *priority* **] [type { mediation-device | standard }] [-noconfirm]**

no radius [mediation-device] accounting server *ip_address* **[oldports | port** *port_number* **]**

no

Removes the server or server port(s) specified from the list of configured servers.

mediation-device

Enables mediation-device specific AAA transactions use to communicate with this RADIUS server.

Important: If this option is not used, by default the system enables standard AAA transactions.

ip_address **[port** *port_number* **]**

Specifies the IP address of the accounting server. *ip_address* must be specified using IPv4 dotted-decimal notation. A maximum of 1600 RADIUS servers per context/system and 128 servers per server group can be configured. This limit includes accounting and authentication servers.
port *port_number* specifies the port number to use for communications. *port_number* must be an integer from 0 through 65535. Default is 1813.

Important: The same RADIUS server IP address and port can be configured in multiple RADIUS server groups within a context.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted.
In 12.1 and earlier releases, the key *value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 256 characters with encryption.
In 12.2 and later releases, the key *value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 236 characters with encryption enabled.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the

key keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

---

acct-on { disable | enable }

Enables and disables sending of the Accounting-On message when a new RADIUS server is added to the configuration.
When this is enabled, the Accounting-On message is sent when a new RADIUS server is added in the configuration. However, if for some reason the Accounting-On message cannot be sent at the time of server configuration (for example; if the interface is down), then the message is sent as soon as possible. Once the Accounting-On message is sent, if it is not responded to after the configured RADIUS accounting timeout, the message is retried the configured number of RADIUS accounting retries. Once all retries have been exhausted, the system no longer attempts to send the Accounting-On message for this server.
Default: disable

---

acct-off { disable | enable }

Disables and enables the sending of the Accounting-Off message when a RADIUS server is removed from the configuration.
The Accounting-Off message is sent when a RADIUS server is removed from the configuration, or when there is an orderly shutdown. However, if for some reason the Accounting-On message cannot be sent at this time, it is never sent. The Accounting-Off message is sent only once, regardless of how many accounting retries are enabled.
Default: enable

---

max *max_messages*

Specifies the maximum number of outstanding messages that may be allowed to the server.
max_messages must be an integer from 1 through 256.
Default: 0

---

max-rate *max_value*

Specifies the rate at which the accounting messages should be sent to the RADIUS server by a single AAA manager task.
max_value must be an integer from 0 through 1000.
Default: 0 (disabled)

---

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

---

priority *priority*

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to.
priority must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.
Default: 1000

type { mediation-device | standard }

mediation-device: Obsolete keyword.
Specifies the type of AAA transactions to use to communicate with this RADIUS server.
standard: Use standard AAA transactions.
Default: **standard**

admin-status { disable | enable }

Configures the admin-status for the RADIUS accounting server.
enable: Enables the RADIUS accounting server.
disable: Disables the RADIUS accounting server.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

Use this command to configure the RADIUS accounting servers with which the system must communicate for accounting.
You can configure up to 1600 RADIUS servers per context/system and 128 servers per server group. The servers can be configured as Accounting, Authentication, Charging servers, or any combination thereof.

Example

The following command sets the accounting server with mediation device transaction for AAA server *10.2.3.4*:

```
radius mediation-device accounting server 10.2.3.4 key sharedKey port
1024 max 127
```

radius algorithm

This command configures the RADIUS authentication server selection algorithm for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius algorithm { first-server | round-robin }

default radius algorithm
```

default

Configures the default setting.
Default: **first-server**

first-server

Accounting data is sent to the first available server based upon the relative priority of each configured server.

round-robin

Accounting data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configure relative priority of the servers.

Usage

Use this command to configure the context's RADIUS server selection algorithm to ensure proper load distribution amongst the available servers.

Example

The following command configures to use the round-robin algorithm for RADIUS server selection:

```
radius algorithm round-robin
```

radius allow

This command configures the system behavior for allowing subscriber sessions when RADIUS accounting and/or authentication is unavailable.

Product

All products used in CDMA deployments

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius allow { authentication-down | accounting-down }
```

no

Specifies that the specified option is to be disabled.

authentication-down

Allows sessions while authentication is not available (down).
Default: Disabled

accounting-down

Allows sessions while accounting is unavailable (down).
Default: Enabled

Usage

Allow sessions during system troubles when the risk of IP address and/or subscriber spoofing is minimal. The denial of sessions may cause dissatisfaction with subscribers at the cost/expense of verification and/or accounting data.

Important: Please note that this command is applicable ONLY to CDMA products. To configure this functionality in UMTS/LTE products (GGSN/P-GW), use the command **mediation-device delay-GTP-response** in APN Configuration mode.

Example

The following command configures the RADIUS server to allow the sessions while accounting is unavailable.

```
radius allow accounting-down
```

radius attribute

This command configures the system's RADIUS identification parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius attribute { nas-identifier nas_id | nas-ip-address address primary_address [
backup secondary_address ] [ nexthop-forwarding-address nexthop_address ] [ mpls-label
input in_label_value | output out_label_value1 [ out_label_value2 ] [ vlan vlan_id ] ] }

no radius attribute { nas-identifier | nas-ip-address }

default radius attribute nas-identifier
```

no

Removes the specified configuration.

default

Configures the default setting.

nas-identifier *nas_id*

Specifies the attribute name by which the system will be identified in Access-Request messages. *nas_id* must be a case-sensitive alphanumeric string of 1 through 32 characters.

nas-ip-address address *primary_address*

Specifies the AAA interface IP address(es) used to identify the system. Up to two addresses can be configured.
primary_address : The IP address of the primary interface to use in the current context. This must be specified using the IPv4 dotted-decimal notation.

Important: In 12.0 and earlier releases, the configuration of NAS IP address with IPv6 prefix is currently not supported.

backup *secondary_address*

backup: The IP address of the secondary interface to use in the current context. This must be specified using IPv4 dotted-decimal notation.

nexthop-forwarding-address *nexthop_address*

Configures next hop IP address for this NAS IP address. It optionally sets the RADIUS client to provide VLAN ID and nexthop forwarding address to system when running in single nexthop gateway mode.
nexthop_address must be specified using IPv4 dotted-decimal notation.

Important: To define more than one NAS IP address per context, in Global Configuration Mode use the **aaa large-configuration** command. If enabled, for a PDSN a maximum of 400 and for a GGSN a maximum of 800 NAS IP addresses/NAS identifiers (1 primary and 1 secondary per server group) can be configured per context.

mpls-label input *in_label_value* **| output** *out_label_value1* **[** *out_label_value2* **]**

Configures the traffic from the specified RADIUS client NAS IP address to use the specified MPLS labels.

- *in_label_value* is the MPLS label that will identify inbound traffic destined for the configured NAS IP address.
- *out_label_value1* and *out_label_value2* identify the MPLS labels to be added to packets sent from the specified NAS IP address.
- *out_label_value1* is the inner output label.
- *out_label_value2* is the outer output label.

MPLS label values must be an integer from 16 to 1048575.

vlan *vlan_id*

This optional keyword sets the RADIUS client to provide VLAN ID with nexthop forwarding address to system when running in single nexthop gateway mode.
vlan_id must be a pre-configured VLAN ID, and must be an integer from 1 through 4096. It is the VLAN ID to be provided to the system in RADIUS attributes.
This option is available only when nexthop-forwarding gateway is also configured with nexthop-forwarding-address *nexthop_address* keyword and **aaa-large configuration** is enabled at Global Configuration level.

Usage

This is necessary for NetWare Access Server usage such as the system must be identified to the NAS.
The system supports the concept of the active nas-ip-address. The active nas-ip-address is defined as the current source ip address for RADIUS messages being used by the system. This is the content of the nas-ip-address attribute in each RADIUS message.
The system will always have exactly one active nas-ip-address. The active nas-ip-address will start as the primary nas-ip-address. However, the active nas-ip-address may switch from the primary to the backup, or the backup to the primary. The following events will occur when the active nas-ip-address is switched:

- All current in-process RADIUS accounting messages from the entire system are cancelled. The accounting message is re-sent, with retries preserved, using the ne w active nas-ip-address. Acct-Delay-Time, however, is updated to reflect the time that has occurred since the accounting event. The value of Event-Timestamp is preserved.
- All current in-process RADIUS authentication messages from the entire system are cancelled. The authentication message is re-sent, with retries preserved, using the new active nas-ip-address. The value of Event-Timestamp is preserved.
- All subsequent in-process RADIUS requests uses the new active nas-ip-address.

The system uses a revertive algorithm when transitioning active NAS IP addresses as described below:

- If the configured primary nas-ip-address transitions from UP to DOWN, and the backup nas-ip-address is UP, then the active nas-ip-address switches from the primary to the backup nas-ip-address.
- If the backup nas-ip-address is active, and the primary nas-ip-address transitions from DOWN to UP, then the active nas-ip-address switches from the backup to the primary nas-ip-address.

Example

The following command configures the RADIUS identification parameter, NAS IP address to *10.2.3.4*.

```
radius attribute nas-ip-address 10.2.3.4
```

radius authenticate

This command configures RADIUS authentication related parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius authenticate { apn-to-be-included { gi | gn } | null-username }

default radius authenticate { apn-to-be-included | null-username }

no radius authenticate null-username
```

default

Configures the default setting.

no radius authenticate null-username

Disables sending an Access-Request message to the AAA server for user names (NAI) that are blank.

apn-to-be-included

Specifies the APN name to be included for RADIUS authentication.
gi: Specifies the usage of Gi APN name in RADIUS authentication request. Gi APN represents the APN received in the Create PDP Context request message from SGSN.
gn: Specifies the usage of Gn APN name in RADIUS authentication request. Gn APN represents the APN selected by the GGSN.

null-username

Specifies attempting RADIUS authentication even if the provided user name is NULL (empty).
Default: Enables authenticating, sending Access-Request messages to the AAA server, all user names, including NULL user names.

Usage

Use this command to disable, or re-enable, sending Access-Request messages to the AAA server for user names (NAI) that are blank (NULL).

Example

The following command disables sending of Access-Request messages for user names (NAI) that are blank:

```
no radius authenticate null-username
```

The following command re-enables sending of Access-Request messages for user names (NAI) that are blank:

```
radius authenticate null-username
```

radius authenticator-validation

This command enables/disables the MD5 authentication of RADIUS user. MD5 authentication is enabled by default.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] radius authenticator-validation
```

no

Disables MD5 authentication validation for an Access-Request message to the AAA server.

Usage

Use this command to disable or re-enable, sending Access-Request messages to the AAA server for MD5 validation.

Example

The following command disables MD5 authentication validation for Access-Request messages for user names (NAI):

```
no radius authenticator-validation
```

The following command enables MD5 authentication validation for Access-Request messages for user names (NAI):

```
radius authenticator-validation
```

radius charging

This command configures basic RADIUS options for Active Charging Service (ACS).

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius charging { deadtime *dead_time* **| detect-dead-server { consecutive-failures** *consecutive_failures_count* **| response-timeout** *response_timeout_duration* **} | max-outstanding** *max_messages* **| max-retries** *max_retries* **| max-transmissions** *max_transmissions* **| timeout** *idle_seconds* **}**

default radius charging { deadtime | detect-dead-server | max-outstanding | max-retries | max-transmissions | timeout }

no radius charging { detect-dead-server | max-transmissions | timeout }

---

no

Removes the specified configuration.

---

default

Configures the default setting for the specified keyword.

---

deadtime *dead_time*

Specifies the number of minutes to wait before attempting to communicate with a server that has been marked as unreachable.
dead_time must be an integer from 0 through 65535.
Default: 10

---

detect-dead-server { consecutive-failures *consecutive_failures_count* **| response-timeout** *response_timeout_duration* **}**

consecutive-failures *consecutive_failures_count*: Specifies the number of consecutive failures, for each AAA Manager, before a server is marked as unreachable.
consecutive_failures_count must be an integer from 1 through 1000.
Default: 4
response-timeout *response_timeout_duration*: Specifies the number of seconds for each AAA Manager to wait for a response to any message before a server is detected as failed, or in a down state.
response_timeout_duration must be an integer from 1 through 65535.

---

max-outstanding *max_messages*

Specifies the maximum number of outstanding messages a single AAA Manager instance will queue.
max_messages must be an integer from 1 through 4000.
Default: 256

max-retries *max_retries*

Specifies the maximum number of times communication with a AAA server will be attempted before it is marked as unreachable, and the detect dead servers consecutive failures count is incremented.
max_retries must be an integer from 0 through 65535.
Default: 5

max-transmissions *max_transmissions*

Sets the maximum number of re-transmissions for RADIUS authentication requests. This limit is used in conjunction with the **max-retries** parameter for each server.
When failing to communicate with a RADIUS sever, the subscriber is failed once all of the configured RADIUS servers have been exhausted or once the configured number of maximum transmissions is reached. For example, if three servers are configured and if the configured max-retries is 3 and max-transmissions is 12, then the primary server is tried four times (once plus three retries), the secondary server is tried four times, and then a third server is tried four times. If there is a fourth server, it is not tried because the maximum number of transmissions (12) has been reached.
max_transmissions must be an integer from 1 through 65535.
Default: Disabled

timeout *idle_seconds*

Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the messages.
idle_seconds must be an integer from 1 through 65535.
Default: 3

Usage

Use this command to manage the basic Charging Service RADIUS options according to the RADIUS server used for the context.

Example

The following command configures the AAA server to be marked as unreachable when the consecutive failure count exceeds *6*:

```
radius charging detect-dead-server consecutive-failures 6
```

The following command sets the timeout value to *300* seconds to wait for a response from RADIUS server before resending the messages:

```
radius charging timeout 300
```

radius charging accounting algorithm

This command specifies the fail-over/load-balancing algorithm to be used for selecting RADIUS servers for charging services.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
radius charging accounting algorithm { first-n n | first-server | round-robin }
```

first-n *n*

Specifies that the AGW must send accounting data to *n* (more than one) AAA servers based on their priority. Response from any one of the *n* AAA servers would suffice to proceed with the call. The full set of accounting data is sent to each of the *n* AAA servers.
n is the number of AAA servers to which accounting data will be sent, and must be an integer from 2 through 128.
Default: 1 (Disabled)

first-server

Specifies that the context must send accounting data to the RADIUS server with the highest configured priority. In the event that this server becomes unreachable, accounting data is sent to the server with the next-highest configured priority. This is the default algorithm.

round-robin

Specifies that the context must load balance sending accounting data among all of the defined RADIUS servers. Accounting data is sent in a circular queue fashion on a per Session Manager task basis, where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to specify the accounting algorithm to use to select RADIUS servers for charging services configured in the current context.

Example

The following command configures to use the round-robin algorithm for RADIUS server selection:

```
radius charging accounting algorithm round-robin
```

radius charging accounting server

This command configures RADIUS charging accounting servers in the current context for ACS Prepaid Accounting.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius charging accounting server *ip_address* **[encrypted] key** *value* **[max** *max_messages* **] [oldports] [port** *port_number* **] [priority** *priority* **] [admin-status { enable | disable }] [-noconfirm]**

no radius charging accounting server *ip_address* **[oldports | port** *port_number* **]**

---

no

Removes the server or server port(s) specified from the list of configured servers.

---

ip_address

Specifies the IP address of the accounting server. *ip_address* must be specified using IPv4 dotted-decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted.
In 12.1 and earlier releases, the key *value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 256 characters with encryption.
In 12.2 and later releases, the key *value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 236 characters with encryption enabled.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plaint text key. Only the encrypted key is saved as part of the configuration file.

---

max *max_messages*

Specifies the maximum number of outstanding messages that may be allowed to the server. *max_messages* must be an integer from 0 through 4000.
Default: 0

---

oldports

Sets the UDP communication port to the out of date standardized default for RADIUS communications to 1646.

---

port *port_number*

Specifies the port number to use for communication.

port_number must be an integer from 0 through 65535.
Default: 1813

priority *priority*

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to. *priority* must be an integer from 1 through 1000, where 1 is the highest priority.
Default: 1000

admin-status { enable | disable }

Enables or disables the RADIUS authentication/accounting/charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

This command is used to configure the RADIUS charging accounting server(s) with which the system is to communicate for ACS Prepaid Accounting requests.
Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

Example

The following commands configure RADIUS charging accounting server with the IP address set to 10.1.2.3, port to 1024, priority to 10:

```
radius charging accounting server 10.1.2.3 key sharedKey212 port 1024 max
127

radius charging accounting server 10.1.2.3 encrypted key scrambledKey234
oldports priority 10
```

radius charging algorithm

This command specifies the RADIUS authentication server selection algorithm for ACS for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius charging algorithm { first-server | round-robin }

default radius charging algorithm
```

default

Configures the default setting.
Default: **first-server**

first-server

Accounting data is sent to the first available server based upon the relative priority of each configured server.

round-robin

Accounting data is sent in a circular queue fashion on a per Session Manager task basis where data is sent to the next available server and restarts at the beginning of the list of configured servers. The order of the list is based upon the configured relative priority of the servers.

Usage

Use this command to configure the context's RADIUS server selection algorithm for ACS to ensure proper load distribution amongst the available servers.

Example

The following command configures to use the round-robin algorithm for RADIUS server selection:

```
radius algorithm round-robin
```

radius charging server

This command configures the RADIUS charging server(s) in the current context for ACS Prepaid Authentication.

radius charging server *ip_address* **[encrypted] key** *value* **[max** *max_messages* **] [oldports] [port** *port_number* **] [priority** *priority* **] [admin-status { enable | disable }] [-noconfirm]**

no radius charging server *ip_address* **[oldports | port** *port_number* **]**

---

no

Removes the server or server port(s) specified from the list of configured servers.

---

ip_address

Specifies the IP address of the server. *ip_address* must be specified using IPv4 dotted-decimal notation. A maximum of 128 RADIUS servers can be configured per context. This limit includes accounting and authentication servers.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted.
In 12.1 and earlier releases, the key *value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 256 characters with encryption.
In 12.2 and later releases, the key *value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 236 characters with encryption enabled.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

---

max *max_messages*

Specifies the maximum number of outstanding messages that may be allowed to the server. *max_messages* must be an integer from 0 through 4000.
Default: 256

---

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

---

port *port_number*

Specifies the port number to use for communications.
port_number must be an integer from 1 through 65535.

Default: 1812

priority *priority*

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to.
priority must be an integer from 1 through 1000, where 1 is the highest priority.
Default: 1000

admin-status { enable | disable }

Enables or disables the RADIUS authentication, accounting, or charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

This command is used to configure the RADIUS charging server(s) with which the system is to communicate for ACS Prepaid Authentication requests.
Up to 128 AAA servers can be configured per context when the system is functioning as a PDSN and/or HA. Up to 16 servers are supported per context when the system is functioning as a GGSN.

Example

The following commands configure RADIUS charging server with the IP address set to 10.2.3.4, port to 1024, priority to 10:

```
radius charging server 10.2.3.4 key sharedKey212 port 1024 max 127

radius charging server 10.2.3.4 encrypted key scrambledKey234 oldports
priority 10
```

radius ip vrf

This command associates the specific AAA group (NAS-IP) with a Virtual Routing and Forwarding (VRF) Context instance for BGP/MPLS, GRE, and IPSec Tunnel functionality which needs VRF support for RADIUS communication. By default the VRF is NULL, which means that AAA group is associated with global routing table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius ip vrf *vrf_name*

no radius ip vrf

no

Disables the configured IP Virtual Routing and Forwarding (VRF) context instance and removes the association between the VRF context instance and the AAA group instance (NAS-IP).
By default this command is disabled, which means the NAS-IP being used is assumed a non-VRF IP and specific AAA group does not have any VRF association.

vrf_name

Specifies the name of a pre-configured VRF context instance.
vrf_name is the name of a pre-configured virtual routing and forwarding (VRF) context configured in Context configuration mode through **ip vrf** command.

Caution: Any incorrect configuration, such as associating AAA group with wrong VRF instance or removing a VRF instance, will fail the RADIUS communication.

Usage

Use this command to associate/disassociate a pre-configured VRF context for a feature such as BGP/MPLS VPN or GRE, and IPSec tunneling which needs VRF support for RADIUS communication.
By default the VRF is NULL, which means that AAA group (NAS-IP) is associated with global routing table and NAS-IP being used is assumed a non-VRF IP.
This IP VRF feature can be applied to RADIUS communication, which associates the VRF with the AAA group. This command must be configured whenever a VRF IP is used as a NAS-IP in the AAA group or at the Context level for the “default” AAA group.
This is a required configuration as VRF IPs may be overlapping hence AAA needs to know which VRF the configured NAS-IP belongs to. By this support different VRF-based subscribers can communicate with different RADIUS servers using the same, overlapping NAS-IP address, if required across different AAA groups.

Example

The following command associates VRF context instance *ip_vrf1* with specific AAA group (NAS-IP):

```
radius ip vrf ip_vrf1
```

radius keepalive

This command configures the RADIUS keepalive authentication parameters.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius keepalive { calling-station-id id | consecutive-response number | encrypted |
interval seconds | password | retries number | timeout seconds | username user_name |
valid-response access-accept [ access-reject ] }

default radius keepalive { calling-station-id | consecutive-response | interval |
password | retries | timeout | username | valid-response }
```

default

Configures the default setting for the specified keyword.

calling-station-id *id*

Specifies the Calling-Station-Id to be used for the keepalive authentication.
id must be an alphanumeric string of size 1 to 15 characters.
Default: 000000000000000

consecutive-response *number*

Specifies the number of consecutive authentication responses after which the server is marked as reachable.
number must be an integer from 1 through 10.
Default: 1

encrypted password

Specifies encrypting the password.
In 12.1 and earlier releases, the *password* must be an alphanumeric string of 1 through 63 characters.
In 12.2 and later releases, the *password* must be an alphanumeric string of 1 through 132 characters.
Default password: Test-Password

interval *seconds*

Specifies the time interval, in seconds, between two keepalive access requests.
Default: 30 seconds

password

Specifies the password to be used for authentication.
password must be an alphanumeric string of 1 through 63 characters.
Default password: Test-Password

retries *number*

Specifies the number of times the keepalive access request to be sent before marking the server as unreachable.
number must be an integer from 3 through 10.
Default: 3

timeout *timeout_duration*

Specifies the time interval between keepalive access request retries.
timeout_duration must be an integer from 1 through 30.
Default: 3 seconds

username *user_name*

Specifies the user name to be used for authentication.
user_name must be an alphanumeric string of 1 through 127 characters.
Default: Test-Username

valid-response access-accept [*access-reject* **]**

Specifies the valid response for the authentication request.
If *access-reject* is configured, then both access-accept and access-reject are considered as success for the keepalive authentication request.
If *access-reject* is not configured, then only access-accept is considered as success for the keepalive access request.
Default: **keepalive valid-response access-accept**

Usage

Use this command to configure the keepalive authentication parameters for the RADIUS server.

Example

The following command configures the user name for RADIUS keepalive access requests to *Test-Username2*:

```
radius keepalive username Test-Username2
```

The following command configures the number of RADIUS keepalive retries to *4*:

```
radius keepalive retries 4
```

radius mediation-device

See the radius accounting server command.

radius probe-interval

This command configures the time interval between two RADIUS authentication probes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius probe-interval *seconds*

default radius probe-interval

default

Configures the default setting.

seconds

Specifies the number of seconds to wait before sending another probe authentication request to a RADIUS server.
seconds must be an integer from 1 through 65535.
Default: 60

Usage

Use this command for Interchassis Session Recovery (ICSR) support to set the duration between two authentication probes to the RADIUS server.

Example

The following command sets the RADIUS authentication probe interval to 30 seconds.

```
radius probe-interval 30
```

radius probe-max-retries

This command configures the number of retries for RADIUS authentication probe response.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius probe-max-retries *retries*

default radius probe-max-retries

default

Configures the default setting.

retries

Specifies the number of retries for RADIUS authentication probe response before the authentication is declared as failed.
retries must be an integer from 0 through 65535.
Default: 5

Usage

Use this command with Interchassis Session Recovery (ICSR) to set the number of attempts to send RADIUS authentication probe without a response before the authentication is declared as failed.

Example

The following command configures the maximum number of retries to *6* seconds.

```
radius probe-max-retries 6
```

radius probe-timeout

This command configures the timeout duration for Interchassis Session Recovery (ICSR) to wait for a response for RADIUS authentication probes.

Product

All

Privilege

Security Administrator, Administrator

Syntax

radius probe-timeout *idle_seconds*

default radius probe-timeout

default

Configures the default setting.

idle_seconds

Specifies the number of seconds to wait for a response from the RADIUS server before re-sending the authentication probe.
idle_seconds must be an integer from 0 through 65535.
Default: 3

Usage

Use this command to set the time duration for ICSR, to wait for a response before re-sending the RADIUS authentication probe to the RADIUS server.

Example

The following command sets the authentication probe timeout to *120* seconds:

```
radius probe-timeout 120
```

radius server

This command configures RADIUS authentication server(s) in the current context for authentication.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius server ip_address [ encrypted ] key value [ admin-status { disable | enable } ] [
max max_messages ] [ max-rate max_value ] [ oldports ] [ port port_number ] [ priority
priority ] [ probe | no-probe ] [ probe-username user_name ] [ probe-password [ encrypted
] password password ] [ type { mediation-device | standard } ] [ -noconfirm ]

no radius server ip_address [ oldports | port port_number ]
```

no

Removes the server or server port(s) specified from the list of configured servers.

ip_address **port** *port_number*

Specifies the IP address and port number of the server.
ip_address: Must be specified using IPv4 dotted-decimal notation. A maximum of 1600 RADIUS servers per context/system and 128 servers per Server group can be configured. This limit includes accounting and authentication servers.
port *port_number*: Specifies the port number to use for communications. *port_number* must be an integer from 1 through 65535.
Default: 1812.

Important: The same RADIUS server IP address and port can be configured in multiple RADIUS server groups within a context.

[encrypted] key *value*

Specifies the shared secret key used to authenticate the client to the servers. The **encrypted** keyword indicates the key specified is encrypted.
In 12.1 and earlier releases, the key *value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 256 characters with encryption.
In 12.2 and later releases, the key *value* must be an alphanumeric string of 1 through 127 characters without encryption, and 1 through 236 characters with encryption enabled.
The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **key** keyword is the encrypted version of the plain text key. Only the encrypted key is saved as part of the configuration file.

admin-status { disable | enable }

Enables or disables the RADIUS authentication, accounting, or charging server functionality and saves the status setting in the configuration file to re-establish the set status at reboot.

max *max_messages*

Specifies the maximum number of outstanding messages that may be allowed to the server.
max_messages must be an integer from 0 through 4000.
Default: 256

max-rate *max_value*

Specifies the rate at which the authentication messages should be sent to the RADIUS server by a single AAA manager task.
max_value must be an integer from 0 through 1000.
Default: 0 (disabled)

oldports

Sets the UDP communication port to the old default for RADIUS communications to 1645.

priority *priority*

Specifies the relative priority of this accounting server. The priority is used in server selection for determining which server to send accounting data to.
priority must be an integer from 1 through 1000, where 1 is the highest priority. When configuring two or more servers with the same priority you will be asked to confirm that you want to do this. If you use the **-noconfirm** option, you are not asked for confirmation and multiple servers could be assigned the same priority.
Default: 1000

probe

Enable probe messages to be sent to the specified RADIUS server.

no-probe

Disable probe messages from being sent to the specified RADIUS server. This is the default behavior.

probe-username *user_name*

The user name sent to the RADIUS server to authenticate probe messages. *user_name* must be an alphanumeric string of 1 through 127 characters.

probe-password [encrypted] password *password*

The password sent to the RADIUS server to authenticate probe messages.
encrypted: This keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
password *password*: Specifies the probe-user password for authentication. *password* must be an alphanumeric string of 1 through 63 characters.

type { mediation-device | standard }

Specifies the type of transactions the RADIUS server accepts.
mediation-device: Specifies mediation-device specific AAA transactions. This device is available if you purchased a transaction control services license. Contact your local Cisco representative for licensing information.

standard: Specifies standard AAA transactions. (Default)

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

This command is used to configure the RADIUS authentication server(s) with which the system is to communicate for authentication.
You can configure up to 1600 RADIUS servers per context/system and 128 servers per Server group. The servers can be configured as accounting, authentication, charging servers, or any combination thereof.

Example

The following commands configure RADIUS server with the IP address set to 10.2.3.4, port to 1024, priority to 10:

```
radius server 10.2.3.4 key sharedKey212 port 1024 max 127

radius server 10.2.3.4 encrypted key scrambledKey234 oldports priority 10
```

radius trigger

This command enables specific RADIUS triggers.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] radius trigger { ms-timezone-change | qos-change | rai-change | rat-change |
serving-node-change | uli-change }

default radius trigger
```

no

Disables specified RADIUS trigger.

default

Configures the default setting.
Default: All RADIUS triggers are enabled.

ms-timezone-change

Specifies to enable RADIUS trigger for MS time zone change.

qos-change

Specifies to enable RADIUS trigger for Quality of Service change.

rai-change

Specifies to enable RADIUS trigger for Routing Area Information change.

rat-change

Specifies to enable RADIUS trigger for Radio Access Technology change.

serving-node-change

Specifies to enable RADIUS trigger for Serving Node change.

uli-change

Specifies to enable RADIUS trigger for User Location Information change.

Usage

Use this command to enable RADIUS triggers.

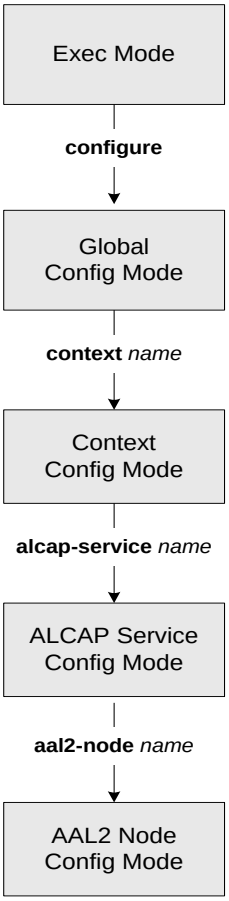
Example

The following command enables RADIUS trigger for RAT change:

```
radius trigger rat-change
```

Chapter 3
AAL2 Node Configuration Mode Commands

The AAL2 Node Configuration Mode is used to configure the ATM Adaptation Layer 2 nodes to manage the Access Link Control Application Part (ALCAP) on HNB-GW for IuCS-over-ATM support towards CS core network.



Important: The AAL2 Node configured here will be used to bind with ATM port in PVC configuration sub-mode of ATM configuration mode for IuCS-over-ATM functionality.

aal2-path-id

This command set the AAL2 path identifier with AAL2 node and also used to block a particular AAL2 path.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

[no] aal2-path-id *aal2_path_id* **[block]**

no

Removes the configured AAL2 path identifier from this AAL2 node configuration.

aal2_path_id

Specifies the AAL2 path identifier configured with adjacent AAL2 node(s). The AAL2 path id must be unique within an AAL2 node configuration. This value is used to identify a particular path towards an adjacent AAL2 node and is sent in ALCAP protocol messages to peer where path identification is required. The *aal2_path_id* must be an integer between 1 through 4294967295.

Important: This AAL2 path id *aal2_path_id* will be used to bind with ATM port in PVC configuration mode of ATM configuration mode.

block

This keyword block the AAL2 path configured with specific path identifier. When this keyword is executed ALCAP-BLO-REQUEST shall be sent to the adjacent AAL2 node.
To unblock an AAL2 path, the no keyword will be used for a locally blocked path by sending ALCAP-UNBLOCK-REQUEST to the adjacent AAL2 node.

Usage

Use this command to configure an AAL2 path between a pair of adjacent nodes, which is identified by a unique number called AAL2 path identifier. An AAL2 path provides 248 AAL2 channels wherein each AAL2 channel is used for one circuit switched call. The AAL2 channel range defined is 8 to 255.
This command can be used for blocking or unblocking an AAL2 path towards an adjacent AAL2 node.

Important: The AAL2 path id configured here will be used to bind with ATM port in PVC configuration sub-mode of ATM configuration mode for IuCS-over-ATM functionality.

Example

Following command sets the AAL2 path identifier *2* in an AAL2 node configuration.

```
al2-path-id 2
```

Following command unblocks the AAL2 path identifier *6* which was earlier blocked in an AAL2 node configuration.

no al2-path-id *6* **block**

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

point-code

This command configure the point code of adjacent AAL2 node in SS7 format address. This point code shall be filled in the destination point-code (dpc) field of MTP3 routing label. This is required if signaling transport network is based on MTP3-broadband (MTP3B).

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

[no] point-code *point_code*

no

Removes the configured point code from this AAL2 node configuration.

point_code

Defines the point code to assign to adjacent AAL2 node in SS7 format.
point_code: value entered must adhere to the point code variant selected when the AAL2 node was defined:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- a string of 1 to 11 combined digits ad period.

Usage

Use this command to configure configure the point code of adjacent AAL2 node in SS7 format address. This point code shall be filled in the destination point-code (dpc) field of MTP3 routing label. This is required if signaling transport network is based on MTP3-broadband (MTP3B).
A maximum of 16 point codes for adjacent AAL2 nodes can be configured in one ALCAP service.

Example

The following command configures the point code *4.121.5* for adjacent AAL2 node.

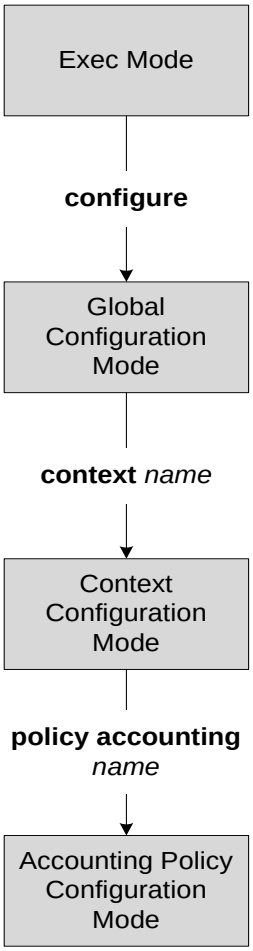
```
point-code 4.121.5
```

The following command removes the point code *4.121.15* from AAL2 node configuration.

```
no point-code 4.121.15
```

Chapter 4
Accounting Policy Configuration Mode Commands

The Accounting Policy Configuration Mode is used to define the accounting method, mode, and event trigger responses for the accounting policy supporting the Rf (off-line charging) interface.



accounting-event-trigger

Configures the response to specific event triggers for this policy. Multiple event instances can be configured.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
accounting-event-trigger { cgi-sai-change | ecgi-change | flow-information-change |
interim-timeout | location-change | rai-change | tai-change } action { interim | stop-
start }

[ default | no ] accounting-event-trigger { cgi-sai-change | ecgi-change | flow-
information-change | interim-timeout | location-change | rai-change | tai-change }
```

default

Returns the command to its default setting of interim for the **action** keyword (for all events).

no

Removes the specified event trigger configuration from this policy.

cgi-sai-change

Specifies that the action is initiated upon indication of a Cell Global Identification-Service Area Identification (CGI-SAI) change.

ecgi-change

Specifies that the action is initiated upon indication of an E-UTRAN Cell Global Identifier (ECGI) change.

flow-information-change

Specifies that the action is initiated upon indication of a change in the flow information.

interim-timeout

Specifies that the action is initiated upon expiration of the interim interval.

location-change

Specifies that the action is initiated upon indication of a location change.

rai-change

Specifies that the action is initiated upon indication of an Routing Area Identifier (RAI) change.

tai-change

Specifies that the action is initiated upon indication of a Tracking Area Identity (TAI) change.

action { interim | stop-start }

Default: interim
Specifies the action initiated upon the occurrence of an event.
interim: Specifies that an interim ACR (Accounting Request) is sent.
stop-start: Specifies that a Stop-Start ACR is sent.

Usage

Use the is command to configure that action taken upon the occurrence on an accounting event trigger.

Example

The following command configures the policy to send a Stop-Start ACR upon indication of an interim timeout:

```
accounting-event-trigger interim-timeout action stop-start
```

accounting-keys

Aggregates the accounting information, using the configurable keys (QCI) along with default keys.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
accounting-keys qci

default accounting-keys
```

default

Aggregate the accounting information, using QoS Class Identifier (QCI) as the additional key.

qci

Aggregate the accounting information, using QCI as the additional key.

Usage

Use this command to aggregate the accounting information, using the configurable keys (QCI) along with default keys.
In service data flow (SDF) level accounting, buckets are created and maintained using the Reporting-Level AVP value present in Gx message. The following are the accounting keys currently supported:

- Rating-group
- Rating-group and Service-Identifier
- Rating-group and QCI
- Rating-group, Service-Identifier, and QCI

Example

The following command aggregates the accounting information, using QCI as the additional key:

```
accounting-keys qci
```

accounting-level

Configures the type of accounting performed by this profile.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
accounting-level { flow | pdn | pdn-qci | qci | sdf | subscriber }

default accounting-level
```

default

Returns the command to the default setting of subscriber-based accounting.

flow

Specifies that flow-based accounting is to be used for this accounting profile. Accounting Request (ACR) Start messages include an AVP with the following Evolved Packet System (EPS) information:

- PDN identifier
- QCI for which accounting is done
- Charging rule name for which accounting is being done
- AF charging identifier (included if PCRF has provided a charging identifier to correlate AF generated information)
- Flow description for the flows
- User Equipment information if available (ESN/MEID)
- Address of HSGW/S-GW
- Address of the P-GW (if available), one or more instances

pdn

Specifies that PDN-based accounting is to be used for this accounting profile. ACR Start messages include an AVP with the following EPS information:

- Addresses allocated to the UE in this PDN
- PDN identifier
- User Equipment information if available (ESN/MEID)
- Address of HSGW/S-GW
- Address of the P-GW (if available), one or more instances

pdn-qci

Specifies that PDN-QCI accounting is to be used for this accounting profile. ACR Start messages include an AVP with the following EPS information:

- Addresses allocated to the UE in this PDN

- PDN identifier
- QCI for which accounting is done
- User Equipment information if available (ESN/MEID)
- Address of HSGW/S-GW
- Address of the P-GW (if available), one or more instances

qci

Specifies that QCI-based accounting is to be used for this accounting profile. ACR Start messages include an AVP with the following EPS information:

- QCI for which accounting is done
- User Equipment information if available (ESN/MEID)
- Address of HSGW/S-GW
- Address of the P-GW (if available), one or more instances

sdf

Specifies that service data flow accounting is to be used for this accounting profile. ACR Start messages include an AVP with the following EPS information:

subscriber

Specifies that subscriber-based accounting is to be used for this accounting profile. ACR Start messages include an AVP with the following EPS information:

- User Equipment information if available (ESN/MEID)
- Address of HSGW/S-GW
- Address of the P-GW (if available), one or more instances

Usage

Use this command to specify the type of accounting performed by this profile.

Example

The following command sets the accounting type for this profile to flow-based:

```
accounting-level flow
```

accounting-mode

Configures the accounting mode for this profile.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

```
accounting-mode normal

default accounting-mode
```

default

Returns the accounting mode for this profile to its default setting of "normal".

normal

Specifies that "normal" (start/interim/stop) accounting will be performed for this profile.

Usage

Use this command to set the accounting mode for this profile.

cc

Configures a charging characteristics (CC) profile, within the accounting profile configuration, for CDR generation.

Product

S-GW, HSGW, P-GW

Privilege

Administrator

Syntax

```
cc profile index { buckets num | interval seconds | sdf-interval seconds | sdf-volume {
downlink octets { uplink octets } | total octets | uplink octets { downlink octets } }  |
serving-nodes num | tariff time1 min hrs [ time2 min hrs...time4 min hrs ] | volume {
downlink octets { uplink octets } | total octets | uplink octets { downlink octets } } }

default cc profile index

no cc profile index { buckets | interval | sdf-interval | sdf-volume | serving-nodes |
tariff | volume }
```

default

Returns all profile features, for the specified profile index, to their default settings.

no

Returns the specified feature to its default setting.

profile *index*

Specifies a billing type to be applied to this profile. *index* must be one of the following:
1: Hot billing
2: Flat billing
4: Prepaid billing
8: Normal billing

buckets *num*

Default: 4
Specifies the number of container changes in the S-GW CDR due to QoS changes or tariff times. If an accounting policy is not configured, this value is 4. GTPP accounting will use the default value if the configured value is beyond 4.
In 12.0 and earlier releases, *num* must be an integer value from 1 through 4.
In 12.2 and later releases, *num* must be an integer value from 1 through 10.

Important: Please note that the maximum value for the CC profile buckets is extended to support up to 10 for Diameter Rf accounting only. However, in the case of GTPP accounting, this CLI command allows configuring only up to 4 buckets.

interval *seconds*

Default: disabled
Specifies a time interval for closing the charging record if the minimum volume thresholds are satisfied. *seconds* must be an integer value from 60 through 40000000.

sdf-interval *seconds*

Default: disabled
Specifies a time interval for closing the charging record for a specific flow if the minimum volume thresholds are satisfied. *seconds* must be an integer value from 60 through 40000000.

sdf-volume { downlink *octets* **{ uplink** *octets* **} | total** *octets* **| uplink** *octets* **{ downlink** *octets* **} }**

Specifies octet volume thresholds for the generation of interim CDRs for a specific flow.
downlink *octets*: Sets the threshold limit for the number of downlink octets that must be reached before the charging record for a specific flow is closed. *octets* must be an integer value from 100000 through 4000000000.
total *octets*: Sets the threshold limit for the total number of octets that must be reached before the charging record for a specific flow is closed. *octets* must be an integer value from 100000 through 4000000000.
uplink *octets*: Sets the threshold limit for the number of uplink octets that must be reached before the charging record for a specific flow is closed. *octets* must be an integer value from 100000 through 4000000000.

serving-nodes *num*

Default: 4
Specifies the number of serving node changes (inter-serving node switchovers) after which the interim CDR is generated. In P-GW and S-GW, a partial record needs to be generated whenever there is a serving node address list overflow. Serving node is added to the CDR list during handover scenarios. *num* must be an integer value from 1 through 4. If an accounting policy is not configured, this value is 4.

tariff time1 *min hrs* **[time2** *min hrs*...**time4** *min hrs* **]**

Specifies time-of-day values used to determine when a container is closed in the charging records.
time1 *min hrs*: Specifies the first time-of-day value used to close the current container in the charging record. *min* must be an integer value from 0 through 59. *hrs* must be an integer value from 0 through 23.
time2 *min hrs*...**time4** *minutes hours*: Specifies the second, third and fourth time-of-day values used to close containers in the charging record. *min* must be an integer value from 0 through 59. *hrs* must be an integer value from 0 through 23.

volume { downlink *octets* **{ uplink** *octets* **} | total** *octets* **| uplink** *octets* **{ downlink** *octets* **} }**

Specifies octet volume thresholds for the generation of interim CDRs.
downlink *octets*: Sets the threshold limit for the number of downlink octets that must be reached before the charging record is closed.
In 12.1 and earlier releases, the downlink *octets* must be an integer value from 100000 to 1345294336.
In 12.2 and later releases, the downlink *octets* must be an integer value from 100000 to 4000000000.
total *octets*: Sets the threshold limit for the total number of octets that must be reached before the charging record is closed.
In 12.1 and earlier releases, the total*octets* must be an integer value from 100000 to 400000000.
In 12.2 and later releases, the total *octets* must be an integer value from 100000 to 4000000000.

uplink *octets*: Sets the threshold limit for the number of uplink octets that must be reached before the charging record is closed.
In 12.1 and earlier releases, the uplink *octets* must be an integer value from 100000 to 400000000.
In 12.2 and later releases, the uplink *octets* must be an integer value from 100000 to 4000000000.

Usage

Use this command to set charging characteristics that directly affect the CDR generation on the HSGW, P-GW, or S-GW.

Example

The following command creates a hot billing profile with a total octet volume threshold set to 500000:

```
cc profile 1 volume total 500000
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

max-containers

Control the number of containers in an ACR message.

Product

GGSN, HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

max-containers { *containers* | fill-buffer }

default max-containers

default

Cache containers until buffer is filled.

containers

System can send any value equal or less than the maximum number of containers selected. The number of containers that can be sent can be dynamically selected by the system, but it should not cross the limit of containers in any message.
containers must be in integer from 1 to 30.

fill-buffer

Cache containers until buffer is filled.

Usage

Use this command to control the number of containers before an interim ACR message is triggered.

Example

The following command sets a maximum of *20* containers in an ACR message:

```
max-containers 20
```

operator-string

Configures a text string to be included with accounting messages sent by this policy.

Product

HSGW, P-GW, S-GW

Privilege

Administrator

Syntax

operator-string *string*

no operator-string

no

Removes the operator string from this policy.

string

Specifies a text string that is included with accounting messages originating from this policy. *string* must be from 1 to 63 alphanumeric characters.

Usage

Use this command to create a text string to be included with accounting messages originating from this policy.

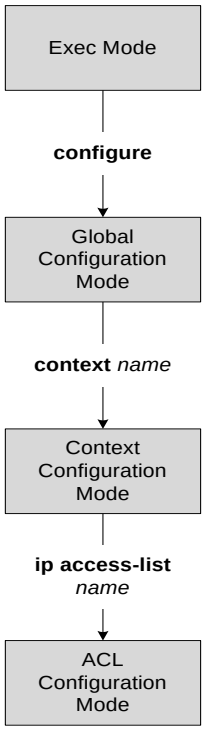
Example

The following command creates the text string *pgw_local* to be included with accounting messages originating from this policy:

```
operator-string pgw_local
```

Chapter 5
ACL Configuration Mode Commands

The Access Control List Configuration Mode is used to create and manage IP-based, user access privileges.



deny/permit (by source IP address masking)

Filters subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] source_address source_wildcard

after { deny | permit } [ log ] source_address source_wildcard

before { deny | permit } [ log ] source_address source_wildcard

no { deny | permit } [ log ] source_address source_wildcard
```

after

Indicates that all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates that all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated. IP addresses must be entered in IPv4 dotted-decimal format.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines two rules with the second logging filtered packets:

```
permit 1.2.3.0 0.0.0.31

deny log 1.2.4.0 0.0.0.15
```

The following sets the insertion point before the first rule defined above:

```
before permit 1.2.3.0 0.0.0.31
```

The following command sets the insertion point after the second rule defined above:

```
after deny log 1.2.4.0 0.0.0.15
```

The following deletes the first rule defined above:

```
no permit 1.2.3.0 0.0.0.31
```

deny/permit (any)

Filters subscriber sessions based on any packet received. This command is also sets the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] any

after { deny | permit } [ log ] any

before { deny | permit } [ log ] any

no { deny | permit } [ log ] any
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.

Indicates all packets which match the filter are to be logged.

any

Indicates all packets will match the filter regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules.

Important: It is suggested that any rule which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security. The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following commands define two rules with the second logging filtered packets:

```
permit any

deny log any
```

The following sets the insertion point before the first rule defined above:

```
before permit any
```

The following command sets the insertion point after the second rule defined above:

```
after deny log any
```

The following deletes the first rule defined above:

```
no permit any
```

deny/permit (by host IP address)

Filters subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

{ deny | permit } [log] host *source_host_address*

after { deny | permit } [log] host *source_host_address*

before { deny | permit } [log] host *source_host_address*

no { deny | permit } [log] host *source_host_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.
Indicates that all packets which match the filter are to be logged.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following commands define two rules with the second logging filtered packets:

```
permit host 10.2.3.4

deny log host 10.2.3.5
```

The following sets the insertion point before the first rule defined above:

```
before permit host 10.2.3.4
```

The following command sets the insertion point after the second rule defined above:

```
after deny log host 10.2.3.5
```

The following deletes the first rule defined above:

```
no permit host 10.2.3.4
```

deny/permit (by source ICMP packets)

Filters subscriber sessions based on the internet control message protocol (ICMP) packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] icmp { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
icmp_type [ icmp_code ] ]

after { deny | permit } [ log ] icmp { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
icmp_type [ icmp_code ] ]

before { deny | permit } [ log ] icmp { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
icmp_type [ icmp_code ] ]

no { deny | permit } [ log ] icmp { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
icmp_type [ icmp_code ] ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated. IP addresses must be entered in IPv4 dotted-decimal format.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP filtering allows flexible controls for pairs of individual hosts or groups by IP masking which allows the filtering of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following commands define two rules with the second logging filtered packets:

```
permit icmp host 10.2.3.4 any 168

deny log icmp 10.2.3.0 0.0.0.31 host 10.2.4.16 168 11
```

The following sets the insertion point before the first rule defined above:

```
before permit icmp host 10.2.3.4 any 168
```

The following command sets the insertion point after the second rule defined above:

```
after deny log icmp 10.2.3.0 0.0.0.31 host 10.2.4.16 168 11
```

The following deletes the first rule defined above:

```
no permit icmp host 10.2.3.4 any 168
```

deny/permit (by IP packets)

Filters subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] ip { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
fragment ] [ protocol num ]

after { deny | permit } [ log ] ip { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
fragment ] [ protocol num ]

before { deny | permit } [ log ] ip { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
fragment ] [ protocol num ]

no { deny | permit } [ log ] ip { source_address source_wildcard | any | host
source_host_address } { dest_address dest_wildcard | any | host dest_host_address } [
fragment ] [ protocol num ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet filtering is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be an integer ranging from 0 to 255.

Important: This keyword is not applicable to a SPIO interface. Instead, you must specify the type of protocol packets for which you want to deny/permit processing on a SPIO. For example, **deny icmp**, **deny tcp**, or **deny udp**.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following commands define two rules with the second logging filtered packets:

```
permit ip host 10.2.3.4 any fragment

deny log ip 10.2.3.0 0.0.0.31 host 10.2.4.16
```

The following sets the insertion point before the first rule defined above:

```
before permit ip host 10.2.3.4 any fragment
```

The following command sets the insertion point after the second rule defined above:

```
after deny log ip 10.2.3.0 0.0.0.31 host 10.2.4.16
```

The following deletes the first rule defined above:

```
no permit ip host 10.2.3.4 any fragment
```

deny/permit (by TCP/UDP packets)

Filters subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
{ deny | permit } [ log ] { tcp | udp } { { source_address source_wildcard | any | host
source_host_address } [ eq source_port | gt source_port | lt source_port | neq
source_port ] } { { dest_address dest_wildcard | any | host dest_host_address } [ eq
dest_port | gt dest_port | lt dest_port | neq dest_port | range start_port end_port ] }

after { deny | permit } [ log ] { tcp | udp } { { source_address source_wildcard | any |
host source_host_address } [ eq source_port | gt source_port | lt source_port | neq
source_port ] } { { dest_address dest_wildcard | any | host dest_host_address } [ eq
dest_port | gt dest_port | lt dest_port | neq dest_port | range start_port end_port ] }

before { deny | permit } [ log ] { tcp | udp } { { source_address source_wildcard | any |
host source_host_address } [ eq source_port | gt source_port | lt source_port | neq
source_port ] } { { dest_address dest_wildcard | any | host dest_host_address } [ eq
dest_port | gt dest_port | lt dest_port | neq dest_port | range start_port end_port ] }

no { deny | permit } [ log ] { tcp | udp } { { source_address source_wildcard | any |
host source_host_address } [ eq source_port | gt source_port | lt source_port | neq
source_port ] } { { dest_address dest_wildcard | any | host dest_host_address } [ eq
dest_port | gt dest_port | lt dest_port | neq dest_port | range start_port end_port ] }
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- **deny**: Indicates the rule, when matched, drops the corresponding packets.
- **permit**: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.
Indicates all packets which match the filter are to be logged.

tcp | udp

Specifies the filter is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Filter applies to TPC packets.
- **udp**: Filter applies to UDP packets.

source_address

The IP address(es) from which the packet originated. IP addresses must be entered in IPv4 dotted-decimal format.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be an integer from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be an integer from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be an integer from 0 through 65535.

range *start_port end_port*

Specifies a range of ports to be matched.
start_port must be an integer from 0 through 65535, and must be less than the *end_port* value.
end_port must be an integer from 0 through 65535, and must be greater than the *start_port* value.

Important: This option is supported in PDIF Release 8.3.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following commands define four rules with the second and fourth rules logging filtered packets:

```
permit tcp host 10.2.3.4 any

deny log udp 10.2.3.0 0.0.0.31 host 10.2.4.16

permit tcp host 10.2.3.64 gt 1023 any

deny log udp 10.2.3.0 0.0.0.31 10.2.4.127 0.0.0.127
```

The following sets the insertion point before the first rule defined above:

```
before permit tcp host 10.2.3.4 any
```

The following command sets the insertion point after the second rule defined above:

```
after deny log udp 10.2.3.0 0.0.0.31 host 10.2.4.16
```

The following deletes the third rule defined above:

```
no permit tcp host 10.2.3.64 gt 1023 any
```

end

Exits the current configuration mode and returns to the Exec mode.

Use this command to return to the parent configuration mode.

readdress server

Alters the destination address and port number in TCP or UDP packet headers to redirect packets to a different server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

readdress server *redirect_address* **[port** *port_no* **] { tcp | udp } { { source_address** *source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { dest_address dest_wildcard | any | host** *dest_host_address* **} [eq]** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

after readdress server *redirect_address* **[port** *port_no* **] { tcp | udp } { { source_address** *source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { dest_address dest_wildcard | any | host** *dest_host_address* **} [eq]** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

before readdress server *redirect_address* **[port** *port_no* **] { tcp | udp } { { source_address** *source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { dest_address dest_wildcard | any | host** *dest_host_address* **} [eq]** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

no readdress server *redirect_address* **[port** *port_no* **] { tcp | udp } { { source_address** *source_wildcard* **| any | host** *source_host_address* **} [eq** *source_port* **| gt** *source_port* **| lt** *source_port* **| neq** *source_port* **] } { { dest_address dest_wildcard | any | host** *dest_host_address* **} [eq]** *dest_port* **| gt** *dest_port* **| lt** *dest_port* **| neq** *dest_port* **] }**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

redirect_address

The IP address to which the IP packets are redirected. TCP or UDP packet headers are rewritten to contain the new destination address. This must be an IPv4 address specified in dotted-decimal notation.

port *port_no*

The number of the port at the redirect address where the packets are sent. TCP or UDP packet headers are rewritten to contain the new destination port number.

tcp | udp

Specifies the redirect is to be applied to the IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TCP packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be an integer from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be an integer 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be an integer 0 through 65535.

Usage

Use this command to define a rule that redirects packets to a different destination address. The TCP and UDP packet headers are modified with the new destination address and destination port.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Prior to Release 8.3, for packets received from the packet data network destined for a subscriber's UE, the system applied logic to reset the source address of a packet to the original destination address of the input packet before applying the outbound access control list (ACL). In Release 8.3 and higher, the system reverses the order and applies the outbound ACL before resetting the source address. This change impacts all current readdress server rules in inbound IPv4 ACLs.

Important: After Release 8.3, for every readdress server rule in an inbound IPv4 ACL, you must add a permit rule to an outbound ACL that explicitly permits packets from the readdress rule's redirect address and port number. If the permit rule is omitted, the system will reject all packets destined for the subscriber's UE from the readdress rule's redirect address and port number.

Example

The following command defines a rule that redirects packets to the server at 192.168.10.4, UDP packets coming from any host with a destination of any host are matched:

```
readdress server 192.168.10.4 udp any any
```

The following sets the insertion point before the rule defined above:

```
before readdress server 192.168.10.4 udp any any
```

The following command sets the insertion point after the first rule defined above:

```
after readdress server 192.168.10.4 udp any any
```

The following deletes the rule defined above:

```
no readdress server 192.168.10.4 udp any any
```

redirect context (by IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log]** *source_address source_wildcard*

after redirect context *context_id* **[log]** *source_address source_wildcard*

before redirect context *context_id* **[log]** *source_address source_wildcard*

no redirect context *context_id* **[log]** *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and the source IP and wildcard of 192.168.22.0 and 0.0.0.31:

```
redirect context 23 198.162.22.0 0.0.0.31
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 198.162.22.0 0.0.0.31
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 198.162.22.0 0.0.0.31
```

The following deletes the first rule defined above:

```
no redirect context 23 198.162.22.0 0.0.0.31
```

redirect context (any)

Redirects subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] any**

after redirect context *context_id* **[log] any**

before redirect context *context_id* **[log] any**

no redirect context *context_id* **[log] any**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: Any rule which is added as a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and any source IP:

```
redirect context 23 any
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 any
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 any
```

The following deletes the first rule defined above:

```
no redirect context 23 any
```

redirect context (by host IP address)

Redirects subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] host** *source_ipv4_address*

after redirect context *context_id* **[log] host** *source_ipv4_address*

before redirect context *context_id* **[log] host** *source_ipv4_address*

no redirect context *context_id* **[log] host** *source_ipv4_address*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_ipv4_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and a host IP address of 192.168.200.11:

```
redirect context 23 host 192.168.200.11
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 host 192.168.200.11
```

The following command sets the insertion point after first the rule defined above:

```
after redirect context 23 host 192.168.200.11
```

The following deletes the first rule defined above:

```
no redirect context 23 host 192.168.200.11
```

redirect context (by source ICMP packets)

Redirects subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

before redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

no redirect context *context_id* **[log] icmp {** *source_address source_wildcard* **| any | host** *source_host_address* **} {** *dest_address dest_wildcard* **| any | host** *dest_host_address* **} [** *icmp_type* **[** *icmp_code* **]]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possibly be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and ICMP packets coming from the host with the IP address 198.162.100.25:

```
redirect context 23 icmp host 192.168.100.25
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 icmp host 192.168.100.25
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 icmp host 192.168.100.25
```

The following deletes the first rule defined above:

```
no redirect context 23 icmp host 192.168.100.25
```

redirect context (by IP packets)

Redirects subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] ip { *source_address source_wildcard* | **any** | **host** *source_host_address* } { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**fragment**] [**protocol** *num*]**

after redirect context *context_id* **[log] ip { *source_address source_wildcard* | **any** | **host** *source_host_address* } { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**fragment**] [**protocol** *num*]**

before redirect context *context_id* **[log] ip { *source_address source_wildcard* | **any** | **host** *source_host_address* } { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**fragment**] [**protocol** *num*]**

no redirect context *context_id* **[log] ip { *source_address source_wildcard* | **any** | **host** *source_host_address* } { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**fragment**] [**protocol** *num*]**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be an integer ranging from 0 to 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and IP packets coming from the host with the IP address 198.162.100.25, and fragmented packets for any destination are matched:

```
redirect context 23 ip host 198.162.100.25 any fragment
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 ip host 198.162.100.25 any fragment
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 ip host 198.162.100.25 any fragment
```

The following deletes the first rule defined above:

```
no redirect context 23 ip host 198.162.100.25 any fragment
```

redirect context (by TCP/UDP packets)

Redirects subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect context *context_id* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port*] }**

after redirect context *context_id* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port*] }**

before redirect context *context_id* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port*] }**

no redirect context *context_id* **[log] { tcp | udp } { { *source_address source_wildcard* | any | host *source_host_address* } [eq *source_port* | gt *source_port* | lt *source_port* | neq *source_port*] } { { *dest_address dest_wildcard* | any | host *dest_host_address* } [eq *dest_port* | gt *dest_port* | lt *dest_port* | neq *dest_port*] }**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be an integer from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be an integer from 0 through 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*. Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and UDP packets coming from any host are matched:

```
redirect context 23 udp any
```

The following sets the insertion point before the rule defined above:

```
before redirect context 23 udp any
```

The following command sets the insertion point after the first rule defined above:

```
after redirect context 23 udp any
```

The following deletes the rule defined above:

```
no redirect context 23 udp any
```

redirect css delivery-sequence

This is a restricted command. In 9.0 and later releases, this command is obsoleted.

redirect css service (any)

Redirects subscriber sessions based on any packet received (Content Service Steering). This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service service_name [ log ] any

after redirect css service service_name [ log ] any

before redirect css service service_name [ log ] any

no redirect css service service_name [ log ] any
```

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definitions which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging all** command to display the names of all configured charging services. *service_name* must be an alphanumeric string from 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definitions to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: Any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and any source IP:

```
redirect css service chgsvc1 any
```

The following sets the insertion point before the rule definition above:

```
before redirect service chgsvc1 any
```

The following command sets the insertion point after the first rule definitions above:

```
after redirect service chgsvc1 any
```

The following deletes the first rule definition above:

```
no redirect service chgsvc1 any
```

redirect css service (by host IP address)

Redirecst subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] host** *source_host_address*

after redirect css service *service_name* **[log] host** *source_host_address*

before redirect css service *service_name* **[log] host** *source_host_address*

no redirect css service *service_name* **[log] host** *source_host_address*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and a host IP address of *192.168.200.11*:

```
redirect css service chgsvc1 host 192.168.200.11
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 host 192.168.200.11
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 host 192.168.200.11
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 host 192.168.200.11
```

redirect css service (by ICMP packets)

Redirects subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service service_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ icmp_type [ icmp_code ]

before redirect css service service_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ icmp_type [ icmp_code ]

after redirect css service service_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ icmp_type [ icmp_code ]

no redirect css service service_name [ log ] icmp { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ icmp_type [ icmp_code ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`service_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`service_name` must be an alphanumeric string from 1 through 15 characters.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

`dest_address`

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *`dest_wildcard`* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets coming from the host with the IP address *198.162.100.25*:

```
redirect css service chgsvc1 icmp host 192.168.200.11
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 icmp host 192.168.200.11
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 icmp host 192.168.200.11
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 icmp host 192.168.200.11
```

redirect css service (by IP packets)

Redirects subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service service_name [ log ] ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

after redirect css service service_name [ log ] ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

before redirect css service service_name [ log ] ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]

no redirect css service service_name [ log ] ip { any | host source_host_address |
source_address source_wildcard } { any | host dest_host_address | dest_address
dest_wildcard } [ fragment ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition that exactly matches the options specified.

`css service` *`service_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`service_name` must be an alphanumeric string from 1 through 15 characters.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`source_address`

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *`source_wildcard`* parameter.

`source_wildcard`

This option is used in conjunction with the *`source_address`* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *`source_address`* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

`any`

Specifies that the rule definition applies to all packets.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

`dest_host_address`

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

`dest_address`

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *`dest_wildcard`* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and IP packets coming from the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched:

```
redirect css service chgsvc1 ip host 192.168.100.25 any fragment
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 ip host 192.168.100.25 any fragment
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 ip host 192.168.100.25 any fragment
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 ip host 192.168.100.25 any fragment
```

redirect css service (by source IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source to the mobile node or the network (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log]** *source_address source_wildcard*

after redirect css service *service_name* **[log]** *source_address source_wildcard*

before redirect css service *service_name* **[log]** *source_address source_wildcard*

no redirect css service *service_name* **[log]** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*:

```
redirect css service chgsvc1 10.2.3.0 0.0.0.31
```

redirect css service (by TCP/UDP packets)

Redirects subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect css service service_name [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt source_port | lt
source_port | neq source_port | range start_source_port end_source_port ] } { {
dest_address dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port
| lt dest_port | neq dest_port | range start_dest_port end_dest_port ] }

after redirect css service service_name [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt source_port | lt
source_port | neq source_port | range start_source_port end_source_port ] } { {
dest_address dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port
| lt dest_port | neq dest_port | range start_dest_port end_dest_port ] }

before redirect css service service_name [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt source_port | lt
source_port | neq source_port | range start_source_port end_source_port ] } { {
dest_address dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port
| lt dest_port | neq dest_port | range start_dest_port end_dest_port ] }

no redirect css service service_name [ log ] { tcp | udp } { { source_address
source_wildcard | any | host source_host_address } [ eq source_port | gt source_port | lt
source_port | neq source_port | range start_source_port end_source_port ] } { {
dest_address dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port
| lt dest_port | neq dest_port | range start_dest_port end_dest_port ] }
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to an integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched:

```
redirect css service chgsvc1 udp any
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 udp any
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 udp any
```

The following command deletes the rule definition above:

```
no redirect css service chgsvc1 udp any
```

redirect css service (for downlink, any)

Redirects subscriber sessions based on any packet received in the downlink (from the Mobile Node) direction (Content Service Steering). This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] downlink any**

after redirect css service *service_name* **[log] downlink any**

before redirect css service *service_name* **[log] downlink any**

no redirect css service *service_name* **[log] downlink any**

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: Any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and any source IP:

```
redirect css service chgsvc1 downlink any
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 downlink any
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 downlink any
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 downlink any
```

redirect css service (for downlink, by host IP address)

Redirects subscriber sessions based on the targeted host IP address in the downlink (from the Mobile Node) direction (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] downlink host** *source_host_address*

before redirect css service *service_name* **[log] downlink host** *source_host_address*

after redirect css service *service_name* **[log] downlink host** *source_host_address*

no redirect css service *service_name* **[log] downlink host** *source_host_address*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1and* a host IP address of *192.168.200.11*:

```
redirect css service chgsvc1 downlink host 192.168.200.11
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 downlink host 192.168.200.11
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 downlink host 192.168.200.11
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 downlink host 192.168.200.11
```

redirect css service (for downlink, by ICMP packets)

Redirects subscriber sessions based on the internet control message protocol packets in the downlink (from the Mobile Node) direction (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]**

after redirect css service *service_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]**

before redirect css service *service_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]**

no redirect css service *service_name* **[log] downlink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets coming in the downlink (from the Mobile Node) direction from the host with the IP address 192.168.100.25:

```
redirect css service chgsvc1 downlink icmp host 192.168.100.25
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 downlink icmp host 192.168.100.25
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 downlink icmp host 192.168.100.25
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 downlink icmp host 192.168.100.25
```

redirect css service (for downlink, by IP packets)

Redirects subscriber sessions based on the internet protocol packets in the downlink (from the Mobile Node) direction (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after redirect css service *service_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

before redirect css service *service_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

no redirect css service *service_name* **[log] downlink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and downlink IP packets coming from the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched:

```
redirect css service chgsvc1 downlink ip host 198.162.100.25 any fragment
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 downlink ip host 198.162.100.25 any
fragment
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 downlink ip host 198.162.100.25 any
fragment
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 downlink ip host 198.162.100.25 any
fragment
```

redirect css service (for downlink, by source IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source in the downlink (from the Mobile Node) direction (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] downlink** *source_address source_wildcard*

after redirect css service *service_name* **[log] downlink** *source_address source_wildcard*

before redirect css service *service_name* **[log] downlink** *source_address source_wildcard*

no redirect css service *service_name* **[log] downlink** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important: A maximum of 16 rule definitions can be configured per ACL.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*:

```
redirect css service chgsvc1 downlink 10.2.3.0 0.0.0.31
```

redirect css service (for downlink, by TCP/UDP packets)

Redirects subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the downlink (from the Mobile Node) direction (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after redirect css service *service_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

before redirect css service *service_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

no redirect css service *service_name* **[log] downlink { tcp | udp } { { *source_address source_wildcard* | **any** | **host** *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to an integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched:

```
redirect css service chgsvc1 downlink udp any
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 downlink udp any
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 downlink udp any
```

The following deletes the rule definition above:

```
no redirect css service chgsvc1 downlink udp any
```

redirect css service (for uplink, any)

Redirects subscriber sessions based on any packet received in the uplink (to the Mobile Node) direction (Content Service Steering). This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] uplink any**

after redirect css service *service_name* **[log] uplink any**

before redirect css service *service_name* **[log] uplink any**

no redirect css service *service_name* **[log] uplink any**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

Important: It is suggested that any rule definition which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.

Important: A maximum of 16 rule definitions can be configured per ACL.

Important: Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and any source IP:

```
redirect css service chgsvc1 uplink any
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 uplink any
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 uplink any
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink any
```

redirect css service (for uplink, by host IP address)

Redirects subscriber sessions based on the targeted host IP address in the uplink (to the Mobile Node) direction (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] uplink host** *source_host_address*

after redirect css service *service_name* **[log] uplink host** *source_host_address*

before redirect css service *service_name* **[log] uplink host** *source_host_address*

no redirect css service *service_name* **[log] uplink host** *source_host_address*

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

`css service` *`service_name`*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **`show active-charging service all`** command to display the names of all configured charging services.
`service_name` must be an alphanumeric string from 1 through 15 characters.

`uplink`

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

`log`

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

`host`

Specifies that the rule definition applies to a specific host as determined by its IP address.

`source_host_address`

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

Usage

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service with the name *`chgsvc1`* and a host IP address of *`192.168.200.11`*:

```
redirect css service chgsvc1 uplink host 192.168.200.11
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 uplink host 192.168.200.11
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 uplink host 192.168.200.11
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink host 192.168.200.11
```

redirect css service (for uplink, by ICMP packets)

Redirects subscriber sessions based on the internet control message protocol packets in the uplink (to the Mobile Node) direction (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] uplink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]**

after redirect css service *service_name* **[log] uplink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]**

before redirect css service *service_name* **[log] uplink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]**

no redirect css service *service_name* **[log] uplink icmp { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [** *icmp_type* **[** *icmp_code* **]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.

Usage

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.
The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: A maximum of 16 rule definitions can be configured per ACL. Also note that “redirect” rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets in the uplink (to the Mobile Node) direction from the host with the IP address *198.162.100.25*:

```
redirect css service chgsvc1 uplink icmp host 192.168.100.25
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 uplink icmp host 192.168.100.25
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 uplink icmp host 192.168.100.25
```

The following deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink icmp host 192.168.100.25
```

redirect css service (for uplink, by IP packets)

Redirects subscriber sessions based on the internet protocol packets in the uplink (to the Mobile Node) direction (Content Service Steering).

Product

Syntax

redirect css service *service_name* **[log] uplink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after redirect css service *service_name* **[log] uplink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

before redirect css service *service_name* **[log] uplink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

no redirect css service *service_name* **[log] uplink ip { any | host** *source_host_address* **|** *source_address source_wildcard* **} { any | host** *dest_host_address* **|** *dest_address dest_wildcard* **} [fragment]**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important: If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage

Block IP packets when the source and destination are of interest.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and uplink IP packets going to the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched:

```
redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

The following command deletes the first rule definition above:

```
no redirect css service chgsvc1 uplink ip host 198.162.100.25 any
fragment
```

redirect css service (for uplink, by source IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source in the uplink (to the Mobile Node) direction (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] uplink** *source_address source_wildcard*

after redirect css service *service_name* **[log] uplink** *source_address source_wildcard*

before redirect css service *service_name* **[log] uplink** *source_address source_wildcard*

no redirect css service *service_name* **[log] uplink** *source_address source_wildcard*

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Usage

Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*:

```
redirect css service chgsvc1 uplink 10.2.3.0 0.0.0.31
```

redirect css service (for uplink, by TCP/UDP packets)

Redirects subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the uplink (to the Mobile Node) direction (Content Service Steering).

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect css service *service_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after redirect css service *service_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

before redirect css service *service_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

no redirect css service *service_name* **[log] uplink { tcp | udp } { { *source_address source_wildcard* | **any** | *source_host_address* } [**eq** *source_port* | **gt** *source_port* | **lt** *source_port* | **neq** *source_port* | **range** *start_source_port end_source_port*] } { { *dest_address dest_wildcard* | **any** | **host** *dest_host_address* } [**eq** *dest_port* | **gt** *dest_port* | **lt** *dest_port* | **neq** *dest_port* | **range** *start_dest_port end_dest_port*] }**

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service *service_name*

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.
service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be configured to an integer value from 0 to 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be configured to an integer value from 0 to 65535.

range *start_source_port end_source_port*

Specifies that all source TCP ports within a specific range are to be filtered.
start_source_port is the initial port in the range and *end_source_port* is the final port in the range.
Both *start_source_port* and *end_source_port* can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.

dest_port must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be configured to an integer value from 0 to 65535.

range *start_dest_port end_dest_port*

Specifies that all destination TCP ports within a specific range are to be filtered.
start_dest_port is the initial port in the range and *end_dest_port* is the final port in the range.
Both *start_dest_port* and *end_dest_port* can be configured to an integer value from 0 to 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched:

```
redirect css service chgsvc1 uplink udp any
```

The following sets the insertion point before the rule definition above:

```
before redirect css service chgsvc1 uplink udp any
```

The following command sets the insertion point after the first rule definition above:

```
after redirect css service chgsvc1 uplink udp any
```

The following deletes the rule definition above:

```
no redirect css service chgsvc1 uplink udp any
```

redirect nexthop (by IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log]** *source_address source_wildcard*

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

Usage

Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and the source IP and wildcard of 192.168.22.0 and 0.0.0.31:

```
redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31
```

redirect nexthop (any)

Redirects subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

after redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

before redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

no redirect nexthop *nexthop_addr* **{ context** *context_id* **| interface** *interface_name* **} [log] any**

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

Important: Any rule which is added to be a catch all should also have the **log** option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and any source IP:

```
redirect nexthop 192.168.10.4 context 23 any
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 any
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 any
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 any
```

redirect nexthop (by host IP address)

Redirects subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ]
host source_ipv4_address

after redirect nexthop nexthop_addr { context context_id | interface interface_name } [
log ] host source_ipv4_address

before redirect nexthop nexthop_addr { context context_id | interface interface_name } [
log ] host source_ipv4_address

no redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log
] host source_ipv4_address
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 to 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_ipv4_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

Usage

Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and a host IP address of 192.168.200.11:

```
redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 host 192.168.200.11
```

redirect nexthop (by source ICMP packets)

Redirects subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ]
icmp { source_address source_wildcard | any | host source_host_address } { dest_address
dest_wildcard | any | host dest_host_address } [ icmp_type [ icmp_code ] ]

after redirect nexthop nexthop_addr { context context_id | interface interface_name } [
log ] icmp { source_address source_wildcard | any | host source_host_address } {
dest_address dest_wildcard | any | host dest_host_address } [ icmp_type [ icmp_code ] ]

before redirect nexthop nexthop_addr { context context_id | interface interface_name } [
log ] icmp { source_address source_wildcard | any | host source_host_address } {
dest_address dest_wildcard | any | host dest_host_address } [ icmp_type [ icmp_code ] ]

no redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log
] icmp { source_address source_wildcard | any | host source_host_address } { dest_address
dest_wildcard | any | host dest_host_address } [ icmp_type [ icmp_code ] ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 through 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.

Usage

Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk. The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that “redirect” rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and ICMP packets coming from the host with the IP address 198.162.100.25:

```
redirect nexthop 192.168.10.4 context 23 icmp host 192.168.100.25
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 icmp host 192.168.100.25
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 icmp host 192.168.100.25
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 icmp host 192.168.100.25
```

redirect nexthop (by IP packets)

Redirects subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ]
ip { source_address source_wildcard | any | host source_host_address } { dest_address
dest_wildcard | any | host dest_host_address } [ fragment ] [ protocol num ]

after redirect nexthop nexthop_addr { context context_id | interface interface_name } [
log ] ip { source_address source_wildcard | any | host source_host_address } {
dest_address dest_wildcard | any | host dest_host_address } [ fragment ] [ protocol num ]

before redirect nexthop nexthop_addr { context context_id | interface interface_name } [
log ] ip { source_address source_wildcard | any | host source_host_address } {
dest_address dest_wildcard | any | host dest_host_address } [ fragment ] [ protocol num ]

no redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log
] ip { source_address source_wildcard | any | host source_host_address } { dest_address
dest_wildcard | any | host dest_host_address } [ fragment ] [ protocol num ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 through 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol *num*

Indicates that the packet filtering is to be applied to a specific protocol number.
num can be an integer ranging from 0 to 255.

Usage

Block IP packets when the source and destination are of interest.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and IP packets coming from the host with the IP address 198.162.100.25, and fragmented packets for any destination are matched:

```
redirect nexthop 192.168.10.4 context 23 ip host 192.168.100.25 any
fragment
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 ip host 192.168.100.25
any fragment
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 ip host 192.168.100.25 any
fragment
```

The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 ip host 192.168.100.25 any
fragment
```

redirect nexthop (by TCP/UDP packets)

Redirects subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log ] {
tcp | udp } { { source_address source_wildcard | any | host source_host_address } [ eq
source_port | gt source_port | lt source_port | neq source_port ] } { { dest_address
dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port | lt
dest_port | neq dest_port ] }

after redirect nexthop nexthop_addr { context context_id | interface interface_name } [
log ] { tcp | udp } { { source_address source_wildcard | any | host source_host_address }
[ eq source_port | gt source_port | lt source_port | neq source_port ] } { { dest_address
dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port | lt
dest_port | neq dest_port ] }

before redirect nexthop nexthop_addr { context context_id | interface interface_name } [
log ] { tcp | udp } { { source_address source_wildcard | any | host source_host_address }
[ eq source_port | gt source_port | lt source_port | neq source_port ] } { { dest_address
dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port | lt
dest_port | neq dest_port ] }

no redirect nexthop nexthop_addr { context context_id | interface interface_name } [ log
] { tcp | udp } { { source_address source_wildcard | any | host source_host_address } [
eq source_port | gt source_port | lt source_port | neq source_port ] } { { dest_address
dest_wildcard | any | host dest_host_address } [ eq dest_port | gt dest_port | lt
dest_port | neq dest_port ] }
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
This moves the insertion point to immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important: If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context *context_id*

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface *interface_name*

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 through 79 characters.

log

Default: packets are not logged.
Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- **tcp**: Redirect applies to TPC packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.
This option is used to filter all packets from a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq *source_port*

Specifies a single, specific source TCP port number to be filtered.
source_port must be an integer from 0 through 65535.

gt *source_port*

Specifies that all source TCP port numbers greater than the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

lt *source_port*

Specifies that all source TCP port numbers less than the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

neq *source_port*

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.
source_port must be an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.
This option is used to filter all packets to a specific IP address or a group of IP addresses.
When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.
The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important: The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq *dest_port*

Specifies a single, specific destination TCP port number to be filtered.
dest_port must be an integer from 0 through 65535.

gt *dest_port*

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
dest_port must be an integer from 0 through 65535.

lt *dest_port*

Specifies that all destination TCP port numbers less than the one specified are to be filtered.
dest_port must be an integer from 0 through 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
dest_port must be an integer from 0 through 65535.

Usage

Block IP packets when the source and destination are of interest but for only a limited set of ports.

Important: The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important: Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and UDP packets coming from any host are matched:

```
redirect nexthop 192.168.10.4 context 23 udp any
```

The following sets the insertion point before the rule defined above:

```
before redirect nexthop 192.168.10.4 context 23 udp any
```

The following command sets the insertion point after the first rule defined above:

```
after redirect nexthop 192.168.10.4 context 23 udp any
```

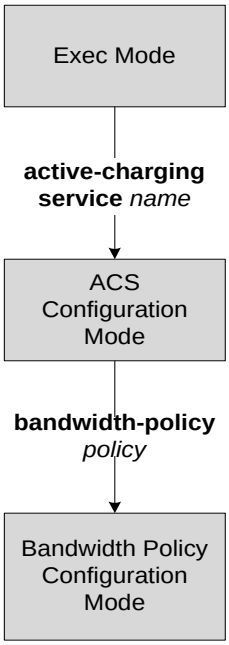
The following deletes the first rule defined above:

```
no redirect nexthop 192.168.10.4 context 23 udp any
```

- redirect nexthop (by TCP/UDP packets)

Chapter 6
ACS Bandwidth Policy Configuration Mode Commands

The ACS Bandwidth Policy Configuration Mode is used to create and manage Active Charging Service (ACS) Bandwidth Policies.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

flow limit-for-bandwidth

This command allows you to configure the flow limit-for-bandwidth parameter for the current bandwidth policy.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

flow limit-for-bandwidth id *bandwidth_id* **group-id** *group_id*

no flow limit-for-bandwidth id *bandwidth_id*

no

If previously configured, removes the specified flow limit-for-bandwidth configuration in the current bandwidth policy.

id *bandwidth_id*

Specifies ID for the current bandwidth policy.
bandwidth_id must be an integer from 1 through 65535.

group-id *group_id*

Specifies group ID for the current bandwidth policy.
group_id must be an integer from 1 through 65535.

Usage

Use this command to configure the flow limit-for-bandwidth configuration for a bandwidth policy.

Example

The following command configures the Flow Limit-for-Bandwidth configuration with bandwidth policy ID *test123* and group ID *123*:

```
flow limit-for-bandwidth id test123 group-id 123
```

group-id

This command allows you to configure the group ID for the current bandwidth policy.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

group-id *group_id* **direction { downlink | uplink } peak-data-rate** *peak_data_rate* **peak-burst-size** *peak_burst_size* **violate-action { discard | lower-ip-precedence } [committed-data-rate** *committed_data_rate* **committed-burst-size** *committed_burst_size* **[exceed-action { discard | lower-ip-precedence }]]**

{ default | no } group-id *group_id* **direction { downlink | uplink }**

default

Configures this command with default settings for the specified group ID.

no

If previously configured, removes the specified group ID configuration from the current bandwidth policy.

group_id

Specifies the group ID.
group_id must be an integer from 1 through 65535.

direction { downlink | uplink }

Specifies the direction for which bandwidth will be controlled.

peak-data-rate *peak_data_rate*

Specifies the peak data rate, in bits per second.
peak_data_rate must be an integer from 1 through 4294967295.
Default: 0

peak-burst-size *peak_burst_size*

Specifies the peak burst size, in bytes.
peak_burst_size must be an integer from 1 through 4294967295.
Default: 0

violate-action { discard | lower-ip-precedence }

Specifies the action to be taken if Peak Data Rate is surpassed.

- **discard**: Specifies to discard the packet
- **lower-ip-precedence**: Specifies to lower IP precedence of the packet

committed-data-rate *committed_data_rate*

Specifies the committed Data Rate, in bits per second. This can also be used to specify the Guaranteed Bit Rate (GBR) for Network Controlled QoS (NCQoS) without exceed-action.
committed_data_rate must be an integer from 1 through 4294967295.
Default: 0

committed-burst-size *committed_burst_size*

Specifies the committed burst size, in bytes.
committed_burst_size must be an integer from 1 through 4294967295.
Default: 0

exceed-action { discard | lower-ip-precedence }

Specifies the action to be taken if Committed Data Rate is surpassed.

- **discard**: Specifies to discard the packet.
- **lower-ip-precedence**: Specifies to lower IP precedence of the packet.

Usage

Use this command to configure the Group ID for an bandwidth policy.

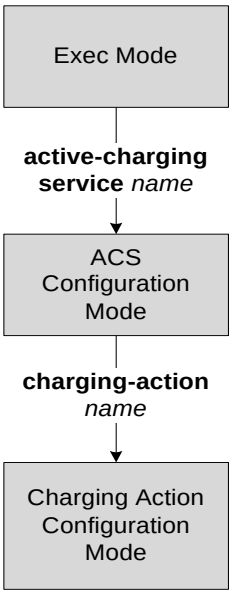
Example

The following command configures the group ID *111* to control bandwidth in the downlink direction specifying peak data rate of *10000* bits per second and peak burst size of *10000* bytes while specifying the action to be taken on violation as discard:

```
group-id 111 direction downlink peak-data-rate 10000 peak-burst-size
10000 violate-action discard
```

Chapter 7
ACS Charging Action Configuration Mode Commands

The ACS Charging Action Configuration Mode is used to configure Active Charging Service (ACS) charging actions.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

allocation-retention-priority

This command allows you to configure the Allocation Retention Priority (ARP).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
allocation-retention-priority priority [ pci pci_value | pvi pvi_value ]

no allocation-retention-priority
```

no

If previously configured, disables ARP configuration in the current charging action.

priority

priority must be an integer from 1 through 15.

pci *pci_value*

Specifies the Pre-emption Capability Indicator (PCI).
pci_value must be integer 0 or 1.

Important: If not explicitly enabled, then the default value of 1 will hold true.

pvi *pvi_value*

Specifies the Pre-emption Vulnerability Indicator (PVI).
pvi_value must be integer 0 or 1.

Important: If not explicitly enabled, then the default value of 0 will hold true.

Usage

This command configures the ARP, which indicates the priority of allocation and retention of the service data flow. The ARP resolves conflicts in demand for network resources. At the time of resource crunch, this parameter prioritizes allocation of resources during bearer establishment and modification. In a congestion situation, a lower ARP flow may be dropped to free up capacity. Once a service flow is successfully established, this parameter plays no role in quality of service (QoS) experienced by the flow.

Example

The following command sets the ARP to *10*:

```
allocation-retention-priority 10
```

billing-action

This command allows you to configure the billing action for packets that match specific rule definitions (ruledefs).

Product

All

Privilege

Security Administrator, Administrator

Syntax

In 12.1 and earlier releases:

```
billing-action { edr edr_format_name [ wait-until-flow-ends ] | egcdr | exclude-from-udrs
| radius | rf } +

no billing-action [ edr | egcdr | exclude-from-udrs | radius | rf ] +
```

In 12.2 and later releases:

```
billing-action { create-edrs { charging-edr charging_edr_format_name | reporting-edr
reporting_edr_format_name } + [ wait-until-flow-ends ] | egcdr | exclude-from-udrs |
radius | rf } +

no billing-action [ create-edrs | egcdr | exclude-from-udrs | radius | rf ] +
```

no

If previously configured, disables the specified configuration in the current charging action.

edr *edr_format_name* **[wait-until-flow-ends]**

Important: This option is available only in 12.1 and earlier releases. In 12.2 and later releases, it is deprecated and is replaced by the **create-edrs charging-edr** option.

Enables EDR billing for packets matching this charging action.
edr_format_name must be the name of an existing EDR format, and must be an alphanumeric string of 1 through 63 characters.

Important: If the EDR format name specified here is not configured in the EDR Format Configuration Mode, or has been deleted, the system accepts it without applying any EDR format for the billing action in this ACS service.

If this option is configured, the system generates an EDR immediately when a packet is received and it matches a ruledef that is associated with this charging action. Other events configured for flow end-condition, flow action, termination, and/or session control also create the triggers for EDR generation.
wait-until-flow-ends: By default, the EDR is generated immediately after a ruledef hit results in this charging action. When this keyword is specified, no EDR is generated on a ruledef hit. When the flow ends, an attempt is made to generate an EDR with the format specified.

create-edrs { charging-edr *charging_edr_format_name* **| reporting-edr** *reporting_edr_format_name* **} + [wait-until-flow-ends]**

Important: This option is available only in 12.2 and later releases.

Enables EDR billing for packets matching this charging action.

- **charging-edr** *charging_edr_format_name*: Specifies to generate charging EDR.

  charging_edr_format_name must be the name of a charging EDR format, and must be an alphanumeric string of 1 through 63 characters.

- **reporting-edr** *reporting_edr_format_name*: Specifies to generate reporting EDR.

  reporting_edr_format_name must be the name of a reporting EDR format, and must be an alphanumeric string of 1 through 63 characters.

If the above options are configured, the system generates an EDR immediately when a packet is received and it matches a ruledef that is associated with this charging action. Other events configured for flow end-condition, flow action, termination, and/or session control also creates the triggers for EDR generation.

- **wait-until-flow-ends**: By default, the EDR is generated immediately after a ruledef hit results in this charging action. When this keyword is specified, no EDR is generated on a ruledef hit. When the flow ends, an attempt is made to generate an EDR with the format specified.

egcdr

Enables eG-CDR billing for packets matching this charging action.
If this option is configured, the system generates an eG-CDR when the subscriber session ends or an interim trigger condition occurs. The interim triggers are configurable in the ACS Rulebase Configuration Mode. In addition, whenever there is an SGSN-to-SGSN handoff the system treats that as a trigger.
To generate an eG-CDR the **accounting-mode** command in the APN Configuration Mode must be configured with the "none" option.
The format of enhanced G-CDRs is controlled by the **inspector** CLI command in the Context Configuration Mode.

exclude-from-udrs

By default, statistics are accumulated on a per content ID basis for possible inclusion in UDRs. The **exclude-from-udrs** keyword causes the system to not include the packet's statistics in UDRs.
When this option is disabled, (the default setting) UDRs will be generated based on the UDR format specified in the rulebase.
Default: Disabled.

radius

Enables billing action as RADIUS Charging Data Records (CDRs) for packets matching this charging action, and the data packet statistics will be included in the postpaid RADIUS accounting.
Default: Disabled.

rf

Enables Rf accounting.
Rf accounting is applicable only for dynamic and predefined rules that are marked for it. Dynamic rules have a field offline-enabled to indicate this. To mark a predefined rule as offline-enabled, use this keyword and the **billing-records** CLI in the ACS Rulebase Configuration Mode.

Usage

Use this command to enable an EDR, eG-CDR and/or RADIUS CDR type of billing for content matching this charging action.

Example

in 12.1 and earlier releases, the following command enables the EDR billing type with EDR format *charge1_format*:

```
billing-action edr charge1_format
```

In 12.2 and later releases, the following command is applied to both charging and reporting EDRs since the trigger for both the EDRs is the same:

```
billing-action create-edrs charging-edr charging_edrformat1 reporting-edr
reporting_edrformat1 wait-until-flow-ends
```

cca charging credit

This command allows you to enable/disable Credit Control Application (CCA) and configure the RADIUS/Diameter prepaid charging behavior.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cca charging credit [rating-group *coupon_id* **] [preemptively-request]**

{ default | no } cca charging

no

If previously configured, disables RADIUS/Diameter Prepaid Credit Control Charging in the current charging action.

default

Disables RADIUS/Diameter Prepaid Credit Control Charging.

credit

Specifies RADIUS/Diameter Prepaid Credit Control Charging Credit behavior.

preemptively-request

Specifies RADIUS/Diameter prepaid credit preemptively requested charging credit behavior. If this option is used, a quota is requested for the specific type of content during session initialization.

rating-group *coupon_id*

Specifies the coupon ID used in prepaid charging as rating-group which maps to the coupon ID for prepaid customer.
coupon_id must be an integer from 0 through 65535.
This option also assigns different content-types for the same charging action depending upon whether or not prepaid is enabled.

Important: This rating-group overrides the content ID, if present in the same charging-action for the prepaid customer in Diameter Credit Control Application (DCCA). But only the content IDs will be used in eG-CDRs irrespective of the presence of rating-group in that charging action.

Usage

Use this command to configure RADIUS/Diameter Prepaid Credit Control Charging behavior.
This command selects reservation based credit control. A CCR-Initial is used to reserve quota upon the first traffic, then a series of CCR-updates are issued as the traffic proceeds and quota dwindles. A CCR-Terminate is issued at the end of the session or at the end of the quota-hold-time.

Example

The following is an example of this command:

```
cca charging credit
```

charge-units

This command allows you to configure the charge units for RADIUS/DCCA charging calculation.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

charge-units *units*

{ default | no } charge-units

default

Configures this command with its default setting.
Default: 0; disables the counter, same as **no charge-units**

no

If previously configured, disables the charge-units configuration in the current charging action.

units

Specifies the service-specific fixed unit counter per content ID for RADIUS/DCCA charging.
units is the value set for charging unit, and must be an integer from 1 through 65535.

Usage

This command configures the unit amount counters for charging calculation on per content ID basis for different protocols and packets regardless of packet direction (uplink or downlink).

Important: For more information on content ID, refer to the **if-protocol** command in the *ACS Ruledef Configuration Mode Commands* chapter.

Example

The following command sets the charging unit to *1024*:

```
charge-units 1024
```

charge-volume

This command allows you to configure how the volume amount counter for eG-CDRs, UDRs, and DCCA charging are calculated.

Product

All

Privilege

Security Administrator, Administrator

Syntax

charge-volume { { dns | ftp-control | ftp-data | http | icmp | imap | ip | mms | pop3 | pptp | rtcp | rtp | rtsp | sdp | secure-http | sip | smtp | tcp | tftp | udp | wsp | wtp } { bytes | packet-length | packets } [downlink | uplink] | constant *fixed_value* **}**

{ default | no } charge-volume

---

default

Configures this command with its default setting.
Default: **charge-volume ip bytes**

---

no

If previously configured, deletes the charge-volume configuration in the current charging action.

{ dns | ftp-control | ftp-data | http | icmp | imap | ip | mms | pop3 | pptp | rtcp | rtp | rtsp | sdp | secure-http | sip | smtp | tcp | tftp | udp | wsp | wtp }

Specifies the charge volume method for the specific rule definition.

- **dns**: Charge volume for DNS
- **ftp-control**: Charge volume for FTP-Control
- **ftp-data**: Charge volume for FTP-Data
- **http**: Charge volume for HTTP
- **icmp**: Charge volume for ICMP
- **imap**: Charge volume for Internet Message Access Protocol (IMAP)
- **ip**: Charge volume for IP
- **mms**: Charge volume for MMS
- **pop3**: Charge volume for POP3
- **pptp**: Charge volume for PPTP
- **rtcp**: Charge volume for RTCP
- **rtp**: Charge volume for RTP
- **rtsp**: Charge volume for RTSP
- **sdp**: Charge volume for SDP
- **secure-http**: Charge volume for secure-https

- **sip**: Charge volume for SIP
- **smtp**: Charge volume for SMTP
- **tcp**: Charge volume for TCP
- **tftp**: Charge volume for TFTP
- **udp**: Charge volume for UDP
- **wsp**: Charge volume for WSP
- **wtp**: Charge volume for WTP

bytes

Sets charge volume for bytes.

packet-length

Sets charge volume for packet length.

packets

Sets charge volume for packets.

constant *fixed_value*

This sets the fixed increment value for charging.
fixed_value is the value set for charging, and must be an integer from 0 through 65535.
If **constant** *3* is configured for every invocation of this Charging Action, the system adds 3 to the downlink/uplink volume counter, depending on the direction of packet.

Usage

This command provides the method for charging volume calculation for different protocols and packets.
For information on supported protocols see the *ACS Ruledef Configuration Mode Commands* chapter.
If **charge-volume rtp packets** is configured, system computes volume amounts for different options for RTP as follows:

Volume	Description
Volume amount	Total (downlink and uplink) RTP packets
Volume amount uplink	Uplink RTP packets
Volume amount downlink	Downlink RTP packets
Volume amount uplink packets	Uplink RTP packets
Volume amount downlink packets	Downlink RTP packets
Volume amount uplink bytes	Uplink RTP bytes
Volume amount downlink bytes	Downlink RTP bytes

Important: Whenever service counts volume, it counts all packets that the relevant analyzers accepted.

Important: If a TCP packet is routed to the HTTP analyzer but there is no HTTP payload, then the TCP statistics will be updated but the HTTP statistics will not be updated (except for the "packets ignored by the HTTP analyzer" statistic).

Example

Following command sets the charging volume of downlink packets for RTP:

```
charge-volume rtp packets downlink
```

content-filtering processing server-group

This command allows you to enable/disable Category-based Content Filtering.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering processing server-group

{ default | no } content-filtering processing
```

default

Configures this command with its default setting.
Default: Content filtering configured for the rulebase is attempted

no

Specifies to bypass content filtering.
This configuration should only be specified for charging actions that are performed when known safe sites are being accessed.

Usage

Use this command to enable or disable Category-based Content Filtering in the charging action.
This command works as second-level filter to process the HTTP/WAP GET request with Internet Content Adaptation Protocol (ICAP) after ruledef matching. The first-level filtering is in the rulebase configuration.
This CLI command is only effective when the **content-filtering mode server-group** command is configured in the rulebase.

Example

The following command enables content filtering in the current charging action:

```
content-filtering processing server-group
```

content-id

This command allows you to specify the content ID to use in the generated billing records, as well as the AVP used by the Credit Control Application, such as the "Rating-Group" AVP for use by the Diameter Credit Control Application (DCCA).

Product

All

Privilege

Security Administrator, Administrator

Syntax

content-id *content_id*

no content-id

no

Removes the content ID configuration from the charging action.

content_id

Specifies the content ID for credit control service.
In 12.1 and earlier releases *content_id* must be an integer from 1 through 65535.
In 12.2 and later releases, *content_id* must be an integer from 1 through 2147483647.

Usage

This command specifies an optional content ID to use in the generated billing records. This identifier assists the carrier's billing post processing and also used by credit-control system to use independent quotas for different value of **content-id**.
If the specified ruledef uses the **if-protocol** command to select a value for content ID, then the *content_id* specified through this command is not used for billing record generation.

Important: For more information on **content-id**, refer to the **if-protocol** command in the *ACS Ruledef Configuration Mode Commands* chapter.

Example

The following command sets the content ID in the current charging action to *23*:

```
content-id 23
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

fair-usage

This command allows you to enable/disable the fair usage credit system for the Mobile Video Gateway's dynamic inline transrating feature CAC (Call Admission Control) policy. The fair usage credit system enforces a maximum number of video clips that can be dynamically transrated at the same time by allocating an equal number of transrating credits to all the ACS managers in the system.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] fair-usage [ cpu-only | cpu-param { threshold-percent } | deact-margin |
memory-only | threshold-percent ]
```

default

Resets the fair usage settings to their default values.

no

Disables the fair usage credit system for dynamic inline transrating if previously configured.

fair-usage

Enables the fair usage credit system for the CAC policy and applies it to the system CPUs and memory.

cpu-only

Enables the fair usage credit system for the CAC policy and applies it to the system CPUs only.

cpu-param { threshold-percent }

Specifies the percent of system CPU resources that the dynamic inline transrating feature is allowed to use, which can be between 1 and 100 percent. CPU usage above this threshold percent starts the monitor action, which disallows additional video requests to be transrated. By default, this value is set to 10 percent when fair usage is enabled.

deact-margin

Specifies the deactivate margin in percent, below which the monitor action is disabled.

memory-only

Enables the fair usage credit system for the CAC policy and applies it to system memory only.

threshold-percent

Specifies the percent of system resources that the dynamic inline transrating feature is allowed to use, which can be between 1 and 100 percent. This threshold percent is used to start the monitor action, which disallows additional video requests to be transrated. By default, this value is set to 10 percent when fair usage is enabled.

Usage

Use this command to enable the fair usage credit system for the dynamic inline transrating feature CAC policy on the Mobile Video Gateway.

Example

The following command enables the fair usage credit system for the dynamic inline transrating feature CAC policy and applies it to the system CPUs only:

```
fair-usage cpu-only
```

flow action

This command allows you to specify the action to take on packets that matched rule definitions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

In 12.1 and earlier releases:

flow action { conditional user-agent end-token *end_token_name* **| discard [downlink | uplink] | random-drop interval** *interval_start* **to** *interval_end* **pkts-to-drop** *packet_min* **to** *packet_max* **| redirect-url** *redirect_url* **[clear-quota-retry-timer] | readdress [server** *ipv4_address* **] [port** *port_number* **] | terminate-flow | terminate-session }**

no flow action

In 12.2 and later releases:

flow action { conditional user-agent end-token *end_token_name* **| discard [downlink | uplink] | random-drop interval** *interval_start* **to** *interval_end* **pkts-to-drop** *packet_min* **to** *packet_max* **| readdress [server** *ipv4_address* **] [port** *port_number* **] | redirect-url** *redirect_url* **[[encryption { blowfish128 | blowfish64 } [encrypted] key** *key* **] clear-quota-retry-timer] | terminate-flow | terminate-session }**

no flow action

---

no

If previously configured, deletes the flow action configuration in the current charging action.

---

conditional user-agent end-token *end_token_name*

Specifies to conditionally redirect the HTTP packets matched to a configured user-agent to a specified URL. The user agent is configured using the **redirect user-agent** command in the ACS Configuration Mode. *end_token_name* must be an alphanumeric string of 1 through 32 characters, and is configured with this command to end the redirection condition.

---

discard [downlink | uplink]

Specifies to discard the specified packets.

- **downlink**: Downlink packets
- **uplink**: Uplink packets

If **downlink** or **uplink** keyword is not specified, both downlink and uplink packets will be discarded.

---

random-drop interval *interval_start* **to** *interval_end* **pkts-to-drop** *packet_min* **to** *packet_max*

Specifies to drop a group of consecutive packets (**pkts-to-drop**) to be dropped in the specified time interval (**random-drop interval**). This will cause degradation in user experience. P2P VoIP would need

more than one packet to be dropped, since that type of protocol is geared to handle occasional single packet drops.

- **random-drop interval** *interval_start* **to** *interval_end*: Specifies the random drop interval, in seconds, at which the voice packets will be dropped.

  interval_start and *interval_end* must be integers from 1 through 999.

- **pkts-to-drop** *packet_min* **to** *packet_max*: Specifies the number of voice packets to be dropped at a time in a flow when the packets have to be dropped.

  packet_min and *packet_max* must be integers from 1 through 100.

---

readdress { server *ipv4_address* **[port** *port_number* **] | port** *port_number***}**

Specifies to readdress (change the destination address) uplink packets, and optionally the destination TCP/UDP port number. Or, you can keep the original destination address and just change the destination TCP/UDP port number.

- *ipv4_address* specifies the re-address server's IPv4 address.
- *port_number* must be the re-address server's port number, and must be an integer from 1 through 65535.

---

redirect-url *redirect_url* **[[encryption { blowfish128 | blowfish64 } [encrypted] key** *key* **] clear-quota-retry-timer]**

Specifies to return a redirect response to the subscriber, and terminate the TCP connections (to the subscriber and server). The subscriber's Web browser should automatically send the original HTTP packet to the specified URL. Redirection is only possible for certain types of HTTP packets (for example, GET requests), which typically are only sent in the uplink direction. If the flow is not HTTP, the **redirect-url** option is ignored, that is the packet is forwarded normally, except for SIP. For SIP, a Contact header with the redirect information is inserted.

- *redirect_url* specifies the redirect URL. *redirect_url* must be an alphanumeric string of 1 through 511 characters. It may include one or more dynamic fields (up to 16 may be specified). For example, *http://search.com/subtarg=#HTTP.URL#*.

  Dynamic fields must be enclosed in "#" (hash).

  Up to 16 dynamic fields out of the following 23 are allowed:

  - #BEARER.CALLED-STATION-ID#
  - #BEARER.CALLING-STATION-ID#
  - #BEARER.NAS-IP-ADDRESS#
  - #BEARER.USER-NAME#
  - #BEARER.ACCT-SESSION-ID#
  - #BEARER.CORRELATION-ID#
  - #BEARER.RULEBASE#
  - #BEARER.SERVED-BSA-ADDR#
  - #BEARER.SERVICE-NAME#
  - #BEARER.SUBSCRIBER-ID#
  - #BEARER.MSISDN#
  - #HTTP.URL#
  - #HTTP.URI#

- #HTTP.HOST#
- #RTSP.URI#
- #WSP.URL#
- #CONTENT-ID-LABEL#
- #CONTENT-ID-LABEL-CAUSING-REDIRECTION#
- #BEARER.HWID#
- #BEARER.IMSI#
- #BEARER.IMEI#
- #BEARER.ESN#
- #BEARER.MEID#

Concatenated fields separated by ';' can also be inserted. For example, #BEARER.IMSI;BEARER.IMEI#

- **encryption**: Specifies to enable encryption for dynamic fields of redirect URL.
  - **blowfish128**: Specifies to use Blowfish encryption with 28 bit key for encrypting the dynamic fields.
  - **blowfish64**: Specifies to use Blowfish encryption with 64 bit key for encrypting the dynamic fields.
- **encrypted**: Specifies to encrypt the key.
- **key** *key*: Specifies key to use for encryption of dynamic fields.

  key must be an alphanumeric string of 1 through 523 characters.
- **clear-quota-retry-timer**: Specifies to reset Credit Control Application (CCA) Quota Retry Timer upon redirection.

Note that encryption is supported only for the following fields:

- #BEARER.MSISDN#
- #BEARER.CALLING-STATION-ID#
- #BEARER.MSISDN#
- #BEARER.IMEI#
- #BEARER.MEID#
- #BEARER.IMSI#
- #BEARER.USERNAME#
- #BEARER.ESN#

Also, concatenated fields having any of the above will be encrypted.
`%3furl=` can be used as a delimiter between URL. As in `http://search.com/subtarg/%3furl=#HTTP.URL#` format.

---

terminate-flow

Specifies to terminate the flow.
Terminates the TCP connection gracefully between the subscriber and external server and sends a TCP FIN to the subscriber and a TCP RST to the server. If the flow does not use TCP, this option simply discard the packets. This option is applicable only for flows that use TCP.

terminate-session

Specifies to terminate the session.
When a rule pointing to a charging action configured with the terminate-session keyword is hit, then the corresponding session will be terminated.

Usage

Use this command to specify the action to take on packets, for example to discard, terminate, or redirect.
When a readdress server is configured for a charging action, the **show configuration** command will display the readdress related configuration only if server address is configured. The **show configuration verbose** command will display the readdress sever if configured, else will display "no flow action".
The redirect-url option can be used to redirect SIP requests as well. The following is a sample configuration:

```
configure
   active-charging service s1
      charging-action ca_sip_redir
         content-id 10
         flow action redirect-url sip:test@sip.org
         exit
      ruledef sip_req
         sip request packet = TRUE
         exit
      rulebase plan1
         action priority 08 ruledef sip_req charging-action ca_sip_redir
         /* other rules, routing rules for sip, etc */
         end
```

This would mean any SIP request that hits the *sip_req* ruledef, would get redirected to the url given in *ca_sip_redir*. This involves creating a redirection packet with the following response line and "Contact" header in the response.
SIP/2.0 302 Moved Temporarily
302 Moved Temporarily
Most of the header fields are copied directly from the request, so that the mandatory SIP headers are present. If content-length header was seen in the original message, it is replaced in the reply with "Content-Length: 0".

Example

The following command sets the flow action to terminate:

```
flow-action terminate-flow
```

The following command resets quota retry timer upon redirection of flow to HTTP URL *http://search.com/?url=#http://msn.com#*:

```
flow action redirect-url http://search.com/%3url=#http://msn.com# clear-
quota-retry-timer
```

flow idle-timeout

This command allows you to configure the maximum duration a flow can remain idle after which the system automatically terminates the flow.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
flow idle-timeout { idle_timeout | flow-mapping flow_timeout }

{ default | no } flow idle-timeout [ flow-mapping ]
```

no

Disables the idle-timeout configuration; sets the idle-timeout to 0 seconds.

default

Configures this command with its default setting.
Default: 300 seconds

idle-timeout *idle_timeout*

Specifies the maximum duration, in seconds, a flow can remain idle.
idle_timeout must be an integer from 0 through 86400.

flow-mapping *flow_timeout*

Specifies the maximum duration of flow-mapping timeout, in seconds.
flow_timeout must be an integer from 0 through 86400.

Usage

Use this command to configure the maximum duration a flow can remain idle after which the system automatically terminates the flow.

Example

The following command configures the idle-timeout setting to *400* seconds:

```
flow idle-timeout 400
```

flow limit-for-bandwidth

For Session Control functionality this command allows you to enable/disable bandwidth limiting and configure the uplink and downlink bandwidth limits for subscriber.

Product

All

Privilege

Security Administrator, Administrator

Syntax

flow limit-for-bandwidth { { direction { downlink | uplink } peak-data-rate *bps* **peak-burst-size** *bytes* **violate-action { discard | lower-ip-precedence } [committed-data-rate** *bps* **committed-burst-size** *bytes* **[exceed-action { discard | lower-ip-precedence }]] } | { id** *id* **} }**

{ default | no } flow limit-for-bandwidth { direction { downlink | uplink } | id }

no

If previously configured, disables bandwidth control traffic policing for the specified direction for the current subscriber.

default

Configures this command with its default setting.

direction { downlink | uplink }

Specifies the direction of flow to apply bandwidth limit:

- **downlink**: Flow of data towards subscriber.
- **uplink**: Flow of data from subscriber.

peak-data-rate *bps*

Specifies the peak data-rate for the subscriber, in bps (bits per second).
bps must be an integer from 1 through 4294967295.
Default: 256000

peak burst-size *bytes*

The peak burst size allowed, in bytes.
bytes must be an integer from 1 through 4294967295.
Default: 3000

Important: It is recommended that this parameter be configured to at least the greater of the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) three seconds worth of token accumulation within the “bucket” for the configured peak-data-rate.

violate-action { discard | lower-ip-precedence }

Specifies the action to take on packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **discard**: Discard the packet
- **lower-ip-precedence**: Transmit the packet after lowering the IP precedence

Default: **discard**

committed-data-rate *bps*

The committed data rate (guaranteed-data-rate) in bits per second (bps).
bps must be an integer from 1 through 4294967295.
Default: 144000

committed-burst-size *bytes*

The committed burst size allowed, in bytes.
bytes must be an integer from 1 through 4294967295.
Default: 3000

exceed-action { discard | lower-ip-precedence }

The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **discard**: Discard the packet
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence

If exceed-action is not configured, the packets are forwarded.
Default: **lower-ip-precedence**

id *id*

Important: This keyword is only available in 8.1 and later releases.

Specifies the bandwidth limiting identifier.
id must be an integer from 1 through 65535.
This identifier enables traffic policing based on a separate identifier other than content ID. This identifier will always take priority over content ID. If this identifier is not configured, traffic policing will be based on the content ID.

Usage

Use this command to limit the bandwidth a subscriber uses in the uplink and downlink directions under Session Control.

Important: If the exceed/violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed/violate the traffic limits regardless of what the **ip user-datagram-tos copy** command is configured to. In addition, the **lower-ip-precedence** option may also override the **ip qos-dscp** command configuration. Therefore, it is recommended that command not be used when specifying this option.

More information on the QoS feature is available in the *QoS Management* appendix of the *System Administration Guide*.

Example

The following command sets an uplink peak data rate of *128000* bps and lowers the IP precedence when the committed-data-rate and the peak-data-rate are exceeded:

```
flow limit-for-bandwidth uplink peak-data-rate 128000 violate-action
lower-ip-precedence
```

The following command sets a downlink peak data rate of *256000* bps and discards the packets when the committed-data-rate and the peak-data-rate are exceeded:

```
flow limit-for-bandwidth downlink peak-data-rate 256000 violate-action
discard
```

flow limit-for-flow-type

This command allows you to specify the maximum number of simultaneous flows (of this type) that a subscriber may have, and the action to take if the limit is reached.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
flow limit-for-flow-type limit over-limit-action { discard | redirect-url | terminate-flow | terminate-session }

no flow limit-for-flow-type
```

no

If previously configured, deletes the flow limit-for-flow-type configuration in the current charging action.

limit

Specifies the maximum number of flows of a type exceeding which the specified over-limit-action triggers. *limit* must be an integer from 1 through 4000000000.

over-limit-action { discard | redirect-url | terminate-flow | terminate-session }

Specifies the action to take on exceeding *limit* for a flow type:

- **discard**: Discards the packets
- **redirect-url**: Redirects the flow
- **terminate-flow**: Terminates the flow to which this packet belongs
- **terminate-session**: Terminates the session to which this packet belongs

Usage

Use this command to specify the number of simultaneous flows (of a type) that a subscriber may have, and the action to take if the limit is reached.
All flows with the same content-id are considered to be the same type. This limit applies to the total of all flows for a subscriber connection (that is, an individual PDP context or individual A10 tunnel).
If the flow is not HTTP, the **redirect-url** option is ignored, that is the packet is forwarded normally. Refer to the **flow action** CLI command.
If the limit specified by the **flow limit-across-applications** command in the Rulebase Configuration Mode is also exceeded, action is taken for that over-limit condition rather than the action configured here.

Example

The following command terminates the flow if total number of flows of a type exceeds *1024*:

```
flow limit-for-flow-type 1024 over-limit-action terminate-flow
```

ip tos

This command allows you to configure the IP Type of Service (ToS) octets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
ip tos { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 |
af43 | be | ef | lower-bits tos_value } [ uplink | downlink ]

{ default | no } ip tos [ uplink | downlink ]
```

default

Configures this command with its default setting.
Default: IP ToS is not modified.

no

If previously configured, deletes the IP ToS configuration in the current charging action.

af *xx*

Specifies the use of an assured forwarding *xx* per hop behavior (PHB).

be

Specifies the use of best effort forwarding PHB.

ef

Specifies the use of expedited forwarding PHB.

lower-bits *tos_value*

Important: In StarOS 8.1 and later releases, this keyword is "**lower-bits** *tos_value*". In StarOS 8.0, it is *tos_value*.

Specifies the least-significant 6 bits in the TOS byte with the specified numeric value.
tos_value must be an integer from 0 through 63.

downlink

Specifies the ToS only for downlink packets.

uplink

Specifies the ToS only for uplink packets.

Usage

Use this command to specify the IP Type of Service (ToS) octets to use in the charging action. If one of the enumerated values is set, the DSCP bits which are the six most-significant bits in the TOS byte are marked. If the integer value is set, it will be written into the six least-significant bits of the TOS byte.
If **downlink** or **uplink** keywords are not specified, the command applies to both directions.
This command may be used multiple times. For example, the following sequence of commands will cause to set the ToS to af11 in the uplink direction, but not modify the ToS in the downlink direction:

```
ip tos af11

no ip tos downlink
```

Example

The following command sets the IP ToS to *be* with *downlink*:

```
ip tos be downlink
```

ip vlan

This command allows you to configure the VLAN identifier to be associated with the subscriber traffic in the destination context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip vlan *vlan_id*

{ default | no } ip vlan

default

Configures this command with its default setting.
Default: Disable this IP VLAN configuration. Same as **no ip vlan** command.

no

If previously configured, deletes the IP VLAN configuration in the current charging action. Whatever value is configured for the VLAN tag in the subscriber configuration or IP pool configuration (or no VLAN tag if there is no configuration elsewhere) is used.

vlan_id

Specifies the VLAN ID.
vlan_id must be an integer from 1 through 4094.

Usage

This command configures the subscriber VLAN ID which is used with the assigned address for the subscriber session to receive packets. If the IP pool from which the address is assigned is configured with a VLAN ID, then this subscriber configured VLAN ID overrides it.
Subscriber traffic can be routed to specific VLANs based on the configuration of their user profile. Using this functionality provides a mechanism for routing all traffic from a subscriber over the specified VLAN. All packets destined for the subscriber must also be sent using only IP addresses valid on the VLAN or they will be dropped.

Example

The following command sets the IP VLAN range to go up to *500*:

```
ip vlan 500
```

The following command sets the IP VLAN range back to default.

```
default ip vlan
```

nexthop-forwarding-address

This command allows you to configure the nexthop forwarding address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

nexthop-forwarding-address *ipv4_address*

no nexthop-forwarding-address

no

If previously configured, deletes the nexthop-forwarding-address configuration in the current charging action.

ipv4_address

Specifies the nexthop-forwarding-address for the current charging action.
ipv4_address must be the nexthop forwarding address, and must be an IPv4 address.

Usage

Use this command to configure the nexthop-forwarding-address for a charging action. When an uplink packet matches a rule and a charging action is applied to it this nexthop forwarding address is used.
There are different methods to configure a nexthop forwarding address, they are prioritized as follows:

- The nexthop forwarding address, if configured, in a redirect ACL is used
- Else, the nexthop address configured in the charging action is used
- Else, the nexthop address, if configured, in the IP pool is used

Example

The following command sets the nexthop forwarding address for the current charging action to *10.1.1.1*:

```
nexthop-forwarding-address 10.1.1.1
```

qos-class-identifier

This command allows you to configure the QoS Class Identifier (QCI).

Product

All

Privilege

Security Administrator, Administrator

Syntax

qos-class-identifier *qos_class_identifier*

no qos-class-identifier

no

If previously configured, deletes the QCI configuration in the current charging action.

qos_class_identifier

Specifies the QCI.
qos_class_identifier must be an integer from 1 through 9 or from 128 through 254 (Operator specific).

Usage

Use this command to configure the QCI for a charging action.

Example

The following command configures the QCI as *3*:

```
qos-class-identifier 3
```

qos-renegotiate

This command allows you to configure the QoS traffic class for the Layer 7 QoS Renegotiation feature, enabling the triggering of QoS renegotiation from a rule.

Important: This command is license dependent. For more information please contact your Cisco account representative.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
qos-renegotiate traffic-class { background | conversational | interactive priority |
streaming }

no qos-renegotiate
```

no

If previously configured, deletes the qos-renegotiate traffic-class configuration in the current charging action.

background

Specifies the traffic class as Background, for traffic patterns in which the data transfer is not time-critical (for example e-mail exchange).

conversational

Specifies the traffic class as Conversational, for traffic patterns in which there is a constant flow of packets.

interactive *priority*

Specifies the traffic class as Interactive, for traffic patterns in which there is an intermittent flow of packets. *priority* specifies the traffic handling priority, and must be an integer from 1 through 3.

streaming

Specifies the traffic class as Streaming, for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream.

Usage

Use this command to configure the QoS traffic class for a charging action for the Layer 7 QoS Renegotiation feature, enabling triggering QoS renegotiation from an active-charging rule.
Layer 7 QoS Renegotiation is an extension of the Dynamic QoS Renegotiation feature. Upon matching a particular layer 7 rule, for example the access of a particular URL, the GGSN triggers the renegotiation of the PDP context.

Example

The following command sets the QoS traffic class in the charging action to streaming:

```
qos-renegotiate traffic-class streaming
```

retransmissions-counted

This command allows you to specify whether to count (for billing purposes) the number of packet retransmissions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] retransmissions-counted
```

default

Configures this command with its default setting.
Default: Disabled; same as **no retransmissions-counted**

no

If previously enabled, disables the retransmissions-counted configuration in the current charging action.

Usage

Use this command to enable counting of the number of retransmissions.
If not enabled, retransmissions are automatically detected but discounted. The retransmissions will still be analyzed by the TCP analyzer (and higher layer analyzers), but the statistics (except for the count of retransmissions) will not be updated. Also, some higher layer analyzers (MMS, SIP, WSP, and WTP) can detect retransmissions when UDP is the transport layer.

Example

The following is an example of this command:

```
retransmissions-counted
```

service-identifier

This command allows you to configure the service identifier to use in the generated billing records, as well as the AVP used by the Credit Control Application, such as the "Service-Identifier" AVP for use by DCCA. This is a more general classifier than content-id.

Product

All

Privilege

Security Administrator, Administrator

Syntax

service-identifier *service_id*

no service-identifier

no

If previously configured, deletes the service ID configuration in the current charging action.

service_id

Specifies the service identifier.
In 12.1 and earlier releases *service_id* must be an integer from 1 through 65535.
In 12.2 and later releases, *service_id* must be an integer from 1 through 2147483647.

Usage

Use this command to configure the service identifier to use in generated billing records, as well as the AVP used by the Credit Control Application, such as the "Service-Identifier" AVP for use by DCCA. This is a more general classifier than content-id.

Example

The following command configures the service identifier in the current charging action to *99*:

```
service-identifier 99
```

tft packet-filter

This command allows you to specify the packet filter to use in TFTs sent to the MS.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] tft packet-filter *packet_filter_name*

no

If previously configured, removes the specified packet filter from the current charging action.

packet_filter_name

Specifies the packet filter to add/remove from the current charging action.
packet_filter_name must be the name of a packet filter, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the packet filter to be sent to the MS. Up to eight packet filters can be specified in a charging action.

Example

The following command configures the packet filter *filter23* to be sent to the MS:

```
tft packet-filter filter23
```

tos

This command allows you to configure the Type of Service (ToS) octets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
tos { af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 | af43 |
be | ef | lower-bits tos_value } [ downlink | uplink ]

no tos [ downlink | uplink ]
```

no

Disables the ToS being used in the charging action.

af *xx*

Specifies the use of an assured forwarding *xx* Per Hop Behavior (PHB).

be

Specifies use of Best Effort forwarding PHB.

ef

Specifies use of Expedited Forwarding PHB.

lower-bits *tos_value*

Important: In 8.1 and later releases, this keyword is "**lower-bits** *tos_value*". In 8.0 release, it is *tos_value*.

Sets the least-significant 6 bits in the ToS byte with the specified numeric value. *tos_value* must be an integer from 0 through 63.

downlink

Specifies the ToS only for downlink packets.

uplink

Specifies the ToS only for uplink packets.

Usage

Use this command to set the ToS octets used in the charging action. If one of the enumerated values is set, the Differentiated Services Code Point (DSCP) bits (the six most-significant bits (MSBs) in the ToS byte) are marked. If the integer value is set, it will be written into the six least-significant bits (LSBs) of the ToS byte.

Example

The following command sets the ToS to *be* for downlink packets:

```
tos be downlink
```

tpo profile

This command allows you to specify the Traffic Performance Optimization (TPO) profile for the current charging action.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

tpo profile *tpo_profile_name*

no tpo profile

no

If previously configured, removes the TPO profile configuration from the current charging action.

tpo_profile_name

Specifies the TPO profile.
tpo_profile_name must be the name of a TPO profile, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the TPO profile for a charging action.
When based on rule matching a charging action is selected, the TPO profile configured in it will be applied for the flow. If a TPO profile was applied to a flow through a particular charging action, and subsequently a different charging action that does not have a TPO profile configured in it is applied to the same flow, TPO will not be disabled.

Example

The following command configures a TPO profile named *tpoprofile10* for the current charging action:

```
tpo profile tpoprofile10
```

video bitrate

This command allows you to specify the default target bit rate to use for the video pacing feature on the Mobile Video Gateway. This value is also used as the suggested maximum bit rate for the video optimization policy control feature and the dynamic inline transrating feature.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

[default | no] video bitrate *bit_rate* **[-noconfirm]**

default

Sets video bitrate to its default value.

no

Deletes the video bit rate if previously configured.

video bitrate *bit_rate*

Specifies the bit rate, in bits per second, at which the TCP video flow should be paced during video pacing. This value is also used as the suggested maximum bit rate for the video optimization policy control feature and the dynamic inline transrating feature. For video pacing, this default bit rate is used on each video flow until the rate determination function calculates the optimal bit rate for pacing.
bit_rate must be an integer from 0 to 256000000.
Default: 0

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to specify the default bit rate to use for the video pacing feature, and the suggested maximum bit rate for the video optimization policy control feature and the dynamic inline transrating feature.

Example

The following command sets the bit rate for the video flow at *300000* (300kbps):

```
video bitrate 300000
```

video cae-readdressing

This command allows you to enable CAE (Content Adaptation Engine) re-addressing, allowing video traffic to be fetched from the CAEs in the CAE group. The CAE is an optional component of the Mobile Videoscape.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

`[ no ] video cae-readdressing [ xheader-format` *`xheader_format_name`* **`]`**

`no`

Disables CAE re-addressing if previously configured.

`video cae-readdressing`

Enables CAE re-addressing, allowing video traffic to be fetched from the CAEs in the CAE group.

`xheader-format` *`xheader_format_name`*

Specifies an HTTP x-header (Extension header) format for readdressing. When specified, the MVG inserts a destination IP address and TCP port number in a proprietary HTTP x-header in the HTTP request to the CAE. The CAE uses this information to connect to the OS (Origin Server) to retrieve selected video clips for adaptation.
`xheader_format_name` must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to enable CAE re-addressing on the Mobile Video Gateway.

Example

The following command enables CAE re-addressing:

```
video cae-readdressing xheader-format format_1
```

video detailed-statistics

This command allows you to enable the collection of detailed video statistics.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] video detailed-statistics [ -noconfirm ]
```

default

Sets video detailed-statistics to its default value, which is the same as **[no]**.

no

Disables the video statistics feature if previously enabled.

video detailed-statistics

Enables the video statistics feature. When a flow matches a rule definition for video during DPI (Deep Packet Inspection), the video statistics feature begins collecting detailed statistics for the video flow.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to enable the video statistics feature.

Example

The following command enables the video statistics feature:

```
video detailed-statistics
```

video optimization-preprocessing all

This command allows you to enable CAE re-addressing by enabling the Active Charging Service (ACS) to re-address video requests to the CAEs in the CAE group and enables transrating by enabling the ACS to transrate video requests.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] video optimization-preprocessing all
```

no

Disables CAE re-addressing and transrating if currently enabled.

video optimization-preprocessing cae-readdressing

Enables CAE re-addressing by enabling the ACS to re-address video requests to the CAEs in the CAE group and enables transrating by enabling the ACS to transrate video requests.

Usage

Use this command to enable CAE re-addressing by enabling the ACS to re-address video requests to the CAEs in the CAE group and enable transrating by enabling the ACS to transrate video requests.

Example

The following command enables CAE re-addressing and transrating:

```
video optimization-preprocessing all
```

video optimization-preprocessing cae-readdressing

This command allows you to enable CAE re-addressing by enabling the Active Charging Service (ACS) to re-address video requests to the CAEs in the CAE group.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] video optimization-preprocessing cae-readdressing
```

no

Disables CAE re-addressing if currently enabled.

video optimization-preprocessing cae-readdressing

Enables CAE re-addressing by enabling the ACS to re-address video requests to the CAEs in the CAE group.

Usage

Use this command to enable CAE re-addressing by enabling the ACS to re-address video requests to the CAEs in the CAE group.

Example

The following command enables CAE re-addressing:

```
video optimization-preprocessing cae-readdressing
```

video optimization-preprocessing transrating

This command allows you to enable video transrating by enabling the Active Charging Service (ACS) to transrate video requests.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] video optimization-preprocessing transrating
```

no

Disables transrating if currently enabled.

video optimization-preprocessing transrating

Enables video transrating by enabling ACS to transrate video requests.

Usage

Use this command to enable video transrating by enabling the ACS to transrate video requests.

Example

The following command enables video transrating:

```
video optimization-preprocessing transrating
```

video pacing by-policing

This command allows you to enable the video pacing feature.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

[default | no] video pacing by-policing [initial-burst-duration *value* **| normal-burst-duration** *value* **][-noconfirm]**

default

Sets video pacing by-policing to its default value, which is the same as **[no]**.

no

Deletes the video pacing by-policing settings and disables video pacing if previously configured.

video pacing by-policing

Enables the video pacing feature. When enabled, video pacing is applied per TCP video flow. The command syntax **by-policing** enables pacing enforcement by the policing method, which is the available method for this software release.

initial-burst-duration *value*

Specifies the duration, in seconds, for the allowed initial burst of video content. Note that the initial burst is configured in terms of time, so that for video files with different encoding bit rates, the amount of bytes allowed without enforcing pacing gets adjusted accordingly. The amount of bytes allowed is calculated by (video encoding rate * initial-burst-duration).
value must be an integer between 1 and 30.
Default: 10 seconds

normal-burst-duration *value*

Specifies the duration, in seconds, for the allowed normal burst of video content after the initial burst is completed. Like the initial burst, the normal burst is also configured in terms of time, so that for video files with different encoding bit rates, the amount of bytes allowed without enforcing pacing gets adjusted accordingly. The amount of bytes allowed is calculated by (video encoding rate * normal-burst-duration).
value must be an integer between 1 and 30.
Default: 3 seconds

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to enable video pacing by policing.

Example

The following command enables video pacing by policing with an initial burst duration of 15 seconds and a normal burst duration of 3 seconds:

```
video pacing by-policing initial-burst-duration 15 normal-burst-duration
3
```

video transrating target-rate-reduction

This command allows you to specify the target bit rate reduction for dynamic inline transrating.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

video transrating target-rate-reduction *percentage_of_input_rate*

video transrating target-rate-reduction *percentage_of_input_rate*

This command configures transrating by specifying the target bit rate reduction as a percentage of the input bit rate, which can be between 1 and 50 percent.

Usage

Use this command to configure the target bit rate reduction for dynamic inline transrating.

Example

The following command specifies the target bit rate reduction as 20 percent of the input bit rate:

```
video transrating target-rate-reduction 20
```

xheader-insert

This command allows you to specify the extension-header (x-header) format whose fields have to be inserted in HTTP GET and POST request packets.

Important: This command is license dependent. For more information please contact your Cisco account representative.

Product

All

Privilege

Security Administrator, Administrator

Syntax

xheader-insert xheader-format *xheader_format_name* **[encryption rc4md5 [encrypted] key** *key* **] [first-request-only] [-noconfirm]**

no xheader-insert

no

Removes previously configured x-header format name.

xheader-format *xheader_format_name*

Enables x-header mode configuration, and specifies the x-header format whose fields are to be inserted in the packets.
xheader_format_name must be the name of an x-header format, and must be an alphanumeric string of 1 through 63 characters.

encryption rc4md5 [encrypted] key *key*

If the x-header format has any encrypted fields defined, specifies to use RC4MD5 encryption.
After configuring this option, the fields in xheader format having “encrypt” enabled will be encrypted as follows:

1. The MD5 hash of the configure key will be calculated.
2. This MD5 hash will be used as a key for RC4 encryption.
3. This encrypted value will be base64 encoded to get the final X-header value. The final inserted X-header will be X-alias: base64(RC4(MD5(key),MSISDN)).

In the default case, if encryption is not enabled as above, the plain text value of the xheader field will be inserted.
Note that if the value of the key is changed on the fly, it will take effect only in case of new calls. Also, if the per rulebase RSA encryption is also enabled in the same config, per charging-action RC4MD5 encryption will take precedence over it.
key specifies the key as an alphanumeric string of 8 through 15 characters.
encryption specifies use of encryption.
The *key* can be configured either as plain text or encrypted. However, in the output of the **show configuration** command it will always be displayed as encrypted. And, in the output of the **show configuration showsecrets** command it will be displayed as plain text.

first-request-only

Specifies x-header insertion only for the first HTTP request in the IP flow. If not configured, the default behavior is insertion for all requests.

-noconfirm

Specifies that the command must execute without any prompts and confirmation from the user.

Usage

Use this command to enable x-header mode, and specify the x-header format name whose fields are to be inserted in HTTP GET and POST request packets.
Also, see the **xheader-format** command in the *ACS Configuration Mode Commands* and *ACS X-header Format Configuration Mode Commands* chapters.

Example

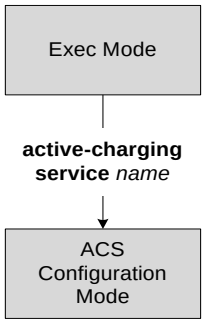
The following command enables x-header mode, and specifies the x-header format name as *test12*:

```
xheader-insert xheader-format test12
```

Chapter 8
ACS Configuration Mode Commands

The ACS Configuration Mode is used to manage active charging service (ACS)/enhanced charging service (ECS) configurations. ACS provides flexible, differentiated, and detailed billing to subscribers through Layer 3 through Layer 7 packet inspection and the ability to integrate with back-end billing mediation systems.

Important: In this release only one active charging service can be configured in a system.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

access-ruledef

This command allows you to create/configure/delete access rule definitions (ruledefs).

Important: This command is available only in StarOS 8.1 and in StarOS 9.0 and later releases, and must be used to configure the Policy-based Stateful Firewall and NAT features.

Product

NAT, FW

Privilege

Security Administrator, Administrator

Syntax

access-ruledef *access_ruledef_name* **[-noconfirm]**

no access-ruledef *access_ruledef_name*

no

If previously configured, deletes the specified access ruledef.

access_ruledef_name

Specifies the access ruledef to add/configure/delete.
access_ruledef_name must be the name of an access ruledef, and must be an alphanumeric string of 1 through 63 characters, and can contain punctuation characters.
If the named access ruledef does not exist, it is created, and the CLI mode changes to the Firewall-and-NAT Access Ruledef Configuration Mode wherein the ruledef can be configured.
If the named access ruledef already exists, the CLI mode changes to the Firewall-and-NAT Access Ruledef Configuration Mode for that access ruledef.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an access ruledef. A ruledef contains different conditions/criteria to permit, drop, or reject a packet/connection/traffic based on one or more parameters. The ruledef name must be unique within the service. Host pool, port map, IMSI pool, and access/firewall, routing, and charging ruledefs configured in the active charging service must all have unique names.

Important: An access ruledef can be referenced by multiple Stateful Firewall rulebases.

Important: Access ruledefs are different from ACS ruledefs.

Also see the *Firewall-and-NAT Access Ruledef Configuration Mode Commands* chapter.

Example

The following command creates an access ruledef named *ruledef1*, and enters the Firewall-and-NAT Access Ruledef Configuration Mode:

```
access-ruledef ruledef1
```

bandwidth-policy

This command allows you to create/configure/delete bandwidth policies.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

bandwidth-policy *bandwidth_policy_name* **[-noconfirm]**

no bandwidth-policy *bandwidth_policy_name*

no

If previously configured, deletes the specified bandwidth policy from the active charging service.

bandwidth_policy_name

Specifies the bandwidth policy to add/configure/delete.
bandwidth_policy_name must be the name of a bandwidth policy, and must be an alphanumeric string of 1 through 63 characters.
If the named bandwidth policy does not exist, it is created, and the CLI mode changes to the ACS Bandwidth Policy Configuration Mode wherein the bandwidth policy can be configured.
If the named bandwidth policy already exists, the CLI mode changes to the ACS Bandwidth Policy Configuration Mode for that bandwidth policy.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a bandwidth policy.
Also see the *ACS Bandwidth Policy Configuration Mode Commands* chapter.

Example

The following command creates a bandwidth policy named *test73*, and enters the ACS Bandwidth Policy Configuration Mode:

```
bandwidth-policy test73
```

buffering-limit

This command allows you to configure packet buffering limits.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

buffering-limit { flow-max-packets *flow_max_packets* **| subscriber-max-packets** *subscriber_max_packets* **}**

{ default | no } buffering-limit { flow-max-packets | subscriber-max-packets }

default

Configures this command with its default setting.
Default: No limit, other than the maximum amount of available memory.

no

Disables the buffering limit configuration.

flow-max-packets *flow_max_packets*

Specifies the maximum number of packets that can be buffered per flow.
flow_max_packets must be an integer from 1 through 255.

subscriber-max-packets *subscriber_max_packets*

Specifies the maximum number of packets that can be buffered per subscriber.
subscriber_max_packets must be an integer from 1 through 255.

Usage

Use this command to configure the limits for buffering packets sent by a subscriber, while waiting for a response from the Diameter server. Packets need to be buffered for various reasons, such as, waiting for Credit Control Authorization or waiting for the result of a content filtering rating request.

Example

The following command sets the buffering limit per flow to *55*:

```
buffering-limit flow-max-packets 55
```

charging-action

This command allows you to create/configure/delete ACS charging actions.

Important: A maximum of 2048 charging actions can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] charging-action` *`charging_action_name`* **`[ -noconfirm ]`**

`no`

If previously configured, deletes the specified charging action from the active charging service.

`charging_action_name`

Specifies the charging action to add/configure/delete.
`charging_action_name` must be the name of a charging action, and must be an alphanumeric string of 1 through 63 characters and can contain punctuation characters.
If the named charging action does not exist, it is created, and the CLI mode changes to the ACS Charging Action Configuration Mode wherein the charging action can be configured.
If the named charging action already exists, the CLI mode changes to the ACS Charging Action Configuration Mode for that charging action.
The charging action's name must be unique in the active charging service. Up to 2048 charging actions can be configured in the active charging service.

`-noconfirm`

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS charging action.
A charging action represents actions to be taken when a configured rule is matched. Actions could range from generating an accounting record (for example, an EDR) to dropping the IP packet, etc. The charging action will also determine the metering principle—whether to count retransmitted packets and which protocol field to use for billing (L3/L4/L7 etc).
Also see the *ACS Charging Action Configuration Mode Commands* chapter.

Example

The following command creates a charging action named *`action123`* and changes to the ACS Charging Action Configuration Mode:

```
charging-action action123
```

content-filtering category match-method

This command allows you to specify the match method to look up URLs in the Category-based Content Filtering database.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering category match-method { exact | generic }

default content-filtering category match-method
```

default

Configures this command with its default setting.
Default: **generic**

exact

Specifies the exact-match method, wherein URLs are rated only on exact match with URLs present in the Category-based Content Filtering database.

generic

Specifies the generic match method, wherein normalization, multi-lookups, and rollback algorithms are applied to URLs during look up. URLs are rated on generic match with URLs present in the Category-based Content Filtering database.

Usage

Use this command to set the match method to look up URLs in the Category-based Content Filtering database.

Example

The following command sets the exact-match method to look up URLs in the Category-based Content Filtering database:

```
content-filtering category match-method exact
```

content-filtering category policy-id

This command allows you to create/configure/delete Content Filtering Category Policies for Category-based Content Filtering support.

Important: A maximum of 64 Content Filtering Category Policies can be configured in the active charging service.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id* **[description [** *description_string* **]] [-noconfirm]**

no content-filtering category policy-id *cf_policy_id*

no

If previously configured, deletes the specified Content Filtering Category Policy from the active charging service.

cf_policy_id

Specifies the Content Filtering Category Policy ID to add/configure/delete.
cf_policy_id must be an integer from 1 through 4294967295.
If the specified policy ID does not exist, it is created and the CLI mode changes to the Content Filtering Policy Configuration Mode, wherein the policy can be configured.
If the specified policy ID already exists, the CLI mode changes to the Content Filtering Policy Configuration Mode for that policy.

description [*description_string* **]**

Specifies a description for the Content Filtering Category Policy.
description_string must be an alphanumeric string of 1 through 31 characters.
Note that both **description** and *description_string* are optional.
"**description** *description_string*" saves *description_string* as the new description.
"**description**" removes the previously specified description.
This description is displayed in the output of the "**show content-filtering category policy-id id** *id*" and "**show active-charging service name** *service_name*" commands.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a Content Filtering Category Policy.

Also see the *Content Filtering Policy Configuration Mode Commands* chapter.

Example

The following command creates a Content Filtering Policy with the ID *101*, and enters the Content Filtering Policy Configuration Mode:

```
content-filtering category policy-id 101
```

credit-control

This command allows you to enable/disable Prepaid Credit Control Configuration Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] credit-control [group *cc_group_name* **]**

no

Disables the specified Prepaid Credit Control Application configuration.

group *cc_group_name*

Important: This option is only available in StarOS 8.1 and later releases.

Specifies the credit control group to add/configure/delete.
cc_group_name must be the name of a credit control group, and must be an alphanumeric string of 1 through 63 characters.
If the named credit control group does not exist, it is created, and the CLI mode changes to the Credit Control Configuration Mode, wherein the credit control group can be configured.
If the named credit control group already exists, the CLI mode changes to the Credit Control Configuration Mode for that credit control group.
Creating different credit control groups enables applying different credit control configurations (DCCA dictionary, failure-handling, session-failover, Diameter endpoint selection, etc.) to different subscribers on the same system.
Without credit control groups, only one credit control configuration is possible on a system. All the subscribers in the system will have to use the same configuration.

Usage

Use this command to enable/disable Prepaid Credit Control Configuration for RADIUS/Diameter charging mode.
Also see the *Credit Control Configuration Mode Commands* chapter.

Example

The following command enables prepaid credit control accounting to use RADIUS and/or Diameter interface mode.

```
credit-control
```

diameter credit-control

Description This command has been deprecated, and is replaced by the credit-control command.

edr-format

This command allows you to create/configure/delete ACS Event Data Record (EDR) formats.

Product

All

Privilege

Security Administrator, Administrator

Syntax

edr-format *edr_format_name* **[-noconfirm]**

no edr-format *edr_format_name*

no

If previously configured, deletes the specified EDR format from the active charging service.

edr_format_name

Specifies the EDR format to add/configure/delete.
edr_format_name must be a string of 1 through 63 characters.
If the named EDR format does not exist, it is created, and the CLI mode changes to the EDR Format Configuration Mode wherein the EDR format can be configured.
If the named EDR format already exists, the CLI mode changes to the EDR Format Configuration Mode for that EDR format.
The EDR format name must be unique in the active charging service. Up to 256 combined total EDR plus User Data Record (UDR) formats can be configured in the active charging service.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an EDR format.
Also see the *EDR Format Configuration Mode Commands* chapter.

Example

The following command creates an EDR format named *edr_format1*:

```
edr-format edr_format1
```

edr-udr-flow-control

This command allows you to enable/disable flow control between Session Managers (SessMgrs) and the CDRMOD process.

Product

All

Privilege

Security Administrator, Administrator

Syntax

edr-udr-flow-control [unsent-queue-size *unsent_queue_size* **]**

{ default | no } edr-udr-flow-control

no

If previously enabled, disables the flow control configuration.

default

Configures this command with its default setting.
Default: Flow control is enabled; **unsent-queue-size**: 375

unsent-queue-size *unsent_queue_size*

Specifies the flow control unsent queue size at Session Manager (SessMgr) level.
unsent_queue_size must be an integer from 1 through 2500.

Usage

Use this command to enable Flow Control between SessMgr and the CDRMOD process, and configure the unsent queue size.

Example

The following command enable Flow Control between SessMgrs and the CDRMOD process, and configure the unsent queue size to *1000*:

```
edr-udr-flow-control unsent-queue-size 1000
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

fair-usage deact-margin

This command allows you to configure the deactivate margin for the Fair Usage feature.

Product

ACS, ADC, CF, FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fair-usage deact-margin *deactivate_margin*

default fair-usage deact-margin

default

Configures this command with its default setting.
Default: 5 percent

deactivate_margin

Specifies that Fair Usage monitoring must be disabled when the instance-level credit usage goes *deactivate_margin* percentage below *usage_threshold*.
deactivate_margin is a percentage value, and must be an integer from 1 through 100.

Usage

Use this command to configure when to disable the Fair Usage feature, which enables SessMgr instance-level load balancing for in-line service features, and resource usage control for subscribers. For additional information, refer to the feature description in the *Enhanced Charging Service Administration Guide*.

Example

The following command configures the deactivate margin to disable Fair Usage monitoring to 10% below the session resource usage threshold (65%):

```
fair-usage deact-margin 10
```

fair-usage tcp-proxy

This command allows you to configure the maximum number of flows for which TCP Proxy can be used per subscriber, and what portion of ECS memory should be reserved for TCP Proxy flows.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

fair-usage tcp-proxy { max-flows-per-subscriber *max_flows_subscriber* **| memory-share** *memory_share* **}**

max-flows-per-subscriber *max_flows_subscriber*

Specifies the maximum number of flows for which TCP Proxy can be used per subscriber.
This limit is per Session Manager.
max_flows_subscriber must be an integer from 1 through 1000.
Default: 5

memory-share *memory_share*

Specifies what portion of ECS memory should be reserved for TCP Proxy flows.
memory_share is a percentage value, and must be an integer from 1 through 100.
Default: 10%

Usage

Use this command to configure the maximum number of flows for which TCP Proxy can be used for a subscriber, and what portion of ECS memory should be reserved for TCP Proxy flows.

Example

The following command configures 100 as the maximum number of flows for which TCP Proxy can be enabled for the subscriber:

```
fair-usage tcp-proxy max-flows-per-subscriber 100
```

fair-usage threshold-percent

This command allows you to configure the usage threshold to start Fair Usage monitoring.

Product

ACS, ADC, CF, FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fair-usage threshold-percent *usage_threshold*

default fair-usage threshold-percent

default

Configures this command with its default setting.
Default: 50 percent

usage_threshold

Specifies the threshold to start Fair Usage monitoring. Until the credit usage hits this threshold, all session resource allocation is allowed. On crossing this threshold, any new resource allocation request is evaluated before being allowed or denied.
usage_threshold is a percentage value, and must be an integer from 1 through 100.

Usage

Use this command to configure the threshold to enable the Fair Usage feature, which enables SessMgr instance-level load balancing for in-line service features, and resource usage control for subscribers. For additional information, refer to the feature description in the *Enhanced Charging Service Administration Guide*.

Example

The following command enables the Fair Usage feature, and configures the session resource usage threshold to start Fair Usage monitoring to 75%:

```
fair-usage threshold-percent 75
```

firewall flow-recovery

This command allows you to configure the Stateful Firewall's Flow Recovery feature.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall flow-recovery { { downlink [ [ timeout timeout ] [ no-flow-creation ] + ] } | { uplink [ timeout timeout ] } }

{ default | no } firewall flow-recovery { downlink | uplink }
```

default

Configures this command with its default setting.
Default: Downlink and uplink flow recovery enabled, 300 seconds

no

Disables the flow recovery configuration.

downlink | uplink

Specifies the packets:

- **downlink**: Enables flow recovery for packets from the downlink direction.
- **uplink**: Enables flow recovery for packets from the uplink direction.

timeout *timeout*

Specifies the Stateful Firewall Flow Recovery Timeout setting, in seconds.
timeout must be an integer from 1 through 86400.
Default: 300 seconds

no-flow-creation

Specifies not to create data session/flow-related information for downlink-initiated packets (from the Internet to the subscriber) while the firewall downlink flow-recovery timer is running, but send to subscriber.

Usage

Use this command to configure Stateful Firewall Flow Recovery feature.

Important: NAT flows will not be recovered.

Example

The following command configures Stateful Firewall Flow Recovery for packets in downlink direction with a timeout setting of *600* seconds:

```
firewall flow-recovery downlink timeout 600
```

firewall max-ip-packet-size

Description In StarOS 8.1 and later releases, for Rulebase-based Stateful Firewall this command is available in the ACS Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the ACS Rulebase Configuration Mode.

firewall mime-flood

Description In StarOS 8.1 and later releases, for Rulebase-based Stateful Firewall this command is available in the ACS Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the ACS Rulebase Configuration Mode.

firewall nat-alg

This command enables/disables Network Address Translation (NAT) Application Level Gateways (ALGs).

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

`[ default | no ] firewall nat-alg { all | ftp | h323 | pptp | rtsp | sip } [ ipv4-and-ipv6 | ipv4-only | ipv6-only ]`

`default`

Configures this command with the default setting for the specified parameter.
Default:

- **`ftp`**: Enabled
- **`h323`**: Enabled
- **`pptp`**: Disabled
- **`rtsp`**: Disabled
- **`sip`**: Disabled

`no`

Disables all/ or the specified NAT ALG configuration. When disabled, the ALG(s) will not do any payload translation for NATd calls.

`all | ftp | h323 | pptp | rtsp | sip`

Specifies the NAT ALG to enable/disable.

- **`all`**: Enables/disables all of the following NAT ALGs.
- **`ftp`**: Enables/disables File Transfer Protocol (FTP) NAT ALG.
- **`h323`**: Enables/disables H323 NAT ALG.
- **`pptp`**: Enables/disables Point-to-Point Tunneling Protocol (PPTP) NAT ALG.
- **`rtsp`**: Enables/disables Real Time Streaming Protocol (RTSP) ALG.
- **`sip`**: Enables/disables Session Initiation Protocol (SIP) NAT ALG.

`ipv4-and-ipv6 | ipv4-only | ipv6-only`

Specifies to enable/disable NAT44/NAT64 ALG.

- **`ipv4-and-ipv6`**: Enables both NAT44 and NAT64 ALGs.
- **`ipv4-only`**: Enables only NAT44 ALG.
- **`ipv6-only`**: Enables only NAT64 ALG.

Usage

Use this command to enable/disable NAT ALGs.
To enable NAT ALG processing, in addition to this configuration, ensure that the routing rule for that particular protocol is added in the rulebase.

Example

The following command enables FTP NAT ALG:

```
firewall nat-alg ftp
```

The following command disables FTP NAT ALG:

```
no firewall nat-alg ftp
```

The following command enables FTP NAT ALG, and disables H.323, PPTP, RTSP, and SIP NAT ALGs:

```
default firewall nat-alg all
```

firewall no-ruledef-matches

Description In StarOS 8.1 and later releases, this command is available in the ACS Rulebase Configuration Mode.

firewall port-scan

This command allows you to configure Stateful Firewall's Port Scan Detection algorithm.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall port-scan { connection-attempt-success-percentage { non-scanner | scanner } *percentage* | inactivity-timeout *inactivity_timeout* | protocol { tcp | udp } response-timeout *response_timeout* | scanner-policy { block inactivity-timeout *inactivity_timeout* | log-only } }

default firewall port-scan { connection-attempt-success- percentage { non-scanner | scanner } | inactivity-timeout | protocol { tcp | udp } response-timeout | scanner-policy }

---

default

Configures this command with its default setting.

---

connection-attempt-success-percentage { non-scanner | scanner } *percentage*

Specifies the connection attempt success percentage:

- **non-scanner**: Specifies the connection attempt success percentage for a non-scanner.

  percentage must be an integer from 60 through 99.

  Default: 70%

- **scanner**: Specifies the connection attempt success percentage for a scanner.

  percentage must be an integer from 1 through 40.

  Default: 30%

---

inactivity-timeout *inactivity_timeout*

Specifies the port scan inactivity timeout period, in seconds.
inactivity_timeout must be an integer from 60 through 1800.
Default: 300 seconds

---

protocol { tcp | udp } response-timeout *response_timeout*

Specifies transport protocol and response-timeout period:

- **tcp**: Specifies response timeout for TCP.

  response_timeout must be an integer from 3 through 30.

- **udp**: Specifies response timeout for UDP.

  response_timeout must be an integer from 3 through 60.

Default: 3 seconds

scanner-policy { block inactivity-timeout *inactivity_timeout* **| log-only }**

Specifies how to treat packets from a source address that has been detected as a scanner:

- **block inactivity-timeout** *inactivity_timeout*: Specifies blocking any subsequent traffic from the scanner. If the scanner is found to be inactive for the inactivity-timeout period, then the scanner is no longer blocked, and traffic is allowed.

  inactivity_timeout specifies the scanner inactivity timeout period, in seconds, and must be an integer from 1 through 4294967295.

- **log-only**: Specifies logging scanner information without blocking scanner traffic.

Default: **log-only**

Usage

Use this command to configure the Stateful Firewall Port Scan Detection algorithm enabled by the **firewall dos-protection port-scan** CLI command.
This protection tracks all uplink source addresses, and the packets they initiate towards all subscribers that have this protection enabled.

Example

The following command configures the Stateful Firewall Port Scan inactivity timeout setting to *900* seconds:

```
firewall port-scan inactivity-timeout 900
```

firewall ruledef

This command allows you to create/configure/delete Stateful Firewall ruledefs.

Important: This command is available only in StarOS 8.1. This command must be used to configure the Rulebase-based Stateful Firewall and NAT features.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall ruledef *firewall_ruledef_name* **[-noconfirm]**

no firewall ruledef *firewall_ruledef_name*

no

If previously configured, deletes the specified Stateful Firewall ruledef from the active charging service.

firewall_ruledef_name

Specifies the Stateful Firewall ruledef to add/configure/delete.
firewall_ruledef_name must be the name of a Stateful Firewall ruledef, and must be a string of 1 through 63 characters, and can contain punctuation characters.
If the named ruledef does not exist, it is created, and the CLI mode changes to the Firewall Ruledef Configuration Mode wherein the ruledef can be configured.
If the named Stateful Firewall ruledef already exists, the CLI mode changes to the Firewall Ruledef Configuration Mode for that ruledef.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a Stateful Firewall ruledef. A Stateful Firewall ruledef contains different conditions to permit, drop, or reject a packet/connection/traffic based on one or more parameters.
The ruledef name must be unique with in the active charging service. Host pool, port map, IMSI pool, and Stateful Firewall, routing, and charging ruledefs must have unique names.
A Stateful Firewall ruledef can be referenced by multiple Stateful Firewall rulebases.

Important: The Stateful Firewall ruledefs are different from the ACS ruledefs.

Also see the *Firewall-and-NAT Access Ruledef Configuration Mode Commands* chapter.

Example

The following command creates a Stateful Firewall ruledef named *fw_ruledef1*, and enters the Firewall Ruledef Configuration Mode:

```
firewall ruledef fw_ruledef1
```

firewall tcp-syn-flood-intercept

Description In StarOS 8.1 and later releases, for Rulebase-based Stateful Firewall this command is available in the ACS Rulebase Configuration Mode, and for Policy-based Stateful Firewall in the Firewall-and-NAT Policy Configuration Mode. In StarOS 8.3, this command is available in the ACS Rulebase Configuration Mode.

firewall track-list

This command allows you to configure the maximum number of server IP addresses to be tracked that are involved in any kind of denial-of-service (DoS) attacks.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall track-list attacking-servers *no_of_servers*

{ default | no } firewall track-list attacking-servers

default

Configures this command with its default setting.
Default: 10 servers

no

Important: This command variant is available only in StarOS 8.3 and later releases.

If previously configured, deletes the configuration from the active charging service.

attacking-servers *no_of_servers*

Specifies the maximum number of servers to track.
no_of_servers must be an integer from 1 through 100.

Usage

Use this command to configure the maximum number of server IP addresses to be tracked that are involved in any kind of DoS attacks.

Example

The following command configures the maximum number of server IP addresses to be tracked that are involved in any kind of DoS attacks to *20*:

```
firewall track-list attacking-servers 20
```

fw-and-nat action

This command allows you to create/configure/delete Firewall-and-NAT actions.

Important: This command is available only in 11.0 and later releases. This command must be used to configure the Stateful Firewall and NAT Action.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat action *action_name* **[-noconfirm]**

no fw-and-nat action *action_name*

no

If previously configured, deletes the specified Firewall-and-NAT action from the active charging service.

action_name

Specifies the Firewall-and-NAT action to add/configure/delete.
action_name must be the name of a Firewall-and-NAT action, and must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a Firewall-and-NAT action.
Entering this command results in the following prompt:
`[context_name]hostname(config-fw-and-nat-action)#`
Also see the *Firewall-and-NAT Action Configuration Mode Commands* chapter.

Example

The following command creates a Firewall-and-NAT action named *test1*, and changes to the Firewall-and-NAT Action Configuration Mode:

```
fw-and-nat action test1
```

fw-and-nat policy

This command allows you to create/configure/delete Firewall-and-NAT policies.

Important: This command is available only in StarOS 8.1 and in StarOS 9.0 and later releases. This command must be used to configure the Policy-based Stateful Firewall and NAT features.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat policy *policy_name* **[-noconfirm]**

no fw-and-nat policy *policy_name*

no

If previously configured, deletes the specified Firewall-and-NAT policy from the active charging service.

Important: When a Firewall-and-NAT policy is deleted, for all subscribers using the policy, Stateful Firewall and NAT processing is disabled, also ACS sessions for the subscribers are dropped. In case of session recovery, the calls are recovered but with Stateful Firewall and NAT disabled.

policy_name

Specifies the Firewall-and-NAT policy to add/configure/delete.
policy_name must be the name of a Firewall-and-NAT policy, and must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a Firewall-and-NAT policy.
Entering this command results in the following prompt:
`[context_name]hostname(config-fw-and-nat-policy)#`
Also see the *Firewall-and-NAT Policy Configuration Mode Commands* chapter.

Example

The following command creates a Firewall-and-NAT policy named *test321*, and changes to the Firewall-and-NAT Policy Configuration Mode:

```
fw-and-nat policy test321
```

group-of-objects

This command allows you to create/configure/delete an ACS group-of-objects.

Important: This command is available only in StarOS 10.2 and later releases.

Important: A maximum of 16 object groups can be configured in the active charging service. And a maximum of 128 objects can be configured within each object group.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

group-of-objects *objects_group_name* **[type string [-noconfirm]]**

no group-of-objects *objects_group_name*

no

If previously configured, deletes the specified group-of-objects from the active charging service.

objects_group_name

Specifies the group-of-objects to add/configure/delete.
objects_group_name must be the name of a group-of-objects, and must be an alphanumeric string of 1 through 63 characters.
If the named group-of-objects does not exist, it is created, and the CLI mode changes to the ACS Group-of-Objects Configuration Mode wherein the group can be configured.
If the named group-of-objects already exists, the CLI mode changes to the ACS Group-of-Objects Configuration Mode for that group.

type

Specifies the data type for the group-of-objects.

Important: "string" is the only data type supported in this release.

string

Specifies the data type as string.
When creating a group, specifying the data type is mandatory.
When modifying an existing group, specifying the data type is optional.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a group-of-objects.
Also see the *ACS Group-of-Objects Configuration Mode Commands* chapter.

Example

The following command creates a group-of-objects named *test4* with the data type string, and enters the ACS Group-of-Objects Configuration Mode:

```
group-of-objects test4 type string
```

group-of-prefixed-urls

This command allows you to create/configure/delete an ACS group-of-prefixed-URLs.

Important: This command is customer specific. For more information contact your Cisco account representative.

Important: A maximum of 64 group-of-prefixed-URL groups can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

group-of-prefixed-urls *prefixed_urls_group_name* **[-noconfirm]**

no group-of-prefixed-urls *prefixed_urls_group_name*

no

If previously configured, deletes the specified group-of-prefixed-urls from the active charging service.

prefixed_urls_group_name

Specifies the group-of-prefixed-urls to add/configure/delete.
prefixed_urls_group_name must be the name of a group-of-prefixed-urls, and must be an alphanumeric string of 1 through 63 characters.
If the named group-of-prefixed-urls does not exist, it is created, and the CLI mode changes to the ACS Group-of-Prefixed-URLs Configuration Mode wherein the group can be configured.
If the named group-of-prefixed-urls already exists, the CLI mode changes to the ACS Group-of-Prefixed-URLs Configuration Mode for that group.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a group-of-prefixed-URLs.
Also see the *ACS Group-of-Prefixed-URLs Configuration Mode Commands* chapter.

Example

The following command creates group-of-prefixed-urls named *test5*, and enters the ACS Group-of-Prefixed-URLs Configuration Mode:

```
group-of-prefixed-urls test5
```

group-of-ruledefs

This command allows you to create/configure/delete an ACS group-of-ruledefs.

Important: A maximum of 64 groups-of-ruledefs can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

group-of-ruledefs *ruledefs_group_name* **[-noconfirm]**

no group-of-ruledefs *ruledefs_group_name*

no

If previously configured, deletes the specified group-of-ruledefs from the active charging service.

ruledefs_group_name

Specifies the group-of-ruledefs to add/configure/delete.
ruledefs_group_name must be unique within the active charging service, and must be a string of 1 through 63 characters. Up 64 groups may be configured.
If the named group-of-ruledefs does not exist, it is created, and the CLI mode changes to the ACS Group-of-Ruledefs Configuration Mode wherein the group can be configured.
If the named group-of-ruledefs already exists, the CLI mode changes to the ACS Group-of-Ruledefs Configuration Mode for that group.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a group-of-ruledefs.
A group-of-ruledefs is a collection of rule definitions to use in access policy creation. The group-of-ruledefs name must be unique within the service.
Also see the *ACS Group-of-Ruledefs Configuration Mode Commands* chapter.

Example

The following command creates a group-of-ruledefs named *group1*, and enters the ACS Group-of-Ruledefs Configuration Mode:

```
group-of-ruledefs group1
```

h323 time-to-live

This command allows you to configure the time period for which an endpoint's registration to an H.323 gatekeeper is valid.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

h323 time-to-live *timeout*

default h323 time-to-live

default

Configures this command with its default setting.
Default: 3600 seconds

timeout

Specifies the timeout setting, in seconds.
timeout must be an integer from 1 through 2147483647.

Usage

Use this command to configure the time period for which an endpoint's registration to a gatekeeper is valid.

Example

The following command configures the time for an endpoint registration with a timeout setting of *5* seconds:

```
h323 time-to-live 5
```

h323 timeout

This command allows you to configure the timeout intervals for various H.323 requests.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

h323 timeout { admission *admission_timeout* **| discovery** *discovery_timeout* **| location** *location_timeout* **| registration** *registration_timeout* **| unregistration** *unregistration_timeout* **}**

default h323 timeout { admission | discovery | location | registration | unregistration }

default

Configures this command with the default setting for the specified parameters.

admission *admission_timeout*

Configures the timeout value for the admission request sent to the gatekeeper.
admission_timeout must be an integer from 1 through 20.
Default: 10 seconds

discovery *discovery_timeout*

Configures the timeout value for the gatekeeper request message sent to the Gatekeeper.
discovery_timeout must be an integer from 1 through 20.
Default: 10 seconds

location *location_timeout*

Configures the timeout value for the location request message sent to the Gatekeeper.
location_timeout must be an integer from 1 through 20.
Default: 10 seconds

registration *registration_timeout*

Configures the timeout value for the registration request message sent to the Gatekeeper.
registration_timeout must be an integer from 1 through 20.
Default: 6 seconds

unregistration *unregistration_timeout*

Configures the timeout value for the unregistration request message sent to the Gatekeeper.
unregistration_timeout must be an integer from 1 through 20.
Default: 3 seconds

Usage

Use this command to configure the timeout interval for the various H.323 requests.

Example

The following command configures the admission request message with a timeout value of *15* seconds:

```
h323 timeout admission 15
```

h323 tpkt

This command allows you to configure the maximum size of Transport Protocol Data Unit Packets (TPKT) that the H.323 Application Layer Gateway (ALG) can handle.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

h323 tpkt *max_tpkt_size*

default h323 tpkt

default

Configures this command with its default setting.
Default: 2048 bytes

max_tpkt_size

Specifies the maximum TPKT size, in bytes.
max_tpkt_size must be an integer from 4 through 4096.

Usage

Use this command to configure the maximum packet size for the H.323 ALG.

Example

The following command configures a maximum TPKT packet size of *100* bytes:

```
h323 tpkt 100
```

h323 version

This command allows you to configure the H.323 version number supported by an H.323 Application Layer Gateway (ALG).

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

h323 version *h323_version_number*

default h323 version

default

Configures this command with its default setting.
Default: 5

h323_version_number

Specifies the H.323 version number.
h323_version_number must be an integer from 1 through 7.

Usage

Use this command to configure the H.323 version number supported by the H.323 ALG.

Example

The following command configures the H.323 version as *1*:

```
h323 version 1
```

host-pool

This command allows you to create/configure/delete host pools.

Product

All

Privilege

Security Administrator, Administrator

Syntax

host-pool *host_pool_name* **[-noconfirm]**

no host-pool *host_pool_name*

no

If previously configured, deletes the specified host pool from the active charging service.

host_pool_name

Specifies the host pool to add/configure/delete.
host_pool_name must be the name of a host pool, and must be a string of 1 through 63 characters, and can contain punctuation characters.
If the named host pool does not exist, it is created, and the CLI mode changes to the ACS Host Pool Configuration Mode wherein the host pool can be configured.
If the named host pool already exists, the CLI mode changes to the ACS Host Pool Configuration Mode for that host pool.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete ACS host pools.
A host pool is a collection of hosts and IP addresses to use in access policy creation. The host pool name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names. A maximum of the 256 host pools can be created.

Important: Host pools configured in other ruledefs cannot be deleted.

Also see the *ACS Host Pool Configuration Mode Commands* chapter.

Example

The following command creates a host pool named *hostpool1*, and enters the ACS Host Pool Configuration Mode:

```
host-pool hostpool1
```

idle-timeout

This command allows you to configure the maximum duration a flow can remain idle for, after which the system automatically terminates the flow.

Product

ACS, NAT, FW

Privilege

Security Administrator, Administrator

Syntax

idle-timeout { alg-media | flow-mapping { tcp | udp } | icmp | tcp | udp } *idle_timeout*

{ default | no } idle-timeout { alg-media | flow-mapping { tcp | udp } | icmp | tcp | udp }

default

Configures this command with the default setting for the specified parameter.
Default:

- **alg-media**: 120 seconds
- **flow-mapping { tcp | udp }**: 300 seconds for TCP and 0 seconds for UDP
- **icmp**, **tcp**, **udp**: 300 seconds

no

Disables the idle-timeout configuration for the specified flow.

alg-media

Configures the ALG media for the specified flow.

flow-mapping { tcp | udp }

The Flow Mapping timer is an extension to the existing flow idle-timeout in ACS. This flow mapping timeout applies only for NAT enabled calls and is supported only for TCP and UDP flows. The purpose of this timer is to hold the resources (NAT IP, NAT port, Private IP NPU flow) associated with a 5-tuple flow until Mapping timeout expiry.
If the Flow Mapping timer is disabled, then the Mapping timeout will not get triggered for UDP/TCP idle timed out flows. The resources such as NAT mapping will be released along with the 5-tuple flow.

icmp

Configures the ICMP protocol for the specified flow.

tcp

Configures the TCP protocol for the specified flow.

udp

Configures the UDP protocol for the specified flow.

idle_timeout

Specifies the timeout duration, in seconds, and must be an integer from 0 through 86400.
For **alg-media** specifies the media inactivity timeout. The *idle_timeout* value gets applied on RTP and RTCP media flows that are created for SIP/H.323 calls. The timeout is applied only on those flows that actually match the RTP and RTCP media pinholes that are created by the SIP/H.323 ALG.
A value of 0 disables the idle-timeout setting.

Usage

Use this command to configure the maximum duration a flow can remain idle, in seconds, after which the system automatically terminates the flow.
Setting the value to 0 will cause the idle-timeout setting to be disabled.
For flows other than TCP, UDP and ICMP, timeout value will always be 300 seconds (unless configured in the charging-action). Charging action's flow idle-timeout will have precedence over ACS idle-timeout. If charging action's flow idle-timeout is default, then flows will have the value configured in the active charging service.

Example

The following command configures the maximum duration a TCP flow can remain idle to *3000* seconds, after which the system automatically terminates the flow:

```
idle-timeout tcp 3000
```

imsi-pool

This command allows you to create/configure/delete International Mobile Subscriber Identity (IMSI) pools.

Product

All

Privilege

Security Administrator, Administrator

Syntax

imsi-pool *imsi_pool_name* **[-noconfirm]**

no imsi-pool *imsi_pool_name*

no

If previously configured, deletes the specified IMSI pool from the active charging service.

imsi_pool_name

Specifies the IMSI pool to add/configure/delete.
imsi_pool_name must be the name of an IMSI pool, and must be an alphanumeric string of 1 through 63 characters, and can contain punctuation characters.
If the named IMSI pool does not exist, it is created, and the CLI mode changes to the ACS IMSI Pool Configuration Mode wherein the IMSI pool can be configured.
If the named IMSI pool already exists, the CLI mode changes to the ACS IMSI Pool Configuration Mode for that IMSI pool.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete pools of International Mobile Subscriber Identifier (IMSI) numbers having group of single or range of IMSI numbers to use in access policy creation. The IMSI pool name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names. A maximum of 256 IMSI pools can be created.

Important: IMSI pools configured in other ruledefs cannot be deleted.

Also see the *ACS IMSI Pool Configuration Mode Commands* chapter.

Example

The following command creates an IMSI pool named *imsipool1*, and enters the ACS IMSI Pool Configuration Mode:

```
imsi-pool imsipool1
```

ip dns-learnt-entries

This command allows you to configure how long to keep the snooped IPv4 addresses that were extracted from DNS responses.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip dns-learnt-entries timeout *timeout_period*

{ default | no } ip dns-learnt-entries timeout

default

Configures this command with the default DNS-learnt-entries timeout setting.
Default: 300 seconds

no

Specifies to always use the TTL value in the DNS response, and not the timeout configured with this command.

timeout_period

Specifies the DNS-learnt-entries timeout period, in seconds.
timeout_period must be an integer from 1 through 2147483647.

Usage

Use this command to configure how long to keep the snooped IPv4 addresses that were extracted from DNS responses—for the TTL specified in the DNS response, or for the time period configured with this command, if greater.
The configurable timer will be at global ECS level and shared across all IP addresses. Internally, a five-minute (300 seconds, non configurable) timer will be started whenever DNS analyzer is enabled. On timeout of this timer, all the learnt IP addresses will be checked for TTL expiry and the expired entries will be flushed.

Example

The following command specifies to keep the snooped IPv4 addresses that were extracted from DNS responses for a time period of *900* seconds, or for the TTL value specified in the DNS response, whichever is greater:

```
ip dns-learnt-entries timeout 900
```

ip max-fragments

This command allows you to limit the maximum number of IPv4/IPv6 fragments per fragment chain.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ip max-fragments *max_fragments*

default ip max-fragments

default

Configures this command with its default setting.
Default: 45

max_fragments

Specifies the maximum number of IPv4/IPv6 fragments per fragment chain.
max_fragments must be an integer from 1 through 300.

Usage

Use this command to limit the maximum number of IPv4/IPv6 fragments.

Example

The following command limits the maximum number of IPv4/IPv6 fragments to *100*:

```
ip max-fragments 100
```

label content-id

This command allows you to specify a label (text string) to associate with a content ID for UDRs/EDRs/eG-CDRs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

label content-id *content_id* **text** *label_text*

no label content-id *content_id*

no

If previously configured, deletes the specified label.

content-id *content_id*

Specifies the content ID to associate with the label.
content_id must be an integer from 1 through 65535.

text *label_text*

Specifies the label to associate with the specified content ID.
label_text must be an alphanumeric string of 1 through 64 characters.

Usage

Use this command to create a text label to associate with a content ID.
A maximum of 2048 labels can be configured in the active charging service.

Example

The following command creates the label *test_charge1* to be associated with the content ID *1378*:

```
label content-id 1378 text test_charge1
```

nat allocation-failure

This command allows you to configure the action to take when NAT IP/Port allocation fails.

Important: This command is available only in StarOS 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat allocation-failure send-icmp-dest-unreachable

{ default | no } nat allocation-failure
```

default

Configures this command with its default setting.
Default: Packets are dropped silently

no

If previously enabled, disables the NAT Allocation Failure configuration. Packets are dropped silently.

nat allocation-failure send-icmp-dest-unreachable

Specifies to send ICMP Destination Unreachable message when NAT IP/Port allocation fails.

Usage

Use this command to configure the action to take when NAT IP/port allocation fails—to send or not to send an “ICMP destination unreachable message” when a NAT IP/port cannot be assigned to a flow in data path.

Example

The following command configures sending ICMP Destination Unreachable message when NAT IP/Port allocation fails:

```
nat allocation-failure send-icmp-dest-unreachable
```

nat allocation-in-progress

This command allows you to configure the action to take on packets when NAT IP/NPU allocation is in progress.

Important: This command is available only in StarOS 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat allocation-in-progress { buffer | drop }

default nat allocation-in-progress
```

default

Configures this command with its default setting.
Default: **buffer**

buffer | drop

Specifies the action to take on packets when NAT IP/NPU allocation is in progress:

- **buffer**: Buffers the packets.
- **drop**:Drops the packets.

Usage

In On-demand NAT IP allocation (wherein NAT IP address is allocated to the subscriber when a packet is being sent), if no free NAT IP address is available, a NAT-IP Alloc Request is sent to the VPNMgr to get NAT-IP. During that time packets are dropped. This command enables buffering the packets received when IP Alloc Request is sent to VPNMgr.

Example

The following command specifies to buffer packets when NAT IP/NPU allocation is in progress:

```
nat allocation-in-progress buffer
```

nat tcp-2msl-timeout

This command allows you to configure the TCP 2MSL (Maximum Segment Lifetime) timeout value for NAT.

Important: This command is available only in StarOS 8.3 and later releases.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat tcp-2msl-timeout *timeout*

default nat tcp-2msl-timeout

default

Configures this command with its default setting.
Default: 60 seconds

timeout

Specifies the TCP 2MSL timeout period, in seconds.
timeout must be an integer from 30 through 240.

Usage

Use this command to configure the TCP 2MSL timeout value for NAT.

Example

The following command configures the TCP 2MSL timeout for NAT to *120* seconds:

```
nat tcp-2msl-timeout 120
```

p2p-detection protocol

This command enables/disables the detection of all or specified peer-to-peer (P2P) protocols.

Product

ADC

Privilege

Security Administrator, Administrator

Syntax

[no] p2p-detection protocol [actsync | aimini | all | antsp2p | applejuice | ares | armagettron | battlefld | bittorrent | blackberry | citrix | clubpenguin | crossfire | ddlink | directconnect | dofus | edonkey | facebook | facetime | fasttrack | feidian | fiesta | filetopia | florensia | freenet | fring | funshion | gadugadu | gamekit | gmail | gnutella | gtalk | guildwars | halflife2 | hamachivpn | iax | icecast | imesh | imo | iptv | irc | isakmp | iskoot | itunes | jabber | kontiki | manolito | maplestory | meebo | mgcp | msn | mute | mypeople | myspace | netmotion | nimbuzz | octoshape | off | ogg | oovoo | openft | openvpn | orb | oscar | paltalk | pando | pandora | popo | pplive | ppstream | ps3 | qq | qqgame | qqlive | quake | quicktime | rdp | rdt | rfactor | rmstream | scydo | secondlife | shoutcast | skinny | skype | slingbox | sopcast | soulseek | splashfighter | spotify | ssdp | stealthnet | steam | stun | tango | teamspeak | teamviewer | thunder | tor | truphone | tunnelvoice | tvants | tvuplayer | twitter | ultrabac | usenet | uusee | veohtv | viber | vpnx | vtun | warcft3 | whatsapp | wii | winmx | winny | wmstream | wofkungfu | wofwarcraft | xbox | xdcc | yahoo | yourfreetunnel | zattoo +]

all

Specifies to detect all supported P2P protocols. Specifying **all** is the same as individually configuring each of the following protocols.

actsync

Specifies to detect ActiveSync protocol.

aimini

Specifies to detect Aimini protocol.

antsp2p

Specifies to detect ANts P2P protocol.

applejuice

Specifies to detect Applejuice protocol.

ares

Specifies to detect Ares Galaxy protocol.

armagettron

Specifies to detect Armagetron protocol.

battlefld

Specifies to detect Battlefield protocol.

bittorrent

Specifies to detect BitTorrent protocol.

blackberry

Specifies to detect BlackBerry protocol.

citrix

Specifies to detect Citrix Independent Computing Architecture (ICA) protocol.

clubpenguin

Specifies to detect Club Penguin protocol.

crossfire

Specifies to detect Crossfire protocol.

ddlink

Specifies to detect DDLink protocol.

directconnect

Specifies to detect Direct Connect protocol.

dofus

Specifies to detect DOFUS protocol.

edonkey

Specifies to detect eDonkey protocol.

facebook

Specifies to detect Facebook protocol.

facetime

Specifies to detect FaceTime protocol.

Important: The **facetime** protocol option is available only in 9.0 and in 11.0 and later releases.

fasttrack

Specifies to detect FastTrack protocol.

feidian

Specifies to detect Feidian protocol.

fiesta

Specifies to detect FIESTA protocol.

filetopia

Specifies to detect Filetopia protocol.

florensia

Specifies to detect Florensia protocol.

freenet

Specifies to detect Freenet protocol.

fring

Specifies to detect Fring SIP protocol.

funshion

Specifies to detect Funshion protocol.

gadugadu

Specifies to detect Gadu-Gadu protocol.

gamekit

Specifies to detect GameKit protocol.

Important: The **gamekit** protocol option is available only in 9.0 and in 11.0 and later releases.

gmail

Specifies to detect Gmail protocol.

gnutella

Specifies to detect Gnutella protocol.

gtalk

Specifies to detect Google Talk protocol.

guildwars

Specifies to detect GuildWars protocol.

halflife2

Specifies to detect Half-Life 2 protocol.

hamachivpn

Specifies to detect Hamachi VPN protocol.

iax

Specifies to detect Inter-Asterisk eXchange protocol.

icecast

Specifies to detect Icecast protocol.

imesh

Specifies to detect iMesh protocol.

imo

Specifies to detect Imo.im instant messenger protocol.

iptv

Specifies to detect IPTV protocol.

irc

Specifies to detect Internet Relay Chat protocol.

isakmp

Specifies to detect Internet Security Association and Key Management Protocol.

iskoot

Specifies to detect iSkoot VoIP protocol.

itunes

Specifies to detect iTunes protocol.

jabber

Specifies to detect Jabber XMPP protocol.

kontiki

Specifies to detect Kontiki delivery protocol.

manolito

Specifies to detect MANOLITO protocol.

maplestory

Specifies to detect MapleStory protocol.

meebo

Specifies to detect Meebo protocol.

mgcp

Specifies to detect Media Gateway Control Protocol.

msn

Specifies to detect MSN Messenger protocol.

mute

Specifies to detect MUTE protocol.

mypeople

Specifies to detect My People protocol.

myspace

Specifies to detect MySpace protocol.

netmotion

Specifies to detect NetMotion Internet Mobility Protocol.

nimbuzz

Specifies to detect Nimbuzz protocol.

octoshape

Specifies to detect Octoshape protocol.

off

Specifies to detect Off-The-Record protocol.

ogg

Specifies to detect Ogg multimedia streaming protocol.

oovoo

Specifies to detect ooVoo protocol.

openft

Specifies to detect OpenFT protocol.

openvpn

Specifies to detect OpenVPN protocol.

orb

Specifies to detect Internet Inter-ORB Protocol.

oscar

Specifies to detect Open System for CommunicAtion in Realtime protocol.

paltalk

Specifies to detect Paltalk protocol.

pando

Specifies to detect Pando protocol.

pandora

Specifies to detect Pandora protocol.

popo

Specifies to detect Popo protocol.

pplive

Specifies to detect PPlive protocol.

ppstream

Specifies to detect PPstream protocol.

ps3

Specifies to detect PS3 protocol.

qq

Specifies to detect Tencent QQ instant messaging protocol.

qqgame

Specifies to detect QQgame protocol.

qqlive

Specifies to detect QQlive protocol.

quake

Specifies to detect Quake network protocol.

quicktime

Specifies to detect QuickTime protocol.

rdp

Specifies to detect Remote Desktop protocol.

rdt

Specifies to detect Real Data Transport (RDT) protocol.

rfactor

Specifies to detect rFactor protocol.

rmstream

Specifies to detect RealMedia streaming protocol.

scydo

Specifies to detect Scydo VoIP protocol.

secondlife

Specifies to detect Second Life protocol.

shoutcast

Specifies to detect SHOUTcast protocol.

skinny

Specifies to detect Skinny Call Control Protocol (SCCP).

skype

Specifies to detect Skype protocol.

slingbox

Specifies to detect Slingbox protocol.

sopcast

Specifies to detect Sopcast streaming protocol.

soulseek

Specifies to detect Soulseek chat and file transfer protocol.

splashfighter

Specifies to detect SplashFighter protocol.

spotify

Specifies to detect Spotify music streaming protocol.

ssdp

Specifies to detect Simple Service Discovery Protocol.

stealthnet

Specifies to detect StealthNet RShare network protocol.

steam

Specifies to detect Steam file transfer protocol.

stun

Specifies to detect Session Traversal Utilities for NAT protocol.

tango

Specifies to detect TAco Next Generation Objects hardware control system protocol.

teamspeak

Specifies to detect TeamSpeak VoIP gaming client protocol.

teamviewer

Specifies to detect TeamViewer remote control protocol.

thunder

Specifies to detect Thunder (Xunlei) download manager protocol.

tor

Specifies to detect Tor hidden service (anonymizer) protocol.

truphone

Specifies to detect Truphone WiFi VoIP protocol.

tunnelvoice

Specifies to detect Tunnel VoIP protocol.

tvants

Specifies to detect TVAnts protocol.

tvuplayer

Specifies to detect TVUPlayer protocol.

twitter

Specifies to detect Twitter protocol.

ultrabac

Specifies to detect UltraBac protocol.

usenet

Specifies to detect Usenet Network News Transfer Protocol (NNTP) protocol.

uusee

Specifies to detect UUSee on-demand streaming protocol.

veohtv

Specifies to detect VeohTV television via Internet protocol.

viber

Specifies to detect Viber VoIP protocol.

vpnx

Specifies to detect VPN-X cross-platform protocol.

vtun

Specifies to detect VTun (Virtual Tunnel) protocol.

warcft3

Specifies to detect Warcraft 3 game protocol.

whatsapp

Specifies to detect WhatsApp messaging protocol.

wii

Specifies to detect Wii Remote Bluetooth protocol.

winmx

Specifies to detect WinMX Peer Network Protocol (WPNP).

winny

Specifies to detect Winny anonymizing protocol.

wmstream

Specifies to detect Windows Media HTTP Streaming Protocol.

wofkungfu

Specifies to detect wofkungfu protocol.

wofwarcraft

Specifies to detect World of Warcraft gaming protocol.

xbox

Specifies to detect Xbox protocol.

xdcc

Specifies to detect eXtended Direct Client-to-Client protocol.

yahoo

Specifies to detect Yahoo! Messenger protocol.

yourfreetunnel

Specifies to detect your free Tunnel chat protocol.

zattoo

Specifies to detect Zattoo IPTV protocol.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to configure the detection of all or specific P2P protocol(s). Multiple keywords can be specified in a single command.

Example

The following command enables detection of all P2P protocols:

```
p2p-detection protocol all
```

packet-filter

This command allows you to create/configure/delete ACS packet filters.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

packet-filter *packet_filter_name* **[-noconfirm]**

no packet-filter *packet_filter_name*

no

If previously configured, deletes the specified packet filter from the active charging service.

packet_filter_name

Specifies the packet filter to add/configure/delete.
packet_filter_name must be the name of a packet filter, and must be an alphanumeric string of 1 through 63 characters.
If the named packet filter does not exist, it is created, and the CLI mode changes to the ACS Packet Filter Configuration Mode wherein the packet filter can be configured.
If the named packet filter already exists, the CLI mode changes to the ACS Packet Filter Configuration Mode for that packet filter.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS packet filter.
Also see the *ACS Packet Filter Configuration Mode Commands* chapter.

Example

The following command creates a packet filter named *filter3*, and enters the ACS Packet Filter Configuration Mode:

```
packet-filter filter3
```

passive-mode

This command allows you to configure the Active Charging Service to operate in passive mode, wherein ACS passively monitors copies of packets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] passive-mode
```

no

If previously enabled, disables the passive mode configuration.

default

Configures this command with its default setting.
Default: Disabled

Usage

Use this command to put the active charging service in/out of passive mode operation, wherein ACS passively monitors copies of packets.

Example

The following command puts the active charging service into passive mode operation:

```
passive-mode
```

policy-control bearer-bw-limit

This command allows you to enable/disable per-bearer MBR policing—bandwidth limiting.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
{ default | no } policy-control bearer-bw-limit
```

default

Configures this command with its default setting.
Default: Enable; by default, per-bearer MBR policing is enabled.

no

Disables per-bearer MBR policing.

Usage

This command allows you to enable/disable per-bearer bandwidth limiting based on bitrates received over Gx. Note that there are only two variants of this command, the default and no variants.

policy-control bind-default-bearer

For PCEF Bearer Binding in 3G and when BCM mode is UE only, this command allows you to enable/disable binding rules having QCI of default bearer to the default bearer and to not ignore/ignore other rules.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] policy-control bind-default-bearer
```

default

Configures this command with its default setting.
Default: Disables binding rules having QCI of default bearer to the default bearer and specifies to not ignore other rules.

no

Enables binding rules having QCI of default bearer to the default bearer and specifies to ignore other rules.

Usage

For PCEF Bearer Binding in 3G and when BCM mode is UE only, use this command to enable/disable binding rules having QCI of default bearer to the default bearer and to not ignore/ignore other rules respectively.

policy-control burst-size

This command allows you to configure the burst size for bandwidth limiting per dynamic-rule or per bearer.

Product

All

Privilege

Security Administrator, Administrator

Syntax

policy-control burst-size { auto-readjust [duration *duration* **] | bytes** *bytes* **}**

{ default | no } policy-control burst-size

default | no

Configures this command with its default setting.
Default: 65535 bytes

duration *duration*

Configures the burst size equal to <seconds> of traffic.
duration must be an integer from 1 through 20.
Default: In 12.1 and earlier releases, 10 seconds. In 12.2 and later releases, 5 seconds.

bytes *bytes*

Specifies the burst size, in bytes.
bytes must be an integer from 1 through 4000000000.

Usage

Use this command to configure the burst size for bandwidth limiting per dynamic-rule or per bearer.

Example

The following command configures the burst size for bandwidth limiting per dynamic-rule or per bearer equal to 10 seconds of traffic:

```
policy-control burst-size auto-readjust
```

policy-control charging-action-override

This command allows you to enable/disable overriding charging parameters of static rule with those of an ip-any rule or a specified dynamic rule.

Important: This command is customer specific. For more information contact your Cisco account representative.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

policy-control charging-action-override custom1 [use-rule *dynamic_rule_name* **]**

{ default | no } policy-control charging-action-override

default

Configures this command with its default setting.
Default: Enables overriding charging parameters of static rule with those of an ip-any or a specified dynamic rule.

no

Disables overriding charging parameters of static rule with those of an ip-any or a specified dynamic rule.

custom1

Specifies overriding Online/Offline, Service ID, Content ID, Flow Control, ARP, and QCI.

use-rule *dynamic_rule_name*

Optional: Specifies the dynamic rule to inherit charging parameters from. If a dynamic rule name is not specified, the charging properties will be inherited from any dynamic rule.
dynamic_rule_name specifies name of the dynamic rule, and must be an alpha and/or numeric string of 1 through 63 characters in length.

Usage

Use this command to enable/disable overriding charging parameters of static rule with those of a dynamic ip-any rule or a specified dynamic rule.

Example

The following command specifies to enable overriding charging parameters of static rule with those of a dynamic rule named *test*:

```
policy-control charging-action-override custom1 use-rule test
```

policy-control charging-rule-base-name

This command allows you to configure how the Charging-Rule-Base-Name AVP from PCRF is interpreted, either as ACS rulebase or ACS group-of-ruledefs.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
policy-control charging-rule-base-name { active-charging-group-of-ruledefs | active-charging-rulebase [ ignore-when-removed ] [ use-first ]}

default policy-control charging-rule-base-name

no policy-control charging-rule-base-name active-charging-rulebase use-first
```

default

Configures this command with its default setting(s).
Default:

- **charging-rule-base-name**: **active-charging-group-of-ruledefs**
- **use-first**: Disabled

no

If multiple Charging-Rule-Base-Name are received from the PCRF, specifies to select the last rulebase. This is the default behavior.

active-charging-group-of-ruledefs

Specifies interpreting Charging-Rule-Base-Name as ACS group-of-ruledefs.

active-charging-rulebase [ignore-when-removed][use-first]

Specifies interpreting Charging-Rule-Base-Name as ACS rulebase.
When Charging-Rule-Base-Name AVP is interpreted as ACS rulebase, if PCRF requests the removal of a Charging-Rule-Base-Name, which is the same as the rulebase used for that PDP context, the PDP context is terminated. This is because after removal of the rulebase, the PDP context will have no rulebase. This is the default behavior.
ignore-when-removed: Specifies to ignore PCRF request for removal of Charging-Rule-Base-Name, and take no action. If this keyword is not configured, the PDP context from which the rulebase is removed gets terminated.
use-first: If multiple Charging-Rule-Base-Name are received from the PCRF, since a call can only have one ACS rulebase applied, specifies to select the first rulebase. If previously enabled, to disable this configuration, use the **no policy-control charging-rule-base-name active-charging-rulebase use-first** command. If this keyword is not configured, by default, the last rulebase is selected. For each call, this interpretation is decided at call setup, and will not be changed during the life of that call. Change will only apply to new calls coming up after the change.

Usage

Use this command to configure interpretation of Charging-Rule-Base-Name AVP from PCRF either as ACS group-of-ruledefs or as ACS rulebase.

Example

The following command configures interpreting of Charging-Rule-Base-Name AVP as ACS rulebase:

```
policy-control charging-rule-base-name active-charging-rulebase
```

policy-control dynamic-rule-limit

This command allows you to enable/disable per-dynamic-rule MBR policing—bandwidth limiting.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
{ default | no } policy-control dynamic-rule-limit
```

default

Configures this command with its default setting.
Default: Enable; by default, per-dynamic-rule MBR policing is enabled.

no

Disables per-dynamic-rule MBR policing.

Usage

This command allows you to enable/disable per-dynamic-rule bandwidth limiting based on bitrates received over Gx. Note that there are only two variants of this command, the default and no variants.

policy-control retransmissions-counted

This command allows you to enable/disable charging of retransmitted packets when they hit a dynamic rule.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] policy-control retransmissions-counted
```

default | no

Disables charging of retransmitted packets when they hit a dynamic rule.
Default: Disabled; no retransmissions counted.

Usage

Use this command to enable/disable charging of retransmitted packets when they hit a dynamic rule.

Example

The following command enables retransmissions to be charged when they hit a dynamic rule:

```
policy-control retransmissions-counted
```

policy-control update-default-bearer

For PCEF Bearer Binding in LTE, this command allows you to enable/disable sending updates that control the default bearer to the subscriber.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] policy-control update-default-bearer
```

default

Configures this command with its default setting.
Default: Enables sending updates towards subscriber on default bearer.

no

Disables sending updates towards subscriber on default bearer.

Usage

For PCEF Bearer Binding in LTE, use this command to enable/disable sending updates like change in TFT, change in bit-rates, and so on towards the subscriber, in downlink direction, on default bearer.

port-map

This command allows you to create/configure/delete port maps.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port-map *port_map_name* **[-noconfirm]**

no port-map *port_map_name*

no

If previously configured, deletes the specified port map from the active charging service.

port_map_name

Specifies the port map to add/configure/delete.
port_map_name must be the name of a port map, and must be an alphanumeric string of 1 through 63 characters, and can contain punctuation characters.
If the named port map does not exist, it is created, and the CLI mode changes to the ACS Port Map Configuration Mode wherein the port map can be configured.
If the named port map already exists, the CLI mode changes to the ACS Port Map Configuration Mode for that port map.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS port map.
The port map name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names. A maximum of the 256 port maps can be created.

Important: Port maps in use in other ruledefs cannot be deleted.

Also see the *ACS Port Map Configuration Mode Commands* chapter.

Example

The following command creates a port map named *portmap1*, and enters the ACS Port Map Configuration Mode:

```
port-map portmap1
```

redirect user-agent

This command allows you to specify the user agent for conditional redirection of traffic flows.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] redirect user-agent *user_agent_name*

no

If previously configured, deletes the specified user agent from the active charging service.

user_agent_name

Specifies the user agent to be used for redirecting traffic flow.
user_agent_name must be the name of a user agent, and must be an alphanumeric string of 1 through 32 characters.
A maximum of 16 user-agents can be configured in the active charging service.

Usage

Use this command to redirect the traffic flow with conditions based on configured user-agent name. This user agent is used with **flow action** command in the ACS Charging Action Configuration Mode.

Example

The following command specifies the redirect user agent *user_rule1* for conditional redirection of traffic flow:

```
redirect user-agent user_rule1
```

rulebase

This command allows you to create/configure/delete ACS rulebases.

Important: A maximum of 512 rulebases can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
rulebase rulebase_name [ -noconfirm ]

no rulebase rulebase_name
```

no

If previously configured, deletes the specified rulebase from the active charging service.

rulebase_name

Specifies the rulebase to add/configure/delete.
rulebase_name must be the name of an ACS rulebase, and must be an alphanumeric string of 1 through 63 characters, and can contain punctuation characters.
If the named rulebase does not exist, it is created, and the CLI mode changes to the ACS Rulebase Configuration Mode wherein the rulebase can be configured.
If the named rulebase already exists, the CLI mode changes to the ACS Rulebase Configuration Mode for that rulebase.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS rulebase. A rulebase is a collection of protocol rules to match a flow and associated actions to be taken for matching flow. The *rulebase_name* must be unique in the active charging service.
The default rulebase is used when a subscriber/APN is not configured with a specific rulebase to use.
Also see the *ACS Rulebase Configuration Mode Commands* chapter.

Example

The following command creates a rulebase named *test1*, and enters the ACS Rulebase Configuration Mode:

```
rulebase test1
```

ruledef

This command allows you to create/configure/delete ACS rule definitions.

Important: A maximum of 2048 ruledefs can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ruledef *ruledef_name* **[-noconfirm]**

no ruledef *ruledef_name*

no

If previously configured, deletes the specified ruledef from the active charging service.

ruledef_name

Specifies the ruledef to add/configure/delete.
ruledef_name must be the name of an ACS ruledef, and must be an alphanumeric string of 1 through 63 characters, and can contain punctuation characters.
ruledef_name must be unique with in the service. Host pool, port map, IMSI pool, and firewall, routing, and charging ruledefs must have unique names.
If the named ruledef does not exist, it is created, and the CLI mode changes to the ACS Ruledef Configuration Mode wherein the ruledef can be configured.
If the named ruledef already exists, the CLI mode changes to the ACS Ruledef Configuration Mode for that ruledef.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an ACS ruledef.
A ruledef represents a set of matching conditions across multiple L3 – L7 protocol based on protocol fields and state information. Each ruledef can be used across multiple rulebases within the active charging service.
Also see the *ACS Ruledef Configuration Mode Commands* chapter.

Example

The following command creates an ACS ruledef named *test1*, and enters the ACS Ruledef Configuration Mode:

```
ruledef test1
```

system-limit l4-flows

This command allows you to configure the system-wide Layer 4 flow limit.

Important: This command is customer specific. For more information contact your Cisco account representative.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

system-limit l4-flows *limit*

{ default | no } system-limit l4-flows

default

Configures this command with its default setting.
Default: Disabled; same as **no system-limit l4-flows**

no

Disables the limit checking configuration.

limit

Specifies the Layer 4 flows limit.
limit must be an integer from 1 through 2147483647.

Usage

Use this command to configure the system-wide limit for Layer 4 flows.
The System-wide L4 Flow Limiting feature provides the capability to limit the number of TCP and UDP flow over the system. This limiting can be applied to all subscribers attaching to the system and to all APNs. This feature is compatible with the existing per-subscriber limiting (configured using the flow limit-for-flow-type charging action). Both limiting can be active in the same time.
System-wide flow limiting is implemented by comparing the "Effective Flows" periodically (~ every 10 seconds) against the configurable "System-wide Flow Limit". Where "Effective Flows" is the number of active data sessions, each identified by the 5-tuple key. If the "Effective Flows" exceeds the "System-wide Flow Limit", the Resource Manager indicates it to the active charging service. When ACS is aware of the "System-wide Flow Limit" being reached, no more data sessions are setup. The packets are discarded. While processing a successive flow-usage update from active charging service a change in behavior is indicated to active charging service to start accepting data sessions. As this relies on periodic reporting there is an inherent delay in the detection of "exceeding/returning once exceeded" to the flow limit.

Example

The following command sets the system limit for L4 flows to *100*:

```
system-limit l4-flows 100
```

tethering-database

This command allows you to enable/disable the Tethering Detection feature, and load the databases from the specified files into the service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

tethering-database [os-signature *os_signature_db_file_name* **| tac** *tac_db_file_name* **| ua-signature** *ua_signature_db_file_name* **] +**

{ default | no } tethering-database

default

Configures this command with its default setting.
Default: Tethering Detection feature is disabled, and the database file names are reset to their default values.

no

Disables Tethering Detection.

tethering-database os-signature *os_signature_db_file_name*

Specifies the OS Signature database file to load.
os_signature_db_file_name must be the name of the OS Signature database file, and must be an alphanumeric string of 1 through 255 characters.

tethering-database tac *tac_db_file_name*

Specifies the TAC database file to load.
tac_db_file_name must be the name of a TAC database file, and must be an alphanumeric string of 1 through 255 characters.

tethering-database ua-signature *ua_signature_db_file_name*

Specifies the User Agent (UA) Signature database file to load.
ua_signature_db_file_name must be the name of a UA Signature database file, and must be an alphanumeric string of 1 through 255 characters.

+

Indicates that more than one of the preceding option can be entered in a single command.

Usage

Use this command to enable the Tethering Detection feature, and load the OS, TAC, and UA databases from the specified files into the service.
Tethering refers to the use of a smartphone as a USB dongle/modem to provide Internet connectivity to laptops/PDAs/tablets like iPad, using the smartphone's data plan. Typically many operators have in place an

eat-all-you-can-get data plan for smartphones, the usage of which is intended to be from the smartphone as a mobile device. However, some users use the low rate/unlimited usage of data plan to provide Internet connectivity to their laptops in places where normal Internet connection via broadband/WiFi might be more costly/not available/insecure.
Operators are interested in detecting such usage of a smartphone as a modem to better understand the usage across their networks and offer plans inline to that usage to their customers. They may also charge the tethered and non-tethered traffic separately.
After Tethering Detection has been enabled here (regardless, it must also be enabled within the rulebase), this CLI command may be used to change the databases with the specified databases.
The files are picked from the disk file system within the /databases directory. If a file name value is not configured, the default file names, *os-db*, *tac-db*, and *ua-db*, are used.
For more information on the Tethering Detection feature, refer to the *Enhanced Charging Services Administration Guide*.

Example

The following command enables Tethering Detection and selects the UA Signature database file named *test*:

```
tethering-database ua-signature test
```

timedef

This command allows you to create/configure/delete ACS Time Definitions (timedefs).

Important: This command is available only in StarOS 8.1 and in StarOS 9.0 and later releases.

Important: A maximum of 10 timedefs can be configured in the active charging service.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

timedef *timedef_name* **[-noconfirm]**

no timedef *timedef_name*

no

If previously configured, deletes the specified timedef from the active charging service.

timedef_name

Specifies the timedef to add/configure/delete.
timedef_name must be the name of a timedef, and must be an alphanumeric string of 1 through 63 characters.
If the named timedef does not exist, it is created, and the CLI mode changes to the ACS Timedef Configuration Mode wherein timeslots for the timedef can be configured.
If the named timedef already exists, the CLI mode changes to the ACS Timedef Configuration Mode for that timedef.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete ACS timedefs for the Time-of-Day Activation/Deactivation of Rules feature. Timedefs enable activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only when they are active.
Also see the *ACS Timedef Configuration Mode Commands* chapter.

Example

The following command creates a timedef named *test1*, and enters the ACS Timedef Configuration Mode:

```
timedef test1
```

tpo policy

This command allows you to create/configure/delete Traffic Performance Optimization (TPO) policies.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

tpo policy *tpo_policy_name* **[-noconfirm]**

no tpo policy *tpo_policy_name*

no

If previously configured, deletes the specified TPO policy from the active charging service.

tpo_policy_name

Specifies the TPO policy to add/configure/delete.
tpo_policy_name must be the name of a TPO policy, and must be an alphanumeric string of 1 through 63 characters.
If the named TPO policy does not exist, it is created, and the CLI mode changes to the ACS TPO Policy Configuration Mode wherein the TPO policy can be configured.
If the named TPO policy already exists, the CLI mode changes to the ACS TPO Policy Configuration Mode for that TPO policy.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Important: A maximum of 2048 TPO policies can be created in the active charging service.

Use this command to create/configure/delete TPO policies.
A TPO Policy contains the rules that determine which TPO profile is to be used.
Also see the *ACS TPO Policy Configuration Mode Commands* chapter.

Example

The following command creates a TPO policy named *tpo_policy_1*, and enters the ACS TPO Policy Configuration Mode:

```
tpo policy tpo_policy_1
```

tpo profile

This command allows you to create/configure/delete Traffic Performance Optimization (TPO) profiles.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

tpo profile *tpo_profile_name* **[-noconfirm]**

no tpo profile *tpo_profile_name*

no

If previously configured, deletes the specified TPO profile from the active charging service.

tpo_profile_name

Specifies the TPO profile to add/configure/delete.
tpo_profile_name must be the name of a TPO profile, and must be an alphanumeric string of 1 through 63 characters.
If the named TPO profile does not exist, it is created, and the CLI mode changes to the ACS TPO Profile Configuration Mode wherein the TPO profile can be configured.
If the named TPO profile already exists, the CLI mode changes to the ACS TPO Profile Configuration Mode for that TPO profile.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Important: A maximum of 2048 TPO profiles can be created in the active charging service.

Use this command to create/configure/delete TPO profiles.
A TPO profile contains the optimization configuration to be used.
Also see the *ACS TPO Profile Configuration Mode Commands* chapter.

Example

The following command creates a TPO profile named *tpo_profile_1*, and enters the ACS TPO Profile Configuration Mode:

```
tpo profile tpo_profile_1
```

udr-format

This command allows you to create/configure/delete a User Data Record (UDR) format.

Product

All

Privilege

Security Administrator, Administrator

Syntax

udr-format *udr_format_name* **[-noconfirm]**

no udr-format *udr_format_name*

no

If previously configured, deletes the specified UDR format from the active charging service.

udr_format_name

Specifies the UDR format to add/configure/delete.
udr_format_name must be the name of a UDR format, and must be an alphanumeric string of 1 through 63 characters.
If the named UDR format does not exist, it is created, and the CLI mode changes to the UDR Format Configuration Mode wherein the UDR format can be configured.
If the named UDR format already exists, the CLI mode changes to the UDR Format Configuration Mode for that UDR format.
Up to 256 UDR and/or EDR formats can be configured in the active charging service.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete a UDR format in the active charging service.
Also see the *UDR Format Configuration Mode Commands* chapter.

Example

The following command creates an UDR format named *udr_fromat1* and changes to the UDR Format Configuration Mode:

```
udr-format udr_format1
```

url-blacklisting match-method

This command allows you to specify the match method to look up URLs in the URL Blacklisting database.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
url-blacklisting match-method { exact | generic }

default url-blacklisting match-method
```

default

Configures this command with its default setting.
Default: **exact**

exact

Specifies the exact-match method, wherein URL Blacklisting is performed only on exact match with a URL present in the URL Blacklisting database.

generic

Specifies the generic-match method, wherein URL Blacklisting is performed on a generic match with URLs present in the URL Blacklisting database.

Usage

Use this command to set the match method to look up URLs in the URL Blacklisting database.

Example

The following command sets the exact-match method to look up URLs in the URL Blacklisting database:

```
url-blacklisting match-method exact
```

xheader-format

This command allows you to create/configure/delete ACS extension-header (x-header) format specifications.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

xheader-format *xheader_format_name* **[-noconfirm]**

no xheader-format *xheader_format_name*

no

If previously configured, deletes the specified x-header format from the active charging service.

xheader_format_name

Specifies the x-header format to add/configure/delete.
xheader_format_name must be the name of an xheader format, and must be an alphanumeric string of 1 through 63 characters.
If the named x-header format does not exist, it is created, and the CLI mode changes to the ACS X-header Format Configuration Mode wherein the x-header format can be configured.
If the named x-header format already exists, the CLI mode changes to the ACS X-header Format Configuration Mode for that x-header format.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to create/configure/delete an x-header format specification in the active charging service.
An x-header may be specified in a charging action to be inserted into HTTP GET and POST request packets.
See **xheader-insert** CLI command in the *ACS Charging Action Configuration Mode Commands* chapter.
Also see the *ACS X-header Format Configuration Mode Commands* chapter.

Example

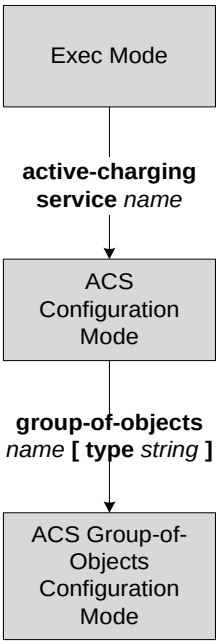
The following command creates an x-header format named *test*, and enters the ACS X-header Format Configuration Mode:

```
xheader-format test
```

Chapter 9
ACS Group-of-Objects Configuration Mode Commands

The ACS Group-of-Objects Configuration Mode is used to configure groups of Active Charging Service (ACS) objects.

Important: This configuration mode is available only in 10.2 and later releases.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

member-object

This command allows you to add or remove objects from the current group-of-objects.

Important: A maximum of 128 objects can be added to a group-of-objects.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] member-object *object*

no

If previously added, removes the specified member object from the current group-of-objects.

object

Specifies the member object to add to or remove from the current group-of-objects.
object must be an alpha and/or numeric string of 1 through 63 characters.

Usage

Use this command to add or remove member objects from a group-of-objects.

Example

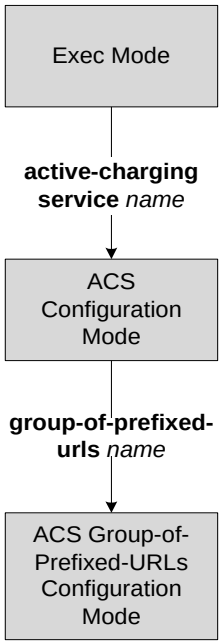
The following command adds the object *test* to the current group-of-objects:

```
member-object test
```

Chapter 10
ACS Group-of-Prefixed-URLs Configuration Mode Commands

The ACS Group-of-Prefixed-URLs Configuration Mode is used to create and configure groups of prefixed URLs.

Important: This configuration mode is customer specific. For more information, contact your Cisco account representative.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

prefixed-url

This command allows you to add or remove URLs from the current group of prefixed URLs.

Important: A maximum of 10 URLs can be added per group.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] prefixed-url` *`url`*

`no`

If added previously, removes the specified URL from the current group of prefixed URLs.

`url`

Specifies the URL to add/remove.
`url` must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to add or remove URLs to be filtered from the group of prefixed URLs.

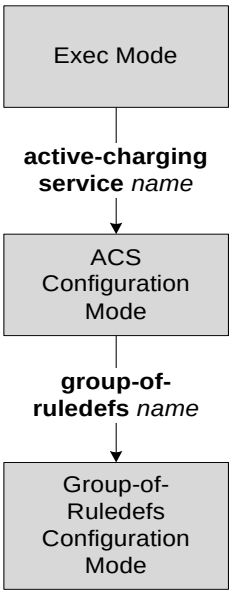
Example

The following command adds the URL *`http://abc.net`* to the current group of prefixed URLs:

```
prefixed-url http://abc.net
```

Chapter 11
ACS Group-of-Ruledefs Configuration Mode Commands

The ACS Group-of-Ruledefs Configuration Mode is used to configure groups of rule definitions (ruledefs).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

add-ruledef

This command allows you to add or remove ruledefs from a group-of-ruledefs.

Important: A maximum of 128 ruledefs can be added to a group-of-ruledefs.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

add-ruledef priority *ruledef_priority* **ruledef** *ruledef_name*

no add-ruledef priority *ruledef_priority*

no

If previously configured, specifies that the ruledef associated with the specified priority number be removed from the current group-of-ruledefs.

priority *ruledef_priority*

Specifies priority of the ruledef in the current group-of-ruledefs.
ruledef_priority must be unique in the group-of-ruledefs, and must be an integer from 1 through 10000.

ruledef *ruledef_name*

Specifies name of the ruledef to add to the current group-of-ruledefs.
ruledef_name must be the name of an ACS ruledef, and must be an alpha and/or numeric string of 1 through 63 characters.

Usage

Use this command to add/remove ruledefs from a group-of-ruledefs.
A group-of-ruledefs can contain optimizable ruledefs. Whether a group is optimized or not is decided on whether all the ruledefs in the group-of-ruledefs can be optimized, and if the group is included in a rulebase that has optimization turned on, then the group will be optimized.
When a new ruledef is added, it is checked if it is included in any group-of-ruledefs, and whether it needs to be optimized, etc.

Example

The following command adds the ruledef *ruledef23* to the current group-of-ruledefs, and assigns it a priority of *3*:

```
add-ruledef priority 3 ruledef ruledef23
```

dynamic-command

This command allows you to add or remove dynamic commands from a group-of-ruledefs.

Product

ACS, CF

Privilege

Security Administrator, Administrator

Syntax

dynamic-command content-filtering category policy-id *policy_id*

no dynamic-command content-filtering category policy-id

no

Specifies to remove dynamic command configuration from the current group-of-ruledefs.

content-filtering category policy-id *policy_id*

Specifies the dynamic command for Content Filtering Category Policy ID configuration. *policy_id* must be a Content Filtering Category Policy ID, and must be an integer from 1 through 4294967295.

Usage

Use this command to add a dynamic command to a group-of-ruledefs, which will be executed when a dynamic protocol specifies that group-of-ruledefs (via the Rulebase-Name AVP).

Important: This release supports only one command option, which is **dynamic-command content-filtering category policy-id** *policy_id*

Example

The following command configures a dynamic command for Content Filtering Category Policy ID configuration using the policy ID *100*:

```
dynamic-command content-filtering category policy-id 100
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

group-of-ruledefs-application

This command allows you to specify the purpose of setting up a group-of-ruledefs as either charging, post-processing, or for other purposes.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
group-of-ruledefs-application { charging | content-filtering | gx-alias | post-processing
| tpo }

no group-of-ruledefs-application
```

no

If previously configured, deletes the group-of-ruledefs-application configuration from the current group-of-ruledefs.

charging

Specifies that the current group-of-ruledefs is for charging purposes.

content-filtering

Specifies that the current group-of-ruledefs is for content-filtering purposes.

gx-alias

Specifies that the current group-of-ruledefs is for Gx-alias purposes.

post-processing

Specifies that the current group-of-ruledefs is for post-processing purposes, that is, for use by the **post-processing** CLI command or automatic name-matching to the Diameter Filter-Id AVPs.

tpo

Important: The **tpo** keyword is available only in 12.2 and later releases.

Specifies that this group-of-ruledefs is for use in Traffic Performance Optimization (TPO) in-line service's match-rule and match-advertisement configurations.
TPO can use both "charging" and "tpo" rule-application types. Note that ruledef/group-of-ruledef statistics are computed only for the "tpo" rule-application type. In the case of charging ruledefs/group-of-ruledefs, statistics are not computed, and are allowed only for backward compatibility. To generate ruledef statistics use "tpo" ruledefs in the TPO policies.
Default: Disabled

Usage

Use this command to specify the purpose of setting up a group-of-ruledefs. If not specified, by default the rule-application type will be charging.

If the group-of-ruledefs-application is configured for content-filtering, no ruledef can be added to it. Similarly, if configured explicitly for charging or post-processing, a content-filtering policy cannot be configured in it.

The group-of-ruledefs may be dynamically selected by Diameter, as described by the **policy-control charging-rulebase-name** command in the Active Charging Service Configuration Mode. If so selected, the priority field of the add-ruledef instances within the group-of-ruledefs are ignored, and all of the rules named by the ruledef keyword that are also configured with the same name in the **action** command are selected.

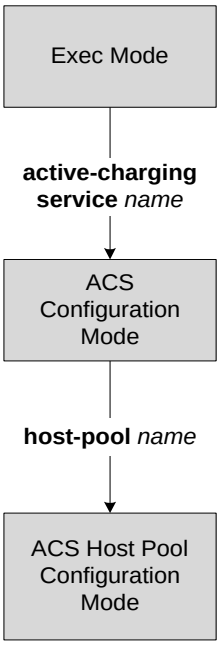
Example

The following command configures the current group-of-ruledefs as for post-processing purposes:

```
group-of-ruledefs-application post-processing
```

Chapter 12
ACS Host Pool Configuration Mode Commands

The ACS Host Pool Configuration Mode is used to define a pool of host addresses within the ACS Configuration Mode. The host pool facilitates to create rules to handle the packets coming from or going to a group of hosts within an access policy.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ip

This command allows you to add/remove an individual or a range of host IPv4/IPv6 address(es) from the current host pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] ip { *ip_address* **|** *ip_address***/***maskbit* **| range** *start_ip* **to** *end_ip* **}**

no

If added previously, removes the specified IPv4/IPv6 address(es) from the current host pool.

ip_address

Specifies an IPv4/IPv6 address to add to the current host pool.
ip_address must be an IPv4/IPv6 address.

*ip_address***/***maskbit*

Specifies an IPv4/IPv6 address/mask bits combination to add to the current host pool.
ip_address must be an IPv4/IPv6 address.
maskbit must be the number of bits in the subnet mask, and must be a numeric value.

range *start_ip* **to** *end_ip*

Specifies a range of IPv4/IPv6 addresses to add to the current host pool.
start_ip specifies the starting IPv4/IPv6 address of the range, and must be less than *end_ip*.
end_ip specifies the ending IPv4/IPv6 address of the range, and must be greater than *start_ip*.

Usage

Use this command to add an individual or a range of IPv4/IPv6 addresses to a host pool. Up to 10 sets of IPv4/IPv6 addresses can be configured in each host pool.

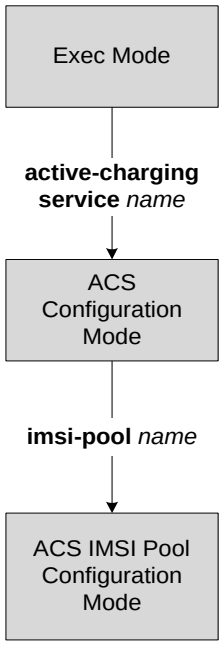
Example

The following command adds all IPv4 addresses from *10.2.3.4* through *10.4.5.6* to the current host pool:

```
ip range 10.2.3.4 to 10.4.5.6
```

Chapter 13
ACS IMSI Pool Configuration Mode Commands

The ACS IMSI Pool Configuration Mode is used to define a pool of subscriber International Mobile Station Identifier (IMSI) numbers within the ACS Configuration Mode. IMSI pool configuration facilitates creation of rules to handle the packets coming from or going to a group of subscriber of IMSI numbers within an access policy.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

imsi

This command allows you to add/remove an individual or a range of subscriber IMSI numbers from the current IMSI pool.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] imsi { *imsi_number* **| range** *start_imsi* **to** *end_imsi* **}**

no

If added previously, removes the specified subscriber IMSI number(s) from the current IMSI pool.

imsi_number

Specifies an IMSI number to add to the current IMSI pool.
imsi_number must be an IMSI number, and must be a sequence of hexadecimal digits between 1 and 15.

start_imsi **to** *end_imsi*

Specifies a range of IMSI numbers to add to the current IMSI pool.
start_imsi specifies the starting IMSI number of the range and must be less than *end_imsi*.
end_imsi specifies the ending IMSI number of the range and must be greater than *start_imsi*.

Usage

Use this command to add an individual or range of subscriber IMSI numbers to an IMSI pool. Up to 10 sets of IMSI numbers can be configured in each IMSI pool.

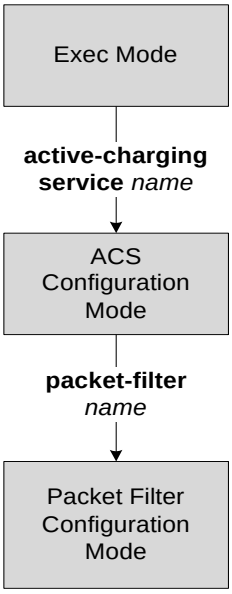
Example

The following command adds IMSI numbers from *310150987654321* to *310150987656879* to the current IMSI pool:

```
imsi range 310150987654321 to 310150987656879
```

Chapter 14
ACS Packet Filter Configuration Mode Commands

The ACS Packet Filter Configuration Mode is used to create and configure Active Charging Service (ACS) packet filters.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

direction

This command allows you to specify the direction in which the current packet filter will be applied.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
direction { bi-directional | downlink | uplink }

default direction
```

default

Configures this command with its default setting.
Default: **bi-directional**

bi-directional

Specifies that the packet filter has to be applied in both uplink and downlink directions.

downlink

Specifies that the packet filter has to be applied only in the downlink direction.

uplink

Specifies that the packet filter has to be applied only in the uplink direction.

Usage

Use this command to specify the direction in which the packet filter has to be applied.

Example

The following command specifies that the packet filter must be applied in the downlink direction:

```
direction downlink
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ip local-port

This command allows you to configure the IP 5-tuple local port(s) for the current packet filter.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip local-port { = *port_number* | range *start_port_number* to *end_port_number* }

no ip local-port

no

If previously configured, deletes the ip local-port configuration from the current packet filter.

port_number

Specifies the port number of the transport protocol.
port_number must be the port number, and must be an integer from 1 through 65535.

range *start_port_number* **to** *end_port_number*

Specifies a range of port numbers.
start_port_number and *end_port_number* must be integers from 1 through 65535.
end_port_number must be greater than *start_port_number*.

Usage

Use this command to configure the IP local port(s) for a packet filter.

Example

The following command configures the IP local port as *456*:

```
ip local-port 456
```

ip protocol

This command allows you to configure the IP protocol(s) for the current packet filter.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.x releases:

ip protocol { = *protocol_number* **| range** *start_protocol_number* **to** *end_protocol_number* **}**

no ip protocol

In StarOS 9.0 and later releases:

ip protocol = *protocol_number*

no ip protocol

no

If previously configured, deletes the IP protocol configuration from the current packet filter.

protocol_number

Specifies the transport protocol field in the IP header.
protocol_number must be the numerical value of the protocol, and must be an integer from 1 through 255.

range *start_protocol_number* **to** *end_protocol_number*

Important: In StarOS 9.0 and later releases this option is deprecated.

Specifies a range of protocol assignment numbers.
start_protocol_number and *end_protocol_number* must be integers from 1 through 255.
end_protocol_number must be greater than *start_protocol_number*.

Usage

Use this command to configure the protocol(s) for a packet filter.

Example

The following command configures the protocol assignment number *300*:

```
ip protocol = 300
```

ip remote-address

This command allows you to configure the IP remote address(es) for the current packet filter.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.x releases:

ip remote-address { = { *ip_address* | *ip_address/mask* } | range { *ip_address* | *ip_address/mask* } to { *ip_address* | *ip_address/mask* } }

no ip remote-address

In StarOS 9.0 and later releases:

ip remote-address = { *ip_address* | *ip_address/mask* }

no ip remote-address

no

If previously configured, deletes the IP remote-address configuration from the current packet filter.

ip remote-address = { *ip_address* | *ip_address/mask* }

ip_address specifies the IPv4/IPv6 address.
ip_address/mask specifies the IPv4/IPv6 address and the number of subnet bits representing the subnet mask in shorthand.

ip remote-address range { *start_ip_address* | *start_ip_address/mask* } to { *end_ip_address* | *end_ip_address/mask* }

Important: In StarOS 9.0 and later releases this keyword has been deprecated.

range specifies a range of IPv4/IPv6 addresses.
start_ip_address and *end_ip_address* specify, for the range, the starting and ending IPv4/IPv6 addresses.*end_ip_address* must be greater than *start_ip_address*.
start_ip_address/mask and *end_ip_address/mask* specify, for the range, the starting and ending IPv4/IPv6 address, and the number of subnet bits representing the subnet mask in shorthand.
end_ip_address/mask must be greater than *start_ip_address/mask*.

Usage

Use this command to configure the remote address(es) for a packet filter.

Example

The following command configures the IP remote address as *10.2.3.4/24*:

```
ip remote-address 10.2.3.4/24
```

ip remote-port

This command allows you to configure the IP remote port(s) for the current packet filter.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip remote-port { = *port_number* | range *start_port_number* to *end_port_number* }

no ip remote-port

no

If previously configured, deletes the ip remote-port configuration from the current packet filter.

port_number

Specifies the port number of the transport protocol.
port_number must be the port number, and must be an integer from 1 through 65535.

range *start_port_number* **to** *end_port_number*

Specifies a range of port numbers.
start_port_number and *end_port_number* must be integers from 1 through 65535.
end_port_number must be greater than *start_port_number*.

Usage

Use this command to configure the IP remote port(s) for a packet filter.

Example

The following command configures the IP remote port as *789*:

```
ip remote-port = 789
```

priority

This command allows you to configure the current packet filter's priority.

Important: This command is deprecated in certain 9.0 releases and in 10.0 and later releases. The precedence values of packet filters (those from both dynamic and predefined rules) are assigned by the PCEF based on an internal process.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

priority *priority*

no priority

no

If previously configured, deletes the priority configuration in the current packet filter.

priority

Specifies this packet filter's priority
priority must be an integer from 0 through 255.

Usage

Use this command to configure the packet filter's priority. The priority must be configured for the packet filter to be used in a TFT. Packets are compared against packet filters in a prioritized fashion, with 0 being the highest priority. Without this setting, this filter will not be used.

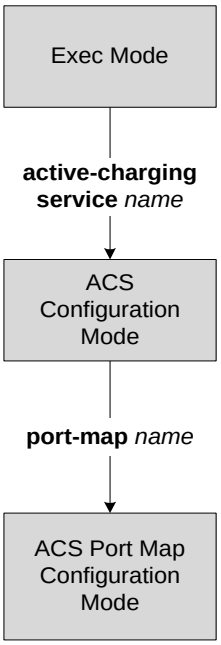
Example

The following command configures the packet filter's priority as *3*:

```
priority 3
```

Chapter 15
ACS Port Map Configuration Mode Commands

The ACS Port Map Configuration Mode is used to define an application-port mapping in the ACS Configuration Mode. The application-port map associates a range of ports to a specific application/protocol within a rule definition (ruledef).



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

port

This command allows you to add/remove an individual or a range of port numbers associated with an application or protocol from the current port map.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] port { *port_number* **| range** *start_port_number* **to** *end_port_number* **}**

no

If added previously, removes the specified port(s) from the current port map.

port_number

Specifies a port number to add to the current port map.
port_number must be a port number, and must be an integer from 1 through 65535.

range *start_port_number* **to** *end_port_number*

Specifies a range of port numbers to add to the current port map.
start_port_number specifies the starting port number of the range, it must be an integer from 1 through 65535, and must be less than *end_port_number*.
end_port_number specifies the ending port number of the range, it must be an integer from 1 through 65535, and must be greater than *start_port_number*.

Usage

Use this command to add an individual or a range of port numbers to a port map. Up to 10 sets of ports can be configured in each port map.

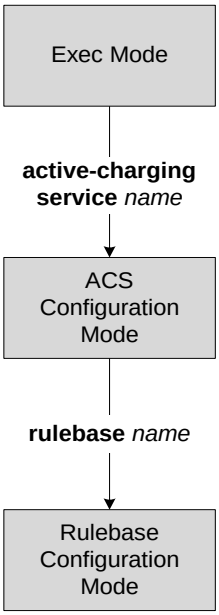
Example

The following command adds all port numbers from *3112* through *5000* to the port map:

```
port range 3112 to 5000
```

Chapter 16
ACS Rulebase Configuration Mode Commands

The ACS Rulebase Configuration Mode is used to configure Active Charging Service (ACS) rulebases.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

action priority

This command allows you to configure the action priority for a ruledef / group-of-ruledefs in the current rulebase.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

action priority *action_priority* **{ [dynamic-only | static-and-dynamic | timedef** *timedef_name* **] { group-of-ruledefs** *ruledefs_group_name* **| ruledef** *ruledef_name* **} charging-action** *charging_action_name* **[monitoring-key** *monitoring_key* **] [description** *description* **] }**

no action priority *action_priority*

no

If previously configured, deletes the specified action priority configuration from the current rulebase.

priority *action_priority*

Specifies a priority for the specified ruledef / group-of-ruledefs in the current rulebase.
action_priority must be unique in the current rulebase, and must be an integer from 1 through 65535. The priority controls the order in which this instance of the CLI command will be examined. Lower numbered priorities are examined first. Up to 2048 instances may be configured, totaled among all rulebases.

dynamic-only

Enables matching of dynamic rules with static rules for this action priority on a flow.
Configuring the **dynamic-only** keyword causes the configuration to be defined, but not enabled. If enabled, the action associated with this option will not be matched against a flow until it is enabled from a dynamic charging interface like Gx. Gx can disable or enable this action entry in the rulebase using Gx messages.
Default: Disabled

static-and-dynamic

The static-and-dynamic option causes the configuration to be defined and enabled, and allows a dynamic protocol (such as the Gx interface) to disable or re-enable the configuration.
Default: Enabled

Important: When R7 Gx is enabled, “static-and-dynamic” rules behave exactly like “dynamic-only” rules. That is, they must be activated explicitly by the Policy and Charging Rules Function (PCRF). When Gx is not enabled, “static-and-dynamic” rules behave exactly like static rules.

timedef *timedef_name*

Important: This keyword is only available in StarOS 8.1 and StarOS 9.0 and later releases.

Associates the specified time definition with the ruledef / group-of-ruledefs. Timedefs activate or deactivate ruledefs / groups-of-ruledefs, making them available for rule matching only when they are active.
timedef_name must be the name of a timedef, and must be an alphanumeric string of 1 through 63 characters.
A timedef can be used with several ruledefs / group-of-ruledefs. When a packet is received, and a ruledef / group-of-ruledefs is eligible for rule matching, if a timedef is associated with the ruledef / group-of-ruledefs, before rule matching the packet-arrival time is compared with the timeslots configured in the timedef. If the packet arrived in any of the timeslots configured in the associated timedef, rule matching is undertaken, else the next ruledef / group-of-ruledefs is considered.

Important: The time considered for timedef matching is the system's local time.

ruledef *ruledef_name*

Adds the specified ruledef to the current rulebase.
ruledef_name must be the name of a ruledef, and must be an alphanumeric string of 1 through 63 characters.
If the specified ruledef does not exist, there will be no ruledef triggers for this action priority within the current rulebase.

Important: If the ruledef specified here is deleted or is not configured, the system accepts it without applying any ruledef under current rulebase for this action priority.

group-of-ruledefs *ruledefs_group_name*

Adds the specified group-of-ruledefs to the current rulebase.
ruledefs_group_name must be the name of a group-of-ruledefs, and must be an alphanumeric string of 1 through 63 characters.
When a group-of-ruledefs is specified, if any of the ruledefs within the group matches, the specified charging-action is applied, any more of the action instances are not processed.

Important: If the group-of-ruledefs specified here is deleted or is not configured, the system accepts it without applying any ruledefs under current rulebase for this action priority.

charging-action *charging_action_name*

Specifies the charging action.
charging_action_name must be the name of a charging action, and must be an alphanumeric string of 1 through 63 characters.
If the specified charging action does not exist, there will be no charging action triggers for this action priority within the current rulebase.

Important: If the charging action specified here is not configured or is later deleted, the system will not apply any charging action under current rulebase for this action priority.

monitoring-key *monitoring_key*

Associates the specified monitoring-key with ruledefs for usage monitoring.
monitoring_key must be an integer from 1 through 4000000000.

description *description*

Adds specified text to the rule and action.
description must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure action priorities for ruledefs / group-of-ruledefs in a rulebase.
This CLI command can be entered multiple times to specify multiple ruledefs and charging actions. The ruledefs are examined in priority order, until a match is found and the corresponding charging action is applied.

Example

The following command assigns a rule and action with the action priority of *23*, a ruledef named *test*, and a charging action named *test1* to the current rulebase:

```
action priority 23 ruledef test charging-action test1
```

active-charging rf

This command allows you to enforce default rating group / service identifier on all PCC rules, predefined ACS rules, and static ACS rules for Rf-based accounting.

Important: This command is customer specific. For more information contact your Cisco account representative.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

active-charging rf { rating-group-override *rating_group* **| service-id-override** *service_id* **}**

{ default | no } active-charging rf { rating-group-override | service-id-override }

default

Configures this command with its default setting.
Default: Override configuration is disabled; same as no.

no

Disables the override configuration.
no active-charging rf rating-group-override: Rating group override will not be enforced on the PCC rules, predefined ACS rules, and static ACS rules. If any of these rules have their own rating group, it will continue to use that.
no active-charging rf service-id-override: Service ID override will not be enforced on the PCC rules, predefined ACS rules, and static ACS rules. If any of these rules have their own service ID, it will continue to use that.

rating-group-override *rating_group*

Enforces the specified rating group on all PCC rules, predefined ACS rules, and static ACS rules. If any of these rules have their own rating group, it will be overridden by the specified rating group.
rating_group must be an integer from 1 through 65535.

service-id-override *service_id*

Enforces the specified service ID on all PCC rules, predefined ACS rules, and static ACS rules. If any of these rules have their own service ID, it will be overridden by the specified service ID.
service_id must be an integer from 1 through 65535.

Usage

Use this command to enforce a specific rating group / service identifier on all PCC rules, predefined ACS rules, and static ACS rules for Rf-based accounting. As this CLI configuration is applied at the rulebase level, all the APNs that have the current rulebase defined will inherit the configuration.

Example

The following command configures the service ID *100*:

```
active-charging rf service-id-override 100
```

bandwidth default-policy

This command allows you to configure the default bandwidth policy for the current rulebase.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

bandwidth default-policy *bandwidth_policy_name*

no bandwidth default-policy

no

If previously configured, deletes the bandwidth default-policy configuration from the current rulebase.

bandwidth_policy_name

Specifies the default bandwidth policy for the current rulebase.
bandwidth_policy_name must be the name of a bandwidth policy, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the default bandwidth policy for a rulebase.
For subscribers using the current rulebase, the default bandwidth policy will be used if in the APN/subscriber profile the **default active-charging bandwidth-policy** command is configured, or no bandwidth policy is configured.

Example

The following command configures a bandwidth policy named *standard* for the rulebase:

```
bandwidth default-policy standard
```

billing-records

This command allows you to configure the type of billing to be performed for subscriber sessions.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
billing-records { egcdr | radius | rf | udr udr-format udr_format_name [ failure-
handling-udr-format udr_format_name ] } +

no billing-records
```

no

If previously configured, deletes the billing-records configuration from the current rulebase.

egcdr

Generates an enhanced G-CDR (eG-CDR) for GGSN / P-GW-CDR for P-GW, and/or UDR with specified format on the occurrence of an interim trigger condition at the end of a subscriber session, or an SGSN-to-SGSN handoff.

radius

Generates postpaid RADIUS accounting records at the start and end of a subscriber session, and on the occurrence of an interim trigger condition. RADIUS accounting records are generated for each content ID.

Important: In the GGSN, if in the APN configuration the "accounting-mode" is set to "none", the system continues to send ACS-generated RADIUS accounting messages. In the PDSN, if in the subscriber default configuration the "accounting-mode" is set to "none", the system does not send any RADIUS accounting messages (including ACS accounting messages).

rf

Enables Rf accounting.
Rf accounting is applicable only for dynamic and predefined rules that are marked for it. Dynamic rules have a field offline-enabled to indicate this. To mark a predefined rule as offline-enabled, use this keyword and the **billing-action** command in the ACS Charging Action Configuration Mode.

udr udr-format *udr_format_name*

Generates UDRs with specified the format on the occurrence of an interim trigger condition, at the end of a subscriber session, or a handoff.
udr_format_name must be the name of an UDR format, and must be an alphanumeric string of 1 through 63 characters.

+

Indicates that more than one of the keywords can be entered in a single command.

Usage

Use this command to generate enhanced G-CDRs (eG-CDRs), P-GW-CDR for P-GW, RADIUS CDRs and/or UDRs for billing records. The format of eG-CDRs for the default GTPP group is controlled by the **inspector** command in the Context Configuration Mode.
If, in the APN configuration, the "accounting-mode" is set as default (GTPP), and in the rulebase configuration "billing-records egcdr" is configured, both G-CDRs and eG-CDRs are generated if configured.
If, in the APN, the accounting-mode is set to "none" G-CDRs will not be generated.

Example

The following command sets the billing record to UDR with UDR format named *udr_format1*:

```
billing-records udr udr-format udr_format1
```

cca diameter requested-service-unit

This command allows you to specify the Diameter sub-AVPs to be included in the Diameter group AVP "Requested-Service-Unit" sent with DCCA Credit Control Requests (CCRs).

Product

All

Privilege

Security Administrator, Administrator

Syntax

cca diameter requested-service-unit sub-avp { time cc-time *duration* **| units cc-service-specific-units** *charging_unit* **| volume { cc-input-octets** *bytes* **| cc-output-octets** *bytes* **| cc-total-octets** *bytes* **} + }**

no cca diameter requested-service-unit sub-avp

no

No sub-AVPs are included in the Requested-Service-Unit grouped AVP.

time cc-time *duration*

Specifies requested service unit for charging time duration in seconds in included sub-AVP.
duration specifies charging time in seconds, and must be an integer from 1 through 4000000000.

units cc-service-specific-units *charging_unit*

Specifies requested service unit by service specific units in bytes/packets in included sub-AVP.
charging_unit specifies service-specific charging unit and must be an integer from 1 through 4000000000.

volume { cc-input-octets *bytes* **| cc-output-octets** *bytes* **| cc-total-octets** *bytes* **} +**

Specifies requested service unit for charging octets by input, output, and total volume in included sub AVP.

- **cc-input-octets**: Specifies input charging octets.
- **cc-output-octets**: Specifies output charging octets.
- **cc-total-octets**: Specifies total charging octets.
- *bytes*: Specifies volume in bytes and must be an integer from 1 through 4000000000.

+: Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to include sub-AVPs based on time, volume, and service specific unit in the "Requested-Service-Unit" grouped AVP with CCRs through Gy interface.

Example

The following command sets the time based sub-AVP with charging duration of 45 seconds in "Requested-Service-Unit" group AVP on DCCA CCRs:

```
cca diameter requested-service-unit sub-avp time cc-time 45
```

cca quota

This command allows you to configure various time- and threshold-based quotas in the Prepaid Credit Control Service (Credit Control Application).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
cca quota { holding-time holding_time content-id content_id | retry-time retry_time [
max-retries retries ] }

{ default | no } cca quota { holding-time content-id content_id | retry-time }
```

holding-time *holding_time*

Specifies the value for the Quota Holding Time (QHT). QHT is used with both time-based and volume-based quotas. After *holding_time* seconds has passed without user traffic, the quota is reported back and the charging stops until new traffic starts.
holding_time must be an integer from 1 through 4000000000.

content-id *content_id*

Specifies the content ID (Rating group AVP) to use for the Quota holding time for the current rulebase.
content_id is the content ID specified for credit control service in ACS.
In 12.1 and earlier releases, *content_id* must be an integer from 1 through 65535.
In 12.2 and later releases, *content_id* must be an integer from 1 through 2147483647.

retry-time *retry_time* **[max-retries** *retries* **]**

Specifies the retry time for the quota request, in seconds.
retry_time must be an integer from 0 through 86400. To disable this assign 0.
Default: 60
This parameter defines the maximum frequency at which the Credit-Control Application (CCA) tries to obtain quota for a subscriber passing traffic for a category with no/exhausted quota.
For a subscriber not passing traffic, the CCA will not try to obtain quota (except once at session start time, if so configured). The quota request from the no quota state is sent in response to user packets only (never based on a timer).
When subscriber hits a charging action that is a flow redirect, the operator can optionally specify that this redirection shall clear the retry-time timer.
This allows the immediately following chargeable user traffic to trip a quota request, even if it would otherwise have been subject to the retry time limit. Such configuration allows quite a large value for retry-time in quota charging or a top-up scenario.
max-retries *retries* configures the maximum number of retries allowed for blacklisted categories. This option has a default value of 65535 retries (the maximum value).
retries must be an integer from 1 through 65535. To disable this assign 0.

Usage

Use this command to set the prepaid credit control quotas.

cca quota retry time allows an operator to set the amount of time that the ACS waits before it retries the prepaid server for a content ID for which quota was exhausted earlier.

When the server sends the quota holding time (QHT) it has highest priority to use that QHT regardless of the value configured in the rulebase or Credit Control Application Configuration Mode. QHT configured here has the second priority for the content ID (rating group) configured here.

If the QHT is not available from the server or rulebase configuration mode, the QHT values configured via the Credit Control Application Configuration Mode are used.

Example

The following command configures the prepaid credit control request retry time to *30* seconds:

```
cca quota retry-time 30
```

The following command specifies the system to use the QHT value configured in the Credit Control Application Mode:

```
no cca quota holding-time content-id 1
```

The following command specifies the system to ignore the QHT value configured in the Credit Control Application Mode:

```
default cca quota holding-time content-id 1
```

The following command configures the prepaid credit control request retry time to *60* seconds and the maximum number of retries to *65535*:

```
default cca quota retry-time max-retries
```

cca quota time-duration algorithm

This command allows you to specify the algorithm to compute time duration for Prepaid Credit Control Application quotas in the current rulebase.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cca quota time-duration algorithm { consumed-time *seconds* **[plus-idle] | continuous-time-periods** *seconds* **| parking-meter** *seconds* **} [content-id** *content_id* **]**

default cca quota time-duration algorithm

no cca quota time-duration algorithm { consumed-time | continuous-time-periods | parking-meter } [content-id *content_id* **]**

no

If previously configured, deletes the quota time-duration algorithm configuration from the current rulebase.

default

Configures this command with its default setting.

consumed-time *seconds*

Specifies the Quota Consumption Time (QCT) in seconds. QCT is used with active time-based quotas and to determine chargeable time envelopes for consuming time quota.
seconds must be an integer from 1 through 4294967295.
Default: 0 (disabled)
A time envelope is the basis for reporting active usage. For each time envelope, the quota consumption includes the last QCT (duration between first packet and last packet + QCT).

plus-idle

Specifies the idle time for QCT.
When used along with **consumed-time** it indicates the active usage + idle time, when no traffic flow occurs.

continuous-time-periods *seconds*

Specifies the charging quota continuous period, in seconds.
seconds must be an integer from 1 through 4294967295.
Default: 0 (disabled)
The Continuous Time Periods (CTP) mechanism constructs time-envelopes from consecutive base time intervals in which traffic has occurred up to and including a base time interval which contains no traffic. As with Quota-Consumption-Time envelopes, the end of an envelope can only be determined “retrospectively”. Again, as with Quota-Consumption-Time, the envelope for CTP includes the last base time interval (the one which contained no traffic).

parking-meter *seconds*

Specifies the Parking Meter (PM) period, in seconds, for a particular rating group.
seconds must be an integer from 1 through 4294967295.
Default: 0 (disabled)
This mechanisms utilizes time quota, but instead of consuming linearly—once a decision to consume has been taken—the granted quota is consumed discretely in "chunks" of the base time interval at the start of each base time interval. Traffic is then allowed to flow for the period of the consumed quota.
The time interval seconds defines the length of the Parking Meter. A time-envelope corresponds to exactly one PM (and thus to one base time interval).

content-id *content_id*

Specifies the content ID (Rating group AVP) to use for the CCA Quota time duration algorithm selection in the current rulebase.
content_id is the content ID specified for credit control service in ACS,
In 12.1 and earlier releases, *content_id* must be an integer from 1 through 65535.
In 12.2 and later releases, *content_id* must be an integer from 1 through 2147483647.

Usage

Use this command to set the various time charging algorithms/schemes for prepaid credit control charging. If operator chooses **parking-meter** *seconds* style charging, then time is billed in *seconds* chunks.

Example

The following command configures the QCT to consumed-time duration of *400* seconds:

```
cca quota time-duration algorithm consumed-time 400
```

cca radius accounting interval

This command allows you to configure how often interim updates are generated by the RADIUS Credit Control Application to be sent to the prepaid server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cca radius accounting interval *interval*

{ default | no } cca radius accounting interval

default

Configures the command with its default setting.
Default: Disabled; same as **no cca radius accounting interval**

no

Disables interim updates.

interval

Specifies the time interval, in seconds, between interim updates generated by the RADIUS Credit Control Application.
interval must be an integer from 1 through 3600.
Default: 1 (Disabled)

Usage

Use this command to specify the RADIUS accounting interval between accounting of a prepaid subscriber. The same parameters are applicable for RADIUS server group.

Example

The following command defines RADIUS accounting interval of *20* seconds for RADIUS prepaid service in the rulebase:

```
cca radius accounting interval 20
```

cca radius charging context

This command allows you to specify the RADIUS servers used for the current rulebase when RADIUS credit control is enabled.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

cca radius charging context *vpn_context* **[group** *server_group_name* **]**

no cca radius charging context

no

RADIUS credit control will not be performed.

vpn_context

Specifies the charging context where RADIUS prepaid charging parameters are configured.
vpn_context must be an alphanumeric string of 1 through 79 characters.

group *server_group_name*

Specifies the RADIUS server group.
server_group_name must be the name of a RADIUS server group, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the RADIUS charging context where RADIUS prepaid charging parameters are configured. The same parameters are applicable for RADIUS server group.

Example

The following command defines RADIUS charging context *prepaid_rad1* for RADIUS prepaid charging in the rulebase:

```
cca radius charging context prepaid_rad1
```

cca radius user-password

This command allows you to configure the value to use for the "User-Password" attribute in RADIUS messages sent to the prepaid server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

cca radius user-password [encrypted] password *password*

no cca radius user-password

no

If previously configured, deletes the RADIUS prepaid service user password configured in the current rulebase.

[encrypted] password *password*

Specifies the password for prepaid services within the current rulebase.
In 12.1 and earlier releases, *password* must be an alphanumeric string of 1 through 63 characters with or without encryption.
In 12.2 and later releases, *password* must be an alphanumeric string of 1 through 63 characters without encryption, and 1 through 132 characters with encryption enabled.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Use this command to specify the RADIUS user password for prepaid services within the current rulebase.

Example

The following command configures the user password as *user_123* without encryption in the current rulebase:

```
cca radius user-password password user_123
```

charging-rule-optimization

This command allows you to configure the internal optimization level to use, for improved performance, when evaluating each instance of the **action priority** command.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
charging-rule-optimization { high | low | medium }

default charging-rule-optimization
```

default

Configures this command with its default setting.
Default: In 10.0 and earlier releases: **low**. In 11.0 and later releases: **high**

high

Enables the highest level of optimization with high memory utilization.

low

Enables minimal level of optimization with minimal memory utilization.

medium

Important: In 11.0 and later releases, the **medium** keyword is deprecated.

Enables medium level of optimization with moderate memory utilization.

Usage

Use this command to specify the level of internal optimization for improved performance when evaluating each instance of the **action priority** command.
Both the high and medium options cause re-organization of the entire memory structure whenever any change is made, such as on the addition of an **action prority** command.

Example

The following command specifies the highest optimization level for rule search and matching in the rulebase:

```
charging-rule-optimization high
```

constituent-policies

This command allows you to configure the Bandwidth, Content Based Billing (CBB), and Firewall/Firewall-and-NAT constituent policies. The combination of the values of all three policies will uniquely identify the associated rulebase.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
constituent-policies { bandwidth-policy bandwidth_policy_name | cbb-policy
cbb_policy_name | firewall-policy fw_policy_name | fw-and-nat-policy fw_nat_policy_name }
+

no constituent-policies
```

no

If previously configured, deletes the constituent-policies configuration from the current rulebase.

bandwidth-policy *bandwidth_policy_name*

Specifies the Bandwidth policy.
bandwidth_policy_name must be the name of a bandwidth policy, and must be an alphanumeric string of 1 through 63 characters.

cbb-policy *cbb_policy_name*

Specifies the Content Based Billing (CBB) policy.
cbb_policy_name must be the name of a CBB policy, and must be an alphanumeric string of 1 through 63 characters.

firewall-policy *fw_policy_name*

Important: This keyword is customer specific. For more information, please contact your Cisco account representative.

Specifies the Stateful Firewall policy.
fw_policy_name must be the name of a Stateful Firewall policy, and must be an alphanumeric string of 1 through 63 characters.

fw-and-nat-policy *fw_nat_policy_name*

Important: This keyword is customer specific, and is only available in StarOS 8.1 and in StarOS 9.0 and later releases.

Specifies the Firewall-and-NAT policy.
fw_nat_policy_name must be the name of a Firewall-and-NAT policy, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the bandwidth, CBB, and Firewall/Firewall-and-NAT constituent policies that will identify the rulebase. The combination of the values of all three policies will uniquely identify the rulebase associated.

Example

The following command configures the constituent bandwidth policy named *test123*:

```
constituent-policies bandwidth-policy test123
```

content-filtering category policy-id

This command allows you to configure the Content Filtering Category Policy Identifier for Policy-based Content Filtering support in the current rulebase.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id *cf_policy_id*

no content-filtering category policy-id [*cf_policy_id* **]**

no

If previously configured, deletes the configuration from the current rulebase.
In StarOS 8.1 and later releases, optionally the policy ID can be specified. If the specified policy ID is invalid, or is not configured in the rulebase, an error message is displayed. If no policy ID is specified, whatever policy is configured, if any, is removed from the rulebase.

content-filtering category policy-id *cf_policy_id*

Configures the specified Content Filtering Category Policy in the current rulebase.
cf_policy_id must be the ID of an existing Content Filtering Category Policy, and must be an integer from 1 through 4294967295.

Important: If the specified Content Filtering Category Policy does not exist, all packets will be passed regardless of the categories/actions determined for such packets.

Important: The category policy ID that is configured using the **category policy-id** *cf_policy_id* command in the APN/Subscriber Configuration Mode prevails over this configuration.

Usage

Use this command to configure the Content Filtering Category Policy ID for Policy-based Content Filtering support in the rulebase.
The Content Filtering Category Policy is created/deleted in the ACS Configuration Mode, and is configured in the Content Filtering Policy Configuration Mode.

Example

The following command configures the Content Filtering Category Policy ID *101* in the rulebase:

```
content-filtering category policy-id 101
```

content-filtering flow-any-error

This command allows you to specify action to take on Content Filtering packets in the case of ACS error scenarios.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
content-filtering flow-any-error { deny | permit }

default content-filtering flow-any-error
```

default

Configures this command with its default setting.
Default: **permit**

deny

Configures flow-any-error configuration as deny.
All the denied packets will be accounted for by the **discarded-flow-content-id** configuration in the Content Filtering Policy Configuration Mode. This content ID will be used to generate UDRs for packets denied via content filtering.

permit

Configures flow-any-error configuration as permit.

Usage

Use this command to allow/discard content filtering packets in case of ACS error scenarios.

Example

The following command allows content filtering packets in case of an ACS error:

```
content-filtering flow-any-error permit
```

content-filtering mode

This command allows you to enable/disable the specified Category-based Content Filtering mode in the current rulebase.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering mode { category { static-and-dynamic | static-only } | server-group *cf_server_group* **}**

no content-filtering mode

---

no

If previously configured, deletes the content-filtering mode configuration from the current rulebase. Content filtering will not to be performed for the current rulebase. This is the default setting.

---

category { static-and-dynamic | static-only }

Specifies the Category-based Content Filtering mode.

- **static-only**: Configures Category-based Content Filtering in static only mode, wherein all URLs are compared against an internal database to categorize the requested content.

  Using Category-based Content Filtering support requires configuration of the **require active-charging content-filtering category** command in the Global Configuration Mode.

- **static-and-dynamic**: Configures Category-based Content Filtering in Static-and-Dynamic mode, wherein a static rating of the URL is first performed, and only if the static rating fails to find a match, dynamic rating of the content that the server returns is then performed.

Important: Before enabling static-and-dynamic rating in the rulebase, it must be enabled at the global level as the resources required for dynamic rating are allocated at the global level. To enable static-and-dynamic rating at the global level, in the Global Configuration Mode use the **require active-charging content-filtering category static-and-dynamic** command.

---

server-group *cf_server_group*

Enables and configures the Content Filtering Server Group (CFSG) mode within the rulebase to manage an external content filtering server with an Internet Content Adaptation Protocol (ICAP) client system.
cf_server_group must be the name of a CFSG, and must be unique, and must be an alphanumeric string of 1 through 63 characters.
If configured, ACS attempts to establish TCP connections to every server in the named group.

Usage

Use this command to enable and apply the content filtering mode in the rulebase to manage a content filtering server with an ICAP client system.

Example

The following command enables the content filtering mode for external content filtering server group *CF_Server1* in the rulebase:

```
content-filtering mode server-group CF_Server1
```

The following command enables the category based static and dynamic content filtering mode for in the rulebase:

```
content-filtering mode category static-and-dynamic
```

dynamic-rule order

This command allows you to specify whether dynamic rules are matched before statically configured rules.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
dynamic-rule order { always-first | first-if-tied }

no dynamic-rule order
```

no

If previously configured, deletes the dynamic-rule order configuration from the current rulebase. By default, dynamic rules are matched against the flow prior to static rules.

always-first

Specifies to match all the dynamic rules against the flow prior to any static rule.

first-if-tied

Specifies to match rules against the flow based on their priority with the condition that dynamic rules match before a static rule of the same priority.
A rule is a combination of a ruledef, charging action, and precedence. Static rules are defined by the **action** CLI command in the ACS Rulebase Configuration Mode, and are applicable to all subscribers that are associated with the rulebase. Dynamic rules are obtained via a dynamic protocol, such as, the Gx-interface for a particular subscriber session.

Usage

Use this command to configure the order in which rules are selected for matching in between dynamic rules (per subscriber) and static rules (from rulebase).

Example

The following command matches all dynamic rules against the flow prior to any static rule:

```
dynamic-rule order always-first
```

edr sn-charge-volume

This command allows you to exclude/include packets/bytes that are dropped/retransmitted by the ACS in the total charge volume — "sn-charge-volume" EDR attribute.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] edr sn-charge-volume { count-dropped-units | count-retransmitted-units }
```

default

Configures this command with its default setting.
Default: Exclude, in the total charge volume, packets/bytes dropped/retransmitted by ACS.

no

Exclude, in the total charge volume, packets/bytes dropped/retransmitted by ACS.

count-dropped-units

Specifies to include dropped units in the total charge volume.

count-retransmitted-units

Specifies to include retransmitted units in the total charge volume.

Usage

Use this command to exclude/include packets/bytes that are dropped/retransmitted by ACS in the total charge volume — "sn-charge-volume" EDR attribute.
This command applies only to the "sn-charge-volume" attribute and does not affect the "sn-volume-amt" counts in any way.

Example

The following specifies to include units retransmitted by ACS in the sn-charge-volume EDR attribute:

```
edr sn-charge-volume count-retransmitted-units
```

edr suppress-zero-byte-records

This command disables/enables the creation of EDRs when there is no data for the flows.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[default | no] edr suppress-zero-byte-records

default

Configures this command with its default setting.
Default: Disabled; same as **no edr suppress-zero-byte-records**

no

Disables the suppression of zero-byte EDRs.

edr suppress-zero-byte-records

Suppresses zero-byte EDRs.

Usage

Use this command to disable/enable the creation of EDRs that are empty. The situation where there is a zero-byte EDR would typically be possible when two successive EDRs are generated for a flow. This CLI command suppresses the second such EDR for the flow.

edr transaction-complete

This command enables/disables the generation of an EDR on the completion of a transaction.

Important: This command is available only in StarOS 8.1 and in StarOS 9.0 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

In 12.1 and earlier releases:

edr transaction-complete http edr-format *edr_format_name*

{ default | no } edr transaction-complete

In 12.2 and later releases:

edr transaction-complete http [charging-edr *charging_edr_format_name* **| edr-format** *edr_format_name* **| reporting-edr** *reporting_edr_format_name* **]**

{ default | no } edr transaction-complete

default

Configures this command with its default setting.
Default: Disabled; same as **no edr transaction-complete**

no

If previously configured, deletes the configuration from the current rulebase.

edr-format *edr_format_name*

Important: This option is available only in 12.1 and earlier releases. In 12.2 and later releases, this option is deprecated and is replaced by the **charging-edr** option.

Specifies to generate EDR on transaction completion, for HTTP protocol.
edr_format_name must be the name of an EDR format, and must be an alphanumeric string of 1 through 63 characters.

charging-edr *charging_edr_format_name*

Important: This option is available only in 12.2 and later releases.

Specifies to generate charging EDR on transaction completion.

charging_edr_format_name must be the name of a charging EDR format, and must be an alphanumeric string of 1 through 63 characters.

reporting-edr *reporting_edr_format_name*

Important: This option is available only in 12.2 and later releases.

Specifies to generate reporting EDR on transaction completion.
reporting_edr_format_name must be the name of a reporting EDR, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the generation of an EDR when certain application transactions (for example, request/response pairs) complete. In this release EDR generation is supported only for HTTP protocol. Note that these EDRs are in addition to those that might be generated due to other conditions, for example, EDR configurations in a Charging Action.

Example

In 12.1 and earlier releases, the following command configures the generation of EDRs on the completion of transactions for HTTP protocol specifying the EDR format as *test123*:

```
edr transaction-complete http edr-format test123
```

In 12.2 and later releases, the following command configures the generation of charging EDRs on the completion of transactions for HTTP protocol specifying the EDR format as *test123*:

```
edr transaction-complete http charging-edr test123
```

edr voip-call-end

This command enables/disables generation of EDRs on the completion of Voice over IP (VoIP) calls.

Product

ACS, ADC

Privilege

Security Administrator, Administrator

Syntax

In 12.1 and earlier releases:

```
edr voip-call-end edr-format edr_format_name

{ default | no } edr voip-call-end
```

In 12.2 and later releases:

```
edr voip-call-end { charging-edr charging_edr_format_name | edr-format edr_format_name |
reporting-edr reporting_edr_format_name } +

{ default | no } edr voip-call-end
```

default

Configures this command with its default setting.
Default: Disabled; same as **no edr voip-call-end**

no

If previously configured, deletes the edr voip-call-end configuration from the current rulebase.

edr-format *edr_format_name*

Important: This option is available only in 12.1 and earlier releases. In 12.2 and later releases, it has been deprecated and is replaced by the **charging-edr** option.

Specifies to generate an EDR when a VoIP call ends.
edr_format_name must be the name of an EDR format, and must be an alphanumeric string of 1 through 63 characters.

charging-edr *charging_edr_format_name*

Important: This option is available only in 12.2 and later releases.

Specifies to generate a charging EDR when a VoIP call ends.
charging_edr_format_name must be the name of a charging EDR format, and must be an alphanumeric string of 1 through 63 characters.

reporting-edr *reporting_edr_format_name*

Important: This option is available only in 12.2 and later releases.

Specifies to generate a reporting EDR when a VoIP call ends.
reporting_edr_format_name must be the name of a reporting EDR format, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to generate an EDR on the completion of voice calls. Note that these EDRs are in addition to those that might be generated due to other conditions, for example EDR configurations in a Charging Action. This command facilitates P2P voice duration reporting.

Example

In 12.1 and earlier releases, the following command specifies generating EDRs on completion of VoIP calls using the EDR format *test13*:

```
edr voip-call-end edr-format test13
```

In 12.2 and later releases, the following command specifies generating charging EDRs on completion of VoIP calls using the EDR format named *test23*:

```
edr voip-call-end charging-edr test23
```

egcdr inactivity-meter

Description This command has been deprecated. It is included in the CLI for backward compatibility with older configuration files. When executed performs no function. Use the **egcdr threshold interval** *interval* **[regardless-of-other-triggers]** command for this functionality.

egcdr cdr-encoding

This command allows you to configure the eG-CDR encoding type.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
egcdr cdr-encoding { ascii [ delimiter { colon | comma | pipe } ] | asn.1 }

default egcdr cdr-encoding
```

default

Configures the default eG-CDR CDR-encoding format.
Default: **asn.1**

ascii [delimiter { colon | comma | pipe }]

Specifies to use ASCII encoding type to generate eG-CDR in ASCII format.
delimiter { colon | comma | pipe }: Specifies the delimiter character to use in eG-CDRs in ASCII format.

- **colon**: Specifies to use ":" (colon) as a delimiter in eG-CDR.
- **comma**: Specifies to use "," (comma), as a delimiter in eG-CDR.
- **pipe**: Specifies to use "|" (pipe) as a delimiter in eG-CDR.

Default: **pipe**

asn.1

Specifies to use ASN.1 encoding type to generate eG-CDR in ASN.1 format.
This is the default setting.

Usage

Use this command to configure the eG-CDR encoding type.
For more information on using eG-CDR ASCII encoding type in your deployment, contact your Cisco account representative.

Example

The following command specifies to use ASCII encoding type to generate eG-CDR in ASCII format while specifying the delimiter character as comma:

```
egcdr cdr-encoding ascii delimiter comma
```

egcdr tariff

This command allows you to configure the eG-CDR tariff time to generate new eG-CDRs for GGSN and P-GW-CDRs for P-GW.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] egcdr tariff minute *minute* **hour** *hour*

no

If previously configured, deletes the configuration from the current rulebase.

minute *minute*

Specifies the minute for the time-of-day configuration.
minute must be an integer from 0 through 59.

hour *hour*

Specifies the hour for the time-of-day configuration.
hour must be an integer from 0 through 23.

Usage

Use this command to configure the eG-CDR tariff time to generate new eG-CDRs for GGSN and P-GW-CDRs for P-GW. Up to four different time-of-day settings may be configured. When any configured tariff time is reached, the current eG-CDR/P-GW-CDR will be closed and a new eG-CDR/P-GW-CDR is opened.

Example

The following command defines an eG-CDR tariff for the 23rd minute of the 22nd hour of the day (10:23 PM):

```
egcdr tariff minute 23 hour 22
```

egcdr threshold

This command allows you to configure the thresholds for generating eG-CDRs for GGSN and P-GW-CDRs for P-GW.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

egcdr threshold { interval *interval* **[regardless-of-other-triggers] | volume { downlink | total | uplink }** *bytes* **}**

{ default | no } egcdr threshold { interval | volume }

---

no

If previously configured, deletes the eG-CDR threshold configuration from the current rulebase.

---

default

Configures this command with the default settings.
Default: Disabled; same as **no egcdr threshold interval** and **no egcdr threshold interval volume** commands.

---

interval *interval* **[regardless-of-other-triggers]**

Specifies the time interval, in seconds, for closing the eG-CDR/P-GW-CDR if the minimum time duration thresholds are satisfied.
interval must be an integer from 60 through 40000000.
regardless-of-other-triggers: This option enables eG-CDR/P-GW-CDR generation at the fixed time interval irrespective of any other eG-CDR/P-GW-CDR triggers that may have happened in between.
Default: Disabled.

---

volume { downlink | total | uplink } *bytes*

Specifies the uplink/downlink volume octet counts for the generation of the interim eG-CDRs/P-GW-CDRs.

- **downlink** *bytes*: Specifies the limit for the number of downlink (from network to subscriber) octets after which the eG-CDR/P-GW-CDR is closed.

  bytes must be an integer from 100000 through 4000000000.

  Default: 4000000000

- **total** *bytes*: Specifies the limit for the total number of octets (uplink+downlink) after which the eG-CDR/P-GW-CDR is closed.

  bytes must be an integer from 100000 through 4000000000.

  Default: Disabled

- **uplink** *bytes*: Specifies the limit for the number of uplink (from subscriber to network) octets after which the eG-CDR/P-GW-CDR is closed.

  bytes must be an integer from 100000 through 4000000000.

  Default: 4000000000

Usage

Use this command to configure thresholds to generate eG-CDRs/P-GW-CDRs.

Thresholds can be specified for both time interval and for data volume, by entering the command twice (once with interval and once with volume). When either configured threshold is reached, the eG-CDR/P-GW-CDRs will be closed. The volume trigger can be specified for uplink or downlink or combined total (uplink + downlink) byte thresholds. The exact keyword forces the configured volume to exactly match the volume in the eG-CDR/P-GW-CDRs, so the triggering packet might have to be divided across two eG-CDRs/P-GW-CDRs.

When both interval and volume triggers are configured, we'll reset the interval time and accumulated volume amount whenever the eG-CDR/P-GW-CDRs is closed regardless of whether it was due to the interval time expiration or reaching the volume limit. Use the regardless-of-other-triggers optional keyword, if you want the eG-CDRs/P-GW-CDRs closed at the configured regular intervals, regardless of whether eG-CDRs/P-GW-CDRs are being closed due to reaching a volume limit.

When the PDP context is terminated, the eG-CDR/P-GW-CDRs will be closed regardless of whether the thresholds have been reached.

Example

The following command defines an eG-CDR threshold interval of *600* seconds:

```
egcdr threshold interval 600
```

egcdr time-duration algorithm

This command allows you to specify the algorithm to compute the duration of time utilization in an eG-CDR for the current rulebase.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

egcdr time-duration algorithm { consumed-time *consumed_time* **[plus-idle] | continuous-time-periods** *ctp_time* **| parking-meter** *seconds* **}**

{ default | no } egcdr time-duration algorithm

no

If previously configured, deletes the eG-CDR time-duration algorithm configuration from the current rulebase.

default

Configures this command with its default setting.
Default: Algorithm configured for CCA, or the CCA default if none is configured.

consumed-time *consumed_time* **[plus-idle]**

Specifies the actual consumption time in seconds. This is used to determine the actual used chargeable time envelopes for the purpose of consuming time quota.
consumed_time must be an integer from 1 through 4294967295.
Default: 0 (disabled)
Time envelope is the basis for reporting active usage. For each time envelope, the time consumption includes the time duration between arrival of last packet and first packet only.
plus-idle: Specifies the idle time between arrival of two packets to include in time usage record in eG-CDR.
When used along with **consumed-time** it indicates the active usage + idle time, when no traffic flow occurs.

continuous-time-periods *ctp_time*

Specifies the continuous time period to compute the usage record in eG-CDR.
ctp_time sets the audition, in seconds, to start a counter on arrival of the first packet and thereafter include only that period in charging in which one or more packets arrived. For the period where no packets arrived or no traffic was detected, usage will not be computed.
ctp_time must be an integer from 1 through 4294967295.

parking-meter *seconds*

Specifies the Parking Meter (PM) period, in seconds.
seconds must be an integer from 1 through 4294967295.
Parking meter is the method with which the usage time is set in the content-id containers in eG-CDRs. When a parking meter value is set, the user is charged for time in increments of the value set. For example, if the

parking meter is set to 300 seconds (5 minutes) and the subscriber only uses one minute, the charge is for 5 minutes.

Usage

Use this command to set the various time charging algorithms/schemes for time usage in eG-CDR.
For example, packets arrive at times T1, T2, T3 and T4. Then the typical time usage might be computed to be T4 – T1. However, if say there is an idle period between times T2 and T3, then system will compute the time usage to be (T2 – T1) + (T4 – T3).
consumed-time in above scenario calculates the time duration as (T2 – T1) + (T4 – T3) where **consumed-time** with **plus-idle** calculates the time duration as (T2-T1)+I + (T4 – T3)+I or (T4-T1).

Example

The following command sets consumed time duration to *400* seconds:

```
egcdr time-duration algorithm consumed-time 400
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

extract-host-from-uri

This command allows you to configure whether to use the host name embedded in the URI as the host field, when the host field option in the HTTP or Wireless Session Protocol (WSP) header is absent.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
extract-host-from-uri { http | wsp ) +

{ default | no } extract-host-from-uri
```

default

Configures this command with its default setting.
Default: Disabled; same as **no extract-host-from-uri**

no

If previously configured, disables the extract-host-from-uri configuration, for both HTPP and WSP, from the current rulebase.

http | wsp

Specifies the protocol(s).

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

If the host field is not present in HTTP/WSP header, this command will extract host from the URI, and store it in the host field to enable “http host” and “wsp host” rule matches using the stored value.

Important: Applying the **extract-host-from-uri** command a second time will overwrite the previous configuration. For example, if you apply the command **extract-host-from-uri http wsp http**, and then apply the command **extract-host-from-uri http wsp**, extraction of host from URI will happen only for WSP analyzer.

Example

The following command configures extraction of host from URI for both HTTP and WSP protocols:

```
extract-host-from-uri http wsp
```

fair-usage session-waiver-percent

This command allows you to configure a waiver on top of average available memory credits per session for the Fair Usage feature.

Product

ACS, ADC, CF, FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fair-usage session-waiver-percent *waiver_percent*

default fair-usage session-waiver-percent

default

Configures this command with its default setting.
Default: 20 percent

waiver_percent

Specifies the Fair Usage session waiver above average available memory for subscribers using the current rulebase.
waiver_percent must be an integer from 1 through 1000.
Default: 20 percent

Usage

Use this command to configure a waiver on top of average available memory credits per session at the rulebase level. That is, an allowance to use more than the average amount of memory.

Example

The following command configures the Fair Usage Session Waiver setting to *25*percent:

```
fair-usage session-waiver-percent 25
```

firewall dos-protection

This command allows you to configure Stateful Firewall protection for subscribers from Denial-of-Service (DoS) attacks.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] firewall dos-protection { all | flooding { icmp | tcp-syn | udp } | ftp-bounce |
ip-unaligned-timestamp | mime-flood | port-scan | tcp-window-containment | source-router
| teardrop | winnuke }

default firewall dos-protection
```

no

If previously enabled, disables Stateful Firewall protection for subscribers from all or specified DoS attack(s).

default

Configures this command with its default setting.
Default: Protection from all DOS attacks is disabled.

all

Enables protection against all DoS attacks supported by the Stateful Firewall in-line service.

flooding { icmp | tcp-syn | udp }

Enables protection against specified flooding attacks:

- **icmp**: Enables protection against ICMP Flood attacks
- **tcp-syn**: Enables protection against TCP SYN Flood attacks
- **udp**: Enables protection against UDP Flood attacks

ftp-bounce

Enables protection against FTP Bounce attacks.
In an FTP Bounce attack, an attacker is able to use the PORT command to request access to ports indirectly through a user system as an agent for the request. This technique is used to port scan hosts discreetly, and to access specific ports that the attacker cannot access through a direct connection.

ip-unaligned-timestamp

Enables protection against IP Unaligned Timestamp attacks.
In an IP Unaligned Timestamp attack, certain operating systems crash if they receive a frame with the IP timestamp option that is not aligned on a 32-bit boundary.

mime-flood

Enables protection against HTTP Multiple Internet Mail Extension (MIME) Header Flooding attacks.
In a MIME Flood attack an attacker sends huge amount of MIME headers which consumes a lot of memory and CPU usage.

port-scan

Enables protection against Port Scan attacks.

tcp-window-containment

Enables protection against TCP Sequence Number Out-of-Range attacks.
In a Sequence Number Out-of-Range attack the attacker sends packets with out-of-range sequence numbers forcing the system to wait for missing sequence packets.

source-router

Enables protection against IP Source Route IP Option attacks.
Source routing is an IP option mainly used by network administrators to check connectivity. When an IP packet leaves a system, its path through various networks to its destination is controlled by the routers and their current configuration. Source routing provides a means to override the control of the routers. Strict source routing specifies the path through all the routers to the destination. The same path in reverse is used to return responses. Loose source routing allows the attacker to spoof both an address and sets the loose source routing option to force the response to return to the attacker's network.

teardrop

Enables protection against Teardrop attacks.
In a Teardrop attack, overlapping IP fragments are exploited causing the TCP/IP fragmentation re-assembly to improperly handle overlapping IP fragments.

winnuke

Enables protection against WIN-NUKE attacks.
This is a type of Nuke denial-of-service attack against networks consisting of fragmented or otherwise invalid ICMP packets sent to the target, achieved by using a modified ping utility to repeatedly send this corrupt data, thus slowing down the affected computer until it comes to a complete stop.
The WinNuke exploits the vulnerability in the NetBIOS handler and a string of out-of-band data sent to TCP port 139 of the victim machine causing it to lock up and display a Blue Screen of Death.

Usage

Use this command to enable Stateful Firewall protection from different types of DoS attacks. This command can be used multiple times for different DoS attacks.

Important: The DoS attacks are detected only in the downlink direction.

Example

The following command enables Stateful Firewall protection from all supported DoS attacks:

```
firewall dos-protection all
```

firewall flooding

This command allows you to configure Stateful Firewall protection from Packet Flooding attacks.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit packets } | {
sampling-interval interval } }

default firewall flooding { { protocol { icmp | tcp-syn | udp } packet limit } | {
sampling-interval } }
```

default

Configures this command the default setting for the specified keyword.

protocol { icmp | tcp-syn | udp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **tcp-syn**: Configuration for TCP-SYN packet limit.
- **udp**: Configuration for UDP protocol.

packet limit *packets*

Specifies the maximum number of specified packets a subscriber can receive during a sampling interval.
packets must be an integer from 1 through 4294967295.
Default: 1000 packets per sampling interval for all protocols.

sampling-interval *interval*

Specifies the flooding sampling interval, in seconds.
interval must be an integer from 1 through 60.
Default: 1 second

Usage

Use this command to configure the maximum number of ICMP, TCP-SYN, / UDP packets allowed to prevent the packet flooding attacks to the host.

Example

The following command ensures a subscriber will not receive more that 1000 ICMP packets per sampling interval:

```
firewall flooding protocol icmp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 UDP packets per sampling interval on different 5-tuples. That is, if an attacker is sending lot of UDP packets on different ports or using different spoofed IPs, those packets will be limited to 1000 packets per sampling interval. This way only "suspected" malicious packets are limited and not "legitimate" packets:

```
firewall flooding protocol udp packet limit 1000
```

The following command ensures a subscriber will not receive more than 1000 TCP-SYN packets per sampling interval:

```
firewall flooding protocol tcp-syn packet limi 1000
```

The following command specifies a flooding sampling interval of 1 second:

```
firewall flooding sampling-interval 1
```

firewall icmp-destination-unreachable-message-threshold

This command allows you to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall icmp-destination-unreachable-message-threshold *messages* **then-block-server**

{ default | no } firewall icmp-destination-unreachable-message-threshold

default

Configures this command with its default setting.
Default: No limit

no

If previously configured, deletes the configuration from the current rulebase.

messages

Specifies the threshold on the number of ICMP error messages sent by the subscriber for a particular data flow.
messages must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of ICMP error messages sent by the subscriber for a particular data flow. After the threshold is reached, it is assumed that the server is not reacting properly to the error messages, and further downlink traffic to the subscriber on the unwanted flow is blocked.
Some servers that run QChat ignore the ICMP error messages (Destination Port Unreachable and Host Unreachable) from the mobiles. So the mobiles continue to receive unwanted UDP traffic from the QChat servers, and their batteries get exhausted quickly.

Example

The following command configures a threshold of 10 ICMP error messages:

```
firewall icmp-destination-unreachable-message-threshold 10 then-block-
server
```

firewall max-ip-packet-size

This command allows you to configure the maximum IP packet size (after IP reassembly) allowed over Stateful Firewall.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall max-ip-packet-size *packet_size* **protocol { icmp | non-icmp }**

default firewall max-ip-packet-size protocol { icmp | non-icmp }

default

Configures the default maximum IP packet size configuration.
Default: 65535 bytes (for both ICMP and non-ICMP)

packet_size

Specifies the maximum packet size.
packet_size must be an integer from 30000 through 65535.

protocol { icmp | non-icmp }

Specifies the transport protocol:

- **icmp**: Configuration for ICMP protocol.
- **non-icmp**: Configuration for protocols other than ICMP.

Usage

Use this command to configure the maximum IP packet size allowed for ICMP and non-ICMP packets to prevent packet flooding attacks to the host. Packets exceeding the configured size will be dropped for “Jolt Attack” and “Ping-Of-Death Attack”.

Example

The following command allows a maximum packet size of *60000* for ICMP protocol:

```
firewall max-ip-packet-size 60000 protocol icmp
```

firewall mime-flood

This command allows you to configure Stateful Firewall protection from Multipurpose Internet Mail Extensions (MIME) Flood attacks.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall mime-flood { http-headers-limit *max_limit* **| max-http-header-field-size** *max_size* **}**

default firewall mime-flood { http-headers-limit | max-http-header-field-size }

default

Configures this command with its default setting.

http-headers-limit *max_limit*

Specifies the maximum number of headers allowed in an HTTP packet. If the number of HTTP headers in a page received is more than the specified limit, the request will be denied.
max_limit must be an integer from 1 through 256.
Default: 16

max-http-header-field-size *max_size*

Specifies the maximum header field size allowed in the HTTP header, in bytes. If the size of HTTP header in the received page is more than the specified number of bytes, the request will be denied.
max_size must be an integer from 1 through 8192.
Default: 4096 bytes

Usage

Use this command to configure the maximum number of headers allowed in an HTTP packet, and the maximum header field size allowed in the HTTP header to prevent MIME flooding attacks.

Example

The following command sets the maximum number of headers allowed in an HTTP packet to *100*:

```
firewall mime-flood http-headers-limit 100
```

The following command sets the maximum header field size allowed in the HTTP header to *1000* bytes:

```
firewall mime-flood max-http-header-field-size 1000
```

firewall no-ruledef-matches

This command allows you to configure the default action for packets when no Stateful Firewall ruledef matches.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, use the **access-rule no-ruledef-matches** command available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

firewall no-ruledef-matches { downlink | uplink } action { deny [charging-action *charging_action_name* **] | permit [bypass-nat | nat-realm** *nat_realm_name* **] }**

default firewall no-ruledef-matches { downlink | uplink } action

default

Configures the default action for packets with no Stateful Firewall ruledef match.

downlink | uplink

Specifies the packet type:

- **downlink**: Downlink (from network to subscriber) packets with no Stateful Firewall ruledef match.

  Default: **deny**

- **uplink**: Uplink (from subscriber to network) packets with no Stateful Firewall ruledef match.

  Default: **permit**

action { deny [charging-action *charging_action_name* **] | permit [bypass-nat | nat-realm** *nat_realm_name* **] }**

Specifies the default action for packets with no Stateful Firewall ruledef match.
permit [bypass-nat | nat-realm *nat_realm_name* **]**: Permit packets.

Important: The **bypass-nat** keyword is only available in StarOS 8.3 and later releases.

Optionally specify:

- **bypass-nat**: Specifies to bypass Network Address Translation (NAT).
- **nat-realm** *nat_realm_name*: Specifies a NAT realm to be used for performing NAT on subscriber packets.

  nat_realm_name must be the name of a NAT realm, and must be an alphanumeric string of 1 through 31 characters.

Important: If neither **bypass-nat** or **nat-realm** are configured, NAT is performed if the **nat policy nat-required** CLI command is configured with the **default-nat-realm** option.

deny [charging-action *charging_action_name* **]**: Denies specified packets.
Optionally, a charging action can be specified.
charging_action_name must be the name of a charging action, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the default action to be taken on packets with no Stateful Firewall ruledef matches.
If, for deny action, the optional charging action is configured, the action taken depends on what is configured in the charging action. For the Stateful Firewall rule, the "flow action", "billing action", and "content ID" of the charging action will be used to take action. If flow exists, flow statistics are updated.
Allowing/dropping of packets is determined in the following sequence:

- Check is done to see if the packet matches any pinholes. If yes, no rule matching is done and the packet is allowed.
- Stateful Firewall ruledef matching is done. If a rule matches, the packet is allowed or dropped as per the **firewall priority** configuration.
- If no Stateful Firewall ruledef matches, the packet is allowed or dropped as per the **no-ruledef-matches** configuration.

For a packet dropped due to Stateful Firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **firewall priority** or the **firewall no-ruledef-matches** command respectively.
In StarOS 8.1, in the case of Policy-based Stateful Firewall, the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command.

Example

The following command configures Stateful Firewall to permit downlink packets with no ruledef matches:

```
firewall no-ruledef-matches downlink action permit
```

firewall policy

This command allows you to enable/disable Stateful Firewall support for all subscribers using the current rulebase.

Important: In StarOS 8.0, this command is available in the APN/Subscriber Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

{ default | no } firewall policy
```

default

Configures this command with its default setting.
Default: Stateful Firewall support is disabled for all subscribers using the current rulebase.

no

If previously enabled, disables Stateful Firewall support for all subscribers using the current rulebase.

firewall-required

Enables Stateful Firewall support for all subscribers using the current rulebase.

Usage

Use this command to enable/disable Stateful Firewall support for all subscribers using the current rulebase.

Example

The following command enables Stateful Firewall support:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support:

```
no firewall policy
```

firewall priority

This command allows you to add and specify the priority and type of a Stateful Firewall ruledef in the current rulebase, and allows you to configure a single or range of ports to be allowed on the server for auxiliary/data connections.

Important: In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, use the **access-rule priority** command available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

firewall priority *priority* **[dynamic-only | static-and-dynamic] firewall-ruledef** *firewall_ruledef_name* **{ { deny [charging-action** *charging_action_name* **] } | { permit [nat-realm** *nat_realm_name* **| [trigger open-port {** *aux_port_number* **| range** *start_port_number* **to** *end_port_number* **} direction { both | reverse | same }]] } }**

no firewall priority *priority*

no

If previously configured, deletes the specified Stateful Firewall ruledef priority configuration from the current rulebase.

priority

Specifies the Stateful Firewall ruledef's priority in the current rulebase.
priority must be a unique value in the current rulebase, and must be an integer from 1 through 65535.

[dynamic-only | static-and-dynamic] firewall-ruledef *firewall_ruledef_name*

Specifies the Stateful Firewall ruledef to add to the rulebase. Optionally, the Stateful Firewall ruledef type can be specified.

- **dynamic-only**: Firewall Dynamic Ruledef—Predefined ruledef that can be enabled/disabled by the policy server, and is disabled by default.
- **static-and-dynamic**: Firewall Static and Dynamic Ruledef—Predefined ruledef that can be disabled/enabled by the policy server, and is enabled by default.
- *firewall_ruledef_name* must be the name of a Stateful Firewall ruledef, and must be an alphanumeric string of 1 through 63 characters.

deny [charging-action *charging_action_name* **]**

Denies packets if the rule is matched. An optional charging action can be specified. If a packet matches the deny rule, action is taken as configured in the charging action. For Stateful Firewall ruledefs, only the terminate-flow action is applicable, if configured in the specified charging action.
charging_action_name must be the name of a charging action, and must be an alphanumeric string of 1 through 63 characters.

permit [nat-realm *nat_realm_name* **| [bypass-nat] [trigger open-port {** *aux_port_number* **| range** *start_port_number* **to** *end_port_number* **}]]**

Permits packets.

- **nat-realm** *nat_realm_name*: Specifies the NAT realm to be used for performing NAT on subscriber packets matching the Stateful Firewall ruledef.

  If the NAT realm is not specified, then NAT will be bypassed. That is, NAT will not be applied on subscriber packets that are matching a Stateful Firewall ruledef with no NAT realm name configured.

  nat_realm_name must be the name of a NAT realm, and must be an alphanumeric string of 1 through 31 characters.

- **bypass-nat**: Specifies that packets bypass NAT.

  Important: If the **nat-realm** is not configured, NAT is performed if the **nat policy nat-required** CLI command is configured with the **default-nat-realm** option.

- **trigger open-port {** *aux_port_number* **| range** *start_port_number* **to** *end_port_number* **}**: Permits packets if the rule is matched, and allows the creation of data flows for Stateful Firewall. Optionally a port trigger can be specified to be used for this rule to limit the range of auxiliary data connections (a single or range of port numbers) for protocols having control and data connections (like FTP). The trigger port will be the destination port of an association which matches a rule.
  - *aux_port_number*: Specifies the number of auxiliary ports to open for traffic, and must be an integer from 1 through 65535.
  - **range** *start_port_number* **to** *end_port_number*: Specifies the range of ports to open for subscriber traffic.
    - *start_port_number* must be an integer from 1 through 65535. This is the start of the port range and must be less than *end_port_number*.
    - *end_port_number* must be an integer from 1 through 65535. This is the end of the port range and must be greater than *start_port_number*.

direction { both | reverse | same }

Specifies the direction from which the auxiliary connection is initiated. This direction can be same as the direction of control connection, or the reverse of the control connection direction, or in both directions.

- **both**: Provides the trigger to open port for traffic in either direction of the control connection.
- **reverse**: Provides the trigger to open port for traffic in the reverse direction of the control connection (from where the connection is initiated).
- **same**: Provides the trigger to open port for traffic in the same direction of the control connection (from where the connection is initiated).

Usage

Use this command to add Stateful Firewall ruledefs to the rulebase and configure the priority, type, and port triggers. Port trigger configuration is optional. Port trigger can be configured only if a rule action is permit. The rulebase specifies the Stateful Firewall rules to be applied on the calls. The ruledefs within a rulebase have priorities, based on which priority matching is done. Once a rule is matched and the rule action is

permit, if the trigger is configured, the appropriate check is made. The trigger port will be the destination port of an association which matches the rule.
Multiple triggers can be defined for the same port number to permit multiple auxiliary ports for subscriber traffic.
Once a rule is matched and if the rule action is deny, the action taken depends on what is configured in the specified charging action. If the flow exists, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, an EDR is generated.
- If the content ID is configured, UDR information is updated.
- If the flow action is configured as "terminate-flow", the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Important: For Stateful Firewall ruledefs, only the terminate-flow action is applicable if configured in the specified charging action.

For a packet dropped due to Stateful Firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **firewall priority** or the **firewall no-ruledef-matches** command respectively.
In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For action on packets dropped due to any error condition after data session is created, the charging action must be configured in the **flow any-error charging-action** command.
The GGSN can dynamically activate/deactivate dynamic Stateful Firewall ruledefs for a subscriber based on the rule name received from a policy server. At rule match, if a rule in the rulebase is a dynamic rule, and if the rule is enabled for the particular subscriber, rule matching is done for the rule. If the rule is disabled for the particular subscriber, rule matching is not done for the rule.

Example

The following command assigns a priority of *10* to the Stateful Firewall ruledef *fw_rule1*, adds it to the rulebase, and permits port trigger to be used for the rule to open ports in the range of *100* to *200* in either direction of the control connection:

```
firewall priority 10 firewall-ruledef fw_rule1 permit trigger open-port
range 100 to 200 direction both
```

The following command configures the Stateful Firewall ruledef *fw_rule2* as a dynamic ruledef:

```
firewall priority 7 dynamic-only firewall-ruledef fw_rule2 deny
```

firewall tcp-first-packet-non-syn

This command allows you to configure the action to take on TCP flows starting with a non-syn packet.

Important: In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-first-packet-non-syn { drop | reset }

default firewall tcp-first-packet-non-syn
```

default

Configures this command with its default setting.
Default: **drop**

drop

Specifies to drop the packet or session.

reset

Specifies to send reset.

Usage

Use this command to configure action to take on TCP flow starting with a non-syn packet.

Example

The following command configures action to take on TCP flow starting with a non-syn packet to drop:

```
firewall tcp-first-packet-non-syn drop
```

firewall tcp-idle-timeout-action

This command allows you to configure the Stateful Firewall action to be taken on TCP idle timeout expiry.

Important: In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

```
firewall tcp-idle-timeout-action { drop | reset }

default firewall tcp-idle-timeout-action
```

default

Configures this command with its default setting.
Default: **reset**

drop

Specifies to drop the packet or session on TCP timeout expiry.

reset

Specifies to send reset on TCP timeout expiry.

Usage

Use this command to configure action to take on TCP idle timeout expiry.

Example

The following command configures action to take on TCP idle timeout expiry to drop:

```
firewall tcp-idle-timeout-action drop
```

firewall tcp-reset-message-threshold

This command allows you to configure a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After this threshold is reached, further downlink traffic to the subscriber on the unwanted flow is blocked.

Important: This command is only available in StarOS 8.3 and later releases. In StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-reset-message-threshold *messages* **then-block-server**

{ default | no } firewall tcp-reset-message-threshold

default

Configures this command with its default setting.
Default: **no firewall tcp-reset-message-threshold**

no

If previously configured, deletes the firewall tcp-reset-message-threshold configuration from the current rulebase.

messages

Specifies the threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. *messages* must be an integer from 1 through 100.

Usage

Use this command to configure a threshold on the number of TCP reset messages sent by the subscriber for a particular data flow. After the threshold is reached, assuming the server is not reacting properly to the reset messages further downlink traffic to the subscriber on the unwanted flow is blocked. This configuration enables QCHAT noise suppression for TCP.

Example

The following command sets the threshold on the number of TCP reset messages to *10*:

```
firewall tcp-reset-message-threshold 10 then-block-server
```

firewall tcp-syn-flood-intercept

This command allows you to configure the TCP intercept parameters to prevent TCP SYN flooding attacks by intercepting and validating TCP connection requests for DoS protection mechanism configured with the **dos-protection** command.

Important: In StarOS 8.0, this command is available in the ACS Configuration Mode. In StarOS 8.1 and StarOS 8.3, use this command for Rulebase-based Firewall-and-NAT configuration. In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT configuration, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

firewall tcp-syn-flood-intercept { mode { none | watch [aggressive] } | watch-timeout *intercept_watch_timeout* **}**

default firewall tcp-syn-flood-intercept { mode | watch-timeout }

default

Sets the default values of TCP intercept parameters for SYN Flood DoS protection.

mode { none | watch [aggressive] }

Specifies the TCP SYN flood intercept mode:

- **none**: Disables TCP SYN flood intercept feature.
- **watch**: Configures TCP SYN flood intercept feature in watch mode. Stateful Firewall passively watches to see if TCP connections become established within a configurable interval. If connections are not established within the timeout period, Stateful Firewall clears the half-open connections by sending RST to TCP client and server. The default watch-timeout for connection establishment is 30 seconds.
- **aggressive**: Configures TCP SYN flood Intercept or Watch feature for aggressive behavior. Each new connection request causes the oldest incomplete connection to be deleted. When operating in watch mode, the watch timeout is reduced by half. If the watch-timeout is 30 seconds, under aggressive conditions it becomes 15 seconds. When operating in intercept mode, the retransmit timeout is reduced by half (i.e. if the timeout is 60 seconds, it is reduced to 30 seconds). Thus the amount of time waiting for connections to be established is reduced by half (i.e. it is reduced to 150 seconds from 300 seconds under aggressive conditions).

Default: **none**

watch-timeout *intercept_watch_timeout*

Specifies the TCP intercept watch timeout, in seconds.
intercept_watch_timeout must be an integer from 5 through 30.
Default: 30

Usage

This TCP intercept functionality provides protection against TCP SYN Flooding attacks.
The system captures TCP SYN requests and responds with TCP SYN-ACKs. If a connection initiator completes the handshake with a TCP ACK, the TCP connection request is considered as valid by system and system forwards the initial TCP SYN to the valid target which triggers the target to send a TCP SYN-ACK. Now system intercepts with TCP SYN-ACK and sends the TCP ACK to complete the TCP handshake. Any TCP packet received before the handshake completion will be discarded.

Example

The following command sets the TCP intercept watch timeout setting to *5* seconds:

```
firewall tcp-syn-flood-intercept watch-timeout 5
```

flow any-error

This command allows you to specify the charging action to be used for packets dropped by Stateful Firewall due to any error conditions.

Product

FW

Privilege

Security Administrator, Administrator

Syntax

flow any-error charging-action *charging_action_name*

default flow any-error

default

Configures the default action for packets dropped by Stateful Firewall due to any errors.
Default: Update the flow statistics if flow is available

charging_action_name

Specifies the charging action based on which accounting action is taken on packets dropped by Stateful Firewall due to any errors.
charging_action_name must be the name of a charging action, and must be an alphanumeric string of 1 through 63 characters.

Important: The charging action specified here should preferably not be used for action on packets dropped due to Stateful Firewall ruledef match or no-match (in the **firewall priority** and **firewall no-ruledef-matches** commands) and the content ID within the charging action must be unique so that dropped counts will not interfere with other content IDs.

Usage

Use this command to configure the charging action for packets dropped by Stateful Firewall due to any error conditions, such as, a packet being inappropriate based on the state of the protocol of the packet's session, or DoS protection causing the packet to be discarded, and so on.
For a packet dropped due to Stateful Firewall ruledef match or no match (first packet of a flow), the charging action applied is the one configured in the **firewall priority** or the **firewall no-ruledef-matches** command respectively.
In StarOS 8.1, in the case of Policy-based Firewall, the charging action applied is the one configured in the **access-rule priority** or the **access-rule no-ruledef-matches** command respectively.
For a packet dropped due to any error condition after data session is created, the charging action used is the one configured in the **flow any-error charging-action** command.
If the charging action applied on a packet is the one specified in the **flow any-error charging-action** command, flow statistics are updated and action is taken as configured in the charging action:

- If the billing action is configured as EDR enabled, an Event Data Record (EDR) is generated.
- If the content ID is configured, Usage Data Record (UDR) information is updated.

- If the flow action is configured as “terminate-flow”, the flow is terminated instead of just discarding the packet.

If the billing action, content ID, and flow action are not configured, no action is taken on the dropped packets.

Example

The following command specifies the charging action *test2* for accounting action on packets dropped/discarded by Stateful Firewall due to any error:

```
flow any-error charging-action test2
```

flow control-handshaking

This command allows you to specify how to charge for the control traffic associated with an application.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
flow control-handshaking { charge-to-application { [ all-packets ] [ initial-packets ] [
mid-session-packets ] [ tear-down-packets ] } | charge-separate-from-application }

default flow control-handshaking

no flow control-handshaking [ charge-to-application ]
```

`default flow control-handshaking`

Configures this command with its default setting.
Default: Same as **`no flow control-handshaking`**

`no flow control-handshaking [ charge-to-application ]`

If previously configured, deletes the flow control-handshaking configuration from the current rulebase. The control packets will use whatever content-id is determined by the normal use of the **`action`** commands.
In this command, the optional keyword **`charge-to-application`** is deprecated and has no effect.

`charge-to-application { [ all-packets ] [ initial-packets ] [ mid-session-packets ] [ tear-down-packets ] }`

Configures the charging action to include the flow control packets either during initial handshaking only or specified control packets during session for charging.

- **`all-packets`**: Specifies that the initial setup packets will wait until the application has been determined before assigning the content-id, and all mid-session ACK packets as well as the final tear-down packets will use that content-id.
- **`initial-packets`**: Specifies that only the initial setup packets will wait for content-id assignment.
- **`mid-session-packets`**: Specifies that the ACK packets after the initial setup will use the application's or content-id assignment.
- **`tear-down-packets`**: Specifies that the final tear-down packets (TCP or WAP) will use the application's or content-id assignment.

`charge-separate-from-application`

Configures the charging action to separate the charging of the initial control packets or all subsequent control packets from regular charging.

Usage

Use this command to configure how to charge for the control traffic associated with an application ruledef. Applications like HTTP use TCP to set up and tear down connections before the HTTP application starts.

This command controls whether the packets that set up and tear down the connections should use the same content ID as the application's flow.
In normal mode 3-way handshake TCP packets (SYN, SYN-ACK, and ACK) and closing or intermittent packets (FIN, RST, etc.) directed and charged based on configured matched rules. This command makes the system to wait for the start and stop of layer 7 packet flow and content ID and charge the initial, intermittent, and closing TCP packets as configured to the same matching rules and content ID as of the flow.
This command also affects applications that do not use TCP but use other methods for control packets, for example WAP, where WTP/UDP may be used to set up and tear down connection-oriented WSP.

Example

Following command enables the charging for initial TCP handshaking control packets and wait for content-id of data traffic flow:

```
flow control-handshaking charge-to-application initial-packets
```

The following command enables charging all mid-session ACKs as well as tear-down packets to application:

```
flow control-handshaking charge-to-application mid-session-packets tear-down-packets
```

flow end-condition

This command allows you to configure the end condition of the session flows related to a user session and triggers EDR generation.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

In 12.1 and earlier releases:

flow end-condition { { content-filtering | normal-end-signaling | timeout + } | { { hagr | handoff | session-end } [flow-overflow] + } [url-blacklisting] } edr *edr_format_name*

no flow end-condition

In 12.2 and later releases:

flow end-condition { content-filtering | hagr | handoff | normal-end-signaling | session-end | url-blacklisting | timeout } [flow-overflow] + { charging-edr *charging_edr_format_name* **| reporting-edr** *reporting_edr_format_name* **}**

no flow end-condition

no

If previously configured, deletes the flow end-condition configuration from the current rulebase.

content-filtering

Creates an EDR with the specified EDR format whenever a flow ends due to Category-based Content Filtering in-line service action. Possible actions include redirect-url, terminate-flow, content-insert.

hagr

Creates an EDR with the specified EDR format whenever a flow is terminated due to Inter-chassis Session Recovery action.

handoff

Creates an EDR with the specified EDR format whenever a flow ends due to hand-off. Whenever a handoff occurs, ACS closes the EDRs for all current flows using the specified EDR format, and begins new statistics collection for the flows for the EDRs that will be generated when the flows actually end.

normal-end-signaling

Creates an EDR with the specified EDR format whenever flow end is signaled normally, for example like detecting FIN and ACK for a TCP flow, or a WSP-DISCONNECT terminating a connection-oriented WSP flow over UDP) and create an EDR for the flow using the specified EDR format.

session-end

Creates an EDR with the specified EDR format whenever a subscriber session ends. By this option ACS creates an EDR with the specified format name for every flow that has had any activity since last EDR was created for the flow on session end.

url-blacklisting

Creates an EDR with the specified EDR format whenever flow ends due to URL Blacklisting action.

timeout

Creates an EDR with the specified EDR format whenever a flow ends due to a timeout condition.

flow-overflow

Important: This keyword is only available in StarOS 8.3 and later releases. And, is only applicable when used with the **hagr**, **handoff**, and **session-end** keywords.

Creates an EDR with the specified EDR format whenever there is a flow-overflow condition. If any of the specified end-conditions that affect subscriber information stored at ACS (such as call line) is configured, the "flow-overflow" EDR is generated.

+

Indicates that more than one of the keywords can be entered within a single command.

edr *edr_format_name*

Important: This option is available only in the 12.1 and earlier releases. In 12.2 and later releases, this option is deprecated and is replaced by the **charging-edr** option.

Specifies the EDR format to record EDR for specified flow end condition.
edr_format_name must be the name of an EDR format, and must be a unique alphanumeric string of 1 through 63 characters.

charging-edr *charging_edr_format_name*

Important: This option is available only in 12.2 and later releases.

Specifies the charging EDR format.
charging_edr_format_name must be the name of a charging EDR format, and must be an alphanumeric string of 1 through 63 characters.

reporting-edr *reporting_edr_format_name*

Important: This option is available only in 12.2 and later releases.

Specifies the reporting EDR format.

reporting_edr_format_name must be the name of a reporting EDR format, and must be a unique alphanumeric string of 1 through 63 characters.

Usage

Use this command to enable or disable the capturing of EDRs based on flow end condition.

Example

In 12.1 and earlier releases, the following command configures the flow end condition as "handoff" and creates a charging EDR with format named *EDR_format1*:

```
flow end-condition handoff edr-format EDR_format1
```

In 12.2 and later releases, the following command configures the flow end condition as handoff and creates a charging EDR with format named *EDR_format1*:

```
flow end-condition handoff charging-edr EDR_format1
```

flow limit-across-applications

This command allows you to limit the total number of simultaneous flows per Subscriber/APN sent to a rulebase regardless of the flow type, or limit flows based on the protocol type under the Session Control feature.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
flow limit-across-applications { limit | non-tcp limit | tcp limit }

no flow limit-across-applications [ non-tcp | tcp ]
```

no

If previously configured, deletes the flow limit-across-applications configuration from the current rulebase.

flow limit-across-applications *limit*

Specifies the maximum number of flows across all applications for the rulebase.
limit must be an integer from 1 through 4000000000.
Default: No limits

non-tcp *limit*

Specifies the maximum limit of non-TCP type flows.
limit must be an integer from 1 through 4000000000.
Default: No limits

tcp *limit*

Specifies the maximum limit of TCP flows.
limit must be an integer from 1 through 4000000000.
Default: No limits

Usage

Use this command to limit the total number of flows allowed for a rulebase regardless of flow type, or limit flows based on the protocol—non-TCP (connection-less) or TCP (connection-oriented).
If a subscriber attempts to exceed these limits system discards the packets of new flow. This limit processing of this command has following aspects for UDP, TCP, ICMP and some of the exempted flows:

- UDP/ICMP: System waits for the flow timeout before updating the counter and removing it from the count of number of flows.
- TCP: After a TCP flow ends, system waits for a short period of time to accommodate the retransmission of any missed packet from one end. TCP flows those are ended, but are still in wait period for timeout are exempted for this limit processing.
- Exempted flows: System exempts all the other flows specified with the **flow limit-for-flow-type** command in the ACS Charging Action Configuration Mode set to **no**.

Example

The following command defines the maximum number of *200000* flows for the rulebase:

```
flow limit-across-applications 200000
```

fw-and-nat default-policy

This command allows you to configure the default Firewall-and-NAT policy for the current rulebase. This command must be used to configure the Policy-based Firewall-and-NAT feature.

Important: This command is only available in StarOS 8.1 and StarOS 9.0 and later releases.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat default-policy *fw_nat_policy_name*

no fw-and-nat default-policy

no

If previously configured, deletes the Firewall-and-NAT default policy configuration from the current rulebase.

fw_nat_policy_name

Specifies the default Firewall-and-NAT policy for the current rulebase.
fw_nat_policy_name must be the name of a Firewall-and-NAT policy, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the default Firewall-and-NAT policy for a rulebase.
For subscribers using the current rulebase, the default Firewall-and-NAT policy will be used if in the APN/subscriber profile the **default fw-and-nat policy** command is configured, and a policy to use is not received from the AAA/OCS.
For more information, see the *Personal Stateful Firewall Administration Guide*.

Example

The following command configures a Firewall-and-NAT policy named *standard* to the rulebase:

```
fw-and-nat default-policy standard
```

ip reassembly-timeout

This command allows you to configure how long to hold onto IP fragments for reassembly, while waiting for the complete packet to arrive.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

ip reassembly-timeout *timeout_duration*

default ip reassembly-timeout

default

Configures the default setting for this command.
Default: 5000 milliseconds

timeout_duration

Specifies the timeout duration, in milliseconds, to hold fragmented packets before reassembly.
timeout_duration must be an integer from 100 through 30000.

Usage

Use this command to configure duration for timeout timer to hold IP fragmented packets before reassembly is needed.
IP fragmented packet are retained, until either all fragmented packets have been received or the configured timeout has expired for the oldest fragment. If all fragments have been received, a temporary complete packet is reconstructed for analysis. Then all fragments are forwarded in order from first to last. If all fragments are not received, the fragments will be forwarded without being passed through the protocol analyzers, except for the IP analyzer.

Example

The following command sets the timeout timer to *15000* milliseconds:

```
ip reassembly-timeout 15000
```

ip reset-tos

This command allows you to reset the IP Type of Service (ToS) value of incoming packets to zero, before proceeding with the rest of ACS processing.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ip reset-tos
```

default

Configures this command with its default setting.
Default: Disabled

no

If previously configured, deletes the IP reset-tos configuration from the current rulebase.

Usage

Use this command to reset the ToS field of any packet after it reaches ACS, or to broaden the range of values that are used in the ToS field in the IP header of any packet.

nat binding-record

This command allows you to configure NAT Binding Record (NBR) generation.

Important: This command is only available in StarOS 8.3. In StarOS 9.0 and later releases this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat binding-record edr-format *edr_format_name* **[port-chunk-allocation] [port-chunk-release] +**

{ default | no } nat binding-record

default

Configures this command with its default setting.
Default: **port-chunk-release**

no

If previously configured, deletes the configuration from the current rulebase.

edr-format *edr_format_name*

Specifies the EDR format.
edr_format_name must be the name of an EDR format, and must be an alphanumeric string of 1 through 63 characters.

port-chunk-allocation

Specifies generating NBR when a port chunk is allocated.

port-chunk-release

Specifies generating NBR when a port chunk is released.

+

Indicates that more than one of the previous keywords can be entered within a single command.

Usage

Use this command to configure NBR generation.

Example

The following command configures an EDR format named *test123* and specifies generating NBR when a port chunk is allocated, and when a port chunk is released:

```
nat binding-record edr-format test123 port-chunk-allocation port-chunk-
release
```

nat policy

This command allows you to enable/disable Network Address Translation (NAT) processing for all subscribers using the current rulebase.

Important: In StarOS 8.1 and StarOS 9.0 and later releases, for Policy-based Firewall-and-NAT, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Important: Before enabling NAT processing for a subscriber, Stateful Firewall must be enabled for the subscriber. See the firewall policy CLI command.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat policy nat-required [default-nat-realm *nat_realm_name* **]**

{ default | no } nat policy

default

Configures this command with its default setting.
Default: NAT processing is disabled for all subscribers using the current rulebase.

no

If previously enabled, disables NAT processing for all subscribers using the current rulebase.

nat policy nat-required

Enables NAT processing for all subscribers using the current rulebase.

default-nat-realm *nat_realm_name*

Important: This keyword is only available in StarOS 8.3 and later releases.

Specifies the default NAT realm to be used if one is not already configured.
nat_realm_name must be the name of a NAT realm, and must be an alphanumeric string of 1 through 31 characters.

Important: Including the default NAT realm, a maximum of three NAT realms are supported.

Usage

Use this command to enable/disable NAT processing for all subscribers using the current rulebase.

After NAT is enabled for a subscriber, the NAT IP address to be used is chosen from the NAT realms defined in the rule priority lines within the rulebase. See the firewall priority CLI command.
NAT enable/disable status in the rulebase can be changed any time, however the changed NAT status will not be applied for active calls using the rulebase. The new NAT status is only applied to new calls.

Example

The following command enables NAT processing:

```
nat policy nat-required
```

The following command disables NAT processing:

```
no nat policy
```

nat suppress-aaa-update call-termination

This command allows you to suppress sending NAT Bind Updates (NBU) to the AAA server when a call gets terminated.

Important: This command is customer-specific. For more information please contact your Cisco account representative. In release 9.0, this command is available in the Firewall-and-NAT Policy Configuration Mode.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

```
nat suppress-aaa-update call-termination

default nat suppress-aaa-update
```

default

Configures this command with its default setting.
Default: Disabled. No suppression of AAA updates.

Usage

Use this command to suppress the sending of NAT Bind Updates (NBU) to the AAA server when the call gets terminated, as these NBUs would be cleared at the AAA after receiving the accounting-stop. This enables to minimize the number of messages between the chassis and AAA server. When not configured, NBUs are sent to the AAA server whenever a port chunk is allocated, de-allocated, or the call is cleared (PPP disconnect).

Example

The following command suppresses the sending of NBU to the AAA server when PPP disconnect happens:

```
nat suppress-aaa-update call-termination
```

p2p dynamic-flow-detection

This command allows you to enable/disable the P2P analyzer to detect peer-to-peer (P2P) applications.

Product

ADC

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] p2p dynamic-flow-detection
```

default

Configures this command with its default setting.
Default: Disabled

no

If previously enabled, disables P2P dynamic flow detection in the current rulebase.

p2p dynamic-flow-detection

Enables dynamic P2P flow detection.

Usage

Use this command to enable dynamic-flow detection. This allows the P2P analyzer to detect the P2P applications configured for the ACS.

post-processing dynamic

This command allows you to specify ruledefs/group-of-ruledefs as dynamic post-processing ruledefs/group-of-ruledefs. This allows the system to differentiate normal post-processing rules from preconfigured ones. By default, this configuration is disabled.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
post-processing dynamic { group-of-ruledefs ruledefs_group_name | ruledef ruledef_name }
charging-action charging_action_name [ description description ]

no post-processing dynamic { group-of-ruledefs ruledefs_group_name | ruledef ruledef_name
}
```

no

If previously configured, deletes the specified configuration from the current rulebase.

group-of-ruledefs *ruledefs_group_name*

Adds the specified group-of-ruledefs to the current rulebase.
ruledefs_group_name must be the name of a group-of-ruledefs, and must be an alphanumeric string of 1 through 63 characters.

ruledef *ruledef_name*

Adds the specified ruledef to the current rulebase.
ruledef_name must be the name of a ruledef, and must be an alphanumeric string of 1 through 63 characters.

charging-action *charging_action_name*

Specifies the charging action.
charging_action_name must be the name of a charging action, and must be an alphanumeric string of 1 through 63 characters.

description *description*

Specifies an optional description for this configuration.
description must be an alphanumeric string of 1 through 31 characters.

Usage

Use this command to configure specific ruledefs/group-of-ruledefs as dynamic post-processing ruledefs/group-of-ruledefs. This allows the system to differentiate normal post-processing rules from the preconfigured ones. This makes possible enabling/disabling ruledefs/groups-of-ruledefs entry from an external server.

Example

The following command specifies the ruledef named *test_rule* as a dynamic post-processing ruledef configured with the charging action *ca13* and a description of *testing*:

```
post-processing dynamic ruledef test_rule charging-action ca13
description testing
```

post-processing policy

This command allows you to specify the post-processing policy to be applied on Limit-Reached packets.

Product

GGSN, P-GW, PDSN

Privilege

Security Administrator, Administrator

Syntax

```
post-processing policy { always | not-for-dynamic-discard }

default post-processing policy
```

default

Configures this command with its default setting.
Default: **not-for-dynamic-discard**

always

Specifies to apply post-processing even if the Credit Control Application (CCA) decides to discard packets due to limit-reached condition. If there are post-processing priority-based rules, CCA will check for any redirection rules. Otherwise, by default, CCA will discard the packets. No other post-processing actions like forward, next-hop, or xheader-insertion will be applied on the limit-reached packets.

not-for-dynamic-discard

Specifies to apply post-processing only if CCA decides not to discard packet. Will directly discard the limit-reached context and will not apply post-processing priority based rules.

Usage

This command allows to enable post-processing priority based rules for content in blacklisted state. Whenever RADIUS/Diameter prepay server blacklists content the packets are generally discarded. To enable redirection of such content, post-processing should be enabled on the blacklisted content. With this command, RADIUS/Diameter Credit-Control application will decide whether to allow post-processing to be enabled or not for the blacklisted content.
The following is a sample configuration:

```
configure
 active-charging service service1
 ruledef http_low
 http any-match = TRUE
 cca quota-state = limit-reached
 rule-application post-processing
 #exit
```

```
ruledef httpany
http any-match = TRUE
#exit
charging-action standard1
content-id 1
cca charging credit
#exit
charging-action redirect
flow action redirect-url http://aoc.com
#exit
rulebase base1
action priority 30 ruledef httpany charging-action standard1
post-processing policy always
post-processing priority 1 ruledef http_low charging-action redirect
#exit
end
```

Example

The following command will enable post processing on Limit-Reached packets:

```
post-processing policy always
```

post-processing priority

This command allows you to configure the post-processing priority and action to be taken on specific ruledef in the current rulebase.

Important: This command is only available in StarOS 8.3 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

post-processing priority *priority* **{ group-of-ruledefs** *ruledefs_group_name* **| ruledef** *ruledef_name* **} charging-action** *charging_action_name* **[description** *description* **]**

no post-processing priority *priority*

no

If previously configured, deletes the specified post-processing priority configuration from the current rulebase.

priority *priority*

Specifies priority for the ruledef/group-of-ruledefs in the current rulebase.
priority must be a unique value in the current rulebase, and must be an integer from 1 through 65535.

group-of-ruledefs *ruledefs_group_name*

Specifies the group-of-ruledefs.
ruledefs_group_name must be the name of a group-of-ruledefs, and must be an alphanumeric string of 1 through 63 characters.

Important: The group-of-ruledefs specified must be configured for post-processing. See the **group-of-ruledefs-application** command in the ACS Group-of-Ruledefs Configuration mode.

ruledef *ruledef_name*

Specifies the ruledef.
ruledef_name must be the name of a ruledef, and must be an alphanumeric string of 1 through 63 characters.

Important: The ruledef specified must be configured for post-processing. See the **rule-application** command in the *ACS Ruledef Configuration Mode Commands* chapter.

charging-action *charging_action_name*

Specifies the charging action.

charging_action_name must be the name of a charging action, and must be an alphanumeric string of 1 through 63 characters.

description *description*

Specifies an optional description for this configuration.
description must be an alphanumeric string of 1 through 31 characters.

Usage

Use this command to configure the post-processing priority and action to be taken on a ruledef in the rulebase.

Example

The following command configures the ruledef named *test_ruledef* with a priority of *10*, and the charging action named *test_ca* for post processing:

```
post-processing priority 10 ruledef test_ruledef charging-action test_ca
```

qos-renegotiate timeout

This command allows you to configure the timeout setting for the Quality of Service (QoS) Renegotiation feature.

Important: This command is license dependent. For more information contact your Cisco account representative.

Product

All

Privilege

Security Administrator, Administrator

Syntax

qos-renegotiate timeout *timeout*

no qos-renegotiate timeout

no

If previously configured, deletes the qos-renegotiate timeout configuration from the current rulebase.

timeout

Specifies the timeout period for the QoS Renegotiation feature in the current rulebase.
timeout is the timeout period in seconds, and must be an integer from 0 through 4294967295. If set to 0, timeout is disabled.

Usage

Use this command to configure timeout setting for the QoS Renegotiation feature.

Example

The following command sets the QoS renegotiate timeout period to 1000 seconds:

```
qos-renegotiate timeout 1000
```

radius threshold

This command allows you to configure the interval and volume thresholds to generate interim RADIUS Charging Data Records (CDRs) and write them to CDR file for ACS postpaid billing.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
radius threshold { interval interval | volume total volume }

{ default | no } radius threshold { interval | volume total }
```

no

If previously configured, deletes the RADIUS threshold configuration from the current rulebase.

default

Configures this command with the default settings.
Default: Disabled

interval *interval*

Specifies the time interval, in seconds, for generating RADIUS interim accounting requests.
interval must be an integer from 60 through 40000000.
Default: Disabled

volume total *volume*

Specifies the limit for the total number of octets (uplink+downlink) after which a stop-start pair will be sent to RADIUS.
volume must be an integer from 100000 through 4000000000.
Default: Disabled

Usage

Use this command to specify a time interval threshold to generate interim RADIUS CDRs and write it to RADIUS CDR file for postpaid billing.

Example

The following command configures a time threshold interval of *600* seconds for RADIUS CDRs:

```
radius threshold interval 600
```

route priority

This command allows you to configure the routing of packets to protocol analyzers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

route priority *route_priority* **ruledef** *ruledef_name* **analyzer { dns | file-transfer | ftp-control | ftp-data | h323 | http | imap | mms | p2p | pop3 | pptp | rtcp | rtp | rtsp | sdp | secure-http | sip [advanced | basic-and-advanced] | smtp | tftp | wsp-connection-less | wsp-connection-oriented } [description** *description* **]**

no route priority *route_priority*

---

no

If previously configured, deletes the specified route priority configuration from the current rulebase.

---

route priority *route_priority*

Specifies the route priority for the specified ruledef in the current rulebase.
route_priority must be an integer from 1 through 65535.
Lower numbered priorities are examined first. Up to 1024 instances can be configured across all rulebases.

---

ruledef *ruledef_name*

Specifies the ruledef to evaluate packets to determine analyzer.
ruledef_name specifies the name of the ruledef configured for the route application using the **rule-application** command in the ACS Ruledef Configuration Mode.
ruledef_name must be the name of a ruledef, and must be an alphanumeric string of 1 through 63 characters.

---

analyzer

Specifies the analyzer for the ruledef, and must be one of the following:

- **dns**: Route to DNS protocol analyzer.
- **file-transfer**: Route to file analyzer.
- **ftp-control**: Route to FTP control protocol analyzer.
- **ftp-data**: Route to FTP data protocol analyzer.
- **h323**: Route to H323 protocol analyzer.
- **http**: Route to HTTP protocol analyzer.
- **imap**: Route to IMAP protocol analyzer.
- **mms**: Route to MMS protocol analyzer.
- **p2p**: Route to the P2P protocol analyzer.
- **pop3**: Route to POP3 protocol analyzer.

- **pptp**: Route to PPTP protocol analyzer.
- **rtcp**: Route to RTCP protocol analyzer.
- **rtp**: Route to RTP protocol analyzer.
- **rtsp**: Route to RTSP protocol analyzer.
- **sdp**: Route to SDP protocol analyzer.
- **secure-http**: Route to secure HTTP protocol analyzer.
- **sip [advanced | basic-and-advanced]**: Route to SIP protocol analyzer.
  - **advanced**: For SIP calls to work with NAT/Stateful Firewall, a SIP Application-Level Gateway (ALG) is required to do payload translation of SIP packets and pin-hole (dynamic flow) creation for media packets. A SIP routing rule must to be configured for routing the packets to the SIP ALG for processing. If the keyword **advanced** is configured, the packets matching the routing rule will be routed to SIP ALG for processing and not to ACS SIP analyzer. If not configured, then packets will not be routed to SIP ALG and will be routed to ACS SIP analyzer for processing.

    Also, see **firewall nat-alg** CLI command in the ACS Configuration Mode.
  - **basic-and-advanced**: For SIP ALG to co-exist with SIP Analyzer, the packets are routed through ACS SIP Analyzer and SIP ALG. The SIP packets can pass through ACS functionality (by ACS SIP Analyzer processing) and at the same time payload translation/pinhole-creation can happen successfully (by SIP ALG processing). If **basic-and-advanced** is configured, then the packets matching the routing rule will be routed through the SIP Analyzer and then through SIP ALG for processing.
- **tftp**: Route to TFTP protocol analyzer.
- **smtp**: Route to SMTP protocol analyzer.
- **wsp-connection-less**: Route to WSP connection-less protocol analyzer.
- **wsp-connection-oriented**: Route to WSP connection-oriented protocol analyzer.

Important: To route packets to the P2P analyzer, the ruledef should have rules to match all IP packets. Otherwise, the analyzer may not detect all P2P traffic.

Important: Use the **show active-charging analyzer statistics** command in the Exec Mode to see the list of supported analyzers.

description *description*

Enables to add a description to the rule and action for later reference in saved configuration file. *description* must be an alphanumeric string of 1 through 63 characters.

Usage

Instances of this CLI command control which packets are routed to which protocol analyzers. Packets sent to ACS are always passed through the IP protocol analyzer. This CLI command controls which higher layer analyzers are also invoked.

Analyzer	Common ways to route to the analyzer
ip	All IPv4 packets are automatically routed here.

Analyzer	Common ways to route to the analyzer
icmp	All IPv4 packets with IP protocol = ICMP (1) are automatically routed here.
tcp	All IPv4 packets with IP protocol = TCP (6) are automatically routed here.
udp	All IPv4 packets with IP protocol = UDP (17) are automatically routed here.
dns	UDP destination port or source port is DNS (53).
http	TCP destination port or source port is HTTP (80).
secure-http	TCP destination port or source port is HTTPS (443). Note that HTTP may use the CONNECT method (see RFC 2817), in which case, the subscriber will be upgraded with transport layer security, but the traffic to/from the chassis will still be HTTP and be passed through the http rather than the secure-http analyzer (assuming that routing to the http analyzer has been configured).
wsp	UDP destination port or source port is connection-less WSP (9200) or connection-oriented WSP (9201).
wtp	Packets are automatically routed here, if you specified "wsp-connection-oriented" as described above.
wap2	TCP destination port or source port of the carrier-specific port number for WAP-2 (e.g. one carrier uses 8799); or, send all HTTP traffic to the **wap2** analyzer if the carrier does not use a special port number.
ftp	TCP destination port or source port is FTP control (21) or FTP data (20); or, ftp analyzer (for FTP control packets) dynamically detected an FTP data flow over TCP (tcp dynamic-flow = ftp-data).
file-transfer	FTP and the command name is **retr** or **stor**; or, HTTP and the request method is **get** or **post**.
mms	WSP content type is application/vnd.wap.**mms**-message; or, WSP uri contains "**mms**"; or, HTTP content type is application/vnd.wap.mms-message; or, HTTP uri contains "**mms**".
sip	UDP destination port or source port is SIP (5060).
sdp	RTSP or SIP content type is application/sdp
smtp	TCP destination port or source port is SMTP (25).
imap	TCP destination port or source port is IMAP (143).
pop3	TCP destination port or source port is POP3 (110).
rtp and **rtcp**	RTSP has embedded RTP/RTCP payloads (you need to enable RTP dynamic flow detection to catch those flows); or, RTSP or SDP (for SDP within SIP) creates an RTP/RTCP flow over UDP (in addition to enabling the aforementioned dynamic flow detection, you must make sure that UDP packets are routed to the UDP analyzer) or, RTP/RTCP uses predefined UDP port numbers (e.g. default UDP port numbers of 5004/5005).
rtsp	TCP destination port or source port is RTSP (554).
p2p	Use the **p2p dynamic-flow-detection** CLI command to enable detection of the different P2P applications specified by the **p2p application** CLI command; that will cause every TCP or UDP packet to be automatically routed here

Example

The following command assigns a route and rule action with the route priority of 23, a ruledef named *test*, and an analyzer *test_analyzer* with description as *route_test1* to the current rulebase:

```
route priority 23 ruledef test analyzer test_analyzer description
route_test1
```

rtp dynamic-flow-detection

This command allows you to enable/disable the Real Time Streaming Protocol (RTSP) and Session Description Protocol (SDP) analyzers to detect the start/stop of RTP and RTCP flows.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ default | no ] rtp dynamic-flow-detection`

`default`

Configures this command with its default setting.
Default: Disabled; same as **`no rtp dynamic-flow-detection`**.

`no`

If previously configured, deletes this configuration from the current rulebase.

Usage

Use this command to enable the RTSP and SDP analyzer to detect the start/stop of RTP and RTCP flows. This command is used in conjunction with the **`route priority`** command.

Example

The following command enables RTP dynamic flow detection:

```
rtp dynamic-flow-detection
```

ruledef-parsing

This command allows you to configure whether to consider or ignore the port number embedded in the application header (for example, the ":80" in www.star.com:80) when comparing the ruledef expressions to the packet contents.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ruledef-parsing ignore-port-numbers-embedded-in-application-headers analyzers { http rtsp sip wsp }

default ruledef-parsing
```

no

If previously configured, deletes the ruledef-parsing configuration from the current rulebase.

default

Configures this command with its default setting.
Default: Same as **no ruledef-parsing ignore-port-numbers-embedded-in-application-headers analyzers { http rstp sip wsp }**— not ignoring port numbers that are embedded in application headers.

ignore-port-numbers-embedded-in-application-headers analyzers { http rtsp sip wsp }

Ignore the port numbers present in application header.
Specifies analyzers for which the port number must be ignored.

Usage

Use this command to make the HTTP, RTSP, SIP, and WSP analyzer ignore port numbers embedded in application headers.

Example

The following command makes the HTTP analyzer in the current rulebase ignore port numbers embedded in application headers:

```
ruledef-parsing ignore-port-numbers-embedded-in-application-headers analyzers http
```

tcp 2msl-timeout

This command allows you to configure how long to retain the TCP flow after the FIN has been acknowledged.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

tcp 2msl-timeout *2msl_timeout*

{ default | no } tcp 2msl-timeout

default

Configures this command with its default setting.
Default: 2 seconds

no

Disables the timeout and sets the system to delete the flow immediately upon seeing the FIN acknowledged.

tcp 2msl-timeout *2msl_timeout*

Specifies the duration to keep the TCP flow.
2msl_timeout specifies the timeout duration, in seconds, and must be an integer from 1 through 20.

Usage

Use this command to configures how long to retain the TCP flow after the FIN has been acknowledged. Acknowledgment to the FIN is not guaranteed to be received by the destination, then the FIN could be resent and re-acknowledged. In this scenario, it is desirable to still have the flow, so that the re-sends do not create a new flow.

Example

The following command sets the timeout to 4 seconds:

```
tcp 2msl-timeout 4
```

tcp check-window-size

This command allows you to enable/disable TCP window-size checking.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] tcp check-window-size
```

default

Configures this command with its default setting.
Default: Enabled (packets after the erroneous packet (with size greater than the receiver's window size) will hit tcp-error ruledef).

no

Disables the window-size check and continues with normal L7 parsing.

tcp check-window-size

Enables the window-size check and continues with normal L7 parsing.

Usage

Use this command to enable/disable TCP window-size check for packets out of TCP window.

Example

The following command enables TCP window-size check:

```
tcp check-window-size
```

tcp mss

This command allows you to configure the TCP Maximum Segment Size (MSS) in TCP SYN packets.

Important: This command is only available in StarOS 8.1 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

tcp mss *tcp_mss* **{ add-if-not-present | limit-if-present } +**

{ default | no } tcp mss

default

Configures this command with its default setting.
Default: Disabled

no

If previously configured, deletes the TCP MSS configuration from the current rulebase.

tcp mss *tcp_mss*

Specifies the TCP MSS.
tcp_mss must be an integer from 496 through 65535.

add-if-not-present

Specifies to add the TCP MSS if not present in the packet.

limit-if-present

Specifies to limit the TCP MSS if present in the packet.

Usage

Using this command, TCP MSS can be limited if already present in the TCP SYN packets. If there are no errors detected in IP header/TCP mandatory header and there are no memory allocation failures, TCP optional header is parsed. If TCP MSS is present in the optional header and its value is greater than the configured MSS value, the value present in the TCP packet is replaced with the configured one.
If the TCP optional header is not present in the SYN packet and there are no errors in already present TCP header, the TCP MSS value configured will be inserted while sending the current packet out.

Example

The following command limits the TCP maximum segment size to *3000*, and if not present adds it to the packets:

```
tcp mss 3000 limit-if-present add-if-not-present
```

tcp out-of-order-timeout

Description This command has been deprecated, and is replaced by the tcp packets-out-of-order command.

tcp packets-out-of-order

This command allows you to configure processing of TCP packets that are out of order, while waiting for the earlier packet(s) to arrive.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

tcp packets-out-of-order { timeout *timeout_duration* **| transmit [after-reordering | immediately] }**

default tcp packets-out-of-order { timeout | transmit }

default

Configures this command with its default setting.

- **timeout**: 5000 milliseconds
- **transmit**: **immediately**

timeout *timeout_duration*

Specifies the timeout duration for re-assembly of TCP out-of-order packets.
timeout_duration is the timeout duration, in milliseconds, and must be an integer from 100 through 30000.
Default: 5000 milliseconds

transmit [after-reordering | immediately]

Configures the TCP out-of-order segment behavior after buffering a copy.

- **after-reordering**: Sends the TCP out-of-order segment after all packets are received and successfully reordered. If reordering is not successful due to a timeout, the received packets are forwarded without being passed through the protocol analyzers. If memory allocation fails or the received packet is partial retransmitted data, the packet will be forwarded immediately without being passed through the protocol analyzers, except for the IP analyzer.
- **immediately**: Sends the TCP out-of-order segment immediately after buffering a copy. The packets are transmitted as they are received without any in-line services or charging action processing, but also a copy of each packet is held onto. When the missing packet is received, complete deep packet inspection of all the packets and all relevant in-line services is done, and then the last packet is forwarded.

Default: **immediately**

Usage

Use this command to configure how to process TCP packets that are out of order, while waiting for the earlier packet(s) to arrive.

Example

The following command sets the timeout timer to *10000* milliseconds:

```
tcp packets-out-of-order timeout 10000
```

tcp proxy-mode

This command allows you to enable/disable TCP Proxy mode for all subscribers using the current rulebase.

Product

ACS, CF, MVG, TPO

Privilege

Security Administrator, Administrator

Syntax

```
tcp proxy-mode { dynamic { all | content-filtering | dcca | ip-readdressing | nexthop-readdressing | xheader-insert } + | static [ port [ port_number [ to port_number ] ] ] }

default tcp proxy-mode

no tcp proxy-mode [ dynamic { content-filtering | dcca | ip-readdressing | nexthop-readdressing | xheader-insert } + | static [ port [ port_number [ to port_number ] ] ] ]
```

default

Configures this command with its default setting.
Default: Disabled

no

If previously enabled, disables TCP Proxy mode.
Optionally, TCP Proxy can be disabled for specific options that were previously enabled.

dynamic { all | content-filtering | dcca | ip-readdressing | nexthop-readdressing | xheader-insert } +

Enables TCP proxy for subscriber-initiated TCP flows under the specified condition(s).

- **all**: Specifies that subscriber-initiated TCP flows be proxied if all/any of the following conditions are satisfied.
- **content-filtering**: Specifies that subscriber-initiated TCP flows be proxied if a URL is requested, and that URL is checked because Category-based Content Filtering is enabled in the rulebase.
- **dcca**: Specifies that subscriber-initiated TCP flows be proxied if DCCA is enabled in the charging action.
- **ip-readdressing**: Specifies that subscriber-initiated TCP flows be proxied if IP Readdressing feature is enabled in the charging action.
- **nexthop-readdressing**: Specifies that subscriber-initiated TCP flows be proxied if Nexthop Readdressing feature is enabled in the charging action.
- **xheader-insert**: Specifies that subscriber-initiated TCP flows be proxied if x-Header Insertion feature is enabled in the charging action.

static [port [*port_number* [to *port_number*]]]

Enables static TCP proxy for every subscriber-initiated TCP flow, unless specific ports are specified.
port [*port_number* [to *port_number*]]]
Specifies port numbers and/or range of port numbers.

port_number must be an integer from 1 through 65535.

Important: Up to 32 port numbers and eight port ranges can be specified.

Usage

Important: In release 11.0, TCP Proxy functions only in Static mode. Dynamic TCP Proxy mode is supported only in 12.0 and later releases.

Use this command to enable/disable TCP Proxy mode for all subscribers using this ACS rulebase. Optionally, TCP Proxy can be enabled/disabled for specific ACS features. Note that enabling/disabling the TCP Proxy feature for any of the optional ACS features, does not affect that feature.

Important: Regardless of the setting of this command, TCP Proxy is enabled whenever a TPO profile is selected for the subscriber's flow(s).

Note that the last command overwrites any previous configuration. For example, when the following commands are applied in sequence:

```
tcp proxy-mode dynamic nexthop-readdressing
tcp proxy-mode dynamic xheader-insert
```

The nexthop configuration is overwritten by the x-header configuration.

Example

The following command enables TCP proxy for subscriber-initiated TCP flows whenever next-hop-forwarding-address is configured in the charging action:

```
tcp proxy-mode dynamic nexthop-readdressing
```

tethering-detection

This command allows you to enable/disable the Tethering Detection feature for the current rulebase, and specifies the database to use.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
tethering-detection { os-db-only | ua-db-only }

{ default | no } tethering-detection
```

default

Configures this command with its default setting.
Default: By default, the Tethering Detection feature is disabled. When enabled, unless a specific database is specified to be used, by default tethering detection will make use of both the databases.

no

If previously configured, deletes the tethering detection configuration from the current rulebase.

os-db-only

Specifies to perform tethering detection using only the OS signature database.

ua-db-only

Specifies to perform tethering detection using only the UA signature database.

Usage

Use this command to enable/disable the Tethering Detection feature for a rulebase, and configures the database to use.
Changing the configuration does not affect existing flows of the subscriber. If Tethering Detection was disabled and is turned enabled, it will be applied only to new flows of subscribers using the rulebase.
Also, see the **tethering-database** command in the *ACS Configuration Mode Commands* chapter.

Example

The following command enables the Tethering Detection feature in the rulebase, and specifies to use only the OS database:

```
tethering-detection os-db-only
```

timestamp rounding

This command allows you to enable/disable timestamp rounding in EDRs or eG-CDRs.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
timestamp rounding { edr | egcdr } { ceiling | floor | round-off }

{ default | no } timestamp rounding { edr | egcdr }
```

default

Configures this command with its default setting.
Default: **round-off**

no

Disables timestamp rounding.

edr

Enables timestamp rounding for EDRs.

egcdr

Enables timestamp rounding for eG-CDRs.

ceiling

If the fractional part of the seconds is greater than 0, adds 1 to the number of seconds and discards the fraction.

floor

Discards the fractional part of the second.

round-off

Sets the fractional part of the seconds to nearest integer value. If the fractional value is greater than or equal to 0.5, it adds 1 to the number of seconds and discards the fractional part of second.

Usage

Use this command to configure the timestamp rounding setting.
The specified rounding will be performed before system attempts any calculation. For example using round-off, if the start time is 1.4, and the end time is 1.6, then the calculated duration will be 1 (for example, 2 – 1 = 1).
This command may be repeated for each type of EDR or eG-CDR.

Example

The following command sets the EDR timestamp to nearest integer value second; for example, 34:12.23 to 34:12.00:

```
timestamp rounding edr round-off
```

tpo default-policy

This command allows you to configure the default TPO policy for the current rulebase.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

tpo default-policy *tpo_policy_name*

no tpo default-policy

no

If previously configured, deletes the default TPO policy configuration from the current rulebase.

tpo default-policy *tpo_policy_name*

Specifies the default TPO policy for the current rulebase.
tpo_policy_name must be the name of a TPO policy, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the default TPO policy for a rulebase.
For subscribers using a particular rulebase, the default TPO policy configured in it will be used only if in the APN/subscriber profile no TPO policy is configured, and a policy to use is not received from the AAA/OCS.

Example

The following command configures a TPO policy named *standard* as default TPO policy for the rulebase:

```
tpo default-policy standard
```

transport-layer-checksum

This command allows you to enable/disable checksum verification for TCP and UDP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] transport-layer-checksum verify-during-packet-inspection [ tcp | udp ]

default transport-layer-checksum
```

no

Disables the checksum calculation for the specified packet type.

default

Configures this command with its default setting.
Default: Same as **transport-layer-checksum verify-during-packet-inspection**—to perform the checksum verification calculation on all TCP and UDP packets.

[tcp | udp]

Specifies that either TCP or UDP packets should be verified/not verified.
If neither of these keywords is specified the command applies to both TCP and UDP packets.

Usage

Use this command to disable or enable performing checksum verification calculations on TCP or UDP packets.
If the checksum is not verified, the packets will go through the TCP/UDP analyzers (and deeper analyzers, if so configured via the **route** command) regardless of the value of the TCP/UDP checksum.
If the checksum is verified, only packets with good checksums will go through the TCP/UDP analyzers (and deeper analyzers, if so configured).

Example

The following command disables checksum verification calculations on all TCP and UDP packets:

```
no transport-layer-checksum verify-during-packet-inspection
```

udr threshold

This command allows you to configure the threshold limit to generate Usage Data Records (UDRs) that provide Comma Separated Value (CSV) records written periodically in a fixed schema designed to reflect a total billable quantity.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
udr threshold { interval interval | volume { downlink bytes [ uplink bytes ] | total
bytes | downlink bytes [ uplink bytes ] } }

default udr threshold { interval | volume }

no udr threshold { interval | volume { downlink [ uplink ] | total | uplink [ downlink ]
} }
```

no

If previously configured, deletes the UDR threshold configuration from the current rulebase.

default

Configures this command with its default setting.
Default: Disabled; same as **no udr threshold interval** and **no udr threshold volume**.

interval *interval*

Specifies the time interval, in seconds, for closing the UDR if the minimum time duration thresholds are satisfied. By default, this option is disabled.
interval must be an integer from 60 through 40000000.
Default: 0 (Disabled)

volume

Specifies uplink/downlink volume octet counts for the generation of interim UDRs.

- **downlink** *bytes*: Specifies the limit for the number of downlink octets after which the UDR is closed.

  bytes must be an integer from 100000 through 4000000000.

  Default: 4000000000

- **total** *bytes*: Specifies the limit for the total number of octets (uplink+downlink) after which the UDR is closed.

  bytes must be an integer from 100000 through 4000000000.

  Default: Disabled

- **uplink** *bytes*: Specifies the limit for the number of uplink octets after which the UDR is closed.

  bytes must be an integer from 100000 through 4000000000.

  Default: 4000000000

UDR records are generated whenever either threshold is reached.

Usage

Use this command to enable thresholds for generation of UDRs.

Example

The following command specifies that UDR records should be generated every 10 minutes (*600* seconds):

```
udr threshold interval 600
```

udr trigger

This command allows you to configure additional triggers for generating UDRs.

Important: This command is only available in StarOS 8.3 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] udr trigger first-hit-content-id

default udr trigger
```

no

Disables first-hit-content-id UDR trigger.

default

Configures this command with its default setting.
Default: Disabled; no additional triggers.

udr trigger first-hit-content-id

Specifies to generate interim UDR on first packet hit per rating group/content ID.

Usage

This command enables to assign first packet trigger to interim UDRs—for generating UDR for first packet hit per rating group/content ID. The first-hit-content-id trigger when configured causes an UDR to be generated as soon as a packet hits a Charging Action with a content ID. UDR generation will be triggered when this command is configured and present in the rulebase.

Example

The following command assigns first packet trigger to interim UDRs, for generating UDR for first packet hit per rating group/content ID:

```
udr trigger first-hit-content-id
```

url-blacklisting action

This command allows you to enable/disable URL Blacklisting functionality for the current rulebase, and configures the action to be taken when there is a URL match.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

url-blacklisting action { discard | redirect-url *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **} [content-id** *content_id* **]**

{ default | no } url-blacklisting action

default

Disables URL Blacklisting in the current rulebase.

no

If previously configured, deletes the URL Blacklisting action configuration from the current rulebase.

discard

Configures URL Blacklisting “discard” action.

redirect-url *url*

Configures URL Blacklisting “redirect-url” action.
url specifies the redirect URL/URI, which must be a fully qualified URL/URI, and must be an alphanumeric string of 1 through 1023 characters.

terminate-flow

Configures URL Blacklisting “terminate-flow” action.

www-reply-code-and-terminate-flow *reply_code*

Configures URL Blacklisting “terminate-flow” action with reply code.
reply_code specifies the reply code, and must be an integer from 100 through 599.

content-id *content_id*

Usage

Use this command to enable/disable URL Blacklisting at the rulebase level, and configure the action to be taken.

Example

The following command enables URL Blacklisting in the rulebase, and configures the terminate-flow action with reply code 300:

```
url-blacklisting action www-reply-code-and-terminate-flow 300
```

The following command disables URL Blacklisting feature in the rulebase:

```
no url-blacklisting action
```

url-preprocessing

This command allows you to enable/disable a group-of-prefixed-urls for preprocessing of embedded URLs.

Important: This command is customer specific. For more information, please contact your Cisco account representative.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] url-preprocessing bypass group-of-prefixed-urls *prefixed_urls_group_name*

no

If previously configured, deletes the URL-preprocessing bypass configuration from the current rulebase.

group-of-prefixed-urls *prefixed_urls_group_name*

Specifies the group-of-prefixed-urls.
prefixed_urls_group_name must be the name of a group-of-prefixed-urls, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to enable/disable a group-of-prefixed-urls for preprocessing of embedded URLs. This command can be issued multiple times to enable multiple groups. If an embedded URL begins with the string specified within any of the groups, that prefix text will be removed from the URL.

Example

The following command enables looking for prefixed URLs of the group-of-prefixed-urls named *test5*:

```
url-preprocessing bypass group-of-prefixed-urls test5
```

wtp out-of-order-timeout

Description This command has been deprecated, and is replaced by the wtp packets-out-of-order command.

wtp packets-out-of-order

This command allows you to configure how to process Wireless Transaction Protocol (WTP) packets that are out of order, while waiting for the earlier packet(s) to arrive.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

wtp packets-out-of-order { out-of-order-timeout *timeout* **| transmit [after-reordering | immediately] }**

default wtp packets-out-of-order { out-of-order-timeout | transmit }

default

Configures this command with its default setting.

- **out-of-order-timeout**: 5000 milliseconds
- **transmit**: **immediately**

out-of-order-timeout *timeout*

Specifies the maximum duration for which WTP out-of-order packets are retained, before reassembly is needed.
timeout is the timeout duration, in milliseconds, and must be an integer from 100 through 30000.
Default: 5000 milliseconds

transmit [after-reordering | immediately]

Specifies the WTP out-of-order segment behavior after buffering a copy:

- **after-reordering**: Sends WTP out-of-order segment after it becomes ordered
- **immediately**: Sends WTP out-of-order segment immediately after buffering a copy

Default: **immediately**

Usage

Use this command to configure TCP out-of-order segment options.
If out-of-order-timeout is specified, out-of-order packets are retained, until either all packets have been received or the configured timeout has expired for the oldest packet. If all packets have been received, a temporary complete packet is reconstructed for analysis. Then all packets are forwarded in order from first to last. If all packets are not received, the packets will be forwarded without being passed through the protocol analyzers, except for the IP analyzer.
If **after-reordering** transmitting is specified, the packets are held onto and reordered. After successfully reordering the packets, they are processed in the proper order. If reordering is not successful due to timeout (wtp out-of-order-timeout), the received packets are forwarded without being passed through the protocol analyzers.
If **immediately** is specified, the packets are transmitted as they are received without any in-line services or Charging Action processing, however a copy of each packet is retained. When the missing packet is received,

complete deep packet inspection of all the packets and all relevant in-line services is undertaken, and then the last packet is forward (unless otherwise configured by the in-line services or Charging Action).

Example

The following command sets the timeout timer to *10000* milliseconds:

```
wtp out-of-order-timeout 10000
```

xheader-encryption

This command allows you to configure X-Header Encryption feature's parameters.

Important: This command is license dependent. For more information, please contact your Cisco account representative.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

xheader-encryption { certificate-name *certificate_name* **| re-encryption period** *period* **}**

default xheader-encryption re-encryption period

no xheader-encryption { certificate-name | re-encryption }

default

Configures this command with its default setting.
Default: Disabled

no

If previously configured, deletes the configuration from the current rulebase.

certificate-name *certificate_name*

Specifies the encryption certificate to use for the X-Header Encryption feature.
certificate_name must be the name of an encryption certificate, and must be an alphanumeric string of 1 through 63 characters.
Default: Disabled; no encryption certificate

re-encryption period *period*

Specifies how often to re-generate the encryption keys.
period specifies the re-encryption time period in minutes, and must be an integer from 1 through 10000.
Default: Disabled; no re-encryption

Usage

Use this command to configure the X-Header Encryption feature's certificate and re-encryption parameters.

Example

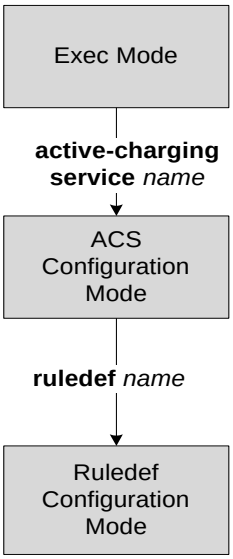
The following command configures the X-Header Encryption feature to use the certificate named *testcert*:

```
xheader-encryption certificate-name testcert
```

Chapter 17
ACS Ruledef Configuration Mode Commands

The ACS Ruledef Configuration Mode is used to create and manage rule expressions in individual rule definitions (ruledefs).

Important: Up to 10 rule expressions can be configured in one ruledef.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

bearer 3gpp apn

This command allows you to define rule expressions to match an Access Point Name (APN) of the bearer flow.

Important: This command is available only in 8.1 and later releases.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer 3gpp apn [ case-sensitive ]` *`operator apn_name`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`apn_name`

Specifies name of the APN to match.
`apn_name` must be an alphanumeric string of 1 through 62 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match an APN in the bearer flow.

Example

The following command defines a rule expression to match user traffic based on APN named *`apn12`*:

```
bearer 3gpp = apn12
```

bearer 3gpp imsi

This command allows you to define rule expressions to match International Mobile Station Identification (IMSI) number in the bearer flow.

Important: This command is available only in 8.1 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp imsi { *operator imsi* **| { !range | range } imsi-pool** *imsi_pool_name* **}**

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imsi

Specifies the IMSI number to match.

!range | range

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

imsi-pool *imsi_pool_name*

Specifies the IMSI pool.
imsi_pool_name must be the name of an IMSI pool, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match an IMSI.

Example

The following command defines a rule expression to analyze user traffic for the IMSI number *9198838330912*:

```
bearer 3gpp imsi = 9198838330912
```

bearer 3gpp rat-type

This command allows you to define rule expressions to match Radio Access Technology (RAT) in the bearer flow.

Important: This command is available only in 8.1 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer 3gpp rat-type` *`operator rat_type`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`rat_type`

Specifies the RAT type to match.
`rat_type` must be one of the following:

- **`geran`**: GSM EDGE Radio Access Network type
- **`utran`**: UMTS Terrestrial Radio Access Network type
- **`wlan`**: Wireless LAN type

Usage

Use this command to define rule expressions to match a RAT type.

Example

The following command defines a rule expression to match user traffic based on RAT type **`wlan`**:

```
bearer 3gpp rat-type = wlan
```

bearer 3gpp sgsn-address

This command allows you to define rule expressions to match SGSN address associated in the bearer flow.

Important: This command is available only in 8.1 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp sgsn-address *operator ip_address*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

ip_address

Specifies the SGSN IP address to match.
ip_address must be in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to define rule expressions to match IP address of an SGSN node. This command replaces the **bearer sgsn-address** command.

Example

The following command defines a rule expression to analyze user traffic for an SGSN node with IP address *10.1.1.1*:

```
bearer 3gpp sgsn-address = 10.1.1.1
```

bearer 3gpp2 bsid

This command allows you to define rule expressions to match Base Station Identifier (BSID) associated with the bearer.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp2 bsid [case-sensitive] use-group-of-objects *operator string*

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

---

use-group-of-objects

Specifies using a group-of-objects as a qualifier to match this rule.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

---

string

Specifies the name of a group-of-objects to match.
If the **use-group-of-objects** keyword is not included in the command, *string* specifies name of the matching 3GPP2 service Base Station ID (BSID) in bearer flow.
If the **use-group-of-objects** keyword is included in the command, *string* must be the name of the group-of-objects to use. In this case, it is checked if the rule is satisfied for either one or none of the objects in the group-of-objects depending upon the operator used. For example, if the *operator* is **contains**, the expression would be true if any of the objects in the specified object group is contained in the BSID. If the *operator* is **!contains**, then the expression would be true if none of the objects in the object group is contained in the BSID.
string must be an alphanumeric string of 1 through 16 characters, and may contain punctuation characters.

Usage

Use this command to define rule expressions to match a 3GPP2 Base Station Identifier (BSID).

Example

The following command defines a rule expression to analyze user traffic for 3GPP2 BSID named *bs001_xyz*:

```
bearer 3gpp2 bsid = bs001_xyz
```

bearer 3gpp2 service-option

This command allows you to define rule expressions to match 3GPP2 service with service options associated with the bearer.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] bearer 3gpp2 service-option *operator service_option_code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

service_option_code

Specifies the 3GPP2 service option code to match.
*service_option_code*must be an integer from 0 through 1000.

Usage

Use this command to define rule expressions to match a 3GPP2 service's service option code.

Example

The following command defines a rule expression to analyze user traffic for a 3GPP2 service's service option matching *1034*:

```
bearer 3gpp2 service-option = 1034
```

bearer apn

This command allows you to define rule expressions to match the APN used for the subscriber session.

Important: In 8.1 and later releases, this command is deprecated and is replaced by the bearer 3gpp apn command.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer apn [ case-sensitive ]` *`operator apn_name`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`apn_name`

Specifies the APN to match.
`apn_name` must be the name of an APN, and must be an alphanumeric string of 1 through 62 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match APN used for subscriber session.

Example

The following command defines a rule expression to match user traffic based on APN name *`apn12`*:

```
bearer apn = apn12
```

bearer imsi

This command allows you to define rule expressions to match IMSI number of the subscriber.

Important: In 8.1 and later releases, this command is deprecated and is replaced by the bearer 3gpp imsi command.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer imsi {` *`operator imsi`* **`| { !range | range } imsi-pool`** *`imsi_pool_name`* **`}`**

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`imsi`

Specifies the IMSI number to match.

`!range | range`

Specifies the range criteria:

- **`!range`**: Not in the range of
- **`range`**: In the range of

`imsi-pool` *`imsi_pool_name`*

Specifies an IMSI pool.
`imsi_pool_name` must be the name of an IMSI pool, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match IMSI number of subscriber.

Example

The following command defines a rule expression to match user traffic based on IMSI number *`9198838330912`*:

```
bearer imsi = 9198838330912
```

bearer rat-type

This command allows you to define rule expressions to match Radio Access Technology (RAT) in the bearer flow.

Important: In 8.1 and later releases, this command is deprecated and is replaced by the bearer 3gpp rat-type command.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] bearer rat-type *operator rat_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

rat_type

Specifies the RAT type to match.
rat_type must be one of the following:

- **geran**: GSM EDGE Radio Access Network type
- **utran**: UMTS Terrestrial Radio Access Network type
- **wlan**: Wireless LAN type

Usage

Use this command to define rule expressions to match a RAT type.

Example

The following command defines a rule expression to match user traffic based on RAT type **wlan**:

```
bearer rat-type = wlan
```

bearer sgsn-address

This command allows you to define rule expressions to match IP address of the SGSN (in acting as GGSN) / P-GW (if acting as S-GW) in the bearer flow.

Important: In 8.1 and later releases, this command is deprecated and is replaced by the bearer 3gpp sgsn-address command.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer sgsn-address` *`operator address`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`address`

Specifies the SGSN IP address to match.
`address` must be in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to define rule expressions to match IP address of the SGSN (in acting as GGSN) / P-GW (if acting as S-GW).

Example

The following command defines a rule expression to match user traffic based on SGSN node IP address *`10.1.1.1`*:

```
bearer sgsn-address = 10.1.1.1
```

bearer traffic-group

This command allows you to define rule expressions to match traffic group number associated with the subscriber session.

Important: This functionality is available only if the Content Access Control license has been installed on the chassis.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] bearer traffic-group` *`operator group_number`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`<=`**: Lesser than or equals
- **`=`**: Equals
- **`>=`**: Greater than or equals

`group_number`

Specifies the traffic group number to match.
`group_number` must be an integer from 1 through 255.

Usage

Use this command to define rule expressions to match traffic group of the subscriber session. See the **`fa-ha-spi`** command in the *HA Service Configuration Mode Commands* chapter for more information.

Example

The following command defines a rule expression to analyze all traffic groups assigned a value greater or equal to *`23`*:

```
bearer traffic-group >= 23
```

cca quota-state

Specifies the quota state of a subscriber for prepaid credit control service. Release 12.0 onwards, this command should be used as a post-processing rule. For more information on post-processing policy command, refer to the *ACS Rulebase Configuration Mode Commands* chapter in this guide.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] cca quota-state operator { limit-reached | lower-bandwidth }
```

no

Disables the configured credit control quota state.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

limit-reached

This state matches an affirmative end-of-quota indication for the current ruledef from the prepay server.

lower-bandwidth

This state matches the lower-bandwidth quota state of a rating group.

Usage

This command supports URL redirection and creates a rule for subscriber prepaid quota state as exhausted or not exhausted.
If a subscriber has exhausted the quota but has not exhausted the qualified period, a different charging-action can be applied via the **cca quota-state** command.

Example

The following command defines a rule expression to match user traffic based on the Credit-Control Application (CCA) quota state **limit-reached**:

```
cca quota-state = limit-reached
```

cca redirect-indicator

This command allows you to define rule expressions to match redirect-indicator state of the Credit Control Application. Release 12.0 onwards, this command should be used as a post-processing rule. For more information on post-processing policy command, refer to *ACS Rulebase Configuration Mode Commands* chapter in this reference.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] cca redirect-indicator` *`operator redirect_indicator`*

`no`

Disables the configured CCA redirect-indicator in the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`<=`**: Lesser than or equals
- **`=`**: Equals
- **`>=`**: Greater than or equals

`redirect_indicator`

Specifies the redirect indicator for the AVP used for redirection of the URL in the RADIUS dictionary for prepaid service. It must be an integer from 0 through 4294967295.

Important: For the RADIUS server configured with different values to return for this AVP, the ACS requires ruledefs to match the different values for system to associate with charging actions that have different redirect URLs configured.

Usage

This command is used to configure an AVP to be used from a dictionary that defines the AVP for the redirect-indicator.
For example, a RADIUS dictionary specifies the 3gpp2-release-indicator to be used for the redirect indicator when RADIUS is used as the Credit-Control Application. In this case, the value for 3gpp2-release-indicator that is returned by the RADIUS prepaid server for a quota request for a given content ID is retained by system and associated with the flow.

Example

The following command defines a rule expression to match redirect indicator *`1234`* for the URL Redirect AVP:

```
cca redirect-indicator = 1234
```

copy-packet-to-log

This command allows you to print every packet that hits the current ruledef to a log statement.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] copy-packet-to-log
```

no

Disables the copy-packet-to-log feature.

copy-packet-to-log

Specifies to print packets hitting the current ruledef to a log.

Usage

Use this command to print every packet that hits a ruledef to a log statement. This facilitates debugging.

dns answer-name

This command allows you to define rule expressions to match answer name in the answer section of DNS response messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] dns answer-name [ case-sensitive ]` *`operator value`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`value`

Specifies the value to match.
`value` must be an alphanumeric string of 1 through 255 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match an answer name from the answer section of DNS response messages.
The answer section of a DNS response may contain more than one answer. A maximum of seven answers from the response packet are parsed. For the equality expressions (=, contains, starts-with, ends-with) a match is sought from any of the answers in the packet (up to the first seven answers). For the inequality expressions (!=, !contains, !starts-with, !ends-with), a non-match is sought from all answers (up to the first seven answers).

Example

The following command defines a rule expression to match user traffic for answer name *test*:

```
dns answer-name = test
```

dns any-match

This command allows you to define rule expressions to match all DNS packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] dns any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define an any-match rule expression to match all DNS packets.

Example

The following command defines an any-match rule expression to match all DNS packets:

```
dns any-match = TRUE
```

dns previous-state

This command allows you to define rule expressions to match previous state of the DNS FSM.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] dns previous-state *operator dns_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

dns_previous_state

Specifies the previous state to match.
dns_previous_state must be one of the following:

- **dns-timeout**
- **init**
- **req-sent**
- **resp-error**
- **resp-success**

Usage

Use this command to define rule expressions to match previous state of DNS FSM.

Example

The following command defines a rule expression to match the DNS FSM previous state **req-sent**:

```
dns previous-state = req-sent
```

dns query-name

This command allows you to define rule expressions to match query name in DNS request messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] dns query-name [case-sensitive] *operator query_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

query_name

Specifies the query name to match.
query_name must be an alphanumeric string of 1 through 255 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match query name in DNS request messages.

Example

The following command defines a rule expression to match DNS query name *test*:

```
dns query-name = test
```

dns return-code

This command allows you to define rule expressions to match response code in DNS response messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] dns return-code *operator return_code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

return_code

Specifies the response code to match.
return_code must be one of the following:

- **format-error**
- **name-error**
- **no-error**
- **not-implemented**
- **refused**
- **server-failure**

Usage

Use this command to define rule expressions to match response code in DNS response messages.

Example

The following command defines a rule expression to match a DNS response code **refused**:

```
dns return-code = refused
```

dns state

This command allows you to define rule expressions to match current state of DNS FSM.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] dns state *operator dns_current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

dns_current_state

Specifies the current state to match.
dns_current_state must be one of the following:

- **dns-timeout**
- **init**
- **req-sent**
- **resp-error**
- **resp-success**

Usage

Use this command to define rule expressions to match DNS FSM current state.

Example

The following command defines a rule expression to match DNS FSM current state of **req-sent**:

```
dns state = req-sent
```

dns tid

This command allows you to define rule expressions to match Transaction Identifier (TID) field in DNS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] dns tid *operator tid_value*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

tid_value

Specifies the DNS transaction identifier to match.
tid_value must be an integer from 1 through 65535.

Usage

Use this command to define rule expressions to match a TID field of DNS messages.

Example

The following command defines a rule expression to match DNS TID field value of *test*:

```
dns tid = test
```

email

This command allows you to define rule expressions to match generic e-mail message parameters. These expressions will be applicable for IMAP, MMS, POP3, and SMTP protocols.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] email { cc | content { class | type } | from | size | subject | to } [ case-sensitive ]` *`operator value`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`cc`

Specifies to match the “cc” field of standard e-mail message.

`content { class | type }`

Specifies to match the “content-type” or “content-class” field of standard e-mail message.

`from`

Specifies to match the “from” field of standard e-mail message.

`subject`

Specifies to match the “subject” field of standard e-mail message.

`to`

Specifies to match the “to” field of standard e-mail message.

`size`

Specifies to match with the total size of e-mail message specified in bytes.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following except for **`size`**:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with

- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

operator must be one of the following for **size**:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

value

Specifies the value to match.
value must be an alphanumeric string and can contain punctuation characters.

- **cc**: A string of 1 through 512 characters
- **content**: A string of 1 through 128 characters
- **from**: A string of 1 through 64 characters
- **size**: A range of bytes from 1 through 4000000000 bytes
- **subject**: A string of 1 through 128 characters
- **to**: A string of 1 through 512 characters

Usage

Use this command to define rule expressions to match different fields/parameters within standard e-mail messages.

Example

The following command defines a rule expression to analyze user traffic for the occurrence of *triangle* in the “cc” field of e-mail messages:

```
email cc contains triangle@xyz.com
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

file-transfer any-match

This command allows you to define rule expressions to match all file-transfer packets. This expression applies to file transfers that use the FTP or HTTP protocols.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all file-transfer packets. This expression applies to file transfers that use the FTP or HTTP protocols.

Example

The following command defines a rule expression to match all file-transfer packets:

```
file-transfer any-match = TRUE
```

file-transfer chunk-number

This command allows you to define rule expressions to match the total number of chunks in an HTTP file as determined by the File Transfer analyzer.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer chunk-number *operator chunks_number*

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

chunks_number

Specifies the number of chunks to match.
chunks_number must be an integer from 1 through 65535.

Usage

Use this command to define rule expressions to match the total number of chunks in an HTTP file as determined by the File Transfer analyzer.

Example

The following command defines a rule expression to match *150* number of chunks:

```
file-transfer chunk-number = 150
```

file-transfer current-chunk-length

This command allows you to define rule expressions to match the length of an HTTP chunk currently in the File Transfer analyzer.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer current-chunk-length *operator current_chunk_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

current_chunk_length

Specifies the current chunk length value (in bytes) to match.
current_chunk_length must be an integer from 1 through 40000000.

Usage

Use this command to define rule expressions to match the length of an HTTP chunk currently in the File Transfer analyzer.

Example

The following command defines a rule expression to match length of current HTTP chunk as *1500000* bytes:

```
file-transfer current-chunk-length = 1500000
```

file-transfer declared-chunk-length

This command allows you to define rule expressions to match the declared length of an HTTP chunk currently in the File Transfer analyzer.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer declared-chunk-length *operator declared_chunk_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

declared_chunk_length

Specifies the declared chunk length value (in bytes) to match.
declared_chunk_length must be an integer from 1 through 40000000.

Usage

Use this command to define rule expressions to match the declared length of an HTTP chunk currently in the File Transfer analyzer.

Example

The following command defines a rule expression to match declared length of the current HTTP chunk as *2500000* bytes:

```
file-transfer declared-chunk-length = 2500000
```

file-transfer declared-file-size

This command allows you to define rule expressions to match the declared file size by the File Transfer analyzer decoding the FTP handshake.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer declared-file-size *operator declared_file_size*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

declared_file_size

Specifies the declared file size (in bytes) to match.
declared_file_size must be an integer from 1 through 40000000.

Usage

Use this command to define rule expressions to match the declared file size by the File Transfer analyzer decoding the FTP handshake.

Example

The following command defines a rule expression to match declared file size as *2500000* bytes:

```
file-transfer declared-file-size = 2500000
```

file-transfer filename

This command allows you to define rule expressions to match file name.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] file-transfer filename [ case-sensitive ]` *`operator file_name`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`file_name`

Specifies the file name to match.
`file_name` must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match file name in file-transfer.

Example

The following command defines a rule expression to match file name containing *`star1`*:

```
file-transfer filename contains star1
```

file-transfer previous-state

This command allows you to define rule expressions to match previous state of File Transfer FSM.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer previous-state *operator file_transfer_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

file_transfer_previous_state

Specifies the previous state to match.
file_transfer_previous_state must be one of the following:

- **init**: Specifies previous state as initialization.
- **request-sent**: Specifies previous state as request sent.
- **transfer-error**: Specifies previous state as transfer error.
- **transfer-ok**: Specifies previous state as transfer ok.

Usage

Use this command to define rule expressions to match previous state of File Transfer FSM.

Example

The following command defines a rule expression to match previous state of **init**:

```
file-transfer previous-state = init
```

file-transfer state

This command allows you to define rule expressions to match the current state of File Transfer FSM.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer state *operator file_transfer_current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

file_transfer_current_state

Specifies the current state to match.
file_transfer_current_state must be one of the following

- **init**: Specifies current state as initialization.
- **request-sent**: Specifies current state as request sent.
- **transfer-error**: Specifies current state as transfer error.
- **transfer-ok**: Specifies current state as transfer ok.

Usage

Use this command to define rule expressions to match current state of File Transfer FSM.
The following table describes details of File Transfer FSM states with event:

Event	init	request-sent	transfer-ok	transfer-err
FTP “RETR” command or HTTP “GET” request received with chunk encoding	request-sent	Discarded	Discarded	Discarded
HTTP 2xx response received	transfer-ok	Discarded	Discarded	Discarded
HTTP 4xx or HTTP 5xx response received	transfer-error	Discarded	Discarded	Discarded
FTP reply received with reply status as file-transfer complete/successful	Discarded	transfer-ok	Discarded	Discarded
FTP reply received with reply status as file-transfer unsuccessful	Discarded	transfer-error	Discarded	Discarded

Example

The following command defines a rule expression to match file-transfer current state of **init**:

```
file-transfer state = init
```

file-transfer transferred-file-size

This command allows you to define rule expressions to match the size of a file that has been transferred so far, as detected by the File Transfer analyzer.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] file-transfer transferred-file-size *operator transferred_file_size*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

transferred_file_size

Specifies the transferred file size (in bytes) to match.
transferred_file_size must be an integer from 1 through 4000000000.

Usage

Use this command to define rule expressions to match the size of the file that has been transferred so far, as detected by the File Transfer analyzer.

Example

The following command defines a rule expression to match file transferred size of *2500* bytes:

```
file-transfer transferred-file-size = 2500
```

ftp any-match

This command allows you to define rule expressions to match all FTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define a rule expression to match all FTP packets.

Example

The following command defines a rule expression to match all FTP packets:

```
ftp any-match = TRUE
```

ftp client-ip-address

This command allows you to define rule expressions to match IP address of the FTP client.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp client-ip-address *operator ip_address*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address

Specifies the FTP client IP address to match.
ip_address must be in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to define rule expressions to match an FTP client IP address, which will be either the IP source address or the IP destination address, depending on the direction.

Example

The following command defines a rule expression to match client IP address *10.1.1.1*:

```
ftp client-ip-address = 10.1.1.1
```

ftp client-port

This command allows you to define rule expressions to match port number of the FTP client.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp client-port *operator port_number*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_number

Specifies the client port number to match.
port_number must be an integer from 1 through 65535.

Usage

Use this command to define rule expressions to match port number of the FTP client, which will be either the TCP source port or the TCP destination port, depending on the direction.

Example

The following command defines a rule expression to match FTP client port number *10*:

```
ftp client-port = 10
```

ftp command args

This command allows you to define rule expressions to match arguments within an FTP command.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp command args [case-sensitive] *operator argument*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

argument

Specifies the argument to match.
argument must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match arguments within an FTP command.

Example

The following command defines a rule expression to match argument *ascii* within an FTP command:

```
ftp command args = ascii
```

ftp command id

This command allows you to define rule expressions to match FTP command ID.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp command id *operator command_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

command_id

Specifies the command identifier to match.
In 8.3 and earlier releases, *command_id* must be an integer from 0 through 15.
In 9.0 and later releases, *command_id* must be an integer from 0 through 18.

Usage

Use this command to define rule expressions to match FTP command ID.

Example

The following command defines a rule expression to match the FTP command ID *10*:

```
ftp command id = 10
```

ftp command name

This command allows you to define rule expressions to match FTP command name.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp command name *operator command_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

command_name

Specifies the command name to match.
command_name must be one of the following:

- **abor**: Abort command
- **cwd**: Current working directory command
- **eprt**: eprt command
- **epsv**: epsv command
- **list**: List command
- **mode**: Transfer mode command
- **pass**: Password command
- **pasv**: Passive command
- **port**: Port command
- **quit**: Quit command
- **rest**: Restore command
- **retr**: Retry command
- **stor**: Store command
- **stru**: File structure command
- **syst**: System command
- **type**: Type command
- **user**: User command

Usage

Use this command to define rule expressions to match FTP command name.

Example

The following command defines a rule expression to match FTP command name **list**:

```
ftp command name = list
```

ftp connection-type

This command allows you to define rule expressions to match FTP connection type.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp connection-type *operator connection_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

connection_type

Specifies the connection type to match.
connection_type must be one of the following:

- **0**: Unknown
- **1**: Control connection
- **2**: Data connection

Usage

Use this command to define rule expressions to match an FTP connection type.

Example

The following command defines a rule expression to match FTP connection type **1**:

```
ftp connection-type = 1
```

ftp data-any-match

This command allows you to define rule expressions to match all FTP data packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp data-any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all FTP data packets.

Example

The following command defines a rule expression to match all FTP data packets:

```
ftp data-any-match = TRUE
```

ftp filename

This command allows you to define rule expressions to match FTP file name.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp filename [case-sensitive] *operator file_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

file_name

Specifies the file name to match.
file_name must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match an FTP file name.

Example

The following command defines a rule expression to match a file named *testtransfer*:

```
ftp filename = testtransfer
```

ftp pdu-length

This command allows you to define rule expressions to match the length of a current FTP packet.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp pdu-length *operator pdu_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the FTP PDU length (in bytes) to match.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match the length of a current FTP packet, that is, FTP PDU length (FTP header + FTP payload).

Example

The following command defines a rule expression to match an FTP PDU length of *9647* bytes:

```
ftp pdu-length = 9647
```

ftp pdu-type

This command allows you to define rule expressions to match FTP Protocol Data Unit (PDU) type.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp pdu-type *operator pdu_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_type

Specifies the PDU type to match.
pdu_type must be one of the following:

- **0**: Unknown
- **1**: Command
- **2**: Reply

Usage

Use this command to define rule expressions to match a PDU type of FTP packet.

Example

The following command defines a rule expression to match FTP PDU type **1**:

```
ftp pdu-type = 1
```

ftp previous-state

This command allows you to define rule expressions to match previous state of FTP session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp previous-state *operator ftp_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

ftp_previous_state

Specifies the previous state to match.
ftp_previous_state must be one of the following:

- **command-sent**
- **init**
- **response-error**
- **response-ok**

Usage

Use this command to define rule expressions to match a previous state of FTP session.

Example

The following command defines a rule expression to match previous FTP state **init**:

```
ftp previous-state = init
```

ftp reply code

This command allows you to define rule expressions to match FTP reply code.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp reply code *operator reply_code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

reply_code

Specifies the FTP reply code to match.
reply_code must be an integer from 100 through 599.

Usage

Use this command to define rule expressions to match an FTP reply code.

Example

The following command defines a rule expression to match FTP reply code *150*:

```
ftp reply code = 150
```

ftp server-ip-address

This command allows you to define rule expressions to match FTP server IP address.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp server-ip-address *operator ip_address*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address

Specifies IP address of the server to match
ip_address must be in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to define rule expressions to match an FTP server IP address, which will be either the IP source address or the IP destination address, depending on the direction.

Example

The following command defines a rule expression to match the FTP server IP address *10.1.1.1*:

```
ftp server-ip-address = 10.1.1.1
```

ftp server-port

This command allows you to define rule expressions to match FTP server port number.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp server-port *operator port*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

port

Specifies the FTP server port number to match.
port must be an integer from 1 through 65535.

Usage

Use this command to define rule expressions to match an FTP server port number, which will be either the TCP source port or the TCP destination port, depending on the direction.

Example

The following command defines a rule expression to analyze user traffic for FTP server port *21*:

```
ftp server-port = 21
```

ftp session-length

This command allows you to define rule expressions to match the total number of bytes sent on an FTP control connection.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp session-length *operator session_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the FTP session length (in bytes) to match.
session_length must be an integer from 1 through 4000000000.

Usage

Use this command to define rule expressions to match the total number of bytes sent on an FTP control connection.

Example

The following command defines a rule expression to match FTP session length of *40000* bytes:

```
ftp session-length = 40000
```

ftp state

This command allows you to define rule expressions to match the current state of an FTP session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp state *operator* **{ close | command-sent | init | response-error | response-ok }**

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

close

Specifies FTP transmissions that are in closed state.

command-sent

Specifies FTP transmissions that are in command-sent state.

init

Specifies FTP transmissions that are in initialized state.

response-error

Specifies FTP transmissions that are in response-error state.

response-ok

Specifies FTP transmissions that are in response-ok state.

Usage

Use this command to define rule expressions to match the current state of an FTP session.

Example

The following command defines a rule expression to match FTP current state **close**:

```
ftp state = close
```

ftp url

This command allows you to define rule expressions to match the FTP URL/path of a file being transferred.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp url [case-sensitive] *operator url*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

url

Specifies the URL to match.
url must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match the FTP URL/path of a file being transferred.

Example

The following command defines a rule expression to match the URL *ftp://rfc.ietf.org/rfc/rfc1738.txt*:

```
ftp url = ftp://rfc.ietf.org/rfc/rfc1738.txt
```

ftp user

This command allows you to define rule expressions to match the user name FTP command packet.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ftp user [case-sensitive] *operator ftp_user*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

ftp_user

Specifies the FTP user name to match.
ftp_user must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match a user name FTP command.

Example

The following command defines a rule expression to match FTP user name *user1*:

```
ftp user = user1
```

http any-match

This command allows you to define rule expressions to match all HTTP and HTTPs Connect Method packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all HTTP packets.

Example

The following command defines a rule expression to match all HTTP packets:

```
http any-match = TRUE
```

http attribute-in-data

This command allows you to define rule expressions to match any arbitrary attribute in the payload following the HTTP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http attribute-in-data *attribute* **[case-sensitive]** *operator value*

no

If previously configured, deletes the specified rule expression from the current ruledef.

attribute

attribute must be an alphanumeric string of 1 through 31 characters.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

value

Specifies the value as an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match arbitrary attribute in the payload following the HTTP headers.

http attribute-in-url

This command allows you to define rule expressions to match arbitrary attribute in the combined Host+URI HTTP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http attribute-in-url *attribute* **[case-sensitive]** *operator value*

no

If previously configured, deletes the specified rule expression from the current ruledef.

attribute

attribute must be an alphanumeric string of 1 through 31 characters.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

value

Specifies the value as an alphanumeric string of 1 through 127 characters.

Usage

Use this command to configure rule expression to match an arbitrary attribute in the combined Host+URI HTTP headers.

http content disposition

This command allows you to define rule expressions to match optional content-disposition field of HTTP entity header.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http content disposition [case-sensitive] *operator content_disposition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

content_disposition

This field offers a mechanism for the sender to transmit presentational information to the recipient, allowing each component of a message to be tagged with an indication of its desired presentation semantics.
content_disposition must be an alphanumeric string of 1 through 127 characters, and may contain punctuation characters.

Usage

Use this command to define rule expressions to match optional content-disposition field of HTTP entity header. This feature supports RFC 2616 for HTTP and RFC 1806 for Content Disposition.

Example

The following command defines a rule expression to match content disposition *successful*:

```
http content disposition = successful
```

http content length

This command allows you to define rule expressions to match the value in HTTP Content-Length entity-header field.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http content length *operator content_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

content_length

Specifies the HTTP body length (in bytes) to match.
content_length must be an integer from 1 through 4000000000.

Usage

Use this command to define rule expressions to match value in HTTP Content-Length entity-header field.

Example

The following command defines a rule expression to match value of *10000* bytes in HTTP Content-Length entity-header field:

```
http content length = 10000
```

http content type

This command allows you to define rule expressions to match value in HTTP Content-Type entity-header field.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] http content type [ case-sensitive ]` *`operator content_type`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_type`

Specifies the content type to match.
`content_type` must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match value in HTTP Content-Type entity-header field.

Example

The following command defines a rule expression to match *`abc100`* in HTTP Content-Type entity-header field:

```
http content type = abc100
```

http domain

This command allows you to define rule expressions to match the domain portion of URIs in HTTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http domain [case-sensitive] *operator domain*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

domain

Specifies the domain to match.
domain must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match the domain portion of URIs in HTTP packets. From the URL, after http:// (if present) is removed, everything until the first "/" is the domain.

Example

The following command defines a rule expression to match user traffic based on domain name *testdomain*:

```
http domain = testdomain
```

http error

This command allows you to define rule expressions to match for errors in HTTP packets (for example, invalid HTTP header) and errors in the HTTP analyzer FSM (Finite State Machine) while parsing HTTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http error *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match for errors in HTTP packets and other errors in HTTP analyzer FSM while parsing HTTP packets. For example, FSM error, invalid header field values, ACS memory and buffer limit, packet related errors, and so on.
ACS supports pipelining of up to 32 HTTP requests on the same TCP connection. Pipeline overflow requests are not analyzed. Such overflow requests are treated as HTTP error. The billing system, based on this information, decides to charge or not charge, or refund the subscriber accordingly.

Example

The following command defines a rule expression to match user traffic based on HTTP error status of **TRUE**:

```
http error = TRUE
```

http first-request-packet

This command allows you to define rule expressions to match the GET or POST request, if it is the first HTTP request for the subscriber's session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http first-request-packet *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match the GET or POST request, if it is the first HTTP request for the subscriber's session.
This expression can be connected with a charging action, so the subscriber is redirected to a splash page for the first Web access attempted.

Example

The following command defines a rule expression to match first-request-packet:

```
http first-request-packet = TRUE
```

http header-length

This command allows you to define rule expressions to match HTTP header length.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http header-length *operator header_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

header_length

Specifies the HTTP header length (in bytes) to match.
header_length must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match the length of an HTTP header.

Example

The following command defines a rule expression to match an HTTP header length of *8000*:

```
http header-length = 8000
```

http host

This command allows you to define rule expressions to match value in HTTP Host request-header field.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http host [case-sensitive] *operator host_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

host_name

Specifies the host name to match.
host_name must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match value in HTTP Host request-header field.

Example

The following command defines a rule expression to match *host1* in HTTP Host request-header field:

```
http host = host1
```

http payload-length

This command allows you to define rule expressions to match HTTP payload length.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http payload-length *operator payload_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

payload_length

Specifies the HTTP payload (data) length (in bytes) to match.
payload_length must be an integer from 1 through 4000000000.

Usage

Use this command to define rule expressions to match an HTTP payload (data) length (pdu-length - header-length).

Example

The following command defines a rule expression to match an HTTP payload length of *100000* bytes:

```
http payload-length = 100000
```

http pdu-length

This command allows you to define rule expressions to match the total length of a single HTTP packet.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http pdu-length *operator pdu_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the HTTP PDU length (in bytes) to match.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match the total length of a single HTTP packet. This will also match packets with partial HTTP message (due to fragmentation).

Example

The following command defines a rule expression to match an HTTP PDU length of *10000* bytes:

```
http pdu-length = 10000
```

http previous-state

This command allows you to define rule expressions to match previous state of HTTP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http previous-state *operator http_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

http_previous_state

Specifies the previous state to match.
http_previous_state must be one of the following:

- **init**: Initialized state
- **response-error**: Response error state
- **response-ok**: Response ok state
- **waiting-for-response**: Waiting for response state

Usage

Use this command to define rule expressions to match a previous state of HTTP sessions.

Example

The following command defines a rule expression to match HTTP previous state **response-ok**:

```
http previous-state = response-ok
```

http referer

This command allows you to define rule expressions to match the value in the HTTP Referer request-header field.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http referer [case-sensitive] *operator referer_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

referer_name

Specifies the HTTP referer name to match.
referer_name must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match value in HTTP Referer request-header field.
This feature allows an operator to collect or track all URLs visited during a particular subscriber session. These URLs include the entire string of visited URLs, including all referral links. This information is output in an Event Data Record (EDR) format to support reporting or billing functions.
For example, if a subscriber begins a mobile web session and clicks on the “Sports” link from the home deck, and then selects ESPN and moves to an advertiser link, the operator can capture all URLs for that entire session. During this period ACS collects the URLs for a particular subscriber session; collection can be limited by time duration or number of URLs visited.

Example

ACS generates EDRs that contain HTTP URL and the HTTP referer fields along with other fields.

The following command defines a rule expression to match the HTTP referer *cricket.espn.com*:

```
http referer = cricket.espn.com
```

http reply code

This command allows you to define rule expressions to match status code associated with HTTP response packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http reply code *operator reply_code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

reply_code

Specifies the HTTP reply code to match.
reply_code must be an integer from 100 through 599.

Usage

Use this command to define rule expressions to match status code associated with HTTP response codes.

Example

The following command defines a rule expression to match HTTP response code *204*:

```
http reply code = 204
```

http request method

This command allows you to define rule expressions to match HTTP request method.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http request method *operator request_method*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

request_method

Specifies the HTTP request method to match.
request_method must be one of the following:

- **connect**
- **delete**
- **get**
- **head**
- **options**
- **post**
- **put**
- **trace**

Usage

Use this command to define rule expressions to match an HTTP request method.

Example

The following command defines a rule expression to match user traffic based on HTTP request method **connect**:

```
http request method = connect
```

http session-length

This command allows you to define rule expressions to match HTTP session length.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http session-length *operator session_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the HTTP total session length (in bytes) to match.
session_length must be an integer from 1 through 4000000000.

Usage

Use this command to define rule expressions to match a total HTTP session length.

Example

The following command defines a rule expression to match an HTTP session length of *200000*:

```
http session-length = 200000
```

http state

This command allows you to define rule expressions to match current state of an HTTP session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies the current state of HTTP session to match.
current_state must be one of the following:

- **close**: Closed state
- **response-error**: Response error state
- **response-ok**: Response ok state
- **waiting-for-response**: Waiting for response state

Usage

Use this command to define rule expressions to match a current state of an HTTP session.

Example

The following command defines a rule expression to match current state **close**:

```
http state = close
```

http transaction-length

This command allows you to define rule expressions to match HTTP transaction length (combined length of one HTTP GET Request message and its associated response messages).

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http transaction-length { *operator transaction_length* **| { { range | !range }** *range_from* **to** *range_to* **} }**

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

transaction_length

Specifies the HTTP transaction length (in bytes) to match.
transaction_length must be an integer from 1 through 4000000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria for length of transaction.

- **range**: Enables the range criteria for HTTP transaction length.
- **!range**: Disables the range criteria for HTTP transaction length.
- *range_from*: Specifies the start of range (in bytes) for HTTP transaction length.
- *range_to*: Specifies the end of range (in bytes) for HTTP transaction length.

Usage

Use this command to define rule expressions to match an HTTP transaction length [one HTTP GET Request message + associated response message(s)] in bytes.

Example

The following command defines a rule expression to match an HTTP transaction length of *10200* bytes:

```
http transaction-length = 10200
```

http transfer-encoding

This command allows you to define rule expressions to match the value in HTTP Transfer-Encoding general-header field.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http transfer-encoding [case-sensitive] *operator transfer_encoding*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

transfer_encoding

Specifies the HTTP transfer encoding to match.
transfer_encoding must be an alphanumeric string of 1 through 127 characters, and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the value in HTTP Transfer-Encoding general-header field.

Example

The following command defines a rule expression to match the value *chunked* in HTTP Transfer-Encoding general-header field:

```
http transfer-encoding = chunked
```

http uri

This command allows you to define rule expressions to match HTTP URI.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http uri [case-sensitive] *operator uri*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

uri

Specifies the HTTP URI to match.
uri must be an alphanumeric string of 1 through 127 characters, and can contain punctuation characters, and excludes the “host” portion.

Usage

Use this command to define rule expressions to match an HTTP URI, excluding the host portion.

Example

The following command defines a rule expression to match the HTTP URI string *http://www.somehost.com*:

```
http uri = http://www.somehost.com
```

http url

This command allows you to define rule expressions to match HTTP URL.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http url [case-sensitive] *operator url*

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

---

url

Specifies the HTTP URL to match.
url must be an alphanumeric string of 1 through 127 characters. that allows punctuation characters and includes “host + URI” for HTTP PDUs.
For example, in case of the URL “http://www.google.fr/”, the host is “http://www.google.fr”, and the URI is “/”:

```
Hypertext Transfer Protocol
 GET / HTTP/1.1\r\n
 Request Method: GET
 Request URI: /
 Request Version: HTTP/1.1
```

```
Accept: */*\r\n

Accept-Language: fr\r\n

Accept-Encoding: gzip, deflate\r\n

User-Agent: Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1)\r\n

Host: www.google.fr\r\n

Connection: Keep-Alive\r\n

\r\n
```

Usage

Use this command to define rule expressions to match HTTP URL.

Example

The following command defines a rule expression to match the HTTP URL *http://rfc.ietf.org/rfc/rfc1738.txt*:

```
http url = http://rfc.ietf.org/rfc/rfc1738.txt
```

http user-agent

This command allows you to define rule expressions to match the User-Agent request-header field of HTTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http user-agent [case-sensitive] *operator user_agent*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

user_agent

Specifies the HTTP user agent value to match.
user_agent must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match value in HTTP user-agent header field.

Example

The following command defines a rule expression to match *xyz.123* in HTTP user-agent header field:

```
http user-agent = xyz.123
```

http version

This command allows you to define rule expressions to match version information in HTTP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http version [case-sensitive] *operator http_version*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

http_version

Specifies this HTTP version value to match.
http_version must be an alphanumeric string of 1 through 127 characters, and may contain punctuation characters.

Usage

Use this command to define rule expressions to match HTTP version.

Example

The following command defines a rule expression to match HTTP version *http4.2*:

```
http version = http4.2
```

http x-header

This command allows you to define rule expressions to match specified field within extension-headers (x-headers).

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] http x-header *field_name* **[case-sensitive]** *operator string*

no

If previously configured, deletes the specified rule expression from the current ruledef.

field_name

field_name must be an alphanumeric string of 1 through 31 characters.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

Specifies the HTTP x-header value to match.
string must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match specified fields within x-headers. The extension-header can be any header fields which are not specified in an RFC.
All x-header fields must begin with “x-”.

Example

The following command defines a rule expression to match the extension-header *test_field* for the value *test_string*:

```
http x-header test_field = test_string
```

icmp any-match

This command allows you to define rule expressions to match all ICMP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] icmp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all ICMP packets.

Example

The following command defines a rule expression to match all ICMP packets:

```
icmp any-match = TRUE
```

icmp code

This command allows you to define rule expressions to match value in the Code field of ICMP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] icmp code operator code
```

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

code

Specifies the ICMP code to match.
code must be an integer from 0 through 255.

Usage

Use this command to define rule expressions to match a code field of ICMP packets.

Example

The following command defines a rule expression to match ICMP code *11*:

```
icmp code = 11
```

icmp type

This command allows you to define rule expressions to match value in Type field of ICMP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] icmp type *operator type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

type

Specifies the ICMP type to match.
type must be an integer from 0 through 255. For example, 0 for Echo Reply, 3 for Destination Unreachable, and 5 for Redirect.

Usage

Use this command to define rule expressions to match a type field of ICMP packets.

Example

The following command defines a rule expression to match user traffic based on ICMP type *3*:

```
icmp type = 3
```

icmpv6 any-match

This command allows you to define rule expressions to match all ICMPv6 packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all ICMPv6 packets.

Example

The following command defines a rule expression to match all ICMPv6 packets:

```
icmpv6 any-match = TRUE
```

icmpv6 code

This command allows you to define rule expressions to match value in Code field of ICMPv6 packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 code *operator code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

code

Specifies the ICMPv6 code to match.
code must be an integer from 0 through 255.

Usage

Use this command to define rule expressions to match a code field of ICMPv6 packets.

Example

The following command defines a rule expression to match ICMPv6 code *134*:

```
icmpv6 code = 134
```

icmpv6 type

This command allows you to define rule expressions to match type field of ICMPv6 packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] icmpv6 type *operator type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

type

Specifies the ICMPv6 type to match.
type must be an integer from 0 through 255. For example, 129 for Echo Reply, 3 for Time Exceeded, and 137 for Redirect Message.

Usage

Use this command to define rule expressions to match type field of ICMPv6 packets.

Example

The following command defines a rule expression to match ICMPv6 type *133*:

```
icmpv6 type = 133
```

if-protocol

This command allows you to associate different content IDs with the same ruledef, depending on the protocol being used.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

if-protocol { http | wsp-connection-less | wsp-connection-oriented } content-id *content_id*

no if-protocol { http | wsp-connection-less | wsp-connection-oriented }

no

If previously configured, deletes the specified rule expression from the current ruledef.

http

Specifies HTTP protocol.
This is the same as the rule expression **http any-match = true**.

wsp-connection-less

Specifies WSP connection-less protocol.
This is the same as requiring "**wsp any-match = true**" but "**wtp any-match = false**" (that is, connection-less WAP1.x).

wsp-connection-oriented

Specifies WSP connection-oriented protocol.
This is the same as the combined rule expression "**wsp any-match = true**" and "**wtp any-match = true**" (that is, connection-oriented WAP1.x).

content-id *content_id*

Specifies the content ID for the specified protocol.
In 12.1 and earlier releases, *content_id* must be an integer from 1 through 65535.
In 12.2 and later releases, *content_id* must be an integer from 1 through 2147483647.

Usage

Use this command to associate different content IDs with the same ruledef, depending on the protocol being used.
This command is only effective for charging ruledefs. See the rule-application command for information on how to configure charging ruledefs.
If a particular ruledef should have three different values for content-id, depending on whether the traffic is connection-oriented WAP1.x, connection-less WAP1.x, or WAP2.0, within the ruledef we should have configuration similar to the following:

if-protocol wsp-connection-oriented content-id *1*
if-protocol wsp-connection-less content-id *2*
if-protocol http content-id *3*
Presumably, the ruledef would have another configurable like "**www url contains** *foo*", which would cause it to use different content IDs when "foo" was accessed, depending upon the protocol being used.

Example

The following command associates HTTP protocol and a content ID of *23*:

```
if-protocol http content-id 23
```

imap any-match

This command allows you to define rule expressions to match all IMAP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all IMAP packets.

Example

The following command defines a rule expression to match all IMAP packets:

```
imap any-match = TRUE
```

imap cc

This command allows you to define rule expressions to match recipient address in the Carbon Copy (cc) field of e-mails in IMAP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap cc [case-sensitive] *operator cc_address*

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

---

cc_address

Specifies the e-mail "cc" address/name to match.
cc_address must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match recipient address in the "cc" field of e-mails in IMAP messages.

Example

The following command defines a rule expression to match recipient address *triangle@xyz.com* in the "cc" field of e-mails in IMAP messages:

```
imap cc contains triangle@xyz.com
```

imap command

This command allows you to define rule expressions to match embedded IMAP commands in IMAP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap command *operator command*

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

command

Specifies the command to match.
command must be one of the following:

- **append**
- **authenticate**
- **capability**
- **check**
- **close**
- **copy**
- **create**
- **delete**
- **examine**
- **expunge**
- **fetch**
- **list**
- **login**
- **logout**
- **lsub**
- **noop**
- **rename**

- **search**
- **select**
- **starttls**
- **status**
- **store**
- **subscribe**
- **uid-copy**
- **uid-fetch**
- **uid-search**
- **uid-store**
- **unsubscribe**

Usage

Use this command to define rule expressions to match an embedded command in the IMAP message.

Example

The following command defines a rule expression to match **close** command in IMAP messages:

```
imap command = close
```

imap content class

This command allows you to define rule expressions to match the content-class field of e-mails in IMAP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap content class [ case-sensitive ]` *`operator content_class`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_class`

Specifies the content class to match.
`content_class` must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the content-class field of e-mails in IMAP messages.

Example

The following command defines a rule expression to analyze user traffic matching content class *`javax.mail.internet.MimeMultipart`* in the content-class field of e-mails in IMAP messages:

```
imap content class contains javax.mail.internet.MimeMultipart
```

imap content type

This command allows you to define rule expressions to match the content-type field of e-mails in IMAP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap content type [case-sensitive] *operator content_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

content_type

Specifies the content type field to match.
content_type must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the content-type field of e-mails in IMAP messages.

Example

The following command defines a rule expression to analyze user traffic matching content type *TEXT/plain; charset=iso-8859-1* in the content-type field of e-mails in IMAP messages:

```
imap content type contains TEXT/plain; charset=iso-8859-1
```

imap date

This command allows you to define rule expressions to match the Date field of e-mails in IMAP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap date [case-sensitive] *operator date*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

date

Specifies the date to match.
date must be an alphanumeric string of 1 through 127 characters that may include punctuation marks and spaces as shown in the example below.

Usage

Use this command to define rule expressions to match the date field of e-mails in IMAP messages.

Example

The following command defines a rule expression to analyze user traffic matching date *Fri, 20 Jan 2012 11:00:00 -0600* in the “date” field of e-mails in IMAP messages:

```
imap date contains Fri, 21 Jan 2012 11:00:00 -0600
```

imap final-reply

This command allows you to define rule expressions to match final-reply value for the last IMAP final-reply message.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap final-reply *operator final_reply*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

final_reply

Specifies the "final-reply" condition to match.
final_reply must be one of the following:

- **bad**: Final reply is invalid or bad.
- **no**: There is no final reply.
- **ok**: Final reply is valid.

Usage

Use this command to define rule expressions to match a final-reply value for the last IMAP final-reply message.

Example

The following command defines a rule expression to analyze user traffic matching the final-reply condition **bad** in the last IMAP final-reply message:

```
imap final-reply = bad
```

imap from

This command allows you to define rule expressions to match the from field of e-mails in IMAP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap from [ case-sensitive ]` *`operator from_address`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`from_address`

Specifies the "from" address/value to match.
`from_address` must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match the from field of e-mails in IMAP messages.

Example

The following command defines a rule expression to analyze user traffic matching *`triangle`* in the "from" field of e-mails in the IMAP messages:

```
imap from contains triangle
```

imap mail-size

This command allows you to define rule expressions to match IMAP e-mail users that have e-mails of a specified size in their mailboxes.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap mail-size *operator mail_size*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

mail_size

Specifies the total size of mail, in bytes, to match.
mail_size must be an integer from 0 through 4000000000.

Usage

Use this command to define rule expressions to discover the number of IMAP e-mail users that have e-mails of a specified size in their mailboxes.

Example

The following command defines a rule expression to match users with e-mail size less than or equal to *23400* bytes:

```
imap mail-size <= 23400
```

imap mailbox-size

This command allows you to define rule expressions to match IMAP e-mail user having a specified number of messages in their mailboxes.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap mailbox-size *operator number_of_email*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

number_of_email

Specifies the total number of e-mail messages in mailbox of an IMAP user to match.
number_of_email must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match the number of IMAP e-mail users having a specified number of messages in their mailboxes.

Example

The following command defines a rule expression to match e-mail users having less than or equal to *1024* e-mail messages in their mailboxes:

```
imap mailbox-size <= 1024
```

imap message-type

This command allows you to define rule expressions to match the type of IMAP packet.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap message-type *operator message_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

message_type

Specifies the IMAP packet message-type to match.
message_type must be one of the following:

- **command-continuation-reply**: Message with command-continuation-reply type.
- **final-reply**: Message is of final reply type.
- **request**: There is of request type.
- **untagged-reply**: Message of reply type, but without any tag.

Usage

Use this command to define rule expressions to match the IMAP message type.

Example

The following command defines a rule expression to match IMAP sessions with message type **request**:

```
imap message-type = request
```

imap previous-state

This command allows you to define rule expressions to match the previous state of IMAP request sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap previous-state` *`operator imap_previous_state`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`imap_previous_state`

Specifies the previous state to match.
`imap_previous_state` must be one of the following:

- **`init`**: Message in initialization state.
- **`request-sent`**: Message in request-sent state.

Usage

Use this command to define rule expressions to match previous state of IMAP request session.

Example

The following command defines a rule expression to match IMAP sessions with previous state **`init`**:

```
imap previous-state = init
```

imap session-length

This command allows you to define rule expressions to match the total length of an IMAP session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap session-length *operator session_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the total length of IMAP session (in bytes) to match.
session_length must be an integer from 1 through 4000000000.

Usage

Use this command to define rule expressions to match the total length of IMAP sessions.
The session length is calculated by adding together the IP payloads (that is, starting after the IP header) of all relevant IMAP session packets.

Example

The following command defines a rule expression to match IMAP sessions with length less than or equal to *4000* bytes:

```
imap session-length <= 4000
```

imap session-previous-state

This command allows you to define rule expressions to match the previous state of an IMAP session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap session-previous-state *operator imap_session_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

imap_session_previous_state

Specifies the previous state of IMAP session to match.
imap_session_previous_state must be one of the following:

- **authenticated**: Session authenticated
- **connected**: Session connected
- **init**: Session initialized
- **mailbox-selected**: Mailbox selected

Usage

Use this command to define rule expressions to match the previous state of IMAP sessions.

Example

The following command defines a rule expression to match IMAP sessions with previous state **init**:

```
imap session-previous-state = init
```

imap session-state

This command allows you to define rule expressions to match the current state of IMAP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap session-state *operator session_current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

session_current_state

Specifies the current state to match.
session_current_state must be one of the following:

- **authenticated**: Session authenticating.
- **connected**: Session connecting.
- **logout**: Session logged out.
- **mailbox-selected**: Mailbox selecting.

Usage

Use this command to define rule expressions to match the current state of IMAP sessions.

Example

The following command defines a rule expression to match IMAP sessions with current state **connected**:

```
imap session-state = connected
```

imap state

This command allows you to define rule expressions to match the current state of IMAP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies current state of IMAP session to match.
current_state must be one of the following:

- **request-sent**: Request message sent
- **response-fail**: Request response failed
- **response-ok**: Request response is good

Usage

Use this command to define rule expressions to match the current state of IMAP session.

Example

The following command defines a rule expression to match IMAP sessions with current state **response-fail**:

```
imap state = response-fail
```

imap subject

This command allows you to define rule expressions to match the subject field of e-mails in IMAP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] imap subject [case-sensitive] *operator subject*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

subject

Specifies the "subject" to match.
subject must be an alphanumeric string of 1 through 127 characters, and may contain punctuation characters and space as shown in the example below.

Usage

Use this command to define rule expressions to match "subject" field of e-mail in IMAP message.

Example

The following command defines rule expression to match occurrence of the string *My test* in the "subject" field of e-mails in IMAP message:

```
imap subject contains My test
```

imap to

This command allows you to define rule expressions to match the “to” field of e-mails in IMAP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] imap to [ case-sensitive ]` *`operator to`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`to`

Specifies the “to” field value to match.
`to` must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match “to” field of e-mails in IMAP messages.

Example

The following command defines a rule expression to analyze user traffic matching the occurrence *`xyz.com`* in the “to” field of e-mails in the IMAP message:

```
imap to contains xyz.com
```

ip any-match

This command allows you to define rule expressions to match all IPv4/IPv6 packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match IPv4/IPv6 packets.

Example

The following command defines a rule expression to match IPv4/IPv6 packets:

```
ip any-match = TRUE
```

ip downlink

This command allows you to define rule expressions to match downlink (network to subscriber) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip downlink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match downlink (to subscriber) IP packets.

Example

The following command defines a rule expression to match IP packet in downlink direction:

```
ip downlink = TRUE
```

ip dst-address

This command allows you to define rule expressions to match IP destination address field within IP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip dst-address { *operator* { *ip_address* | *ip_address/mask* } | { !range | range } host-pool *host_pool_name* }

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies the IP address of the destination node for outgoing traffic. *ip_address* must be an IP address in IPv4 dotted-decimal or IPv6 colon-separated notation.
ip_address/mask: Specifies the IP address of the destination node for outgoing traffic. *ip_address/mask* must be an IP address in IPv4 dotted-decimal or IPv6 colon-separated notation with subnet mask bit. The mask bit is a numeric value which corresponding to the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool_name*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool_name*: Specifies the name of the host pool. *host_pool_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match the IP destination address field within IP headers.

Example

The following command defines a rule expression to match the IPv4 destination address *10.1.1.1*:

```
ip dst-address = 10.1.1.1
```

ip error

This command allows you to define rule expressions to match user traffic for invalid IP packets and other errors, for example IP header error, while parsing IP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip error *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match invalid IP packets and any other errors while parsing IP packets.

Example

The following command defines a rule expression to match user traffic for invalid IP packets and other errors:

```
ip error = TRUE
```

ip protocol

This command allows you to define rule expressions to match the protocol field in IP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip protocol *operator* **{** *protocol_assignment_no* **|** *protocol* **}**

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals—available only in 8.1 and later releases
- **=**: Equals
- **>=**: Greater than or equals—available only in 8.1 and later releases

protocol_assignment_no

Specifies the protocol by assignment number.
protocol_assignment_no must be an integer from 0 through 255.
For example, 1 for ICMP, 6 for TCP, and 17 for UDP.

protocol

Specifies the protocol by name.
protocol must be one of the following:

- **ah**
- **esp**
- **gre**
- **icmp**
- **icmpv6**
- **tcp**
- **udp**

Usage

Use this command to define rule expressions to match protocol field in IP packet headers.

Example

The following command defines a rule expression to match protocol assignment number *1*:

```
ip protocol = 1
```

ip server-domain-name

This command allows you to define rule expressions to match host names (domain names).

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip server-domain-name *operator domain_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

domain_name

Specifies the domain name to match.
domain_name must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match full or partial host names (domain names).
The rule will be matched for the learnt IP addresses resolved from DNS queries to the specified domain names. DNS responses for the specified domain names will be snooped and the learnt IP addresses stored. Besides being used for standard rule matching, this command also enables the DNS Snooping feature if the rulebase references any ruledefs with this configuration. The DNS protocol analyzer must also be enabled in the rulebase.

Example

The following command defines a rule expression to match domain name values containing *star*:

```
ip server-domain-name contains star
```

ip server-ip-address

This command allows you to define rule expressions to match the IP address of the destination end of the connection.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip server-ip-address { *operator* **{** *ip_address* **|** *ip_address/mask* **} | { !range | range } host-pool** *host_pool_name* **}**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies the server IP address. For uplink packets (subscriber to network), this field matches the destination IP address in the IP header. For downlink packets (network to subscriber), this field matches the source IP address in the IP header.*ip_address* must be an IP address in IPv4 dotted-decimal notation or IPv6 colon-separated notation.
ip_address/mask: Specifies the server IP address with subnet mask bit. For uplink packets (subscriber to network), this field matches the destination IP address in the IP header. For downlink packets (network to subscriber), this field matches the source IP address in the IP header. *ip_address/mask* must be an IP address in IPv4 dotted-decimal notation or IPv6 colon-separated notation with subnet mask bit. The mask bit is a numeric value which is the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool_name*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool_name*: Specifies name of the host pool. *host_pool_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match the IP address of the destination end of the connection. For uplink packets, this field matches the destination IP address in the IP header. For downlink packets, this field matches the source IP address in the IP header.

Example

The following command defines a rule expression to match user traffic based on IPv4 server address *10.1.1.1*:

```
ip server-ip-address = 10.1.1.1
```

ip src-address

This command allows you to define rule expressions to match the source IP address field within IP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip src-address { *operator* **{** *ip_address* **|** *ip_address/mask* **} | { !range | range }**
host-pool *host_pool_name* **}**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies IP address of the source node for incoming traffic. *ip_address* must be an IP address in IPv4 dotted-decimal or IPv6 colon-separated notation.
ip_address/mask: Specifies the IP address of the source node for incoming traffic with subnet mask bit. *ip_address/mask* must be an IP address in IPv4 dotted-decimal or IPv6 colon-separated notation with subnet mask bit. The mask bit is a numeric value which corresponds to the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool_name*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool_name*: Specifies name of the host pool. *host_pool_name* must be a string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match IP source address field within IP header.

Example

The following command defines a rule expression to match user traffic based on IPv4 source address *10.1.1.1*:

```
ip src-address = 10.1.1.1
```

ip subscriber-ip-address

This command allows you to define rule expressions to match the IP address of the subscriber, which will be either the source or destination address depending on the direction.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip subscriber-ip-address { *operator* **{** *ip_address* **|** *ip_address/mask* **} | { !range | range } host-pool** *host_pool_name* **}**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator **{** *ip_address* **|** *ip_address/mask* **}**

operator: Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

ip_address: Specifies the subscriber IP address. Depending on the direction of packet this IP address will be either the IP source address or the IP destination address. *ip_address* must be an IP address in IPv4 dotted-decimal or IPv6 colon-separated notation.
ip_address/mask: Specifies the subscriber IP address with subnet mask bit. Depending on the direction of packet this IP address will either be the IP source address or the IP destination address. *ip_address/mask* must be an IP address in IPv4 dotted-decimal or IPv6 colon-separated notation with subnet mask bit. The mask bit is a numeric value which corresponds to the number of bits in the subnet mask.

{ !range | range } host-pool *host_pool_name*

!range | range: Specifies the range criteria:

- **!range**: Not in the range of
- **range**: In the range of

host-pool *host_pool_name*: Specifies the name of the host pool. *host_pool_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match the IP address of the subscriber, which will be either the source or destination address depending on the direction.

Example

The following command defines a rule expression to match user traffic based on subscriber IPv4 address *10.1.1.1*:

```
ip subscriber-ip-address = 10.1.1.1
```

ip total-length

This command allows you to define rule expressions to match the total length field in IP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip total-length *operator total_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

total_length

Specifies the total length of the IP packet (including payload) to match.
total_length must be an integer from 0 through 4096.

Usage

Use this command to define rule expressions to match the total length field in IP headers.

Example

The following command defines a rule expression to match user traffic based on IP total length of *2000* bytes:

```
ip total-length = 2000
```

ip uplink

This command allows you to define rule expressions to match uplink (subscriber to network) IP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] ip uplink` *`operator condition`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`condition`

Specifies the condition to match.
`condition` must be one of the following:

- **`FALSE`**
- **`TRUE`**

Usage

Use this command to define rule expressions to match uplink (subscriber to network) IP packets.

Example

The following command defines a rule expression to match uplink packets:

```
ip uplink = TRUE
```

ip version

This command allows you to define rule expressions to match the version number in IP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] ip version *operator ip_version*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be **=** (equals).

ip_version

Specifies the IP version to match.
ip_version must be one of the following:

- **ipv4**
- **ipv6**

Usage

Use this command to define rule expressions to match version number in IP header.

Example

The following command defines a rule expression to match user traffic for the IP version **ipv6**:

```
ip version = ipv6
```

mms any-match

This command allows you to define rule expressions to match all Multimedia Messenging Service (MMS) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all MMS packets.

Example

The following command defines a rule expression to match all MMS packets:

```
mms any-match = TRUE
```

mms bcc

This command allows you to define rule expressions to match recipient addresses in the bcc field of MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms bcc [ case-sensitive ]` *`operator bcc_address`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`bcc_address`

Specifies the “bcc” address/value to match.
`bcc_address` must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters and space.

Usage

Use this command to define rule expressions to match recipient address in the “bcc” field of MMS messages.

Example

The following command defines a rule expression to match recipient address containing *`test1`* in “bcc” field of MMS messages:

```
mms bcc contains test1
```

mms cc

This command allows you to define rule expressions to match recipient addresses in the cc field of MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] mms cc [ case-sensitive ]` *`operator cc_address`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`cc_address`

Specifies the "cc" address/value to match.
`cc_address` must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters and space.

Usage

Use this command to define rule expressions to match recipient addresses in "cc" field of MMS messages.

Example

The following command defines a rule expression to match recipient address containing *`test1`* in the "cc" field of MMS messages:

```
mms cc contains test1
```

mms content location

This command allows you to define rule expressions to match the content-location field of MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms content location [case-sensitive] *operator string*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

Specifies the value to match.
string must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters and space.

Usage

Use this command to define rule expressions to match the content-location field of MMS messages.

Example

The following command defines a rule expression to match *test1* in content-location field of MMS messages:

```
mms content location contains test1
```

mms content type

This command allows you to define rule expressions to match the content-type field of MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms content type [case-sensitive] *operator content_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

content_type

Specifies the MMS content type to match.
content_type must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters and space.

Usage

Use this command to define rule expressions to match content-type field of MMS messages.

Example

The following command defines a rule expression to match *image* in content-type field of MMS messages:

```
mms content type contains image
```

mms downlink

This command allows you to define rule expressions to match downlink (network to subscriber) MMS packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms downlink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the downlink (from the Mobile Node direction) status to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match downlink MMS packets.

Example

The following command defines a rule expression to match all downlink MMS packets:

```
mms downlink = TRUE
```

mms from

This command allows you to define rule expressions to match the “from” field in MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms from [case-sensitive] *operator from_address*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

from_address

Specifies the “from” address/value to match.
from_address must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters and space.

Usage

Use this command to define rule expressions to match the “from” field of MMS messages.

Example

The following command defines a rule expression to match *test1* in the “from” field of MMS messages:

```
mms from contains test1
```

mms message-id

This command allows you to define rule expressions to match the message ID field of MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms message-id [case-sensitive] *operator message_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

message_id

Specifies the MMS message ID to match.
message_id must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the “message ID” field of MMS messages.

Example

The following command defines a rule expression to match *test1* in the “message ID” field of MMS messages:

```
mms message-id contains test1
```

mms pdu-type

This command allows you to define rule expressions to match Protocol Data Unit (PDU) type in the current MMS packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms pdu-type *operator pdu_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

pdu_type

Specifies the MMS PDU type to match.
pdu_type must be one of the following:

- **mms-pdu-type-m-acknowledge-ind**
- **mms-pdu-type-m-delivery-ind**
- **mms-pdu-type-m-http-get**
- **mms-pdu-type-m-notification-ind**
- **mms-pdu-type-m-notify-rsp-ind**
- **mms-pdu-type-m-retrieve-conf**
- **mms-pdu-type-m-send-conf**
- **mms-pdu-type-m-send-request**
- **mms-pdu-type-m-wsp-get**
- **mms-pdu-type-response**: This option is deprecated. Use the **mms_pdu_type_m_retrieve_conf** option instead.

Usage

Use this command to define rule expressions to match the PDU type in the current MMS packet.

Example

The following command defines a rule expression to match PDU type **mms-pdu-type-m-http-get** in the current MMS packet:

```
mms pdu-type = mms-pdu-type-m-http-get
```

mms previous-state

This command allows you to define rule expressions to match the previous state of MMS sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms previous-state *operator mss_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

mms_previous_state

Specifies the previous state to match.
mms_previous_state must be one of the following:

- **delayed-ack-pending**: This option is deprecated, use **retrieve-conf-received**.
- **delayed-m-notify-rsp-sent**: This option is deprecated, use **notify-rsp-sent**.
- **delayed-retrieval-pending**: This option is deprecated, use **retrieval-pending**.
- **immediate-retrieval-pending**: This option is deprecated, use **retrieval-pending**.
- **init**
- **m-send-conf-rcvd**: This option is deprecated, use **send-success**.
- **m-send-req-sent**
- **notification-ind-rcvd**
- **notify-rsp-sent**
- **retrieval-pending**
- **retrieve-conf-received**
- **send-success**

Usage

Use this command to define rule expressions to match the previous state of MMS sessions.

Example

The following command defines a rule expression to match user traffic based on MMS previous state of **retrieval-pending**:

```
mms previous-state = retrieval-pending
```

mms response status

This command allows you to define rule expressions to match the response status code of MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms response status *operator status_code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

status_code

Specifies the status code to match.
status_code must be an integer from 128 through 136.

Usage

Use this command to define rule expressions to match response status code of MMS messages.

Example

The following command defines a rule expression to match user traffic based on MMS response status code *129*:

```
mms response status = 129
```

mms state

This command allows you to define rule expressions to match the current state of MMS sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms state *operator current_state*

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

current_state

Specifies current state of MMS session to match.
current_state must be one of the following:

- **delayed-ack-pending**: This option is deprecated, use **retrieve-conf-received**.
- **delayed-m-notify-rsp-sent**: This option is deprecated, use **notify-rsp-sent**.
- **delayed-retrieval-pending**: This option is deprecated, use **retrieval-pending**.
- **delivery-failed**
- **delivery-success**
- **immediate-retrieval-pending**: This option is deprecated, use **retrieval-pending**.
- **m-send-conf-rcvd**: This option is deprecated, use **send-success**.
- **m-send-req-sent**
- **notification-ind-rcvd**
- **notify-rsp-sent**
- **retrieval-failed**
- **retrieval-pending**
- **retrieval-success**
- **retrieve-conf-received**
- **send-success**

Usage

Use this command to define rule expressions to match the current state of MMS session.

Example

The following command defines a rule expression to match user traffic based on the current state of MMS session as **retrieval-failed**:

```
mms state = retrieval-failed
```

mms status

This command allows you to define rule expressions to match the current status of MMS sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms status *operator status*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

status

Specifies the MMS status to match.
status must be an integer from 128 through 132.

Usage

Use this command to define rule expressions to match current status of MMS sessions.

Example

The following command defines a rule expression to match user traffic based on MMS current status *130*:

```
mms status = 130
```

mms subject

This command allows you to define rule expressions to match the “subject” field of MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms subject [case-sensitive] *operator subject_string*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

subject_string

Specifies the value to match.
subject_string must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters and space.

Usage

Use this command to define rule expressions to match “subject” field of MMS messages.

Example

The following command defines a rule expression to match *test1* in the “subject” field of MMS messages:

```
mms subject contains test1
```

mms tid

This command allows you to define rule expressions to match the "Transaction Identifier" (TID) field of MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms tid [case-sensitive] *operator transaction_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

transaction_id

Specifies the MMS TID to match.
transaction_id must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match TID field of MMS messages.

Example

The following command defines a rule expression to match *test* in TID field of MMS messages:

```
mms tid = test
```

mms to

This command allows you to define rule expressions to match the “to” field of MMS messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms to [case-sensitive] *operator to_address*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

to_address

Specifies the “to” address/name to match.
to_address must be an alphanumeric string of 1 through 127 characters, and may contain punctuation characters and space.

Usage

Use this command to define rule expressions to match “to” field of MMS messages.

Example

The following command defines a rule expression to match user traffic based on *test* in “to” field of MMS messages:

```
mms to = test
```

mms uplink

This command allows you to define rule expressions to match uplink (subscriber to network) MMS packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms uplink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the uplink (from the Mobile Node direction) status to match.
condition must one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match uplink MMS packets.

Example

The following command defines a rule expression to match uplink MMS packets:

```
mms uplink = TRUE
```

mms version

This command allows you to define rule expressions to match the MMS version in MMS packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] mms version *operator version*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

version

Specifies the MMS version to match.
version must be an integer from 1 through 65535.

Important: MMS protocol analyzer supports decoding of only MMS version 1.0.

Usage

Use this command to define rule expressions to match MMS version in MMS packets.

Example

The following command defines a rule expression to match MMS version *1.0* in MMS packets:

```
mms version = 1
```

multi-line-or all-lines

This command applies the OR operator to all lines in the current ruledef.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] multi-line-or all-lines
```

no

If previously configured, deletes this configuration in the current ruledef.

multi-line-or all-lines

Applies the OR operator to all lines in the current ruledef.

Usage

When a ruledef is evaluated, if the **multi-line-or all-lines** command is configured, the logical OR operator is applied to all the rule expressions in the ruledef to decide if the ruledef matches or not. If the **multi-line-or all-lines** command is not configured, the logical AND operator is applied to all the rule expressions.

The intent of this command is to allow a single ruledef to specify multiple URL expressions. Otherwise, multiple ruledefs need to be created, each with one URL expression. When this CLI command is used, each expression in the ruledef impacts the total number of ruledefs allowed. So from a “maximum number of possible ruledefs” perspective, it makes no difference whether there are N ruledefs with one expression each, or one ruledef with N expressions.

p2p any-match

This command allows you to define rule expressions to match all Peer-to-Peer (P2P) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] p2p any-match` *`operator condition`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`=`**: Equals

`condition`

Specifies the condition to match.
`condition` must be one of the following:

- **`TRUE`**: The rule matches any P2P traffic.
- **`FALSE`**: The rule does not match any P2P traffic.

Usage

Use this command to define rule expressions to match all P2P packets.

Example

The following command defines a rule expression to match all P2P packets:

```
p2p any-match = TRUE
```

p2p protocol

This command allows you to define rule expressions to match P2P protocol. This command must be used for charging purposes. It must not be used for detection purposes.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] p2p protocol *operator protocol*

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be **=** (equals).

---

protocol

Specifies the protocol to match.
protocol must be one of the following:

- **actsync**
- **aimini**
- **antsp2p**
- **applejuice**
- **ares**
- **armagettron**
- **battlefld**
- **bittorrent**
- **blackberry**
- **citrix**
- **clubpenguin**
- **crossfire**
- **ddlink**
- **directconnect**
- **dofus**
- **edonkey**
- **facebook**
- **facetime**

Important: The **facetime** protocol is available only in 9.0 and in 11.0 and later releases.

- **fasttrack**
- **feidian**
- **fiesta**
- **filetopia**
- **florensia**
- **freenet**
- **fring**
- **funshion**
- **gadugadu**
- **gamekit**

Important: The **gamekit** protocol is available only in 9.0 and in 11.0 and later releases.

- **uusee**
- **veohtv**
- **viber**
- **vpnx**
- **vtun**
- **warcft3**
- **whatsapp**
- **wii**
- **winmx**
- **winny**
- **wmstream**
- **wofkungfu**
- **wofwarcraft**
- **xbox**
- **xdcc**
- **yahoo**
- **yourfreetunnel**
- **zattoo**

Usage

Use this command to define rule expressions to detect P2P protocols for charging purposes. For detection purposes use the **p2p-detection protocol** command in the ACS Configuration Mode.

Example

The following command specifies to detect orb protocol for charging purposes:

```
p2p protocol = orb
```

p2p traffic-type

This command allows you to define rule expressions to match traffic type—audio, video, and unclassified.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] p2p traffic-type *operator traffic_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

traffic_type

Specifies the traffic type to match.
In 11.0 and later releases, *traffic_type* must be one of the following:

- **audio**
- **unclassified**
- **video**

In 10.0 and earlier releases, *traffic_type* must be **voice**.

Usage

Use this command to configure the system to detect voice or non-voice P2P traffic. When the detection of a protocol is enabled then the detection of sub-type is enabled by default.

Example

The following command configures the system to detect video traffic:

```
p2p traffic-type = video
```

pop3 any-match

This command allows you to define rule expressions to match all Post Office Protocol 3 (POP3) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all POP3 packets.

Example

The following command defines a rule expression to match all POP3 packets:

```
pop3 any-match = TRUE
```

pop3 command args

This command allows you to define rule expressions to match POP3 command arguments.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] pop3 command args [ case-sensitive ]` *`operator argument`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

Specifies the command argument to match.
`argument` must be an alphanumeric string of 1 through 40 characters, and may contain punctuation characters.

Usage

Use this command to define rule expressions to match POP3 command argument.

Example

The following command defines a rule expression to match POP3 command argument *`test`*:

```
pop3 command args = test
```

pop3 command id

This command allows you to define rule expressions to match POP3 command ID.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 command id *operator command_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

command_id

Specifies the command ID to match.
command_id must be an integer from 1 through 12.

Usage

Use this command to define rule expressions to match a POP3 command ID.

Example

The following command defines a rule expression to match POP3 command ID *8*:

```
pop3 command id = 8
```

pop3 command name

This command allows you to define rule expressions to match command sent within a POP3 packet.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 command name *operator command_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

command_name

Specifies the command name to match.
command_name must be one of the following:

- **apop**
- **dele**
- **list**
- **noop**
- **pass**
- **quit**
- **retr**
- **reset**
- **stat**
- **top**
- **uidl**
- **user**

Usage

Use this command to define rule expressions to match commands sent within POP3 packets.

Example

The following command defines a rule expression to match the **list** command sent in POP3 packets:

```
pop3 command name = list
```

pop3 mail-size

This command allows you to define rule expressions to match POP3 mail size.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 mail-size { *operator mail_size* **| { range | !range }** *range_from* **to** *range_to* **}**

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies start of the range.

  range_from must be an integer from 1 through 4000000000.
- *range_to*: Specifies the end range.

  range_to must be an integer from 1 through 4000000000, and must be greater than *range_from*.

mail_size

Specifies the mail size to match.
mail_size must be an integer from 1 through 4000000000.

Usage

Use this command to define rule expressions to match POP3 mail size.

Example

The following command defines a rule expression to match POP3 mail size of *40000*:

```
pop3 mail-size = 40000
```

pop3 pdu-length

This command allows you to define rule expressions to match the Protocol Data Unit (PDU) length of POP3 packets equal to the POP3 header plus POP3 payload.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 pdu-length { *operator pdu_length* **| { { range | !range }** *range_from* **to** *range_to* **} }**

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies the start of range as an integer from 0 through 65535.
- *range_to*: Specifies the end range. *range_to* must be an integer from 0 through 65535, and must be greater than *range_from*.

pdu_length

Specifies the POP3 PDU length to match.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match POP3 PDU length (header + payload) in bytes.

Example

The following command defines a rule expression to match PDU length of *1000* bytes:

```
pop3 pdu-length = 1000
```

pop3 pdu-type

This command allows you to define rule expressions to match POP3 Protocol Data Unit (PDU) type.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 pdu-type *operator pdu_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

pdu_type

Specifies the POP3 PDU type to match.
pdu_type must be one of the following:

- **command-packet**
- **data-packet**
- **relay-packet**

Usage

Use this command to define rule expressions to match POP3 PDU type.

Example

The following command defines a rule expression to match POP3 PDU type **relay-packet**:

```
pop3 pdu-type = relay-packet
```

pop3 previous-state

This command allows you to define rule expressions to match the previous state of POP3 sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 previous-state *operator pop3_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

pop3_previous_state

Specifies the previous state to match.
pop3_previous_state must be one of the following:

- **connected**: Connected state
- **data transaction**: Data transaction state
- **init**: Initialized state
- **reply-error**: Reply error state
- **reply-ok**: Response ok state
- **waiting-for-reply**: Waiting for reply state

Usage

Use this command to define rule expressions to match a POP3 previous state.

Example

The following command defines a rule expression to match user traffic for a POP3 previous state of **connected**:

```
pop3 previous-state = connected
```

pop3 reply args

This command allows you to define rule expressions to match specified arguments with POP3 reply.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] pop3 reply args [ case-sensitive ]` *`operator argument`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

Specifies the reply argument to match.
In 11.0 and earlier releases, *`argument`* must be an alphanumeric string of 1 through 512 characters, and may contain punctuation characters.
In 12.0 and later releases, *`argument`* must be an alphanumeric string of 1 through 127 characters, and may contain punctuation characters.

Usage

Use this command to define rule expressions to match specified arguments within a POP3 reply.

Example

The following command defines a rule expression to match the argument *`test`* with POP3 replies:

```
pop3 reply args = test
```

pop3 reply id

This command allows you to define rule expressions to match POP3 reply ID.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 reply id *operator reply_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

reply_id

Specifies the POP3 reply ID to match.
reply_id must be one of the following:

- **0**: Unknown reply
- **1**: +OK
- **2**: -Error

Usage

Use this command to define rule expressions to match POP3 reply ID.

Example

The following command defines a rule expression to match POP3 reply ID of *2*:

```
pop3 reply id = 2
```

pop3 reply status

This command allows you to define rule expressions to match POP3 reply status.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 reply status *operator reply_status*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

reply_status

Specifies the reply status to match.
reply_status must be one of the following:

- **+OK**: Reply OK
- **-ERR**: Reply error

Usage

Use this command to define rule expressions to match POP3 reply status.

Example

The following command defines a rule expression to match POP3 reply status **+OK**:

```
pop3 reply status = +OK
```

pop3 session-length

This command allows you to define rule expressions to match POP3 session-length.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 session-length { *operator session_length* **| { range | !range }** *range_from* **to** *range_to* **}**

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the POP3 session length to match.
session_length must be an integer from 1 through 4000000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria for PoP3 session length.

- **range**: Enables the range criteria for POP3 session length.
- **!range**: Disables the range criteria for POP3 session length.
- *range_from*: Specifies the start of range of POP3 session as an integer from 1 through 4000000000, but less than or equal to *range_to*.
- *range_to*: Specifies the end of range of POP3 session as an integer from 1 through 4000000000, but greater than or equal to *range_from*.

Usage

Use this command to define rule expressions to match the total length of POP3 sessions.

Example

The following command defines a rule expression to match a POP3 session length of *40000*:

```
pop3 session-length = 40000
```

pop3 state

This command allows you to define rule expressions to match the current state of POP3 sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies the current state to match.
current_state must be one of the following:

- **close**
- **connected**
- **data-transaction**
- **reply-error**
- **reply-ok**
- **waiting-for-reply**

Usage

Use this command to define rule expressions to match the current state of POP3 sessions.

Example

The following command defines a rule expression to match the POP3 current state **close**:

```
pop3 state = close
```

pop3 user-name

This command allows you to define rule expressions to match POP3 user name.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pop3 user-name [case-sensitive] *operator user_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

user_name

Specifies the POP3 user name to match.
user_name must be an alphanumeric string of 1 through 64 characters, and may contain punctuation characters and space.

Usage

Use this command to define rule expressions to match POP3 user name.

Example

The following command defines a rule expression to match POP3 user name *test*:

```
pop3 user-name = test
```

pptp any-match

This command allows you to defines a rule expression to match all Point-to-Point Tunneling Protocol (PPTP) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pptp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a ruledef to analyze user traffic based on the PPTP any match status.

Example

The following command creates a PPTP ruledef for analyzing user traffic using a PPTP any match status of *FALSE*:

```
pptp any-match = FALSE
```

pptp ctrl-msg-type

This command allows you to define rule expressions to match control message type in PPTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pptp ctrl-msg-type = *message_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

message_type

message_type must be one of the following:

- **call-clear-request**
- **call-disconnect-notify**
- **echo-reply**
- **echo-request**
- **incoming-call-connected**
- **incoming-call-reply**
- **incoming-call-request**
- **outgoing-call-reply**
- **outgoing-call-request**
- **set-link-info**
- **start-control-connection-reply**
- **start-control-connection-request**
- **stop-control-connection-reply**
- **stop-control-connection-request**
- **wan-error-notify**

Usage

Use this command to define rule expressions to match the control message type in PPTP packets.

Example

The following command specifies to match **echo-reply** message type:

```
pptp ctrl-msg-type = echo-reply
```

pptp gre any-match

This command allows you to define rule expressions to match all PPTP Generic Routing Encapsulation (GRE) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] pptp gre any-match = *condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

condition

condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all PPTP GRE packets.

Example

The following command defines a rule expression to match all PPTP GRE packets:

```
pptp gre any-match = TRUE
```

rtcp any-match

This command allows you to define rule expressions to match all Real-Time Transport Control Protocol (RTCP) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **TRUE**: The rule matches any RTCP traffic.
- **FALSE**: The rule does not match any RTCP traffic.

Usage

Use this command to define rule expressions to match all RTCP packets.

Example

The following command defines a rule expression to match all RTCP packets:

```
rtcp any-match = TRUE
```

rtcp jitter

This command allows you to define rule expressions to match the jitter parameter in RTCP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp jitter *operator jitter*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

jitter

Specifies the RTCP inter-arrival jitter value (in milliseconds) to match.
jitter must be an integer from 0 through 4294967295.

Usage

Use this command to define rule expressions to match jitter parameter found in the RTCP sender report or receiver report packets.

Example

The following command matches packets for jitter greater than or equal to 1295 milliseconds:

```
rtcp jitter >= 1295
```

rtcp parent-proto

This command allows you to define rule expressions to match the parent protocol of the RTCP flow.

Important: This command is available only in 8.1 and 9.0 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtcp parent-proto` *`operator parent_protocol`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`parent_protocol`

Specifies the RTCP parent protocol to match.
`parent_protocol` must be one of the following:

- **`rtsp`**: Real Time Streaming Protocol
- **`sip`**: Session Initiation Protocol

Usage

Use this command to define rule expressions to match user traffic based on the parent protocol of the RTCP flow.

Example

The following command defines a rule expression to match user traffic based on SIP being the parent protocol of the RTCP flow:

```
rtcp parent-proto = sip
```

rtcp pdu-length

This command allows you to define rule expressions to match Protocol Data Unit (PDU) length of RTCP packets, (RTCP header + RTCP payload).

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp pdu-length *operator pdu_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the RTCP length (in bytes) to match.
In 8.1 and later releases, *pdu_length* must be an integer from 1 through 65535.
In 8.0, *pdu_length* must be an integer from 1 through 2000.

Usage

Use this command to define rule expressions to match RTCP PDU length (header + payload) in bytes.

Example

The following command defines a rule expression to match user traffic based on an RTCP PDU length of *10000* bytes:

```
rtcp pdu-length = 10000
```

rtcp rtsp-id

This command allows you to define rule expressions to match user traffic based on a Real-time Streaming Protocol (RTSP) ID associated with an RTCP flow.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp rtsp-id [case-sensitive] *operator rtsp_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

rtsp_id

Specifies the value to match.
rtsp_id must be an alphanumeric string of 1 through 32 characters.

Usage

Use this command to define rule expressions to match an RTSP ID associated with an RTCP flow.

Example

The following command defines a rule expression to match user traffic containing RTSP message ID of *test1*:

```
rtcp rtsp-id contains test1
```

rtcp session-length

This command allows you to define rule expressions to match the total length of RTCP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp session-length *operator session_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the RTCP total session length (in bytes) to match.
In 8.1 and later releases, *session_length* must be an integer from 1 through 4000000000.
In 8.0, *session_length* must be an integer from 1 through 40000000.

Usage

Use this command to define rule expressions to match RTCP total session length.

Example

The following command defines a rule expression to match user traffic for a total RTCP session length of *200000*:

```
rtcp session-length = 200000
```

rtcp uri

This command allows you to define rule expressions to match URI associated with RTCP flows.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtcp uri [case-sensitive] *operator uri*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

uri

Specifies the URI to match.
uri must be an alphanumeric string of 1 through 127 characters and may include punctuation characters.

Usage

Use this command to define rule expressions to match URI associated with RTCP flow.

Example

The following command defines a rule expression to match user traffic for RTCP URI *rtsp://www.example.org*:

```
rtcp uri = rtsp://www.example.org
```

rtp any-match

This command allows you to define rule expressions to match all Real-time Transport Protocol (RTP) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all RTP packets.

Example

The following command defines a rule expression to match all RTP packets:

```
rtp any-match = TRUE
```

rtp parent-proto

This command allows you to define rule expressions to match the parent protocol of the RTP flow.

Important: This command is available only in 8.1 and in 9.0 and later releases.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtp parent-proto` *`operator parent_protocol`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`parent_protocol`

Specifies the RTP parent protocol to match.
`parent_protocol` must be one of the following:

- **`rtsp`**: Real Time Streaming Protocol
- **`sip`**: Session Initiation Protocol

Usage

Use this command to define rule expressions to match user traffic based on the parent protocol of the RTP flow.

Example

The following command defines a rule expression to match user traffic with parent protocol of the RTP flow being SIP:

```
rtp parent-proto = sip
```

rtp pdu-length

This command allows you to define rule expressions to match PDU length of RTP packets, equal to the RTP header + RTP payload.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtp pdu-length *operator pdu_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the RTP PDU length (in bytes) to match.
In 8.1 and later releases, *pdu_length* must be an integer from 1 through 65535.
In 8.0, *pdu_length* must be an integer from 1 through 2000.

Usage

Use this command to define rule expressions to match PDU length (header + payload) of RTP packets in bytes.

Example

The following command defines a rule expression to match an RTP PDU length of *1000* bytes:

```
rtp pdu-length = 1000
```

rtp rtsp-id

This command allows you to define rule expressions to match RTSP ID associated with RTP flows.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtp rtsp-id [case-sensitive] *operator rtsp_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

rtsp_id

Specifies the RTSP ID to match.
rtsp_id must be an alphanumeric string of 1 through 32 characters.

Usage

Use this command to define rule expressions to match RTSP ID associated with RTP flows.

Example

The following command defines a rule expression to match RTSP message ID of *test1*:

```
rtp rtsp-id contains test1
```

rtp session-length

This command allows you to define rule expressions to match the total length of RTP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtp session-length *operator session_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the RTP total session length (in bytes) to match.
In 8.1 and later releases, *session_length* must be an integer from 1 through 4000000000.
In release 8.0, *session_length* must be an integer from 1 through 40000000.

Usage

Use this command to define rule expressions to match the RTP total session length. The session-length is calculated by adding together the “rtp pdu-length” values of all relevant packets.

Example

The following command defines a rule expression to match a total RTP session length of *200000*:

```
rtp session-length = 200000
```

rtp uri

This command allows you to define rule expressions to match the media URI associated with RTP flows.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtp uri [case-sensitive] *operator uri*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

uri

Specifies the RTP URI to match.
uri must be an alphanumeric string of 1 through 127 characters. *uri* allows punctuation characters and excludes the “host” portion.

Usage

Use this command to define rule expressions to match media URI associated with RTP flow.

Example

The following command defines a rule expression to match the RTP URI string *rtsp://www.example.org*:

```
rtp uri = rtsp://www.example.org
```

rtsp any-match

This command allows you to define rule expressions to match all Real Time Streaming Protocol (RTSP) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all RTSP packets.

Example

The following command defines a rule expression to match all RTSP packets:

```
rtsp any-match = TRUE
```

rtsp content length

This command allows you to define rule expressions to match the content length field in RTSP header.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp content length *operator content_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

content_length

Specifies the content length (in bytes) to match.
content_length must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match “content length” field in RTSP headers.

Example

The following command defines a rule expression to match content length of *10000* in RTSP headers:

```
rtsp content length = 10000
```

rtsp content type

This command allows you to define rule expressions to match the content type field in RTSP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtsp content type [ case-sensitive ]` *`operator content_type`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_type`

Specifies the content type to match.
`content_type` must be an alphanumeric string of 1 through 127 characters, and may contain punctuation characters.

Usage

Use this command to define rule expressions to match “content type” field in RTSP headers.

Example

The following command defines a rule expression to match RTSP content type *`abc100`*:

```
rtsp content type = abc100
```

rtsp date

This command allows you to define rule expressions to match the date field in the RTSP message headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtsp date [ case-sensitive ]` *`operator date`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`date`

Specifies the date in RTSP header to match.
`date` must be an alphanumeric string of 1 through 127 characters, and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the “date” field in the RTSP message headers.

Example

The following command defines a rule expression to match the date *`12_04_2006`* in RTSP message headers:

```
rtsp date = 12_04_2006
```

rtsp previous-state

This command allows you to define rule expressions to match the previous state of RTSP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp previous-state *operator rtsp_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

rtsp_previous_state

Specifies the previous state to match.
rtsp_previous_state must be one of the following:

- **init**
- **open**
- **play**
- **ready**
- **record**

Usage

Use this command to define rule expressions to match the previous state of RTSP sessions.

Example

The following command defines a rule expression to match RTSP previous state **ready**:

```
rtsp previous-state = ready
```

rtsp reply code

This command allows you to define rule expressions to match the return code in RTSP responses.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp reply code *operator reply_code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

reply_code

Specifies the RTSP reply code to match.
reply_code must be an integer from 100 through 599.

Usage

Use this command to define rule expressions to match the return code in RTSP response.

Example

The following command defines a rule expression to match RTSP return code *302*:

```
rtsp reply code = 302
```

rtsp request method

This command allows you to define rule expressions to match the method in RTSP responses.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp request method *operator request_method*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

request_method

Specifies the RTSP request method to match.
request_method must be one of the following requests:

- **announce**
- **describe**
- **get-parameter**
- **options**
- **pause**
- **play**
- **record**
- **redirect**
- **set-parameter**
- **setup**
- **teardown**

Usage

Use this command to define rule expressions to match the method in RTSP responses.

Example

The following command defines a rule expression to match RTSP request method **announce**:

```
rtsp request method = announce
```

rtsp request packet

This command allows you to define rule expressions to match all RTSP request messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp request packet *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **TRUE**: Is request
- **FALSE**: Is response

Usage

Use this command to define rule expressions to match all RTSP request messages.

Example

The following command defines a rule expression to match all RTSP request messages:

```
rtsp request packet = TRUE
```

rtsp rtp-seq

This command allows you to define rule expressions to match the “seq” field in the RTP-Info header of RTSP responses.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp rtp-seq *operator sequence_number*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

sequence_number

Specifies the sequence number in the RTSP RTP-Info field to match.
sequence_number must be an alphanumeric string of 0 through 65535 characters in Normal Play Time (NPT) time format.

Usage

Use this command to define rule expressions to match user traffic matching the “seq” field in the RTP-Info header of RTSP response for a PLAY request.

Example

The following command defines a rule expression to match user traffic based on RTP-seq number *npt-12:34:59*:

```
rtsp rtp-seq = npt-12:34:59
```

rtsp rtp-time

This command allows you to define rule expressions to match the “time” field in RTP-Info header of RTSP responses.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp rtp-time *operator time*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

time

Specifies the time to match.
time must be an alphanumeric string of 1 through 2147483647 characters in Normal Play Time (NPT) time format.

Usage

Use this command to define rule expressions to match the “time” field in the RTP-Info header of RTSP response for a PLAY request.

Example

The following command defines a rule expression to match RTP timestamp of *20120123T153600Z*:

```
rtsp rtp-time = 20120123T153600Z
```

rtsp rtp-uri

This command allows you to define rule expressions to match the URI field in the RTP-Info header of RTSP responses.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtsp rtp-uri [ case-sensitive ]` *`operator uri`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`uri`

Specifies the value to match with the URI in RTP-Info header of the RTSP message.
`uri` must be an alphanumeric string of 1 through 127 characters. *`uri`* allows punctuation characters and excludes the “host” portion.

Usage

Use this command to define rule expressions to match the URI field in the RTP-Info header of the RTSP response for a PLAY request.

Example

The following command defines a rule expression to match user traffic based on RTP-URI string *`rtsp://www.foo.com`* in the RTP-info header of RTSP packet:

```
rtsp rtp-uri = rtsp://www.foo.com
```

rtsp session-id

This command allows you to define rule expressions to match the session ID in RTSP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp session-id [case-sensitive] *operator session_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

session_id

Specifies the session ID to match.
session_id must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match the session ID in RTSP messages.

Example

The following command defines a rule expression to match the RTSP session ID *0123abc100*:

```
rtsp session-id = 0123abc100
```

rtsp session-length

This command allows you to define rule expressions to match the total length of RTSP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp session-length *operator session_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the RTSP session length (in bytes) to match.
session_length must be an integer from 1 through 40000000.

Usage

Use this command to define rule expressions to match the total length of RTSP sessions. That is, the sum of the “rtsp pdu-length” values of all relevant packets.

Example

The following command defines a rule expression to match RTSP session length of *3000000* bytes:

```
rtsp session-length = 3000000
```

rtsp state

This command allows you to define rule expressions to match the current state of RTSP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies the current state to match.
current_state must be one of the following:

- **end**
- **init**
- **open**
- **play**
- **ready**
- **record**

Usage

Use this command to define rule expressions to match the current state of RTSP sessions.

Example

The following command defines a rule expression to match RTSP current state **init**:

```
rtsp state = init
```

rtsp uri

This command allows you to define rule expressions to match URI in RTSP request message.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp uri [case-sensitive] *operator uri*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

uri

Specifies the URI to match.
uri must be an alphanumeric string of 1 through 127 characters. *uri* allows punctuation characters and excludes the “host” portion.

Usage

Use this command to define rule expressions to match URI in RTSP request.

Example

The following command defines a rule expression to match user traffic based on RTSP URI *rtsp://www.example.com:554/twister/audiotrack*:

```
rtsp uri = rtsp://www.example.com:554/twister/audiotrack
```

rtsp uri sub-part

This command allows you to define rule expressions to match user traffic by parsing sub-parts of the URI in an RTSP request message.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] rtsp uri sub-part { { absolute-path | host | query } [case-sensitive] *operator string* **| port {** *port_operator port_value* **| { range | !range }** *range_from* **to** *range_to* **} }**

no

If previously configured, deletes the specified rule expression from the current ruledef.

absolute-path

Specifies the absolute path matching criteria to RTSP URI in an RTSP request message.

host

Specifies the host name matching criteria to RTSP URI in an RTSP request message.

query

Specifies the query string matching criteria to RTSP URI in an RTSP request message.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

Specifies the absolute path/host name or query string to match with the URI in RTSP header.

string must be an alphanumeric string of 1 through 127 characters. *string* allows punctuation characters and excludes the “host” portion.

port

Specifies the port related matching for RTSP URI in an RTSP request message.

port_operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

port_value

Specifies the RTSP port number to match with port rule in the RTSP flow as an integer from 0 through 65535.

{ range | !range } *range_from* **to** *range_to* **}**

Enables or disables the range criteria for RTSP flow ports.

- **range**: Enables the range criteria for RTSP flow ports.
- **!range**: Disables the range criteria for RTSP flow ports.
- *range_from*: Specifies the start of range of RTSP flow ports as an integer from 0 through 65535, but less than or equal to *range_to*.
- *range_to*: Specifies the end of range of RTSP flow ports as an integer from 0 through 65535, but more than or equal to *range_from*.

Usage

Use this command to define rule expressions to match URI sub parts like host, absolute path, port, and query in RTSP request messages.

Example

The following command defines a URI sub part rule expression to analyze user traffic based on an RTSP URI port number between *1023* and *1068*:

```
rtsp uri sub-part port range 1023 to 1068
```

rtsp user-agent

This command allows you to define rule expressions to match the user-agent field in RTSP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] rtsp user-agent [ case-sensitive ]` *`operator user_agent`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`user_agent`

Specifies the user agent to match.
`user_agent` must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match the “user-agent” field in RTSP header.

Example

The following command defines a rule expression to match *`test`* in “user-agent” field of RTSP header:

```
rtsp user-agent = test
```

rule-application

This command allows you to specify the purpose of a ruledef, such as for charging, post-processing, routing, and so on.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
rule-application { charging | post-processing | routing | tpo }

no rule-application
```

no

Disables the rule application configuration.

charging

Specifies that the current ruledef is for charging purposes.
Up to 2,048 rule definitions can be defined for the charging application in an Active Charging Service.
Default: Enabled

post-processing

Important: The **post-processing** keyword is available only in 8.3 and later releases.

Specifies that the current ruledef is for post-processing purposes. This enables processing of packets even if the rule matching for them has been disabled.

routing

Specifies that the current ruledef is for routing purposes. Up to 256 rule definitions can be defined for routing in an Active Charging Service. Default: Disabled

tpo

Important: The **tpo** keyword is available only in 12.2 and later releases.

Specifies that the current ruledef is for use in Traffic Performance Optimization (TPO) in-line service's match-rule and match-advertisement configurations.
TPO can use both "charging" and "tpo" ruledefs. Note that ruledef/group-of-ruledef statistics are computed only for TPO ruledefs. For charging ruledefs/group-of-ruledefs, statistics are not computed, and are allowed only for backward compatibility. To enable ruledef statistics, in the TPO policies use "tpo" ruledefs.
Default: Disabled

Usage

Use this command to specify the rule application for a rule definition.
If, when configuring a ruledef, the rule-application is not specified, by default the system configures the ruledef as a charging ruledef.

Example

The following command configures the rule application “charging” to the current rule definition:

```
rule-application charging
```

sdp any-match

This command allows you to define rule expressions to match all packets that contain Session Description Protocol (SDP) descriptions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sdp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all packets containing SDP descriptions.

Example

The following command defines a rule expression to match all packets containing SDP descriptions:

```
sdp any-match = TRUE
```

sdp connection-ip-address

This command allows you to define rule expressions to match the IP address in the connection field of SDP descriptions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sdp connection-ip-address *operator ip_address*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

ip_address

Specifies the IP address to match.
ip_address must be in IPv4 dotted-decimal notation.

Usage

Use this command to define rule expressions to match IP address in the connection field of SDP descriptions.

Example

The following command defines a rule expression to match the IP address *10.1.1.1* in the connection field of SDP descriptions:

```
sdp connection-ip-address = 10.1.1.1
```

sdp media-audio-port

This command allows you to define rule expressions to match media audio ports specified in the media sections of SDP descriptions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sdp media-audio-port *operator port*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

port

Specifies the port number to match.
port must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match media audio ports specified in the media sections of SDP descriptions.

Example

The following command defines a rule expression to match media audio port *100* in the media sections of SDP descriptions:

```
sdp media-audio-port = 100
```

sdp media-video-port

This command allows you to define rule expressions to match media video ports specified in the media sections of SDP descriptions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sdp media-video-port *operator port*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

port

Specifies the port number to match.
port must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match media video ports specified in the media sections of SDP descriptions.

Example

The following command defines a rule expression to match media video port *100* in the media sections of SDP descriptions:

```
sdp media-video-port = 100
```

sdp uplink

This command allows you to define rule expressions to match SDP descriptions in the uplink (subscriber to network) direction.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sdp uplink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**: Is not uplink
- **TRUE**: Is uplink

Usage

Use this command to define rule expressions to match SDP descriptions in uplink direction.

Example

The following command defines a rule expression to match all SDP descriptions in the uplink direction:

```
sdp uplink = TRUE
```

secure-http any-match

This command allows you to define rule expressions to match all Secure HTTP (HTTPS) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] secure-http any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all Secure HTTP packets.

Example

The following command defines a rule expression to match all HTTPS packets:

```
secure-http any-match = TRUE
```

secure-http uplink

This command allows you to define rule expressions to match uplink (subscriber to network) HTTPS packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] secure-http uplink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**: Is not uplink
- **TRUE**: Is uplink

Usage

Use this command to define rule expressions to match uplink HTTPS packets.

Example

The following command defines a rule expression to match all uplink HTTPS packets:

```
secure-http uplink = TRUE
```

sip any-match

This command allows you to define rule expressions to match all Session Initiation Protocol (SIP) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all SIP packets.

Example

The following command defines a rule expression to match all SIP packets:

```
sip any-match = TRUE
```

sip call-id

This command allows you to define rule expressions to match the Call ID in SIP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip call-id [case-sensitive] *operator call_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

call-id

Specifies the call ID to match.
call-id must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the call ID in SIP messages.

Example

The following command defines a rule expression to match the call ID *test* in SIP messages:

```
sip call-id = test
```

sip content length

This command allows you to define rule expressions to match the content-length field in SIP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip content length *operator content_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

content_length

Specifies the SIP content length to match.
content_length must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match the content-length field in SIP headers.

Example

The following command defines a rule expression to match the content length *10000* in SIP headers:

```
sip content length = 10000
```

sip content type

This command allows you to define rule expressions to match the content type field in SIP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] sip content type [ case-sensitive ]` *`operator content_type`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`content_type`

Specifies the content type to match.
`content_type` must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match the content type field in SIP headers.

Example

The following command defines a rule expression to match content type *`download_string`* in SIP headers:

```
sip content type = download_string
```

sip from

This command allows you to define rule expressions to match the from field in SIP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip from [case-sensitive] *operator string*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

Specifies the value to match.
string must be an alphanumeric string of 1 through 127 characters, and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the “from” field in SIP messages.

Example

The following command defines a rule expression to match *test1* in the “from” field in SIP messages:

```
sip from contains test1
```

sip previous-state

This command allows you to define rule expressions to match previous state of SIP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip previous-state *operator sip_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

sip_previous_state

Specifies the previous state to match.
sip_previous_state must be one of the following:

- **init**
- **provisional-response**
- **request-sent**
- **response-fail**
- **response-ok**

Usage

Use this command to define rule expressions to match a previous state of SIP sessions.

Example

The following command defines a rule expression to match user traffic based on the SIP previous state of **request-sent**:

```
sip previous-state = request-sent
```

sip reply code

This command allows you to define rule expressions to match the reply code in SIP responses.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip reply code *operator reply_code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

reply_code

Specifies the SIP reply code to match.
reply_code must be an integer from 100 through 699.

Usage

Use this command to define rule expressions to match the reply code in SIP responses.

Example

The following command defines a rule expression to match *180* in the reply code in SIP responses:

```
sip reply code = 180
```

sip request method

This command allows you to define rule expressions to match the method in SIP requests.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip request method *operator method*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

method

Specifies the SIP method to match.
method must be one of the following:

- **ack**
- **bye**
- **cancel**
- **invite**
- **options**
- **register**

Usage

Use this command to define rule expressions to match the method in SIP requests.

Example

The following command defines a rule expression to match the method **bye** in SIP request messages:

```
sip request method = bye
```

sip request packet

This command allows you to define rule expressions to match all SIP request packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip request packet *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **=**: Equals
- **!=**: Does not equal

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**: Is a response
- **TRUE**: Is a request

Usage

Use this command to define rule expressions to match all SIP request packets.

Example

The following command defines a rule expression to match all SIP request packets:

```
sip request packet = TRUE
```

sip state

This command allows you to define rule expressions to match current state of the SIP session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies the current state to match.
current_state must be one of the following:

- **ack-received**
- **provisional-response**
- **request-sent**
- **response-fail**
- **response-ok**

Usage

Use this command to define rule expressions to match the current SIP session.

Example

The following command defines a rule expression to match user traffic based on SIP current state **request-sent**:

```
sip state = request-sent
```

sip to

This command allows you to define rule expressions to match the “to” field in SIP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] sip to [case-sensitive] *operator to_address*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

to_address

Specifies the “to” address/name to match.
to_address must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the “to” field in SIP messages.

Example

The following command defines a rule expression to match *test1* in the “to” field of SIP messages:

```
sip to contains test1
```

sip uri

This command allows you to define rule expressions to match the URI in SIP messages.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] sip uri [ sub-part { headers | host | parameters | port | userinfo } ] [ case-sensitive ]` *`operator uri`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`sub-part { headers | host | parameters | port | userinfo }`

This is an optional keyword that defines what sub-part of a SIP URI to check.

- **`headers`**: Apply the rule to SIP URI header field.
- **`host`**: Apply the rule the SIP URI host field.
- **`parameters`**: Apply the rule to the SIP URI parameters field.
- **`port`**: Apply the rule to the SIP URI port field.
- **`userinfo`**: Apply the rule to the SIP URI userinfo field.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

The string for sub-part keyword **`port`** must be an integer and requires different operators. Use the following operators with the **`port`** keyword:

- **`!=`**: Does not equal
- **`<=`**: Is less than

- **=**: Equals
- **>=**: Is greater than

uri

Specifies the SIP URI to match.
uri must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters. The string for sub-part keyword **port** must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match the URI in SIP messages.

Example

The following command defines a rule expression to match the URI string *sip:10.1.1.1:5060* in SIP messages:

```
sip uri = sip:10.1.1.1:5060
```

The following command defines a rule expression to match the URI string *sip:nnnn@host:5060;user=phone* in SIP messages:

```
sip uri = sip:nnnn@host:5060;user=phone
```

smtp any-match

This command allows you to define rule expressions to match all Simple Mail Transfer Protocol (SMTP) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all SMTP packets.

Example

The following command defines a rule expression to match all SMTP packets:

```
smtp any-match = TRUE
```

smtp command arguments

This command allows you to define rule expressions to match SMTP command arguments.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] smtp command arguments [ case-sensitive ]` *`operator argument`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

Specifies the command argument to match.
`argument` must be an alphanumeric string of 1 through 63 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match SMTP command arguments.

Example

The following command defines a rule expression to match SMTP command argument *`test`*:

```
smtp command arguments = test
```

smtp command id

This command allows you to define rule expressions to match SMTP command IDs.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp command id *operator command_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

command_id

Specifies the command argument to match.
command_id must be an integer from 0 through 10.

Usage

Use this command to define rule expressions to match SMTP command IDs.

Example

The following command defines a rule expression to match SMTP command ID *8*:

```
smtp command id = 8
```

smtp command name

This command allows you to define rule expressions to match commands sent in SMTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp command name *operator command_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

command_name

Specifies the command name to match.
command_name must be one of the following:

- **bdat**
- **data**
- **ehlo**
- **expn**
- **helo**
- **mail-from**
- **noop**
- **quit**
- **rcpt-to**
- **rset**
- **vrfy**

Usage

Use this command to define rule expressions to match commands sent in SMTP packets.

Example

The following command defines a rule expression to match **data** command in SMTP packets:

```
smtp command name = data
```

smtp mail-size

This command allows you to define rule expressions to match the size of mail sent by a SMTP client.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] smtp mail-size { operator mail_size | { { range | !range } range_from to range_to
} }
```

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

mail_size

Specifies the mail size (in bytes) to match.
mail_size must be an integer from 1 through 40000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies the start of range as an integer from 1 through 40000000.
- *range_to*: Specifies the end range. *range_to* must be an integer from 1 through 40000000, and must be greater than *range_from*.

Usage

Use this command to define rule expressions to match the size of mail sent by an SMTP client.

Example

The following command defines a rule expression to match mail size of *40000* bytes:

```
smtp mail-size = 40000
```

smtp pdu-length

This command allows you to define rule expressions to match the Protocol Data Unit (PDU) length of SMTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp pdu-length { *operator pdu_length* **| { { range | !range }** *range_from* **to** *range_to* **} }**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

pdu_length

Specifies the SMTP PDU length (in bytes) to match.
pdu_length must be an integer from 1 through 65535.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies the start of range as an integer from 1 through 65535.
- *range_to*: Specifies the end range. *range_to* must be an integer from 1 through 65535, and must be greater than *range_from*.

Usage

Use this command to define rule expressions to match PDU length of SMTP packets, that is headers + payload.

Example

The following command defines a rule expression to match a PDU length of *1600* bytes:

```
smtp pdu-length = 1600
```

smtp previous-state

This command allows you to define rule expressions to match previous state of SMTP command sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp previous-state *operator smtp_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

smtp_previous_state

Specifies the previous state to match.
smtp_previous_state must be one of the following:

- **close**: Closed state
- **init**: Initialized state
- **response-error**: Reply error state
- **response-ok**: Response ok state
- **waiting-for-response**: Waiting for response state

Usage

Use this command to define rule expressions to match a previous state of SMTP command sessions.

Example

The following command defines a rule expression to match user traffic based on SMTP previous state **close**:

```
smtp previous-state = close
```

smtp recipient

This command allows you to define rule expressions to match the recipient e-mail ID in the current SMTP transaction.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] smtp recipient [ case-sensitive ]` *`operator argument`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`case-sensitive`

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`!contains`**: Does not contain
- **`!ends-with`**: Does not end with
- **`!starts-with`**: Does not start with
- **`=`**: Equals
- **`contains`**: Contains
- **`ends-with`**: Ends with
- **`starts-with`**: Starts with

`argument`

Specifies the response argument to match.
`argument` must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the recipient e-mail ID in the current SMTP transaction.

Example

The following command defines a rule expression to match recipient e-mail ID containing *`test`* in the current SMTP transaction:

```
smtp recipient contains test
```

smtp reply arguments

This command allows you to define rule expressions to match the arguments within SMTP responses.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp reply arguments [case-sensitive] *operator argument*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

argument

Specifies the reply argument to match.
argument must be an alphanumeric string of 1 through 63 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the arguments with SMTP response.

Example

The following command defines a rule expression to match reply argument *forward-path* in SMTP response:

```
smtp reply arguments = forward-path
```

smtp reply id

This command allows you to define rule expressions to match reply ID assigned to SMTP responses.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] smtp reply id` *`operator reply_id`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`reply_id`

Specifies the reply ID to match.
`reply_id` must be one of the following:

- **`0`**: +NO reply
- **`1`**: +OK reply
- **`2`**: -ERR reply

Usage

Use this command to define rule expressions to reply ID assigned to SMTP response.

Example

The following command defines a rule expression to match reply ID *`2`* assigned to SMTP response:

```
smtp reply id = 2
```

smtp reply status

This command allows you to define rule expressions to match the reply status in SMTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp reply status *operator reply_status*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

reply_status

Specifies the SMTP reply status to match.
reply_status must be one of the following:

- **+OK**: Response OK
- **-ERR**: Response error

Usage

Use this command to define rule expressions to match reply status in SMTP packets.

Example

The following command defines a rule expression to match reply status **+OK** in SMTP packets:

```
smtp reply status = +OK
```

smtp sender

This command allows you to define rule expressions to match sender e-mail ID in the current SMTP transaction.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp sender [case-sensitive] *operator sender*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

sender

Specifies the sender value to match.
sender must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match sender e-mail ID in the current SMTP transaction.

Example

The following command defines a rule expression to match sender e-mail ID containing *test* in the current SMTP transaction:

```
smtp sender contains test
```

smtp session-length

This command allows you to define rule expressions to match total length of SMTP sessions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp session-length { *operator session_length* **| { range | !range }** *range_from* **to** *range_to* **}**

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the session length to match.
session_length must be an integer from 1 through 40000000.

{ range | !range } *range_from* **to** *range_to*

Enables or disables the range criteria.

- **range**: Enables the range criteria.
- **!range**: Disables the range criteria.
- *range_from*: Specifies the start of range as an integer from 1 through 40000000.
- *range_to*: Specifies the end range. *range_to* must be an integer from 1 through 40000000, and must be greater than *range_from*.

Usage

Use this command to define rule expressions to match total length of SMTP session.

Example

The following command defines a rule expression to match SMTP session length of *4000000*:

```
smtp session-length = 4000000
```

smtp state

This command allows you to define rule expressions to match current state of a SMTP command session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] smtp state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies the current state to match.
current_state must be one of the following:

- **close**: Closed state
- **init**: Initialized state
- **response-error**: Response of error state
- **response-ok**: Response of ok state
- **waiting-for-response**: Waiting for response state

Usage

Use this command to define rule expressions to match current state of SMTP command session.

Example

The following command defines a rule expression to match current state as **close** of SMTP command session:

```
smtp state = close
```

tcp analyzed out-of-order

This command allows you to define rule expressions to determine whether the received TCP packet was received before all of the earlier sequenced packets have been received. This functionality is for whether the packet was analyzed or discarded because the earlier sequenced packet(s) was (were) not received before a timeout expired.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

`[ no ] tcp analyzed out-of-order` *`operator condition`*

`no`

If previously configured, deletes the specified rule expression from the current ruledef.

`operator`

Specifies how to match.
`operator` must be one of the following:

- **`!=`**: Does not equal
- **`=`**: Equals

`condition`

Specifies the condition to match.
`condition` must be one of the following:

- **`FALSE`**: Not analyzed
- **`TRUE`**: Analyzed

Usage

This command is used to set the status flag to ‘analyzed’ or ‘not analyzed’ for all TCP packets received at the ACSMgr/SessMgr prior to their earlier packets.
When a packet reaches ACSMgr/SessMgr prior to earlier packet(s), it and subsequent packets are buffered at ACSMgr/SessMgr as TCP out-of-order packets and ACSMgr/SessMgr waits for missing packet(s) until the time-out duration expires. If the packet(s) with the missing sequence number(s) arrives within the time-out duration, all buffered packets with the correct sequence will be presented to upper layers (HTTP etc.) for analysis; otherwise buffered TCP out-of-order packets will be sent to charging with analysis done flag at the TCP/IP layer only.
If this command is enabled the TCP out-of-order packets are marked and sent to TCP analyzer as analyzed for charging action, otherwise they are discarded.

Example

The following command sets to analyze TCP out-of-order packets:

```
tcp analyzed out-of-order = TRUE
```

tcp any-match

This command allows you to define rule expressions to match all TCP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**: Not analyzed
- **TRUE**: Analyzed

Usage

Use this command to define rule expressions to match all TCP packets.

Example

The following command defines a rule expression to match all TCP packets:

```
tcp any-match = TRUE
```

tcp connection-initiator

This command allows you to define rule expressions to match the TCP connection initiator.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tcp connection-initiator operator subscriber
```

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

subscriber

Specifies that the connection is being initiated by the subscriber.

Usage

Use this command to define rule expressions to match the TCP connection initiator, and to allow the operator to differentiate when the connection initiated by subscriber or the subscriber is acting as a Transaction Control Server (TCS) server.

Example

The following command defines a rule expression to match user traffic based on TCP connection initiator **subscriber**:

```
tcp connection-initiator = subscriber
```

tcp downlink

This command allows you to define rule expressions to match downlink (network to subscriber) TCP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp downlink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match downlink (to subscriber) TCP packets.

Example

The following command defines a rule expression to match downlink TCP packets:

```
tcp downlink = TRUE
```

tcp dst-port

This command allows you to define rule expressions to match destination port number in TCP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp dst-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map_name* **} }**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the range of destination TCP ports.

- *start_range* must be an integer from 1 through 65535.
- *end_range* must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map_name*

Specifies the port map for the port range. *port_map_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match destination port number in TCP headers.

Example

The following command defines a rule expression to match destination port number *10* in TCP headers:

```
tcp dst-port = 10
```

tcp duplicate

This command allows you to define rule expressions to match TCP retransmissions.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tcp duplicate operator condition
```

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**: Not duplicated/retransmitted
- **TRUE**: Duplicated/retransmitted

Usage

Use this command to specify rule expressions to match TCP retransmission.

Example

The following command defines a rule expression to match TCP retransmissions:

```
tcp duplicate = TRUE
```

tcp either-port

This command allows you to define rule expressions to match either a destination or source port number in TCP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp either-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map_name* **} }**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.

- *start_range* must be an integer from 1 through 65535.
- *end_range* must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map_name*

Specifies the port map for the port range. *port_map_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match either a destination or source port number in TCP headers.
This command expression allows you to create a single ruledef using either-port, rather than needing two ruledefs (one with dst-port and one with src-port).

Example

The following command defines a rule expression to match destination/source port number *10* in TCP header:

```
tcp either-port = 10
```

tcp error

This command allows you to define rule expressions to identify errors, either in the packet (for example, TCP checksum error) or in the TCP analyzer's Finite State Machine (FSM).

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp error *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define a rule expression to identify errors, either in the packet (for example, TCP checksum error) or in the TCP analyzer's FSM.

Example

The following command defines a rule expression to match TCP errors:

```
tcp error = TRUE
```

tcp flag

This command allows you to define rule expressions to match bit within the flag field of TCP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tcp flag operator flag
```

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!contains**: Does not contain
- **contains**: Contains
- **!=**: Does not equal
- **=**: Equals

flag

Specifies the flag value to match.
flag must be one of the following:

- **ack**: TCP FLAG ACK
- **fin**: TCP FLAG FIN
- **push**: TCP FLAG PUSH
- **reset**: TCP FLAG RESET
- **syn**: TCP FLAG SYN

Usage

Use this command to define rule expressions to match a bit within the flag field of TCP headers.

Example

The following command defines a rule expression to match **reset** within flag field of TCP headers:

```
tcp flag = reset
```

tcp initial-handshake-lost

This command allows you to define rule expressions to match data packets when there has been no TCP handshaking to establish TCP connection.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp initial-handshake-lost *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match data packets when there has been no TCP handshaking to establish TCP connection.

Example

The following command defines a rule expression to identify TCP flow where the initial handshake was not seen:

```
tcp initial-handshake-lost = TRUE
```

tcp payload

This command allows you to define rule expressions to match hexadecimal or ASCII string content in the payload protocol-signature field of the TCP payload.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp payload starts-with { hex-signature *hex_string* **| string-signature** *string* **}**

no

If previously configured, deletes the specified rule expression from the current ruledef.

hex-signature *hex_string*

Specifies hexadecimal protocol signature in payload field.
hex_string must be a dash-delimited list of hex data of size smaller than 32.

string-signature *string*

Specifies protocol signature in payload field.
string must be an alphanumeric string of 1 through 32 characters.

Usage

Use this command to define rule expressions to match for Hex/ASCII string content in payload protocol-signature field.
This rule expression is useful for detecting certain applications.

Example

The following command defines a rule expression to identify user traffic based on TCP protocol signature *tcp1*:

```
tcp payload starts-with string-signature tcp1
```

tcp payload-length

This command allows you to define rule expressions to match the length of a TCP payload.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp payload-length *operator payload_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

payload_length

Specifies the TCP payload length to match.
payload_length must be an integer from 0 through 40000000.

Usage

Use this command to define rule expressions to match length of TCP payload, excluding the TCP or lower layer headers.
To match TCP control packets configure a payload-length of 0 (zero).

Example

The following command defines a rule expression to match TCP payload length of *10000*:

```
tcp payload-length = 10000
```

tcp previous-state

This command allows you to define rule expressions to match previous state of TCP connections.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp previous-state *operator tcp_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

tcp_previous_state

Specifies the previous state to match.
tcp_previous_state must be one of the following:

- **close**
- **close-wait**
- **closing**
- **established**
- **fin-wait1**
- **fin-wait2**
- **last-ack**
- **listen**
- **syn-received**
- **syn-sent**
- **time-wait**

Usage

Use this command to define rule expressions to match a TCP previous state.

Example

The following command defines a rule expression to match user traffic based on previous state **time-wait**:

```
tcp previous-state = time-wait
```

tcp proxy-prev-state

This command allows you to define rule expressions to match TCP previous state on the ingress side of the TCP proxy.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp proxy-prev-state *operator previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

previous_state

Specifies the previous state to match.
previous_state must be one of the following:

- **close**
- **close-wait**
- **closing**
- **established**
- **fin-wait1**
- **fin-wait2**
- **last-ack**
- **listen**
- **syn-received**
- **syn-sent**
- **time-wait**

Usage

If there is no TCP proxy configured, this configuration is not applicable.
For proxy-enabled flows, TCP state handling interprets the ingress side as the radio side and the egress side as the Internet side of the TCP connection.
tcp state and **tcp prev-state** is the state of the client stack, which would be either the state of the subscriber's stack (if flow is not proxy enabled) or the MS state of proxy on the egress-side (if flow is proxy-enabled).

tcp proxy-state and **tcp proxy-prev-state** is the state of the embedded TCP proxy server, that is the proxy ingress-side.
So, depending on the use case, if using **tcp state** and **tcp prev-state** an existing configuration may work fine regardless of whether proxy is enabled. For other use cases, other ruledefs may have to be created. Both **tcp state** and **tcp proxy-state** can be used in the same ruledef. If proxy was being used, they would map to the egress-side and ingress-side, respectively. If proxy was not being used, then this would not match ruledef because proxy state would not be applicable.

Example

The following command defines a rule expression to match user traffic based on TCP proxy previous state of established:

```
tcp proxy-prev-state = established
```

tcp proxy-state

This command allows you to define rule expressions to match the TCP state on the ingress side of the TCP proxy.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp proxy-state *operator state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the state to match.
state must be one of the following:

- **close**
- **close-wait**
- **closing**
- **established**
- **fin-wait1**
- **fin-wait2**
- **last-ack**
- **listen**
- **syn-received**
- **syn-sent**
- **time-wait**

Usage

If there is no TCP proxy configured, this configuration is not applicable.
For proxy-enabled flows, TCP state handling interprets the ingress side as the radio side and the egress side as the Internet side of the TCP connection.
tcp state and **tcp prev-state** is the state of the client stack, which would be either the state of the subscriber's stack (if flow is not proxy enabled) or the MS state of proxy on egress-side (if flow is proxy-enabled).

tcp proxy-state and **tcp proxy-prev-state** is the state of the embedded TCP proxy server, that is the proxy ingress-side.
So, depending on the use case, if using **tcp state** and **tcp prev-state** an existing configuration may work fine regardless of whether proxy is enabled. For other use cases, other ruledefs may have to be created. Both **tcp state** and **tcp proxy-state** can be used in the same ruledef. If proxy was being used, they would map to the egress-side and ingress-side, respectively. If proxy was not being used, then this would not match the ruledef because proxy state would not be applicable.

Example

The following command defines a rule expression to match user traffic based on TCP proxy previous state of established:

```
tcp proxy-state = established
```

tcp session-length

This command allows you to define rule expressions to match the total length of a TCP session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp session-length *operator session_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

session_length

Specifies the TCP session length (in bytes) to match as be an integer from 0 through 4000000000.

Usage

Use this command to define rule expressions to match the total length of a TCP session.
The session-length is calculated by adding together the TCP payload-length values of all relevant packets.

Example

The following command defines a rule expression to match user traffic based on TCP session length of *2000* bytes:

```
tcp session-length = 2000
```

tcp src-port

This command allows you to define rule expressions to match source a port number in TCP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp src-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map_name* **} }**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

---

range | !range

Specifies the range criteria:

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.

- *start_range* must be an integer from 1 through 65535.
- *end_range* must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map_name*

Specifies the port map for the port range. *port_map_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match source a port number in TCP headers.

Example

The following command defines a rule expression to analyze user traffic matching TCP source port *10*:

```
tcp src-port = 10
```

tcp state

This command allows you to define rule expressions to match current state of TCP connections.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies the current state to match.
current_state must be one of the following:

- **close**
- **close-wait**
- **closing**
- **established**
- **fin-wait1**
- **fin-wait2**
- **last-ack**
- **listen**
- **syn-received**
- **syn-sent**
- **time-wait**

Usage

Use this command to define rule expressions to match a current state of TCP connections.

Example

The following command defines a rule expression to match user traffic based on current state **close**:

```
tcp state = close
```

tcp uplink

This command allows you to define rule expressions to match uplink (subscriber to network) TCP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tcp uplink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to uplink TCP packets.

Example

The following command defines a rule expression to uplink TCP packets:

```
tcp uplink = TRUE
```

tethering-detection

This command allows you to define rule expressions to match tethered or non-tethered flows.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

tethering-detection { flow-not-tethered | flow-tethered }

no tethering-detection

no

Deletes the tethering detection configuration from the ruledef.

flow-not-tethered

Specifies to match if tethering is not detected on flow.

flow-tethered

Specifies to match if tethering is detected on flow.

Usage

Use this command to define rule expressions to match tethered/non-tethered flows.
Note that in order for the rule containing the tethering-detection configuration to get matched, at least one valid rule line has to be present in it.
This configuration is treated in a special manner by the rule matching engine in that it is excluded from the condition **multi-line-or all-lines**. For example, if there are three rule-lines in a ruledef and multi-line-or is enabled as follows:

```
ruledef all-tethered-web-traffic

   http any-match = TRUE

   wsp any-match = TRUE

   multi-line-or all-lines

   tethering-detection flow-tethered

   exit
```

In this case, if for a packet only the rule line **tethering-detection flow-tethered** matches, it is not sufficient to result in a rule match even though **multi-line-or all-lines** is enabled in the ruledef.

Example

The following command defines a rule expression to match tethered flows:

tethering-detection flow-tethered

tftp any-match

This command allows you to define rule expressions to match all Trivial File Transfer Protocol (TFTP) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] tftp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**: Not analyzed
- **TRUE**: Analyzed

Usage

Use this command to define rule expressions to match all TFTP packets.

Example

The following command defines a rule expression to match all TFTP packets:

```
tftp any-match = TRUE
```

tftp data-any-match

This command allows you to define rule expressions to match all TFTP data packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tftp data-any-match operator condition
```

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**: Not analyzed
- **TRUE**: Analyzed

Usage

Use this command to define rule expressions to match all TFTP data packets.

Example

The following command defines a rule expression to match all TFTP data packets:

```
tftp data-any-match = TRUE
```

udp any-match

This command allows you to define rule expressions to match all UDP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] udp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all UDP packets.

Example

The following command defines a rule expression to match all UDP packets:

```
udp any-match = TRUE
```

udp downlink

This command allows you to define rule expressions to match downlink (network to subscriber) UDP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] udp downlink operator condition
```

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match downlink UDP packets.

Example

The following command defines a rule expression to match downlink UDP packets:

```
udp downlink = TRUE
```

udp dst-port

This command allows you to define rule expressions to match destination port number in UDP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] udp dst-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map_name* **} }**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.

- *start_range* must be an integer from 1 through 65535.
- *end_range* must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map_name*

Specifies the port map for the port range. *port_map_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match destination port number in UDP headers.

Example

The following command defines a rule expression to match user traffic based on destination port number *10*:

```
udp dst-port = 10
```

udp either-port

This command allows you to define rule expressions to match either a destination or source port number in UDP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] udp either-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map_name* **} }**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map_name*

Specifies the port map for the port range. *port_map_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match either destination or source port number in UDP headers.

Example

The following command defines a rule expression to match user traffic based on match either source/destination port number *10*:

```
udp either-port = 10
```

udp payload starts-with

This command allows you to define rule expressions to match hex/ASCII string content in UDP payload protocol-signature field.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] udp payload starts-with { hex-signature *hex_string* **| string-signature** *string* **}**

no

If previously configured, deletes the specified rule expression from the current ruledef.

hex-signature *hex_string*

Specifies hexadecimal protocol signature in payload field.
hex_string must be a dash-delimited list of hex data of size smaller than 32.

string-signature *string*

Specifies protocol signature in payload field.
string must be an alphanumeric string of 1 through 32 characters.

Usage

Use this command to define rule expressions to match for Hex/ASCII string content in UDP payload protocol-signature field.
This rule expression is useful for detecting certain applications.

Example

The following command defines a UDP rule expression to analyze user traffic based on UDP protocol signature *udp1*:

```
udp payload starts-with string-signature udp1
```

udp src-port

This command allows you to define rule expressions to match source port number in UDP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] udp src-port { *operator port_number* **| { !range | range } {** *start_range* **to** *end_range* **| port-map** *port_map_name* **} }**

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

---

port_number

Specifies the port number to match.
port_number must be an integer from 1 through 65535.

!range | range

Specifies the range criteria.

- **!range**: Not in the range
- **range**: In the range

---

start_range **to** *end_range*

Specifies the starting and ending port numbers for the port range.
start_range must be an integer from 1 through 65535.
end_range must be an integer from 1 through 65535, and must be greater than *start_range*.

---

port-map *port_map_name*

Specifies the port map for the port range. *port_map_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define rule expressions to match source port number in UDP headers.

Example

The following command defines a rule expression to match source port number *10* in UDP headers:

```
udp src-port = 10
```

udp uplink

This command allows you to define rule expressions to match uplink (subscriber to network) UDP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] udp uplink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match uplink UDP packets.

Example

The following command defines a rule expression to match uplink (from subscriber) UDP packets:

```
udp uplink = TRUE
```

wsp any-match

This command allows you to define rule expressions to match all Wireless Session Protocol (WSP) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to specify a rule expression to match all WSP packets.

Example

The following command defines a rule expression to match all WSP packets:

```
wsp any-match = TRUE
```

wsp content type

This command allows you to define rule expressions to match the content type field in WSP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp content type [case-sensitive] *operator content_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

content_type

Specifies content type to match.
content_type must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match “content type” field in WSP headers.

Example

The following command defines a rule expression to WSP content type *test*:

```
wsp content type = test
```

wsp domain

This command allows you to define rule expressions to match domain portion of the URI for WSP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp domain [case-sensitive] *operator domain*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

domain

Specifies the domain to match.
domain must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match the domain portion of URIs in WSP packets. From the URL, after http:// (if present) is removed, everything until the first "/" is the domain.

Example

The following command defines a rule expression to match user traffic based on domain name *testdomain*:

```
wsp domain = testdomain
```

wsp downlink

This command allows you to define rule expressions to match downlink (network to subscriber) WSP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp downlink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the downlink (from the Mobile Node direction) status to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match downlink WSP packets.

Example

The following command defines a rule expression to match downlink WSP packets:

```
wsp downlink = TRUE
```

wsp first-request-packet

This command allows you to define rule expressions to match WSP first-request-packet.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp first-request-packet *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match the GET or POST request, if it is the first WSP request for the subscriber's session.

Example

The following command defines a rule expression to match WSP first-request-packet:

```
wsp first-request-packet = TRUE
```

wsp host

This command allows you to define rule expressions to match the host name header field in WSP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp host [case-sensitive] *operator host_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

host_name

Specifies the WSP host name to match.
host_name must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match host name header field in WSP headers.

Example

The following command defines a rule expression to match host name *host1* in WSP headers:

```
wsp host contains host1
```

wsp pdu-length

This command allows you to define rule expressions to match WSP PDU length.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp pdu-length *operator pdu_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the WSP PDU length (in bytes) to match.
pdu_length must be an integer from 1 through 65535.

Usage

Use this command to define rule expressions to match WSP PDU length (header + payload) in bytes.

Example

The following command defines a rule expression to match user traffic based on WSP PDU length of *10000* bytes:

```
wsp pdu-length = 10000
```

wsp pdu-type

This command allows you to define rule expressions to match WSP PDU type in the current packet.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp pdu-type *operator pdu_type*

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

---

pdu_type

Specifies the WSP PDU type to match.
pdu_type must be one of the following:

- **confirmed push**
- **connect-reply**
- **connect-request**
- **data-fragment**
- **delete**
- **disconnect**
- **get**
- **head**
- **options**
- **post**
- **push**
- **put**
- **redirect**
- **reply**
- **resume**
- **suspend**
- **trace**

Usage

Use this command to define rule expressions to match WSP PDU type value in current packet.

Example

The following command defines a rule expression to match WSP PDU type **resume**:

```
wsp pdu-type resume
```

wsp previous-state

This command allows you to define rule expressions to match previous WSP method invocation state.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp previous-state *operator wsp_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

wsp_previous_state

Specifies the previous state to match.
wsp_previous_state must be one of the following:

- **init**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to define rule expressions to match WSP previous state.

Example

The following command defines a rule expression to match WSP previous state of *response-ok*:

```
wsp previous-state = response-ok
```

wsp reply code

This command allows you to define rule expressions to match WSP reply code.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp reply code *operator reply_code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

reply_code

Specifies the WSP reply code to match.
reply_code must be an integer from 0 through 101.

Usage

Use this command to define rule expressions to match WSP reply code.

Example

The following command defines a rule expression to match WSP reply code of *50*:

```
wsp reply code = 50
```

wsp session-length

This command allows you to define rule expressions to match total length of a WSP session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp session-length *operator session_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: less than equals
- **=**: Equals
- **>=**: greater than equals

session_length

Specifies the WSP session length (in bytes) to match.
session_length must be an integer from 1 through 65535.

Usage

Use this command to define rule expressions to match total length of WSP session.

Example

The following command defines a rule expression to match WSP session length of *2000* bytes:

```
wsp session-length = 2000
```

wsp session-management

This command allows you to define rule expressions to match WSP Session Management state.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp session-management { previous-state | state } *operator state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

previous-state

Specifies the previous WSP Session Management state.

state

Specifies current WSP Session Management Finite State Machine (FSM) state.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

state

Specifies the state to match.
For **previous-state**, *state* must be one of the following:

- **connected**
- **connecting**
- **init**
- **resuming**
- **suspended**

For **state**, *state* must be one of the following:

- **close**
- **connected**
- **connecting**
- **init**
- **resuming**
- **suspended**

Usage

Use this command to define rule expressions to match a WSP Session Management state.

Example

The following command defines a rule expression to match previous WSP Session Management state of **connecting**:

```
wsp session-management previous-state = connecting
```

wsp state

This command allows you to define rule expressions to match WSP Method Invocation state.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies the current state to match.
current_state must be one of the following:

- **close**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to define rule expressions to match WSP Method Invocation state.

Example

The following command defines a rule expression to match a WSP Method Invocation state **close**:

```
wsp state = close
```

wsp status

This command has been deprecated. See the **wsp reply-code**command.

wsp tid

This command allows you to define rule expressions to match Transaction Identifier (TID) field for connection-less WSP.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp tid *operator transaction_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

transaction_id

Specifies the transaction identifier to match.
transaction_id must be an integer from 0 through 255.

Usage

Use this command to define rule expressions to match TID field for connection-less WSP.

Example

The following command defines a rule expression to match a TID value of *22* for connection-less WSP:

```
wsp tid = 22
```

wsp total-length

This command has been deprecated. See the **wsp session-length** command.

wsp transfer-encoding

This command allows you to define rule expressions to match transfer encoding present in WSP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp transfer-encoding [case-sensitive] *operator transfer_encoding*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

transfer_encoding

This must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match transfer encoding present in WSP header.

Example

The following command defines a rule expression to match user traffic based on WSP transfer encoding 7:

```
wsp transfer-encoding contains 7
```

wsp uplink

This command allows you to define rule expressions to match uplink (subscriber to network) WSP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp uplink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the uplink (to the Mobile Node direction) status to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match uplink WSP packets.

Example

The following command defines a rule expression to match uplink WSP packets:

```
wsp uplink = TRUE
```

wsp url

This command allows you to define rule expressions to match WSP URL.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp url [case-sensitive] *operator url*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

url

Specifies the URL to match.
url must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match the complete URL, including the host portion.

Example

The following command defines a rule expression to match user traffic based on WSP URL *wsp://wiki.tcl.tk*:

```
wsp url = wsp://wiki.tcl.tk
```

wsp user-agent

This command allows you to define rule expressions to match user agent field in WSP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp user-agent [case-sensitive] *operator user_agent*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

user_agent

Specifies the WSP user agent to match.
user_agent must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match a user agent field in WSP headers.

Example

The following command defines a rule expression to match value *test* in user agent field in WSP headers:

```
wsp user-agent contains test
```

wsp x-header

This command allows you to define rule expressions to match WSP extension-headers (x-headers).

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wsp x-header *name* **[case-sensitive]** *operator string*

no

If previously configured, deletes the specified rule expression from the current ruledef.

name

Specifies the x-header value as an alphanumeric string of 1 through 31 characters.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

string

Specifies the value of the extension header as an alphanumeric string of 1 through 127 characters.

Usage

Use this command to configure any x-header field in WSP and parse it. The extension-header mechanism allows additional header fields to be defined without changing the protocol. The extension-header can be any header fields that are not specified in the RFC standard.

Example

The following command defines a rule expression to analyze user traffic containing WSP extension-header of *test_field* and value of *test_string*:

```
wsp x-header test_field = test_string
```

wtp any-match

This command allows you to define rule expressions to match all Wireless Transaction Protocol (WTP) packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all WTP packets.

Example

The following command defines a rule expression to match all WTP packets:

```
wtp any-match = TRUE
```

wtp downlink

This command allows you to define rule expressions to match downlink (network to subscriber) WTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp downlink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the downlink (from the Mobile Node direction) status to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match downlink WTP packets.

Example

The following command defines a rule expression to match all downlink WTP packets:

```
wtp downlink = TRUE
```

wtp gtr

This command allows you to define rule expressions to match Group Transmission (GTR) flag in the current WTP PDU.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp gtr *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match the GTR flag (that indicates the last packet of a packet group) in the current WTP PDU.

Example

The following command defines a rule expression to match WTP user traffic based on WTP GTR:

```
wtp gtr = TRUE
```

wtp pdu-length

This command allows you to define rule expressions to match WTP PDU length.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp pdu-length *operator pdu_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

pdu_length

Specifies the WTP PDU length (in bytes) to match.
pdu_length must be an integer from 1 through 65535.

Usage

Use this command to define rule expressions to match WTP PDU length (header + payload) in bytes.

Example

The following command defines a rule expression to match WTP PDU length of *9647* bytes:

```
wtp pdu-length = 9647
```

wtp pdu-type

This command allows you to define rule expressions to match WTP PDU type.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp pdu-type *operator pdu_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

pdu_type

Specifies the WTP PDU type to match.
pdu_type must be one of the following:

- **abort**
- **ack**
- **invoke**
- **negative-ack**
- **result**
- **segment-invoke**
- **segment-result**

Usage

Use this command to define rule expressions to match WTP PDU type.

Example

The following command defines a rule expression to match the WTP PDU type **result**:

```
wtp pdu-type = result
```

wtp previous-state

This command allows you to define rule expressions to match previous WTP state.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp previous-state *operator wtp_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

wtp_previous_state

Specifies the previous state to match.
wtp_previous_state must be one of the following:

- **ack-sent**
- **init**
- **invoke-sent**
- **rcvd**
- **result-rcvd**

Usage

Use this command to define rule expressions to match WTP previous state.

Example

The following command defines a rule expression to match user traffic based on WTP previous state of **ack-sent**:

```
wtp previous-state = ack-sent
```

wtp rid

This command allows you to define rule expressions to match Re-transmission Indicator (RID) flag set in WTP traffic.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp rid *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match WTP RID flag.

Example

The following command defines a rule expression to match user traffic containing WTP RID flag:

```
wtp rid = TRUE
```

wtp state

This command allows you to define rule expressions to match current WTP state.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies the current state to match.
current_state must be one of the following:

- **ack-sent**
- **close**
- **init**
- **invoke-sent**
- **rcvd**
- **result-rcvd**

Usage

Use this command to define rule expressions to match current WTP state.

Example

The following command defines a rule expression to match user traffic based on current WTP state **close**:

```
wtp state = close
```

wtp tid

This command allows you to define rule expressions to match WTP Transaction Identifier (TID).

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp tid *operator transaction_id*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

transaction_id

Specifies the transaction identifier to match.
transaction_id must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match WTP TID. This expression ignores the high order bit in the protocol that indicates the direction.

Example

The following command defines a rule expression to match user traffic containing WTP TID value of *22*:

```
wtp tid = 22
```

wtp transaction class

This command allows you to define rule expressions to match WTP Transaction Class (TCL) state.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp transaction class *operator transaction_class*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

transaction_class

Specifies the WTP TCL to match.
transaction_class must be an integer from 0 through 2.

Usage

Use this command to define rule expressions to match WTP transaction class.

Example

The following command defines a rule expression to match WTP traffic based on WTP transaction class *2*:

```
wtp transaction class = 2
```

wtp ttr

This command allows you to define rule expressions to match WTP Trailer Transmission (TTR) flag.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp ttr *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match TTR flag (used to indicate the last packet in a segmented message) in the current WTP PDU.

Example

The following command defines a rule expression to match WTP traffic based on the presence of the WTP TTR flag:

```
wtp ttr = TRUE
```

wtp uplink

This command allows you to define rule expressions to match uplink (subscriber to network) WTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] wtp uplink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match uplink WTP packets.

Example

The following command defines a rule expression to match all uplink WTP packets:

```
wtp uplink = TRUE
```

www any-match

This command allows you to define rule expressions to match all WWW packets. It is true for HTTP, WAP1.x, and WAP2.0 protocols.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www any-match *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match all WWW packets. This expression is true for HTTP, WAP1.x, and WAP2.0 protocols

Example

The following command defines a rule expression to match all WWW packets:

```
www any-match = TRUE
```

www content type

This command allows you to define rule expressions to match the Content-Type field of HTTP/WSP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www content type [case-sensitive] *operator content_type*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

content_type

Specifies the value to match.
content_type must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the “content type” field of HTTP/WSP header.

Example

The following command defines a rule expression to match the WWW content type *Accept*:

```
www content type = Accept
```

www domain

This command allows you to define rule expressions to match the domain portion of URIs in WSP/HTTP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www domain [case-sensitive] *operator domain*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

domain

Specifies the domain to match.
domain must be an alphanumeric string of 1 through 127 characters.

Usage

Use this command to define rule expressions to match the domain portion of URIs in WSP/HTTP packets. From the URL, after http:// (if present) is removed, everything until the first "/" is the domain.

Example

The following command defines a rule expression to match user traffic based on domain name *testdomain*:

```
www domain = testdomain
```

www downlink

This command allows you to define rule expressions to match downlink (network to subscriber) HTTP/WSP packets.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www downlink *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match downlink HTTP/WSP packets.

Example

The following command defines a rule expression to match all downlink WWW packets:

```
www downlink = TRUE
```

www first-request-packet

This command allows you to define rule expressions to match the GET or POST request, if it is the first WSP/HTTP request for the subscriber's session.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www first-request-packet *operator condition*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

condition

Specifies the condition to match.
condition must be one of the following:

- **FALSE**
- **TRUE**

Usage

Use this command to define rule expressions to match the GET or POST request, if it is the first WSP/HTTP request for the subscriber's session.

Example

The following command defines a rule expression to match user traffic based on the WWW first-request-packet:

```
www first-request-packet = TRUE
```

www header-length

This command allows you to define rule expressions to match WWW packet header length.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www header-length *operator header_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

header_length

Specifies the WWW packet header length (in bytes) to match, *header_length* must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match WWW packet header length.

Example

The following command defines a rule expression to match user traffic based on WWW packet header length of *10000* bytes:

```
www header-length = 10000
```

www host

This command allows you to define rule expressions to match the “host name” header field present in HTTP/WSP headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www host [case-sensitive] *operator host_name*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

host_name

Specifies the WWW host name to match.
host_name must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the host name header field present in HTTP/WSP headers.

Example

The following command defines a rule expression to match user traffic based on WWW host name *host1*:

```
www host = host1
```

www payload-length

This command allows you to define rule expressions to match WWW payload length.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www payload-length *operator payload_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

payload_length

Specifies the payload length (in bytes) to match.
payload_length must be an integer from 1 through 4000000000.

Usage

Use this command to define rule expressions to match WWW payload length.

Example

The following command defines a rule expression to match user traffic based on WWW payload length of *10000*:

```
www payload-length = 10000
```

www pdu-length

This command allows you to define rule expressions to match WWW PDU length.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www pdu-length *operator pdu_length*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

pdu_length

Specifies the WWW PDU length (in bytes) to match.
pdu_length must be an integer from 0 through 65535.

Usage

Use this command to define rule expressions to match WWW PDU length (header + payload) in bytes.

Example

The following command defines a rule expression to match user traffic based on WWW PDU length of *9767* bytes:

```
www pdu-length = 9767
```

www previous-state

This command allows you to define rule expressions to match previous HTTP/WSP(HTTP) state.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www previous-state *operator www_previous_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

www_previous_state

Specifies the previous state to match.
www_previous_state must be one of the following:

- **init**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to define rule expressions to match a previous HTTP/WSP(HTTP) state.

Example

The following command defines a rule expression to match user traffic based on WWW previous state **init**:

```
www previous-state = init
```

www reply code

This command allows you to define rule expressions to match WWW reply code arguments.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www reply code *operator reply_code*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **<=**: Lesser than or equals
- **=**: Equals
- **>=**: Greater than or equals

reply_code

Specifies the reply code to match.
reply_code must be an integer from 100 through 599.

Usage

Use this command to define rule expressions to match HTTP 1.1 status code, or WSP status code that has been remapped to the corresponding HTTP value.
WSP status codes 0 – 101 are automatically remapped to the HTTP status code values, as defined by Table 36 WAP-230-WSP Version 5.

Example

The following command defines a rule expression to analyze WWW user traffic based on reply code of *125*:

```
www reply code = 125
```

www state

This command allows you to define rule expressions to match current HTTP/WSP(HTTP) state.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www state *operator current_state*

no

If previously configured, deletes the specified rule expression from the current ruledef.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **=**: Equals

current_state

Specifies the current state to match.
current_state must be one of the following:

- **close**
- **response-error**
- **response-ok**
- **waiting-for-response**

Usage

Use this command to define rule expressions to match current HTTP/WSP state.

Example

The following command defines a rule expression to match user traffic based on the current WWW state **close**:

```
www state = close
```

www transfer-encoding

This command allows you to define rule expressions to match the transfer encoding field present in HTTP/WSP(HTTP) headers.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www transfer-encoding [case-sensitive] *operator transfer_encoding*

no

If previously configured, deletes the specified rule expression from the current ruledef.

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

transfer_encoding

Specifies the WWW transfer encoding to match.
transfer_encoding must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the “transfer encoding” field present in HTTP/WSP(HTTP) headers.

Example

The following command defines a rule expression to match user traffic based on the WWW transfer encoding *user1*:

```
www transfer-encoding = user1
```

www url

This command allows you to define rule expressions to match URL for any Web protocol analyzer—HTTP, WAP1.X, WAP2.0.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

[no] www url [case-sensitive] *operator url*

---

no

If previously configured, deletes the specified rule expression from the current ruledef.

---

case-sensitive

Specifies that the rule expression be case-sensitive. By default, rule expressions are not case-sensitive.

---

operator

Specifies how to match.
operator must be one of the following:

- **!=**: Does not equal
- **!contains**: Does not contain
- **!ends-with**: Does not end with
- **!starts-with**: Does not start with
- **=**: Equals
- **contains**: Contains
- **ends-with**: Ends with
- **starts-with**: Starts with

---

url

Specifies the URL to match.
url must be an alphanumeric string of 1 through 127 characters and may contain punctuation characters.

Usage

Use this command to define rule expressions to match the URL for any Web protocol analyzer—HTTP, WAP1.X, WAP2.0.

Example

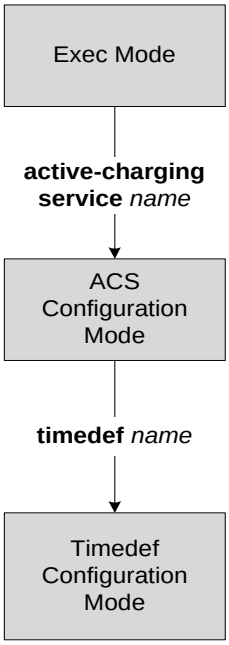
The following command defines a rule expression to match user traffic based on WWW URL *www.abc.com*:

```
www url = www.abc.com
```

Chapter 18
ACS Timedef Configuration Mode Commands

The ACS Timedef Configuration Mode enables configuring the Time-of-Day Activation/Deactivation feature.

Important: This configuration mode is only available in StarOS 8.1 and in StarOS 9.0 and later releases.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

start

This command allows you to configure timeslots in the current timedef.

Important: This command is only available in StarOS 8.1 and in StarOS 9.0 and later releases.

Important: A maximum of 24 timeslots can be specified within a timedef.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] start day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time` *`hh mm ss`* **`end day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time`** *`hh mm ss`*

`[ no ] start time` *`hh mm ss`* **`end time`** *`hh mm ss`*

`no`

If previously configured, removes the specified timeslot from the current timedef.

`start day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time` *`hh mm ss`* **`end day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } time`** *`hh mm ss`*

Specifies a timeslot with a start day and time, and an end day and time.

- **`start day`**: Specifies the start day and start time.
- **`end day`**: Specifies the end day and end time.
- **`time`** *`hh mm ss`*: Specifies the start/end time:
  - *`hh`*: Specifies the start/end hour, and must be an integer from 0 through 23.
  - *`mm`*: Specifies the start/end minute, and must be an integer from 0 through 59.
  - *`ss`*: Specifies the start/end second, and must be an integer from 0 through 59.

`start time` *`hh mm ss`* **`end time`** *`hh mm ss`*

Specifies a timeslot with a start time and an end time to be applicable for all days of the week.
In specifying the start/end time:

- *`hh`*: Specifies the start/end hour, and must be an integer from 0 through 23.
- *`mm`*: Specifies the start/end minute, and must be an integer from 0 through 59.
- *`ss`*: Specifies the start/end second, and must be an integer from 0 through 59.

Usage

Use this command to create timeslots in a timedef during which rules have to be active. Timedefs enable activation/deactivation of ruledefs/groups-of-ruledefs such that they are available for rule matching only when they are active.
When a packet is received, and a ruledef/group-of-ruledefs is eligible for rule matching, if a timedef is associated with the ruledef/group-of-ruledefs, before rule matching, the packet-arrival time is compared with the timeslots configured in the timedef. If the packet arrived in any of the timeslots configured in the associated timedef, rule matching is undertaken, else the next ruledef/group-of-ruledefs is considered.

Important: The time considered for timedef matching is the system's local time.

This release does not support configuring a timeslot for a specific date.
If in a timeslot, only the time is specified that timeslot will be applicable for all days.
If for a timeslot "start time" is after "end time", that rule will span midnight and be considered to be active from the current day until the next day.
If for a timeslot, "start day" is after "end day", that rule will span the current week until the end day in the next week.
In the following cases a rule will be active all the time:

- A timedef is not configured in an action priority
- A timedef is configured in an action priority, but the named timedef is not defined
- A timedef is defined but without timeslots

Example

The following command specifies a timeslot that starts on *Tuesday* at *09:00:00* and ends on *Friday* at *21:30:00*:

```
start day tuesday time 9 0 0 end day friday time 21 30 0
```

The following command specifies a timeslot that starts at *15:00:00* and ends at *17:00:00* on all days of the week:

```
start time 15 0 0 end time 17 0 0
```

The following command specifies a timeslot that starts on *Friday* at *22:00:00* and ends on *Tuesday* at *08:00:00*. This timeslot spans the complete week until the end day, up to *Tuesday*.

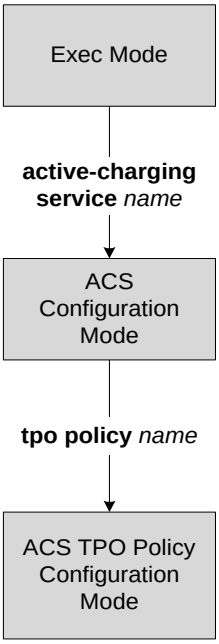
```
start day friday time 22 0 0 end day tuesday time 8 0 0
```

The following command specifies a timeslot that starts at *16:00:00* and ends at *09:00:00* on all days of the week. Also, as start time > end time, this timeslot spans midnight too (that is, from *16:00:00* to *23:59:59* and from *00:00:00* to *09:00:00*).

```
start time 16 0 0 end time 9 0 0
```

Chapter 19
ACS TPO Policy Configuration Mode Commands

The ACS TPO Policy Configuration Mode is used to configure Traffic Performance Optimization (TPO) policies.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

ad-filter

This command allows you to configure the bypass string for the Advertisement Filter feature.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

ad-filter ad-click-identity *bypass_string*

no ad-filter ad-click-identity

no

Removes the bypass string if previously configured.

bypass_string

Specifies the bypass string.
bypass_string must be an alphabetic string of 1 through 14 characters.

Important: The bypass string must consist of any of the following characters: "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ". Numeric and special characters are not accepted.

Usage

Use this command to configure the bypass string for the Advertisement Blocking with On-click feature. To enable retrieving a blocked advertisement requested by the subscriber, in the HTTP request the bypass string is added to the advertisement's URL, which TPO interprets and forwards to the Web Server allowing the advertisement to be retrieved.

Example

The following command configures the bypass string as *allow*:

```
ad-filter ad-click-identity allow
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

match-ad

This command allows you to define rules to match advertisements.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

match-ad priority *rule_priority* **tpo-ruledef** *tpo_ruledef_name*

no match-ad priority *rule_priority*

no

If previously configured, removes the specified TPO match-advertisement rule from the current TPO policy.

priority *rule_priority*

Specifies the priority of the TPO match-advertisement rule in the current TPO policy.
rule_priority must be an integer from1 through 65535, and must be unique in the current TPO policy.

tpo-ruledef *tpo_ruledef_name*

Specifies the TPO rule to add/remove from the current TPO policy.
tpo_ruledef_name must be the name of a TPO ruledef, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to define the rules to block advertisements.

Example

The following command creates a match-advertisement rule to use the TPO ruledef named *tporule1* with the priority *1*:

```
match-ad priority 1 tpo-ruledef tporule1
```

match-rule no-ruledef-match

This command allows you to specify the action to be taken when the traffic does not match any TPO ruledef.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

match-rule no-ruledef-match tpo { none | profile *tpo_profile_name* **}**

default match-rule no-ruledef-match

default

Configures this command with its default setting.
Default: **none**. No TPO profile is selected.

none

Specifies that no TPO profile be used.

profile *tpo_profile_name*

Specifies the TPO profile to use when there is no rule match.
tpo_profile_name must be the name of a TPO profile, and must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the action to be taken when the traffic does not match any TPO ruledef in the TPO policy.

Example

The following command specifies to use a TPO profile named *tpo_profile2* when the traffic does not match any TPO ruledefs in the TPO policy:

```
match-rule no-ruledef-match tpo profile tpo_profile2
```

match-rule priority

This command allows you to specify the TPO profile to use when the traffic matches a particular TPO ruledef/TPO group-of-ruledefs.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

match-rule priority *rule_priority* **{ tpo-group-of-ruledefs** *tpo_group_of_ruledefs_name* **| tpo-ruledef** *tpo_ruledef_name* **} tpo { none | profile** *tpo_profile_name* **} [description** *description* **]**

no match-rule priority *rule_priority*

no

Removes the specified match rule configuration.

match-rule priority *rule_priority*

Specifies priority of the rule within the TPO policy.
rule_priority must be an integer from1 through 65535, and must be unique in the current TPO policy.

tpo-group-of-ruledefs *tpo_group_of_ruledefs_name*

Important: The **tpo-group-of-ruledefs** option is available only in 12.2 and later releases.

Specifies the TPO group-of-ruledefs.
tpo_group_of_ruledefs_name must be the name of the TPO group-of-ruledefs, and must be an alphanumeric string of 1 through 63 characters.
If any of the ruledefs within a group-of-ruledefs match, that group-of-ruledefs is considered a match.

tpo-ruledef *tpo_ruledef_name*

Specifies the TPO rule.
tpo_ruledef_name must be the name of a TPO ruledef, and must be an alphanumeric string of 1 through 63 characters.

tpo { none | profile *tpo_profile_name* **}**

Specifies the TPO profile to be used.

- **none**: Specifies that no TPO profile be used.
- **profile** *tpo_profile_name*: Specifies the TPO profile to be used. *tpo_profile_name* must be the name of a TPO profile, and must be an alphanumeric string of 1 through 63 characters.

description *description*

Adds the specified description to this rule priority configuration.

description must be an alphanumeric string of 1 through 127 characters.

Usage

Important: A maximum of 2048 optimization rules can be configured in the system.

Use this command to specify the TPO profile to use when the traffic matches a particular TPO ruledef/TPO group-of-ruledefs in the TPO policy.
This CLI command can be entered multiple times to specify multiple rules and TPO profiles. The rules are examined in order of priority, until a match is found and the corresponding TPO profile is applied. Lower numbered priorities are examined first.

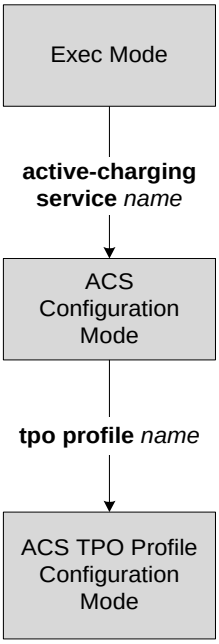
Example

The following command creates a rule match configuration to use the TPO profile named *tpoprofile1* when the traffic matches the TPO ruledef named *tporule1* with priority *1*:

```
match-rule priority 1 tpo-ruledef tporule1 tpo profile tpoprofile1
```

Chapter 20
ACS TPO Profile Configuration Mode Commands

The ACS TPO Profile Configuration Mode is used to configure Traffic Performance Optimization (TPO) profiles.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

http

This command allows you to configure the HTTP parameters.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

http { ad-filter display { no-text | text-only *text_only_string* **| text-with-click** *text_with_click_string* **} | compression | optimize-compressed-page | params { ad-filter display bgcolor** *bg_color_code* **| compression level** *compression_level* **| url-rewrite prefix** *url_rewrite_prefix* **} | prevent-server-compression | url-rewrite }**

default http { ad-filter display | compression | optimize-compressed-page | params { ad-filter display bgcolor | compression level | url-rewrite prefix } | prevent-server-compression | url-rewrite }

no http { compression | optimize-compressed-page | params ad-filter display bgcolor | prevent-server-compression | url-rewrite }

---

default

Configures this command with the default setting for the specified parameter.
Default:

- **ad-filter display**: none
- **compression**: Disabled
- **optimize-compressed-page**: Disabled
- **params**:
  - **ad-filter display bgcolor**: FFFFFF
  - **compression level**: 6
  - **url-rewrite prefix**: urlrewrite
- **prevent-server-compression**: Disabled
- **url-rewrite**: Disabled

---

no

Deletes TPO configuration for the specified parameter.

---

ad-filter display { no-text | text-only *text_only_string* **| text-with-click** *text_with_click_string* **}**

Enables HTTP Advertisement Filter, and configures the specified options:

- **no-text**: Blocks advertisements. Mobile client users see the “cannot display image” icon (usually an X mark) instead of a blocked advertisement. Users cannot view the blocked advertisements even if they want to.

- **text-only** *text_only_string*: Blocks advertisements. Mobile client users will see a placeholder frame instead of each blocked advertisement. Each placeholder frame contains the text specified here along with the advertisement's URL. Users cannot view the blocked advertisements even if they want to.

  text_only_string must be an alphanumeric string of 1 through 255 characters.

- **text-with-click** *text_with_click_string*: Blocks advertisements. Mobile client users will see a placeholder frame instead of each blocked advertisement. Each placeholder frame contains the text specified here along with the advertisement's URL. To view the blocked advertisements, users must click the placeholder frames.

  text_with_click_string must be an alphanumeric string of 1 through 255 characters.

---

compression

Enables HTTP compression for Web pages.
Default: Disabled

---

optimize-compressed-page

Enables uncompressing of compressed Web pages to apply other HTTP optimization techniques.
If the Web server responds to the mobile client with a compressed Web page, in order to apply other HTTP optimization techniques that maybe enabled, TPO can uncompress the Web page, apply the other HTTP optimizations, recompress the Web page, and then send it to the mobile client.
Default: Disabled

---

params { ad-filter display bgcolor *bg_color_code* **| compression level** *compression_level* **| url-rewrite prefix** *url_rewrite_prefix* **}**

Configures HTTP compression optimization parameters:

- **ad-filter display bgcolor** *bg_color_code*: For the HTTP Advertisement Filter feature, specifies color code for the advertisement placeholder frames' background.

  bg_color_code must be a string of 1 through 6 hexadecimal characters.

- **compression level** *compression_level*: Enables HTTP compression, and specifies the compression level.

  compression_level specifies the HTTP compression level, and must be an integer from 1 through 9. The higher the compression level, the better the compression but with a higher CPU and memory utilization.

  Default: 6

- **url-rewrite prefix** *url_rewrite_prefix*: Enables HTTP URL rewrite, and specifies the HTTP URL rewrite prefix.

  url_rewrite_prefix specifies the HTTP URL rewrite prefix, and must be an alphanumeric string of 8 through 32 characters.

  When embedded URLs are returned, they are replaced. For example, when "http://www.foo.com/xxx" is in the response, the URL is replaced with "http://ip-address/<url_rewrite_prefix>/www.foo.com/xxx". In this example, the DNS client resolves "www.foo.com" and puts that resolution as "ip-address". When the subscriber later does a GET, that request is modified as:

  URL: STRING/www.foo.com/xxx — will be changed to be just xxx

  Host: ip-address — will be changed to be "www.foo.com"

Default: urlrewrite

prevent-server-compression

Specifies TPO (to manipulate the HTTP request) to prevent server compression at the Web server.
TPO receives uncompressed data from the Web server, on which it can apply other HTTP optimization techniques, and then compresses and sends the data to the mobile client.
Default: Disabled

url-rewrite

Enables the URL Rewrite feature.
The URLs that are embedded in response pages are rewritten. This eliminates the need for the subscriber to perform DNS to resolve those URLs. See the **url-rewrite** option.
Default: Disabled

Usage

Use this command to configure TPO's HTTP parameters.

Example

The following command configures HTTP compression optimization parameter to level *3*:

```
http params compression level 3
```

p2p-detected

This command allows you to disable/continue TPO optimizations when a P2P flow is detected.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

```
p2p-detected { cease-tpo | continue-tpo }

default p2p-detected
```

default

Configures this command with its default setting.
Default: **continue-tpo**

cease-tpo

Specifies to disable TPO optimizations when a flow is detected as P2P.

Important: In this release, only TPO TCP optimizations are disabled. Disabling HTTP optimizations will be supported in a future release.

continue-tpo

Specifies to continue TPO optimizations when a flow is detected as P2P.

Usage

Use this command to disable/continue TPO optimizations when a P2P flow is detected.
While switching TPO profiles, if P2P flow is detected, TPO optimizations will be ceased/allowed based on the current TPO profile's configuration.

Example

The following command disables all TPO TCP optimizations when a P2P flow is detected:

```
p2p-detected cease-tpo
```

tcp

This command allows you to configure the TCP parameters.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

tcp { bandwidth { *bandwidth_kbps* | dynamic } | buffer-size { downlink | uplink } *buffer_size_kb* | congestion-control { basic | vegas | westwood-plus } | fast-retransmit-dupacks { *duplicate_acks* | dynamic } | handoff-optimization | initial-window { *initial_window* | dynamic bdp-percent *bdp_percent* | rfc5681 } | mss *mss* | pacing | rto { retrans-backoff { 1.0 | 1.5 | 2.0 } | rttvar-scaling *scaling_factor* } }

default tcp { bandwidth | buffer-size { downlink | uplink } | congestion-control | fast-retransmit-dupacks | handoff-optimization | initial-window | mss | pacing | rto { retrans-backoff | rttvar-scaling } }

no tcp { bandwidth | handoff-optimization | pacing }

---

no

Removes/disables the specified configuration.

---

default

Configures this command with the default setting for the specified parameter.
Default:

- **bandwidth**: No known bandwidth limit
- **buffer-size**:
  - **downlink**: 128 KB
  - **uplink**: 32 KB
- **congestion-control**: basic
- **fast-retransmit-dupacks**: 3
- **handoff-optimization**: Disabled
- **initial-window**: rfc5681
- **mss**: 536 bytes
- **pacing**: Disabled
- **rto**:
  - **retrans-backoff**: 2.0
  - **rttvar-scaling**: 2

bandwidth { *bandwidth_kbps* | dynamic }

Specifies bandwidth, which is used by TCP to optimize the data transfer rate.

- *bandwidth_kbps* specifies the maximum available bandwidth for a TCP flow, in kbps, and must be an integer from 1 through 100000.
- **dynamic** specifies the use of a value that is computed dynamically at runtime.

Default: No known bandwidth limit, same as **no tcp bandwidth** command.

buffer-size { downlink | uplink } *buffer_size_kb*

Specifies the socket send and receive buffer size for uplink/downlink traffic.

- **downlink**: Specifies the maximum amount of data that can be buffered inside TCP Proxy in downlink direction for each TCP connection. When the amount of data buffered in TCP Proxy in downlink direction reaches this limit, TCP Proxy sets receive window size in TCP header to 0 towards TCP server.
- **uplink**: Specifies the maximum amount of data that can be buffered inside TCP Proxy in uplink direction for each TCP connection. When the amount of data buffered in TCP Proxy in uplink direction reaches this limit, TCP Proxy sets receive window size in TCP header to 0 towards TCP client.

buffer_size_kb specifies the buffer size, in kilobytes, an must be an integer from 4 through 8192.

congestion-control { basic | vegas | westwood-plus }

Specifies the TCP congestion-control algorithm to use.

- **basic**: Use the basic TCP congestion-control algorithm.
- **vegas**: Use the Vegas TCP congestion-control algorithm.
- **westwood-plus**: Use the Westwood-plus TCP congestion-control algorithm.

Default: **basic**

fast-retransmit-dupacks { *duplicate_acks* | dynamic }

Specifies the number of duplicate ACKs required for fast retransmission.

- *duplicate_acks*: Specifies the number of duplicate ACKs that will trigger a fast-retransmit of the missing segment. After the specified number of duplicate ACKs is received, it is assumed that the segment was lost and is retransmitted.

  duplicate_acks must be an integer from 1 through 10. Default: 3

- **dynamic**:

  In 12.0 and earlier releases, this keyword dynamically changes the number of duplicate ACKs required for fast retransmission based on the number of in-flight packets (one-third of the in-flight packets, subject to a minimum of two). This helps to eliminate spurious retransmissions when packet reordering in the network is high.

In 12.2 and later releases, this keyword dynamically changes the number of duplicate ACKs required for fast retransmission based on the number of in-flight packets, and controls the actions taken on D-SACK detection. If the **dynamic** keyword is not configured, D-SACK detection takes place, but no action is taken.

Important: If the client does not support SACK, the behavior falls back to the behavior as described for earlier releases.

For information on D-SACK Support, refer to the *Traffic Performance Optimization Administration Guide*.

handoff-optimization

Enables handoff detection and relevant processing by TCP.
Default: Disabled

initial-window { *initial_window* | dynamic bdp-percent *bdp_percent* | rfc5681 }

Specifies the initial window size for a TCP session.

- *initial_window*: Specifies the initial-window as Maximum Segment Size (MSS), and must be an integer from 1 through 255.
- **dynamic bdp-percent** *bdp_percent*: Use a dynamically computed value at runtime, that is calculated as a percentage of bandwidth-delay product (BDP).

  bdp_percent must be an integer from 1 through 100.

  Bandwidth information is dynamically derived from the **bandwidth** command. The delay is calculated using the SYN-ACK exchange. If bandwidth information is not available, this configuration has no effect (behavior will be same as the default setting).
- **rfc5681**: Use a value recommended by RFC 5681, which will vary from 2 through 4 based on MSS.

Default: **rfc5681**

mss *mss*

Specifies the Maximum Segment Size (MSS), in bytes.
mss must be an integer from 248 through 65535.
Default: 536 bytes

pacing

Enables TCP Pacing.
Under some conditions (typically at the end of fast-recovery) a single ACK is received, which acknowledges huge amounts of data. Because of this, the sliding-window suddenly shifts to the right, causing the sender to burst huge amount of data into the network at one shot; this typically triggers a tail-drop (loss of series of packets) at the bottleneck router. Huge data bursts can also occur due to other factors, such as ACK compression. TCP Pacing causes the sender to evenly distribute the window of data over an entire round-trip time (RTT).
Default: Disabled

rto { retrans-backoff { 1.0 | 1.5 | 2.0 } | rttvar-scaling *scaling_factor* **}**

Specifies Retransmission Timeout (RTO) settings.

- **retrans-backoff { 1.0 | 1.5 | 2.0 }**

  Specifies the RTO back-off factor. Once retransmission timeout RTO fires for a packet, TCP will retransmit that packet and set the RTO to be a factor X, specified here, of the previous RTO.

  Default: 2.0

  - **1.0**: Use backoff factor 1.0.
  - **1.5**: Use backoff factor 1.5.
  - **2.0**: Use backoff factor 2.0.
- **rttvar-scaling** *scaling_factor*

Specifies the scaling factor for Round Trip Time Variation (RTTVAR).

The configured scaling factor is used as a power of 2, so values of 0 through 4 correspond to 1, 2, 4, 8, and 16. RTO is calculated in TCP using following formula:

RTO = SRTT + K*RTTVAR

where:

- SRTT = mean Round Trip Time (RTT)
- RTTVAR = Round Trip Time Variation

As wireless networks exhibit high RTT variation, the value of K is made configurable. The value of K decides the extent to which RTO timer depends on RTT variance. If RTT variance is higher, then K should be higher.

scaling_factor must be an integer from 0 through 4.

Default: 2

Usage

Use this command to configure TPO TCP parameters.

Example

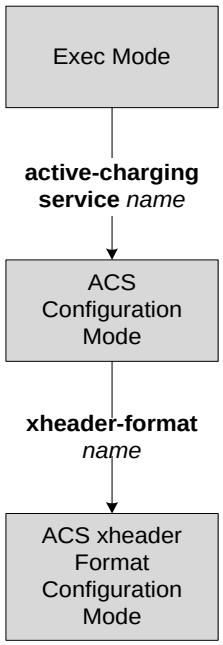
The following command configures the initial window size for a TCP session to *100*:

```
tcp initial-window 100
```

Chapter 21
ACS x-header Format Configuration Mode Commands

The ACS x-header Format Configuration Mode is used to create and configure extension-header (x-header) formats.

Important: This feature is license dependent. Please contact your Cisco sales representative for more information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

insert

This command allows you to configure the x-header fields to be inserted in HTTP/WSP GET and POST request packets.

Important: This command is license dependent. Please contact your Cisco accounts representative for more information.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

In StarOS 8.0:

insert *xheader_field_name* **{ string-constant** *xheader_field_value* **| variable { bearer { 3gpp charging-id | ggsn-address | imsi | radius-calling-station-id | sgsn-address | sn-rulebase | subscriber-ip-address } | http { host | url } }**

no insert *xheader_field_name*

In StarOS 8.1, StarOS 9.0, and later releases:

insert *xheader_field_name* **{ string-constant** *xheader_field_value* **| variable { bearer { 3gpp { apn | charging-characteristics | charging-id | imei | imsi | qos | rat-type | s-mcc-mnc | sgsn-address } | acr | customer-id | ggsn-address | mdn | msisdn-no-cc | radius-calling-station-id | session-id | sn-rulebase | subscriber-ip-address | username } [encrypt] | http { host | url } }**

no insert *xheader_field_name*

no

If previously configured, removes the specified x-header field configuration.

xheader_field_name

Specifies the x-header field name to be inserted in the packets.
xheader_field_name must be an alphanumeric string of 1 through 31 characters.
Up to ten fields can be inserted in each x-header format.

string-constant *xheader_field_value*

Specifies constant a string value for x-header field to be inserted in the packets.
xheader_field_value must be the x-header field value, and must be an alphanumeric string of 1 through 63 characters.

variable

Specifies name of the x-header field whose value must be inserted in the packets.

bearer { 3gpp { apn | charging-characteristics | charging-id | imei | imsi | qos | rat-type | s-mcc-mnc | sgsn-address } | acr | customer-id | ggsn-address | mdn | msisdn-no-cc | radius-calling-station-id | session-id | sn-rulebase | subscriber-ip-address | username } [encrypt]

Specifies value of x-header field to be inserted:

- **3gpp**: 3GPP service.
  - **apn**: APN of the bearer flow. This field is deprecated from under **bearer apn** and has been added within **bearer 3gpp apn**.
  - **charging-characteristics**: Charging characteristics of the bearer flow.
  - **charging-id**: Charging ID of the bearer flow.
  - **imei**: IMEI or IMEISV (depending on the case) associated with the bearer flow.
  - **imsi**: Specific Mobile Station Identification number.
  - **qos**: EPC QoS associated with the bearer flow.

    The inserted x-header is seen as:

    x-bearer-qos: 020400000100000002000000010000000200\r\n
  - **rat-type**: This field is deprecated from under **bearer rat-type** and has been added within **bearer 3gpp rat-type**.
  - **s-mcc-mnc**: 3GPP serving node MCC + MNC associated with the bearer.

    The inserted x-header is seen as: x-s-mcc-mnc: 123765\r\n
  - **sgsn-address**: SGSN associated with the bearer flow.
- **acr**: Anonymous Customer Reference. Only MSISDN part of this is encrypted, if encrypt flag is set.
- **customer-id**: Customer ID of the bearer.
- **ggsn-address**: GGSN IP address field.
- **imsi**: This field is deprecated from within **bearer imsi** and has been moved within **bearer 3gpp imsi**. The IMSI as added via **bearer 3gpp imsi**.
- **mdn**: MDN of the bearer flow.
- **msisdn-no-cc**: MSISDN of the mobile handling the flow without the country code.
- **radius-calling-station-id**: Calling Station ID of the mobile handling the flow. Use this for MSISDN of the mobile handling the flow with the country code.
- **session-id**: Accounting session ID of the bearer flow.
- **sn-rulebase**: Name of the ACS rulebase.
- **sgsn-address**: This field is deprecated from under **bearer sgsn-address** and has been moved within **bearer 3gpp sgsn-address**.
- **subscriber-ip-address**: Subscriber IP address.
- **username**: User name of the bearer flow.

encrypt: Specifies encryption of x-header field configuration. This option must only be configured when x-header encryption is enabled.

http { host | url }

Specifies value of the x-header field to be inserted:

- **host**: Host

- **url**: Uniform Resource Locator

Usage

Use this command to configure the x-header fields to be inserted in HTTP/WSP GET and POST request packets. The x-headers would be inserted at the end of the HTTP/WSP header. This CLI command may be used up to 10 times. There is no control over the order of the fields that are to be inserted. Any of the indicated ruledef variables may be inserted using the variable option, or a static string may be inserted using the string-constant option.
Operators may insert x-headers in some HTTP/WSP packets, for which some rules will be configured. The charging-action associated with these rules will contain the list of x-headers to be inserted in the packets.

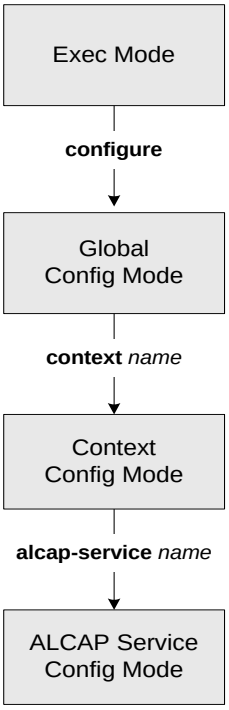
Example

The following command configures an x-header field named *test12* with a constant string value of *testing* to be inserted in HTTP/WSP GET and POST request packets:

```
insert test12 string-constant testing
```

Chapter 22
ALCAP Configuration Mode Commands

The ALCAP Service Configuration Mode is used to create, provide, and manage the Access Link Control Application Part (ALCAP) on HNB-GW to support IuCS-over-ATM connectivity to HNB subscriber in a 3G UMTS networks towards CS core network.



aal2-node

Thsi command creates/configures AAL2 node configuration to defined AAL2 node properties for IuCS-over-ATM fucntion.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

aal2-node *aal2_node_name* [**-noconfirm**]

no aal2-node *aal2_ndoe_name*

no

Removes the configured AAL2 node from ALCAP service configuration.

aal2_node_name

Identifies the name of the AAL2 node name to configure the AAL2 node paramters.
The *aal2_node_name* must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to create/configure the AAL2 node configuration and switch to AAL2 Node Configuration mode.
Entering this command results in the following prompt:
`[context_name]hostname(config-aal2-node-aal2_node_name)#`
A maximum of *TBD* AAL2 node can be configured in one ALCAP service.

Important: The AAL2 Node configured here will be used to bind with ATM port in PVC Configuration sub-mode of ATM Configuration mode for IuCS-over-ATM functionality.

Important: For more information on AAL2 node configuration, refer *AAL2 Node Configuration Mode Commands*.

Example

Following command creates AAL2 node configuration mode named *aal2_1* within the specific ALCAP service for IuCS-over-ATM support towards CS core networks and switch the user to AAL2 Node Configuration Mode named *aal2_1*:

aal2-node *aal2_node_name* **-noconfirm**

aal2-route

This command defines a route for each ATM Endpoint Service Address (AESA) with which it can have transport layer communication. This route actually maps an AESA to one or more AAL2 paths which will be used to setup an end to end communication path.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

aal2-route end-point {*AESA_address* | **default**} **aal2-node** *aal2_node_name*

no aal2-route end-point {*AESA_address* | **default**} [**aal2-node** *aal2_node_name*]

no

Removes defined AAL2 route from ALCAP service configuration.

end-point [*AESA_address* **| default]**

Specifies the AESA address in an ATM (or AAL2) network to map with adjacent AAL2 node. The AESA is based on the generic network service access point (NSAP) format. The ATM connection from HNB-GW terminates at this point.
The *AESA_address* must be an alpha/numeric string from 1 through 63 characters.
The **default** keyword is used to configure a default AAL2 route which will match any AESA received from MSC and for which AESA specific route is not configured. When a connection is established an AESA specific route will have higher priority than **default** route.

aal2-node *aal2_node_name*

Identifies the name of the AAL2 node name to configure in AAL2 route.
The *aal2_node_name* must be an alphanumerical string from 1 through 63 characters.

Usage

Use this command to create a mapping between ATM endpoint and adjacent node for AAL2 connection routing purposes.
It defines a route for each ATM Endpoint Service Address (AESA) with which it can have transport layer communication. This route actually maps an AESA to one or more AAL2 paths which will be used to setup an end to end communication path.
The **default** keyword can be used to configure a default **aal2-route** which will match any AESA received from MSC and for which AESA specific route is not configured. When a connection is established an AESA specific route will have higher priority than default route.

Important: The default route shall not be used when AESA specific route exists.

If an HNB-GW configured with a route for *MGW1* which consists of *AAL2_path_A* and *AAL2_path_B* for **AAL2 switch-A** and **AAL2 switch-B** switch respectively then similarly **AAL2 switch-A** and **AAL2 switch-B** need to be configured with routes for *MGW1*.

A maximum of *TBD* AAL2 routes can be configured in one ALCAP service.

Example

Following command create a mapping between ATM endpoint *MGW1* and AAL2 node *aal2_1* for AAL2 connection routing purposes:

```
aal2-route end-point MGW1 aal2-node aal2_1
```

associate

This command associates a previously configured SS7 routing domain with this ALCAP service on HNB-GW node which will be used to define the SS7 routing domain in 3G UMTS networks.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

associate ss7-routing-domain *ss7_rd_id*

no associate ss7-routing-domain

no

Removes the associated SS7 routing domain id from this ALCAP service configuration.

ss7_rd_id

Identifies the SS7 routing domain index configured in Global configuration mode to associate with ALCAP service for IuCS-over-ATM support.
The *ss7_rd_id* must be an integer from 1 through 12.

Important: For SS7 routing doman configuration, refer *SS7 Routing Domain Configuration Commands Mode* chapter.

Usage

Use this command to associate a preconfigured SS7 routing domain index to provide IuCS-over-ATM support towards CS core network for HNB subscriber.
A maximum of *TBD* SS7 routing domains can be configured in one ALCAP service.

Example

Following command associates a predefined SS7 routing domain id *3* with ALCAP service to define routing domain for IuCS-over-ATM supprot towards CS core networks:

```
associate ss7-routing-domain 3
```

end

Exits the current mode and returns to the Exec Mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous mode.

maximum reset-retransmission

This command sets the maximum number of retries allowed for transmission of RESET message to reset the AAL2 path.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

maximum reset-retransmissions *retries*

default maximum reset-retransmissions

default

Sets the number of RESET meesage retries to default value of 1.

retires

Sets the maximum number of retries allowed for transmission of RESET message to reset the AAL2 path by ALCAP service.
retries must be an integer value from 0 through 4. When 0 is used retransmission will be disabled.
Default: 1

Usage

Use this command to sets the maximum number of retries allowed for transmission of RESET message by ALCAP service to reset the AAL2 path when **Timer_RES** expires. Once the maximum number of RESET retries have been performed the ALCAP service shall stop the RESET procedure for the affected path and path will become available for connections.

Example

The following command configures ALCAP service to send maximum number of *2* RESET messages after expiry of RESET timer for AAL2 path RESET procedure:

```
maximum reset-retransmissions 2
```

self-point-code

This command specifies the SS7 point code address for ALCAP service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

self-point-code *point_code*

no self-point-code

no

Deletes the configured self point code for this ALCAP service.

point_code

Defines the point code to assign to this ALCAP service.
point_code: value entered must adhere to the point code variant selected when the ALCAP service instance was defined:

- ITU Range 0.0.1 to 7.255.7
- ANSI Range 0.0.1 to 255.255.255
- TTC Range 0.0.1 to 15.31.255
- a string of 1 to 11 combined digits and period.

Usage

Use this command to assign the self point code to use for this ALCAP service.

Example

The following command sets an ITU-based point code for this ALCAP service:

```
self-pointcode 4.121.5
```

The following command removes the configured self-point code:

```
no self-pointcode
```

timeout alcap

This command configures the timeout duration for various ALCAP procedure timers in ALCAP service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

timeout alcap {**blo** *blo_timer_value* | **erq** *erq_timer_value* | **mod** *mod_timer_value* | **rel** *rel_timer_value* | **res** *res_timer_value* | **ubl** *ubl_timer_value*}

default timeout alcap {**blo** | **erq** | **mod** | **rel** | **res** | **ubl**}

default

Sets the timer values to default duration for specific ALCAP procedure in an ALCAP service.

blo *blo_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Path Block procedure. When a request to block a particular AAL2 path is recieved by ALCAP service, the ALCAP service sends ALCAP-BLOCK-REQEST message to AAL2 node/peer ALCAP Manage and starts **Timer_BLO** timer. The timer waits for specified timeout duration *blo_timer_value* for ALCAP-BLOCK-CONFRIM message before reporting error in procedure.
If AAL2 Node responds with ALCAP-BLOCK-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
blo_timer_value must be an integer value from 2 through 60.
Default: 5

erq *erq_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Establish Request procedure. When a request to esblish a connection through ALCAP-ESTABLISH-REQUEST message is sent to AAL2 node the system starts the **Timer_ERQ** timer. The timer waits for specified timeout duration *erq_timer_value* for ALCAP-ESTABLISH-CONFRIM message before reporting error in procedure and system requests ALCAP Manager to free the AAL2-channel used for connection and also indicates to start the RESET procedure for this channel.
If AAL2 Node responds with ALCAP-ESTABLISH-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
erq_timer_value must be an integer value from 5 through 30.
Default: 5

mod *mod_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Modify Request procedure. When a request to modify a connection or channel through ALCAP-MODIFY-REQUEST message is sent to AAL2 node the system starts the **Timer_MOD** timer. The timer waits for specified timeout duration *mod_timer_value* for ALCAP-MODIFY-CONFRIM message before reporting error in procedure and system requests ALCAP Manager to initiates the RESET or

any other appropriate procedure for this channel and HNB-GW shall release the RUA connection towards HNB and SCCP connection towards CN.
If AAL2 Node responds with ALCAP-MODIFY-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
mod_timer_value must be an integer value from 5 through 30.
Default: 5

---

rel *rel_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Release Request procedure. When a request to release a connection or channel through ALCAP-RELEASE-REQUEST message is sent to AAL2 node the system starts the **Timer_REL** timer and sends RAB-ASST-REQ to HNB. The timer waits for specified timeout duration *rel_timer_value* for ALCAP-RELEASE-CONFRIM message before reporting error in procedure and system requests ALCAP Manager to release the AAL2 channel. System also indicates to start RESET procedure for this channel.
If AAL2 Node responds with ALCAP-RELEASE-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
rel_timer_value must be an integer value from 2 through 60.
Default: 2

---

res *res_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Reset Request procedure. When a request to reset a connection or channel through ALCAP-RESET-REQUEST message is sent to AAL2 node the system starts the **Timer_RES** timer. The timer waits for specified timeout duration *res_timer_value* for ALCAP-RESET-CONFRIM message before retrying the RESET procedure. The system will retry the RESET procedure for configured number of times and on completion of retry limit the stops the RESET procedure for the affected path and path will become available for connections.
If AAL2 Node responds with ALCAP-RESET-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
res_timer_value must be an integer value from 2 through 60.
Default: 2

---

ubl *ubl_timer_value*

Specifies the maximum time, in seconds, the system waits for response from adjacent AAL2 node before reporting the failure of AAL2 Path UnBlock procedure. When a request to unblock a particular AAL2 path is recieved by ALCAP service, the ALCAP service sends ALCAP-UNBLOCK-REQEST message to AAL2 node/peer ALCAP Manager and start **Timer_BLO** timer. The timer waits for specified timeout duration *ubl_timer_value* for ALCAP-UNBLOCK-CONFRIM message before reporting error in procedure.
If AAL2 node/peer ALCAP Manager responds with ALCAP-BLOCK-CONFRIM message the timer will stop before the expiry of timeout duration and system reports the successful completion of the procedure.
ubl_timer_value must be an integer value from 2 through 60.
Default: 2

Usage

Use this command to configure the timeout duration for various ALCAP procedures in ALCAP service.

Example

The following command sets the timeout duration of 10 seconds for ALCAP-MODIFY-REQUEST procedure:

timeout alcap mod *10*

timeout stc

This command configures the timeout duration for STC long (T30) and and STC short (T29) timers used in congestion indication procedure at Signaling Transport Converter (STC) layer in ALCAP service.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

timeout stc {**long** *long_timer_value* | **short** *short_timer_value*}

default timeout stc {**long** | **short**}

default

Sets the timer values to default duration for specific STC procedure in an ALCAP service.

long *long_timer_value*

Specifies the duration in millinseconds for STC long timer. This timer is used by the congestion indication procedure. Receipt of a repeated congestion indication from MTP3B before the expiry of this timer is interpreted as the congestion situation. On the other hand, if no congestion indication is received from MTP3B before expiry of this timer, the congestion situation is considered to have improved.
long_timer_value must be an integer value from 5000 through 10000.
Default: 5000

short *short_timer_value*

Specifies the duration in millinseconds for STC short timer. This timer is used by the congestion indication procedure. The role of this timer is to avoid overreacting if multiple congestion indications are received from MTP3B in quick succession.
short_timer_value must be an integer value from 300 through 600.
Default: 300

Usage

Use this command to configure the long (T30) and short (T29) timer for congestion indication procedure in ALCAP service.
When the first congestion indication is received by, the traffic load into the affected destination point code is reduced and the same time two timers STC short timer (T29) and STC long timer (T30) are started. During STC short timer all received congestion indications for the same destination point code are ignored in order not to reduce traffic too rapidly. Reception of a congestion indication after the expiry of STC short timer, but still during STC long timer, will decrease the traffic load by one more step and restart both the timers again. If STC long timer expires (i.e. no congestion indications having been received during the STC long timer period), traffic will be increased by one step and STC long timer will be restarted unless full traffic load has been resumed.

Example

The following command sets the timeout duration of 5000 milliseconds for STC long timer:

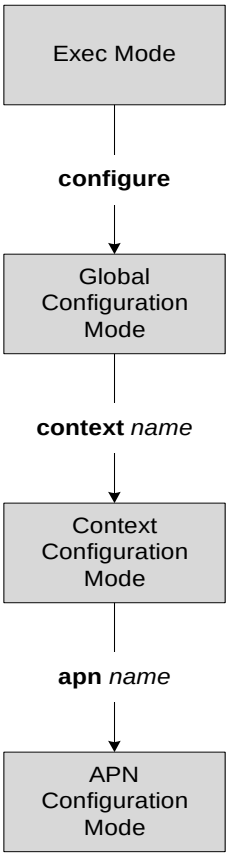
```
default timeout stc long
```

The following command sets the timeout duration of 300 milliseconds for STC short timer:

```
default timeout stc short
```

Chapter 23
APN Configuration Mode Commands

The Access Point Name (APN) Configuration Mode is used to create and configure APN profiles within the current system context of a UMTS/LTE service.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

aaa

This command configures Authentication, Authorization, and Accounting (AAA) functionality at the Access Point Name (APN) level.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

aaa { **group** *aaa_group_name* | **secondary-group** *aaa_group_name* }

default aaa { **group** | **secondary-group** *aaa_group_name* }

no aaa { **group** *aaa_group_name* | **secondary-group** }

no aaa

Disables the specified AAA group for the specific APN.

no aaa { group | secondary-group }

- **group**: Uses the default AAA group.
- **secondary-group**: Removes the secondary AAA group from the APN's configuration.

default aaa { group | secondary-group }

Configures the default setting for the specified parameter.

- **group**: Uses the default AAA group—the one specified at the context level or in the APN template.
- **secondary-group**: Removes the secondary AAA group from the APN configuration.

aaa_group_name

Specifies the AAA server group for the APN as an alphanumeric string of 1 through 63 characters.

secondary-group *aaa_group_name*

Specifies the secondary AAA server group for the APN. *aaa_group_name* must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure AAA functionality at the APN level.
Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual server group for APNs in that context. Each server group consists of a list of AAA servers for each AAA function (accounting, authentication, charging, etc.).
The AAA secondary server group supports the RADIUS Fire-and-Forget feature in conjunction with GGSN for secondary accounting (with different RADIUS accounting group configuration) to the RADIUS servers without expecting acknowledgement from the server, in addition to standard RADIUS accounting. This secondary accounting will be an exact copy of all the standard RADIUS accounting message (RADIUS Start / Interim / Stop) sent to the standard AAA RADIUS server.

If the same AAA group is configured with both the **aaa group** *aaa_group_name* and the **aaa secondary-group** *aaa_group_name* commands, then this configuration will have no effect and secondary accounting will not happen.
The AAA secondary server group configuration takes effect only when used with APN accounting-mode set to radius-diameter (or) with mediation-acct enabled. The RADIUS accounting triggers for both standard RADIUS accounting and secondary accounting will be taken from the AAA group configured with the **aaa group** *aaa_group_name* command. On the fly change of this configuration is not supported. Any change to the configuration will have effect only for new calls.

Example

The following command applies the AAA server group *star1* to an APN within the specific context:

```
aaa group star1
```

access-link

Configures IP fragmentation processing over the Access-link (PPP, GTP etc.).

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
access-link ip-fragmentation { normal | df-ignore | df-fragment-and-icmp-notify }

default access-link ip-fragmentation
```

normal

Default: Enabled
Drops the packet and sends an ICMP unreachable message to the source of packet. This is the default behavior.

df-ignore

Default: Disabled
Ignores the DF (Don’t Fragment) bit setting; fragments and forwards the packet over the access link.

df-fragment-and-icmp-notify

Default: Disabled
Partially ignorse the DF bit; fragments and forwards the packet, but also returns an ICMP error message to the source of the packet. The number of ICMP errors sent like this is rate-limited to one ICMP error packet per second per session.

Usage

If the IP packet to be forwarded is larger than the access-link MTU and if the DF (Don't Fragment) bit is set for the packet, then the fragmentation behavior configured by this command is applied. Use this command to fragment packets even if they are larger than the access-link MTU.
Fragmentation may also occur for other reasons, regardless of whether or not fragmentation is performed because of one of the above reasons.
Payloads are encapsulated within IP/UDP/GTP before being sent to the SGSN. If that encapsulation causes the packet to exceed 1500 bytes, the inner IP payload is fragmented (even if it's not considered too-large by the above tests) into two payloads (if the DF bit is not set). If the DF bit is set (and access-link ip-fragmentation normal is configured), the system performs IP fragmentation of the entire packet (i.e., IP fragmentation in the outer IP header) rather than fragmenting the inner IP payload. Either way, the result is two packets, but in one case the MS would have to perform IP reassembly while in the other case the SGSN would have to perform reassembly.

Example

Set fragmentation so that the DF bit is ignored and the packet is forwarded anyway by entering the following command:

```
access-link ip-fragmentation df-ignore
```

accounting-mode

Configures the protocol to be used for PDP context accounting by this APN.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
accounting-mode { gtpp | none | radius-diameter [ no-interims ] [ no-early-pdus ] }

default accounting-mode
```

default

Restores the command to its default setting.

gtpp

Configures the APN to use GPRS Tunneling Protocol Prime for accounting purposes. If used, accounting will begin as soon as the PDP context is established. This is the default setting. Default: Enabled

Important: The system's GTPP parameters must be configured prior to using this protocol for accounting. Refer to the **gtpp** commands in the *Context Configuration Mode Commands* chapter.

none

Disables accounting for PDP contexts using this APN.
When accounting mode is set to none, it indicates to the GTP stack at session manager to not generate the regular GTPP accounting triggers. Default: Disabled.

radius-diameter

Configures the APN to use RADIUS/Diameter protocol for accounting purposes. Default: Disabled

Important: The system's RADIUS/Diameter accounting parameters must be configured prior to using either of the protocols for accounting. Refer to the **radius**/**diameter** commands in the *Context Configuration Mode Commands* and the *AAA Server Group Configuration Mode Commands* chapters.

no-early-pdus

Configures the GGSN to discard user traffic once the buffer is full until the RADIUS server has returned a response to the GGSN's accounting START request per 3GPP standards.
Configures the GGSN to delay PDUs from/to MS until the RADIUS server returns a response to the GGSN's accounting START request as per 3GPP standards. The GGSN buffers up to two PDUs per call. Additional PDUs disable the queuing. On receiving the Accounting response message, the GGSN forwards all the subsequent PDUs for that call.

Important: For StarOS 10.0 and earlier releases, the system buffers up to four PDUs and queues or discards the remaining PDUs.

Important: For StarOS 11.0 and later releases, the system is configured so that none of the PDUs are discarded.

no-interims

Disables the generation of RADIUS interims per APN.
When configured, RADIUS interim updates for this APN will not be sent, regardless of what is configured in the context that is used for RADIUS accounting.

Important: Different CLI commands are used to disable RADIUS interims for RADIUS accounting and mediation accounting. To disable RADIUS interims for RADIUS accounting, use the following command: **accounting-mode radius-diameter no-interims**. To disable RADIUS interims for mediation accounting, use the following command: **mediation-device context-name** *context_name* **no-interims**.

Usage

This command specifies which protocol, if any, will be used to provide accounting for PDP contexts accessing the APN profile.
When the GTPP protocol is used, accounting messages are sent to the charging gateways (CGs) over the Ga interface. The Ga interface and GTPP functionality are typically configured within the system's source context. As specified by the standards, a CDR is not generated when a session starts - CDRs are generated according to the interim triggers (configured using the **cc** command in the GGSN service configuration mode) and a CDR is generated when the session ends. For interim accounting, STOP/START pairs are sent based on configured triggers.
GTPP version 2 is always used. However, if version 2 is not supported by the CGF, the system reverts to using GTPP version 1. All subsequent CDRs are always fully-qualified partial CDRs. All CDR fields are R4.
If the **radius-diameter** option is used, either the RADIUS or the Diameter protocol is used as configured in the Context Configuration mode or the AAA Server Group Configuration mode.
If the RADIUS protocol is used, accounting messages can be sent over a AAA interface or the Gi to the RADIUS server. The AAA or Gi interface(s) and RADIUS functionality are typically configured with the system's destination context along with the APN. RADIUS accounting begins immediately after an IP address is allocated for the MS. Interim accounting can be configured using the **radius accounting interim interval**. The **radius accounting interim interval** command sends INTERIM-UPDATE messages at specific intervals.
Keywords to this command can be used in combination to each other, depending on configuration requirements.

Important: If the accounting type in the APN is set to 'none' then G-CDRs will not be generated. If accounting type is left as default "GTPP" and "billing-records" are configured in the ACS Rulebase Configuration Mode, then both G-CDRs and eG-CDRs would be generated.

Example

The following command configures the APN to use the RADIUS/Diameter protocol for accounting:

```
accounting-mode radius-diameter
```

```
accounting-mode radius-diameter no-interims no-early-pdus
```

```
accounting-mode radius-diameter no-early-pdus no-interims
```

active-charging bandwidth-policy

Configures the bandwidth policy to be used for subscribers who use this APN.

Product

GGSN, ECS

Privilege

Security Administrator, Administrator

Syntax

active-charging bandwidth-policy *bandwidth_policy_name*

[**default** | **no**] **active-charging bandwidth-policy**

default

Configures the default setting.
Default: The default bandwidth policy configured in the rulebase is used for subscribers who use this APN.

no

Disables bandwidth control for the APN.

bandwidth-policy *bandwidth_policy_name*

Specifies the bandwidth policy name. *bandwidth_policy_name* must be an alphanumeric string from 1 through 63 characters.

Usage

Use this command to configure bandwidth policy to be used for subscribers who use this APN.

Example

The following command configures a bandwidth policy named *standard* for the APN:

```
active-charging bandwidth-policy standard
```

active-charging link-monitor tcp

Enables the TCP link monitoring feature on the Mobile Video Gateway. This command can be configured in either APN Configuration Mode or Subscriber Configuration Mode.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] active-charging link-monitor tcp [ log [ rtt [ histogram | time-series ] [ bitrate [ histogram | time-series ] ] | bitrate [ histogram | time-series ] [ rtt [ histogram | time-series ] ] ] ] [ -noconfirm ]
```

default

Sets TCP link monitoring to its default value, which is the same as **no**.

no

Deletes the TCP link monitoring settings and disables TCP link monitoring if previously configured.

link-monitor tcp

Enables the TCP link monitoring feature on the Mobile Video Gateway. Note that TCP link monitoring is not enabled by default. Also note that when this command is configured without the **log** option, TCP link monitoring is enabled without logging, and the output from TCP link monitoring is only used by the dynamic translating feature.

log [rtt [histogram | time-series] [bitrate [histogram | time-series]] | bitrate [histogram | time-series] [rtt [histogram | time-series]]]

This option enables statistical logging for TCP link monitoring.
The **rtt** option can be used to enable either **histogram** or **time-series** logging for RTT.
Similarly, the **bitrate** option can be used to enable either **histogram** or **time-series** logging for bit rate.
When **rtt** and **bitrate** options are used without additional options, histogram and time-series logging are enabled for RTT and/or bit rate respectively.

-noconfirm

Specifies that the command must execute without prompting for confirmation.

Usage

Use this command to enable TCP link monitoring on the Mobile Video Gateway.

Examples

The following command enables TCP link monitoring with statistical logging, with histogram and time-series logging enabled for both RTT and bit rate:

```
active-charging link-monitor tcp log
```

The following command enables TCP link monitoring with statistical logging, with histogram and time-series logging enabled for RTT:

```
active-charging link-monitor tcp log rtt
```

The following command enables TCP link monitoring with statistical logging, with histogram logging enabled for RTT:

```
active-charging link-monitor tcp log rtt histogram
```

The following command enables TCP link monitoring with statistical logging, with histogram logging enabled for RTT and time-series logging enabled for bit rate:

```
active-charging link-monitor tcp log rtt histogram bitrate time-series
```

active-charging rulebase

Specifies the name of the Active Charging Service (ACS) rulebase to be used for subscribers who use this APN.

Product

GGSN, ECS, P-GW, MVG

Privilege

Security Administrator, Administrator

Syntax

active-charging rulebase *rulebase_name*

no active-charging rulebase

no

Removes the rulebase previously configured for this APN.

rulebase_name

Specifies the name of the ACS rulebase as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the ACS rulebase to be used for subscribers who use the APN.

Example

The following command specifies the ACS rulebase named *rule1* for the APN:

```
active-charging rulebase rule1
```

apn-ambr

Configures the Aggregated Maximum Bit Rate (AMBR) for all PDNs using this APN.

Product

P-GW

Privilege

Administrator

Syntax

apn-ambr rate-limit direction { downlink | uplink } [burst-size { auto-readjust duration *seconds* **|** *bytes* **} | violate-action { drop | lower-ip-precedence | shape [transmit-when-buffer-full] | transmit }]**

[default | no] apn-ambr rate-limit direction { downlink | uplink }

default

Returns the selected command to it's default setting of no APN-AMBR.

no

Disables the selected command.

rate-limit direction { downlink | uplink }

Specifies that the rate limit is to be applied to either the downlink (network to subscriber) traffic or the uplink (subscriber to network) traffic.
downlink: Applies the AMBR parameters to the downlink direction.
uplink: Applies the AMBR parameters to the uplink direction.

burst-size { auto-readjust duration *seconds* **|** *bytes***}**

This parameter is used by policing and shaping algorithms to permit short bursts of traffic in order to not exceed the allowed data rates. It is the maximum size of the token bucket.
auto-readjust duration *seconds*: The duration (in seconds) used in this burst size calculation: burst size = peak data rate/8 * auto-readjust duration
seconds must be an integer value from 1 to 30. Default is 1 second
bytes: Specifies the burst size in bytes allowed by this APN for the associated PDNs. It must be an integer from 1 to 4294967295 (1 byte to 4 GB).

violate-action { drop | lower-ip-precedence | shape [transmit-when-buffer-full] | transmit }

The action that the P-GW will take when the data rate of the bearer context exceeds the AMBR.
drop: Drops violating packets.
lower-ip-precedence: Sets the DSCP value to zero ("best effort") for violating packets.
shape [transmit-when-buffer-full]: Places all violating packets into a buffer and, optionally, transmits the packets when the buffer is full.

Important: The **shape** keyword and optional **transmit-when-buffer-full** are only available in StarOS v12.0 and earlier releases. P-GW does not currently support traffic shaping for APN-AMBR.

transmit: Transmits violating packets. This is the default setting.

Usage

Use this command to enforce the AMBR for the APN on bearers that do not have a Guaranteed Bit Rate (GBR).

Example

The following command sets the downlink burst rate to use an auto-readjust duration of 2 seconds and lowers the IP precedence of violating packets:

```
apn-ambr rate-limit direction downlink burst-size auto-readjust duration
2 violate-action lower-ip-precedence
```

associate accounting-policy

Associates the APN with specific pre-configured policies configured in the same context.

Product

P-GW

Privilege

Administrator

Syntax

`[ no ] associate accounting-policy` *`name`*

`no`

Removes the selected association from this APN.

`name`

Associates the P-GW APN with an accounting policy configured in the same context. *`name`* must be an existing accounting policy expressed as a string of 1 through 63 characters.
Accounting policies are configured through the **`policy accounting`** command in the Context Configuration mode.

Usage

Use this command to associate the P-GW APN with an accounting policy configured in this context.

Example

The following command associates this P-GW APN with an accounting policy called *`acct1`*:

```
associate accounting-policy acct1
```

authentication

Configures the APN's authentication parameters.

Product

GGSN, P-GW, PDG

Privilege

Security Administrator, Administrator

Syntax

authentication [[**msid-auth** | **imsi-auth** [**password-use-pco** | **username-strip-apn** | **prefer-chap-pco**] | **msisdn-auth** [**password-use-pco** | **username-strip-apn** | **prefer-chap-pco**] | **eap initial-access-request** [**authenticate-authorize** | **authenticate-only**] | [**allow-noauth**] [**chap** *preference* [**convert-to-mschap**]] [**mschap** *preference*] [**pap** *preference*]]

default authentication

default

Sets the default authentication type for this APN. By default **allow-noauth** is the type for authentication for an APN.

msid-auth

Obsolete. Use **imsi-auth**.

imsi-auth

Default: Disabled.
Configures the APN to attempt to authenticate the subscriber based on their International Mobile Subscriber Identification (IMSI) number.

msisdn-auth

Default: Disabled.
Configures the APN to attempt to authenticate the subscriber based on their Mobile Station International Integrated Services Digital Network (MSISDN) number as described in the *Usage* section of this command.

username-strip-apn

Default: Disabled.
This keyword if enabled, either with **msisdn-auth** or **imsi-auth** strips the APN name from the user name *msisdn@apn* or *imsi@apn* received from AAA and makes the user name as *msisdn* or *imsi* respectively.

password-use-pco

Default: Disabled.
This keyword, if enabled, uses the password received through Protocol Configuration Options (PCO) from AAA for authentication.

prefer-chap-pco

Default: Disabled.

If this keyword along with msisdn-auth/imsi-auth is enabled, GGSN performs Challenge Handshake Authentication Protocol (CHAP) authentication, if CHAP parameters are received in Protocol Configuration Options (PCO). However, chap username would be constructed as *msisdn@apn* / *imsi@apn* and chap challenge, chap response parameters should be used as it is from CHAP parameters received in the PCO IE. If CHAP parameters are not received in the PCO IE of the CPC Request, GGSN does normal Password Authentication Protocol (PAP) authentication with PAP username as *msisdn@apn* / *imsi@apn* (ignoring any PAP username if received).

---

eap initial-access-request

Default: Enabled
Configures the type of initial access request to be used in Diameter EAP (Extensible Authentication Protocol) request. This feature is applicable to only Diameter-based AAA interface and not applicable to RADIUS or any other type of AAA interface.

---

authenticate-authorize

Default: Enabled
Configures the "authenticate and authorize" type of initial access request to be used in a Diameter EAP request.

---

authenticate-only

Default: Disabled
Configures the "authenticate only" type of initial access request to be used in a Diameter EAP request.

---

allow-noauth

Default: Enabled
Configures the APN to not perform authentication for PDP contexts as described in the *Usage* section.

---

chap *preference*

Default: Disabled
Configures the APN to attempt to use CHAP to authenticate the subscriber as described in the *Usage* section of this command.
A *preference* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. It must be an integer from 1 through 1000. The lower the integer, the higher the preference.

---

convert-to-mschap

Default: Disabled
If enabled, the CHAP parameters received with the length of 49 bytes, the AAAmgr converts it to MSCHAP.

---

mschap *preference*

Default: Disabled
Configures the APN to attempt to use the Microsoft Challenge Handshake Authentication Protocol (MSCHAP) to authenticate the subscriber as described in the *Usage* section of this command.
A *preference* can be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. It must be an integer from 1 through 1000. The lower the integer, the higher the preference.

pap *preference*

Default: Disabled
Configures the APN to attempt to use PAP to authenticate the subscriber as described in the *Usage* section of this command.
A *preference* must be specified in conjunction with this option. Priorities specify which authentication protocol should be attempted first, second, third and so on. It must be an integer from 1 through 1000. The lower the integer, the higher the preference.

Usage

Use this command to specify how the APN profile should handle PDP context authentication and what protocols to use (if any). The ability to configure this option is provided to accommodate the fact that not every MS will implement the same authentication protocols.
The authentication process varies depending on whether the PDP context is of type IP or PPP. Table given in this section describes these differences.
For IP PDP contexts, the authentication protocol and values will be passed from the SGSN as Protocol Configuration Options (PCOs) within the create PDP context PDU to the GGSN. The GGSN requires that the authentication protocol is specified by this command (with no regard to priority) and will use this information to authenticate the subscriber.

Table 6. Authentication Process Variances Between PDP Context Type

Authentication Mechanism	IP PDP Context Behavior	PPP PDP Context Behavior
allow-noauth	Allows the session even if the PCOs do not match any of the configured algorithms. If the there was no match and the **aaa constructed-nai authentication** parameter is enabled in the authentication context, the system attempts to determine a subscriber profile (via PAP with no password) using the subscriber's MSISDN as the username.	Allows the session with no authentication algorithm selected. If the **aaa constructed-nai authentication** parameter is enabled in the authentication context, the system attempts to determine a subscriber profile (via PAP with no password) using the subscriber's MSISDN as the username.
chap	If also specified in the PCOs, this protocol will be used to authenticate the subscriber.	Attempts this protocol according to its configured priority. If accepted by the remote end of the PPP connection, this protocol will be used to provide authentication.
mschap	If also specified in the PCOs, this protocol will be used to authenticate the subscriber.	Attempts this protocol according to its configured priority. If accepted by the remote end of the PPP connection, this protocol will be used to provide authentication.
pap	If also specified in the PCOs, this protocol will be used to authenticate the subscriber. If this protocol is used is specified and the **allow-noauth** parameter is disabled, the system will attempt to use the APN's default username/password specified by the **outbound** command for authentication via PAP.	Attempts this protocol according to its configured priority. If accepted by the remote end of the PPP connection, this protocol will be used to provide authentication.
msid-auth	Obsolete. Use **imsi-auth**.	Obsolete. Use **imsi-auth**.

Authentication Mechanism	IP PDP Context Behavior	PPP PDP Context Behavior
imsi-auth	Values in the PCOs are ignored. The subscriber's IMSI is used as the username for PAP authentication. No password is used.	The subscriber's IMSI is used as the username for PAP authentication. No password is used.
msisdn-auth	Values in the PCOs are ignored. The subscriber's MSISDN is used as the username for PAP authentication. No password is used.	Option not available.

Example

The following command would configure the system to attempt subscriber authentication first using MSCHAP, then CHAP, and finally PAP. Since the **allow-noauth** command was also issued, if all attempts to authenticate the subscriber using these protocols fail, then the subscriber would be still be allowed access.

```
authentication mschap 1 chap 2 pap 3 allow-noauth
```

To enable **imsi-auth** or **msisdn-auth**, the following command instances must be issued:

```
authentication imsi-auth
```

```
authentication msisdn-auth
```

bearer-control-mode

Enables or disables the bearer control mode for network controlled QoS (NCQoS) through this APN. It also controls the sending of an IE in GTP messages.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
bearer-control-mode [ mixed | ms-only | none [ prefer-local-value ] ]

default bearer-control-mode
```

default

Sets the bearer control mode to default mode of "none".

mixed

Default: Disabled.
This keyword indicates that the bearer will be controlled by User Equipment (UE) and network side (from GGSN) as well.
To enable network controlled QoS this option must be enabled.

ms-only

Default: Disabled.
This keyword indicates that the bearer will be controlled by the UE side.

none

Default: Enabled.
This keyword indicates that the system will not send any BCM mode information, BCM IE and BCM information in the protocol configuration option (PCO) IE within GTPC messages sent by the GGSN. This option is useful in networks where AGWs or firewalls do not support unknown optional IEs in GTP messages.

prefer-local-value

Default: Disabled.
This keyword indicates that the APN configured with "none" option for bearer control mode will not be overridden by any other interface (e.g. Gx interface towards PCRF). As a result it is ensured that BCM IE is never sent in GTP message.

Important: When bearer control mode is set to "none" with the keyword set "prefer-local-value", even PCRF provided values will not override APN config and therefore sending of BCM mode IE and BCM in PCO IE in CPC Response is supressed.

Usage

Use this command to enable the QoS through bearer control. This can be done either through the MS side or from both the GGSN and MS. To enable network requested QoS user need to enable “Mixed” mode for bearer control.
With this keyword the operator can control sending of BCM information in GTPC messages from the GGSN. With MS-Only or Mixed options in this mode, the system sends the BCM information element in every Create PDP Context Response and Unknown PDP Context Request and Response message.
In some networks AGWs/Firewall drop/reject GTPC messages if there is an Unknown optional IE. To resolve this, the operator can use the “none” option to control sending of BCM IE and BCM information in the PCO IE within GTPC messages from the GGSN.

Example

The following command enables the bearer control from network and MS side for NCQoS.

```
bearer-control-mode mixed
```

cc-home

Configures the home subscriber charging characteristics (CC) used by the GGSN when those from the SGSN will not be accepted.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
cc-home { behavior bits | profile index }

default cc-home
```

default

Restores the cc-home parameter to its default setting of the following:

- **behavior bits:** 0x00
- **profile index:** 8

behavior *bits*

Specifies the behavior bit for the home subscriber charging characteristic. *bits* can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.

profile *index*

Specifies the profile index for the home subscriber charging characteristic. *index* can be configured to any integer value between 0 and 15. Default: 8

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

Usage

When the GGSN is configured to reject the charging characteristics sent by the SGSN for "home" subscribers, it uses the profile index specified by this command to determine the appropriate CCs to use. Multiple behavior bits can be configured for a single profile index by ORing the bit strings together and converting the result to hexadecimal.

The properties of the actual CC profile index are configured as part of the GGSN service using the **cc profile** command. Refer to the *GGSN Service Configuration Mode* chapter of this reference for additional information on this command.

Example

The following command configures a behavior bit of 2 (0000 0000 0010) and a profile index of *10* for home subscribers charging characteristics:

```
cc-home behavior 2 profile 10
```

The following command configures the behavior bits *3* (0000 0000 0100) and 5 (0000 0001 0000 bin) and a profile index of *14* for home subscriber charging characteristics:

```
cc-home behavior 14 profile 14
```

cc-roaming

Configures the roaming subscriber charging characteristics (CC) used by the GGSN when those from the SGSN will not be accepted.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

cc-roaming { **behavior** *bits* | **profile** *index* }

default cc-roaming

default

Restores the cc-roaming parameter to its default setting of the following:

- **behavior bits:** 0x00
- **profile index:** 8

behavior *bits*

Specifies the behavior bit for the roaming subscriber charging characteristic. *bits* can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.

profile *index*

Specifies the profile index for the roaming subscriber charging characteristic. *index* can be configured to any integer value between 0 and 15. Default: 8

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

Usage

When the GGSN is configured to reject the charging characteristics sent by the SGSN for "roaming" subscribers, it uses the profile index specified by this command to determine the appropriate CCs to use. Multiple behavior bits can be configured for a single profile index by ORing the bit strings together and convert the result to hexadecimal.

The properties of the actual CC profile index are configured as part of the GGSN service using the cc profile command. Refer to the GGSN Service Configuration Mode chapter of this reference for additional information on this command.

Example

The following command configures a behavior bit 10 (0010 0000 0000) and a profile index of *10* for roaming subscriber charging characteristics:

```
cc-roaming behavior 200 profile 10
```

The following command configures the behavior bits 9 (0001 0000 0000) and 6 (0000 0010 0000) and a profile index of *14* for roaming subscriber charging characteristics:

```
cc-roaming behavior 120 profile 14
```

cc-sgsn

Specifies the GGSN's source for charging characteristics (CC) - those configured locally or those received from the SGSN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
cc-sgsn { home-subscriber-use-GGSN | radius-returned | roaming-subscriber-use-GGSN |
visiting-subscriber-use-GGSN } +

cc-sgsn { use-GGSN behavior bits profile index[ 0...15 ] [ radius-returned ] }

default cc-sgsn

no cc-sgsn { { radius-returned | home-subscriber-use-GGSN | roaming-subscriber-use-GGSN |
visiting-subscriber-use-GGSN } + | [ use-GGSN ] [ radius-returned ] }
```

default cc-sgsn

Restores the cc-sgsn parameter to its default setting of the following:

- **home-subscriber-use-GGSN**: Disabled
- **roaming-subscriber-use-GGSN**: Disabled
- **visiting-subscriber-use-GGSN**: Disabled

no cc-sgsn

Causes the GGSN to accept CCs from the SGSN(s) when the **no cc-sgsn** command is entered with all applicable keywords. Otherwise, **no cc-sgsn** can be used to turn off one or more of the GGSN sources of CC.

- **roaming-subscriber-use-GGSN**
- **home-subscriber-use-GGSN**
- **roaming-subscriber-use-GGSN**
- **visiting-subscriber-use-GGSN**

Before entering **no cc-sgsn**, it is helpful to determine which CC sources have been configured. This can be done with either **show configuration** or **show apn name** in Exec Mode.

home-subscriber-use-GGSN

Configures the GGSN to use the locally defined charging characteristics for home subscribers, as configured with the APN Configuration Mode **cc-home** command.

radius-returned

Configures the GGSN to accept charging characteristics returned from the RADIUS server for all subscribers for the APN.

roaming-subscriber-use-GGSN

Configures the GGSN to use the locally defined charging characteristics for roaming subscribers, as configured with the APN Configuration Mode **cc-roaming** command.

visiting-subscriber-use-GGSN

Configures the GGSN to use the locally defined charging characteristics for visiting subscribers, as configured with the APN Configuration Mode **cc-visiting** command.

use-GGSN [behavior *bits* **] profile** *index[0...15]*

Configures the GGSN to accept charging characteristics for all subscribers in the APN.
bits specifies the behavior bit for the charging characteristic. This variable can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.
index indicates which profile defined with **cc profile** in GGSN Service Configuration mode, the GGSN will use as a source for CCs. The index can be configured to an integer from 0 to 15.
The **use-GGSN** keyword can be entered alone or in conjunction with the **radius-returned** keyword. When entered, this keyword overrides the previous configuration using any of the home, roaming, and/or visiting keywords.

+

More than one of the above keywords can be entered within a single command.

Usage

This command specifies whether or not CCs received from the SGSN will be accepted. If they are not accepted, the GGSN will use those that have been configured locally.
The GGSN's behavior can be configured for the following subscriber types:

- **Home:** Subscribers belonging to the same Public Land Mobile Network (PLMN) as the one on which the GGSN is located.
- **Roaming:** Subscribers that are serviced by a an SGSN belonging to a different PLMN than the one on which the GGSN is located.
- **Visiting:** Subscribers belonging to a different PLMN than the one on which the GGSN is located.
- Any subscriber in the APN.

Example

The following command instructs the GGSN to accept CCs for any subscriber in the APN based on local profile configurations of CCs.

```
cc-sgsn use-GGSN profile x
```

Assuming the CC source as defined with the previous command, the following command instructs the GGSN to accept CCs supplied by the SGSN(s) and disables the acceptance of CCs supplied by the GGSN for any subscriber within the APN:

```
no cc-sgsn use-GGSN
```

The following command instructs the GGSN to accept CCs for any subscriber in the APN based on CC information returned from the RADIUS server. This command can be issued after the previous command to expand the possible sources.

```
cc-sgsn radius-returned
```

The following command disables the acceptance of CCs supplied by the GGSN for visiting and roaming subscribers:

```
no cc-sgsn roaming-subscriber-use-GGSN visiting-subscriber-use-GGSN
```

cc-visiting

Configures the visiting subscriber charging characteristics (CC) used by the GGSN when those from the SGSN will not be accepted.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

cc-visiting behavior *bits* **profile** *index*

default cc-visiting

default

Restores the cc-visiting parameter to its default setting of the following:

- **behavior bits:** 0x00
- **profile index:** 8

behavior *bits*

Specifies the behavior bit for the visiting subscriber charging characteristic. *bits* can be configured to any unique bit from 001H to FFFH (0001 to 1111 1111 1111 bin) where the least-significant bit corresponds to B1 and the most-significant bit corresponds to B12.

profile *index*

Specifies the profile index for the visiting subscriber charging characteristic. *index* can be configured to any integer value between 0 and 15. Default: 8

Important: 3GPP standards suggest that profile index values of 1, 2, 4, and 8 be used for hot billing, flat rate billing, prepaid billing and normal billing, respectively. A single charging characteristics profile can contain multiple behavior settings.

Usage

When the GGSN is configured to reject the charging characteristics sent by the SGSN for "visiting" subscribers, it uses the profile index specified by this command to determine the appropriate CCs to use. Multiple behavior bits can be configured for a single profile index by ORing the bit strings together and convert the result to hexadecimal.

The properties of the actual CC profile index are configured as part of the GGSN service using the cc profile command. Refer to the GGSN Service Configuration Mode chapter of this reference for additional information on this command.

Example

The following command configures a behavior bit 7 (0000 0100 0000) and a profile index of 10 for visiting subscriber charging characteristics:

```
cc-visiting behavior 40 profile 10
```

The following command configures the behavior bits 1 (0000 0000 0001) and 12 (1000 0000 0000) and a profile index of 14 for visiting subscriber charging characteristics:

```
cc-visiting behavior 801 profile 14
```

content-filtering category

Enables or disables the specified pre-configured Category Policy Identifier for Category-based Content Filtering support.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering category policy-id*cf_policy_id*

no content-filtering category policy-id

no

Disables the previously configured category policy identifier for Content Filtering support to the APN. This is the default setting.

policy-id *cf_policy_id*

Applies the specified content filtering category policy ID, configured in the ACS Configuration Mode, to this APN.
cf_policy_id must be a category policy ID entered as an integer from 1 through 4294967295.
If the specified category policy ID is not configured in the ACS Configuration Mode, all packets will be passed regardless of the categories determined for such packets.

Important: Category Policy ID configured through this mode overrides the Category Policy ID configured through **content-filtering category policy-id** command in the ACS Rulebase Configuration Mode.

Usage

Use this command to enter the Content Filtering Policy Configuration Mode and to enable or disable the Content Filtering Category Policy ID for an APN.

Important: If Content Filtering Category Policy ID is not specified here the similar command in the ACS Rulebase Configuration Mode determines the policy.

Up to 64 different policy IDs can be defined.

Example

The following command enters the Content Filtering Policy Configuration Mode and enables the Category Policy ID *101* for Content Filtering support:

```
content-filtering category policy-id 101
```

credit-control-group

Configures the credit control group to be used for subscribers who use this APN.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

credit-control-group *cc_group_name*

no credit-control-group

no

Removes the previously configured credit control group from the APN configuration.

cc_group_name

Specifies name of the credit control group as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the credit control group for this APN.
Creating different credit control groups enables applying different credit control configurations (DCCA dictionary, failure-handling, session-failover, Diameter endpoint selection, etc.) to different subscribers on the same system.
Without credit control groups, only one credit control configuration is possible on a system. All the subscribers in the system will have to use the same configuration.

Example

The following command configures a credit control group named *testgroup12* for the current APN:

```
credit-control-group testgroup12
```

data-tunnel mtu

Configures the Maximum Transmission Unit (MTU) for data sent on the IPv6 tunnel between the P-GW and the mobile node.

Product

P-GW

Privilege

Administrator

Syntax

data-tunnel mtu*bytes*

default data-tunnel mtu

default

Returns the command to the default value of 1500.

bytes

Specifies the MTU for the IPv6 tunnel between the P-GW and the mobile node. *bytes* must be an integer between 1280 and 2000. Default: 1500

Usage

Use this command to set the MTU for data traffic on the IPv6 tunnel between the P-GW and the mobile node.

Example

The following command sets the MTU for IPv6 data traffic to *1400* bytes:

```
data-tunnel mtu 1400
```

data-tunneling ignore df-bit

Controls the handling of the DF (Don't Fragment) bit present in the user IPv4/IPv6 packet for tunneling used for the Mobile IP data path.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] data-tunneling ignore df-bit
```

default

Restores the data-tunneling parameter to its default setting of disabled.

no

Disables this option. The DF bit in the tunneled IP packet header is not ignored during tunneling. This is the default setting.

ignore df-bit

Ignores the DF bit in the tunneled IP packet header during tunneling. This is the default setting.

Usage

Use this command to configure a user so that during Mobile IP tunneling the DF bit is ignored and packets are fragmented.
If this feature is enabled, and fragmentation is required for the tunneled user IPv4/IPv6 packet, then the DF bit is ignored and the packet is fragmented. Also the DF bit is not copied to the outer header.
In the GGSN, this command also affects the other L3 tunneling options, IP-in-IP and GRE, but does not affect L2TP tunneling.

Example

To enable fragmentation of a subscribers packets over a MIP tunnel even when the DF bit is present, enter the following command:

```
data-tunneling ignore df-bit
```

dcca origin endpoint

This command is obsolete. To configure the Diameter Credit Control Origin Endpoint, in the Credit Control Configuration Mode, use the **diameter origin endpoint** command.

dcca peer-select

Specifies the Diameter credit control primary and secondary host for credit control.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

dcca peer-select peer *host_name* [**realm** *realm_name*] [**secondary-peer** *host_name*]

no dcca peer-select

no

Removes the previously configured Diameter credit control peer selection.

host_name

Specifies a unique name for the peer as an alphanumeric string of 1 through 63 characters that allows punctuation marks.

realm *realm_name*

Specifies the ream as an alphanumeric string of from 1 through 127 characters that allows punctuation marks. The realm may typically be a company or service name.

secondary-peer *host_name*

Specifies a back-up host that is used for fail-over processing as an alphanumeric string of from 1 through 63 characters. When the route-table does not find an AVAILABLE route, the secondary host performs fail-over processing.

Usage

Use this command to select a Diameter credit control peer and realm.

WARNING: This configuration completely overrides all instances of **diameter peer-select** that have been configured within the Credit Control Configuration Mode for an Active Charging Service.

Example

The following command selects a Diameter credit control peer named test and a realm of *companyx*:

```
dcca peer-select test realm companyx
```

dhcp context-name

Configures the name of the context on the system in which Dynamic Host Control Protocol (DHCP) functionality is configured.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] dhcp context-name name
```

no

Removes a previously configured context name.

name

Specifies the name of a context configured on the system in which one or more DHCP services are configured. *name* is an alphanumeric string of 1 through 79 characters that is case sensitive.

Usage

If the APN is to support dynamic address assignment via DHCP (either the proxy or relay mode), this parameter must be configured to point the APN to the name of a pre-configured context on the chassis in which one or more DHCP services are configured.
The command can be used to identify a single DHCP service instance within the specified context to use to facilitate the address assignment.

Example

The following command configures the APN to look for DHCP services in a context called *dhcp-ctx:*

```
dhcp context-name dhcp-ctx
```

dhcp lease-expiration-policy

Configures the system's handling of PDP contexts whose DHCP assigned IP lease has expired.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
dhcp lease-expiration-policy { auto-renew | disconnect }

default dhcp lease-expiration-policy
```

default

Restores the dhcp lease-expiration-policy parameter to its default setting of auto-renew.

auto-renew

Configures the system to automatically renew an IP address' lease when it is about to expire for PDP contexts facilitated by the APN. Default: Enabled

disconnect

Configures the system to automatically release the PDP context when the lease for the IP address associated with that context expires. Default: Disabled

Usage

Use this command to specify the action the system is to take when leases for IP addresses for PDP contexts that it are currently facilitated by the current APN are about to expire.

Example

The following command causes the system to release PDP contexts associated with the current APN when the lease for their DHCP-assigned IP address expires:

```
dhcp lease-expiration-policy disconnect
```

dhcp service-name

Configures the name of a specific DHCP service to use when dynamically assigning IP addresses to PDP contexts using the Dynamic Host Control Protocol.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] dhcp service-name svc_name
```

no

Removes a previously configured DHCP service name.

svc_name

Configures the name of the DHCP service instance that is to be used by the current APN for the dynamic assignment of IP addresses to PDP contexts. The name can be an alphanumeric string of 1 through 63 characters that is case sensitive.

Usage

Use this command to specify a pre-configured DHCP service instance that is to be used by the APN for IP address assignment when the Dynamic Host Control Protocol is used.
The name of the context in which the desired DHCP service is configured must be specified by the **dhcp context-name** command.

Example

The following command instructs the APN to use a DHCP service called *dhcp1*:

```
dhcp service-name dhcp1
```

dns

Configures the Domain Name Service (DNS) servers that will be used by the APN for PPP.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

dns { **primary** | **secondary** } { *address* }

no dns { **primary** | **secondary** } [*dns_address*]

no

Deletes a previously configured DNS server.

primary

Configures the primary DNS server for the APN.

secondary

Configures the secondary DNS server for the APN. Only one secondary DNS server can be configured.

address

Configures the IP address of the DNS server expressed in IPv4 dotted-decimal notation.
Default: primary = 0.0.0.0, secondary = 0.0.0.0

dns_address

Specifies the IP address of the DNS server to remove, expressed in IPv4 dotted-decimal notation.

Usage

DNS servers are configured on a per-APN profile basis. This allows each APN profile to use specific servers in processing PDP contexts.
The configured DNS IP addresses are relayed to the subscriber within IPCP if the PDP type is PPP, or as PCOs (Protocol Configuration Options) if the PDP type is IP.
The DNS can be specified at the APN level in APN configuration as well as at the Context level in Context configuration mode with **ip name-servers** command, or it can be received from AAA server.
When DNS is requested in PCO configuration, the following preference will be followed for DNS value:
1. DNS Values received from LNS have the first preference.
2. DNS values received from RADIUS Server has the second preference.
3. DNS values locally configured with APN has the third preference.
4. DNS values configured at context level with **ip name-servers** command has the last preference.

Important: The same preference would be applicable for the NBNS (NetBIOS Name Service) servers to be negotiated via ICPC (Initial Connection Protocol Control) with the LNS (L2TP Network Server).

Example

The following commands configure a primary DNS server address of *192.168.100.3* and a secondary DNS server address of *192.168.100.4*:

```
dns primary 192.168.100.3

dns secondary 192.168.100.4
```

ehrpd-access

Configures the P-GW to exclude IPv6 traffic from being delivered to UEs, accessing PDNs from the eHRPD network that do not have IPv6 capabilities.

Product

P-GW

Privilege

Administrator

Syntax

[default | no] ehrpd-access drop-ipv6-traffic

[default | no]

Resets this command to its default setting of disabled.

drop-ipv6-traffic

Excludes IPv6 traffic from being delivered to UEs, accessing PDNs from the eHRPD network that do not have IPv6 capabilities.

Usage

Use this command to exclude IPv6 traffic from being delivered to UEs on the eHRPD network that do not have IPv6 capabilities.

emergency-apn

Configures this APN as an emergency APN for Voice over LTE (VoLTE) based E911 support.

Product

P-GW

Privilege

Administrator

Syntax

```
[ default | no ] emergency-apn
```

[default | no]

Resets this command to its default setting of disabled.

Usage

Use this command to configure this APN as an emergency APN for VoLTE based E911 support. With this support, a UE is able to connect to an emergency PDN and make Enhanced 911 (E911) calls while providing the required location information to the Public Safety Access Point (PSAP).
E911 is a telecommunications-based system that is designed to link people who are experiencing an emergency with the public resources that can help. This feature supports E911-based calls across the LTE and IMS networks. In a voice over LTE scenario, the subscriber attaches to a dedicated packet data network (PDN) called EPDN (Emergency PDN) in order to establish a voice over IP connection to the PSAP. Both signaling and RTP media flow over a dedicated emergency bearer. Additionally, different than normal PDN attachment that relies on AAA and PCRF components for call establishment, the EPDN attributes are configured locally on the P-GW, which eliminates the potential for emergency call failure if either of these systems is not available.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

firewall policy

Eenables or disables Stateful Firewall support for the APN.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
firewall policy firewall-required

[ default | no ] firewall policy
```

no

Disables Stateful Firewall support for this APN.

default

Configures the default setting for Stateful Firewall support.
Default: Disabled

Usage

Use this command to enable or disable Stateful Firewall support for this APN.

Important: This command is only available in StarOS 8.0. In StarOS 8.1 and later, this configuration is available in the ACS Rulebase Configuration Mode.

Important: Unless Stateful Firewall support for this APN is enabled using this command, firewall processing for this APN is disabled.

Important: If firewall is enabled, and the rulebase has no firewall configuration, Stateful Firewall will cause all packets to be discarded.

Example

The following command enables Stateful Firewall support for an APN:

```
firewall policy firewall-required
```

The following command disables Stateful Firewall support for an APN:

```
no firewall policy
```

fw-and-nat policy

Configures the Firewall-and-NAT policy to be used for subscribers who use this APN.

Product

FW, NAT

Privilege

Security Administrator, Administrator

Syntax

fw-and-nat policy *fw_nat_policy*

[default | no] fw-and-nat policy

default

Configures the default setting.
Default: The default Firewall-and-NAT policy configured in the rulebase is used for subscribers who use this APN.

no

Disables Firewall and NAT for the APN.

fw_nat_policy

Specifies the Firewall-and-NAT policy for the APN as an alphanumeric string of 1 through 63 characters. Note that this policy will override the **default Firewall-and-NAT policy** configured in the ACS rulebase.

Usage

Use this command to configure the Firewall-and-NAT policy for the APN. Note that the policy configured in the subscriber mode will override the default policy configured in the ACS rulebase. If a policy is not configured in the subscriber mode, the default policy configured in the ACS rulebase will be used.

Important: This command is customer-specific and is only available in StarOS 8.1.

Important: This customer-specific command must be used to configure the Policy-based Firewall-and-NAT feature.

Example

The following command configures a Firewall-and-NAT policy named *standard* for the APN:

```
fw-and-nat policy standard
```

gsm-qos negotiate

Enables negotiation of the QoS Reliability Class attribute based on the configuration provided for Service Data Unit (SDU) Error Ratio and Residual Bit Error Ratio (BER) attributes in the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

gsm-qos negotiate sdu-error-ratio *sdu-error-ratio-code* [**residual-ber** *residual-ber-code*]

[**no**] **gsm-qos negotiate sdu-error-ratio** [*sdu-error-ratio-code* [**residual-ber** *residual-ber-code*]]

no

Disables negotiation of the QoS Reliability Class attribute.

sdu-error-ratio *sdu-error-ratio-code*

Enables the negotiation of the QoS Reliability Class attribute based on Service Data Unit (SDU) Error Ratio attributes. *sdu-error-ratio-code* corresponds to distinct SDU Error ratio values within an integer range of 1 to 7.

residual-ber *residual-ber-code*

Enables the optional configuration of negotiation of the QoS Reliability Class attribute based on Residual Bit Error Ratio (BER) attributes. *residual-ber-code* corresponds to distinct Residual Bit Error Ratio values within an integer range of 1 to 9.

Usage

This command configures the QoS attribute Reliability Class to be negotiated based on the configuration provided for SDU Error Ratio and Residual BER attributes. The derived Reliability Class and the configured values for SDU Error Ratio and Residual BER are sent back in CPC and UPC response.
The mapping for *sdu-error-ratio-code* is as follows:

Code	Value
1	10-2
2	7*10-3
3	10-3
4	10-4
5	10-5
6	10-6
7	10-1

Residual BER needs to be specified when SDU Error Ratio is set to codes 1, 2, 3 or 7 (Or, SDU Error Ratio is intended to be set to a value greater than 5*10-4), for determining the Reliability Class QoS attribute. Otherwise, the Residual BER value received in the Create PDP context request QoS (or UPC request) would be used. The mapping for *residual-ber-code* is as follows:

Code	Value
1	5*10-2
2	10-2
3	5*10-3
4	4*10-3
5	10-3
6	10-4
7	10-5
8	10-6
9	6*10-8

Example

The following commands configures the negotiation of QoS attribute Reliability Class based on Service Data Unit (SDU) Error Ratio *3* attributes in the APN:

```
gsm-qos negotiate sdu-error-ratio 3
```

gtpp group

Enables a configured GTPP server group to an APN for CGF accounting functionality.

Important: In Releases prior to 11.0, only one GTPP group is allowed to configure per APN. In Releases 11.0 and later, this CLI can be used to configure up to a maximum of 32 GTPP groups for each APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

gtpp group *group_name* [**accounting-context** *ac_context_name*]

default gtpp group

no gtpp group *group_name*

no

Removes all the configured GTPP groups for the specific APN.

group_name

Specifies the name of server group that is used for authentication/accounting for specific APN. *group_name* must be an alphanumeric string of 1 to 63 characters. It must be identical to the one configured earlier within the same APN context.

Important: In Release 11.0 and later, if you have mistakenly configured a GTPP group, you should remove the initially configured group and configure the new desired group. However, in Releases prior to 11.0, there is no need to remove the incorrect configuration; instead you can directly reconfigure the desired GTPP group.

Important: If a GTPP group entry is invalid, this GTPP group will be ignored and the next valid GTPP group in the APN will be used. If no valid GTTP group exists, then the default GTPP group in the accounting context specified by the GGSN service will be used.

accounting-context *ac_context_name*

Specifies the name of an accounting context on the system that processes accounting for PDP contexts handled by this GGSN service for accounting to specific APN.
ac_context_name must be an alphanumeric string of 1 through 79 characters that is case sensitive.
Note that if an accounting context is not specified here, the system uses the GGSN service context or the context configured by the **accounting context** command in the GGSN Service Configuration mode.

Usage

This feature provides the GTPP server configurables under a GTPP group node. Instead of having a single list of servers per context, this feature configures multiple server groups within a context and applies individual an GTPP server group for subscribers in that context. Each server group consists of a list of CGF (Charging Group Function) accounting servers.
In case no GTPP group is applied for the said APN or default APN template, then the default GTPP server group available at the context level is applicable for accounting of a specific APN.

Important: When multiple GTPP groups are applied to the same APN, the load will be shared across these GTPP groups. Sessions for this APN will use all the configured GTPP groups in a round robin fashion.

Once a GTPP group is selected for a subscriber session, the GTPP group will never change under any circumstances. A request is initially sent to primary CGF server configured in that group. When the primary fails to respond, the request is sent to secondary CGF server.
The process of failover from primary to secondary is per the 3GPP standards. Multiple GTPP groups configuration is actually supported only for load sharing of sessions within an APN and not used for failover. When all CGFs are down in a GTPP group, the requests are archived either in hard disk or main memory depending on whether or not streaming is enabled.

Example

The following command applies a previously configured GTPP server group named *star1* to an APN within the specific context:

```
gtpp group star1
```

The following command disables the applied GTPP server group for the specific APN:

```
no gtpp group star1
```

gtpp secondary-group

Enables or associates a preconfigured secondary GTPP server group to an APN for CGF (Charging Group Function) accounting functionality. By default it is disabled.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

gtpp secondary-group *group_name* [**accounting-context** *actt_ctxt_name*]

[**default** | **no**] **gtpp secondary-group** *group_name*

default

Default: Enabled
Restores the default mode for secondary GTPP group for APN template.

no

Disables the configured/associated GTPP secondary group for specific APN.

group_name

Specifies the name of secondary GTPP server group that is used as an alternate for the primary GTPP group associated with a specific APN for storage of GTPP messages. *group_name* must be an alphanumeric string of 1 through 63 characters. It must be the same name as configured earlier within the same APN context.

accounting-context *actt_ctxt_name*

Specifies the name of an accounting context on the system that processes accounting for PDP contexts handled by this GGSN service for accounting to a specific APN.
actt_ctxt_name specifies the name of the context to be used for accounting as an alphanumeric string of 1 through 79 characters that is case sensitive.
Note that if an accounting context is not specified here, the system uses the GGSN service context or the context configured by the **accounting context** command in the GGSN Service Configuration mode.

Usage

Use this feature to provide the secondary GTPP server group support for an APN.
When the secondary GTPP group is configured with this command, the GTPP messages will also be mirrored to the secondary servers.
This secondary group configuration is ignored, if the configured *group_name* is the same as the primary group. It will also be ignored, if the configured GTPP *group_name* and/or accounting context *ac_context_name* is invalid. In such cases, the call will be established successfully (unlike the primary group configuration where the call drops).
In the absence of a configured *ac_context_name* context, the GGSN service context is chosen by default.
The secondary group messages are low priority and thus are purged when there is no room for the new messages.
For more information on GTPP group, refer the description of the **gtpp group** command.

Example

The following command applies a previously configured GTPP server group named *star2* to as secondary GTPP group to an APN within the specific context:

```
gtpp secondary-group star2
```

The following command disables the applied secondary GTPP server group for the specific APN:

```
no gtpp secondary-group star2
```

idle-timeout-activity

Configures a session idle-timeout to be reset with uplink packets only, or with both uplink and downlink packets.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] idle-timeout-activity ignore-downlink

default idle-timeout-activity
```

default

Sets or restores the command to the default setting.

ignore-downlink

Sets the system to ignore the downlink traffic for consideration as activity for idle-timeout.

Usage

If **idle-timeout-activity ignore-downlink** is configured, the downlink (network to subscriber) traffic will not be used to reset the idle-timeout. Only uplink (subscriber to network) packets will be able to reset the idle-timeout.
By default, **ignore-downlink** is negated by the **no** command so downlink traffic is also used to reset the idle-timeout.

Example

The following command causes both uplink and downlink traffic to reset a session idle-timeout:

```
default idle-timeout-activity
```

The following command causes the session idle-timeout to be reset with only uplink packets:

```
idle-timeout-activity ignore-downlink
```

ims-auth-service

Applies an IMS (IP Multimedia Subsystem) authorization service to a subscriber through APN for Gx interface support and functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ims-auth-service auth_svc_name
```

no

Disables the applied IMS authorization service for a specific APN.

auth_svc_name

Specifies the name of the IMS authorization service name that is used for Gx interface authentication for a specific APN. *auth_svc_name* must be a alphanumeric string of 1 through 63 characters preconfigured within the same context as this APN.

Usage

This feature provides the IMS authorization service configuration for Gx interface in IMS service node.

Example

The following command applies a previously configured IMS authorization service named *gx_interface1* to an APN within the specific context:

```
ims-auth-service gx_interface1
```

The following command disables the applied IMS authorization service *gx_interface1* for the specific APN:

```
no ims-auth-service gx_interface1
```

ip access-group

Configures an IPv4/IPv6 access group for the current APN profile.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip access-group acl_group_name [ in | out ]
```

no

Removes a previously configured IPv4/IPv6 access group association.

acl_group_name

Specifies the name of the IPv4/IPv6 access group. *acl_group_name* is a previously configured ACL group expressed as an alphanumeric string of 1 to 79 characters.

in | out

Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords **in** and **out**, respectively.

Usage

Use this command to apply a single IPv4/IPv6 access control list to multiple subscribers via this APN for inbound or outbound IPv4/IPv6 traffic.
If no traffic direction is specified, the selected access control list will be applied to both directions.

Example

The following command associates the *sampleipv4Group* access group with the current APN profile for both inbound and outbound access.

```
ip access-group sampleipv4Group
```

The following command removes the outbound access group flag for *sampleipv4Group*.

```
no ip access-group sampleipv4Group out
```

ip address alloc-method

Configures the method by which this APN will obtain IP addresses for PDP contexts.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip address alloc-method { dhcp-proxy [ allow-deferred ] [ prefer-dhcp-options ] | dhcp-relay | local [ allow-deferred ] | no-dynamic [ allow-deferred ] } [ allow-user-specified ]

default ip address allocation-method
```

default

Restores the APN ip parameters to the following default settings.

dhcp-proxy

Default: Disabled
Configures the APN to assign an IP address received from a DHCP server.

Important: If this option is used, the system's DHCP parameters must be configured.

dhcp-relay

Configures the APN to forward DHCP packets received from the MS to a DHCP server. Default: Disabled

Important: If this option is used, the system's DHCP parameters must be configured.

local

Configures the APN to allocate IP addresses from a pool configured in the destination context on the system. Default: Enabled

Important: If this option is used, the name of the IP address pool from which to allocate addresses must be configured using the **ip address pool-name** command. If no pool name is specified, the system will attempt to allocate an address from any public pool configured in the destination context.

no-dynamic

Disables the dynamic assignment of IP addresses to PDP contexts using this APN. Default: Disabled
If a PDP context needing an IP address is received by an APN with this option enabled, it will be rejected with a cause code of 220 (Unknown PDP address or PDP type).

prefer-dhcp-options

If this keyword is specified with **dhcp-proxy** for IP address allocation configuration, the GGSN will prefer DHCP-supplied parameters over values provided by AAA server or by local configuration. This keyword controls the following parameters:

- primary and secondary Domain Name Server (DNS) addresses
- primary and secondary NetBIOS Name Server (NBNS) addresses

These values will be sent out in the PCO IE of a GTP Create PDP Response Message whenever the MS Requests them in A Create PDP Request Message.
Default: Disabled

Important: This keyword is available only with dhcp-proxy ip allocation method as this functionality is implemented only for GGSN acting as DHCP proxy.

By default, this functionality is disabled. Hence, DNS and NBNS values received from a DHCP server will not be considered by the GGSN.

allow-deferred

Enables support for P-GW deferred address allocation. Default: Disabled

allow-user-specified

Enables support for PDP contexts requesting the use of specific (static) addresses. Default: Enabled

Important: If this option is not enabled, PDP contexts requesting the use of a static address will be rejected with a cause code of 220 (Unknown PDP address or PDP type).

Usage

Use this command to configure the method by which the APN profile will assign IP addresses to PDP contexts.
When the PDP context is being established and the APN name is determined, the system will examine the APN's configuration profile. Part of that procedure is determining how to handle IP address allocation. The figure in the Example section below displays the process used by the system to determine how the address should be allocated.

Example

The following command configures the APN to dynamically assign an address from a DHCP server and reject PDP sessions with static IP addresses:

```
ip address alloc-method dhcp-proxy
```

The following command configures the APN to reject sessions requesting dynamically assigned addresses and only allow those with static addresses:

```
ip address alloc-method no-dynamic allow-user-specified
```

The following figure provides the IP address allocation process:

Figure 3. IP Address Allocation Process

ip address pool

Configures the name of a a private IP address pool configured on the system from which to assign an address for a PDP context.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip address pool name pool_name
```

no

Removes a previously configured pool name.

pool_name

Specifies the name of the private pool configured on the system from which an IP address will be assigned. The name is expressed as an alphanumeric string of 1 through 31 characters that is case sensitive.

Usage

If the **ip address alloc-method** command is configured to allow the assignment of IP addresses from a local pool configured on the system. It command instructs the system as to which pool should be used.
The pool specified by this command must be a private pool configured in the destination context on the system. Please refer to the **ip pool** command in the *Context Configuration Mode Commands* chapter for information on configuring IP address pools.
Multiple APNs can use the same IP address pool if required. In addition, this command could be issued multiple times to allow a single APN to use different address pools.

Example

The following command configures the system to use a pool named *private_pool1* for address allocation:

```
ip address pool private_pool1
```

ip context-name

Configures the name of the destination context to use for subscribers accessing this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ip context-name ctxt_name
```

no

Removes a previously configured context name.

ctxt_name

Specifies the name of the context through which subscriber data traffic will be routed. *ctxt_name* must be an alphanumeric string from 1 to 79 characters.

Usage

Use this command to specify the name of a destination context configured on the system through which to route all subscriber data traffic. This context will be used for subscribers accessing this APN. If no name is specified, the system will use the context in which the APN is configured as the destination context.
When the APN is used to support Mobile IP functionality, this command is used to indicate the context in which the FA (foreign Agent) service is configured. If no name is specified, the context in which the GGSN service facilitating the subscriber PDP context is used.

Example

The following command configures the system to route subscriber traffic for the APN through a context called isp1:

```
ip context-name isp1
```

ip header-compression

Configures IP packet header compression parameters for this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip header-compression vj

default ip header-compression

no ip header-compression
```

default

Disables Van-Jacobson header compression.

no

Disables Van-Jacobson header compression.

vj

Enables Van-Jacobson header compression for IP packets. Default: Enabled

Usage

IP header compression reduces packet header overhead resulting in more efficient utilization of available bandwidth.

Example

The following command disables packet header compression for the APN:

```
no ip header-compression
```

ip hide-service-address

Renders the IP address of the GGSN unreachable from mobile stations (MSs) using this APN. This command is configured on a per-APN basis.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ip hide-service-address
```

default

Does not allow the mobile station to reach the GGSN IP address using this APN.

no

Allows the mobile station to reach the GGSN IP address using this APN.

Usage

This hides the GGSN IP address from the mobile station for security purposes.

Example

The following command allows the GGSN's IP address to be viewed by the mobile station:

```
no ip hide-service-address
```

ip local-address

Configures the local-side IP address of the subscriber's point-to-point connection.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ip local-address *ip_address*

no ip local-address

no

Removes a previously configured IP local-address.

ip_address

Specifies an IP address configured in a destination context on the system through which a packet data network can be accessed. *ip_address* must be expressed in IPv4 dotted-decimal notation.

Usage

This parameter specifies the IP address on the system that the MS uses as the remote-end of the PPP connection. If no local address is configured, the system uses an unnumbered scheme for local-side addresses.

Example

The following command configures a local address of 192.168.1.23 for the MS:

```
ip local-address 192.168.1.23
```

ip multicast discard

Configures the IP multicast discard packet behavior.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ip multicast discard
```

default

Restores the APN IP parameters to the default multicast settings, which is to discard PDUs.

no

Removes a previously configured IP multicast discard.

Usage

This command specifies if IP multicast discard is enabled or disabled.

Example

The following command enables IP multicast discard for an APN:

```
ip multicast discard
```

ip qos-dscp

Configures the quality of service (QoS) differentiated service code point (DSCP) used when sending data packets of a particular 3GPP QoS class over the Gi interface.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
ip qos-dscp { qci { 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 } { dscp } } +

default ip qos-dscp

no ip qos-dscp { qci { 1 | 2 | 3 | 4 | 5 { allocation-retention-priority { 1..3 } } | 6 {
allocation-retention-priority { 1..3 } } | 7 { allocation-retention-priority { 1..3 } } |
8 { allocation-retention-priority { 1..3 } } | 9 } } } +
```

default

Restores the APN IP parameters to the default setting *conversational ef streaming af11 interactive af21 background be*.

no

Restores the QoS parameter to its default setting.

allocation-retention-priority

Specifies the DSCP for interactive class if the allocation priority is present in the QoS profile.
allocation-retention-priority can be the integers 1, 2, or 3.
DSCP values use the following matrix to map based on traffic handling priority and Alloc/Retention priority if the allocation priority is present in the QoS profile.
Following table shows the DSCP value matrix for *allocation-retention-priority*.

Table 7. Default DSCP Value Matrix

Allocation Priority	1	2	3
Traffic Handling Priority			
1	ef	ef	ef
2	ef	ef	ef
3	af21	af21	af21
4	af21	af21	af21

Important: If you only configure DCSP marking for interactive traffic classes without specifying ARP, it may not properly take effect. The CLI allows this scenario for backward compatibility. However, it is recommended that you configure all three values.

qci

Configures the QoS Class Identifier (QCI) attribute of QoS. Here the *qci_val* is the QCI for which the negotiate limit is being set; it ranges from 1 to 9.

dscp

Specifies the DSCP for the specified traffic pattern. *dscp* can be configured to any one of the following:

• **af11:** Assured Forwarding 11 per-hop-behavior (PHB)	• **af33:** Assured Forwarding 33 PHB
• **af12:** Assured Forwarding 12 PHB	• **af41:** Assured Forwarding 41 PHB
• **af13:** Assured Forwarding 13 PHB	• **af42:** Assured Forwarding 42 PHB
• **af21:** Assured Forwarding 21 PHB	• **af43:** Assured Forwarding 43 PHB
• **af22:** Assured Forwarding 22 PHB	• **be:** Best effort forwarding PHB
• **af23:** Assured Forwarding 23 PHB	• **ef:** Expedited forwarding PHB
• **af31:** Assured Forwarding 31 PHB	• **pt:** Pass through (ToS of user packet is not modified)
• **af32:** Assured Forwarding 32 PHB	

Default: QCI:

- 1: ef
- 2: ef
- 3: af11
- 4: af11
- 5: ef
- 6: ef
- 7: af21
- 8: af21
- 9: be

+

More than one of the above keywords can be entered within a single command.

Usage

DSCP levels can be assigned to specific traffic patterns in order to ensure that data packets are delivered according to the precedence with which they're tagged. The diffserv markings are applied to the IP header of every subscriber data packet transmitted over the Gi interface(s).
The traffic patterns are defined by QCI (1 to 9). Data packets falling under the category of each of the traffic patterns are tagged with a DSCP that further indicate their precedence as shown in following tables respectively:

Table 8. Class structure for assured forwarding (af) levels

Drop Precedence	Class			
	Class 1	Class 2	Class 3	Class 4
Low	af11	af21	af31	af41
Medium	af12	af22	af32	af41
High	af13	af23	af33	af43

Precedence (low to high)	DSCP
1	Best Effort (be)
2	Class 1
3	Class 2
4	Class 3
5	Class 4
6	Express Forwarding (ef)

The DSCP level can be configured for multiple traffic patterns within a single instance of this command.

Example

The following command configures the DSCP level for QCI to be Expedited Forwarding,**ef**:

```
ip qos-dscp qci 1 ef
```

ip source-violation

Enables or disables packet source validation for the current APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ip source-violation { **ignore** | **check** [**drop-limit** *limit*] } [**exclude-from-accounting**]

default ip source-violation

default

Restores the APN ip parameters to the default settings **check** *enabled*, **drop-limit** *10*.

ignore

Default: Disabled
Disables source address checking for the APN.

check [drop-limit *limit* **]**

Default: Enabled, limit = 10
Enables the checking of source addresses received from subscribers for violations.
A **drop-limit** can be configured to set a limit on the number of invalid packets that can be received from a subscriber prior to their session being deleted. *limit* can be configured to any integer value between 0 and 1000000. A value of 0 indicates that all invalid packets will be discarded but the session will never be deleted by the system.

exclude-from-accounting

Default: Disabled
Excludes the packets identified with IP source violation from the statistics generated for accounting records.

Usage

Source validation is useful if packet spoofing is suspected or for verifying packet routing and labeling within the network.
Source validation requires the source address of received packets to match the IP address assigned to the subscriber (either statically or dynamically) during the session.

Example

The following command enables source address validation for the APN and configures a drop-limit of *15*:

```
ip source-violation check drop-limit 15
```

ip user-datagram-tos copy

Controls the copying of the IP ToS octet value from user IPv4/IPv6 datagrams into the IP header of GTP tunnel encapsulations.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] ip user-datagram-tos copy
```

default

Sets the default behavior of this command. By default this function is disabled.

no

Removes the preconfigured parameter for this command.

Usage

This command enables or disables the copying of the ToS byte from the inner IP header to the outer IP header for an RP connection.
When this function is enabled, the SGSN can detect the special ToS marking in the outer IP header of GTP tunnel packets and identify certain packets as control messages.

ipv6 access-group

Configures the IPv6 access group for the current APN profile which applies a single Access Control List (ACL) to multiple subscribers via the APN for IPv6 traffic.

Product

GGSN, ECS, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 access-group group_name [ in | out ]
```

no

Removes a previously configured IPv6 ACL applied to a particular APN for IPv6 traffic. If at least one of the two **{ in | out }** options is not selected for the ACL that will be removed, the ACL will be removed for both directions.

group_name

Specifies the name of the IPv6 access group as an alphanumeric string of 1 through 79 characters.

[in | out]

Default: both (in and out)
Specifies the access-group as either inbound or outbound by the keywords **in** and **out**, respectively.
If no direction is supplied in the base command, the specified IPv6 access control list will be applied to both directions.

Usage

Use this command to apply a single IPv6 access control list to multiple subscribers via an APN for inbound or outbound IPv6 traffic.
If no traffic direction is specified, the selected access control list will be applied to both traffic directions.

Example

The following command associates the *sampleipv6Group* access group with the current APN profile for both inbound and outbound access:

```
ipv6 access-group sampleipv6Group
```

The following removes the outbound access group flag for *sampleipv6Group*:

```
no ipv6 access-group sampleipv6Group out
```

ipv6 dns

Configures primary and secondary IPv6 Domain Name Service (DNS) servers.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 dns { primary | secondary } { ipv6_dns_address }
```

no

Deletes a previously configured DNS server.

primary

Configures the IPv6 address of primary DNS server for the APN.

secondary

Configures IPv6 address of the secondary DNS server for the APN. Only one secondary DNS server can be configured.

ipv6_dns_address

The IP address of the DNS server entered using IPv6 colon-separated notation.

Usage

DNS servers are configured on a per-APN profile basis. This allows each APN profile to use specific servers in processing PDP contexts.
The DNS can be specified at the APN level in APN configuration as well as at the Context level in Context configuration mode with **ip name-servers** command, or it can be received from AAA server.
When DNS is requested in PCO configuration, the following preference will be followed for DNS value:
1. DNS Values received from LNS have the first preference
2. DNS values received from RADIUS Server has the second preference
3. DNS values locally configured with APN has the third preference
4. DNS values configured at context level with **ip name-servers** command has the last preference.

Important: The same preference would be applicable for the NBNS (NetBIOS Name Service) servers to be negotiated via ICPC (Initial Connection Protocol Control) with the LNS (L2TP Network Server).

Example

The following command provides an example of setting the primary DNS server:

```
ipv6 dns primary fe80::c0a8:a04
```

ipv6 egress-address-filtering

Enables or disable IIPv6 egress address filtering. This function filters out packets not meant for the mobile interface ID. The GGSN records the source interface ID of all the packets received from the mobile node. When packets sent to the mobile node are received, the destination interface ID is compared against the list of recorded interface IDs and with the local interface-ID assigned to the MS during IPv6CP. If no match is found, the packet is dropped.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] ipv6 egress-address-filtering
```

no

Disables IPv6 egress address filtering.

Usage

Used to filter packets that arrive from the internet to a particular site.

Example

The following command provides an example disabling egress address filtering:

```
no ipv6 egress-address-filtering
```

ipv6 initial-router-advt

Creates an IPv6 initial router advertisement interval for the current APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ipv6 initial-router-advt { **interval** *int_value* | **num-advts** *num_value* }

[**default**] **ipv6 initial-router-advt** { **interval** | **num-advts** }

default

Resets interval or num-advts to their default setting.

interval *int_value*

Specifies the time interval (in milliseocnds) when the initial IPv6 router advertisement is sent to the mobile node as an integer from 100 through 16000. Default: 3000ms
value is .

num-advts value *num_value*

Specifies the number of initial IPv6 router advertisements sent to the mobile node as an integer from 1 through 16. Default: 3

Usage

This command is used to set the advertisement interval and the number of advertisements. Using a smaller advertisement interval increases the likelihood of router being discovered more quickly when it first becomes available.

Example

The following command specifies the initial ipv6 router interval to be 2000ms:

```
ipv6 initial-router-advt interval 2000
```

l3-to-l2-tunnel address-policy

Configures the address allocation/validation policy, when subscriber L3 (IPv4/IPv6) sessions are tunneled using an L2 tunneling protocol, such as L2TP.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
l3-to-l2-tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default l3-to-l2-tunnel address-policy
```

default

Restores the layer 3-to-layer 2 tunnel address policy parameter to the default setting of validation with no allocation.

alloc-only

Specifies that the system locally allocates and validates subscriber addresses. Default: Disabled

alloc-validate

Specifies that the system allocates addresses when IP addresses are dynamically assigned. The system does not validate the address specified by the subscriber. Default: Disabled

no-alloc-validate

Specifies that the system does not allocate or validate subscriber addresses locally for such sessions; it passes the address between remote tunnel terminator to the mobile node. Default: Enabled

Usage

This command can be useful for MIP HA sessions tunneled from the system using L2TP tunnels, or GGSN PDP contexts of type IP tunneled using L2TP to a remote LNS.

Example

The following command configures the system to locally allocate and validate subscriber addresses:

```
l3-to-l2-tunnel address-policy alloc-only
```

loadbalance-tunnel-peers

Configures how tunnel-peers are selected for this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

loadbalance-tunnel-peers { **balanced** | **prioritized** | **random** }

default loadbalance-tunnel-peers

default

Restores the loadbalance-tunnel-peers parameter to the default setting of random.

balanced

Tunnel-peer selection is made without regard to prioritization, but in a sequential order that balances the load across the total number of peer nodes available. Default: Disabled

prioritized

Tunnel-peer selection is made based on the priority configured for the peer. Default: Disabled

random

Tunnel-peer selection is random in order. Default: Enabled

Usage

Use this command to configure the load-balancing algorithm that defines how the tunnel-peers are selected by the APN when multiple peers are configured in the APN.

Example

The following command sets the APN to connect to tunnel-peers in a sequential order:

```
load-balancing balanced
```

long-duration-action detection

Sets the detection of a session that exceeds the long duration timer and sends notification.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
long-duration-action detection

default long-duration-action
```

default

Restores the long-duration-action parameter to its default setting of detection.

long-duration-action detection

Detects long duration sessions and sends SNMP TRAP and CORBA notification. This is the default behavior.
Default: Enabled

Usage

Use this command to detect a session that exceeds the limit set by the long duration timer.
Refer to the **timeout idle** and **timeout long-duration** commands for information on setting the long duration timer.

Example

Use the following command to enable detecting the session that exceeds the long duration timer:

```
long-duration-action detection
```

long-duration-action disconnection

Specifies what action is taken when the long duration timer expires.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
long-duration-action disconnection [ suppress-notification ] [ dormant-only ] +
```

long-duration-action disconnection

Detects a long duration session and disconnects the session after sending SNMP TRAP and CORBA notification. Default: Disabled

suppress-notifiaction

Suppress the SNMP TRAP and CORBA notification after detecting and disconnecting a long duration session. Default: Disabled

dormant only

Disconnects the dormant sessions after long duration timer and inactivity time with idle time-out duration expires. It sends the SNMP TRAP and CORBA notification after disconnecting a long duration session. Default: Disabled

Usage

Use this command to determine what action is taken when a session exceeds the limit set by the long duration timer.
Refer to the **timeout idle** and **timeout long-duration** command for information on setting the long duration timer.

Example

Use the following command to enable disconnecting sessions that exceed the long duration timer:

```
long-duration-action disconnection
```

Use the following command to disconnect the session that exceed the long duration timer without sending SNMP TRAP and CORBA notification:

```
long-duration-action disconnection suppress-notification
```

Use the following command to disconnect the session that exceed the long duration timer and also inactivity timer for idle time-out duration and send SNMP TRAP and CORBA notification:

```
long-duration-action disconnection dormant-only
```

Use the following command to disconnect the session that exceed the long duration timer and also inactivity timer for idle time-out duration without sending any SNMP TRAP and CORBA notification. If the session is idle and the session-idle-time >= inactivity time the session gets disconnected. Even if session is idle when

the long-duration timed-out and session-idle time < inactivity time the timer value is reset to idle-timeout time.

long-duration-action disconnection dormant-only suppress-notification

max-contexts

Configures the maximum number of PDP contexts (primary and secondary) that can be facilitated by the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

max-contexts [per-subscriber secondary *secondary_ctx* **] [primary** *number* **total** *total_number* **]**

default max-contexts

default

Restores the max-contexts parameter to its default settings of:

- **primary:** 1000000
- **total:** 1000000

per-subscriber secondary *secondary_ctx*

This keyword specifies the maximum number of secondary PDP contexts that can be facilitated by the APN per primary context (per-subscriber). Subscribers can have primary PDP and secondary PDP contexts; the secondary contexts share the same IP address as the primary.
secondary_ctx is an integer from 0 through 10. Default: 10

primary *number*

This keyword specifies the maximum number of primary PDP contexts that can be facilitated by the APN. Subscribers can have primary PDP and secondary PDP contexts; the secondary contexts can be configured using the **per-subscriber secondary** keyword.
number isbe an integer value from 1 to 4000000. Default: 4000000

total *total_number*

Specifies the maximum total number of PDP contexts (primary and secondary) that can be facilitated by the APN. *total_number* can be configured to any integer value from 1 to 4000000. Default: 4000000

Usage

This parameter can be used to configure a “soft” limit on the number of PDP contexts supported by a single APN.
Soft limits are based on measurements gathered at regular short intervals (several times per minute) as opposed to measurements taken in real-time. Therefore the sampled measurement may not match the actual number of PDP contexts currently being processed. Every PDP context request received is compared against the result of the last sample. If the sample is less than the soft limit configured, the request will be processed. If it is more, the request will be rejected.

Example

The following command specifies that the maximum number of primary PDP contexts the APN can facilitate is 500,000 while the maximum total number is 750,000:

```
max-contexts primary 500000 total 750000
```

mbms bmsc-profile

Applies a configured Broadcast-Multicast Service Center (BM-SC) profile to subscribers through APN for Multimedia Broadcast Multicast Service (MBMS) support and functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mbms bmsc-profile name *bmsc_profile_name*

[default | no] mbms bmsc-profile

default

Applies the default BMSC profile to the subscribers through the APN.

no

Deletes a previously associated BM-SC profile with this APN.

name *bmsc_profile_name*

Specifies a name for the BM-SC profile already configured in BMSC configuration mode.
bmsc_profile_name is an alphanumeric string of 1 through 79 characters that may contain dots (.) and/or dashes (-).

Usage

Use this command to associate a configured BM-SC profile to use for MBMS contexts with this APN for MBMS feature support.
For more information on BM-SC profile configuration, refer to the *BMSC Profile Configuration Mode Commands* chapter.
This command also configures the specific BM-SC profile to use for Internet Group Management Protocol (IGMP) JOIN requests received from PDP contexts with this APN.

Example

Following command applies a previously configured BM-SC profile named *bm_sc_1* to an APN within the specific context.

```
mbms bmsc-profile name bm_sc_1
```

mbms bearer timeout

Configures the session timeout values for the Multimedia Broadcast Multicast Service (MBMS) bearer contexts with this MBMS APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mbms bearer timeout { absolute | idle } *time*

[default | no] mbms bearer timeout { absolute | idle }

default

Sets the default value for the followed option for MBMS bearer context timeout.

no

Returns the timeout parameter to its default setting. If neither the absolute or idle keywords are used in conjunction with this keyword, both timeout options will be returned to their default settings.

absolute

Configures the absolute maximum time (in seconds) an MBMS bearer context may exist in any state (active or idle). Default: Disabled

idle

Default: Disabled
Configures the maximum amount of time (in seconds) an MBMS bearer context may be idle.

time

time can be any integer value between 0 and 4294967295. A time of 0 disables timeouts for this APN.
Default: 0

Usage

Use this command to limit the amount of time that an MBMS bearer context session can remain connected.

Example

The following commands enables an absolute time timeout of *60000* seconds for MBMS bearer context:

```
mbms bearer timeout absolute 60000
```

mbms ue timeout

Configures the session timeout values for the Multimedia Broadcast Multicast Service (MBMS) user equipment (UE) contexts with this MBMS APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mbms ue timeout absolute *time*

[default | no] mbms ue timeout absolute

default

Set the default value for the followed option for MBMS UE context timeout.

no

Returns the timeout parameter to its default setting. If neither the absolute or idle keywords are used in conjunction with this keyword, both timeout options will be returned to their default settings.

absolute *time*

Configures the absolute maximum time (in seconds) an MBMS UE context may exist in any state (active or idle). *time* can be any integer value between 0 and 4294967295. A time of 0 disables timeouts for this APN. Default: 0

Usage

Use this command to limit the amount of time that an MBMS UE context session can remain connected.

Example

The following commands enables an absolute time timeout of *60000* seconds for MBMS UE context:

```
mbms bearer timeout absolute 60000
```

mediation-device

Enables the use of a mediation device and specifies the system context to use for communicating with the device.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mediation-device [ context-name context_name ] [ delay-GTP-response ] [ no-early-PDUs ] [
no interims ] +

[ default | no ] mediation-device
```

+

Indicates that more than one of the options can be specified with a single execution of the command.

default

Changes the mediation device to no context-name configured and restores the mediation device's default properties.

no

Deletes the mediation-device configuration.

context-name *context_name*

Configures the mediation VPN context for this APN as an alphanumeric string of 1 through 79 characters that is case sensitive. If not specified, the mediation context is the same as the destination context of the subscriber. Default: The subscribers destination context.

delay-GTP-response

When enabled, delays the CPC response until an Accounting Start response is received from the mediation device. Default: Disabled

no-early-pdus

Specifies that the system delays PDUs from the MS until a response to the GGSN accounting start request is received from the mediation device. The PDUs are queued, not discarded. Default: Disabled
If "no-early-PDUs" is enabled, the chassis does not send uplink/downlink data from/to a MS until it receives the Acct-Rsp Start for the same from the mediation device. On receiving the Acct-Rsp, pending PDUs are forwarded. The chassis buffers up to two PDUs per call. As soon as the third PDU comes, the buffering is disabled and all the PDUs are forwarded for that call.
Configures the system to queue up to two PDUs until the mediation device returns a response to the system's accounting START request per 3GPP standards. On receiving the Accounting response message, the system forwards the subsequent PDUs without discarding any of the packets.

Important: For StarOS 10.0 and earlier releases, the system buffers up to four PDUs and queues or discards the remaining PDUs.

Important: For StarOS 11.0 and later releases, the system is configured so that none of the PDUs are discarded.

no-interims

Disables sending interims to the mediation server. Default: Disabled

Important: Different commands are used to disable RADIUS interims for RADIUS accounting and mediation accounting. To disable RADIUS interims for mediation accounting, use the following command: **mediation-device context-name** *context_name* **no-interims**. To disable RADIUS interims for RADIUS accounting, use the following command: **accounting-mode radius-diameter no-interims**.

Usage

This command enables mediation device support for the APN. Mediation devices can be either deep-packet inspection servers or transaction control servers.
Keywords to this command can be used in combination to each other, depending on configuration requirements.

Example

The following command enables mediation device support for the APN and uses the protocol configuration located in an system context called *ggsn1*:

```
mediation-device context-name ggsn1

mediation-device context-name ggsn1 no-interims no-early-pdus

mediation-device no-early-pdus no-interims

mediation-device no-interims no-early-pdus
```

The following command enables mediation device support for the APN and uses the protocol configuration located in the subscribers destination context:

```
mediation-device
```

mobile-ip home-agent

Configures the IP address of the home agent (HA) used by the current APN to facilitate subscriber Mobile IP sessions.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

mobile-ip home-agent *ip_address* **[alternate]**

no mobile-ip home-agent *ip_address* **alternate**

default mobile ip home-agent

default

Restores the APN mobile-ip parameters to the default setting, no HA address defined.

no

Removes a previously configured HA address.

ip_address

Specifies the IP address of the HA expressed in IPv4 dotted-decimal notation.

alternate

Designates this Mobile IP HA as the alternate that will be used in the event of a fail-over.

Usage

If the APN is configured to support Mobile IP for all PDP contexts it is facilitating, this command specifies the IP address of the HA that is to be used.

Example

The following command configures an HA IP address of 192.168.1.15:

```
mobile-ip home-agent 192.168.1.15
```

mobile-ip mn-aaa-removal-indication

Configures the system to remove various information elements when relaying Registration Request messages to the HA.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] mobile-ip mn-aaa-removal-indication
```

default

Sets the default setting for mobile IP MN-AAA-Removal-Indication.

no

Disables this functionality. This is the default setting.

Usage

When this functionality is enabled, the MN-FA challenge and MN-AAA authentication extensions are removed when relaying a Registration Request (RRQ) to the HA.

mobile-ip mn-ha-hash-algorithm

Designates the encryption algorithm to use for Hash-based Message Authentication Code (HMAC).

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
mobile-ip mn-ha-hash-algorithm { hmac-md5 | md5 | rfc2002-md5 }

default mobile-ip mn-ha-hash-algorithm
```

default

Designates the default encryption algorithm to use.

hmac-md5 | md5 | rfc-2002-md5

Default: hmac-md5
The encryption algorithms that may be used.

Usage

Provides security by encrypting the data.

Example

The following command sets encryption for md5:

```
mobile-ip mn-ha-hash-algorithm md5
```

mobile-ip mn-ha-shared-key

Configures the subscriber MobileNode-Home Agent (MN-HA) shared key.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mobile-ip mn-ha-shared-key *key*

no mobile-ip mn-ha-shared-key

no

Disables this functionality. This is the default setting.

key

Specifies the subscriber MN-HA shared key as either an alphanumeric string or a hexadecimal number sequence beginning with "0x". The string or sequence consists of 16 to 127 characters.

Usage

Configures a shared key for the APN.

Example

The following command configures a shared key as the alphanumeric string *sfd23408imi9yn*:

```
mobile-ip mn-ha-shared-key sfd23408imi9yn
```

mobile-ip mn-ha-spi

Configures the Mobile IP Security Parameter Index (SPI).

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

mobile-ip mn-ha-spi *spi_number*

no mobile-ip mn-ha-spi

no

Disables this functionality. This is the default setting.

spi_number

Specifies the SPI as an integer from 256 through 4294967295.

Usage

Configures an SPI for the APN.

Example

The following command configures an SPI of *151111111111111111111111111111111*:

```
mobile-ip mn-ha-spi 151111111111111111111111111111111
```

mobile-ip required

Enables support for Mobile IP functionality for all PDP contexts facilitated by the current APN.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] mobile-ip required
```

default

Applies the default setting for mobile-ip for the APN. Default is disabled.

no

Disables mobile-ip for the APN.

Usage

Mobile IP functionality for IP PDP contexts is only supported at the APN-level. This command enables or disables Mobile IP support for the APN.
When Mobile IP is performed, the system authenticates the subscriber and the Mobile IP FA.
If this option is enabled, the system deletes all PDP contexts attempting to access the APN for which a Mobile IP session can not be established.

mobile-ip reverse-tunnel

Configures the system to support reverse-tunneling for Mobile IP sessions facilitated by the current APN.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] mobile-ip reverse-tunnel
```

default

Designates the default reverse tunnel for the APN. The default is enabled.

no

Disables this functionality.

Usage

Use this command to enable support for Mobile IP reverse tunneling for the APN. Reverse tunneling is enabled by default.

nai-construction

Configures the Network Access Identifier (NAI) construction parameters on a per-APN basis only, rather than by per-aaa-group when constructed NAI authentication is enabled.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

nai-construction { imsi | msisdn } [override-null-username] [encrypted password *encrypt_password* **| use-shared-secret-password | password** *password* **]**

no nai-construction

no

Disables the NAI construction at the APN level.

imsi

Enables NAI construction using IMSI for authentication for a user. GGSN constructs NAI using IMSI when no user-name is received. This is the default setting. Default: Enabled

msisdn

Enables NAI construction using Mobile Station International ISDN Number (MSISDN) for authentication for a user. GGSN constructs NAI using MSISDN when no user-name is received.

override-null-username

Enables NAI construction using IMSI/MSISDN for authentication for a user or when empty user name is received.

encrypted password

Specifies an encrypted password is to be used for this NAI-constructed user. *string* is an alphanumeric string of 0 through 63 characters.

password

Configures the authentication user-password for this NAI-constructed user. *password* is an alphanumeric string of 0 through 63 characters.

use-shared-secret-password

Specifies use of the RADIUS authentication shared secret password for this NAI-constructed user.

Usage

NAI-construction defines the behavior for construction at the APN level. If defined for a particular APN, this command works independently and overwrites the behavior of aaa constructed-nai defined at the context level for calls involving this APN.
Note that NAI construction using IMSI or MSISDN, where either no user name is received or a blank user name is received for authentication, is applicable only when NAI constructed authentication is enabled using the **aaa nai-construction authentication** command in Context Configuration Mode.

Example

The following command enables NAI-construction using IMSI as the authentication type with an encrypted password:

```
nai-construction imsi encrypted password s1289sf980333jwwdo97342
```

nbns

Configures and enables use of NetBios Name Service (NBNS) for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] nbns { primary | secondary } *IP_address*

no

Removes/disables use of a previously configured NetBios Name Service.

primary

Designates primary NBNS server. Must be followed with an IPv4 address in dotted-decimal notation.

secondary

Designates secondary/failover NBNS server. Must be followed with an IPv4 address in dotted-decimal notation.

IP_address

Specifies the IP address in IPv4 dotted-decimal notation.

Usage

This command specifies NBNS parameters. The NBNS option is present for both pdp type IP and pdp type PPP for GGSN.
The system can be configured to use NetBios Name Service for the APN.

Example

The following command configures the APN's NetBios Name Service to primary IP 192.168.1.15.

```
nbns primary 192.168.1.15
```

nexthop-forwarding-address

Configures the next hop forwarding address for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

nexthop-forwarding-address *ip_address*

no nexthop-forwarding-address

no

Disables this function. This is the default setting.

ip_address

Specifies the IP address of the nexthop forwarding address in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to configure the next hop forwarding address for the APN.

Example

The following command configures the next hop forwarding address to 10.1.1.1:

```
nexthop-forwarding-address 10.1.1.1
```

npu qos

Configures an NPU QoS priority queue for packets facilitated by the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator\

Syntax

npu qos traffic priority { best-effort | bronze | derive-from-packet-dscp | gold | silver }

default npu qos traffic priority

default

Configures the default NPU QoS traffic priority.

traffic priority { best-effort | bronze | derive-from-packet-dscp | gold | silver }

best-effort: Assigns the best-effort queue priority. This is the lowest priority.
bronze: Assigns the bronze queue priority. This is the third-highest priority.
derive-from-packet-dscp: Specifies that the priority is to be determined from the DSCP (Differentiated Services Code Point) field in the packet's TOS octet. Default: Enabled
gold: Assigns the gold queue priority. This is the highest priority.
silver: Assigns the silver queue priority. This is the second-highest priority.

Usage

This command is used in conjunction with the Network Processing Unit (NPU) Quality of Service (QoS) functionality.
The system can be configured to determine the priority of a subscriber packet either based on the configuration of the APN, or from the differentiated service (DS) field in the packet's TOS octet (representing the differentiated service code point (DSCP) value).
Refer to the *GGSN Administration Guide* for additional information on NPU QoS functionality.

Example

The following command configures the APN's priority queue to be *gold*:

```
npu qos traffic priority gold
```

outbound

Configures the APN host username and password.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
outbound { [ encrypted ] password pwd | username name }

no outbound password | username
```

no

Removes previously configured outbound information for the APN.

encrypted

The **encrypted** keyword is intended only for use by the chassis while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

password *pwd*

Specifies the password to use for session authentication as an alphanumeric string of 1 through 132 characters that is case sensitive.

username *name*

Specifies the username to use for session authentication as an alphanumeric string of 1 to 127 characters that is case sensitive.

Usage

This command can be used to provide a username and password for authentication when the subscriber does not supply one in accordance with 3GPP standards. In addition, it can be used to create a PPP session when using L2TP to tunnel IP PDP contexts.
If only a username is specified using this command, the password is determined based on the setting of the **aaa constructed-nai** command in the Context Configuration mode. That command is also used to determine the password if an outbound username and password are configured for the APN when the imsi-auth keyword is specified for the **authentication** command in this mode.

Example

The following commands configures an APN username of *isp1* and a password of *secRet123*.

```
outbound username isp1

outbound password secRet123
```

p-cscf

Enables use of locally configured Proxy Call Session Control Function (P-CSCF) addresses or a Fully Qualified Domain Name (FQDN).

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

p-cscf { fqdn *fqdn* **| primary [ip** *IPv4_address* **| ipv6** *IPv6_address* **] | secondary [ip** *IPv4_address* **| ipv6** *IPv6_address* **] }**

no p-cscf { fqdn | primary [ip | ipv6] | secondary [ip | ipv6] }

no

Disables use of previously configured P-CSCF addresses or FQDN.

fqdn *fqdn*

Configures the P-CSCF FQDN server name for the APN as an alphanumeric string of 1 through 256 characters.

primary [ip*IPv4_address* **| ipv6** *IPv6_address* **]**

Specifies the primary P-CSCF address for the APN.
IPv4_address must be expressed in IPv4 dotted-decimal notation.
IPv6_address must be expressed in IPv6 colon-separated notation.

secondary [ip *IPv4_address* **| ipv6** *IPv6_address* **]**

Specifies the secondary P-CSCF address for the APN.
IPv4_address must be expressed in IPv4 dotted-decimal notation.
IPv6_address must be expressed in IPv6 colon-separated notation.

Usage

Use this command to specify the P-CSCF addresses or FQDN server name associated with this APN.

Example

The following command enables a P-CSCF with the primary IPv4 address *10.2.3.4* for the APN:

```
p-cscf primary ip 10.2.3.4
```

The following command enables a P-CSCF with FQDN server name *pcscfalias1.ind.pun.cisco.com* for the APN:

```
p-cscf fqdn pcscfalias1.ind.pun.cisco.com
```

pdp-type

Configures the type of PDP contexts that are supported by this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
pdp-type { ipv4 [ ipv6 ] | ipv6 [ ipv4 ] | ppp }

default pdp-type
```

default

Configures the default PDP type, IPv4, for the APN.

ipv4 [ipv6]

Enables support for IPv4 PDP contexts. Also enables support for IPv6 if the IPv6 optional keyword is entered in this command. Default: Enabled

Important: Entering both IPv4 and IPv6 in either order enables support for both.

ipv6 [ipv4]

Enables support for IPv6 PDP contexts. Also enables support for IPv4 if the IPv6 optional keyword is entered in this command. Default: Disabled

Important: Entering both IPv4 and IPv6 in either order enables support for both.

ppp

Enables support for PPP PDP contexts. Default: Disabled

Usage

IP PDP context types are those in which the MS is communicating with a PDN such as the Internet or an intranet using IP. PPP PDP contexts are those in which PPP or PPP Network Control Protocol (NCP) frames from the MS are either terminated at, or forwarded by the GGSN.
If a session specifies a PDP type that is not supported by the APN, the system rejects the session with a cause code of 220 (DCH, Unknown PDP address or PDP type).

Caution: For the IPv6 calls to work, the destination context must have at least one IPv6 interface configured.

Example

The following command configures the APN to support PPP context types:

```
pdp-type ppp
```

permission

Enables the ability to use network mobility service (NEMO) functionality for the current APN.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] permission nemo

default permission
```

no | default

Disables the ability to use NEMO functionality.

nemo

Enables the ability to use NEMO functionality.

Usage

Use this command to enable support for NEMO functionality on the APN. NEMO is disabled by default.

Example

The following command enables NEMO functionality:

```
permission nemo
```

The following command disables NEMO functionality:

```
no permission nemo
```

policy

Configures the Mobile IPv6 policy to set the action to be taken when IPv4/IPv6 subscriber packets need to be tunneled and the encapsulated packets exceed the tunnel maximum transmission unit (MTU).

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

```
policy ipv6 tunnel mtu exceed { fragment [ inner ] | notify-sender }

[ default | no ] policy ipv6 tunnel mtu exceed
```

default

IPv6: System will do a Path MTU (PMTU) discovery and send "ICMPv6 Packet Too Big" to the original sender if the subscriber packet exceeds MTU after encapsulation.
IPv4: System will do an outer IPv6 fragmentation if the packet exceeds MTU after encapsulation.

no

Disables this functionality.

ipv6 tunnel mtu exceed { fragment [inner] | notify-sender }

fragment: System will do an outer IPv6 fragmentation if the subscriber packet exceeds MTU after encapsulation.
inner:
IPv6: System will do a PMTU discovery and send "ICMPv6 Packet Too Big" to the original sender if the subscriber packet exceeds MTU after encapsulation.
IPv4: If packet will exceed tunnel MTU after encapsulation, based on DF bit and ignore-df config, the original IPv4 packet will be fragmented and then encapsulated so that it will not exceed MTU, or ICMP Error will be sent if IPv4 packet fragmentation is not allowed.
notify-sender:
IPv6: System will do a PMTU discovery and send "ICMPv6 Packet Too Big" to the original sender if subscriber packet exceeds MTU after encapsulation.
IPv4: System will do an outer IPv6 fragmentation if packet exceeds MTU after encapsulation.

Usage

This command sets the Mobile IPv6 policy for the action to be taken when IPv4/IPv6 subscriber packets need to be tunneled and the encapsulated packets exceed tunnel MTU size.

Example

The following command causes the system to do outer IPv6 fragmentation if the subscriber packet exceeds MTU after encapsulation:

```
policy ipv6 tunnel mtu exceed fragment
```

ppp

Configures the Point-to-Point Protocol (PPP) options for the current APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

ppp { **data-compression** { **protocols** *protocols* | **mode** *modes* } | **keepalive** *seconds* | **min-compression-size** *min_octets* | **mtu** *max_octets* }

default ppp { **data-compression protocols** | **keepalive** | **min-compression-size** | **mtu** }

no ppp { **data-compression protocols** | **keepalive** *seconds* | **mtu** }

default

Configures the default PPP parameters for the specified APN.

no

Resets the option specified to its default setting.

data-compression { mode *modes* **| protocols** *protocols***}**

Configures the data compression or the compression protocol to use for the APN. Default: all protocols enabled

mode *modes*: Sets the compression mode to one of the following:

- **normal**: Packets are compressed using the packet history for automatic adjustment and for best compression.
- **stateless**: Each packet is compressed individually.

protocols *protocols*: Sets the compression protocol to one of the following:

- **deflate**: DEFLATE algorithm
- **mppc**: Microsoft Point-to-Point Compression
- **stac**: STAC LZS algorithm

keepalive *seconds*

Specifies the frequency of sending the Link Control Protocol (LCP) keep alive messages. *seconds* must be either 0 or an intgeger from 5 through 14400. The special value 0 disables the keep alive messages entirely. Default: 30

min-compression-size *min_octets*

Specifies the smallest packet to which compression may be applied as an integer from 0 through 2000. Default: 128

mtu *max_octets*

Specifies the maximum transmission unit (MTU) for packets accessing the APN as an integer from 100 through 2000. Default: 1500

Important: The MTU refers to the PPP payload which excludes the two PPP octets. Therefore, an MTU of 1500 corresponds to the 3GPP standard MTU of 1502 for GTP packets with PPP payloads.

Usage

Adjust packet sizes and compression to improve bandwidth utilization. Each network may have unique characteristics such that determining the best packet size and compression options may require system monitoring over an extended period of time.

Example

The following command configures the ppp data-compression mode for the APN to be *stateless*:

```
ppp data-compression mode stateless
```

The following command configures an MTU of *500* for the APN:

```
ppp mtu 500
```

proxy-mip

Configures support for Proxy Mobile IP functionality for the APN.

Product

GGSN, FA, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] proxy-mip { required | null-username static-homeaddr }
```

default

Configures the default proxy MIP setting for the specified APN

no

Disables this functionality.

required

Default: Disabled.
Enables proxy-mip for all subscribers using this APN.

null-username static-homeaddr

Configures handling of RRQ to enable the acceptance without an NAI extension in this APN. Default: Disabled

Usage

This command requires that Proxy Mobile IP functionality be performed for all PDP contexts facilitated by the APN.
When Proxy Mobile IP is performed, the system performs subscriber authentication but not Mobile IP FA authentication. It can be configured to handling of RRQ without NAI extension in an APN.
More information about Proxy Mobile IP support for the GGSN can be found in the *GGSN Administration Guide*.

Example

The following command causes the system to support Proxy Mobile IP for all PDP contexts facilitated by the APN:

```
proxy-mip required
```

The following command will enables the accepting of RRQ without NAI extensions in this APN.

```
proxy-mip null-username static-homeaddr
```

qos negotiate-limit

Cconfigures the QoS profile to provide the peak and committed data rate limits that the GGSN assigns to the APN. The GGSN sends the QoS profile to the SGSNs in response to GTP Create/Update PDP Context requests for traffic shaping and policing functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
qos negotiate-limit direction { downlink | uplink } [ qci qci_val ] [ peak-data-rate bps
[ committed-data-rate bps ] | committed-data-rate [ peak-data-rate bps ] ]

no qos negotiate-limit direction { downlink | uplink } [ qci qci_val ] }
```

no

Disables the QoS Profile for the APN.

Important: When no QoS Profile is configured, the system's default behavior is to use the information provided by the SGSN.

direction { downlink | uplink }

downlink: Apply the specified limits and actions to the downlink (to-Gn direction).
uplink: Apply the specified limits and actions to the uplink (to-Gi direction).

qci *qci_val*

qci_val is the QoS Class Identifier (QCI) for which the negotiate limit is being set. QCI ranges from 1 to 9. If no qci-val is configured, it will be handled as an undefined-qci (same as undefined-qos class).

committed-data-rate *bps*

Default: See the *Usage* section for this command
The committed data rate (guaranteed-data-rate) in bps (bits per second).
bps must be an integer from 1 through 16000000 for the downlink direction or 1 through 8640000 for the uplink direction. The value must also correspond to one of the permitted values identified the tables below. If a non-permitted value is entered for this parameter, the system rounds the value to the nearest lower supported value, except in the case where value is less than 1,000 bps. In this case, the system rounds the value to 1,000 bps. In addition, if the configured committed rate is lower than the value configured for the peak-data-rate, the system uses the configured peak rate for this parameter.

Important: System measurements for this value exclude the GTP and outer packet headers. In addition, some traffic classes have both a committed rate and a peak rate, while other traffic classes have just a peak rate. If a committed rate is not applicable (such as, the traffic class is **background** or **interactive**), an error occurs if this option is configured. If the committed-rate is applicable (such as, the traffic class is **conversational** or **streaming**), the values supplied by the SGSN are used if this option is not configured.

peak-data-rate *bps*

Default: See the *Usage* section for this command
Specifies the peak data-rate for the subscriber in bps (bits per second).
bps must be an integer from 1 through 16000000 for the downlink direction or 1 through 8640000 for the uplink direction. The value must also correspond to one of the permitted values identified in the tables below. If a non-permitted value is entered for this parameter, the system rounds the value to the nearest lower supported value, except in the case where value is less than 1,000 bps. In this case, the system rounds the value to 1,000 bps.

Usage

This command configures the APN quality of service (QoS) profile. This feature enables configuring and enforcing bandwidth limitations on individual PDP contexts of a particular traffic class. Traffic classes are defined in 3GPP TS 23.107 and are negotiated during PDP context activation. Bandwidth enforcement is configured and enforced independently for the downlink and the uplink directions.
The profile information is sent to the SGSN(s) in response to GTP Create/Update PDP Context Request messages. If the QoS profile requested by the SGSN is lower than the configured QoS profile configured, the profile requested by the SGSN is used. If the QoS profile requested by the SGSN is higher, the configured rates are used.
Note that the values for the uplink/downlink committed-data-rate and peak-data-rate parameters are exchanged in the GTP messages between the GGSN and the SGSN. Therefore, the values used may be lower than the configured values. When negotiating the rate with the SGSN(s), the system convert this to a value that is permitted by GTP as shown in the tables below.

Table 9. Permitted Values for Committed and Peak Data Rates in GTP Messages

Value (bps)	Increment Granularity (bps)
From 1000 to 63,000	1,000 (e.g 1000, 2000, 3000, ... 63000)
From 64,000 to 568,000	8,000 (e.g. 64000, 72000, 80000, ... 568000)
From 57,6000 to 8,640,000	64,000 (e.g. 576000, 640000, 704000, ... 86400000)
From 8,700,000 to 16,000,000	100,000 bps (e.g. 8700000, 8800000, 8900000, ... 16000000)

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN (such as, it accepts all of the SGSN-provided values for the PDP context.

Important: This command should be used in conjunction with the **max-contexts** command to limit the maximum possible bandwidth consumption by the APN.

Additional information on the QoS traffic shaping functionality is located in the *System Administration Guide*.
Default Values:

Example

The following command sets an uplink peak data rate of 128000 bps for QoS negotiation limit:

```
qos negotiate-limit direction uplink peak-data-rate 128000
```

qos rate-limit

Configures the action on a subscriber traffic flow that violates or exceeds the peak/committed data rate under traffic policing/shaping functionality.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
qos rate-limit direction { downlink | uplink } [ qci qci_val ] [ burst-size { bytes |
auto-readjust [ duration dur ] } ] [ exceed-action { drop | lower-ip-precedence |
transmit } [ violate-action { drop | lower-ip-precedence | shape [ transmit-when-buffer-
full ] | transmit } ] ] | [ violate-action { drop | lower-ip-precedence | shape [
transmit-when-buffer-full ] | transmit } [ exceed-action { drop | lower-ip-precedence |
transmit } ] ] +

no qos rate-limit direction { downlink | uplink } [ qci qci_val ]
```

no

Disables the QoS data rate limit configuration for the APN.

Important: When no Qos Profile is configured, the system defaults to using the information provided by the SGSN.

qos rate-limit direction { downlink | uplink }

downlink: Apply the specified limits and actions to the downlink (the Gn direction).
uplink: Apply the specified limits and actions to the uplink (the Gi direction).

qci *qci_val*

qci_val is the QoS Class Identifier (QCI) for which the negotiate limit is being set. QCI ranges from 1 to 9. If no qci-val is configured, it will be handled as an undefined-qci (same as undefined-qos class).

burst-size { *bytes* | auto-readjust [duration *dur*] }

Default: See Usage section for this command
The burst size allowed, in bytes for peak data rate and committed data rate.
bytes must be an integer from 1 through 6000000.

Important: It is recommended that the minimum value of this parameter be configured to the greater of the following two values: 1) three times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the “bucket” for the configured peak-data-rate. In addition, if the committed-data-rate parameter is specified, the burst-size is applied to both the committed and peak rates.

auto-readjust [duration *dur* **]** keyword provides the option to calculate the Burst size dynamically while configuring the rate-limit. Whenever this keyword is enabled to calculate burst size, the GGSN QoS negotiated rate is enforced for this calculation.
Whenever there is a change in the rates (due to a QoS update), the burst sizes will be updated accordingly. This keyword also provides two different burst sizes. One burst size for peak rate and another for committed rate.
By default this keyword is disabled.
duration *dur* describes the duration of burst in seconds. If duration is not specified this keyword will use 1 second as default value. *dur* must be an integer between 1 through 30.

---

exceed-action { drop | lower-ip-precedence | transmit }

Default: See the *Usage* section for this command
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **drop**: Drop the packet
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence
- **transmit**: Transmit the packet

---

violate-action { drop | lower-ip-precedence | shape [transmit-when-buffer-full] | transmit }

Default: See he *Usage* section for this command
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:
drop: Drop the packet
lower-ip-precedence: Transmit the packet after lowering the IP precedence
shape [transmit-when-buffer-full]: Enables traffic shaping and provides the buffering of user packets when subscriber traffic violates the allowed peak/committed data rate. The **transmit-when-buffer-full** keyword allows the packet to be transmitted when buffer memory is full.
transmit: Transmit the packet

+

More than one of the above keywords can be entered within a single command.

Usage

This command configures APN quality of service (QoS) data rate shaping through traffic policing/shaping. This command enables the actions on subscriber flows exceeding or violating the allowed peak/committed data rate. The shaping function also provides an enhanced function that buffers the excessive user packets and sends them to the subscriber when subscriber traffic goes below the committed or peak data rate limit.

Important: The user packet buffer function in traffic shaping is not applicable for real-time traffic.

Important: If the exceed/violate action is set to “lower-ip-precedence”, this command may override the configuration of the **ip qos-dscp** command in the GGSN Service Configuration mode for packets from the GGSN to the SGSN. In addition, the GGSN service **ip qos-dscp** command configuration can override the APN setting for packets from the GGSN to the Internet. Therefore, it is recommended that this command not be used in conjunction with this action.

The command can be entered multiple times to specify different combinations of direction and class. If this command is not configured at all, the GGSN does not perform traffic policing or QoS negotiation with the SGSN. (It accepts all of the SGSN-provided values for the PDP context.)

Important: This command should be used in conjunction with the **max-contexts** command to limit the maximum possible bandwidth consumption by the APN.

To calculate the burst size dynamically an optional keyword **auto-readjust** [**duration** *dur*] is provided with the **burst-size** keyword. By default the burst size is fixed if defined in bytes with this command. Regardless of the rate being enforced, burst-size is fixed as set by the **burst-size** *bytes* parameter.
The **auto-readjust** [**duration** *dur*] keyword enables variable burst size depending on the rate being enforced. the system calculates burst size using a per token bucket algorithm calculation as T=B/R, where T is the time interval, B is the burst size and R is the Rate being enforced. It also provides different burst size for Peak and Committed data rate-limiting.
If the **auto-readjust** keyword is not used, a fixed burst size must be defined which will be applicable for peak data rate and committed data rate regardless of the rate being enforced.
If the **auto-readjust** keyword is provided without specifying the duration, a default duration of 1 second will be used for burst size calculation.

Example

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command buffers the excess user packets when the subscriber traffic violates the configured peak or committed data-rate bps in uplink direction. Once the peak/committed data rate for that subscriber goes below the configured limit, the system transmits the packets. It also transmits them if buffer memory is full:

```
qos rate-limit direction uplink violate-action shape transmit-when-
buffer-full
```

qos-renegotiate

This keyword is obsolete.

qos traffic-police

This command is obsolete. This functionality is now supported through **`qos negotiate-limit`** and **`qos rate-limit`** commands.

radius

This command is obsolete.

radius group

This command is obsolete.

radius returned-framed-ip-address

Sets the policy whether or not to reject a call when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
radius returned-framed-ip-address 255.255.255.255-policy { accept-call-when-ms-ip-not-supplied | reject-call-when-ms-ip-not-supplied }

default radius returned-framed-ip-address 255.255.255.255-policy
```

default

Set the policy to its default of rejecting calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.

{ accept-call-when-ms-ip-not-supplied | reject-call-when-ms-ip-not-supplied }

accept-call-when-ms-ip-not-supplied: Accept calls when the RADIUS server does not supply a framed IP address and the MS does not supply and address.
reject-call-when-ms-ip-not-supplied: Reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address.

Usage

Use this command to set the behavior in the APN when the RADIUS server supplies 255.255.255.255 as the framed IP address and the MS does not supply an address.

Example

Use the following command to set the APN to reject calls when the RADIUS server does not supply a framed IP address and the MS does not supply an address:

```
radius returned-framed-ip-address 255.255.255.255-policy reject-call-when-ms-ip-not-supplied
```

radius returned-username

Configures the username that is returned in accounting messages. If the username is not available in the Protocol Configuration Options (PCO), the RADIUS returned username is preferred to the constructed username (imsi@apn, msisdn@apn, or outbound username).

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
radius returned-username { override-constructed-username | prefer-constructed-username }

default radius returned-username
```

default

The default value for the RADIUS returned-username is prefer-constructed-username. The constructed username (imsi@apn, msisdn@apn) will be used.

Important: If the username is available in the PCO, that username will be used regardless of the setting for this command (radius returned-username).

override-constructed-username

If the RADIUS server returns a username in the Access-Accept message and that username is not available in the Protocol Configuration Options (PCO), the new username from the RADIUS server will be used.

prefer-constructed-username

If the username is not available in the PCO, a constructed username (imsi@apn, msisdn@apn) will be used regardless of the username from the RADIUS server. This is the default.

Usage

Use this command to configure the username that is returned in accounting messages

Example

Following command sets the default value for the RADIUS returned-username is prefer-constructed-username [constructed username (imsi@apn, msisdn@apn)]:

```
default radius returned-username
```

restriction-value

Configures the level of restriction to ensure controlled co-existence of the Primary PDP Contexts.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

restriction-value *value*

[default | no] restriction-value

default | no

Default: no restriction-value
Entering either **default** or **no restriction-value** sets the internal value to zero (0) so that connection to any APN is allowed.

value

Specifies a unique number that identifies the type of network supported for primary PDP contexts facilitated by this APN. The following values are supported:

- *1*: Value used for Wireless Application Protocol (WAP) or Multimedia Messaging Service (MMS) type of networks. This corresponds to APN type public-1.
- *2*: Value used for Internet or Packet-Switched Public Data Network (PSPDN) type of networks. This corresponds to APN type public-2.
- *3*: Value used for corporate customers who use MMS. This corresponds to APN type private-1.
- *4*: Value used for corporate who do not use MMS. This corresponds to APN type private-2.

Usage

Restricts the ability to have connections to public access and certain private APNs as required by the APN configuration. Also allows co-existence of the Primary PDP Contexts in a controlled manner.
It does not restrict the total number of Primary PDP Contexts for the user. It also configures a method for preventing hackers in the public domain from using the UE as a router.
Access is provided based on the following rules:

- If *value* = 1, then PDP contexts with restriction values of 0, 1, 2, and/or 3 are allowed
- If *value* = 2, then PDP contexts with restriction values of 0, 1 and/or 2 are allowed
- If *value* = 3, then PDP contexts with restriction values of 0 and/or 1 are allowed
- If *value* = 4, then PDP contexts with no restriction values are allowed
- If **default** or **no** syntax is entered, then no PDP contexts have restriction

In the event that a Maximum APN Restriction value is received from the SGSN as part of a PDP Context Create (CPCR) or Update (UPCR) message, the GGSN allows the request based on the following matrix:

- If maximum = 0, then allow connection to any APN
- If maximum = 1, then allow APN Restriction values of 0, 1, 2, and/or 3

- If maximum = 2, then allow APN Restriction values of 0, 1 and/or 2
- If maximum = 3, the allow APN Restriction values of 0 and/or 1
- If maximum = 4, then always reject
- If maximum = anything else, then allow all APN Restriction values (1, 2, 3, and/or 4)

Refer to 3GPP 23.060 version 6.9.0 for more information.

Example

The following command sets the restriction value of the APN to *2*:

```
restriction-value 2
```

secondary ip pool

This command specifies a secondary IP pool to be used as backup pool for Network Address Translation (NAT).

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

secondary ip pool *pool_name*

no secondary ip pool

no

Removes the previous secondary IP pool configuration.

pool_name

Specifies the secondary IP pool name.
pool_name must be an alphanumeric string of 1 through 31 characters.

Usage

Use this command to configure a secondary IP pool for NAT subscribers, which is not overwritten by the RADIUS supplied list. The secondary pool configured will be appended to the RADIUS supplied IP pool list / APN provided IP pool list whichever is applicable during call setup.

Important: This command is license dependent, requiring the 600-00-7871 NAT Bypass license. Please contact your local sales representative for more information.

Example

The following command configures a secondary IP pool named *test123*:

```
secondary ip pool test123
```

selection-mode

Configures the level of verification that will be used to ensure a mobile station's subscription to use this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
selection-mode { chosen-by-sgsn | sent-by-ms | subscribed } +

default selection-mode
```

default

Sets the default selection mode as "subscribed".

chosen-by-sgsn

Default: Disabled
The MS's subscription will not be verified and the APN will be provided by the SGSN.

sent-by-ms

Default: Disabled
The MS's subscription will not be verified and the APN will be provided by the MS.

subscribed

Default: Enabled
The MS's subscription will be verified by the SGSN.

+

More than one of the above keywords can be entered within a single command.

Usage

Use this command to specify the level of verification that will be used to ensure a MS's subscription to use this APN. This setting must mach the corresponding setting on the SGSN. If the two settings are not identical, the GGSN rejects the session with a cause code of 201 (D1H, User authentication failed).

Example

The following command specifies that the MS's subscription will not be verified and that the APN name will be supplied by the SGSN:

```
selection-mode chosen-by-sgsn
```

timeout

Configures the session timeout values for this APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

timeout { absolute | qos-renegotiate } *time*

[default | no] timeout [absolute | qos-renegotiate]

default

Set the default value for the followed option.

no

Returns the timeout parameter to its default setting. If neither the absolute or idle keywords are used in conjunction with this keyword, both timeout options will be returned to their default settings.

absolute

Configures the absolute maximum time a session may exist in any state (active or idle).

qos-renegotiate

This keyword is obsolete.

time

Default:
- absolute = 0 (Disabled)
- qos-renegotiation = 300

Measured in seconds, the time can be configured to any integer value between 0 and 4294967295.
A time of 0 disables timeouts for this APN.

Usage

Use this command to limit the amount of time that a subscriber session can remain connected or as a QoS renegotiation dampening timer.

Example

The following commands enables an absolute time timeout of *60000* seconds:

```
timeout absolute 60000
```

timeout bearer-inactivity

This command configures the bearer inactivity timer and the threshold value of the traffic (uplink + downlink) through an APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

timeout bearer-inactivity *time* **volume-threshold total** *bytes*

[default | no] timeout bearer-inactivity

default

Sets the bearer inactivity timer to disabled mode.

no

Removes the configured bearer inactivity timer values and traffic threshold limit.

time

Specifies the timeout duration in second to check inactivity on the bearer.
time must be an integer value from 3600 through 2592000.

qos-renegotiate

Configures the dampening timeout value for the QoS renegotiation (in seconds).
In the event of a QoS upgrade, the specified timeout duration will be ignored and renegotiation will start immediately.

volume-threshold total *bytes*

The keyword sets the volume threshold in bytes to check the low activity on the bearer. This total volume is the sum of the traffic in uplink and downlink directions.
bytes must be an integer value from 1 through 4294967295.

Usage

Use this command to configure the bearer inactivity timer and the threshold value of the traffic (uplink + downlink) through an APN.

Example

The following command enables the inactivity time on the bearer with a timeout duration of *7200* seconds and the total traffic volume of *256000* bytes in uplink and downlink directions as thresholds:

```
timeout bearer-inactivity 7200 volume-threshold total 25600
```

timeout emergency-inactivity

Configures the emergency session inactivity-timeout for this APN. The APN must be configured as an emergency APN for Voice over LTE (VoLTE) E911 support.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout emergency-inactivity *seconds*

[default | no] timeout emergency-inactivity

default | no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified, then all are set to their default behavior.

seconds

Default: 0 (disabled)
Specifies the timeout duration, in seconds, to check inactivity on the emergency session.
seconds must be an integer value from 1 through 3600.

Usage

Use this command to set the emergency session inactivity-timeout for this APN.
At reception of an IP CAN Session Modification Request triggered by the Policy and Charging Rules Function (PCRF) for an IP-CAN (IP Connectivity Access Network) session serving an IMS emergency session that removes all PCC rules with a QCI other than the default bearer QCI and the QCI used for IMS signalling, the Policy and Charging Enforcement Function (PCEF) shall start a configurable inactivity timer (to enable PSAP Callback session). When the configured period of time expires, the PCEF shall initiate an IP-CAN Session Termination Request for the IP-CAN session serving the IMS Emergency session.
If a PCRF-Initiated IP-CAN Session Modification Request provides new PCC rule(s) with a QCI other than the default bearer QCI and the QCI used for IMS signalling, the PCEF shall cancel the inactivity timer.
Refer to the **emergency-apn** command in this chapter for additional information.

Example

The following command sets the emergency inactivity timeout duration to *450* seconds.

```
timeout emergency-inactivity 450
```

timeout idle

Configures the idle timeout duration for the long duration timer associated with a subscriber session.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout idle *idle_dur*

no timeout idle

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all are set to their default behavior.

idle_dur

Default: 0
Designates the maximum duration of the session (in seconds). After expiry the system considers the session as dormant or idle and invokes the long duration timer action.
idle_dur must be an integer value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

Usage

Use this command to set the idle time duration for subscriber session to determine the dormant session. Refer to the **long-duration-action detection** and **long-duration-action disconnection** command in this chapter for additional information.

Example

Following command sets the idle timeout duration to *450* seconds.

```
timeout idle 450
```

timeout long-duration

Configures the long duration timeout and inactivity duration for subscriber sessions.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timeout long-duration *ldt_timeout* **[inactivity-time** *inact_timeout* **]**

no timeout long-duration

no

Indicates the timeout specified is to be returned to its default behavior. If no specific timeout is specified then all timeouts are set to their default behavior.

ldt_timeout

Default: 0
Designates the maximum duration of the session (in seconds) before the system automatically reports/terminates the session.
Specifies the maximum amount of time (in seconds) before the specified timeout action is initiated.
ldt_timeout must be an integer value in the range from 0 through 4294967295.
The special value 0 disables the timeout specified.

inactivity-time *inact_timeout*

Specifies the maximum amount of time (in seconds) before the specified session is marked as dormant.
inact_timeout must be an integer value in the range from 0 through 4294967295.
The special value 0 disables the inactivity time specified.

Usage

Use this command to set the long duration timeout period and inactivity timer for subscriber sessions. Reduce the idle timeout to free session resources faster for use by new requests.
Refer to the **long-duration-action detection** and **long-duration-action disconnection** commands in this chapter for additional information.

Example

The following command sets the long duration timeout duration to *300* seconds and the inactivity timer for subscriber session to *45* seconds.

```
timeout long-duration 300 inactivity-time 45
```

tpo policy

Specifies the Traffic Performance Optimization (TPO) policy for the APN.

Product

TPO

Privilege

Security Administrator, Administrator

Syntax

tpo policy *tpo_policy_name*

{ default | no } tpo policy

default

Configures the default setting.
Default: Use the default TPO policy configured in the rulebase.

no

Removes the TPO policy from the APN configuration.

tpo_policy_name

Specifies the TPO policy for the APN as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the TPO policy for the APN.

Example

The following command specifies to use the TPO policy named *tpo_policy_110*:

```
tpo policy tpo_policy_110
```

tunnel address-policy

This command specifies the address allocation/validation policy for all tunneled calls (IP-IP, IP-GRE) except L2TP calls. This means that GGSN IP address validation could be disabled for specified incoming calls.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

```
tunnel address-policy { alloc-only | alloc-validate | no-alloc-validate }

default tunnel address-policy
```

default

Resets the tunnel address-policy to alloc-validate.

alloc-only

IP addresses are allocated locally and no validation is done.

alloc-validate

Default.
The VPN Manager allocates and validates all incoming IP addresses from a static pool of IP addresses.

no-alloc-validate

No IP address assignment or validation is done for calls arriving via L3 tunnels. Incoming static IP addresses are passed. This allows for the greatest flexibility.

Usage

This command supports scalable solutions for Corporate APN deployment as many corporations handle their own IP address assignments. In some cases this is done to relieve the customer or the mobile operators from the necessity of reconfiguring the range of IP addresses for the IP pools at the GGSN.
For calls coming through L2TP tunnels, the command **l3-to-l2-tunnel address policy** as defined in the APN Configuration mode, will be in effect.

Example

Use the following command to reset the IP address validation policy to validate against a static pool of address:

```
default tunnel address-policy
```

Use the following command to disable all IP address validation for calls coming through tunnels:

```
tunnel address-policy no-alloc-validate
```

tunnel gre

Configures Generic Routing Encapsulation (GRE) tunnel parameters between the GGSN and an external gateway for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

tunnel gre peer-address *peer_address* **local-address** *local_addr* **[preference** *num* **]**

no tunnel gre peer-address *peer_address*

no

Disables GRE tunneling for the APN.

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the GRE tunnel.
peer_address must be expressed in dotted decimal notation.

local-address *local_addr*

Specifies the IP address of the interface in the destination context of the GGSN originating the GRE tunnel.
local_addr must be expressed in IPv4 dotted-decimal notation.

preference *num*

Default: 1
This option can be used to assign a preference to the tunnel.
preference can be configured to any integer value from 1 to 128.

Important: Only one GRE tunnel per APN is supported. Therefore, the preference should always be set to "1".

Usage

Subscriber IP payloads are encapsulated with IP/GRE headers and tunneled by the GGSN to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using GRE and tunnel it from a local address of *192.168.1.100* to a gateway with an IP address of *192.168.1.225*:

```
tunnel gre peer-address 192.168.1.225 local-address 192.168.1.100
preference 1
```

tunnel ipip

Configures IP-in-IP tunnelling parameters between the GGSN and an external gateway for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

tunnel ipip peer-address *peer_address* **local-address** *local_addr* **[preference** *num* **]**

no tunnel ipip

no

Disables IP-in-IP tunneling for the APN.

peer-address *peer_address*

Specifies the IP address of the external gateway terminating the IP-in-IP tunnel.
peer_address must be expressed in IPv4 dotted-decimal notation.

local-address *local_addr*

Specifies the IP address of the interface in the destination context of the GGSN originating the IP-in-IP tunnel.
local_addr must be expressed in IPv4 dotted-decimal notation.

preference *num*

Default: 1
If multiple tunnels will be configured, this option can be used to assign a preference to the tunnel.
preference can be configured to any integer value from 1 to 128.

Usage

Subscriber IP payloads are encapsulated with IP-in-IP headers and tunneled by the GGSN to an external gateway.

Example

The following command configures the system to encapsulate subscriber traffic using IP-in-IP and tunnel it from a local address of *192.168.1.100* to a gateway with an IP address of *192.168.1.225*:

```
tunnel ipip peer-address 192.168.1.225 local-address 192.168.1.100
preference 1
```

tunnel ipsec

This command configures sessions for the current APN to use an Internet Protocol Security (IPSec) tunnel based on the IP pool corresponding to the subscribers assigned IP address.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] tunnel ipsec use-policy-matching-ip-pool
```

no

Disables the use of the IPSec policy that matches the IP pool that the assigned IP address relates to.

Usage

Use this command to set the APN to use an IPSec policy that is assigned to the IP pool that the subscribers assigned IP address relates to.

Example

The following command enables the use of the policy that matches the IP pool address:

```
tunnel ipsec use-policy-matching-ip-pool
```

tunnel l2tp

Configures Layer 2 Tunnelling Protocol (L2TP) parameters between the GGSN and an external gateway for the APN.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

tunnel l2tp [peer-address *lns-address* **[[encrypted] secret** *l2tp_secret* **] [preference** *num* **] [tunnel-context** *name* **] [local-address** *ip-address* **] [crypto-map** *map_name* **{ [encrypted] isakmp-secret** *crypto_secret* **}] [local-hostname** *hostname* **]**

no tunnel [peer-address *lns-address***]**

no

Disables L2TP, or secure L2TP tunneling for the APN if a specific peer-address is not specified, or, if a peer-address is specified, this keyword removes the peer-address configuration from the APN.

peer-address *lns-address*

Specifies the IP address of the LNS node that the LAC service connects to.
lns-address must be expressed in IPv4 dotted-decimal notation.

Important: A maximum of four LNS peers can be configured per APN.

encrypted

This keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.

secret *l2tp_secret*

Specifies the shared secret (password) between the L2TP Access Concentrator (LAC) service (configured on the system) and the LNS node.
l2tp_secret must be an alphanumeric string of 1 through 127 characters and is case sensitive.

preference *num*

Default: 1
Specifies the preference of the tunnel if the LAC service communicates with multiple LNS nodes.
preference can be configured to any integer value from 1 to 128.

tunnel-context *name*

Specifies the name of the destination context on the system in which the LAC service(s) is configured.
name must be an alphanumeric string of 1 through 79 characters and is case sensitive.

Important: If this option is not configured, the system will attempt to determine the name of the destination context from the **ip context-name** parameter configured for the APN.

local-address *ip-address*

Specifies the IP address of an interface that is bound to a LAC service. This is a mechanism to dictate which LAC service to use to facilitate the subscriber's L2TP session.
address is the IP address of the interface in IPv4 dotted-decimal notation.

Important: If the address configured does not exist or is not bound to a LAC service, the system will automatically choose a LAC service to use.

local-hostname *hostname*

This keyword configures LAC-Hostname to be used for the communication with the LNS peer for this APN. When Tunnel parameters are not received from the RADIUS server, Tunnel parameters configured in APN are considered for the LNS peer selection. When APN Configuration is selected, local-hostname configured with the "tunnel l2tp" command in the APN for the LNS peer will be used as a LAC Hostname.

Important: For this configuration to take effect **allow aaa-assigned-hostname** command, which is used to configure LAC-Hostname based on the "Tunnel-Client-Auth-ID" attribute received from the RADIUS server, needs to be configured in the LAC Service Configuration mode.

hostname is name of the local host for the LNS peer and must be an alphanumeric string of 1 through 127 characters.
When Tunnel parameters are not received from the RADIUS Server, Tunnel parameters configured in APN will be considered for the LNS peer selection. When APN Configuration is selected, the local hostname *hostname* configured with this command in the APN for the LNS peer will be used as a LAC Hostname.

crypto-map *map_name* **{ [encrypted] secret** *crypto_secret* **}**

Configures the IPSec crypto-map policy that is to be associated with this L2TP tunnel configuration for secure L2TP.
map_name is the name of a crypto-map policy configured on the system expressed as an alphanumeric string of 1 through 127 characters and is case sensitive.
encrypted is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the secret keyword is the encrypted version of the plain text secret. Only the encrypted secret is saved as part of the configuration file.
secret specifies the secret associated with the crypto-map policy. *crypto_secret* can be from 0 to 255 bytes.

Usage

This command can be used to configure the GGSN to tunnel subscriber traffic to one or more peer LNSs using L2TP or L2TP with IPSec.
When using L2TP, the system functions as a L2TP access Concentrator (LAC) and tunnels traffic to a peer L2TP Network Server (LNS). LAC functionality is supported through the configuration of LAC Services defined in destination contexts configured on the system.

When using crypt-map policies, the system functions in the same fashion as with L2TP, with the exception that the encapsulated L2TP traffic is further encrypted using IPSec. IPSec functionality is supported through the definition of crypto maps configured in the same destination context as the LAC services.
A maximum of four LNS peers can be configured per APN. If no peer is specified, the system will use the LAC Service(s) configured in the same destination context as the APN.

Example

The following command configures L2TP support for the APN. It configures the APN to tunnel traffic to an LNS with an IP address of 192.168.1.50 through a LAC service bound to an interface with an IP address 192.168.1.201 configured in a destination context on the system called pdn1. The shared secret between the system and the LNS is 5496secRet. This will be the only LNS configured so the default preference of 1 will not be changed.

```
tunnel l2tp peer-address 192.168.1.50 secret 5496secRet tunnel-context
pdn1 local-address 192.168.1.201
```

virtual-apn

Configures references (or links) to alternative APNs to be used for PDP context processing based on properties of the context. This command also configures the APN properties against which the PDP contexts are compared.It also supports roaming and visiting subscribers.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

virtual-apn { gcdr apn-name-to-be-included { Gn | virtual } | preference *priority* **apn** *apn_name* **[access-gw-address {** *ip_address* **|** *ip_address/mask* **} | bearer-access-service** *svc_name* **| cc-profile** *cc_profile_index* **[rat-type { eutran | gan | geran | hspa | utran | wlan }] | domain** *domain_name* **| mcc** *mcc_number* **mnc** *mnc_number* **[cc-profile** *cc_profile_index* **] | [msin-range from** *msin_range_from* **to** *msin_range_to* **] | [rat-type { eutran | gan | geran | hspa | utran | wlan }] | msisdn-range { from** *msisdn_start_range* **to** *msisdn_to_range* **| rat-type { eutran | gan | geran | hspa | utran | wlan } } | rat-type { eutran | gan | geran | hspa | utran | wlan } | roaming-mode { home | roaming | visiting }] }**

default virtual-apn gcdr apn-name-to-be-included

no virtual-apn preference *priority*

---

default

The virtual APN name is sent in G-CDRs.

---

no

Removes a previously configured “virtual” APN.

---

gcdr apn-name-to-be-included { *gn* **|** *virtual* **}**

If **virtual** APN to be used is configured, the virtual APN name is sent in G-CDRs. Provides an option to either send the virtual APN name or the Gn APN name (that comes from the SGSN) in G-CDRs.
Gn: the APN received in the Create PDP Context Request message from SGSN.
virtual: the APN selected by the GGSN/P-GW. This is the default.

---

preference *priority*

Specifies the order in which the referenced APNs are compared by the system.
priority specifies the order and can be configured to any integer value from 1 (highest priority) to 1000 (lowest priority).

---

apn *apn_name*

Specifies the name of an alternative APN configured on the system that is to be used for PDP contexts with matching properties.
apn_name is the name of the alternative APN expressed as an alphanumeric string of 1 through 62 alphanumeric characters and is case insensitive. It may also contain dots (.) and/or dashes (-).

access-gw-address { *ip_address* | *ip_address/mask* }

Specifies the Access gateway (SGSN/SGW/Others) address for the virtual APN.
ip_address is an IP address entered in IPv4 dotted-decimal or IPv6 colon-separated notation.
ip_address/mask is the IP address in IPv4 dotted-decimal or IPv6 colon-separated notation with network-host mask separation.

bearer-access-service *svc_name*

Specifies the Bearer Access Service name for the virtual APN. This service name is unique across the context.
svc_name is an alphanumeric string of 1 through 63 characters.

cc-profile *cc_profile_index*

Specifies the APN for charging characteristics (CC)-profile index.
cc_profile_index is an integer from 1 to 15.

domain *domain_name*

Specifies the subscriber's domain name (realm).
domain_name must be an alphanumeric string of 1 through 79 characters, is case sensitive and can contain all special characters.

mcc *mcc_number*

Specifies the mobile country code (MCC) portion of the PLMN's identifier.
mcc_number is the PLMN MCC identifier and can be configured to any 3-digit integer value between 100 and 999.

mnc *mnc_number*

Specifies the mobile network code (MNC) portion of the PLMN's identifier.
mnc_number is the PLMN MNC identifier and can be configured to any 2- or 3-digit integer value between 00 and 999.

msin-range{ from *msin_range_from* **to** *msin_range_to*| **rat-type { eutran | gan | geran | hspa | utran | wlan } }**

Specifies the APN for this IMSI MSIN range or the radio access technology (RAT) type.
msin_range_from is the start prefix of the IMSI MSIN range and can be configured between 0 and 9999999999.
msin_range_to is the end prefix of the IMSI MSIN range and can be configured as a string of size 1 to 10 digits between 0 and 9999999999.
msin-range should follow the following rules

- Start prefix (such as *msin_range_from*) and end prefix (such as *msin_range_from*) must be of the same length.
- Total length of mcc + mnc + msin-range <= 15 digits.
- For a given combination of mcc + mnc + msin-range (start-end prefix), overlapping range is not allowed.

rat-type is the type of the radio access technology based on which the APN would be specified.

msisdn-range from *msisdn_start_range* **to** *msisdn_to_range*

Specifies the APN for this MSISDN range.
msisdn_start_range is the starting MSISDN number which a string of size 2 to 15 and its value ranges between 00 and 999999999999999.
msisdn_to_range is the ending MSISDN number which is also a string of size 2 to 15 and its value ranges between 00 and 999999999999999.

rat-type { eutran | gan | geran | hspa | utran | wlan }

is the type of the radio access technology based on which the APN would be specified. The available options include:

- eutran
- gan
- geran
- hspa
- utran
- wlan

roaming-mode { home | roaming | visiting }

Supports separate PDP context processing for roaming, visiting, and home subscribers. It supports separate rule type along with domain, imsi, and sgsn-address types.

Usage

This command simplifies the configuration process for mobile operators allowing them to provide subscribers with access to a large number of packet data networks, characterized by APN templates, while only having to configure a small number of APNs on the HLR.
Each "virtual" APN is a reference, or a link, to an alternate APN configured on the system. Each reference is configured with a rule that subscriber PDP contexts are compared against and a priority that dictates the comparison order. The references works as follows:
1. A Create PDP Context Request message is received by the GGSN. The message specifies an APN configured in the HLR.
2. The GGSN determine whether its own matching APN configuration contains "virtual" APN references.
3. The system determines the priority of the references and compares the associated information pertaining to the PDP context against the configured rules.
4. If the rule matches, the parameters in the APN specified by the reference are applied to the PDP context. If not, the rules in the reference with the next highest priority are compared against the PDP context. This occurs until a match is found. If none of the references match, then the parameters within the current APN are applied to the PDP context.
The GGSN supports a maximum of 1023 Virtual APN mapping configurations in a system. A single Gn APN can be configured with up to 1000 mapping rules. Multiple Gn APNs are supported - each requiring Virtual APN mapping configurations. The limit imposed is that the total virtual APN mappings across all Gn APNs should not exceed 1023.
The functionality provided by this command can also be used to restrict access to particular APNs. To restrict access based on a particular rule (either domain name or mobile country code/mobile network code), the "virtual" APN reference should refer to an APN that not is configured on the system and contain the desired rule. All PDP contexts matching the configured rule would then be denied with a reason code of 219 (DBH), Missing or Unknown APN.

Example

The following commands configure two "virtual" APNs, priority 1 references the *bigco* APN with a domain rule of *bigco.com*, priority 2 references the *bigtown* APN with a mobile country code rule of *100* and a mobile network code rule of *50*.

```
virtual-apn preference 1 apn bigco domain bigco.com

virtual-apn preference 2 apn bigtown mcc 100 mnc 50 msin-range from
4000000000 to 4999999999

virtual-apn preference 3 apn bigco.com sgsn-address 192.168.62.2

virtual-apn preference 4 apn bigco.co.kr sgsn-address 192.168.60.2/24
```

Chapter 24
APN Profile Configuration Mode

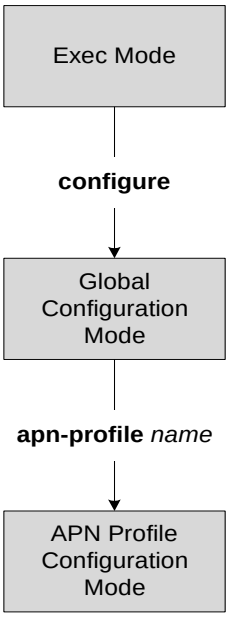
The APN Profile configuration mode defines a set of parameters controlling the SGSN or MME behavior when a specific APN is received or no APN is received in a Request. An APN profile is a key element in the Operator Policy feature and an APN profile is not used or valid unless it is associated with an APN and this association is specified in an operator policy (see the *Operator Policy Configuration Mode Commands* chapter elsewhere in this guide).

Essentially, an APN profile is a template that consists of a set of APN-specific commands that may be applicable to one or more APNs. When a subscriber requests an APN that has been identified in a selected operator policy, the set of commands in the associated APN profile will be applied. The same APN profile can be associated with multiple APNs and multiple operator policies.

The SGSN and the MME each support a total of 1,000 APN profile configurations per SGSN/MME; up to 50 APN profiles can be associated with a single operator policy. For additional SGSN limit information, refer to the *Engineering Rules* appendix in the *SGSN Administration Guide*.

When this mode is accessed, the command prompt should resemble:

```
[local]asr5000(apn-profile-<profile_name>)#
```



address-resolution-mode

Identifies the address resolution mode for this APN profile. This command is specific to the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
address-resolution-mode { fallback-for-dns | local }

default address-resolution-mode
```

default

Resets the configuration to the default value; i.e. **fallback-for-dns**.

fallback-for-dns

Instructs the system to try DNS resolution. If the DNS query fails, the SGSN will use locally configured addresses, if they have been configured.
Default: enabled

local

Instructs the system to only use locally configured addresses and not to use DNS query.
Default: disabled

Usage

Use this command to specify the DNS query or local address resolution for this APN profile.

Example

The following command sets the address resolution mode to use local addresses *only if* the DNS query fails:

```
address-resolution-mode fallback-for-dns
```

apn-resolve-dns-query

Command enables the SGSN to send Straightforward Name Authority Pointer (SNAPTR) type DNS query for APN resolution on a per APN basis.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
apn-resolve-dns-query snaptr

remove apn-resolve-dns-query snaptr
```

remove

Removes the DNS SNAPTR function from the configuration.

Usage

SNAPTR filters based on the EPC-capability of the user equipment (UE). Use this command to enable SNAPTR type DNS query for APN resolution for 3G subscribers with EPC subscription. Configuration in this mode promotes control of this feature per APN.
When this functionality is enabled, an SGSN using Gn/Gp interfaces can optionally select a PGW while activating a context if the subscriber is EPS capable. This supports EPS-based mobility if the subscriber is anchored at the PGW. At PDP Context Activation, the SGSN will use the UE capability as input to select the GGSN or PGW. SNAPTR DNS query allows for PGW resolution.
By default, this functionality is not enabled.

Example

Enable the SGSN to select a PGW during APN resolution:

```
apn-resolve-dns-query snaptr
```

cc

Configures the charging characteristics (CC) for this APN profile.

Product

SGSN, S-GW

Privilege

Security Administrator, Administrator

Syntax

cc { local-value-for-scdrs behavior *bit_value* **profile** *index_bit* **| prefer { hlr-value-for-scdrs | local-value-for-scdrs } }**

remove cc { local-value-for-scdrs | prefer }

remove

Removes the charging characteristics configuration from this APN profile.

local-value-for-scdrs behavior *bit_value* **profile** *index_bit*

Sets the value of the behavior bits and profile index for the charging characteristics for S-CDRs locally, when the Home Location Register (HLR) does not provide these values.
If the HLR provides the charging characteristics with behavior bits and profile index, and the operator wants to ignore what the HLR provides, then specify the **prefer local-value-for-scdrs** keyword with this command.
bit_value: must be a hexadecimal value between 0x0 and 0xFFF.
index_bit: must be an integer from 1 through 15.
Some of the index values are predefined according to 3GPP standard:

- **1** for hot billing
- **2** for flat billing
- **4** for prepaid billing
- **8** for normal billing

Defaults: *bit_value* = 0x0; *index_bit* = 8

prefer { hlr-value-for-scdrs | local-value-for-scdrs }

Specify what charging characteristic settings the system will use for S-CDRs.

- **hlr-value-for-scdrs**: instructs the system to use charging characteristic settings received from the HLR for S-CDRs.
- **local-value-for-scdrs**: instructs the profile preference to only use locally configured/stored charging characteristic settings for S-CDRs.

Default: **hlr-value-for-scdrs**

Usage

Use this command to specify the charging characteristic for S-CDRs -- either from the HLR or locally from the SGSN.

These charging characteristics parameters for S-CDRs and M-CDRs are also configurable in the Call-Control Profile configuration mode. When CC parameters are specified in both types of profiles, then:

- For generation of M-CDRs, the parameters configured in the Call-Control Profile configuration mode will take precedence.
- For generation of S-CDRs, the parameters configured in the APN Profile configuration mode will take precedence.

Example

The following command configures the APN profile to instruct the SGSN not to use charging characteristic settings received from the HLR for S-CDR generation:

```
cc prefer hlr-value-for-scdrs
```

description

Defines a descriptive string relevant to the specific APN profile.

Product

MME, SGSN, S-GW

Privilege

Security Administrator, Administrator

Syntax

description *description*

remove description

remove

Removes the configured description from this APN profile.

description

Specifies a description for this APN profile as an alphanumeric string of 1 through 100 characters. The string may include spaces, punctuation, and case-sensitive letters if the string is enclosed in double quotation marks (“).

Usage

Define information that identifies this particularly APN profile.

Example

Indicate that APN profile *apnprof1* is to be used for customers in Saudi Arabia and that the profile was created on April 10th of 2010:

```
description “apnprof1 defines APNs for customers in Saudi Arabia
(4/10/10).”
```

direct-tunnel

Defines the permission for direct tunnel establishment by GGSNs. This command is specific to the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
direct-tunnel not-permitted-by-ggsn

remove direct-tunnel
```

remove

Removes the direct tunnel establishment configuration from this APN profile.

not-permitted-by-ggsn

Specifies that a direct tunnel is not permitted by the GGSN when resolved by this APN.
Default: disabled.

Usage

Use this command to enable/disable the permission for establishment of direct tunnels between an RNC and a GGSN.

Example

The following command instructs the SGSN not to permit establishment of a direct tunnel with a GGSN:

```
direct-tunnel not-permitted-by-ggsn
```

dns-extn

Takes an offset group of digits from the MSISDN and appends the digits to the DNS query string to create a new APN intended to assist roaming subscribers to use the local GGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

dns-extn { charg-id { binary | decimal | hexadecimal } | lac-rac | msisdn start-offset *start_digits* **end-offset** *end-digits* **| rnc-id [charg-id { binary | decimal | hexadecimal }] }**

remove dns-extn { charg-id | lac-rac | msisdn | rnc-id [charg-id] }

charg-id { binary | decimal | hexadecimal }

Instructs the SGSN to take the profile index value of the charging characteristics, from the PDP subscription record (selected during APN selection) and include the profile index value in the APN name prior to sending out DNS queries. The operator can also specify the format (binary, decimal or hexadecimal) for the CC information to be included.

lac-rac

Enables the SGSN to append geographical information to the APN string that is being sent in the DNS query. This information is used during the DNS query process to select the geographically closest GGSN.

msisdn start-offset *start_digits* **end-offset** *end-digits*

Defines an offset group of digits from the MSISDN and appends the digits to create a new APN DNS query string that is intended to assist roaming subscribers to use the local GGSN.

- *start_digits* is an integer from 1 through 14 that identifies the position of the first digit in the MSISDN to start the offset.
- *end-digits* is an integer from 2 through 15 that identifies the position of the last digit in the MSISDN to be part of the offset.

rnc-id [charg-id { binary | decimal | hexadecimal }]

Instructs the SGSN to include the ID of the calling RNC in the APN DNS query string. Optionally, the profile index value of the charging characteristics can be inserted into the APN name prior to sending out DNS queries. As well, the operator can specify the format (binary, decimal or hexadecimal) for the CC information to be included.

Usage

With this command, the APN in the DNS query string, used for querying the GGSN address, can be appended with additional information, such as

- digits from the MSISDN
- LAC/RAC info

- RNC-ID
- profile index from the charging characteristics information (SCHAR)

This additional information allows some customization of the DNS query string to facilitate selecting a specific (usually local or nearest) GGSN.
For example, roaming subscribers using a specific APN may want to be directed to a specific GGSN. This can be achieved by having an operator policy for roaming subscribers associated with an APN profile that includes a configuration specifying certain digits, from the MSISDN or geographical information from the LAC/RAC, be appended to the APN. This is then used as the DNS query string.
In addition, the operator must configure appropriate DNS entries to enforce the selection of the required GGSN. After appending the MSISDN digits to the DNS query string, the string will have the form: `ni.<digits>.mnc*.mcc*.gprs`. After appending the LAC/RAC information to the DNS query string, the string will have the form: `<apn_network_id>.racAAAA.lacBBBB.<apn_operator_id>` , where the AAAA and BBBB are Hex-coded digits (less than 4 significant digits and one or more zero ("0") digits will be inserted to the left side of the Hex to fill the 4-digit coding).
After appending the charging characteristic (SCHAR) information, the DNS string will take the following form: `<apn_network_id>.<profile_index>.<apn_operator_id>`. The profile index in the following example has an integer value 10: `quicknet.com.uk.1010.mnc234.mcc027.gprs`.
If the RNC-ID information is configured to be a part of the APN name, and if inclusion of the profile index of the charging characteristics information is also enabled before the DNS query is sent, the profile index is included after the included RNC-ID and the DNS APN name will appear in the following form: `<apn_network_id>.<rnc_id>.<profile_index>.<apn_operator_id>`.
Once the DNS extension is defined, the selected extension is applicable when either the wildcard APN feature or the default APN feature are configured and used.
The information is appended to the DNS query and the actual APN string sent to the GGSN will not be modified in any way.

Example

A sample MSISDN is '112233445566778' and a sample APN NI (network identifier) is 'wap98.testnetz.ca'. The following command instructs the SGSN to create a new APN with digits pulled from the MSISDN and appended to the APN:

```
msisdn start-offset 3 end-offset 9
```

The resulting APN DNS query string would have appended 7 digits (2233445)to the APN NI so that it would appear something like `wap98.testnetz.ca.2233445.MNC009.MCC262.GPRS`
Enable inclusion of geographical information in the APN string used for the DNS query to locate the closest GGSN:

```
lac-rac
```

In the following example, the DNS query for a subscriber using RNC 0321 with the profile index of value 8 would appear as: `quicknet.com.uk.0321.1000.mnc234.mcc027.gprs`

end

Use this command to return to the parent configuration mode.

gateway-address

Configures the IPv4 or IPv6 address of the GGSN supporting the APN associated with this APN profile. Also, use this command to create a secondary pool of GGSNs. This command is specific to the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gateway-address *ip_address* **{ priority** *priority* **| weight** *weight* **[secondary-pool] }**

no gateway-address *ip_address*

no

Disables the GGSN address configured in this APN profile.

ip_address

Specifies the IP address for the GGSN in IPv4 dotted-decimal or IPv6 colon-separated notation.

priority *priority*

Specifies the priority, for the configured GGSN address, to be considered during address selection. If the highest priority GGSN fails to respond, the next priority level GGSN is selected. *priority* is an integer from 1 through 100. Note that the lower integer has the higher priority, so that 1 is the highest priority.

weight *weight* **[secondary-pool]**

Specifies the weight (importance) assigned to a GGSN to facilitate load balancing. *weight* is an integer from 1 to 100.
If a weight is assigned to an address, then load balancing (of primary CPC requests) depends on the weight value. For example:

```
GGSN1 172.16.130.1 weight 30 and GGSN2 172.16.130.3 weight 70
```

With this configuration, 30% of the activation requests for this APN will go to GGSN1 and 70% of the requests will go to GGSN2. Also note that the sum of the weights does not need to be 100. The calculation of weight percentiles is carried out proportionately, so the following configuration will also yield the same 30% - 70% results:

```
GGSN1 172.16.130.1 weight 6 and GGSN2 172.16.130.3 weight 14
```

secondary-pool

This optional keyword allows the operator to enable multiple GGSN pools by assigning the GGSN to a secondary pool of GGSNs. The selection algorithm for GGSNs in a secondary pool is weight-based.

Usage

Use this command to define priority or load balancing to be applied during GGSN selection. A maximum of 16 GGSN address can be configured for this APN profile.
Also use this command to setup GGSN pools - primary and secondary pools with up to 16 GGSNs in each pool. By default, GGSNs will always be selected from the primary pool. However, working in tandem with the **ggsn-fail-retry-timer** command configuration (SGTP service configuration mode) which enables the local DNS feature, some of the primary GGSNs can be temporarily blacklisted if they become unavailable or overburdened.

Example

Set a GGSN address with a secondary priority level:

```
gateway-address 123.123.123.2 priority 2
```

Add a GGSN to the secondary GGSN pool and define selection weighting of 7th:

```
gateway-address 198.168.138.8 weight 7 secondary-pool
```

gtp

Enables or disables the GTPC private extension for the Overcharging Protection feature. This command is specific to the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] gtp private-extension loss-of-radio-coverage send-to-ggsn [ send-to-peer-sgsn
]
```

remove

Disables the inclusion of the GTPC private extension, thereby disabling the Overcharging Protection feature.

private-extension loss-of-radio-coverage send-to-ggsn

Instructs the SGSN to set a proprietary GTPC private extension (in the LORC Intimation IEs) in the event of loss of radio coverage (LORC). These private extensions are only understood by a GGSN with an Overcharging Protection license.
The mandatory **loss-of-radio-coverage send-to-ggsn** keyword set instructs the SGSN to forward the private extension flag to the GGSN in the event of a loss of radio coverage (LORC).

send-to-peer-sgsn

This optional keyword instructs the SGSN to also forward the LORC private extension to the peer SGSN.

Usage

gtp private-extension is one of the two commands required to enable the Overcharging Protection feature. The second command sets the RANAP cause code in the Iu Release to enable the SGSN to detect the LORC state of the MS/UE. This second command is configured in the IuPS service and is explained in the *IuPS Service Configuration Mode* chapter.
When there is a loss of coverage and the Overcharging Protection feature is enabled with the **gtp private-extension** command, the SGSN includes the proprietary private extension in the GTP LORC Intimation IE messages. This LORC IE is also included in UPCQ, DPCQ, and SGSN Context Response GTP messages. Refer to the *SGSN Administration Guide* for additional information regarding the Overcharging Protection feature.

Example

Use the following command to have the SGSN send the GGSN the GTPC private extension in the LORC Intimation IE:

```
gtp private-extension loss-of-radio-coverage send-to-ggsn
```

idle-mode-acl

Configures a group of access control lists (ACLs) that define rules to apply to downlink data destined for UEs in an idle mode.

Product

S-GW

Privilege

Administrator

Syntax

[remove] idle-mode-acl { ipv4 | ipv6 } access-group *acl_name*

remove

Removes the specified ACL name from the access group.

{ ipv4 | ipv6 } access-group *acl_name*

Specifies the ACL type to add to the access group.

- **ipv4**: Specifies that an IPv4 ACL is being added to the access group.
- **ipv6**: Specifies that an IPv6 ACL is being added to the access group.

access-group *acl_name* specifies the name of the ACL being added to the access group as an existing IPv4 or IPv6 ACL name expressed as an alphanumeric string of 1 through 47characters.

Usage

Use this command to create a group of ACLs that contain rules to apply to data sent to UEs that are currently in idle mode.
IPv4 ACLs are configured through the Context Configuration Mode using the **ip access-list** command.
IPv6 ACLs are configured through the Context Configuration Mode using the **ipv6 access-list** command.

Example

The following command configures the APN profile to use an IPv4 ACL named *acl-3-permit* to apply rules to downlink data sent to UEs that are currently in idle mode:

```
idle-mode-acl ipv4 access-group acl-3-permit
```

ip

Defines the IP parameters for this APN profile.

Product

SGSN, S-GW

Privilege

Administrator

Syntax

```
ip { qos-dscp { { downlink | uplink } { background forwarding | conversational forwarding
| interactive traffic-handling-priority priority forwarding | streaming forwarding } + }
| source-violation { deactivate [ all-pdp | exclude-from accounting | linked-pdp |
tolerance-limit } | discard [ exclude-from-accounting ] | ignore }

default ip { qos-dscp [ downlink | uplink ] | source-violation }

no ip qos-dscp { downlink | uplink } { background | conversational | interactive |
streaming } +
```

Important: All parameters not specifically configured will be included in the configuration with default values.

default

Resets the configuration to the default values.

no

Disables the specified IP QoS-DSCP mapping.

qos-dscp

Configures the Differentiated Services Code Point (DCSP) marking to be used for sending packets of a particular 3GPP QoS class.

downlink | uplink

Configures the packets for either downlink (network to subscriber) or uplink (subscriber to network) direction. **downlink** and **uplink** configuration must include one or more of the following:

- **background** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP background class. Must be followed by a DSCP marking
- **conversational** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP conversational class. Must be followed by a DSCP marking
- **interactive** - Configures the DSCP marking to be used for packets of sessions subscribed to different traffic priorities in the 3GPP interactive class. Must be followed by a traffic handling priority (THP): 1, 2, or 3.
- **streaming** - Configures the DSCP marking to be used for packets of sessions subscribed to 3GPP streaming class. Must be followed by a DSCP marking

DSCP marking options

Downlink and uplink must include a DSCP forwarding marking; supported options include:

- af11 - Designates use of Assured Forwarding 11 PHB
- af12 - Designates use of Assured Forwarding 12 PHB
- af13 - Designates use of Assured Forwarding 13 PHB
- af21 - Designates use of Assured Forwarding 21 PHB
- af22 - Designates use of Assured Forwarding 22 PHB
- af23 - Designates use of Assured Forwarding 23 PHB
- af31 - Designates use of Assured Forwarding 31 PHB
- af32 - Designates use of Assured Forwarding 32 PHB
- af33 - Designates use of Assured Forwarding 33 PHB
- af41 - Designates use of Assured Forwarding 41 PHB
- af42 - Designates use of Assured Forwarding 42 PHB
- af43 - Designates use of Assured Forwarding 43 PHB
- be - Designates use of Best Effort forwarding PHB
- ef - Designates use of Expedited Forwarding PHB

Forwarding defaults for both uplink and downlink are:

- conversational - ef;
- streaming - af11;
- interactive 1 - ef;
- interactive 2 - af21;
- interactive 3 - af21;
- background - be

source-violation

Configures settings related to IP source-violation detection with one of the following criteria:

- **deactivate** - deactivate the PDP context with one of the following conditions:
- **all-pdp** - deactivates all PDP context of the MS/UE. Default is to deactivate errant PDP contexts.
- **exclude-from-accounting** - excludes packets having an invalid source IP address from the statistics used in the accounting records.
- **linked-pdp** - deactivate all associated pdp contexts (primary and secondary). Default is to deactivate errant pdp context.
- **tolerance-limit** - Configures maximum number of allowed IP source violations before the session is deactivated.
- **discard** - discard errant packets, can include the following option:
- **exclude-from-accounting** - excludes packets having an invalid source IP address from the statistics used in the accounting records.
- **ignore** - ignore checking of packets for MS/UE IP source violation.

Usage

This command configures a range of IP functions to be associated with the APN profile; such as:

- SGSN/S-GW action in response to detected IP source violations,
- DSCP marking for downlink and uplink configuration per traffic class,
- QoS class diffserv code.

Example

The following command configures the APN profile to instruct the SGSN or S-GW not to check incoming packets for IP source violation information:

```
ip source-violation ignore
```

pdp-data-inactivity

Configures the APN profile regarding PDP data inactivity. This command is specific to the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
pdp-data-inactivity { action { deactivate [ all-pdp | linked-pdp ] | detach-when { all-
pdp-inactive | any-pdp-inactive } } | timeout minutes minutes }

default pdp-data-inactivity { action | timeout }

no pdp-data-inactivity timeout
```

default

Resets the APN Profile configuration to the default values for PDP data-inactivity.

no

Disables the timeout feature of the PDP data-inactivity configuration for this APN profile.

action

Defines the action to be taken if PDP data-inactivity occurs:

- **deactivate** - defines which PDP context should be deactivated:
- **all-pdp** - deactivates all PDP contexts.
- **linked-pdp** - deactivates only linked PDP contexts.
- **detach-when** - defines the condition that warrants a detach:
- **all-pdp-inactive** - detach when all PDP contexts are inactive.
- **any-pdp-inactive** - detach when any PDP context is inactive.

timeout minutes *minutes*

Specifies the inactivity timeout in minutes. *minutes:* is an integer from 1 through 1440. Note that even though the timeout is set for minutes, the configuration displays in seconds.

Usage

Use this command to define how the SGSN will handle a situation where the PDP is not fully active. Repeat the command, as needed, to configure more than one keyword-controlled function.

Example

Use the following command to have the SGSN deactivate all PDP contexts associated with the APN when it detects the PDP is inactive:

```
pdp-data-inactivity action deactivate all-pdp
```

Use the following command to have the SGSN wait *2* minutes after detecting PDP data inactivity:

```
pdp-data-inactivity timeout minutes 2
```

pdp-type-ipv4v6-override

Configure the PDP type to use, per APN, if dual PDP type addressing is not supported by the network and the MS/UE requests the IPv4v6 PDP type.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
pdp-type-ipv4v6-overrride { ipv4 | ipv6 }

remove pdp-type-ipv4v6-overrride
```

remove

Deletes the override configuration and reverts to the default behavior so the SGSN ignores the IPv4v6 request and sends IPv4 to the GGSN.

ipv4

Configures IPv4 as the PDP type to send towards the GGSN when overriding the dual PDP type addressing requested by the MS/UE.

ipv6

Configures IPv6 as the PDP type to send towards the GGSN when overriding the dual PDP type addressing requested by the MS/UE.

Usage

This command configures the SGSN to send either IPv4 or IPv6 towards the GGSN when the MS/UE requests PDP type as IPv4v6 but either the SGSN or the RNC is not configured to support dual PDP type.

Example

Use this command to configure the SGSN to always send IPv6, for the PDP type, to the GGSN when overriding a dual PDP type address request from the MS/UE:

```
pdp-type-ipv4v6-override ipv6
```

pgw-address

Configures the IPv4 or IPv6 address of the P-GW supporting the APN associated with this APN profile. This command is specific to the MME.

Product

MME

Privilege

Administrator

Syntax

pgw-address *ip_address* **[s5-s8-protocol pmip] [weight** *weight* **]**

no pgw-address *ip_address*

no

Disables the P-GW address configured in this APN profile.

ip_address

Specifies the IP address for the P-GW in IPv4 dotted-decimal or IPv6 colon-separated notation.

s5-s8-protocol pmip

Configures the S5-S8 protocol for the gateway.

weight *weight*

Specifies the weight (importance) assigned to the addressed P-GW for load balancing. *weight* is an integer from 1 through 100.
If a weight is assigned to an address, then load balancing (of primary CPC requests) depends on the weight value. For example:

```
pgw-address 172.16.130.1 weight 30 and pgw-address 172.16.130.3 weight 70
```

With this configuration, 30% of the activation requests for this APN will go to he 130.1 address and 70% of the requests will go to 130.3 address. Also note that the sum of the weights does not need to be 100. The calculation of weight percentiles is carried out proportionately, so the following configuration will also yield the same 30% - 70% results:

```
pgw-address 172.16.130.1 weight 6 and pgw-address 172.16.130.3 weight 14
```

Usage

Use this command to define load balancing to be applied during P-GW selection. A maximum of 16 P-GW addresses can be configured for this APN profile.

Example

The following command configures the P-GW IP address for this APN profile as *10.2.3.4*:

```
pgw-address 10.2.3.4
```

qos apn-ambr

Configures the APN-AMBR (aggregate maximum bit rate) that will be stored in the Home Subscriber Server (HSS). This command is specific to the MME.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

qos apn-ambr max-ul *mbr-up* **max-dl** *mbr-dwn*

remove qos apn-ambr

remove

Removes the APN-AMBR changes from the configuration for this APN profile.

max-ul *mbr-up* **max-dl** *mbr-dwn*

Defines the maximum bit rates for uplink (subscriber to network) and downlink (network to subscriber) traffic.
mbr-up is an integer from 0 through 1410065408.
mbr-dwn is an integer from 0 through 1410065408.

Usage

Use this command to define the MBR that will be enforced by the P-GW for both uplink and downlink traffic shaping.

Example

```
qos apn-ambr max-ul 24234222 max-dl 23423423
```

qos class

Configures local values for the traffic class (TC) parameters for the quality of service (QoS) configured for this APN profile.

Important: To enable any of the values/features configured with this command, the **qos prefer-as-cap** configuration (also in the APN profile configuration mode) must be set to either **local** or **both-hlr-and-local**.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

qos class { background | conversational | interactive | streaming } [*qualif_option* **]**

remove qos class { background | conversational | interactive | streaming } [*qualif_option* **]**

remove

Removes previously defined values for the specified option or for an entire class if a qualifying option is not included in the command.

background

Selects the background traffic class. This 'best-effort' class manages traffic that is handled as a background function, like email, where time to delivery is not a key factor. The selection of background traffic class can be refined with the addition of one of the following qualifying options:

- **all-values**
- **arp**
- **mbr-down**
- **mbr-map-down**
- **mbr-map-up**
- **mbr-up**
- **residual-bit-error-rate**
- **sdu**

All qualifying options are explained below.

conversational

Selects the 'real-time' conversational traffic class of service, which has the most stringent time requirements of the four classes and is typically reserved for voice traffic. The section of the conversational traffic class can be refined with the addition of one of the following qualifying options:

- **all-values**

- **arp**
- **gbr-down**
- **gbr-up**
- **mbr-down**
- **mbr-map-down**
- **mbr-map-up**
- **mbr-up**
- **min-transfer-delay**
- **residual-bit-error-rate**
- **sdu**

All qualifying options are explained below.

---

interactive

Selects interactive traffic class of service. This class is characterized by a request/response pattern (someone sends data and then waits for a response) which requires the preservation of the data but delivers on a 'best-effort' model. The section of the interactive traffic class can be refined with the addition of one of the following qualifying options:

- **all-values**
- **arp**
- **mbr-down**
- **mbr-map-down**
- **mbr-map-up**
- **mbr-up**
- **residual-bit-error-rate**
- **sdu**
- **thp**

All qualifying options are explained below.

---

streaming

Selects the streaming traffic class of service, which handles one-way, real-time data transmission - such as streaming video or audio. The section of the interactive traffic class can be refined with the addition of one of the following qualifying options:

- **all-values**
- **arp**
- **gbr-down**
- **gbr-up**
- **mbr-down**

- **mbr-map-down**
- **mbr-map-up**
- **mbr-up**
- **min-transfer-delay**
- **residual-bit-error-rate**
- **sdu**

All qualifying options are explained below.

---

qualif_option

Qualifying options are the QoS parameters and they include:

- **all-values** - This option will change the configuration to predefined values for *all* the relevant QoS parameters for the class. This keyword is not used if other options are to be defined. The predefined values are:

1.....Predefined QoS Parameters

QoS Parameter	Predefined Value
Traffic Class	**Background**
SDU delivery order	No
Delivery of Erroneous SDUs	No
Max Bit Rate Uplink	64 kbps
Max Bit Rate Downlink	64 kbps
Allocation/Retention Priority	3
SDU Max Size	1500 octets
SDU Error Ratio	3 (1 * 10 ^ -3)
Residual Bit Error Rate	4 (4 * 10 ^ -3)
Traffic Class	**Conversational**
SDU delivery order	No
Delivery of Erroneous SDUs	No
Max Bit Rate Uplink	16 kbps
Max Bit Rate Downlink	16 kbps
Allocation/Retention Priority	3
Guaranteed Bit Rate Uplink	16 kbps
Guaranteed Bit Rate downlink	16 kbps
SDU Max Size	1500 octets

QoS Parameter	Predefined Value
Minimum Transfer Delay	100 milliseconds
SDU Error Ratio	1 (1 * 10 ^ -2)
Residual Bit Error Rate	1 (5 * 10 ^ -2)
Traffic Class	**Interactive**
SDU delivery order	No
Delivery of Erroneous SDUs	No
Max Bit Rate Uplink	64 kbps
Max Bit Rate Downlink	64 kbps
Traffic Handling Priority	3
SDU Max Size	1500 octets
SDU Error Ratio	3 (1 * 10 ^ -3)
Residual Bit Error Rate	4 (4 * 10 ^ -3)
Traffic Class	**Streaming**
SDU delivery order	No
Delivery of Erroneous SDUs	No
Max Bit Rate Uplink	16 kbps
Max Bit Rate Downlink	16 kbps
Allocation/Retention Priority	3
Guaranteed Bit Rate Uplink	16 kbps
Guaranteed Bit Rate downlink	16 kbps
SDU Max Size	1500 octets
Minimum Transfer Delay	300 milliseconds
SDU Error Ratio	7 (1 * 10 ^ -3)
Residual Bit Error Rate	1 (5 * 10 ^ -2)

- **arp** - Sets the allocation/retention priority. Enter an integer from 1 to 3.
- **gbr-down** - Guaranteed Kbps rate for the downlink direction. Enter an integer from the range 1 to 256000.
- **gbr-up** - Guaranteed Kbps rate for the uplink direction. Enter an integer from 1 to 256000.
- **mbr-down** - Maximum Kbps rate for the downlink direction. Enter an integer from the range 1 to 256000.

- **mbr-map-down from** *from_kbps* **to** *to_kbps* - Map received HLR MBR (**from** value) to a locally configured downlink MBR value (**to** value):
  - *from_kbps* - Enter an integer from 1 to 25600.
  - *to_kbps* - Enter an integer from 1 to 25600.
- **mbr-map-up from** *from_kbps* **to** *to_kbps* - Map received HLR MBR (**from** value) to a locally configured uplink MBR value (**to** value):
  - *from_kbps* - Enter an integer from 1 to 25600.
  - *to_kbps* - Enter an integer from 1 to 25600.
- **mbr-up** - Maximum Kbps rate for the uplink direction. Enter an integer from 1 to 256000.
- **min-transfer-delay** - Minimum transfer delay in milliseconds. Enter an integer from 80 to 4000.
- **residual-bit-error-rate** -
  - Background TC residual-bit-error-rate range is from 4*10^-4 to 6*10^-8. Enter on of the following integers, where:
    - **4**: represents 4*10^-3
    - **7**: represents 10^-5
    - **9**: represents 6*10^-8
  - Conversational TC residual-bit-error-rate range is from 5*10^-2 to 10^-6. Enter one of the following integers, where:
    - **1**: represents 5*10^-2
    - **2**: represents 10^-2
    - **3**: represents 5*10^-3
    - **5**: represents 10^-3
    - **6**: represents 10^-4
    - **7**: represents 10^-5
    - **8**: represents 10^-6
  - Interactive TC residual-bit-error-rate range is from 4*10^-4 to 6*10^-8. Enter one of the following integers, where:
    - **4**: represents 4*10^-3
    - **7**: represents 10^-5
    - **9**: represents 6*10^-8
  - Streaming TC residual-bit-error-rate range is from 5*10^-2 to 10^-6. Enter one of the following integers, where:
    - **1**: represents 5*10-2
    - **2**: represents 10^-2
    - **3**: represents 5*10^-3
    - **5**: represents 10^-3
    - **6**: represents 10^-4

- **7**: represents 10^-5
- **8**: represents 10^-6

- **sdu** - Signalling data unit keyword, must include one of the following options:
  - **delivery-order**- Enter one of the two following options:
    - **no**- Without delivery order
    - **yes**- With delivery order
  - **erroneous**- Enter one of the two following options:
    - **no**- Erroneous SDUs will not be delivered
    - **no-detect**- Erroneous SDUs are not detected ('-')
    - **yes**- Erroneous SDUs will be delivered
  - **error-ratio**- The SDU error-ratio range is from 10^-3 to 10^-6. Enter an integer from 1 to 6, where:
    - **3**- Represents 10^-3
    - **4**- Represents 10^-4
    - **6**- Represents 10^-6
  - **max-size**- Defines the maximum number of octets (size) of the SDU. Enter an integer from 10 to 1502.
- **thp** - Sets the traffic handling priority. Enter an integer from 1 to 3.

Usage

This command defines the qualifying options (parameters) for each QoS traffic class defined for this APN profile.

Important: Typically this command is only used to define QoS parameters when the APN record does not exist in the subscription record.

Repeat the command as often as needed with different options to define all required QoS criteria. For example, to configure the maximum bit rate (MBR) for the downlink and uplink directions for a traffic class, this command must be used twice, specifying **mbr-down** once and **mbr-up** once.
Advantage for local mapping of MBR: some HLRs cannot be configured with high MBR values. Using the **mbr-map-up** and the **mbr-map-down** parameters allows the SGSN to be configured to treat a specific HLR value as meaning the desired high MBR value. In a case where the HLR does not support HSPA+ bit rates, but the handsets and network do, this feature allows the operator to overcome limitations on the HLR and provide HSPA+ bit rates by overwriting the provisioned HLR-QoS MBR values with SGSN-configured values. When MBR mapping is configured, if QoS is preferred as the HLR value, then the subscription QoS MBR received from the HLR is compared with the "from" value in the table. If it matches, then it is converted to the value specified by the "to" value in the table. QoS negotiation happens based on the converted value.
Advantage for QoS capping with THP and ARP: Controlling THP and ARP via Operator Policy: This functionality can differentiate home vs. roaming subscribers, and prevent visiting subscribers from receiving a high-tiered service. For example, a service provider could offer service differentiation using Ultra/Super/Standard service levels based upon QoS; this could justify charging a corporate customer more to

use the Internet APN than would be charged to a consumer. This could be accomplished by controlling the traffic handling priority (THP) over the air interface, i.e. THP 1 = Ultra, THP 2 = Super and THP 3 = Standard.

Example

Use the following command to configure the entire conversational traffic class with predefined QoS options:

```
qos class conversational all-values
```

Now change the background class ARP from 3 to 2:

```
qos class background arp 2
```

Invalidate the THP parameter, by removing all value from the parameter, for the interactive class:

```
remove qos class interactive thp
```

qos dedicated-bearer

Configures the quality of service maximum bit rate (MBR) parameters for the dedicated bearer. This command is specific to the MME.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

qos dedicated-bearer mbr max-ul *mbr-up* **max-dl** *mbr-dwn*

remove qos dedicated-bearer

remove

Removes the dedicated bearer maximum bit rate (MBR) changes from the configuration for this APN profile.

max-ul *mbr-up* **max-dl** *mbr-dl*

Defines the maximum bit rates for uplink and downlink traffic.
mbr-up is an integer from 0 through 1410065408.
mbr-dl is an integer from 0 through 1410065408.

Usage

Use this command to define the MBRs that will be enforced by the P-GW for both uplink and downlink traffic shaping.

Example

```
qos dedicated-bearer mbr max-ul 24234222 max-dl 23423423
```

qos default-bearer

Configures the quality of service parameters for the default bearer. This command is specific to the MME.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
qos default-bearer { arp arp_value [ preemption-capability { may | shall-not } |
vulnerability { not-preemptable | preemptable } ] | qci qci }

remove qos default-bearer { arp | qci }
```

remove

Removes the default bearer QoS configuration from this APN profile.

arp *arp_value*

Defines the address retention priority value. *arp_value* is an integer from 1 through 15.

preemption-capability { may | shall-not }

Specifies the preemption capability flag. Options are:

- **may**: Bearer may be preempted
- **shall-not**: Bearer shall not be preempted

vulnerability { not-preemptable | preemptable }

Specifies the vulnerability flag. Options are:

- **not-preemptable**: Bearer cannot be preempted.
- **preemptable**: Bearer can be preempted.

qci *qci*

Specifies the QoS Class Identifier for the default bearer profile. *qci* is an integer from 0 through 255.

Usage

Use this command to set the QoS APR and QCI parameters for the default bearer configuration.

Example

```
qos default-bearer arp 2 preemption-capability may
```

qos prefer-as-cap

Specifies operational preferences for QoS parameters, specifically QoS bit rates. This command is specific to the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
qos prefer-as-cap { both-hlr-and-local | hlr-subscription | local }

remove qos prefer-as-cap
```

Important: Command and keyword names have changed. **prefer** has become **prefer-as-cap** and **hlr** has become **hlr-subscription**. These changes will not impact configuration generated with earlier releases as the keywords are aliases for the previous names.

remove

Removes previous configuration changes and resets the default.

both-hlr-and-local

Instructs the SGSN to use, as the capping value during session establishment, the lower of either the locally configured QoS bit rate or the Home Location Register (HLR) subscription.

hlr-subscription

Instructs the SGSN to take the QoS bit rates from the HLR configuration and use the HLR rate as the capping value for session establishment.
Default.

local

Instructs the SGSN to take the QoS bit rate from the local configuration and use it for session establishment.

Usage

Use this command to instruct the SGSN to take QoS configuration as the bit rate for session establishment.

Example

The following command specifies use of the bit rate in subscription at the HLR:

```
qos prefer-as-cap hlr-subscription
```

The following command instructs the SGSN to cap the bit rate with the lower rate of the two configurations, HLR or local:

```
qos prefer-as-cap both-hlr-and-local
```

qos rate-limit direction

Configures the actions governing the subscriber traffic flow, if the flow violates or exceeds the configured or netogiated peak or committed data-rates.

This command can be entered multiple times to specify different combinations of traffic direction and class. The SGSN only performs traffic policing if **qos rate-limit direction** is configured.

Additional information on the QoS traffic policing functionality is located in the *System Administration Guide*.

Product

SGSN, S-GW

Privilege

Security Administrator, Administrator

Syntax

```
qos rate-limit direction { downlink | uplink } [ burst-size { auto-readjust [ duration
seconds ] | bytes } ] [ class { background | conversational | interactive
traffic_priority | streaming } ] [ exceed-action { drop | lower-ip-precedence | transmit
} ] [ gbr-qci [ committed-auto-readjust durarion seconds ] ] [ non-gbr-qci [ committed-
auto-readjust durarion  seconds ] ] [ violate-action { drop | lower-ip-precedence |
transmit } ] +

remove qos rate-limit direction { downlink | uplink } [ class { background |
conversational | interactive traffic_priority | streaming } ]
```

remove

Removes the qos rate-limit direction entries from the configuration.

downlink | uplink

Apply the limits and actions configured with the other keywords to the selected link:
downlink - This is the direction from the GGSN or P-GW to the MS.
uplink - This is the direction from the MS to the GGSN or the P-GW.

burst-size { auto-readjust [duration *seconds* **] | *bytes* }**

Default: See the table of class default values in the *Usage* section below.
This keyword specifies the peak burst size allowed. System measurements for this value exclude the GTP and outer packet headers. Supported options include:

- **auto-readjust**: This keyword enables dynamic burst-size calculation using negotiated peak data-rate and negotiated committed data-rate.
- **duration** *seconds*: Must be an integer from 1 to 30; default is 1. This keyword sets the number of seconds that the dynamic burst-size calculation will last. This allows the traffic to be throttled at the negotiated rates.
- *bytes*: Must be an integer from 1 to 6000000. This value specifies the static burst size for traffic policing. This option is present for backward compatibility.

Important: Use of dynamic burst size (**auto-readjust**) for traffic policing is recommended, rather than the static burst size.

class { background | conversational | interactive *traffic_priority* **| streaming }**

The **class** keyword configures the specified traffic policing actions per traffic class, or per traffic priority in the case of interactive traffic class. The following classes are supported:

- **background**: Specifies the traffic action for traffic patterns in which the data transfer is not time-critical (for example, email exchanges).
- **conversational** : Specifies the traffic policing action for traffic patterns in which there is a constant flow of packets in each direction, upstream and downstream.
- **interactive** *traffic_priority*: Specifies the traffic policing action for traffic patterns in which there is an intermittent flow of packets in each direction, upstream and downstream.

  traffic_priority is the 3GPP traffic handling priority and can be an integer 1,2 or 3.
- **streaming**: Specifies the traffic policing action for traffic patterns in which there is a constant flow of data in one direction, either upstream or downstream.

Important: This is an SGSN-specific feature. If this keyword is omitted, the same values are used for all classes.

exceed-action { drop | lower-ip-precedence | transmit }

Default: See the table of class default values in the *Usage* section below.
The action to take on the packets that exceed the committed-data-rate but do not violate the peak-data-rate. The following actions are supported:

- **drop**: Drop the packet
- **lower-ip-precedence**: Transmit the packet after lowering the ip-precedence
- **transmit**: Transmit the packet

gbr-qci [committed-auto-readjust durarion *seconds* **]**

Applies the traffic policing policy to guaranteed bitrate bearers.
committed-auto-readjust duration *seconds*: Must be an integer from 1 to 30. This keyword sets the number of seconds that the committed burst-size calculation will last. This allows the traffic to be throttled to the negotiated rates.

Important: This is an S-GW-specific feature.

non-gbr-qci [committed-auto-readjust durarion *seconds* **]**

Applies the traffic policing policy to non-guaranteed bitrate bearers.
committed-auto-readjust duration *seconds*: Must be an integer from 1 to 30. This keyword sets the number of seconds that the committed burst-size calculation will last. This allows the traffic to be throttled to the negotiated rates.

Important: This is an S-GW-specific feature.

violate-action { drop | lower-ip-precedence | transmit }

Default: See the table of class default values in the *Usage* section below.
The action to take on the packets that exceed both the committed-data-rate and the peak-data-rate. The following actions are supported:

- **drop**: Drops the packet
- **lower-ip-precedence**: Transmits the packet after lowering the IP precedence
- **transmit**: Transmits the packet

+

This symbol indicates that the keywords can be entered multiple times within a single command.

Usage

This command configures the APN's quality of service (QoS) traffic policing. Configured actions prevent subscriber flow exceeding or violating configured peak or negotiated peak or committed data rate limits.

Important: If either **exceed action** or **violate action** is set to **lower-ip-precedence**, this command may override the configuration of the **ip qos-dscp** command in the APN profile.

Class: Background	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Conversational	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): 16000000 Burst Size (in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): 8640000 Burst Size (in bytes): 65535 Exceed Action: lower-ip-precedence Violate Action: drop
Class: Interactive, Traffic Handling Priority: 1	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 2	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Interactive, Traffic Handling Priority: 3	

Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop
Class: Streaming	
Downlink Traffic: Disabled Peak Data Rate (in bps): 16000000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop	Uplink Traffic: Disabled Peak Data Rate (in bps): 8640000 Committed Data Rate (in bps): n/a Burst Size (in bytes): 65535 Exceed Action: n/a Violate Action: drop

Example

The following command lowers the IP precedence when the committed-data-rate and the peak-data-rate are violated in uplink direction:

```
qos rate-limit direction uplink violate-action lower-ip-precedence
```

The following command drops the excess user packets when the subscriber traffic violates both the configured peak and the committed data-rate in the uplink direction. Once either the peak or the committed data-rate for that subscriber goes below the configured/negotiated limit, it transmits them.

```
qos rate-limit direction uplink exceed-action drop
```

ranap allocation-retention-priority-ie

Configures the allocation/retention priority (ARP) IE for this APN profile. This command is specific to the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ranap allocation-retention-priority-ie subscription-priority *priority* **class { { background | conversational | interactive | streaming } { not-pre-emptable | priority | queuing-not-allowed | shall-not-trigger-pre-emptable } + }**

Important: All parameters not specifically configured will be included in the configuration with default values.

[default | remove | no] ranap allocation-retention-priority-ie [subscription-priority *priority* **class { background | conversational | interactive | streaming }]**

default

Resets the configuration to the default values.

no

Disables the specified configuration

remove

Removes the specified configuration.

subscription-priority *priority*

This keyword sets the subscription priority. The lowest number has the highest priority. *priority* must be an integer from 1 to 3.

class

Configure allocation/retention priority (ARP) for specific QoS traffic classes. Include one or more of the following class options:

- **background**: background class of service
- **conversational**: conversational class of service
- **interactive**: interactive class of service
- **streaming**: streaming class of service

Default values will be included in the configuration for any class configuration not specified.

qualifying options

For each of the class options, the configuration must include one or more of the following qualifying options:

- **not-pre-emptable**

- **priority**: smallest number is the highest priority. Value must be an integer from 1 to 15
- **queuing-not-allowed**
- **shall-not-trigger-pre-emptable**

When entering more than one option, we recommend that you do it in the order in which they are listed.

+

This symbol indicates that the keywords can be entered multiple times within a single command.

Usage

Use this command to configure values for the allocation/retention priority (ARP) IE in the radio access bearer (RAB) assignment request message for RANAP that occurs during RAB setup.
This command can be used multiple times to define multiple priorities, with different combinations of **subscription-priority** and **class**.
If the HLR returns a matching value for the subscribed ARP for the desired traffic class, the SGSN includes the configured qualifying options for the ARP IE in the RANAP message.
If there is no matching configuration, the SGSN includes the following default values for the traffic class within the ARP IE:

- Default values for traffic class = background:
  priority-level = (subscribed-value * 3) + 3
  pre-emption-capability = may-trigger-pre-emption
  pre-emption-vulnerability = pre-emptable
  queuing-allowed = yes
- Default values for traffic class = conversational:
  priority-level = (subscribed-value * 3) + 2
  pre-emption-capability = may-trigger-pre-emption
  pre-emption-vulnerability = pre-emptable
  queuing-allowed = yes
- Default values for traffic class = interactive:
  priority-level = (subscribed-value * 3) + 3
  pre-emption-capability = may-trigger-pre-emption
  pre-emption-vulnerability = pre-emptable
  queuing-allowed = yes
- Default values for traffic class = streaming:
  priority-level = (subscribed-value * 3) + 1
  pre-emption-capability = may-trigger-pre-emption
  pre-emption-vulnerability = pre-emptable
  queuing-allowed = yes

Example

The following series of commands define the highest priority for conversational traffic class with priority level 1-10 (Subscribed priority 0-3), PCI of shall-not-trigger-pre-emption, PVI of not-pre-emptable with queuing-not-allowed:

```
ranap allocation-retention-priority-ie subscription-priority 0 priority
class conversational not-pre-emptable priority 1 shall-not-trigger-pre-
emptable

ranap allocation-retention-priority-ie subscription-priority 1 priority
class conversational not-pre-emptable priority 4 shall-not-trigger-pre-
emptable

ranap allocation-retention-priority-ie subscription-priority 2 priority
class conversational not-pre-emptable priority 7 shall-not-trigger-pre-
emptable

ranap allocation-retention-priority-ie subscription-priority 3 priority
class conversational not-pre-emptable priority 10 shall-not-trigger-pre-
emptable
```

restrict access-type

Configures the activation restrictions of PDP context on the basis of the access type and QoS class. This command is specific to the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
restrict access-type { { gprs | umts } [ qos-class { background | conversational |
interactive | streaming } ] }

no restrict access-type { gprs | umts } [ qos-class ]

default restrict access-type { gprs | umts }
```

no

Remove the restriction rules for PDP context activation configured in this APN profile.

default

Resets the restriction rules for PDP context activation to the default values to allow all access types and QoS class.

gprs

Configures the APN profile to restrict the PDP context activation from General Packet Radio Service (2.5G) network access.

umts

Configures the APN profile to restrict the PDP context activation from Universal Mobile Telecommunications Systems (3G) network access.

qos-class

Configures the APN profile to restrict the PDP context activation for to a specific QoS traffic class. It is optional and can be configured after selecting the network access type. Possible traffic classes options are:

- **background**: Specifies the QoS class as background service session
- **conversational**: Specifies the QoS class as conversational service session
- **interactive**: Specifies the QoS class as interactive service session
- **streaming**: Specifies the QoS class as streaming service session

Usage

Use this command to configure the restriction rules in an APN profile for activation of PDP context on the basis of the access type. It also provides the facility to restrict type of traffic QoS class.

Example

The following command configures the APN profile to restrict all traffic from a GPRS network service having a QoS class of interactive:

```
restrict access-type grps qos-class interactive
```

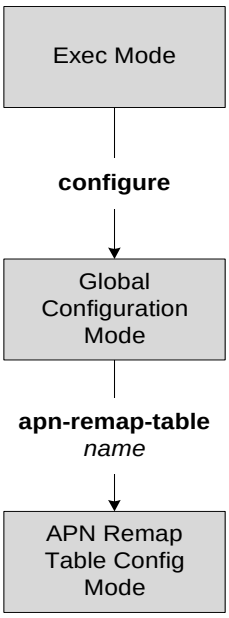
Chapter 25
APN Remap Table Configuration Mode

APN Remap Table Configuration mode provides the commands to configure parameters for multiple features related to Access Point Name (APN) handling, such as: Default APN, APN Remap, and Wildcard APN. APN remap table is a key element of the Operator Policy feature and a table is not usable (valid) until it has been associated with an operator policy (see the *Operator Policy Configuration Mode Commands* chapter.)

A maximum of 1,000 APN remap tables are supported, and each APN remap table supports a maximum of 100 APN remap entries. Multiple tables can be defined and stored but an operator policy and/or IMEI profile each only support association with a single (one) table per policy/profile configuration. The APN remap table associated with an IMEI profile will be used in IMEI override scenarios.

When this mode is accessed, the command prompt should be similar to:

```
[local]asr5000(apn-remap-table<table_id>)#
```



apn-remap

Creates an entry in the APN remap table and provides the ability override the APN requested by the UE.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

apn-remap { network-identifier *apn_net_id* **{ new-ni** *new_apn_net_id* **| operator-identifier** *apn_op_id* **new-ni** *new_apn_net_id* **{ new-oi** *new_apn_op_id* **| value-for-oi-mcc** *mcc* **| value-for-oi-mnc** *mnc* **} | value-for-ni-wc** *new_apn_net_id* **} | operator-identifier** apn_op_id **{ new-oi** *new_apn_op_id* **| value-for-oi-mcc** *mcc* **| value-for-oi-mnc** *mnc* **} }**

no apn-remap { network-identifier *apn_net_id* **| operator-identifier** *apn_op_id* **}**

no

Delete the specified APN remap entry from the APN remap table.

network-identifier *apn_net_id*

Identifies the "old" APN network identifier that is being mapped for replacement as an alphanumeric string of 1 to 62 characters, including dots (.) and dashes (-). Additionally, one wildcard character (*) can be included anywhere within the string.

new-ni *new_apn_net_id*

Identifies the new (target) network identifier to use when no wildcard character is included in the “old” APN network identifier. *new_apn_net_id* is an alphanumeric string of 1 to 62 characters, including dots (.) and dashes (-).

value-for-ni-wc *new_apn_net_id*

Identifies the information to replace the wildcard in the new APN network identifier. Use this keyword when a wildcard character is included in the “old” APN network identifier.
new_apn_net_id is an alphanumeric string of characters, including dots (.) and dashes (-). This string replaces the wildcard (*) specified in the *apn_net_id*. The two strings together must not exceed 62 characters.

operator-identifier *apn_op_id*

Identifies the “old” APN operator identifier that is being mapped for replacement. *apn_op_id* is an alphanumeric string of 1 through 18 characters including dots (.). The entry must be in the following format, where # represents a digit: `MNC###.MCC###.GPRS`.
Optionally, either one or two wildcard characters (*) can be entered. Wildcard characters can be used in place of one # or three # -- for example `MNC1*.MCC*.GPRS`.

new-oi *new_apn_op_id*

Identifies the new (target) operator identifier to use when no wildcard character is included in the "old" APN operator identifier. *new_apn_op_id* is an alphanumeric string of 1 through 18 characters including dots (.). The entry must be in the following format, where # represents a digit: MNC###.MCC###.GPRS.

value-for-oi-mcc *mcc*

Identifies the information to replace the wildcard in the new APN operator identifier when a wildcard character is included in the MCC portion of the "old" APN operator identifier, for example MNC###.MCC*.GPRS.

value-for-oi-mnc *mcc*

Identifies the information to replace the wildcard in the new APN operator identifier when a wildcard character is included in the MNC portion of the "old" APN operator identifier, for example MNC*.MCC###.GPRS.

Usage

Important: Entries in the APN remap table are only valid if the table is associated with an operator policy. The same table can then be associated with an IMEI profile as IMEI-specific remap entries are not supported.

Use this command to define table entries in the APN remap table. Each entry can remap an "old" APN network identifier (NI) or "old" APN operator identifier (OI) to a new NI or OI. Mapping can be done one-to-one with a specific APN NI/OI mapped to a specific new APN NI/OI. Mapping can also be done with wildcards in the "old" APN entry mapped to wildcard replacements to dynamically create 'new' identifiers.

Example

A one-to-one APN NI remap entry is illustrated by:

```
apn-remap network-identifier 123abc.com new-ni 333CBC.com
```

Create an entry with a wildcard so that part of an incoming APN NI will be replaced - for example, incoming "xyzabcpqr.com" becomes "xyzinternet2pqr.com".

```
apn-remap network-identifier xyz*pqr.com value-for-ni-wc internet2
```

Replace any incoming APN NI with a new APN NI.

```
apn-remap network-identifier * value-for-ni-wc newnet.com
```

A one-to-one APN OI remap entry is illustrated by:

```
apn-remap operator-identifier MNC423.MCC222.GPRS new-oi
MNC123.MCC456.GPRS
```

Replace any incoming APN OI with a new APN OI *MNC123.MCC456.GPRS*:

```
apn-remap operator-identifier MNC*.MCC*.GPRS value-for-oi-mnc 123 value-
for-oi-mcc 456
```

apn-selection-default

Enables and configures or disables the Default APN feature for use when the normal APN selection process fails.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

apn-selection-default { first-in-subscription | network-identifier *apn_net_id* **[fallback-apn network-identifier** *apn_net_id* **| fallback-to-first-in-subscription | prefer-single-subscription | reject-blank-apn | require-dns-fail-wildcard | require-subscription-apn] + }**

no apn-selection-default

no

Delete the configuration statement and disable the default APN feature.

first-in-subscription

Specifies that the first APN in the subscription record matching the PDN type is used as the default APN when normal APN selection fails and if the UE APN is absent and the defined default APN is not a match. For the SGSN, “first-in-subscription” means the first record from the list of records sent from the HLR (in the same order) with PDP type matching the requested PDP type. With this configuration, if the first record is a wildcard APN it is expected that the wildcard APN be configured. If not, the activation will be rejected.

network-identifier *apn_net_id*

Specifies the network identifier will be used as the default APN name as an alphanumeric string of 1 through 62 characters, including dots (.) and dashes (-).
Any of the following optional keywords can be used with **network-identifier** as qualifications.

fallback-apn network-identifier *apn_net_id*

SGSN only.
Specifies a dummy APN to be used when the default APN is not present in the subscription so that the activation does not fail. With this keyword configured, the context is activated with a dummy APN and the GGSN displays a static page for this APN, instructing the subscriber to subscribe for appropriate services.
apn_net_id: Enter an alphanumeric string of 1 through 62 characters, including dots (.) and dashes (-).

fallback-to-first-in-subscription

Uses the APN from the first subscription record when configured default APN is not available.

prefer-single-subscription

Uses the APN from the subscription record if it is the only record available and normal APN selection fails.

reject-blank-apn

Disables use of the default APN if a blank APN is received.

require-dns-fail-wildcard

Enables the default APN to be used if the DNS query fails with the selected APN.

require-subscription-apn network-identifier *apn_net_id*

If defined, this APN name must also be included in the subscription data for the Default APN feature to function. *apn_net_id* is an alphanumeric string of 1 through 62 characters, including dots (.) and dashes (-).

Usage

Important: The Default APN feature will only work if it is configured in an APN remap table entry and the table is associated to an IMEI profile.

The default APN feature will be used in error situations when the SGSN cannot select a valid APN via the normal APN selection process. Within an operator policy, a default APN can be configured for the SGSN to:

- override a requested APN when the HLR does not have the requested APN in the subscription profile.
- provide a viable APN if APN selection fails because there was no "requested APN" and wildcard subscription was not an option.

The default APN feature can also be used in the event of a DNS query failure with the selected APN, if:

- the **wildcard-apn** command is configured,
- a wildcard subscription is present,
- the **require-dns-fail-wildcard** keyword is included with the **apn-selection-default** command then the configured default APN will be used when the DNS query is retried.

In all of the instances outlined above, the SGSN can provide the default APN as an alternate behavior to ensure that PDP context activation is successful.

Example

The following command enables default APN feature for APN *HomeNet1*:

```
apn-selection-default network-identifier HomeNet1
```

The following command enables use of a default APN if the DNS query fails:

```
apn-selection-default network-identifier HomeNet1 require-dns-fail-
wildcard
```

blank-apn

Enables the Blank APN feature and defines the APN that will be used when no APN is requested. This command is specific to SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

blank-apn network-identifier *apn_net_id*

no blank-apn

no

Removes the APN NI from the APN Remap Table configuration and disables the Default APN feature.

network-identifier *apn_net_id*

Identifies the APN network identifier that will be used when no APN is requested. *apn_net_id* is an alphanumeric string of 1 through 62 characters, including dots (.) and dashes (-).

Usage

Use this command to enable the Blank APN feature.

Example

The following command creates an entry that supplies the *starnet.com* as the APN network identifier whenever a request does not include an APN:

```
blank-apn network-identifier starnet.com
```

cc

This command defines APN remapping behavior so that remapping occurs based on the charging characteristics value.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

cc behavior *bit_value* **profile** *index_bit* **apn-remap network-identifier** *apn_net_id* **new-ni** *new_apn_net_id*

no cc behavior *bit_value* **profile** *index_bit* **apn-remap network-identifier** *apn_net_id*

no

Disables the configured remapping behavior.

behavior*bit_value*

Specify the bit value for the behavior bit for the charging characteristic.
bit_value must be a hex value from 0x0 to 0xFFF.

profile *index_bit*

Specifies the charging characteristic profile index for this apn remap entry.
index_bit must be an integer value from 1 through 15.
Some of the index values are predefined according to 3GPP standard:

- **1** for hot billing
- **2** for flat billing
- **4** for prepaid billing
- **8** for normal billing

apn-remap network-identifier *apn_net_id*

Identifies the 'old' APN network identifier that is being mapped for replacement.
apn_net_id : Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-) .
Additionally, one wildcard character (*) can be included anywhere within the string.

new-ni *new_apn_net_id*

Identifies the 'new' APN network identifier that is being mapped to.
new_apn_net_id : Enter a string of 1 to 62 alphanumeric characters, including dots (.) and dashes (-) .

Usage

Use this command to enable APN remapping only when the charging characteristic value in the subscription record associated with the requested APN matches the value configured for the **new-ni** .

The new APN NI must be part of the subscription data so that the charging characteristic associated with the new APN NI will be used for activating the context and if there isn't one associated then the general charging characteristic will be used.

Example

The following command associates a new APN NI 'locals1' with a set of charging characteristics:

```
cc behavior 0xF profile 4 apn-remap network-identifier homer1 new-ni
locals1
```

description

Defines a string that describes this APN remap table.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

description *description*

no description

no

Removes the description configuration from this APN Remap Table configuration.

description

Specifies descriptive text to be associated with the APN remap table as an alphanumeric string of 1 through 100 characters. The string may include spaces, punctuation, and case-sensitive letters if the string is enclosed in double quotation marks (“).

Usage

Define information that identifies this particularly APN remap table.

Example

```
description “APN_remap1 replaces all MNC1## Ids.”
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

Security Administrator, Administrator

Syntax

wildcard-apn pdp-type { dual-ipv4v6 | ipv4 | ipv6 | ppp } network-identifier*apn_net_id*

no wildcard-apn pdp-type { dual-ipv4v6 | ipv4 | ipv6 | ppp }

no

Disables the wildcard-apn definition from the configuration.

pdp-type { dual-ipv4v6 | ipv4 | ipv6 | ppp } network-identifier *apn_net_id*

Specifies the PDP type.

- **dual-ipv4v6**- for a dual PDP context association with one IPv4 address and one IPv6 address/prefix (SGSN only)
- **ipv4** - for an IPv4 context
- **ipv6** - for an IPv6 context
- **ppp** - for a PPP context

network-identifier *apn_net_id* must be one of the APN network identifiers specified via the **apn** command in the Operator Policy Configuration mode. The identifier must be expressed as an alphanumeric string of 1 through 62 characters, including dots (.) and dashes (-), to define the network identifier.

Usage

This command is used to define a wildcard APN with the type of PDP context and the APN's network ID. This wildcard APN would be used when an APN is not identified.
The command should be repeated per PDP type, as needed, to enable wildcard APN for two or more of the PDP types.
The wildcard APN configured with the dual PDP IPv4v6 context will be used under in the following scenarios:

- the UE requested a PDP type of IPv4v6
- the UE did not request any specific APN
- the subscription includes wildcard APN with PDP type as IPv4v6

Important: Wildcard APN feature configuration is only valid if the APN remap table is associated with at least one operator policy. The same table can then be associated with an IMEI profile as IMEI-specific Wildcard APN is not supported.

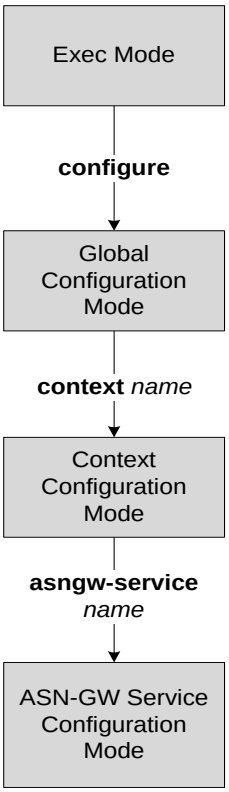
Example

Use this command to enable an APN wildcard for PDP type IPv4:

```
wildcard-apn pdp-type ipv4 network-identifier homer1
```

Chapter 26
ASN Gateway Service Configuration Mode Commands

Use the ASN GW Service Configuration Mode to create and manage ASN Gateway services within the current context.



active-relay

Use this command to enable the active relay of R4 and R6 messages in ASN GW, and to configure the timeout duration in seconds for the R4 or R6 messages (for example, Data Path messages).

Product

ASN GW

Privilege

Administrator

Syntax

active-relay timeout < *duration*>

[default] active-relay timeout

default

Sets the total timeout duration to 15 seconds to actively relayed R4 or R6 messages.

duration

Default: 15
Specifies the maximum allowable timeout duration for the ASN GW service to actively relay the R4 or R6 messages.
duration is measured in seconds. Configure as an integer from 5 through 65535.

Usage

Use this command to enable the active relay of R4 and R6 messages and also to configure the maximum timeout duration for the actively relayed R4 or R6 messages by ASN GW.
By default, the system is pre-configured for passive relay functionality for R4 and R6 messages.

Example

The following command configures the timeout duration of *20* seconds for actively relayed R4 or R6 messages:

active-relay timeout *20*

authentication

Use this command to configure the authentication type and parameters used for subscribers in this service.

Product

ASN GW

Privilege

Administrator

Syntax

```
authentication { single-eap |  none }

default authentication
```

default

Disables the authentication requirement for the ASN GW service.

single-eap

This keyword enables single Extensible Authentication Protocol (EAP) authentication for specific ASN GW service subscribers. Possible single-EAP authentication options are User-only, Device-only, or Device-User.

none

This is the default setting for authentication. Enter this keyword to disable all authentication types for a specific ASN GW service.

Usage

Use this command to configure authentication requirements for the ASN GW service.

Example

The following command sets the user authentication for ASN GW service with single EAP:

```
authentication single-eap
```

bind

Use this command to bind the ASN GW service to a logical IP interface and to configure the maximum number of subscribers supported within an ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *max_subs* **]**

no bind

no

Removes the binding of the service to a specified interface.

ip_address

Specifies the IP address of the interface to which the service is to be bound. Express *ip_address* in IPv4 dotted decimal or IPv6 colon-separated notation.

max-subscribers *max_subs*

Configures the maximum number of subscribers allowed to connect with this ASN Gateway within a specific ASN GW service.
max_subs must be an integer from 1 and 1500000.

Usage

Use this command to associate the service with a specific logical IP address and provide the identity of the ASN Gateway. The identity is either the domain name of the ASN GW service or the IP address. This command also configures the maximum number of subscribers with this service.

Example

The following command binds the ASN GW service to a logical interface with an IP address of *1.2.3.4* with a limit of *250000* subscribers:

```
bind address 1.2.3.4 max-subscribers 250000
```

bs-monitor

Use this command to enable or disable the ASN base station monitoring and related parameters in a WiMAX ASN.

Product

ASN GW

Privilege

Administrator

Syntax

bs-monitor [interval *duration* **| num-retry** *retries* **| timeout** *idle_time* **]**

[default | no] bs-monitor

default

Disables the configured BS monitoring parameters.

no

Removes the configured BS monitoring feature and parameters.

interval *duration*

Default: 60
Configures the interval duration in seconds between two ICMP ping messages sent to the ASN BS for BS monitoring.
duration specifies the amount of time in seconds between two ICMP ping messages sent to monitor an ASN BS. Specify an integer from 1 through 36000.

num-retry *retries*

Default: 5
Configures the number of retries before marking a specific ASN BS as unreachable.
retries specifies the number of times to send ICMP ping messages to an ASN BS before the ASN BS is declared unreachable. Enter an integer from 0 through 100.

timeout *idle_time*

Default: 3
Configures the timeout duration to wait for a response from ASN BS of ICMP ping message before retransmitting the ICMP ping packets.
idle_time must be an integer value in the range of 1 through 10.

Usage

Use this command to enable or disable base station monitoring and to configure the ASN BS monitoring parameters in a WiMAX ASN.

Important: Base Station Monitoring is a license-enabled feature.

Example

The following command configures the timeout duration of *5* seconds before sending an ICMP ping message if the ASN BS does not respond:

bs-monitor timeout *6*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

gre

This command configures the GRE tunnel parameters for ASN GW gateway functionality within a specific ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

gre mtu *mtu_size*

default gre mtu

default

Sets the MTU size for the GRE tunnel to the default value of 1500 bytes in a WiMAX network.

mtu *mtu_size*

Default: 1500 bytes
Configures the maximum transmission unit size in bytes for the GRE tunnel within a specific ASN GW service.
mtu_size must be an integer between 36 and 2000.

Usage

Use this command to support tunnel reassembly optimization with the MTU size for a GRE tunnel in a WiMAX network.

Example

The following command configures the maximum transmission unit (MTU) size to *1700* bytes for a GRE tunnel:

```
default gre mtu 1700
```

handover

This command specifies the handover-related parameters between BS, ASN GW, and MS.

Product

ASN GW

Privilege

Administrator

Syntax

handover { anchor { dp-pre-reg-termination timeout *duration*| **dp-termination timeout** *duration* **} | max-dp-pre-registrations** *reg_num* **| non-anchor { dp-pre-reg-termination timeout** *duration* **| dp-termination timeout** *duration* **} }**

default handover { anchor { dp-pre-reg-termination timeout | dp-termination timeout } | max-dp-pre-registrations | non-anchor { dp-pre-reg-termination timeout | dp-termination timeout } }

default

Sets the default values for configured handover parameters.

anchor

Configures datapath pre-registration and/or termination parameters for an anchor gateway handover.

dp-pre-reg-termination timeout *duration*

Default: 5
Configures the maximum duration in seconds that a single MS can keep the pre-registration datapath with the previous BS after a completed handover to another BS.
duration is measured in seconds. Configure as any integer from 0 through 65535.

dp-termination timeout *duration*

Default: 0
Configures the maximum duration in seconds for which the datapath with the previous BS is maintained after a completed handover to another BS. The system maintains the old datapath for the specified period after the new datapath setup is completed, and then terminates it.
duration is measured in seconds. Configured as any integer from 0 through 65535.

max-dp-pre-registrations *reg_num*

Default: 1
Configures the maximum number of pre-registrations from multiple BSs that a single MS can keep at a time.
reg_num is the number of pre-registrations. Configure as any integer from 0 through 5.

non-anchor

Configures datapath pre-registration and/or termination parameters for a non-anchor gateway handover.

Usage

Use this command to configure the handover-related parameters between MS, BS, and ASN GW.
By default, the system is configured to terminate the previous sessions immediately. The number of pre-registrations from multiple BSs is set to 0 for an MS.

Example

The following command configures the maximum duration as *20* seconds. This is the amount of time for which the datapath with the previous BS is maintained after a completed handover to another BS:

```
dp-pre-reg-termination timeout 20
```

header-compression-rohc

Use this command to configure (Robust Header Compression (ROHC) support and ROHC parameters in an ASNGW service. Header compression is applied to ASNGW service flows when the ROHC is enabled on the ASNGW, and MS and AAA authorize ROHC for the ASNGW call. If ROHC is supported on the service, it is indicated in the MS attachment messages. ROHC parameter values are negotiated over R6. Unidirectional and bi-directional ROHC service flow are supported.

Product

ASN GW

Privilege

Administrator

Syntax

header-compression rohc { [default] | cid-mode-large max-cid < *max-cid* > **| cid-mode-small** < *max-cid* > | **mrru** < *integer* > } **profile-id { rtp- ip | esp-ip | rtp-udp | udp-ip | uncompressed-ip}**

header-compression rohc

Sets the default values for configured ROHC parameters.

default

Sets the default values for configured ROHC parameters.

cid-mode-large max-cid

ROHC large context identifier range mode: an integer from 0 to 31.

cid-mode-small max-cid

ROHC small context identifier range mode: an integer from 0 to 15.

mrru

Maximum Reconstructed Reception Unit: The maximum possible size of a packet reassembled from ROHC segments: an integer from 0 to 65535.

profile id

The ROHC configuration is controlled by a set of attributes which are assocated with an ROHC profile. A system may have multiple profiles..

Usage

Data packets that are transferred over a wireless link are dependent on each other and share common parameters, such a equal source and destination addresses. They can usually be grouped together logically, for example, data packets that constitute an audio stream and data packets that make up the accompanying video stream. Therefore, you can use a stream-oriented approach in ROHC to compress packet headers. Each stream or flow is identified by its parameters that are common to all packets in a particular stream. The compressor and decompresor maintain a context for each stream, which is identified by the same context

identifier (CID) on both sides. A context, being a set of data, contains, for example, the statis and dynamic header fields that define a stream.

Example

The following command configures a small context ROHC CID.

```
header-compression rohc cid-mode small max 15 profile-id udp-id
```

idle-mode

Use this command to configure the time in seconds that an ASN GW service waits to place a session in idle mode or reactivates an idle session after the specified time for exit timeout. This occurs if there is no activity for the amount of time you specified.

Product

ASN GW

Privilege

Administrator

Syntax

idle-mode { entry-timeout *duration* **| exit-timeout** *duration* **| timeout** *duration* **}**

default idle-mode { entry-timeout | exit-timeout | timeout }

default

Resets the idle mode durations to their respective default values.

no

Disables/removes the configured idle mode entry and/or exit timeout duration for a session.

entry-timeout *duration*

Default: 60
Specifies the maximum duration in seconds allowed for idle mode entry for a session.
duration is measured in seconds. Configure as an integer from 1 through 100000.

exit-timeout *duration*

Default: 60
Specifies the maximum duration in seconds allowed for session to reenter active mode after idle mode exit.
duration is measured in seconds. Configure as an integer from 1 through 100000.

timeout *duration*

Default: 4069
Specifies the maximum time (in seconds) allowed for a session to remain in idle mode. *duration* is an integer from 128 to 65535.

Usage

Use this command to configure the ASN GW service to send a session for idle mode or active mode after specified duration of time.

Example

The following command configures the idle mode entry timeout value to *50* seconds:

```
idle-mode entry-timeout 50
```

local-data-tunnel

Use this command to specify the tunnel endpoint on the ASNGW side to receive the uplink data packets over the R6 interface. This address is different from the R6 control address.

Product

ASN GW

Privilege

Administrator

Syntax

local-data-tunnel address < *address* >

default

Default is no tunnel endpoint is configured and the control address is used as the uplink tunnel endpoint.

no

Disables/removes the configured tunnel endpoint.

address *address*

Specifies the tunnel endpoint that will receive uplink data packets over the R6 interface.

Example

The following command specifies the tunnel endpoint on the ASNGW side that will receive uplink data packets over the R6 interface.

```
local-data-tunnel address 102.168.1.5
```

max-retransmission

Use this command to specify the number of times the system can attempt retransmission of R6 control packets to communicate with an unresponsive BS.

Product

ASN GW

Privilege

Administrator

Syntax

max-retransmission *retry*

default max-retransmission

default

Sets the maximum number of retransmission counters to 3 for R6 control packets within a specific ASN GW service.

retry

Default: 3
Configures the maximum number of retransmission of R6 control packets to BS before marking it as failed. *retry* must be an integer between 1 and 10.

Usage

Use this command to configure number of retransmission of R6 control packets to BS before marking it as failed.

Example

The following command configures the system to attempt sending R6 control packets to the BS *2* times:

```
max-retransmission 2
```

mobile-access-gateway

Use this command to associate MAG context and/or MAG service for an ASNGW service. This is available only when PMIPv6 is supported and the license is enabled. Default: no

Product

ASN GW

Privilege

Administrator

Syntax

mobile-access-gateway context < *context_name* >**[mag-service**< *service-name* > **]**

no mobile-access-gateway context

Usage

MAG service is responsible for PMIPv6 signaling. MAG service establishes and maintains a bi-directional tunnel for the subscriber traffic with LMA.
Use the **no mobile-access-gateway context** to delete a previously configured context.

Example

The following command instructs the ASN GW service to use the context named mag-service for MAG functionality:

mobile-access-gateway context *context-name***mag-service** *service-name*

mobile-ip

This command configures Mobile IP support with FA service(s) for specific ASN GW service and specifies the context in which the FA service is configured. Default: no

Product

ASN GW

Privilege

Administrator

Syntax

mobile-ip foreign-agent context *context_name*

no mobile-ip foreign-agent context

foreign-agent context *context_name*

Default: No FA context specified.
Specifies the name of the previously configured context that facilitates the FA service(s).
context_name must be between 1 and 79 alpha or numeric characters and is case sensitive.

Usage

You can configure FA services on the system in either the same or different contexts from those facilitating ASN GW services. When they are configured in separate contexts, this command, configured within an ASN GW service, instructs the ASN GW service to route traffic to the context facilitating the FA service.
Use the **no mobile-ip foreign-agent context** to delete a previously configured destination context.

Example

The following command instructs the ASN GW service to use the context named FA-destination for FA functionality:

mobile-ip foreign-agent context *fa-destination*

peer-asngw

Use this command to configure the addresses of trusted non-anchor ASN GWs or ASN PC/LR peers for which a specific ASN GW service can allow R4 control and data path registration.

Product

ASN GW

Privilege

Administrator

Syntax

[no] peer-asngw address < *ip_address*> **[id** < *6-byte MAC address* > | **mode** {*legacy* | *non-legacy* } | < *simple-ip re-anchoring* >]

no

Removes the configured non-anchor ASN GW or non-anchor ASN PC/LR peers from a specific ASN GW service's trusted peer list.

peer-asngw address

Specifies the IP address of the non-anchor ASN GW or non-anchor ASN PC/LR peers. The IP address is added as a trusted peer with the ASN GW service.
ip_address is the IP address of the non-anchor ASN GW or non-anchor ASN PC/LR peers expressed in IPv4 dotted decimal or IPv6 colon separated notation.
6-byte MAC address is the 6-byte identifier on the ASNGW service.

Usage

Use this command to create trusted non-anchor ASN GW or non-anchor ASN PC/LR peers with a specific ASN GW service to establish R4 control and data path registration. The ASN GW supports the 6-byte ASNGW ID in the souce ID TLV and destination ID TLV of all the messages. The 6-byte anchor gateway ID and authenticator ID are also supported.
On receipt of an R4 control or data path registration request message, the ASN GW service checks whether a non-anchor DPF/Authenticator ASN GW/ASN PC-LR address received in a request message, is in the trusted peer list configured with this command. If the Anchor DPF/Authenticator ASN GW/ASN PC-LR address is not configured in the non-anchor ASN GW or non-anchor ASN PC/LR peers' list, the ASN GW service sends a response for a request message with Failure Indication TLV and unspecified error code.
You can configure a maximum of 32 ASN GWs or ASN PC/LRs with this command.

Example

The following command adds the ASN GW with an IP address as a trusted peer within an ASN GW service, and a 6-byte ID for the peer ASN GW.

peer-asngw address *1.2.3.4* **id** *00-05-47-00-37-44*

policy

This command configures the policies for ASN Gateway behavior within a specific ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

```
policy { asngw-initiated-reauth | ms-unexpected-network-reentry | msid-dhcp-chaddr-mismatch | | non-anchor-mode | overload } { allow | disallow }

default policy { ms-unexpected-network-reentry | msid-dhcp-chaddr-mismatch | non-anchor-mode }
```

default

Resets the policy parameters to their respective default values.

asngw-initiated-reauth

Defualt: allow
Configures ASNGW-initiated reauthentication parameters.

ms-unexpected-network-reentry

Default: allow
Configures the ASN Gateway to allow or disallow an MS re-entry from the same or a new BS, when an active call already exists for the same MS on the ASN Gateway.
This policy performs in the following manner:

- If the pre-attachment request of the new call comes from a different BS, re-entry is accepted regardless of the call state.
- If the pre-attachment request of the new call comes from the same BS, re-entry is accepted if the original call is in any state past the pre-attachment phase.
- Original call is dropped in favor of new call.

msid-dhcp-chaddr-mismatch

Default: disallow
Valid only for the primary host. Configures the ASN Gateway to allow or disallow an MS to connect if the MSID and DHCP address information is mismatched.

non-anchor-mode

Default: allow
Configures the ASN Gateway to allow or disallow the creation of non-anchor sessions based on the DP Registration Request from any base station.
When non-anchor mode is not allowed and a DP Registration Request is received, if there is no matching session for the MSID, the request is rejected and a DP Registration Response is sent with an error code: "**Admin Prohibited**".

overload

Default: allow

Designates the rejection of ASNGW services in case of session overload.

allow

Sets the policies to allow the MS matching with specified policy for ASN Gateway.

disallow

Sets the policies to deny or disallow the MS matching the specified policy for ASN Gateway.

Usage

Use this command to configure the policies of the ASN Gateway to handle the MS connection within a specific ASN GW service.

Example

The following command enforces the policy to allow an MS re-entry from a new BS, when an active call exists for the same MS on the ASN Gateway via another BS.:

```
policy ms-unexpected-network-reentry allow
```

policy asngw-initiated-reauth

This command configures the policies for how the ASN Gateway initiates reauthorization triggers from an ASN GW service.

Product

ASN GW

Privilege

Administrator

Syntax

policy asngw-initiated-reauth { allow | disallow | max-cmac-key-count *max_count*| **pmk-grace-time** *grace_time* **}**

default policy asngw-initiated-reauth [max-cmac-key-count | pmk-grace-time]

default

Resets the policy to disallow ASN GW-initiated re-authorization and sets the default values for CMAC key count and PMK grace time within a specific ASN GW service.

max-cmac-key-count *max_count*

Default: 100
Configures the ASN Gateway to trigger the reauthorization on the basis of Cipher-based Message Authentication Code (CMAC) key counter. Once the CMAC counter crosses the configured value, the system initiates the reauthorization trigger.
max_count is the CMAC key counter and is an integer from 2 through 32768.

pmk-grace-time *grace_time*

Default: 60
Configures the ASN Gateway to trigger the reauthorization on the basis of the Pair-wise Master Key (PMK) key grace period. Once the configured PMK grace period is exhausted, the system initiates the reauthorization trigger.
grace_time is the grace period in seconds to wait for the Pair-wise Master Key (PMK) and is an integer from 10 through 65335.

allow

Default: disabled
Configures the ASN Gateway to trigger re-authentication based on two locally configured parameters: **pmk-grace-time** and **cmac-key-count**.

disallow

Default: enabled
Configures the ASN Gateway not trigger the re-authentication based on two locally configured parameters: **pmk-grace-time** and **cmac-key-count**.

Usage

Use this command to enable the ASN GW to initiate the reauthorization trigger on the basis of the configured policy.

Example

The following command enforces the reauthorization policy from the ASN GW:

```
policy asngw-initiated-reauth allow
```

policy overload

Configures the traffic overload policy that controls congestion in this service.

Product

ASN GW

Privilege

Administrator

Syntax

```
policy overload { drop | reject }

default policy overload
```

default

Sets the traffic overload policy action to reject in this service.

drop

Default: disabled
Specifies that the system is to drop incoming packets containing new session requests.

reject

Default: enabled
Specifies that the system processes new session request messages and responds with a reject message.

Usage

You can configure congestion policies at the service-level. When congestion control functionality is enabled at the service level, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures an overload policy of reject for this ASN GW service:

```
policy overload reject
```

ran-peer-map

Use this command to configure a mapping between the BSID and IPv4 address of known base station peers; identifies a base station peer map for this service.

Product

ASN GW

Privilege

Administrator

Syntax

ran-peer-map *name* **ran-peer id**< *mac-addr* >**address**< *ip-addr* >**[mode {non-legacy | legacy}]**

no ran-peer-map

name

Specifies the name of the RAN Peer Map. Specify a *name* from 1 to 31 alpha and/or numeric characters. The name must be an existing peer map. Configure RAN Peer Maps in the Global Configuration Mode.

ran-peer id

Creates a mapping for id to ip address.

address

Specifies the IPv4 address of the base station which is added as a peer for the given service.

mode {non-legacy | legacy}]

Default: non-legacy

Usage

Use this command to configure a base station peer map that this service will use to map MAC addresses received in R6 protocol messages to IPv4 addresses.

Example

The following command configures the service to refer to a peer map named *ran12* when reconciling a base station MAC address to an IP address:

ran-peer-map *ran12*

retransmission-timeout

Use this command to configure the non-response time before the system re-attempts to send R6 control packets to the BS.

Product

ASN GW

Privilege

Administrator

Syntax

retransmission-timeout *duration*

[no | default] retransmission-timeout

default

Sets the timeout duration to 3 seconds before R6 control packets are retransmitted.

no

Disables or removes the configured timeout duration for the retransmission of R6 control packets.

duration

Default: 3
Specifies the the number of seconds for the ASN GW service to wait for a response from the BS before it (a) attempts to communicate with the BS again (if the system is configured to retry the BS), or (b) marks the BS as unreachable.
duration is measured in seconds and can be configured to any integer value between 1 and 1,000.

Usage

Use this command in conjunction with the **max-retransmission** command to configure the ASN GW services behavior when it does not receive a response from a particular BS.
Use the **no retransmission-timeout** command to delete a previously configured timeout value. If after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default retransmission-timeout** command.
The chassis is shipped with the retransmission timeout set to 3 seconds.

Example

The following example configures a retransmission timeout value of 5 seconds:

```
retransmission-timeout 5
```

The following command deletes a previously configured retransmission-timeout setting:

```
no retransmission-timeout
```

secondary-ip-hosts

Use this command to enable or disable multiple host support behind WiMAX customer premises equipment (CPE).
Default: disabled

Product

ASN GW

Privilege

Administrator

Syntax

secondary-ip-hosts *max_hosts*

default multiple-ip-hosts

default

Sets the multiple host configuration in an ASN GW service to disabled (default mode).

max_hosts

Default: 0 (disabled)
Specifies the maximum number of hosts allowed to connect through one primary node connection behind a WiMAX CPE.
max_hosts must be an integer from 0 through 4, where 0, the default value, disables this feature.

Usage

Use this command to enable or disable multi-IP host support in an ASN GW service behind one WiMAX CPE through a primary airlink. If enabled, this command supports up to four hosts as an auxiliary connection. Accounting and UDR generation for such connections are based on the primary connection with the WiMAX CPE. To apply this facility to a subscriber, configure the **ip address secondary-pool** command in the **Subscriber Configuration** mode.

Example

The following command enables multiple host support and instructs the ASN GW service to allow *3* IP hosts as auxiliary connections behind one CPE:

```
secondary-ip-hosts 3
```

The following command disable the multiple host support and instructs the ASN GW service not to allow auxiliary connections behind one CPE:

```
default secondary-ip-host
```

secondary-ip-hosts

Use this command to enable or disable multiple host support behind WiMAX customer premises equipment (CPE).
Default: disabled

Product

ASN GW

Privilege

Administrator

Syntax

secondary-ip-hosts *max_hosts*

default multiple-ip-hosts

default

Sets the multiple host configuration in an ASN GW service to disabled (default mode).

max_hosts

Default: 0 (disabled)
Specifies the maximum number of hosts allowed to connect through one primary node connection behind a WiMAX CPE.
max_hosts must be an integer from 0 through 4, where 0, the default value, disables this feature.

Usage

Use this command to enable or disable multi-IP host support in an ASN GW service behind one WiMAX CPE through a primary airlink. If enabled, this command supports up to four hosts as an auxiliary connection. Accounting and UDR generation for such connections are based on the primary connection with the WiMAX CPE. To apply this facility to a subscriber, configure the **ip address secondary-pool** command in the **Subscriber Configuration** mode.

Example

The following command enables multiple host support and instructs the ASN GW service to allow *3* IP hosts as auxiliary connections behind one CPE:

```
secondary-ip-hosts 3
```

The following command disable the multiple host support and instructs the ASN GW service not to allow auxiliary connections behind one CPE:

```
default secondary-ip-host
```

service-flow create-before-ip-alloc

This command specifies whether service flows should be created before the IP allocation is completed. If this command is not configured, during the INE process, only an Initial Service Flow (ISF) is created with a wildcard classifier. The remaining service flow is created after the IP allocation.

Product

ASN GW

Privilege

Administrator

Syntax

```
[ no | default ]service-flow create-before-ip-alloc
```

default

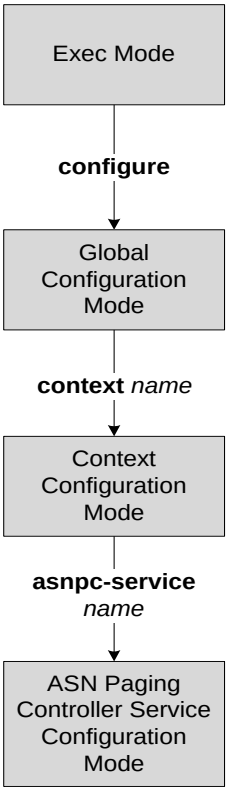
The default is *disabled*.

Usage

There are two types of service flows: 1) pre-provisioned service flows are created during INE and created, modified, or deleted based on some external trigger from the PCRF/AAA; 2) dynamic service flow creation is on an on-demand basis and because of some external trigger from the PCFR/AAA. Path modification is requested to changes in the state of the service flow, for example, from admit to active or from active to admit.

Chapter 27
ASN Paging Controller Configuration Mode Commands

Use the ASN Paging Controller Configuration Mode to create and manage Access Service netowrk (ASN) paging and location register services for WiMAX subscribers within a context.



asnpc-id

Configures the identifier for an ASN paging controller for the subscribers in this service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

asnpc-id *mac_address*

default asnpc-id

default

Sets the ASN paging controller identifier as the IP address of the system running the ASN paging controller and location registry service.

mac_address

Specifies the MAC address of the system running the ASN paging controller and location registry service. *mac_address* is the MAC address of the paging controller in standard (IEEE 802) format – six groups of two hexadecimal digits separated by hyphens (-) or colons (:).

Usage

Use this command to configure the MAC address of the paging controller for the ASN paging controller service.

Example

The following command sets the MAC address of paging controller to *01:23:45:67:89:ab* in colon (:) separated format:

```
asnpc-id 01:23:45:67:89:ab
```

bind

Binds the ASN paging controller service to a logical IP interface and configures the maximum number of subscribers allowed within a service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

bind address *ip_address* **[max-subscribers** *max_subs* **]**

no bind

no

Removes the binding of the service to a specified interface.

ip_address

Specifies the IP address of the interface to which the service is to be bound in IPv4 dotted-decimal or IPv6 colon-separated notation.

max-subscribers *max_subs*

is an integer from 0 through 3000000.

Usage

Use this command to associate the service with a specific logical IP address and to provide the identity of the ASN paging controller as either the domain name of the ASN paging controller service or the IP address. This command also configures the maximum number of subscribers allowed with this service.

Example

The following command binds the ASN paging controller service to a logical interface with an IP address of *10.2.3.4* and a limit of *250000* subscribers:

```
bind address 10.2.3.4 max-subscribers 250000
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

max-retransmission

Configures the maximum number of times the system attempts retransmission of R6 control packets to communicate with an unresponsive BS.

Product

ASN PC-LR

Privilege

Administrator

Syntax

max-retransmission *retry*

default max-retransmission

default

Sets the maximum number of retransmission counter to 3 for R6 control packets within a specific ASN paging controller service.

retry

Configures the maximum number of retransmission attempts of R6 control packets to the BS before marking it as unresponsive as an integer from 1 through 10. Default: 3

Usage

Use this command to configure the number of retransmission attempts of R6 control packets to the BS before marking it as unresponsive.

Example

The following command configures the system to attempt *2* tries to send R6 control packets to BS:

```
max-retransmission 2
```

paging-announce

Configures the number of seconds to wait before sending a paging announcement messages to the MS.

Product

ASN PC-LR

Privilege

Administrator

Syntax

paging-announce timeout *duration*

default paging-announce timeout

default

Sets the paging announcement timeout to 10 seconds.

duration

Specifies the maximum duration in seconds to wait for sending a paging announce to the MS as an integer from 1 through 1000. Default: 10

Usage

Use this command to configure the number of seconds for the ASN paging controller services to wait before sending a paging announcement if there is no data communication.

Example

The following command configures the paging announce timeout value of *500* seconds:

```
paging-announce timeout 500
```

paging-group

Creates or removes the Paging-Group Identifier within a specific ASN paging controller service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

paging-group id *paging_group_id* **paging node id**< *mac-addr* >**addr**< *ip-addr* >**[mode {non-legacy | legacy}][-noconfirm]**

no paging-group id *paging_group_id*

no

Disables or removes the paging group identifier from a specific ASN paging controller service.

id *paging_group_id*

Configures the paging group identifier and other parameters within a specific ASN paging controller service. This is a logical network identifier for the serving BS or other network entity that retains MS service and operational information or administers paging activity for the MS while it is in idle mode
*paging_group_id*is an integer from 1 through 65535.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

WARNING: If you use this keyword option with **no paging-group id** *paging_group_id* command, the **paging group id** *paging_group_id* is deleted and disabled with all active or inactive configurations in a paging group. There are no prompts, warning, or confirmations.

Usage

Use this command to enter, enable, or disable the Paging Group Identifier Configuration mode functionality within a specific ASN paging controller service.

Important: Configure a maximum of 32 paging groups within a service.

Example

The following command configures the paging group identifier as *1234* for the ASN paging controller service:

```
paging-group id 1234
```

peer-asngw

Configures the addresses of trusted anchor ASN-GW peers. These are the peers with which a specified ASN Paging Controller and Location Registry service will allow R4 control and data path registration.

Product

ASN PC-LR

Privilege

Administrator

Syntax

[no] peer-asngw address *ip_address*[**id** *<MAC>* | **mode** [*legacy* | *non-legacy*]]

no

Removes the configured peer anchor ASN GW from a specific ASN PC/LR service's trusted peer list.

address *ip_address*

Specifies the IP address of the anchor ASN GW which is added as a trusted peer with the ASN PC/LR service in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to create trusted peer anchor ASN GWs with a specific ASN PC/LR service to establish R4 control and data path registration.
There is support for 6-byte ASNPC ID in the source or destination ID TLV, and for the Anchor GW and Authenticator IDs.
On receipt of an idle mode entry request message, the ASN PC/LR service checks the anchor DPF/authenticator. If the Anchor DPF/Authenticator ASN GW address received in the idle mode entry request message is not there, (or not configured in the peer list), the ASN PC/LR service sends the idle mode entry response message with a Failure Indication TLV with an unspecified error code.
Configure a maximum of 32 ASN GWs with this command.

Example

The following command adds the anchor ASN GW with an IP address of *10.2.3.4* as a trusted peer within an ASN PC service.

```
peer-asngw address 10.2.3.4
```

peer-asnpc

Configures the peer Anchor Paging Controller(s) in this ASN PC/LR service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

[no] peer-asnpc [id < *mac_address*> **ip-address** < *ip_address* >]

no

Removes the configured peer ASN PC/LR MAC address and IP address as the trusted peer anchor ASN PC/LR.

id *mac_address*

Specifies the MAC address of the trusted peer system running the ASN paging controller and location registry service.
mac_address is the 6-byte MAC address of the paging controller (trusted R4 ASNGW peer) in standard (IEEE 802) format in six groups of two hexadecimal digits, separated by hyphens (-) or colons (:).

ip-address *ip_address*

Specifies the IP address of the trusted peer system running the ASN paging controller and location registry service in IPv4 dotted-decimal notation.

Usage

Use this command to configure the trusted peer anchor paging controller for ASN paging controller service. This command provides the input for the internal mapping from PC ID to IP address that is needed to forward the Location Update request from an Anchor PC to the current Anchor PC during PC relocation.

Example

The following command sets the peer AS NPC id to *01:23:45:67:89:ab* in colon (:) separated format and the IP address of the paging controller to 1.1.1.1:

```
peer-asnpc id 01:23:45:67:89:ab ip-address 1.1.1.1
```

policy overload

Configures traffic overload policy to control congestion in this service.

Product

ASN PC-LR

Privilege

Administrator

Syntax

```
policy overload { drop | reject }

default policy overload
```

default

Sets the traffic overload policy action to reject in this service.

drop

Specifies that the system is to drop incoming packets containing new session requests. Default: disabled

reject

Specifies that the system processes new session request messages and responds with a reject message. Default: enabled

Usage

Configure congestion policies at the service-level. When congestion control functionality is enabled at the service level, these policies dictate how services respond should the system detect that a congestion condition threshold has been crossed.

Example

The following command configures an overload policy of reject for this ASN PC service:

```
policy overload reject
```

retransmission-timeout

Configures the amount of time that must pass before the system re-attempts to send R6 control packets to the BS.

Product

ASN PC-LR

Privilege

Administrator

Syntax

retransmission-timeout < *duration* >

[no | default] retransmission-timeout

default

Sets the timeout duration to 3 seconds for retransmission of R6 control packets.

no

Disables or removes the configured timeout duration for retransmission of R6 control packets.

duration

Specifies the maximum time (in seconds) for the ASN paging controller service to wait for a response from the BS before it a) attempts to communicate with the BS again (if the system is configured to retry the BS), or b) marks the BS as unreachable.
duration is an integer from 1 through 1000. Default: 3

Usage

Use this command in conjunction with the **max-retransmission** command to configure the ASN paging controller services behavior when it does not receive a response from a particular BS.
Use the **no retransmission-timeout** command to delete a previously configured timeout value. If, after deleting the lifetime setting you desire to return the lifetime parameter to its default setting, use the **default retransmission-timeout** command.
The chassis is shipped from the factory with the retransmission timeout set to 3 seconds.

Example

The following command configures a retransmission timeout value of 5 seconds:

```
retransmission-timeout 5
```

The following command deletes a previously configured retransmission-timeout setting:

setup-timeout

Configures the amount of time for the ASN paging controller service to set up a connection with the BS before it marks the BS as unreachable.

Product

ASN PC-LR

Privilege

Administrator

Syntax

setup-timeout *duration*

default setup-timeout

default

Sets the timeout to 60 seconds to set up a connection with BS.

duration

Specifies the maximum allowable time (in seconds) for the ASN paging controller service to set up the R6 connection with BS before it marks the BS as unreachable.
duration is an integer between 1 and 100000. Default: 60

Usage

Use this command to configure the maximum timeout duration to setup an R6 connection with BS. This command supersedes the duration set through the **max-retransmission** and **retransmission-timeout** commands for R6 connection.

Example

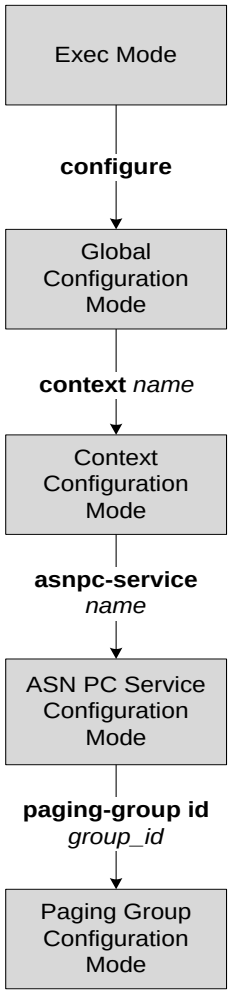
The following command configures an ASN paging controller service to mark a BS after waiting for *100* seconds before it marks it as unreachable:

```
setup-timeout 100
```

Chapter 28
ASN Paging Group Configuration Mode Commands

Use the Paging Group Configuration Mode to create and manage Paging Agents for the paging and location register controller within the Access Service Network Paging Controller and Location Registry (ASN PC-LR) service.

Important: This functionality is still in development stage.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

paging

Configures the paging parameters within the paging group for PC-LR functionality.

Product

ASN PC-LR

Privilege

Administrator

Syntax

paging { cycle *cycle_value* **| interval** *interval_value* **| node id** *mac_address* **address***ip_address* **| offset algorithm uniform start** *start_value* **increment** *inc_value* **count** *count_value* **}**

no paging { cycle | node id *mac_address* **| offset }**

no

Disables the configured paging parameters within this paging group.

cycle *cycle_value*

Specifies the cycle in which the paging message is transmitted within the paging group as an integer from 0 through 65535.

interval *interval_value*

Specifies the maximum duration in frames of Paging Listening Interval; used in calculation of Paging Listening Interval.
interval_value must be an integer from 1 through 5.

node id *mac_address* **address** *ip_address*

id *mac_address*: Configures the MAC address of the node in the paging group.
mac_address must be in one of the following formats:
nn:nn:nn:nn:nn:nn or nn-nn-nn-nn-nn-nn
address *ip_address*: Specifies the IP address of the node in IPv4 dottted-decimal or IPv6 colon-separated notation.

Important: Configure up to 128 paging nodes per paging group.

offset algorithm uniform start *start_value* **increment** *inc_value* **count** *count_value*

start *start_value*: Specifies the starting value of the available offset as an integer from 0 through 65535.
increment *inc_value*: Specifies the distance between two offsets as n integer from 0 through 65535.
count *count_value*: Specifies the number of offsets available as an integer from 0 through 65535.
Offsets are uniformly load balanced across the available range. For this configuration:
paging offset algorithm uniform start *10* **increment** *10* **count** *4*
the following occurs:
if MS1, MS2,...MS100, perform IM-Entry, then offset assigned: MS1=10, MS2=20, MS3=30, MS4=40, MS5=10, MS6=20, etc.

Usage

Use this command to define the paging behavior of a paging group. There must be only one instance of paging parameters per paging group.

Example

The following example configures the paging cycle for a paging group to *10*.

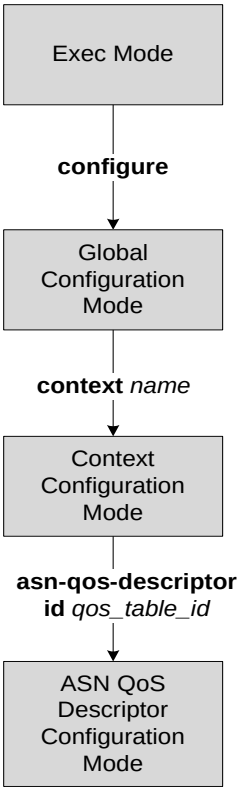
```
paging cycle 10
```

The following example configures a paging node in the group:

```
paging node id 00:05:47:00:37:44 address 12.345.76.789
```

Chapter 29
ASN QoS Descriptor Configuration Mode Commands

Use the ASN QoS Descriptor Configuration mode to create and manage the Quality of Service Descriptor table for ASN-GW service subscribers.



dscp

Configures DSCP marking of IP packets received on the ASN-GW on a service flow basis.

Product

ASN-GW

Privilege

Administrator

Syntax

```
dscp [ be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af42 |
af43 | cs1 | cs2 | cs3 | cs4 | cs5 | cs6 | cs7 | ef ]
```

be

Best effort. This is the default.

af11 through af43

Specifies that the DSCP marking is AFnn.

ef

Specifies that the DSCP marking is EF.

Usage

DSCP marking can be done via AAA or the CLI. From the AAA, it is received as part of the QoS descriptor. In the CLI, the DSCP value is configured as part of the asn-qos-descriptor.

Example

The following example shows the inclusion of DSCP marking in the command.

```
asn-qos-descriptor id 100 dscpaf21
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

global-service-class-name

Configures the global service class name within a QoS descriptor table.

Product

ASN-GW

Privilege

Administrator

Syntax

global-service-class-name *svc_class_name*

no global-service-class-name

no

Deletes the configured global service class name from this QoS descriptor table.

svc_class_name

Specifies the global service class name in QoS descriptor table an alphanumeric string of 6 characters.

Usage

Use this command to specify the global service class name (as per IEEE 802.16e standard) within a QoS descriptor table for an ASN-GW service.
The global service class name is similar in function to the Service Class Name except that (1) it may not be modified by a BS, (2) it remains consistent among all BSs, and 3) it is based on a rules-based naming system and contains referential QoS parameter codes.

Example

The following command specifies the global service class name *g_svc1* in an ASN QoS descriptor table:

```
global-service-class-name g_svc1
```

schedule-type

Configures the type of data delivery service identifier/type for an ASN-GW service.

Product

ASN-GW

Privilege

Administrator

Syntax

schedule-type be [max-sustained-traffic-rate *max_sust_traffic_rate* **| traffic-priority** *priority_value* **] +**

schedule-type ert-vr min-reserved-traffic-rate *min_resd_traffic_rate* **max-latency** *dur_ms* **unsolicited-grant-interval** *dur_ms* **[max-sustained-traffic-rate** *max_sust_traffic_rate* **| max-traffic-burst** *burst_size* **| tolerated-jitter** *dur_ms* **| traffic-priority** *priority_value* **] +**

schedule-type nrt-vr min-reserved-traffic-rate *min_resd_traffic_rate* **[max-sustained-traffic-rate** *max_sust_traffic_rate* **| max-traffic-burst** *burst_size* **| traffic-priority** *priority_value* **] +**

schedule-type rt-vr min-reserved-traffic-rate *min_resd_traffic_rate* **max-latency** *dur_ms* **unsolicited-polling-interval** *dur_ms* **[max-sustained-traffic-rate** *max_sust_traffic_rate* **| max-traffic-burst** *burst_size* **| traffic-priority** *priority_value* **] +**

schedule-type ugs max-sustained-traffic-rate *max-latency* **max-latency** *dur_ms* **unsolicited-grant-interval** *dur_ms* **[sdu-size** *sdu_size* **| tolerated-jitter** *dur_ms* **| traffic-priority** *priority_value* **| min-reserved-traffic-rate** *min-latency* **] +**

default schedule-type

default

Configures the data delivery service type to Best Effort (BE) service for a specific ASN-GW service.

be

Configures the data delivery service type to Best Effort (BE) service for a specific ASN-GW service.

ert-vr

Configures the data delivery service type to Extended Real-Time Variable Rate (ERT-VR) service for a specific ASN-GW service.

nrt-vr

Configures the data delivery service type to Non-Real-Time Variable Rate (NRT-VR) service for specific ASN-GW service.

rt-vr

Configures the data delivery service type to Real-Time Variable Rate (RT-VR) service for a specific ASN-GW service.

ugs

Configures the data delivery service type to Unsolicited Grant Service (UGS) for a specific ASN-GW service.

max-sustained-traffic-rate *max_resd_traffic_rate*

Specifies the maximum sustained traffic rate in bits per second, reserved for a service flow as n integer from 0 through 65535. Maximum latency set to zero means no commitment is available for this service flow.

max-latency *dur_ms*

Specifies the maximum interval (in milliseconds) between the receipt of a packet to a BS or an SS on its network interface/Convergence Sublayer (CS), and the arrival of a packet to its RF interface or the peer device. This value represents a service commitment.
dur_ms is an integer from 0 through 65535. Maximum latency set to zero means no commitment is available for this service flow.

min-reserved-traffic-rate *min_resd_traffic_rate*

Specifies the minimum traffic rates in bits per second, reserved for a service flow as an integer from 0 through 65535. A minimum reserved traffic rate set to zero means no minimum traffic rate reservation is required for this service flow. Default: 0 (disabled)

max-sustained-traffic-rate *max_sust_traffic_rate*

Configures the maximum sustained traffic rate in bits per second for traffic schedule as an integer from 1 through 65535.

max-traffic-burst *burst_size*

Specifies the maximum burst size in bits that must be maintained for the service as an integer from 0 through 65535. A maximum traffic burst set to zero means no maximum traffic burst reservation is required for this service flow. Default: 0 (disabled)

sdu-size *sdu_size*

Specifies the length of the Service Data Unit (SDU) in bytes for a fixed-length SDU service flow as an integer from 1 through 65535. Default: 49

Important: Use this parameter only if packing is on and the service flow is carrying fixed-length SDUs.

tolerated-jitter *dur_ms*

Specifies the maximum delay variation (jitter in milliseconds) allowed for the connection as an integer from 1 through 65535.

traffic-priority *priority_value*

Specifies the traffic priority as an integer from 0 through 7. Default: 0 (disabled)

unsolicited-grant-interval *dur_ms*

Specifies the nominal interval (in milliseconds) between successive data grant opportunities for this service flow as n integer from 1 through 65535.

unsolicited-polling-interval *dur_ms*

Specifies the maximum nominal interval (in milliseconds) between successive polling grants opportunities for this service flow as an integer from 1 through 65535.

Usage

Use this command to configure type of data delivery service identifier within ASN-GW service.

Important: Only one data delivery service type, **be**, **ert-vr**, **rt-vr**, **nrt-vr**, or **ugs** is allowed within an ASN-GW service.

Example

The following command configures the data delivery service type to Best Efforts (BE) service for an ASN-GW service:

```
default schedule-type
```

service-class-name

Configures the Service Class Name name within a specific QoS descriptor table.

Product

ASN-GW

Privilege

Administrator

Syntax

service-class-name *svc_class_name*

no service-class-name

no

Deletes the configured global service class name from this QoS descriptor table.

svc_class_name

Specifies the service class name in a QoS descriptor table as an alphanumeric string of 2 through 128 characters.

Usage

A service class name is a group of QoS parameters defined at the BS that can be referenced by a service flow to apply certain QoS parameters. Use this command to specify a service class name (per IEEE 802.16 standard) within a specific QoS descriptor table for an ASN-GW service

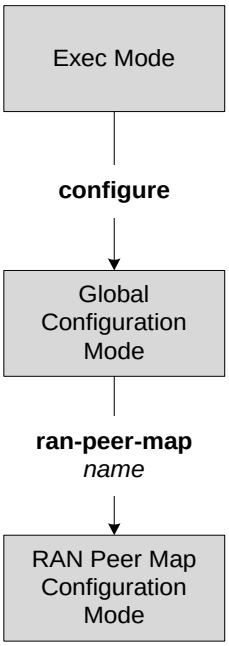
Example

The following command specifies the service class name *ASN_Serv_class1* in a ASN QoS descriptor table:

```
service-class-name ASN_Serv_class1
```

Chapter 30
ASN RAN Peer Map Configuration Mode Commands

Use the RAN Peer Map Configuration Mode to create and manage global mapping tables of Radio Access Network base station peers.



end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

ran-peer

Configure the MAC and IP addresses of the base station peers you are adding to this map.

Product

ASN-GW

Privilege

Administrator

Syntax

[no] ran-peer id *mac_address* **address** *ip_address* **[mode{non-legacy | legacy}]**

no

Removes the base station peer entry from this map.

id *mac_address* **address** *ip_address*

id *mac_address*: Configures the MAC address of the base station peer in this map.
mac_address must be in one of the following formats:
nn:nn:nn:nn:nn:nn or nn-nn-nn-nn-nn-nn
address *ip_address*: Specifies the IP address of the base station peer in IPv4 dotted-decimal or IPv6 colon-separated notation.
mode {non-legacy | legacy}: Default mode is non-legacy.

Usage

Use this command to add base station peers to this peer map.

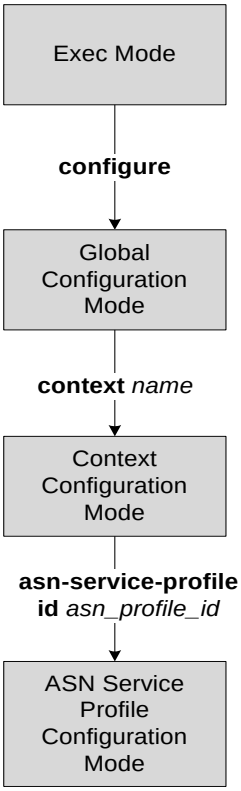
Example

The following command adds a base station peer to this map:

```
ran-peer id 00:05:47:00:37:44 address 12.345.76.789
```

Chapter 31
ASN Service Profile Configuration Mode Commands

Use the ASN Service Profile Configuration Mode to create and manage the service profiles table for the ASN-GW service subscribers within the current context.



downlink-classifier

Specifies which classifier to match for traffic flow in the downlink direction for subscribers in this service.

Product

ASN-GW

Privilege

Administrator

Syntax

[no] downlink-classifier class-map < *class_map_name* > [**id** < *0-65535* >] [**priority** < *0-255* >] **[action { permit | deny }]**

no

Deletes the configured class map for this traffic flow in the ASN-GW service.

class-map *class_map_name*

Associates an existing Class-Map in the destination context to this traffic flow.
For example:

- For downlink-classifier class-map c4, an id of 1 is generated or assigned.
- For downlink-classifier class-map c5, an id of 2 is generated or assigned.
- For downlink-classifier class-map c6, an id of 3 is generated or assigned.

Refer to the *Class-Map Configuration Mode Commands* chapter for additional information on configuring the class maps.

id < *0-65535* >

Assure that **id** is unique in an asn-service-profile. If you do not configure the classier id, the sorted classifier name order is assigned as *id*.

priority < *0-255* >

Default: 0

0 = minimum, 255 = maximum

Usage

Use this command to configure classifier for downlink traffic with a configured Class-Map for the ASN-GW service subscribers.
You can configure a maximum of four class-maps in one ASN-GW service profile.
Access Class-Map Configuration Mode through the Context Configuration Mode.

Example

The following command applies the Class-Map *class_1* to this traffic:

```
downlink-classifier class-map class_1
```

downlink-qos-id

Specifies the QoS table identifier to traffic flowing in the downlink direction for subscribers in this service.

Product

ASN-GW

Privilege

Administrator

Syntax

downlink-qos-id *< qos_table_id >*

[no] downlink-qos-id

no

Deletes the configured class map for this traffic flow in the ASN-GW service.

qos_table_id

Associates an existing ASN QoS descriptor identifier in the source context to this traffic flow.
Refer to the *ASN QoS Descriptor Configuration Mode Commands* chapter of this reference for additional information on configuring QoS descriptor table identifiers.

Usage

Use this command to apply a QoS identifier for downlink traffic with a configured ASN QoS descriptor table identifier for the ASN-GW service subscribers.
Configure only one QoS identifier per ASN-GW service profile.
Access ASN QoS Descriptor Configuration Mode through Context Configuration Mode.

Example

The following command applies the QoS table identifier *123* to this traffic:

```
downlink-qos-id 123
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

uplink-classifier

Specifies which classifier to match for traffic flow in the uplink direction for subscribers in this service.

Product

ASN-GW

Privilege

Administrator

Syntax

[no] uplink-classifier class-map < *class_map_name* > [**id** < *0-65535* >] [**priority** < *0-255* >] **[action { permit | deny }]**

no

Deletes the configured class map for this traffic flow in the ASN-GW service.

class-map *class_map_name*

Specifiesan existing Class-Map in the destination context to this traffic flow. For example:

- For uplink-classifier class-map c1, an id of 1 is generated or assigned.
- For uplink-classifier class-map c2, an id of 2 is generated or assigned.
- For uplink-classifier class-map c3, an id of 3 is generated or assigned.

Refer to the *Class-Map Configuration Mode Commands* chapter for additional information on configuring class maps.

id < *0-65535* >

Assure that **id** is unique in an asn-service-profile. If you do not configure the classier id, the sorted classifier name order is assigned as *id*.

priority < *0-255* >

Default: 0

0 = minimum, 255 = maximum

Usage

Use this command to configure classifier for uplink traffic with a configured Class-Map for the ASN-GW service subscribers.
Configure a maximum of 4 class-maps per ASN-GW service profile.
Access Class-Map Configuration Mode through Context Configuration Mode.

Example

The following command applies the Class-Map *class_1* to this traffic:

```
uplink-classifier class-map class_1
```

uplink-qos-id

Specifies the QoS table identifier to the traffic flow in the uplink direction for subscribers in this service.

Product

ASN-GW

Privilege

Administrator

Syntax

uplink-qos-id *qos_table_id*

[no] uplink-qos-id

no

Deletes the configured class map for this traffic flow in the ASN-GW service.

uplink_qos_id

Associates an existing ASN QoS Descriptor Identifier in the source context to this traffic flow.
Refer to the *ASN QoS Descriptor Configuration Mode Commands* chapter for additional information on configuring the QoS descriptor table identifier.

Usage

Use this command to apply a QoS identifier for uplink traffic with a configured ASN QoS Descriptor Table Identifier for the ASN-GW service subscribers.
Configure only one QoS identifier per ASN-GW service profile.
Access ASN QoS Descriptor Configuration Mode through Context Configuration Mode.

Example

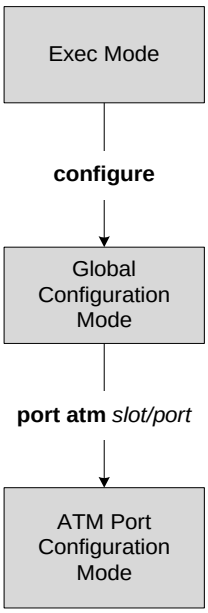
The following command applies the QoS table identifier *123* to this traffic:

```
uplink-qos-id 123
```

Chapter 32
ATM Port Configuration Mode Commands

The Asynchronous Transfer Mode (ATM) port configuration mode provides the commands to create, configure, bind, and manage the ATM ports on line cards that support ATM, such as the ATM/POS OC-3 single-mode and multi-mode optical line cards.

Important: Before using these commands, card framing should be configured for either SDH or SONET with the framing command described in the *Card Configuration Mode* chapter.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

clock-source

This command sets the source of the port's transmit clock.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
clock-source { internal-timing | loop-timing }

default clock-source
```

default

Using this command combination sets the port clock source to internal timing.

internal-timing

Sets the port clock to derive timing from the recovered receive clock.

loop-timing

Sets the port clock to transmit in sync with the system timing.

Usage

Use this command for either SONETports on the SGSN.

Important: This command is only available for releases 8.1 or higher.

Example

The following command resets the transmit clock source to internal timing.

```
default clock-source
```

description

Defines descriptive text that provides useful information about the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's defined description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters.

Example

The following example sets a port description that will read in the configuration file:

description *samplePortDescriptiveText*

The following example sets a port description that will be easy to read because it retains the spaces between words:

description *"This is a sample description"*

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

line-timing

This command enables the SPIO to recover transmit timing source via the line attached to the selected port. By default, line-timing is not enabled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] line-timing
```

no

Disables line-timing as the source for the transmit clock.

Usage

The port must be enabled (**no shutdown**) to enable recovery of timing source via the line. As well, the card's slot number must be entered in the **recover line#** command in the BITS port configuration mode.

Example

Disable configured line-timing as the clock source for this port.

```
no line-timing
```

loopback

Enables/disables loopback and configures the type of loopback mode used for diagnostic testing.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

loopback { ds1-e1-diag | ds1-e1-line | none | sonet-sdh-diag | sonet-sdh-line }

ds1-e1-diag

Enables a system generated diagnostic lookback signal at the DS1/E1 layer.

ds1-e1-line

Loops back a network diagnostic signal at the DS1/E1 layer.

none

Stops diagnostic loopback signalling.

sonet-sdh-diag

Enables a system generated diagnostic lookback signal at the SONET/SDH layer.

sonet-sdh-line

Loops back a network diagnostic signal at the SONET/SDH layer.

Usage

Setup diagnostic loopback signals for troubleshooting purposes.

Example

Use the following command to setup loopback diagnosis:

```
loopback ds1-e1-diag
```

Use the following command to disable loopback:

```
loopback none
```

preferred slot

This command identifies which card in a chassis assumes revertive (redundancy auto-recovery) functionality when the slot/port being configured go down.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

[default | no] preferred slot

default

Default: non-revertive operation.
Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch to command to return service to the original port.

no

Disables revertive, or auto-recovery, operation for the port.

slot#

Identifies the physical slot in the chassis where the preferred line card is installed.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as “preferred” on the LC in slot 17 while ports 5 through 8 are “preferred” on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch command to return service to the original port.

Example

The following commands sets revertive port redundancy for ports on the card in slot 17:

```
preferred slot 17
```

pvc

This command creates a Permanent Virtual Connection (PVC), including the definition of the associated Virtual Path Identifiers (VPI) and Virtual Connection Identifiers (VCI) for the PVC. By defining a PVC, this command enters into PVC configuration mode. The ATM port supports a maximum of 256 PVC definitions.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

[no] pvc vpi *vpi#* **vci** *vci#* **[type { aal2 [cps-payload-size** *cps_payload_value* **| aal5 }]] [-noconfirm]**

no

Deletes the PVC's entry from the configuration.

vpi *vpi#*

VPI identifies a unique path to a destination point in the ATM portion of the network. The VPI and the VCI combine to create the PVC between the MS and the destination point. *vpi#* must be an integer, 0 to 255.

vci *vci#*

VCI identifies a unique virtual circuit within the associated VPI. *vci#* must be an integer, 0 to 65535.

type

This keyword is used to define the type of PVC as AAL2 or AAL5 for HNB-GW service configuration within the associated VPI and VCI.

aal2

This keyword is used to define the type of PVC as AAL2 for HNB-GW service configuration within the associated VPI and VCI.

aal5

This keyword is used to define the type of PVC as AAL5 for HNB-GW service configuration within the associated VPI and VCI.

cps-payload-size *cps_payload_value*

This keyword configures the Common Part Sublayer (CPS) payload in Bytes for AAL2 type of PVC within the associated VPI. CPS payload is carried out by the AAL2 protocol over ATM. During the call, the payload size is negotiated between HNB-GW and MSC. Default size for payload is 64 but values may range from 1 to 64 Bytes. This command makes the operator to choose the size dynamically
The CPS payload size dynamically configured for per PVC. If user is not providing the CPS payload size then default value of 64 Bytes is considered else user provided value is taken.
cps_payload_value is the value of CPS payload in Bytes and must be an integer between 1 through 64.

-noconfirm

Specifies that the command must execute without any additional prompt and confirmation from the user.

Usage

Creates a virtual circuit between two specific points that the carrier will use repeatedly.
This command is used to define the type of PVC as AAL2 or AAL5 for HNB-GW service configuration. It also configures the CPS payload which is carried out by the AAL2 protocol over ATM. During the call, the payload size is negotiated between HNB-GW and MSC. Default size for payload is 64 but values may range from 1 to 64 Bytes. This command makes the operator to choose the size dynamically.
This command configures the type of PVC to ATM Adaptation Layer2 (AAL2) or ATM Adaptation Layer5 (AAL5) for ATM traffic between HNB-GW and MSC. It also enables the operator to configure the Common Part Sublayer (CPS) payload for AAL2 protocol over ATM for HNB-GW session between MSC and HNB-GW.

Example

Define a PVC with VPI 2 and VCI 353.

```
pvc vpi 2 vci 353
```

Following command configures the PVC type as AAL2 with VPI as *2* and VCI as *353*. It also configures the CPS payload to *45* bytes over the ATM during the call.

```
pvc vpi 2 vci 353 type aal2 cps-payload-size 45
```

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the port's administrative state. When this command is omitted from the configuration, the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities. This is the default state of each port upon installation and initial configuration.
This command with the **no** keyword is *required* to bring a port into active service.

Example

The following command enables the port for service:

```
no shutdown
```

The following command disables the port and takes it out of service:

```
shutdown
```

snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap link-status
```

no

Disables the sending of traps for link-status changes.

Usage

Enable the sending of link-status change traps for this port if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

Use the following command to send SNMP link-status traps for this port:

```
snmp trap link-status
```

Use the following command to disable the sending SNMP link-status traps for this port:

```
no snmp trap link-status
```

threshold high-activity

Configures the port's high and low activity thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold high-activity *high_thresh* **[clear** *low_thresh* **]**

default threshold high-activity

default

Restores both port high-activity thresholds to the system default of 50 percent.

high_thresh

Default: 50
Sets the threshold for the highest percentage of port activity that must be met or exceeded, within the polling interval, to generate an alert or alarm.
high_thresh_% can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 50
Sets the threshold for the lowest percentage level of port activity that must be met to generate and send a clear alarm. If port activity does not drop to or below this threshold then the alarm is maintained.
low_thresh_% can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis.
Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port > High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the *Global Configuration Mode Commands* chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a high port utilization threshold of 70 percent and a low threshold of 50 percent for a system using the Alarm thresholding model:

```
threshold high-activity 70 clear 50
```

threshold monitoring

Enables thresholding for port-level values.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] threshold monitoring
```

default

Restores the system default to disable threshold monitoring for port-level values.

no

Disables threshold monitoring for port-level values. This is the default setting.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 10. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

This command enables thresholding for port-level values. Refer to the sections covering **threshold high-activity**, **threshold rx-utilization,** and **threshold tx-utilization** commands in this chapter for information on configuring these values. In addition, refer to the **threshold poll** command in the *Global Configuration Mode Commands* chapter of this reference for information on configuring the polling interval over which these values are monitored.

threshold rx-utilization

Configures thresholds for receive-port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold rx-utilization *high_thresh* **[clear** *low_thresh* **]**

default threshold rx-utilization

default

Restores both rx-utilization thresholds to the system default of 80 percent.

high_thresh

Default: 80
The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear *low_thresh*

Allows the configuration of the low threshold.
Default: 80
The low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data > High Threshold

- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```

threshold tx-utilization

Configures thresholds for transmit port utilization.

Product

All

Privilege

Security Administrator, Administrator

Syntax

threshold tx-utilization *high_thresh* **[clear** *low_thresh* **]**

default threshold tx-utilization

default

Restores the port tx-thresholds to their system defaults of 80 percent.

high_thresh

Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear *low_thresh*

Allows the configuration of the low threshold.
Default: 80
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for transmit data > High Threshold

- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```

toh-sdsf

Enable/disable line SDSF BER thresholds and configure the line transport overhead (TOH) signal degrade and signal failure (SDSF) bit error rate (BER) threshold.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

toh-sdsf *toh_value*

default toh-sdsf

default

Resets the default which disables this threshold.

toh_value

To facilitate configuration the SD and SF rates have been combined into a single setting. .

- 0: Disabled
- 1 -1.E-04
- 2 - 1.E-05
- 3 - 1.E-06
- 4 - 1.E-07
- 5 - 1.E-08
- 6 - 1.E-09
- 7 - 1.E-10
- 8 - 1.E-11

Usage

This command is typically configured in combination with configuring APS/MSP redundancy for the line card - see the **aps** and the **redundancy** commands documented in the *Card Configuration Mode Commands* chapter..

This command can be used to configure the line threshold whether the port is active or standby and sets a standard option for the paired values of the line's signal degrade and signal failure (SDSF) BER.

The SD is kept at a value of 100 erroredBits/sec less than the corresponding value of the SF. So if the SD threshold is configured at 1 error in every 100000 bits/sec, then the SF threshold automatically becomes 1 error in every 1000 bits/sec.

The port will go operationally down as soon as the SD threshold is crossed.

Example

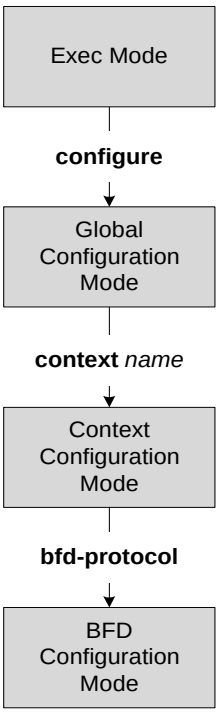
Set

```
toh-sdsf 1
```

Chapter 33
BFD Configuration Mode Commands

The BFD Configuration Mode manages the protocol settings for Bidirectional Forwarding Detection (BFD).

BFD provides a low-overhead, short duration method of detecting failures in the forwarding path between two BGP adjacent routers, including the interfaces, data links, and forwarding plane. BFD must be enabled on both routers. The ASR 5000 supports BFD on Layer 3 clients only in asynchronous mode with optional Echo functionality.



bfd multihop-peer

Configures parameters for any multihop-BFD sessions with the same destination address. If these parameters are not configured via this command, MH-BFD sessions with the same destination address will be in the Admin-down state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

bfd multihop-peer *dst-ip-address* **{ authentication { md5 | meticulous-md5 | meticulous-sha1 plain-text | sha1 } { encrypted** *password-string* **| password** *password-string* **} | interval** *tx_interval* **min_rx** *rx_interval* **multiplier** *value* **}**

no bfd multihop-peer *dst-ip-address* **authentication**

---

no

Removes all the parameters for the MH-BFD destination address and if there are any sessions with the same destination address, those sessions will go to Admin-down state.

---

dst-ip-address

Specifies the destination address of the BFD enabled peer in IPv4 dotted-decimal or IPv6 colon-separated notation. This destination address must have been previously configured via the **ip route static bfd** commands in the Context Configuration mode.

---

authentication { md5 | meticulous-md5 | meticulous-sha1 plain-text | sha1

Specifies the method for authenticating all multihop BFD sessions to the specified peer. By default, authentication for Multihop-BFD sessions to a destination address is disabled. The authentication type options include:

- **md5** – Message Digest 5
- **meticulous-md5** – MD5 using a secret key and sequence numbers updated for every packet
- **meticulous-sha1** – SHA1 with sequence numbers updated for every packet
- **plain-text** – plain text (unencrypted)
- **sha1** – Secured Hash Algorithm 1

---

encrypted *password-string* **| password** *password-string*

Specifies the password for authentication of BFD sessions. The password must be the same between the peer neighbors for the BFD sessions to work. If the authentication password is configured incorrectly between peers, the BFD sessions to the destination address will not come UP. If the password is configured for BFD sessions that are already UP, BFD neighbors will be reset.

- **encrypted** *password-string*: Specifies the use of an encrypted password for authentication of BFD sessions as an alphanumeric string of up to 523 characters.
- **password** *password-string*: Specifies the use of a plain text password for authentication of BFD sessions as an alphanumeric string of 1 through 19 characters.

Important: The destination address and its transmit/receive intervals must be configured before the password is applied to any MH-BFD sessions at a destination address.

`interval` *`tx_interval`* **`min_rx`** *`rx_interval`* **`multiplier`** *`value`*

`interval` *`tx_interval`*: Specifies the transmit interval (in milliseconds) between BFD packets as an integer from 50 through 999. Default: 50
`min_rx` *`rx_interval`*: Specifies the receive interval (in milliseconds) between BFD packets as an integer from 50 through 999. Default: 50
`multiplier` *`value`*: Specifies the multiplier value sued to compute holddown as an integer from 3 through 50. Default: 3

Usage

Use this command to configure basic operating parameters between BFD enabled peers.

Example

```
bfd multihop-peer 10.2.3.4 authentication md5 encrypted 5-klm7783 bfd
multihop-peer 10.2.3.4 interval 100 min_rx 100 multiplier 5
```

bfd nbr-group-name

Configures BFD neighbor groups.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] bfd nbr-group-name *neighbor-group* **{ active-if-name** *if-name* **| passive-if-name** *if-name* **}** *gw-ip-address*

no bfd nbr-group-name *neighbor-group*

no

Removes all the parameters for the BFD neighbor group.

bfd nbr-group-name *neighbor-group*

Specifies an identifier for a BFD neighbor group as an alphanumeric string of 1 through 19 characters.

active-if-name *if-name* **| passive-if-name** *if-name*

Specifies the logical/physical interface associated with this BFD group.
active-if-name *if-name*: Specifies an active interface that notifies all passive interfaces in this group. There should be only one active interface in a group. *if-name* is a logical or physical interface specified as an alphanumeric string of 1 through 79 characters.
passive-if-name *if-name*: Specifies a passive interface that receives BFD notifications from the active interface in this group. *if-name* is a logical or physical interface specified as an alphanumeric string of 1 through 79 characters.

gw-ip-address

Specifies the gateway address of the BFD neighbor in IPv4 dotted-decimal or IPv6 colon-separated notation (optional CIDR notation).

Usage

Allow scaling of BFD sessions when a large number of logical interfaces are configured on a physical interface. A failure on the physical interface or a logical interface can be propagated to all passive interfaces in this group.

Example

```
bfd nbr-group-name bgpgroup132 active-if-name bgpif02
```

echo

Enables or disables BFD echo mode functionality. The Echo function tests the forwarding path on the remote system. Echo is only used for single hop BFD sessions

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] echo
```

no echo

Disables BFD echo functionality.

Usage

Use this function to send a stream of Echo packets that the other endpoint then sends back via its forwarding plane. Echo tests the forwarding path on the remote system.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

slow-timers

Specifies the asynchronous mode control packet interval when Echo mode is enabled. In BFD asynchronous mode, BFD-enabled peers periodically send BFD Control packets to one another. If a number of those packets in a row are not received within the specified interval by the other peer, the session is declared to be down.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] slow-timers *timer-value*

no slow-timers

no

Disables previously specified BFD slow timers.

slow-timers *timer-value*

Specifies the BFD control packet interval (in milliseconds) for Echo mode as an integer from 1000 through 300000. Default: 2000

Usage

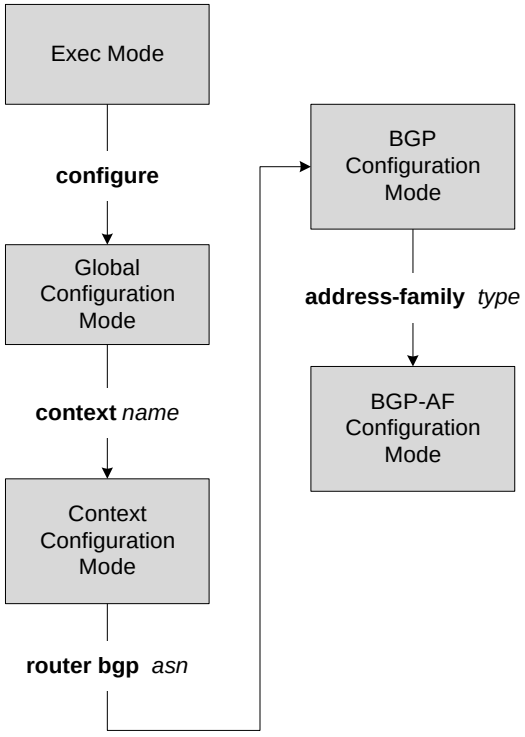
Use this command to configure the interval between BFD control packets sent between peers in Echo mode.

Example

```
slow-timers 10000
```

Chapter 34
BGP Address-Family (IPv4/IPv6) Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family (IPv4/IPv6) Configuration Mode is used to configure the IPv4 and IPv6 address family information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

maximum-paths

Controls the maximum number of parallel external BGP (eBGP) or internal BGP (iBGP) routes that can be installed in a routing table.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] maximum-paths { ebgp *num_paths* **| ibgp** *num_paths* **}**

no

Disables the above command.

maximum-paths ebgp *num_paths*

Specifies the maximum number of parallel External Border Gateway Protocol routes as an integer from 1 through 10.

maximum-paths ibgp *num_paths*

Specifies the maximum number of parallel Internal Border Gateway Protocol routes as an integer from 1 through 10.

Important: If configured under the router-bgp-mode, multipath is enabled only for the prefixes learnt in the default-vrf. There is no support for vpnv4 prefixes even though multipath is turned on for the default-vrf. If configured under the address-family-vrf-mode, multipath is enabled only for prefixes learnt in the vrf.

Usage

Use this command to forward packets over multiple paths. User can control the maximum number of parallel eBGP routes that can be installed in a routing table. Enabling multipath does not affect the best path selection in BGP. If multipath is enabled, all the paths with the same weight, local-preference, as-path length, origin, and multi-exit discriminator (MED) as the best path are added to the routing table.

Example

The following command disables forward of packets over multiple paths:

no maximum-paths ebgp

neighbor

Configures the IPv4/IPv6 Address Family for BGP routers that interconnect to non-broadcast networks.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] neighbor *ip_address* **{ activate | advertisement-interval** *adv_time* **| capability graceful-restart | default-originate [route-map** *map_name* **] | distribute-list** *dist_list* **{ in | out } | ebgp-multihop [max-hop** *number* **] encrypted password** *encryp_password* **fall-over bfd multihop | filter-list** *filt_list* **{ in | out } | max-prefix** *max_num* **[threshold** *thresh_percent* **] [warning-only] next-hop-self | password** *password* | **remote-as** *AS_num* **| remove-private-AS | restart-time** *rest_time* **| route-map** *map_name* **{ in | out} | send-community { both | extended | standard } | shutdown | srp-activated-soft-clear | timers { connect-interval** *connect_interval* **[keepalive-interval** *keepalive_interval* **holdtime-interval** *holdtime_interval* **[min-peer-holdtime-interval** *min_peer_hold_interval* **]] | keepalive-interval** *keepalive_interval* **holdtime-interval** *holdtime_interval* **{ connect-interval** *connect_interval* **| min-peer-holdtime-interval** *min_peer_hold_interval* **[connect-interval** *connect_interval* **] } } | update-source** *ip_address* **| weight value }**

no

Delete the specified parameter from the router configuration.

neighbor *ip_address*

Specifies the IP address of a BGP neighbor. *ip_address* must be in IPv4 dotted-decimal or IPV6 colon-separated notation.

activate

Enables the exchange of routes with this neighbor.

advertisement-interval *adv_time*

Specifies the minimum interval (in seconds) between sending BGP routing updates.
adv_time must be an integer from 0 through 600. Default: 30

capability graceful-restart

Configures graceful re-start attributes.

default-originate [route-map *map_name* **]**

Specifies the default originate routes to this neighbor
route-map *map_name*: Specifies the route-map that contains the criteria to originate default routes.
map_name must be the name of an existing route-map in the current context.

distribute-list *dist_list* **{ in | out }**

Filters updates to and from this neighbor based on a route access list. Default: No filtering is performed.
dist_list is the name or number of an existing route-access-list.
in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

ebgp-multihop [max-hop *number* **]**

Allows eBGP neighbors that are not on directly connected networks.
max-hop *number*: Specifies the maximum number of hops allowed to reach a neighbor as an integer from 1 through 255. Default hop count: 255

encrypted password *encryp_password*

Specifies the encrypted password that is used only inside configuration files. This is an alphanumeric string of 1 through 24 characters.

fall-over bfd multihop

Supports Bidirectional Forwarding Detection (BFD) multihop for fallover.

filter-list *filt_list* **{in | out}**

Establishes BGP filters based on an autonomous system (AS) path access list. *filt_list* is name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

max-prefix *max_num* **[threshold** *thresh_percent* **] [warning-only]**

Specifies the maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset. *max_num* is an integer from 1 through 4294967295. Default: No maximum prefix limit.
threshold *thresh_percent*: Specifies a percentage value of when the BGP table is full. When this value is reached peer warnings are sent to the neighbor. *thresh_percent* must be an integer from 1 through 100.
warning-only: Specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset

next-hop-self*ip_address*

Disables the next hop calculation for this neighbor.

password*password*

Sets a *password* expressed as an alphanumeric string of 1 through 24 characters.

remote-as *AS_num*

Specify the AS number of the BGP neighbor as an integer from 1 through 4294967295.

remove-private-AS

Removes the private AS number from outbound updates. Default: Do not remove the private AS number.

restart-time *rest_time*

Specifies the maximum time (in seconds) required to for neighbor to restart as an integer from 1 through 3600.

route-map *map_name* **{ in | out }**

Applies a route map to the neighbor. *map_name* must be the name of an existing route-map in the current context.
in: Indicates that the route map applies to incoming advertisements.
out: Indicates that the route map applies to outgoing advertisements.

send-community{ both | extended | standard }

Sends the community attributes to a peer router (neighbor).
both:Sends standard and extended community attributes
extended:Sends extended community attributes.
standard:Sends standard community attributes.

shutdown

Administratively shuts down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

srp-activated-soft-clear

Enables BGP updates when SRP-enabled resources are modified.

timers { [connect-interval *connect_interval* **] | [keepalive-interval** *keepalive_interval* **holdtime-interval** *holdtime_interval* **] }**

Sets BGP timers for the specified neighbor.
connect-interval *connect_interval*: Specifies the connect timer (in seconds) as an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval *keepalive_interval*: Specifies the frequency (in seconds) at which the current BGP router sends keepalive messages to its neighbor. *keep_time* must be an integer from 0 through 65535. The default is 30 seconds.
holdtime-interval *holdtime_interval*: Specifies the interval (in seconds) the router waits for a keepalive message before declaring a neighbor dead. *hold_time* must be an integer from 0 through 65535. The default is 90 seconds.
min-peer-holdtime-interval *min_peer_hold_interval*: Specifies the minimum acceptable hold time (in seconds) from peer for a keepalive message before declaring a neighbor dead.
min_peer_hold_interval must be an integer from 0 through 65535. The default is 90 seconds.

update-source *ip_address*

Binds the specified IP address to the BGP socket that is used to communicate to the peer. *ip_address* is an IPv4 address in dotted-decimal notation.
In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the TCP connection does not go down until there is no route for the loopback address in the peering router.

weight *value*

Sets the default weight for routes from this neighbor as an integer from 0 through 65535. Default: 0

Usage

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

Important: A remote AS number must be specified for a neighbor before other parameters can be configured.

Example

The following command specifies that the neighbor at the IP address *192.168.100.25* has an AS number of *2000*:

```
neighbor 192.168.100.25 remote-as 2000
```

The following command allows BGP neighbors that are a maximum of *27* hops away:

```
neighbor 192.168.100.25 ebgp-multihop max-hop 27
```

The following command sets the minimum interval between sending routing updates to 3 minutes (180 seconds):

```
neighbor 192.168.100.25 advertisement-interval 180
```

The following command sets the default weight for all routes from the specified neighbor to *100*:

```
neighbor 192.168.100.25 weight 100
```

network

Configures and specifies a network to announce via BGP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] network *ip_address/mask* **[route-map** *map_name* **]**

no

Delete the specified network from the configuration for the BGP router.

network *ip_address/mask*

Specifies the IP address and netmask bits for the network to announce via BGP. *ip_address* is a network IP address in IPV4 dotted-decimal notation and *mask* is the number of subnet bits, representing a subnet mask in CIDR. These must be entered in the IPv4 dotted-decimal notation/subnet bits format.

route-map *map_name*

Filter routes through the specified route map before announcing the network. *map_name* specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to specify a network to announce via BGP.

Example

The following command announces the network *192.168.0.0* with a netmask of *16* via BGP:

```
network 192.168.0.0/16
```

The following command removes the network from the BGP router configuration:

```
no network 192.168.0.0/16
```

redistribute

Redistributes routes into BGP from another protocol as BGP neighbors.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] redistribute { connected | ospf | rip | static } [route-map *map_name* **]**

no

Remove the specified redistribution parameters from the BGP router configuration.

redistribute connected

Specifies that connected routes will be redistributed.

redistribute ospf

Specifies that Open Shortest Path First (OSPF) routes will be redistributed

redistribute rip

Specifies that Routing Information Protocol (RIP) routes will be redistributed. (RIP is not supported at this time.)

redistribute static

Specifies that static routes will be redistributed.

route-map *map_name*

Filters routes through the specified route map before redistribution. *map_name* specifies the name of the route-map to use as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to specify what routes this BGP router should redistribute into BGP.

Example

The following command redistributes OSPF routes after filtering them through the route map named *Map1*:

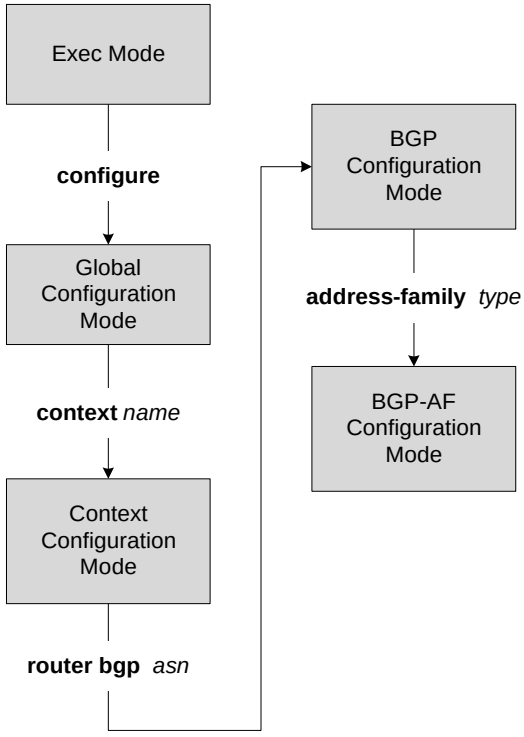
```
redistribute ospf route-map Map1
```

The following command removes the redistribution of OSPF routes from the router's configuration:

```
no redistribute ospf route-map Map1
```

Chapter 35
BGP Address-Family (VPNv4) Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family (VPNv4) Configuration Mode is used to configure the VPNv4 address family information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

neighbor

Configures the VPNv4 address family on BGP routers that interconnects to non-broadcast networks and enables the exchange of routing information with a peer router (neighbor).

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] neighbor *ip_address* **{ activate | send-community { both | extended | standard } }**

no

Delete the specified parameter from the router configuration.

neighbor *ip_address*

Specifies the IP address of the peer router (neighbor) in IPv4 dotted-decimal or IPv6 colon-separated notation.

activate

Enables the exchange of routing information with this neighbor.

send-community { both | extended | standard }

Sends the community attributes to a peer router (neighbor).
both: Sends standard and extended community attributes.
extended: Sends extended community attributes.
standard: Sends standard community attributes.

Usage

Use this command to enable the exchange of routing information with a peer router. The chassis supports a maximum of 64 peers per context.

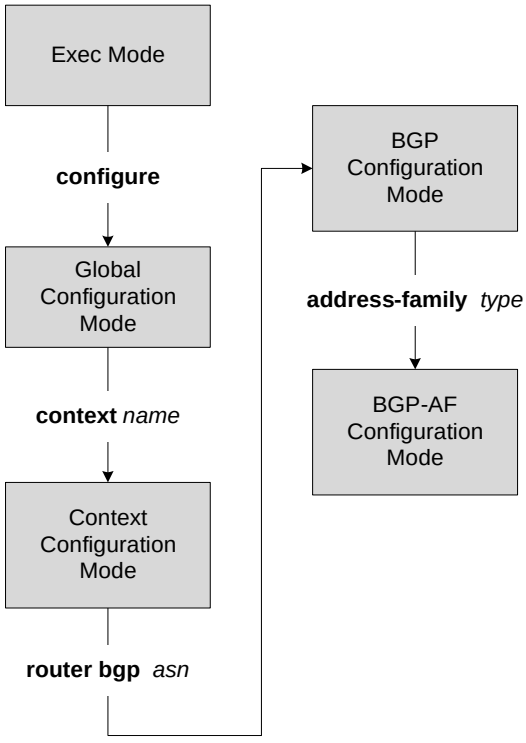
Example

The following command enables the exchange of routing information with the neighbor at IP address *192.168.100.25*:

```
neighbor 192.168.100.25 activate
```

Chapter 36
BGP Address-Family (VRF) Configuration Mode Commands

The Border Gateway Protocol (BGP) Address-Family (VRF) Configuration Mode is used to configure the Virtual Routing and Forwarding address family information.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

neighbor

Configures the Virtual Routing and Forwarding (VRF) address family for BGP routers that interconnect to non-broadcast networks.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] neighbor *ip_address* **{ activate | advertisement-interval** *adv_time* **| default-originate [route-map** *map_name* **] | distribute-list** *dist_list* **{ in | out } | ebgp-multihop [max-hop** *number* **] | filter-list** *filt_list* **{ in | out } | max-prefix** *max_num* **[threshold** *thresh_percent* **] [warning-only] | remote-as** *AS_num* **| remove-private-AS | route-map** *map_name* **{ in | out } | shutdown | srp-activated-soft-clear | timers { [connect-interval** *conn_time* **] | [keepalive-interval** *keep_time* **holdtime-interval** *hold_time* **] } | update-source** *ip_address* **| weight** *value* **}**

no

Delete the specified parameter from the router configuration.

neighbor *ip_address*

Specifies the IP address of the peer router (neighbor) in IPv4 dotted-decimal or IPv6 colon-separated notation.

activate

Enables the exchange of routes with this neighbor.

advertisement-interval *adv_time*

The minimum interval (in seconds) between sending BGP routing updates.
adv_time must be an integer from 0 through 600.
Default: 30

default-originate [route-map *map_name* **]**

Originate default routes to this neighbor
route-map *map_name*: Specifies the route-map that contains the criteria to originate default routes.
map_name must be the name of an existing route-map in the current context.

distribute-list *dist_list* **{in | out}**

Filter updates to and from this neighbor based on a route access list.
Default: No filtering is performed.
dist_list: The name or number of an existing route-access-list.
in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

ebgp-multihop [max-hop *number***]**

Allow external BGP (eBGP) neighbors not on directly connected networks.
max-hop *number*: The maximum number of hops allowed to reach a neighbor. *number* must be an integer from 1 through 255.
Default hop count: 255

filter-list *filt_list* **{ in | out }**

Establish BGP filters based on an AS path access list
filt_list: The name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

max-prefix *max_num* **[threshold** *thresh_percent* **] [warning-only]**

The maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset.
max_num: Specifies the maximum number of prefixes permitted. This must be an integer from 1 through 4294967295.
Default: No maximum prefix limit.
threshold *thresh_percent*: A percentage value which specifies that when the BGP table is the specified percentage full from this peer warnings are sent to the neighbor. *thresh_percent* must be an integer from 1 through 100.
warning-only: This keyword specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset

remote-as *AS_num*

Specify the AS number of the BGP neighbor.
AS_num: The neighbor's autonomous system number. must be an integer from 1 through 65535.

remove-private-AS

Remove the private AS number from outbound updates.
Default: Do not remove the private AS number.

route-map *map_name* **{ in | out }**

Apply a route map to the neighbor.
map_name: Specifies the route-map apply. *map_name* must be the name of an existing route-map in the current context.
in: Indicates that the route map applies to incoming advertisements.
out: Indicates that the route map applies to outgoing advertisements.

shutdown

Administratively shut down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

srp-activated-soft-clear

Enables BGP updates when SRP-enabled resources are modified.

timers {[connect-interval *conn_time* **] | [keepalive-interval** *keep_time* **holdtime-interval** *hold_time* **]}**

BGP timers for the specified neighbor.
connect-interval *conn_time*: Specifies the connect timer in seconds. *conn_time* must be an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval *keep_time*: The frequency (in seconds) at which the current BGP router sends keepalive messages to its neighbor. *keep_time* must be an integer from 0 through 65535. The default is 30 seconds.
Holdtime-interval *hold_time*: The interval (in seconds) the router waits for a keepalive message before declaring a neighbor dead. *hold_time* must be an integer from 0 through 65535. The default is 90 seconds.

update-source *ip_address*

use this keyword to bind the specified IP address to the BGP socket that is used to communicate to the peer. *ip_address* is an IPv4 address in dotted-decimal notation.
In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the TCP connection does not go down until there is no route for the loopback address in the peering router.

weight *value*

This command sets the default weight for routes from this neighbor.
value: This must be an integer from 0 through 65535.
Default: 0

Usage

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

Important: A remote AS number must be specified for a neighbor before other parameters can be configured.

Example

The following command specifies that the neighbor at the IP address *192.168.100.25* has an AS number of *2000*:

```
neighbor 192.168.100.25 remote-as 2000
```

The following command allows BGP neighbors that are a maximum of *27* hops away:

```
neighbor 192.168.100.25 ebgp-multihop max-hop 27
```

The following command sets the minimum interval between sending routing updates to 3 minutes (180 seconds):

```
neighbor 192.168.100.25 advertisement-interval 180
```

The following command sets the default weight for all routes from the specified neighbor to *100*:

```
neighbor 192.168.100.25 weight 100
```

redistribute

Redistributes routes into BGP. This means that any routes from another protocol are redistributed to BGP neighbors using the BGP protocol.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[no] redistribute {connected | ospf | rip | static} [route-map map_name]
```

no

Remove the specified redistribution parameters from the BGP router configuration.

connected

Specifies that connected routes will be redistributed.

ospf

Specifies that Open Shortest Path First (OSPF) routes will be redistributed

rip

Specifies that Routing Information Protocol (RIP) routes will be redistributed. (RIP is not supported at this time.)

static

Specifies that static routes will be redistributed.

route-map *map_name*

Filter routes through the specified route map before redistribution.
map_name specifies the name of the route-map to use and must be specified as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to specify what routes this BGP router should redistribute into BGP.

Example

The following command redistributes OSPF routes after filtering them through the route map named *Map1*:

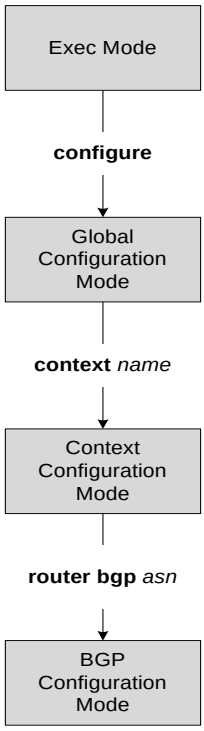
```
redistribute ospf route-map Map1
```

The following command removes the redistribution of OSPF routes from the router's configuration:

```
no redistribute ospf route-map Map1
```

Chapter 37
BGP Configuration Mode Commands

The Border Gateway Protocol (BGP) Configuration Mode is used to configure properties for BGP-4 routing.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

address-family ipv4

Configures the IPv4 Address Family information for the specified BGP Autonomous System (AS) number. Optionally, it also enables the Virtual Routing and Forwarding (VRF) routing information, if specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] address-family ipv4 [vrf *vrf_name*]

no

Removes the configured IPv4 address family VRF mode for specific BGP AS number.

address-family ipv4

Enters the BGP Address-Family IPv4 mode to allow entry of IPv4 BGP parameters for the BGP AS number.

Important: The route distinguisher ID must be configured for the VRF name via the **route-distinguisher** command in BGP VRF Configuration mode, before using this keyword.

vrf *vrf_name*

Enables the exchange of VRF routing information. When this keyword is specified with this command, the address family mode changed to VRF address family mode for specific BGP AS number. *vrf_name* is the name of an existing VFR expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to configure the IPv4 or IPv6 BGP address family configuration parameters and optionally enables the exchange of VRF routing information.
Use of the **address-family ipv4** command switches the command mode to BGP Address Family Configuration Mode; the CLI prompt changes to:

```
[context_name>]host_name(config-bgp-af-v4)#
```

Use of **address-family ipv4 vrf** *vrf_name* command switches the command mode to BGP Address Family Configuration Mode; the CLI prompt changes to:

```
[context_name>]host_name(config-bgp-af-vrf)#
```

Example

Use the following command to enter the IPv4 BGP Address-Family configuration mode:

```
address-family ipv4
```

Use following command to enter the IPv4 VRF BGP Address-Family configuration mode for exchange of VRF routing information from VRF *route_vrf1*:

```
address-family ipv4 vrf route_vrf1
```

address-family ipv6

Configures the IPv6 Address Family information for the specified BGP AS number.

Product

All

Privilege

Security Administrator, Administrator

Syntax

address-family ipv6

address-family ipv6

Enters the BGP Address-Family IPv6 mode to allow entry of IPv6 BGP parameters for the BGP AS number.

Usage

Use this command to configure the IPv6 BGP address family configuration parameters for BGP router. Use of **address-family ipv6** command switches the command mode to BGP Address Family Configuration Mode; the CLI prompt changes to:

```
[context_name>]host_name(config-bgp-af-v6)#
```

Example

Use the following command to enter the IPv6 BGP Address-Family configuration mode:

```
address-family ipv6
```

address-family vpnv4

Configures the VPNv4 Address Family information for the specified BGP AS number.

Product

All

Privilege

Security Administrator, Administrator

Syntax

address-family vpnv4

address-family vpnv4

Enters the BGP Address-Family VPNv4 mode to allow entry of VPN BGP parameters for the BGP AS number.

Usage

Use this command to configure the VPNv4 address family configuration parameters for BGP router. This command is also used to switch the command mode to enter the BGP Address Family Configuration Mode. Use of **address-family vpnv4** command switches the command mode to BGP Address Family Configuration Mode; the CLI prompt changes to:

```
[context_name>]host_name(config-bgp-af-vpnv4)#
```

Example

Use the following command to enter the BGP Address-Family configuration mode for VPNv4 address parameters:

```
address-family vpnv4
```

bgp

Defines the BGP-specific parameters regarding graceful restarts.

Product

All

Privilege

Security Administrator, Administrator

Syntax

bgp graceful-restart { restart-time *rest_time* **| stalepath-time** *stale_time* **| update-delay** *delay* **}**

no

Removes the specified administrative distance for the specific route.

graceful-restart restart-time *rest_time*

Specifies the maximum time (in seconds) required for neighbor(s) to gracefully restart. *rest_time* must be an integer from 1 through 3600.

graceful-restart stalepath-time *stale_time*

Specifies the maximum time (in seconds) to retain stale paths from restarting neighbor(s). *stale_time* must be an integer from 1 through 3600.

graceful-restart update-delay *rest_time*

Specifies the maximum time (in seconds) to defer initial route-selection. *update-delay* must be an integer from 1 through 3600.

Usage

Use this command to set BGP-specific parameters regarding graceful restarts.

Example

Use the following command to retain stale paths from restarting neighbor(s) for *100* seconds:

```
bgp graceful-restart stalepath-time 100
```

distance

Defines the administrative distance for routes. The administrative distance is the default priority for a specific route or type route.

Product

All

Privilege

Security Administrator, Administrator

Syntax

distance { admin *distance* **prefix** *prefix_addr* **[route-access-list** *list_name* **] | bgp external** *ebgp_dist* **internal** *ibgp_dist* **local** *local_dist* **}**

no distance { admin *distance* **prefix** *prefix_addr* **[route-access-list** *list_name* **] | bgp [external** *ebgp_dist* **internal** *ibgp_dist* **local** *local_dist* **] }**

no

Removes the specified administrative distance for the specific route.

distance admin *distance* **prefix** *prefix_addr* **[route-access-list** *list_name* **]**

Sets the administrative distance to a specified value for routes with a specific IP prefix. If you also specify a route access list, the IP prefix must match the rules of that access list.
admin *distance*: Specifies the administrative distance that you want to apply to the IP prefix. *distance* must be an integer from 1 through 254.
prefix *prefix_addr*: Specifies the IP prefix of routes that should have the admin distance applied. *prefix_addr* must be an IPv4 address in dotted-decimal notation and the number of subnet bits, representing the subnet mask in CIDR shorthand (for example, 10.1.1.1/24).
route-access-list *list_name*: Defines the name of a route access list that defines for which routes the administrative distance should be set.

distance bgp external *ebgp_dist* **internal** *ibgp_dist* **local** *local_dist*

Sets the administrative distance for external (eBGP), internal (iBGP) and local routes.
external *ebgp_dist*: Sets the administrative distance for eBGP routes. *ebgp_dist* must be an integer from 1 through 254.
internal *ibgp_dist*: Sets the administrative distance for iBGP routes. *ibgp_dist* must be an integer from 1 through 254.
local *local_dist*: Sets the administrative distance for local routes. *local_dist* must be an integer from 1 through 254.

Usage

Use this command to set the administrative distance for specific routes to values that you specify. These values are only applied to the current router.

Example

Use the following command to set the administrative distance to *100* for all routes that have an IP prefix of *192.168.0.0* with a netmask of *16* and are specified in a remote access list named *racl1*:

```
distance admin 100 prefix 192.168.0.0/16 route-access-list rac11
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

enforce-first-as

Enforces the first Autonomous System (AS) for Exterior Border Gateway Protocol (eBGP) routes. An AS is a connected group of one or more Internet Protocol prefixes run by one or more network operators which has a single and clearly defined routing policy (RFC 1930).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] enforce-first-as
```

no

Disables the enforcement of the first AS for Exterior Border Gateway Protocol (eBGP) routes.

enforce-first-as

Enables the enforcement of the first AS for Exterior Border Gateway Protocol (eBGP) routes.

Usage

Use this command to enforce the use of the first AS for EBGP routes.

Example

Use the following command to enable this functionality:

```
enforce-first-as
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

ip vrf

Adds a preconfigured IP VRF context instance to the BGP ASN and configures the BGP attributes and related parameters to the VRF. This command also switches the command mode to BGP VRF Configuration mode.

Product All

Privilege

Security Administrator, Administrator

Syntax

[no] ip vrf *vrf_name*

no

Removes an associated IP VRF from specified BGP AS number and other configured parameters.

vrf_name

Specifies the IP VRF context configured in the Context configuration mode and to be associated with a BGP AS number. *vrf_name* must be an alphanumeric string of 1 through 79 characters identifying an existing instance.

Usage

Use this command to associate the specified IP VRF context instance to the BGP AS number and configures the BGP attributes and related parameters to the VRF. This command also switches the command mode to BGP VRF Configuration mode.
This command switches the command mode to BGP IP VRF Configuration Mode; the CLI prompt changes to:

```
[context_name>]host_name(config-bgp-vrf)#
```

Example

The following command associates the pre-defined VRF context instance *router_mpls* to this BGP AS number:

```
ip vrf router_mpls
```

maximum-paths

Enables forwarding packets over multiple paths and specifies the maximum number of external BGP (eBGP) or internal BGP (iBGP) paths between neighbors.

Product All

Privilege

Security Administrator, Administrator

Syntax

maximum-paths { ebgp *max_num* **| ibgp** *max_num* **}**

[no] maximum-paths { ebgp | ibgp }

no

Disables forwarding packets over multiple eBGP or iBGP paths between neighbors.

ebgp *max_num*

Enables forwarding packets over multiple eBGP paths between neighbors and specifies the maximum number of eBGP paths. *max_num* must be an integer from 1 through 10.

ibgp *max_num*

Enables forwarding packets over multiple iBGP paths between neighbors and specifies the maximum number of iBGP paths. *max_num* must be an integer from 1 through 10.

Usage

Use this command to enable or disable forwarding packets over multiple paths between neighbors and specify the maximum number of EBGP or IBGP paths.

Example

To enable forwarding packets over multiple paths and set the maximum number of EBGP paths to *10*, enter the following command:

```
maximum-paths ebgp 10
```

To disable forwarding packets over multiple EBGP paths, enter the following command:

```
no maximum-paths ebgp
```

neighbor

Configures BGP routers that interconnect to non-broadcast networks. Note that a remote AS number must be specified for a neighbor before other parameters can be configured.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] neighbor *ip_address* **{ activate | advertisement-interval** *adv_time* **| capability graceful-restart | default-originate [route-map** *map_name* **] | distribute-list** *dist_list* **{ in | out } | ebgp-multihop [max-hop** *number* **] | encrypted password** *encrypted password* **| fall-over bfd [multihop] | filter-list** *filt_list* **{ in | out } | max-prefix** *max_num* **[threshold** *thresh_percent* **] [warning-only] | next-hop-self | password** *password* **| remote-as** *AS_num* **| remove-private-AS | restart-time** *rest_time* **| route-map** *map_name* **{ in | out } | send-community { both | extended | standard } | shutdown | srp-activated-soft-clear | timers { [connect-interval** *conn_time* **] | [keepalive-interval** *keep_time* **holdtime-interval** *hold_time* **] } | update-source** *ip_address* **| weight** *value* **}**

no

Delete the specified parameter from the router configuration.

neighbor *ip_address*

Specifies the IP address of a BGP neighbor. *ip_address* must be in IPv4 dotted-decimal or IPV6 colon-separated notation.

activate

Enable the exchange of routes with this neighbor.

advertisement-interval *adv_time*

The minimum interval (in seconds) between sending BGP routing updates. *adv_time* must be an integer from 0 through 600. Default: 30

capability graceful-restart

Configures BGP graceful restart attributes.

default-originate [route-map *map_name* **]**

Enables the origination of default routes to this neighbor
route-map *map_name*: Specifies the route-map that contains the criteria to originate default routes. *map_name* must be the name of an existing route-map in the current context.

distribute-list *dist_list* **{ in | out }**

Filters updates to and from this neighbor based on a route access list. *dist_list*: The name or number of an existing route-access-list. Default: No filtering is performed.

in: Indicates that incoming advertised routes should be filtered.
out: Indicates that outgoing advertised routes should be filtered.

---

ebgp-multihop [max-hop *number* **]**

Allows EBGP neighbors that are not on directly connected networks.
[max-hop] *number*: Specifies the maximum number of hops allowed to reach a neighbor. *number* must be an integer from 1 through 255. Default hop count: 255

---

encrypted password *encrypted password*

Specifies an encrypted password that is used only inside configuration files. This should be an alphanumeric string of 1 through 523 characters.

---

fall-over bfd [multihop]

Enables Bidirectional Fwarding Detection (BFD) multihop support for fallover.
This command adds or modifies a session in BFD for the BGP peer. If there is an existing session in BFD (same source-address/destination address), BGP protocol will be added to the list of clients for the BFD session. BGP will then be notified when there is a change in the BFD session state.
If there is no such BFD session, a new session is added in BFD. For MH-BFD, the session inherits the parameters including min-tx, min-rx, multiplier and authentication from the multihop-peer configuration in BFD by matching the destination address. If the parameters (interval) are not configured in BFD, then the BFD session will be in Admin-down state.
BGP adds a session in BFD only when the BGP peer is Established state. If there is a state transition in bgp where the peer is no longer in established state, then the bfd session is deleted. It will be added again, once the peer comes back to Established state.

---

filter-list *filt_list* **{ in | out }**

Establishes BGP filters based on an AS path access list. **filt_list** is the name of an existing AS path access list.
in: Indicates that incoming advertised routes will be filtered.
out: Indicates that outgoing advertised routes will be filtered.

---

max-prefix *max_num* **[threshold** *thresh_percent* **] [warning-only]**

The maximum number of prefixes accepted from this peer. When the maximum is exceeded the neighbor connection is reset.
Default: No maximum prefix limit.
max_num: Specifies the maximum number of prefixes permitted. This must be an integer from 1 through 4294967295.
[threshold *thresh_percent* **]**: Specifies a percentage value of when the BGP table is full. When this value is reached, peer warnings are sent to the neighbor and the neighbor connection is reset.
thresh_percent must be an integer from 1 through 100.
[warning-only]: Specifies that only a warning message is sent when the limit is exceeded. The neighbor connection is not reset

---

next-hop-self

Disables the next hop calculation for this neighbor.

password *password*

Specifies a password that is only used inside configuration files. This should be an alphanumeric string of 1 through 24 characters.

remote-as *AS_num*

Specify the AS number of the BGP neighbor.
AS_num: Specifies the neighbor's AS number as an integer from 1 through 65535.

remove-private-AS

Removes the private AS number from outbound updates. Default: Do not remove the private AS number.

restart-time *rest_time*

Specifies the maximum time (in seconds) required for a neighbor to restart. *rest_time* must be an integer between 1 and 3600.

route-map *map_name* **{ in | out }**

Applies a route map to the neighbor. *map_name*i s the name of an existing route-map in the current context.
in: Indicates that the route map applies to incoming advertisements.
out: Indicates that the route map applies to outgoing advertisements.

send-community { both | extended | standard }

Sends the community attributes to a peer router (neighbor).
both: Sends extended and standard community attributes.
extended: Sends extended community attributes.
standard: Sends standard community attributes.

shutdown

Administratively shuts down this neighbor. This disables exchanging routes or configuring parameters for this neighbor.

srp-activated-soft-clear

Enables BGP updates when Service Redundancy Protocol SRP-enabled resources are modified.

timers {[connect-interval *conn_time* **] | [keepalive-interval** *keep_time* **holdtime-interval** *hold_time* **]}**

Specifies BGP timers for this neighbor.
connect-interval *conn_time*: Specifies the connect timer in seconds. *conn_time* must be an integer from 0 through 65535. The default is 60 seconds.
keepalive-interval *keep_time*: The frequency (in seconds) at which the current BGP router sends keepalive messages to its neighbor. *keep_time* must be an integer from 0 through 65535. The default is 30 seconds.
Holdtime-interval *hold_time*: The interval (in seconds) the router waits for a keepalive message before declaring a neighbor dead. *hold_time* must be an integer from 0 through 65535. The default is 90 seconds.

update-source *ip_address*

Binds the specified IP address to the BGP socket that is used to communicate to the peer. *ip_address* is an IPv4 address in dotted-decimal notation.

In most cases you should set the update-source address to the address of the loopback interface in the current context. By doing this, the TCP connection does not go down until there is no route for the loopback address in the peering router.

weight *value*

Sets the default weight for routes from this neighbor. *value* must be an integer from 0 through 65535. Default: 0

Usage

Use this command to set parameters for communication with a specified neighbor. The chassis supports a maximum of 64 peers per context.

Example

The following command specifies that the neighbor at the IP address *192.168.100.25* has an AS number of *2000*:

```
neighbor 192.168.100.25 remote-as 2000
```

The following command allows BGP neighbors that are a maximum of *27* hops away:

```
neighbor 192.168.100.25 ebgp-multihop max-hop 27
```

The following command sets the minimum interval between sending routing updates to 3 minutes (180 seconds):

```
neighbor 192.168.100.25 advertisement-interval 180
```

The following command sets the default weight for all routes from the specified neighbor to *100*:

```
neighbor 192.168.100.25 weight 100
```

network

Specifies a network to announce via BGP.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] network *ip_address*/*mask* **[route-map** *map_name* **]**

no

Delete the specified network from the configuration for the BGP router.

ip_address/*mask*

Specifies the IP address and netmask bits for the network to announce via BGP. *ip_address* is a network IPv4 address in dotted-decimal notation and *mask* is the number of subnet bits, representing a subnet mask in CIDR shorthand. These must be entered in the dotted-decimal notation/subnet bits format (for example, 10.1.1.1/24).

[route-map *map_name* **]**

Filter routes through the specified route map before announcing the network. *map_name* is the name of the route-map to use specified as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to specify a network to announce via BGP.

Example

The following command announces the network *192.168.0.0* with a netmask of *16* via BGP:

```
network 192.168.0.0/16
```

The following command removes the network from the BGP router configuration:

```
no network 192.168.0.0/16
```

redistribute

Redistributes routes via BGP from another protocol to BGP neighbors.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] redistribute { connected | ospf | rip | static } [route-map *map_name* **]**

no

Remove the specified redistribution parameters from the BGP router configuration.

redistribute connected

Specifies that connected routes will be redistributed.

redistribute ospf

Specifies that Open Shortest Path First (OSPF) routes will be redistributed

redistribute rip

Specifies that Routing Information Protocol (RIP) routes will be redistributed. (RIP is not supported at this time.)

redistribute static

Specifies that static routes will be redistributed.

[route-map *map_name* **]**

Filter routes through the specified route map before redistribution. map_name specifies the name of the route-map to use and must be specified as an alphanumeric string of 1 through 79 characters.

Usage

Use this command to specify what routes this BGP router should redistribute into BGP.

Example

The following command redistributes OSPF routes after filtering them through the route map named *Map1*:

```
redistribute ospf route-map Map1
```

The following command removes the redistribution of OSPF routes from the router's configuration:

```
no redistribute ospf route-map map1
```

router-id

Overrides the configured router identifier and causes BGP peers to reset.

Product

All

Privilege

Security Administrator, Administrator

Syntax

router-id *ip_address*

no router-id [*ip_address* **]**

no

Remove the specified router ID from the router's configuration and use the default router ID.

router-id *ip_address*

Specifies the IP address to use as the BGP router ID as an IPv4 address in dotted-decimal notation.

Usage

Use this command to configure a specific router ID that overrides the default.

Example

The following command sets the router ID to *192.168.100.25*:

```
router-id 192.168.100.25
```

scan-time

Configures the BGP background scanner interval. BGP monitors the next hop of the installed routes to verify next-hop reachability and to select, install, and validate the BGP best path. By default, the BGP scanner polls the Routing Information Base (RIB) for this information every 60 seconds. During the 60-second time period between scan cycles, Interior Gateway Protocol (IGP) instabilities or other network failures can cause temporarily black holes and routing loops.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] scan-time *time*

no

Remove the user specified scan time from the router's configuration. The scan time is reset to the default value.

scan-time *time*

Specifies the amount of time (in seconds) to wait between background scans to determine next-hop validity. *time* must be an integer from 5 through 60. Default: 60

Usage

Use this command to set the background scanner interval for the BGP router.

Example

The following command sets the background scanner interval to *30* seconds:

```
scan-time 30
```

timers

Configures BGP routing timers.

Product

All

Privilege

Security Administrator, Administrator

Syntax

timers bgp keepalive-interval *interval* **holdtime-interval** *time* **[min-peer-holdtime-interval** *time* **]**

no

Remove the user specified timer values from the router's configuration. The timer values are reset to the default values.

timers bgp keepalive-interval *interval* **holdtime-interval** *time*

keepalive-interval *interval*: Specifies the interval (in seconds) to wait between sending keepalive packets as an integer from 0 through 65535. Default: 30
holdtime-interval *time*: Specifies the interval (in seconds) after which the neighbor is considered dead if keepalive messages are not received as an integer from 0 through 65535.

[min-peer-holdtime-interval *time* **]**

Specifies the interval (in seconds) that is the minimum acceptable hold time from a neighbor as an integer from 0 through 65535. The default is 0 so that there is no restriction on the hold time received in an OPEN message from the peer.

Usage

Use this command to configure the how long to wait between sending keepalive packets and how long to wait for a keepalive before considering a a neighbor dead.

Example

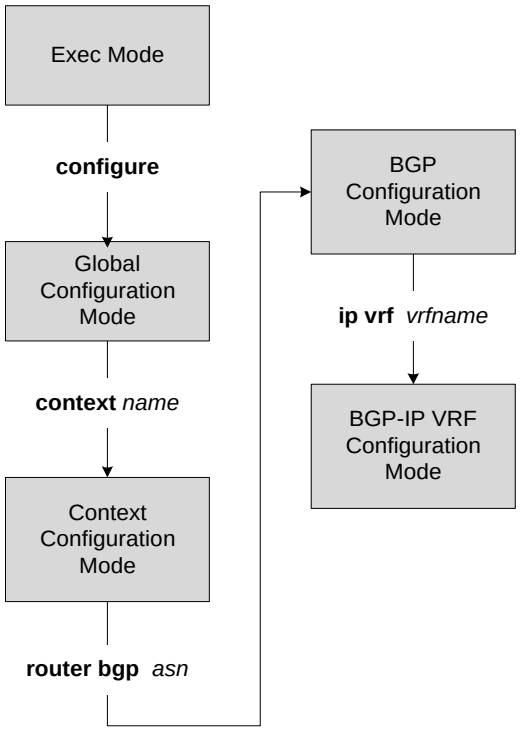
The following command sets the keepalive interval to 2 minutes (120 seconds) and the holdtime interval to 3 minutes (180 seconds):

```
timers bgp keepalive-interval 120 holdtime-interval 180 min-peer-
holdtime-interval 0
```

Chapter 38
BGP IP VRF Configuration Mode Commands

The Border Gateway Protocol (BGP) IP VRF (Virtual Routing and Forwarding) Configuration Mode is used to configure properties for BGP-4 routing.

Important: The VRF must have been preconfigured using the **`ip vrf`** command in the Context Configuration mode before you can enter this configuration mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

route-distinguisher

Assigns a route distinguisher (RD) for the VRF that helps identify a VPN in a provider's network and allows for overlapping IP space. The route distinguisher must be a unique value on the router for each VRF.

Product

All

Privilege

Security Administrator, Administrator

Syntax

route-distinguisher { *as_value* | *ip_address* } *rd_value*

route-distinguisher *as_value rd_value*

Identifies the target VRF by an autonomous system (AS) number. *ASN value* is a 16-bit ASN expressed as an integer from 0 through 65535.

route-distinguisher *ip_address rd_value*

Identifies the target VRF by its IP address. *ip_address* is entered using IPv4 dotted-decimal notation.

rd_value

rd_value is a unique route distinguisher identifier and must be an integer from 0 through 4294967295.

Usage

Use this command to assign a router distinguisher (RD) for the IP VRF. The combination of AS number or IP address and RD value must be unique for every VRF configured. The RD is added to the beginning of the pool addresses to change them into globally unique VPN-IPv4 prefixes.
If the RD is not configured for a VRF, user cannot enter into the BGP Address-Family mode for that VRF to configure the neighbors or other related BGP commands.
An RD assigned to a VRF cannot be changed until the existing VRF is deleted or removed and reconfigured.

Example

The following command assigns a router distinguisher *12345* to VRF with AS number *300*:

```
route-distingusher 300 12345
```

The following command assigns a router distinguisher *12345* to VRF with IP address *10.5.3.4*:

```
route-distingusher 10.5.3.4 12345
```

route-target

Adds an export and/or import list of extended route target communities to the VRF. BGP uses an extended-community attribute, the route target, to filter appropriate VPN routes into the correct VRFs. You configure the export list on the VRF to specify export route targets. When BGP advertises a route from this VRF's forwarding table, it associates the list of export route targets with the route and includes this attribute in the update message that advertises the route. You also configure a route-target import list on each VRF to specify import route targets.

Product

All

Privilege

Security Administrator, Administrator

Syntax

route-target { both | import | export } { *as_value* **|** *ip_address* **}** *rt_value*

route-target both

Creates a list of import and export route targets for the VRF with the same parameters. The list contains an AS number or IP address along with a route target (RT) value.

route-target import

Creates a list of import RTs for the VRF with the same parameters. The list contains an AS number or IP address along with an RT value.

route-target export

Creates a list of export RTs for the VRF with the same parameters. The list contains an AS number or IP address along with an RT value.

as_value

Specifies a 16-bit autonomous-system (AS) number expressed as an integer from 0 through 65535.

ip_address

Specifies an IP address in IPv4 dotted-decimal notation.

rt_value

Specifies a unique RT identifier as an integer from 0 through 4294967295.

Usage

Use this command to create the list of export and/or import route target extended communities for VRF.
A maximm of 5 route targets can be defined with this command up to release 9.0.
A maximm of 10 route targets can be defined with this command from release 10.0 onward.

Important: This command must be executed for each route target extended community.

Example

The following command creates an export list of route target extended community *12345* for VRF with AS number *300*:

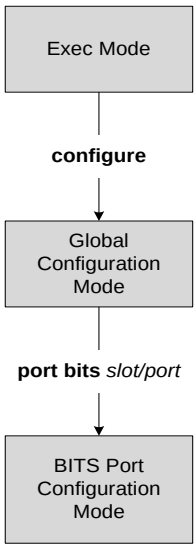
```
route-target export 300 12345
```

The following command creates an export list of route target extended community *12345* for VRF with IP address *192.168.1.2*:

```
route-target export 192.168.1.2 12345
```

Chapter 39
BITS Port Configuration Mode Commands

The Building Integrated Timing Supply (BITS) port configuration mode provides the commands to configure the BITS ports on the SPIO and optionally to configure the transmit timing source.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

default

Restores the port's default speed and communication mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
default { mode | preferred slot }
```

mode

Default: none
Sets the default for the ports framing mode.

preferred slot

Default: non-revertive
Sets the port for non-revertive operation for port redundancy auto-recovery; requiring an administrative user to manually issue a port switch command to return service to the original port.

Usage

Restores port-level parameters to their default values.

Example

Use the following command to remove any setting for this port's framing mode:

```
default mode
```

description

Defines descriptive text that provides useful information about the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters.

Example

Use the following command to set a sample port description in the configuration file:

description *samplePortDescriptiveText*

Use the following command to set a more readable description:

description *"This is a sample description"*

end

Exits the BITS port configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

exit

Exits the BITS port configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global configuration mode.

mode

Configures the framing mode for the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

mode { e1 | t1 } framing *type*

e1 | t1

e1 selects the SDH E1 framing mode.
t1 selects the SONET T1 framing mode.

framing *type*

basic: Selects the Frame Alignment Signal (FAS) used with E1.
crcmf: Selects the Multiframe with CRC (FAS+CRC) used with E1.
esf: Selects the extended superframe format used with T1.
sf: Selects the superframe format (D4) used with T1.

Usage

Set the ports framing mode parameters.

Example

Configure the port to support E1 with crcmf framing.

```
mode e1 framing crcmf
```

preferred slot

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. There are only two SPIO, one in slot 24 and the other in slot 25.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

[default | no] preferred slot

default

Default: non-revertive operation.

no

Disables revertive, or auto-recovery, operation for the port.

slot#

Identifies the physical slot in the chassis where the SPIO is installed.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a **port switch** to command to return service to the original port.

Example

Use this command to set the ports on the card in slot 25 as “preferred” for port redundancy:

preferred slot *25*

recover

Configure line-timing so the SPIO recovers the transmit timing source from an external source via one of the line cards in the chassis. The recovered clock is then distributed for use to all line cards in the chassis.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

recover { line1 *slot#* **| line2** *slot #* **}**

no recover { line1 | line2 }

no

Deletes the identified line-timing source definition from the configuration.

line1 *slot#*

Sets first priority for line-timing clock recovered from the line card in the specified slot.
slot#: a number between 1 and 48.

line2 *slot#*

Sets second priority for line-timing clock recovered from the line card in the specified slot.
slot#: a number between 1 and 48. Can not be the same slot number entered for **line1**.

Usage

Define which line-timing source has priority.

Example

Configure the line card in slot 19 as the preferred source for line-timing.

```
recover line1 19
```

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port and BITS -timing as a transmit timing source.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.
This command with the **no** keyword is required to bring a port into service.

Example

Use the following command to enable the port for service:

```
no shutdown
```

snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap link-status
```

no

Disables the sending of traps for link-status changes.

Usage

Enable the sending of link-status change traps if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

Use this command to enable sending of link-status SNMP traps:

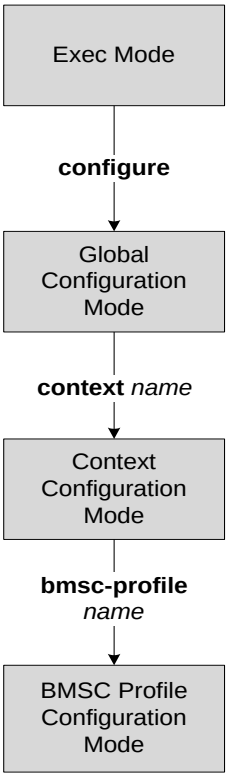
```
snmp trap link-status
```

Use this command to disable sending of link-status SNMP traps:

```
no snmp trap link-status
```

Chapter 40
BMSC Profile Configuration Mode Commands

The BMSC Profile Configuration Mode is used to configure Broadcast Multicast Service Center profiles for Multimedia Broadcast Multicast Service (MBMS) applications. The mode is accessed by entering the **`bmsc-profile`** command from the Context Configuration Mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Returns the CLI prompt to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Change the mode back to the Exec mode.

Example

```
end
```

exit

Exits the current mode and returns to the previous mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Return to the previous or parent mode.

Example

exit

gmb diameter dictionary

This command specifies the Diameter dictionary for the Gmb interface in the BMSC profile of an MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

```
gmb diameter dictionary { custom1 | custom10 | custom2 | custom3 | custom4 | custom5 |
custom6 | custom7 | custom8 | custom9 | standard }

default gmb diameter dictionary
```

custom1 ... custom10

Custom-defined Diameter dictionary. Specific to customer requirement.

standard

Default: Enabled
Specifies the standard Gmb Diameter dictionary conforming to 3GPP TS 29.061 (Rel. 7).

default

Sets the Diameter dictionary to standard.

Usage

Use this command to select the Gmb Diameter dictionary in BM-SC profile of MBMS user service.

Example

The following command sets the Gmb Diameter dictionary to TS 29.061 (Rel. 7) specific:

```
gmb diameter dictionary standard
```

gmb diameter endpoint

This command specifies the Diameter endpoint name for the Gmb interface in the BMSC profile of an MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gmb diameter endpoint *endpoint_name*

no gmb diameter endpoint

no

Removes the previously configured Diameter endpoint name for the Gmb interface in the BMSC profile of an MBMS user service.

endpoint_name

Specifies the Diameter endpoint name for Gmb interface. This must be present in all Diameter messages and is the endpoint that originates the Diameter message.
endpoint_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to create a Gmb Diameter endpoint for a BMSC profile.

Example

The following command creates a Diameter endpoint named *test1* in the BMSC profile of an MBMS user service:

```
gmb diameter endpoint test1
```

gmb diameter peer-select

This command specifies the peer ids of BM-C Diameter primary and secondary host in the BMSC profile for an MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gmb diameter peer-select peer *peer_name* **[realm** *realm_name* **] [secondary-peer** *sec_peer_name* **[realm** *sec_realm_name* **]]**

gmb diameter peer-select

no

Removes the previously configured BM-C Diameter peer ids configured in the BMSC profile of an MBMS user service.

peer *peer_name*

Specifies the primary diameter host id for BMSC in this BMSC profile for MBMS user service. This is a unique name that is specified for the primary peer.
peer_name must be an alphanumeric string of 1 through 127 characters including punctuation marks.

realm *realm_name*

Specifies the realm or domain for the Gmb Diameter peer. The realm may typically be a company or service name.
realm_name must be an alphanumeric string of 1 to 127 characters including punctuation marks.

secondary-peer *sec_peer_name*

Specifies a back-up host that is used for fail-over processing. When the route-table does not find an AVAILABLE route, the secondary host performs fail-over processing.
sec_peer_name must be an alphanumeric string of 1 through 127 characters including punctuation marks.

realm *sec_realm_name*

Specifies the realm or domain for the Gmb Diameter secondary host. The realm may typically be a company or service name.
sec_realm_name must be an alphanumeric string of 1 through 127 characters including punctuation marks.

Usage

Use this command to select a BMSC Diameter peer and realm in this BMSC profile for MBMS user service.

Example

The following command selects a Gmb Diameter peer named *test1* and a realm of *companyx*:

```
gmb diameter peer-select peer test1 realm companyx
```

gmb user-data

This command configures the parameters in this BMSC profile for user data for MBMS user service.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gmb user-data { mode-preference { multicast | unicast } | unicast-self-address *self_ip_address* **}**

default gmb user-data mode-preference

no gmb user-data unicast-self-address

no

Removes the configured self address of GGSN for unicast in the BMSC profile for user data of MBMS user service.

defualt

Sets the user data mode to unicast in the BMSC profile for user data of MBMS user service.

mode-preference { multicast | unicast }

Default: unicast
Specifies the preferred mode of GGSN for receiving MBMS user service data.
multicast: specifies the preferred mode as multicast for MBMS user service.

Important: Note that this **multicast** keyword is not supported in this release.

unicast: specifies the preferred mode as unicast for MBMS user service.

unicast-self-address *self_ip_address*

Specifies the GGSN's IP address for BMSC to use as the outer destination address for the IP-in-IP tunnel to send multicast data, if the configured preferred data mode is unicast.
self_ip_address must be the IPv4 address in dotted-decimal notation.
This command must be configured if GGSN's user-data mode-preference is Unicast.

Usage

Use this command to configure user data mode and other parameters in the BMSC profile for user data of MBMS user service.
GGSN can receive multicast data from BMSC in one of two modes - Multicast or Unicast. In Unicast mode, BM-SC tunnels the multicast data to the GGSN in an IP-in-IP tunnel instead of direct multicast. This command with the **mode-preference** keyword configures the GGSN's preferred mode for receiving multicast data.

Important: Both GGSN and BMSC must support the Unicast mode of multicast data transfer. If any GGSN or BMSC does not support Multicast mode, BMSC will transfer multicast data using Unicast mode only.

Use the **unicast-self-address** keyword to configure the GGSN's IP address which the BMSC should use as the outer destination address for the IP-in-IP tunnel to send multicast data, if the selected user data mode to receive multicast data is Unicast.

Example

The following command sets the MBMS data transfer mode to unicast:

```
default gmb user-data mode-preference
```

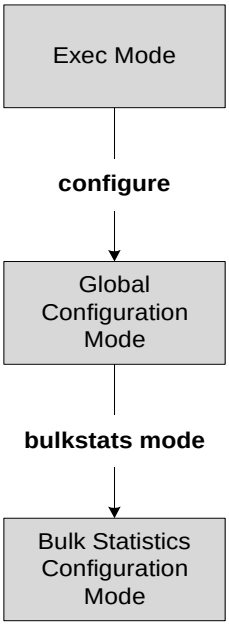
Chapter 41
Bulk Statistics File Configuration Mode Commands

This section describes a bulk statistic “file” under which to group the bulk statistic configuration. The Bulk Statistics File Configuration mode supports the configuration of “files” used for organizing bulk statistics schema, delivery options, and receiver information.

Because multiple “files” can be configured, this functionality provides greater flexibility in that it allows you to configure different schemas to go to different receivers. To configure a bulk statistics file, enter the following command:

Important: Use of bulk statistics “files” is optional. However system logically assigns “file 1” to the standard configuration. Therefore, if you wish to configure bulk statistics “files” at a later time, “file 1” can be used.

Caution: If the Web Element Manager application is used to collect and process (XML parsing, graphing, etc.) bulk statistics data, “file 1” is used by the Web Element Manager’s default bulk statistics collection information and schemas. To avoid errors in processing by the Web Element Manager, do not configure “file 1" via the CLI. However, it is possible to configure files 1 through 4 using the system’s CLI, regardless of whether or not the Web Element Manager is configured as a receiver. In this case, the bulk statistics data is written to the server but not processed by the Web Element Manager application.



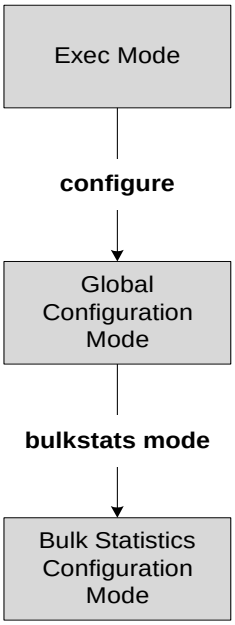
Important: The commands in this configuration mode are identical to the same commands in the “Bulk Statistics Configuration Mode Commands” chapter.

Chapter 42
Bulk Statistics Configuration Mode Commands

The Bulk Statistics Configuration Mode is used to manage the options for the collection, formatting and delivery of system statistics to remote nodes.

Refer to the *Common Syntax Options* section in this chapter for information about formatting the output of bulk statistics.

Important: Unless otherwise indicated, all statistics are counters. For statistics with the Int32 data type, the roll-over to zero limit is 4,294,967,295. For statistics with the Int64 data type, the roll-over to zero limit is 18,446,744,073,709,551,615.



Overview

Schema Format String Syntax

The following defines common syntax block options. These options appear in similar commands and are detailed here for easy reference.

The schema format string is used to define the structure of generated bulk statistics data. The string may contain static text, dynamic content, and bulk statistic variables, or any combination.

Static text includes any ASCII characters that are of a fixed value. Static text may also include control characters by using Escape character sequences. Supported Escape character shortcuts are “\n” for new line and “\t” for tab.

Enclosing an alphanumeric string within double quotation marks (“) allows you to include spaces in the string.

Variables within the format string must be enclosed within “% and %”, for example, “%var%”. The actual variables supported are command-dependent and are described in the *Statistics and Counters Reference*.

Common Statistics

For a list of the statistics that are common to all schema, refer to the *Statistics and Counters Reference*.

aal2 schema

Configures the ATM adaptation layer 2 (AAL2) bulk statistics schema within an ATM virtual connection by the HNB-GW.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

aal2 schema *schema_name* **format** *format_string*

no aal2 schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for ATM adaptation layer 2 (AAL2) bulk statistics collection. Multiple AAL2 schemas can be created to further categorize HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple AAL2 schemas, re-issue the **aal2 schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *aal2stats1* that records the number of AAL2 uplink packets transmitted and AAL2 downlink packets received by Access Link Control Application Part (ALCAP) service on HNB-GW:

```
aal2 schema aal2stats1 format "%uplink-pkts-tx%" "%downlink-pkts-rx%"
```

alcap schema

Configures the Access Link Control Application Part (ALCAP) bulk statistics schema for an ALCAP service on an HNB-GW node.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

alcap schema *schema_name* **format** *format_string*

no alcap schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for Access Link Control Application Part (ALCAP) service bulk statistics collection on HNB-GW node. Multiple ALCAP schemas can be created to further categorize at AAL2 channel-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple ALCAP schemas, re-issue the **alcap schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *alcap1stats1* that records the number of AAL2 channels in connecting and connected state on ALCAP service:

```
alcap schema alcaplstats1 format "%num-aal2-channels-in-connecting%"
"%num-aal2-channels-in-connected-state%"
```

apn schema

Configures the Access Point Name (APN) bulk statistics schema.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

apn schema *schema_name* **format** *format_string*

no apn schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for APN bulk statistics collection. Multiple APN schemas can be created to further categorize APN-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple APN schemas, re-issue the **apn schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *apn1stats1* that records the number of sessions currently facilitated by the APN:

```
apn schema apn1stats1 format "%sess-curr%"
```

asngw schema

Configures Access Service Gateway (ASN-GW) bulk statistics schema.

Product

ASN GW

Privilege

Security Administrator, Administrator

Syntax

asngw schema *schema_name* **format** *format_string*

no asngw schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format. as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for ASN-GW bulk statistics collection. Multiple ASN-GW service schemas can be created to further categorize ASN-GW service bulk statistics. All of the schemas are processed at each collection interval. To create multiple ASN-GW service schemas, re-issue the **asngw schema** *schema_name* command using a different schema name.

Example

To create an ASN-GW schema called *asngw_statistics* that specifies a schema format of:

- VPN context name: *vpnname*
- VPN Context Identifier: *vpnid*
- ASN-GW Service name: *servname*
- ASN-GW Service identifier: *servid*
- Peer IP address: *peeripaddr*

Use the following command:

```
asngw schema asngw_statistics format "VPN name: %vpnname%\nVPN ID:
%vpnid%\nASN-GW Service Name: %servname%\nASN-GW Service Identifier:
%servid%\nPeer IP Address: %peeripaddr%"
```

bcmcs schema

Configures Broadcast and Multicast Service (BCMCS) bulk statistics schema.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

bcmcs schema *schema_name* **format** *format_string*

no bcmcs schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for BCMCS bulk statistics collection. Multiple BCMCS schemas can be created to further categorize BCMCS-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple BCMCS schemas, re-issue the **bcmcs schema** *schema_name* command using a different schema name.

Example

The following command creates a schema named *bcmcs1stats1* that records the number of sessions currently facilitated by BCMCS:

```
bcmcs schema bcmcs1stats1 format "%sess-curr%"
```

card schema

Configures card bulk statistics schema. These are statistics for circuit cards installed in the ASR 5x00 chassis.

Product

All

Privilege

Security Administrator, Administrator

Syntax

card schema *schema_name* **format** *format_string*

no card schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for card bulk statistics collection. Multiple card schemas can be created to categorize card-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple card schemas, re-issue the **card schema** *schema_name* command using a different schema name.

Important: Not supported on all platforms

Example

The following command creates a schema called *card1stats1* that records the number of processes for all installed cards:

```
card schema card1stats1 format "%slot%-%numproc%"
```

To create a card-level schema called *cardresourcestats* that specifies a schema format of:

- Chassis slot number: *slot*
- Available Memory: *memtotal* Memory Used (%): *memused*
- Available CPU (%): *cpuidle*

Use the following command:

```
card schema cardresourcestats format "Chassis slot number:
%slot%\nAvailable Memory: %memtotal%\tMemory Used (%):
%memused%\nAvailable CPU (%): %cpuidle%"
```

context schema

Configures context bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

context schema *schema_name* **format** *format_string*

no context schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema forma as an alphanumeric string of 1 through 3600 characters. For syntax details, see Schema Format String Syntax section.

Important: For the complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for Context bulk statistics collection. Multiple context schemas can be created to categorize context statistics. All of the schemas are processed at each collection interval. To create multiple context schemas, re-issue the **context schema** *schema_name* command using a different schema name.

Example

To create a Firewall context schema called *sfw_context_stats1* that specifies a schema format of:

- Total packets received by firewall: *sfw-total-rxpackets*
- Total packets sent by firewall: *sfw-total-txpackets*
- Total ICMP packets discarded by firewall: *fw-icmp-discardpackets*

Use the following command:

```
context schema sfw_context_stats1 format "Packets received Rx: %sfw-
total-rxpackets%\nPackets Sent Tx:: %sfw-total-txpackets%\nICMP Packets
discarded: %fw-icmp-discardpackets%"
```

cscf schema

Configures Call Session Control Function (CSCF) bulk statistics schema.

Product

SCM

Privilege

Security Administrator, Administrator

Syntax

cscf schema *schema_name* **format** *format_string*

no cscf schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format. as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for CSCF bulk statistics collection. Multiple CSCF-service schemas can be created to categorize CSCF-service bulk statistics. All of the schemas are processed at each collection interval. To create multiple CSCF-service schemas, re-issue the **cscf schema** *schema_name* command using a different schema name.

Example

To create a CSCF schema called *cscf_statistics* that specifies a schema format of:

- Call attempts received: *callattrx*
- Call attempts transmitted: *callatttx*
- Call successes received: *callsuccrx*
- Call successes transmitted: *callsucctx*
- Call failures received: *callfailrx*
- Call failures transmitted: *callfailtx*

Use the following command:

```
cscf schema cscf_statistics format "Call Attempts Rx: %callattrx%\nCall
Attempts Tx: %callatttx%\nCall Successes Rx: %callsuccrx%\nCall Successes
```

```
Tx: %callsucctx%\nCall Failures Rx: %callfailrx%\nCall Failures Tx:
%callfailtx%”
```

cs-network-ranap

Configures the Radio Access Network Application Part (RANAP) bulk statistics schema in a Circuit Switched (CS) network associated with an HNB-GW node.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

cs-network-ranap schema *schema_name* **format** *format_string*

no cs-network-ranap schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for RANAP procedure related bulk statistics collection in a CS network associated with HNB-GW in a Femto UMTS network. Multiple CS Networks RANAP schemas can be created to further categorize at CS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple CS Networks RANAP schemas, re-issue the **cs-network-ranap schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *cs_ranap1stats1* that records the total number of Iu Release Request messages transmitted and total number of Iu Release Command message received by the HNB-GW node:

```
cs-network-ranap schema cs_ranaplstats1 format "%iu-rel-req-tx%" "%iu-rel-cmd-rx%"
```

cs-network-rtp

Configures the Real-Time Transport Protocol (RTP) bulk statistics schema in a Circuit Switched (CS) network associated with an HNB-GW node.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

cs-network-rtp schema *schema_name* **format** *format_string*

no cs-network-rtp schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for RTP procedure related bulk statistics collection in a CS network associated with HNB-GW in a Femto UMTS network. Multiple CS Networks RTP schemas can be created to further categorize at CS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple CS Networks RTP schemas, re-issue the **cs-network-rtp schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *cs_rtp1stats1* that records the total number of RTP Downlink Packets received and RTP Uplink Packets transmitted by HNB-GW node in an associated CS network:

```
cs-network-rtp schema cs_rtplstats1 format "%rtp-uplink-pkts-tx%" "%rtp-downlink-pkts-rx%"
```

dcca schema

Configures Diameter Credit Control Application (DCCA) bulk statistics schema. This command is available only in 9.0 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dcca schema *schema_name* **format** *format_string*

no dcca schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for DCCA bulk statistics collection.

default

Restores the system default for the option specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
default { limit | receiver mode | remotefile format | sample-interval | transfer-interval
}
```

limit

Restores the memory utilization limit system default: 1000 kilobytes.

receiver mode

Restores the behavior for sending files to the receivers to the default value.
Default: secondary-on-failure

remotefile format

Restores the format of remote bulkstats file names to the default value.
Default: "%date%-%time%"

sample-interval

Restores the system default for the local polling interval for statistic sampling.
Default: 15 minutes

transfer-interval

Restores the system default for the time between transfer of data files to receivers.
Default: 480 minutes

Usage

Restore the default values when troubleshooting the system. Setting values to the system defaults places them in well known states as starting points for monitoring for problems.

Example

```
default limit

default transfer-interval
```

diameter-acct schema

Configures Diameter Accounting bulk statistics schema. This command is available only in 11.0 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter-acct schema *schema_name* **format** *format_string*

no diameter-acct schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for Diameter Accounting bulk statistics collection.

diameter-auth schema

Configures Diameter Authentication bulk statistics schema. This command is available only in 11.0 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

diameter-auth schema *schema_name* **format** *format_string*

no diameter-auth schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for Diameter Authentication bulk statistics collection.

dlci-util schema

Configures the collection of statistics for the DLCI-Util (DLCI utilization) schema.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

dlci-util schema *dlci_schema_name* **format** *dlci_schema_format*

no dlci-util schema *dlci_schema_name*

no

Removes the specified schema.

dlci_schema_name

Specifies a name for a model collection schema for DLCI utilization statistics. The name must be comprised of an alphanumeric string of 1 to 31 characters.

format *dlci_schema_format*

Specifies the format of the collected DLCI utilization statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters. For syntax details, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for the DLCI-Util schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for DLCI-Util bulk statistics collection in the generated stats report files.. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified. Multiple schemas can be created to categorize DLCI-Util bulk statistics. All of the schemas are processed at each collection interval. To create multiple DLCI-Util schemas, re-issue the **dlci-util schema** *dlci_schema_name* command using a different schema name each time.

Example

Include the bulk statistic variable names to create a schema named *dlciutilstats_sgsn1* that specifies collection of statistics (a schema format) for:

- card
- port
- path
- DS1/E1

- DLCI
- DLCI utilization snapshot for received packets
- DLCI utilization for received packets in the last 5 minutes
- DLCI utilization for received packets in the last 15 minutes

Use the following command:

```
gprs schema gprsstats_sgsn1 format "Card: %card%\nPort: %port%\nDLCI in
path: %dlci_util_path%\nDS1/E1: %dlci_util_ds1e1%\nDLCI ID:
%dlci_util_dlci_no%\nCurrent Rx: %dlci_util_dlci_curr_rx%\nRx in 5
minutes: %dlci_util_dlci_5min_rx%\nRx in 15 minutes:
%dlci_util_dlci_15min_rx%\n"
```

dpca schema

Configures Diameter Policy Control Application (DPCA) bulk statistics schema. This command is available only in 9.0 and later releases.

Product

All

Privilege

Security Administrator, Administrator

Syntax

dpca schema *schema_name* **format** *format_string*

no dpca schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for DPCA bulk statistics collection.

ecs schema

Configures Enhanced Charging Service (ECS) bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ecs schema *schema_name* **format** *format_string*

no ecs schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for ECS bulk statistics collection. Multiple ECS schemas can be created to categorize ECS bulk statistics. All of the schemas are processed at each collection interval. To create multiple ECS schemas, re-issue the **ecs schema** *schema_name* command using a different schema name.

egtpc schema

Configures the enhanced GTP-C statistics schema for naming conventions of data files.

Product

P-GW, S-GW

Privilege

Administrator

Syntax

egtpc schema *schema_name* **format** *format_string*

no egtpc schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for enhanced GTP-C bulk statistics collection. Multiple eGTP-C service schemas can be created to categorize eGTP-C service bulk statistics. All of the schemas are processed at each collection interval. To create multiple eGTP-C service schemas, re-issue the **egtpc schema** *schema_name* command using a different schema name.

Example

For an eGTP-C-level schema called *egtpcservicestats* that specifies a schema format of:

- Tunnel - Create Session Request Sent: *tun-sent-cresess*
- Tunnel - Create Session Request Received: *tun-recv-cresess*

Use the following command:

```
egtpc schema egtpcservicestats format "Number of GTP Tunnel Requests
Sent: %tun-sent-cresess%\nNumber of GTP Tunnel Requests Received: %tun-
recv-cresess%\n"
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

fa schema

Configures Foreign Agent (FA) bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

fa schema *schema_name* **format** *format_string*

no fa schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for FA bulk statistics collection. Multiple FA service schemas can be created to categorize FA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple FA service schemas, re-issue the **fa schema** *schema_name* command using a different schema name.

Example

To create a FA-level schema named *faservicestats* that separates the *date*, *time*, and *vpnname* by tabs, enter the following command:

```
fa schema faservicestats format %date%\t%time%\t%vpnname%
```

The schema format appears as follows:

```
date    time    vpnname
```

file

Enters the Bulk Statistics File Configuration mode which supports the configuration of “files” used for grouping bulk statistic configuration information.

Product

All

Privilege

Security Administrator, Administrator

Syntax

`[ no ] file` *`number`*

`no`

Removes a previously configured bulk statistic file.

`number`

Specifies a number for the bulkstatistics file as an integer from 1 through 4. This number is how the file is recognized by the system.

Usage

Bulk statistics “files” are used to group bulk statistic schema, delivery options, and receiver configuration. Because multiple “files” can be configured, this functionality provides greater flexibility in that it allows you to configure different schemas to go to different receivers. A Maximum of four files can be assigned for bulk statistics collection.

Executing this command allows you to enter the Bulk Statistics File Configuration Mode. This mode supports all of the commands from the Bulk Statistics Configuration mode except **`limit, local-directory, sample-interval,`** and **`transfer-interval`**. (these commands are configured globally for all “files”.)

Important: Use of bulk statistics “files” is optional. If you do not wish to configure bulk statistic “files”, you can perform a standard configuration using the commands in the Bulk Statistic Configuration Mode. Note, however, that the system logically assigns “file 1” to the standard configuration. Therefore, if you wish to configure bulk statistics “files” at a later time, “file 1” will already be used.

Caution: If the Web Element Manager application is used to collect and process (XML parsing, graphing, etc.) bulk statistics data, “file 1” is used by the Web Element Manager’s default bulk statistics collection information and schemas. To avoid errors in processing by the Web Element Manager, do not configure "file 1" via the CLI. However, it is possible to configure files 1 through 4 using the system’s CLI, regardless of whether or not the Web Element Manager is configured as a receiver. In this case, the bulk statistics data is written to the server but not processed by the Web Element Manager application.

Example

The following command creates a bulk statistics file numbered 2 and enters the Bulk Statistics File Configuration Mode:

```
file 2
```

fng schema

Configures Femto Network Gateway (FNG) bulk statistics schema.

Product

FNG

Privilege

Security Administrator, Administrator

Syntax

fng schema *schema_name* **format** *format_string*

no fng schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

footer

Configures the footer string placed at the end of the generated bulk statistics data files.

Product

All

Privilege

Security Administrator, Administrator

Syntax

footer format *format_string*

no footer format

no

Clears the footer format string which results in the default file footer being used in generated data files.

format *format_string*

Specifies the footer format string for use in generated data files as an alphanumeric string from 1 through 2047 characters. The format string syntax is described in the Schema Format String Syntax section. Default: "" (an empty footer)
The following variables are supported:

Table 11. footer Command Format String Variables

Variable	Description	Data Type
date	The date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.	String
host	The system hostname that created the file	String
ipaddr	The default management (local context) IP address in ###.###.###.### format. An empty string is inserted if no address is available.	String
sysuptime	The uptime (in seconds) of the system that created the file.	32-bit signed
time	The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.	String

Usage

Define a unique footer in data files which allows for easy identification of which system generated the data file or any other useful information. The use of the variables is suggested so as to allow for a uniform footer across all systems. The hostname variable should be used to identify the source of the data in the footer and all remaining items can be formatted consistently across all chassis.

Example

The following commands define different footer formats:

```
footer format northStreet

footer format "Created on: %date%-%time% by %host%"

no footer format
```

gather-on-standby

Controls whether or not statistics are gathered when a system is in the standby state.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] gather-on-standby
```

no

Does not gather bulk statistics when the system is in the standby state.

default

Resets this command to its default action of gathering bulk statistics when the system is in the standby state.

Usage

Use this command to configure a system to either gather or not gather statistics when the system is in the standby state. This is useful for systems configured for Interchassis Session Recovery (ICSR). See the *System Administration Guide* for more details on this feature.

If a chassis transitions to standby state and it has accumulated but not yet transferred bulk statistics data, the previously accumulated data is transferred at the first opportunity. However, no additional statistics gathering takes place.

Example

The following command disables gathering statistics when the system is in the standby state:

```
no gather-on-standby
```

The following command enables the gathering of statistics when the system is in the standby state:

```
gather-on-standby
```

gprs schema

Configures the collection of statistics for the GPRS schema.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gprs schema *gprs_schema_name* **format** *gprs_schema_format*

no gprs schema *gprs_schema_name*

no

Removes the specified schema.

gprs_schema_name

Specifies a name for a model collection schema for GPRS statistics. The name must be comprised of an alphanumeric string of 1 to 31 characters.

format *gprs_schema_format*

Specifies the format of the collected GPRS statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters. For syntax details, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for the GPRS schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for GPRS bulk statistics collection in the generated stats report files.. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple GPRS schemas can be created to categorize GPRS bulk statistics. All of the schemas are processed at each collection interval. To create multiple GPRS schemas, re-issue the **gprs schema** *gprs_schema_name* command using a different schema name each time.

Example

Include the bulk statistic variable names to create a GPRS schema named *gprsstats_sgsn1* that specifies collection of statistics (a schema format) for:

- context name
- GPRS service name
- number of LLC packets dropped

Use the following command:

```
gprs schema gprsstats_sgsn1 format "Context Name: %vpnname%\nGPRS Service
Name: %servname%\nTotal LLC Packets Dropped: %bssgp-total-usr-req-
drop%\n"
```

gtpc schema

Configures GPRS Tunneling Protocol-Control (GTPC) message statistics schema.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpc schema *gtpc_schema_name* **format** *gtpc_schema_format*

no gtpc schema *gtpc_schema_name*

no

Removes the specified schema.

gtpc_schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *gtpc_schema_format*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for GTPC bulk statistics collection. Multiple GTPC schemas can be created to categorize GTPC bulk statistics. All of the schemas are processed at each collection interval. To create multiple GTPC schemas, re-issue the **gtpc schema** *schema_name* command using a different schema name.

Example

To create a GTPC-level schema named *gtpc_stats* that specifies a schema format of:

- Context Name: *vpnname*
- GGSN Service Name: *servname*
- Total PDP Contexts Processed: *setup-total*

Use the following command:

```
gtpc schema gtpc_stats format "Context Name: %vpnname%\nGGSN Service
Name: %servname%\nTotal PDP Contexts Processed: %setup-total%\n"
```

gtpp schema

Configures GPRS Tunneling Protocol-Prime (GTPP) statistics schema.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

gtpp schema *gtpp_schema_name* **format** *gtpp_schema_format*

no gtpp schema *gtpp_schema_name*

no

Removes the specified schema.

gtpp_schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *gtpp_schema_format*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for GTPP bulk statistics collection. Multiple GTPP schemas can be created to categorize GTPP bulk statistics. All of the schemas are processed at each collection interval. To create multiple GTPP schemas, re-issue the **gtpp schema** *schema_name* command using a different schema name.

Example

To create a GTPP schema named *gtpp_statistics* that specifies a schema format of:

- Time: *time*
- Total Redirection Requests Received: *redir-rcvd*

Use the following command:

```
gtpp schema gtpp_statistics format "Time: %time%\tTotal Redirection
Requests Received: %redir-rcvd%\n"
```

gtpu schema

Configures GTP-U bulk statistics schema.

Product

GGSN, HNB-GW, P-GW, S-GW

Privilege

Security Administrator, Administrator

Syntax

gtpu schema *schema_name* **format** *format_string*

no gtpu schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the format of the collected GTP-U statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters.The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for GTP-U bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified. Multiple GTP-U schemas can be created to categorize GTP-U bulk statistics. All of the schemas are processed at each collection interval. To create multiple GTP-U schemas, re-issue the **gtpu schema** *schema_name* command using a different schema name each time.

ha schema

Configures Home Agent (HA) bulk statistics schema.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

ha schema *schema_name* **format** *format_string*

no ha schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format. as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for HA bulk statistics collection. Multiple HA service schemas can be created to categorize HA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple HA service schemas, re-issue the **ha schema** *schema_name* command using a different schema name.

Example

For an HA schema named *haservicestats* that specifies a schema format of:

- Number of HA authentication failures: *reply-haauthfail*
- Number of Mobile Node authentication failures: *reply-mnauthfail*

Use the following command:

```
ha schema haservicestats format "Number of HA authentication failures:
%reply-haauthfail%\nNumber of Mobile Node authentication failures:
%reply-mnauthfail%\n"
```

header

Configures the header string placed at the beginning of the generated bulk statistics data files.

Product

All

Privilege

Security Administrator, Administrator

Syntax

header format *format_string*

no header format

no

Clears the header format string which results in the default file header being used in generated data files.

format *format_string*

Specifies the header format string for use in generated data files as an alphanumeric string of 1 through 2047 characters. The format string syntax is described in the Schema Format String Syntax section. Default: "" (an empty header)
The following variables are supported:

Table 12. header Command Format String Variables

Variable	Description	Data Type
date	The UTC date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.	String
date3	The UTC date that the collection file was created in YYMMDD format where YY represents the year, MM represents the month and DD represents the day.	String
host	The system hostname that created the file	String
ipaddr	The default management (local context) IP address in ###.###.###.### format. An empty string is inserted if no address is available.	String
sysuptime	The uptime (in seconds) of the system that created the file.	32-bit signed
time	The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.	String

Usage

Define a unique header in data files which allows for easy identification as to which system generated the data file or any other useful information.

Using the variables described above allows for a uniform header across all systems. The hostname variable should be used to identify the source of the data in the header and all remaining items can be formatted consistently across all chassis.

Example

The following commands define different header formats:

```
header format northStreet

header format "Created on: %date%-%time% by %host%"

no header format
```

hnbgw-hnbap schema

Configures bulk statistics schema for HNB-Application Part (HNB-AP) message statistics collection in HNB-GW session instance.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

hnbgw-hnbap schema *schema_name* **format** *format_string*

no hnbgw-hnbap schema *schema_name*

no

Removes the configured HNB-AP schema.

schema_name

Specifies a name for the HNB-AP schema to be used as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies a name for HNB-AP schema format followed by schema variables. *format_string* must be an alphanumeric string of 1 through 3599 characters. For syntax details, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

This command defines schemas used for HNB-AP statistics collection. Multiple HNB-AP schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **hnbgw-hnbap schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *hnbap1stats1* that records the number of registered UEs and registered HNBs along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-hnbap schema hnbap1stats1 format "%vpnname%-%vpnid%-%servname%-
%registered-hnb%-%registered-ue%"
```

To create a schema called *hnbapuestats* that specifies a schema format of:

- Number of UEs with CS and PS Core Network Connections: *ue-with-ps-cs-conn*
- Number of UEs in Idle Condition: *idle-u*e

Use the following command:

```
hnbgw-hnbap schema hnbapuestats format "Number of UEs with CS and PS Core
Network Connections: %ue-with-ps-cs-conn%\nNumber of UEs in Idle
Condition: %idle-ue%"
```

hnbgw-ranap schema

Configures bulk statistics schema for Radio Access Network-Application Part (RANAP) message statistics collection in HNB-GW session instance.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

hnbgw-ranap schema *schema_name* **format** *format_string*

no hnbgw-ranap schema *schema_name*

no

Removes the configured RANAP schema.

schema_name

Specifies a name for the RANAP schema to be used as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies a name for RANAP schema format, to be used, followed by schema variables. *format_string* must be an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

This command defines schemas used for RANAP messaging statistics collection. Multiple RANAP schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **hnbgw-ranap schem** *schema_name* command using a different schema name.

Example

The following command creates a schema called *ranap1stats1* that records the number of CS-Direct-Transfer messages sent and received on RANAP along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-ranap schema ranap1stats1 format "%vpnname%-%vpnid%-%servname%-%cs-dir-transfer-rx%-%cs-dir-transfer-tx%"
```

To create a schema called *ranappagingstats* that specifies a schema format of:

- Number of paging requests sent on RANAP from CS Core Network Connections: *cs-paging-req-tx*
- Number of paging requests sent on RANAP from PS Core Network Connections: *ps-paging-req-tx*

Use the following command:

```
hnbgw-ranap schema hnbapuestats format "Number of paging requests sent on
RANAP from CS Core Network Connections: %cs-paging-req-tx%\nNumber of
paging requests sent on RANAP from PS Core Network Connections: %ps-
paging-req-tx%"
```

hnbgw-rtp schema

Configures bulk statistics schema for Real-Time Protocol (RTP) message statistics collection in HNB-GW session instance.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

hnbgw-rtp schema *schema_name* **format** *format_string*

no hnbgw-rtp schema *schema_name*

no

Removes the configured RTP schema.

schema_name

Specifies a name for the RTP schema to be used as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies a name for RTP schema format, to be used, followed by schema variables. *format_string* must be an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

This command defines schemas used for RTP messaging statistics collection. Multiple RTP schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **hnbgw-rtp schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *rtp1stats1* that records the number of RTP uplink packets dropped and number of RTCP application report messages received on RTP link along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-rtp schema rtp1stats1 format "%vpnname%-%vpnid%-%servname%-%rtp-
uplink-pkts-dropped%-%rtcp-app-report-rx%"
```

hnbgw-rua schema

Configures bulk statistics schema for RANAP User Adaptation (RUA) protocol message statistics collection in HNB-GW session instance.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

hnbgw-rua schema *schema_name* **format** *format_string*

no hnbgw-rua schema *schema_name*

no

Removes the configured RUA schema.

schema_name

Specifies a name for the RUA schema to be used as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies a name for RUA schema format, to be used, followed by schema variables. *format_string* must be an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

This command defines schemas used for RUA protocol messaging statistics collection. Multiple RUA schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **hnbgw-rua schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *rua1stats1* that records the number of CS-Connect messages received and sent on RUA link along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-rua schema rua1stats1 format "%vpnname%-%vpnid%-%servname%-%cs-
connect-rx%-%cs-connect-tx%"
```

hnbgw-sctp schema

Configures bulk statistics schema for Stream Control Transmission Protocol (SCTP) message statistics collection in HNB-GW session instance.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

hnbgw-sctp schema *schema_name* **format** *format_string*

no hnbgw-sctp schema *schema_name*

no

Removes the configured SCTP schema.

schema_name

Specifies a name for the SCTP schema to be used as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies a name for SCTP schema format, to be used, followed by schema variables. *format_string* must be an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

This command defines schemas used for SCTP protocol messaging statistics collection. Multiple SCTP schemas can be created to further categorize bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **hnbgw-sctp schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *sctp1stats1* that records the number of bytes received from lower layer and number of bytes sent to lower layer over SCTP connection along with Context name, Context Id, and HNB-GW service name:

```
hnbgw-sctp schema sctp1stats1 format "%vpnname%-%vpnid%-%servname%-
%total-bytes-sent-to-lower-layer%-%total-bytes-rcvd-from-lower-layer%%"
```

hsgw schema

Configures HRPD Serving Gateway (HSGW) bulk statistics schema.

Product

HSGW

Privilege

Security Administrator, Administrator

Syntax

hsgw schema *schema_name* **format** *format_string*

no hsgw schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the format of the collected HSGW statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters.The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for HSGW bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple HSGW schemas can be created to categorize HSGW bulk statistics. All of the schemas are processed at each collection interval. To create multiple HSGW schemas, re-issue the **hsgw schema** *schema_name* command using a different schema name each time.

imsa schema

Configures IP Multimedia System Authorization (IMSA) bulk statistics schema.

Product

GGSN, HA, HSGW, IPSG, PDSN, P-GW, S-GW

Privilege

Security Administrator, Administrator

Syntax

imsa schema *schema_name* **format** *format_string*

no imsa schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the format of the collected IMSA statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters.The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for IMSA bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple IMSA schemas can be created to categorize IMSA bulk statistics. All of the schemas are processed at each collection interval. To create multiple IMSA schemas, re-issue the **imsa schema** *schema_name* command using a different schema name each time.

ippool schema

Configures IP pool bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ippool schema *schema_name* **format** *format_string*

no ippool schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for IP pool bulk statistics collection. Multiple IP pool schemas can be created to further categorize IP pool bulk statistics. All of the schemas are processed at each collection interval. To create multiple IP pool schemas, re-issue the **ippool schema** *schema_name* command using a different schema name.

Example

To create an IP pool schema named *ippoolstats* that specifies a schema format of:

- Number of IP addresses on hold: *hold*
- Number of free IP addresses: *free*

Use the following command:

```
ippool schema ippoolstats format "Number of IP addresses on hold:
%hold%\nNumber of free IP addresses: %free%\n"
```

ipsg schema

Configures IP Services Gateway (IPSG) bulk statistics schema.

Product

IPSG

Privilege

Security Administrator, Administrator

Syntax

ipsg schema *schema_name* **format** *format_string*

no ipsg schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define the schemas used for IPSG bulk statistics collection. Multiple IPSG schemas can be created to categorize IPSG bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **ipsg schema** *schema_name* command using a different schema name.

Example

To create an IPSG schema named *ipsgstats* that specifies a schema format of:

- Context name: *vpnname*
- Service name: *servname*
- Total responses sent: *total-rsp-sent*

Use the following command:

```
ipsg schema ippoolstats format "Context name: %vpnname%\nService name:
%servname%\nTotal responses sent: %total-rsp-sent%\n"
```

lac schema

Configures LAC (L2TP Access Concentrator) bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

lac schema *schema_name* **format** *format_string*

no lac schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for LAC bulk statistics collection. Multiple LAC schemas can be created to categorize LAC bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **lac schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *lac1stats1* that records the number of active subscriber sessions and the number of sessions that failed or were disconnected due to the maximum tunnel limit being reached:

```
lac schema lac1stats1 format "%sess-curactive%-%sess-maxtunnel%"
```

To create a schema called *lacresourcestats* that specifies a schema format of:

- Number of Successful Session Connections: *sess-successful*
- Number of Session Attempts That Failed: *sess-failed*
- Number of Sessions Currently Active: *sess-curative*

Use the following command:

```
lac schema lacresourcestats format "Number of Successful Session
Connections: %sess-successful%\nNumber of Session Attempts That Failed:
%sess-failed%\nNumber of Sessions Currently Active: %sess-curative%"
```

limit

Configures the maximum amount of system memory bulk statistics may utilize.

Product

All

Privilege

Security Administrator, Administrator

Syntax

limit *kilobytes*

kilobytes

Specifies the maximum amount of memory (in kilobytes) that may be used for bulk statistics as an integer from 1 through 32000. Default: 100

Usage

Adjust bulk statics memory usage when considering the sampling interval adjustments.

Caution: Bulk statistics are stored in Random Access Memory (RAM) on the SMC. In the event of power loss or system failure, the statistics will be lost. If the maximum storage limit has been reached before the system's configured transfer-interval is reached, the oldest information stored in the collection will be overwritten.

Example

```
limit 2048
```

lma schema

Configures the Local Mobility Anchor (LMA) statistics schema for the naming conventions of data files.

Product

P-GW

Privilege

Administrator

Syntax

lma schema *schema_name* **format** *format_string*

no lma schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name. as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for LMA bulk statistics collection. Multiple LMA service schemas can be created to categorize LMA service bulk statistics. All of the schemas are processed at each collection interval. To create multiple LMA service schemas, re-issue the **lma schema** *schema_name* command using a different schema name.

Example

For an LMA-level schema called *lmaservicestats* that specifies a schema format of:

- Binding Update Received: *bindupd*
- Binding Update Received - Denied: *bindupd-denied*

Use the following command:

```
lma schema lmaservicestats format "Number of Binding Updates Received:
%bindupd%\nNumber of Binding Updates Received and Denied: %bindupd-
denied%\n"
```

lns schema

Configures LNS (L2TP Network Server) bulk statistics schema.

Product

LNS

Privilege

Security Administrator, Administrator

Syntax

lns schema *schema_name* **format** *format_string*

no lns schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the format of the collected LNS statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters.The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for LNS bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple LNS schemas can be created to categorize LNS bulk statistics. All of the schemas are processed at each collection interval. To create multiple LNS schemas, re-issue the **lns schema** *schema_name* command using a different schema name each time.

local-directory

Sets the local directory for storing bulkstats collection files

Product

All

Privilege

Security Administrator, Administrator

Syntax

local-directory *pathname*

no local-directory

no

Delete the setting for local-directory.

pathname

Specifies the local path of the directory in which to store bulkstats collection files. This must be an alphanumeric string of 1 through 127 characters. Pathnames are case sensitive.

Usage

Use this command to designate a directory on a local file system in which collection files with bulkstats information are stored. The directory specified must already exist. Use the Exec Mode command **mkdir** to create a directory.

Example

To specify that bulkstats collection files are stored in the local directory */flash/bulkstats*, enter the following command:

```
local-directory /flash/bulkstats
```

mag schema

Configures the Mobile Access Gateway (MAG) statistics schema for naming conventions of data files.

Product

HSGW, S-GW

Privilege

Administrator

Syntax

mag schema *schema_name* **format** *format_string*

no mag schema *schema_name*

no

Removes the specified schema from MAG bulk statistics generation.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for MAG bulk statistics collection. Multiple MAG service schemas can be created to categorize MAG service bulk statistics. All of the schemas are processed at each collection interval. To create multiple MAG service schemas, re-issue the **mag schema** *schema_name* command using a different schema name.

Example

For a MAG-level schema called *magservicestats* that specifies a schema format of:

- Binding Update Sent: *bindupd*
- Binding Acknowledgement Received: *bindack*

Use the following command:

```
mag schema magservicestats format "Number of Binding Updates Sent:
%bindupd%\nNumber of Binding Acknowledgements Received: %bindack%\n"
```

mipv6ha schema

Configures MIPv6 HA (home Agent) bulk statistics schema.

Product

HA

Privilege

Security Administrator, Administrator

Syntax

mipv6ha schema *schema_name* **format** *format_string*

no mipv6ha schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for MIPv6 HA bulk statistics collection. Multiple MIPv6 HA bulk statistics schemas can be created to categorize MIPv6 HA bulk statistics. All of the schemas are processed at each collection interval. To create multiple MIPv6 HA service schemas, re-issue the **mipv6ha schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *mipv6haservicestats* that records the number of authorization attempt failures due to access rejects from AAA:

```
mipv6ha schema mipv6haservicestats format "%aaa-actauthfail%"
```

mme schema

Configures MME (Mobility Management Entity) bulk statistics schema.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

mme schema *schema_name* **format** *format_string*

no mme schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for MME bulk statistics collection. Multiple MME bulk statistics schemas can be created to categorize MME bulk statistics. All of the schemas are processed at each collection interval. To create multiple MME service schemas, re-issue the **mme schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *mmeservice_s1ap_cfg_transfers* that records the total number of S1AP - transmit data - configuration transfers:

```
mme schema mmeservice_s1ap_cfg_transfersformat "s1ap-trnsdata-cfg-tfr
```

mvs schema

Configures MVS (Mobile Videoscape) bulk statistics schema.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

mvs schema *schema_name* **format** *format_string*

no mvs schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name. as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference.*

nat-realm schema

Creates and configures Network Address Translation (NAT) realm statistics schema.

Product

NAT

Privilege

Security Administrator, Administrator

Syntax

nat-realm schema *schema_name* **format** *format_string*

no nat-realm schema *schema_name*

schema_name

Specifies the NAT realm bulk statistics schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for NAT Realm bulk statistics collection. Multiple NAT realm schemas can be created to further categorize NAT realm level bulk statistics. All of the schemas are processed at each collection interval. To create multiple NAT Realm schemas, re-issue the **nat-realm schema** *schema_name* command using a different schema name.

Example

The following command creates a NAT realm schema with the VPN name, realm name, and flows information:

```
nat-realm schema realm1 format "%vpnname% %realmname% %nat-rlm-flows%"
```

pcc-af schema

Configures Policy and Charging Control-Application Function (PCC-AF) service bulk statistics schema.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

pcc-af schema *schema_name* **format** *format_string*

no pcc-af schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for PCC-AF service bulk statistics collection. Multiple PCC-AF service schemas can be created to categorize PCC-AF service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PCC-AF service schemas, re-issue the **pcc-af schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *pcc_af1stats1* that records the total number of Rx STR messages received and total number of Rx AAR Accept messages sent along with Context name, Context Id, and PCC-AF service name:

```
pcc-af schema pcc_af1stats1 format "%vpnname%-%vpnid%-%servname%-%total-
rx-ccai-accept-sent%-%total-rx-aar-accept-sent%"
```

pcc-policy schema

Configures Policy and Charging Control-Policy (PCC-Policy) service bulk statistics schema.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

pcc-policy schema *schema_name* **format** *format_string*

no pcc-policy schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for PCC-Policy service bulk statistics collection. Multiple PCC-Policy service schemas can be created to categorize PCC-Policy service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PCC-Policy service schemas, re-issue the **pcc-policy schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *pcc_plcy1stats1* that records the total number of Gx messages sent and total number of Gx CCR messages received along with Context name, Context Id, and PCC-Policy service name:

```
pcc-policy schema pcc_plcy1stats1 format "%vpnname%-%vpnid%-%servname%-
%total-gx-outbound-msgs%-%total-gx-ccr-rcvd%"
```

pcc-sp-endpt schema

Configures the bulkstats schema at the Sp interface endpoint for PCC procedures with Subscriber Service Controller/Subscriber Policy Register (SSC/SPR).

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

pcc-sp-endpt schema *schema_name* **format** *format_string*

no pcc-sp-endpt schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for PCC-Sp-Endpoint bulk statistics collection. Multiple PCC-Sp-Endpoint schemas can be created to categorize PCC-Sp-Endpoint bulk statistics. All of the schemas are processed at each collection interval. To create multiple PCC-Sp-Endpoint schemas, re-issue the **pcc-sp-endpt schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *pcc_sp1stats1* that records the total number of SPRMgr Sh session close and open requests received from PCCMgr and processed by PCC-Sp-Endpoint along with Context name, Context Id, and PCC-Sp-Endpoint name:

```
pcc-sp-endpt schema pcc_svc1stats1 format "%vpnname%-%vpnid%-%endpt-
name%-%req-open%-%req-close%"
```

pcc-service schema

Configures Policy and Charging Control-Service (PCC-Service) bulk statistics schema.

Product

IPCF

Privilege

Security Administrator, Administrator

Syntax

pcc-service schema *schema_name* **format** *format_string*

no pcc-service schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for PCC-Service bulk statistics collection. Multiple PCC-Service schemas can be created to categorize PCC-Service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PCC-Service schemas, re-issue the **pcc-service schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *pcc_svc1stats1* that records the total number of Gx and Gy request processed by PCC-Service along with Context name, Context Id, and PCC-Service name:

```
pcc-service schema pcc_svc1stats1 format "%vpnname%-%vpnid%-%servname%-
%total-gx-processed%-%total-gy-processed%"
```

pdif schema

Configures Packet Data Interworking Function (PDIF) bulk statistics schema.

Product

PDIF

Privilege

Security Administrator, Administrator

Syntax

pdif schema *schema_name* **format** *format_string*

no pdif schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3600 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for PDIF bulk statistics collection. Multiple PDIF schemas can be created to categorize PDIF bulk statistics. All of the schemas are processed at each collection interval. To create multiple schemas, re-issue the **pdif schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *pdifschema1* for the category current active ipv4 sessions:

```
pdif schema pdifschema1 format %sess-curactip4%
```

pgw schema

Configures Packet Data Network Gateway (P-GW) bulk statistics schema.

Product

P-GW

Privilege

Security Administrator, Administrator

Syntax

pgw schema *schema_name* **format** *format_string*

no pgw schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the format of the collected P-GW statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters.The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for P-GW bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple P-GW schemas can be created to categorize P-GW bulk statistics. All of the schemas are processed at each collection interval. To create multiple P-GW schemas, re-issue the **pgw schema** *schema_name* command using a different schema name each time.

port schema

Configures port bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

port schema *schema_name* **format** *format_string*

no port schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format. as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for port bulk statistics collection. Multiple port schemas can be created to categorize port-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple port schemas, re-issue the **port schema** *schema_name* command using a different schema name.

Important: The *card* variable in the Port schema is not supported on all platforms

Example

To create a port-level schema named *portstats1* that separates the *card/port*, *bcast_inpackets*, and *bcast-outpackets* variables by hyphens ("-"), enter the following command:

```
port schema portstats1 format "%card%/%port% - %bcast_inpackets% -
%bcast_outpackets%"
```

ppp schema

Configures Point-to-Point Protocol (PPP) bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

ppp schema *schema_name* **format** *format_string*

no ppp schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for point-to-point protocol bulk statistics collection. Multiple PPP-service schemas can be created to categorize PPP-service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PPP-service schemas, re-issue the **ppp schema** *schema_name* command using a different schema name.

Example

To create a ppp-level schema named *pppstats* that specifies a schema format of:

- CHAP: (Challenge Handshake Authentication Protocol)
- Auth. Attempts: *auth-attempt-chapAuth*. Successes: *auth-success-chap*
- PAP: (Password Authentication Protocol)
- Auth. Attempts: *auth-attempt-papAuth*. Successes: *auth-success-pap*

Use the following command:

```
ppp schema pppstats format "CHAP:\nAuth. Attempts: %auth-attempt-
chap%\tAuth. Successes: %auth-success-chap%\nPAP:\nAuth. Attempts: %auth-
attempt-pap%\tAuth. Successes: %auth-success-pap%\n"
```

ps-network-ranap

Configures the Radio Access Network Application Part (RANAP) bulk statistics schema in Packet Switched (PS) network associated with an HNB-GW node.

Product

HNB-GW

Privilege

Security Administrator, Administrator

Syntax

ps-network-ranap schema *schema_name* **format** *format_string*

no ps-network-ranap schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format. as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for RANAP procedure related bulk statistics collection in a PS network associated with HNB-GW in a Femto UMTS network. Multiple PS Networks RANAP schemas can be created to further categorize at PS network or HNB-GW-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple PS Networks RANAP schemas, re-issue the **ps-network-ranap schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *ps_ranap1stats1* that records the total number of Iu Release Request messages transmitted and total number of Iu Release Command message received by HNB-GW node:

```
ps-network-ranap schema ps_ranaplstats1 format "%iu-rel-req-tx%" "%iu-rel-cmd-rx%"
```

radius schema

Configures RADIUS bulk statistics schema.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

radius schema *schema_name* **format** *format_string*

no radius schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters that is case sensitive.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for RADIUS bulk statistics collection. Multiple RADIUS schemas can be created to categorize RADIUS bulk statistics. All of the schemas are processed at each collection interval. To create multiple RADIUS schemas, re-issue the **radius schema** *schema_name* command using a different schema name.

Example

To create a RADIUS schema named *radius_statistics* that specifies a schema format of:

- Server: *ipaddr*
- Authentication Requests Sent: *auth-req-sent*
- Accounting Requests Sent: *acc-req-sent*

Use the following command:

```
radius schema radius_statistics format "Server: %ipaddr%\nAuthentication
Requests Sent: %auth-req-sent%\nAccounting Requests Sent: %acc-req-sent%"
```

receiver

Configures a host system to receive bulkstats information through Trivial File Transfer Protocol (TFTP), File Transfer Protocol (FTP) or SSH File Transfer Protocol (SFTP).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
receiver { mode { redundant | secondary-on-failure } | ip_address { primary | secondary }
[ mechanism { { { ftp | sftp } login user_name [ encrypted ] password pwd } | tftp } } ]
}

no receiver ip_address
```

no

Removes the receiver specified from the list of receivers where data files are sent.

mode { redundant | secondary-on-failure }

Determines how bulkstats are delivered to the primary and secondary receivers.
Default: **secondary-on-failure**
redundant: Files are transferred to both the primary and secondary receivers. If either transfer is not currently possible, the file is transferred when possible. The system continues to hold in memory as much data as possible until the data has been successfully transferred to both receivers. Data is only discarded if the in-memory data reaches the configured limit. Refer to the **limit** command.
secondary-on-failure: Files are transferred to the secondary receiver if the primary receiver fails. In-memory data is erased once the data is transferred to either the primary or secondary receiver. This is the default behavior.

ip_address

Specifies the IP address of the receiver of interest using IPv4 dotted-decimal notation.

primary | secondary

Primary and secondary are used to indicate the order in which receivers are connected. The secondary is used when the primary is unreachable.
primary: indicates the receiver is the primary receiver of data.
secondary: indicates the receiver is the secondary receiver of data.

mechanism { { { ftp | sftp } login *user_name* **[encrypted] password** *pwd* **} | tftp } }**

Specifies the method by which data is transferred to the receiver.
ftp login *user_name* [**encrypted**] **password** *pwd*: the FTP protocol shall be used for data file transfer. *user_name* specifies the user to provide for remote system secure logins and must be an alphanumeric string of 1 through 31 characters. The password to use for remote system authentication is specified as *pwd* and must be from 1 to 31 characters or 1 to 64 characters if the **encrypted** keyword is also specified.

sftp login *user_name* [**encrypted**] **password** *pwd*: the SFTP protocol shall be used for data file transfer. *user_name* specifies the user to provide for remote system secure logins and must be an alphanumeric string of 1 through 31 characters. The password to use for remote system authentication is specified as *pwd* and must be from 1 to 31 characters or 1 to 64 characters if the **encrypted** keyword is also specified.
tftp: the TFTP protocol is to be used to transfer files.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

Usage

Use TFTP methods to reduce transfer times if excessive system resources are being used across the network for transfer of data.
FTP transfer method allows for login which then provides system logging within the enabled FTP logs.
The initial connection is attempted to the primary receiver. If the primary receiver is unreachable for any reason, the secondary receiver is used. If the secondary receiver is also unreachable, the system retries after a delay period where it again attempts to connect to the primary receiver followed by the secondary receiver as necessary.

Important: For redundant receivers, configuration changes to the receivers are applied to all existing and all subsequent data sets pending transfer. If no receiver is configured, bulk statistics will be collected and stored on the system until the maximum amount of memory is used; they will not be transferred to the receiver(s). When the storage limit has been reached the oldest information is overwritten. When a receiver is configured for the primary and secondary target, this command will use both receivers as default if no receiver is specified.

Example

```
receiver 10.2.3.4 primary mechanism tftp

receiver 10.2.3.5 secondary

no receiver 10.2.3.4
```

remotefile

Configures the naming convention with support for multiple file format to multiple receivers when storing the data files on the remote receiver(s).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
remotefile format format_string [ both-receivers | primary-receiver | secondary-receiver
]

no remotefile format
```

no

Resets the remote file naming convention to the system default.

format *format_string*

Specifies the naming convention format to use as an alphanumeric string of 1 through 127 characters. The format string syntax is described in the Schema Format String Syntax section. Default: "%date%-%time%"

Important: The remote file naming format should only use static text and bulk statistic variables to avoid any possible file creation issues on the receivers.

The following variables are supported:

Table 13. remote file Command Naming Format Variables

Variable	Description	Data Type
date	The UTC date that the collection file was created in YYYYMMDD format where YYYY represents the year, MM represents the month and DD represents the day.	String
date3	The UTC date that the collection file was created in YYMMDD format where YY represents the year, MM represents the month and DD represents the day.	String
host	The system hostname that created the file	String
sysuptime	The uptime (in seconds) of the system that created the file.	32-bit signed
time	The time that the collection file was created in HHMMSS format where HH represents the hours, MM represents the minutes, and SS represents the seconds.	String

both-receivers | primary-receiver | secondary-receiver

Sets the remote file creation target to both receivers, primary receiver or secondary receiver. Default: Both receivers.

Usage

Set the remote file naming format to ensure consistent data file naming across a network or adjusting a single system's format for easy identification.
This command specifies whether the format should be used in conjunction with both receivers, only the primary receiver, or only the secondary receiver.

Important: For redundant receivers, the filenames for the output data files are applied when the information is first gathered. If the name format is modified, the change takes effect for the next data set. The current data set name remains unchanged. even if has not yet been transferred.

Example

```
remotefile format simpleFormat

remotefile format "%host%-%date%-%time%"

remotefile format "%host%-%date%-%time%" both-receivers

remotefile format "%host%-%date%" primary-receiver

no remotefile format
```

rp schema

Configures R-P bulk statistics schema.

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

rp schema *schema_name* **format** *format_string*

no rp schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for R-P bulk statistics collection. Multiple PDSN service schemas can be created to categorize PDSN service bulk statistics. All of the schemas are processed at each collection interval. To create multiple PDSN service schemas, re-issue the **rp schema** *schema_name* command using a different schema name.

Example

To create an PDSN-level schema called *pdsnservicestats* that specifies a schema format of:

- Date: *date*
- Time: *time*
- Number of Authentication Denials: *deny-auth*

Use the following command:

```
rp schema rpservicestats format "Date: %date%\nTime: %time%\nNumber of
Authentication Denials: %deny-auth%\n"
```

sample-interval

Configures the time interval between collecting local statistics.

Product

All

Privilege

Security Administrator, Administrator

Syntax

sample-interval *minutes*

minutes

Specifies the frequency (in minutes) of polling for local statistics as an integer from 1 through 1440.

Usage

Adjust the sampling interval to tune the system response as shorter periods can cause undue system overhead whereas longer periods have less of a statistical importance when analyzing data.
The system is shipped from the factory with the sampling interval set to 15 minutes.

Example

```
sample-interval 120
```

sccp schema

Configures the collection of statistics for the SCCP schema.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

sccp schema *sccp_schema_name* **format** *sccp_schema_format*

no sccp schema *sccp_schema_name*

no

Removes the specified schema.

sccp_schema_name

Specifies a name for a model collection schema for SCCP statistics. The name must be comprised of an alphanumeric string of 1 to 31 characters.

format *sccp_schema_format*

Specifies the format of the collected SCCP statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters. For syntax details, see the Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for the SCCP schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for SCCP bulk statistics collection in the generated stats report files.. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple SCCP schemas can be created to categorize SCCP bulk statistics. All of the schemas are processed at each collection interval. To create multiple SCCP schemas, re-issue the **sccp schema** *sccp_schema_name* command using a different schema name each time.

Example

Include the bulk statistic variable names to create an SCCP schema named *sccpstats11* that specifies collection of statistics (a schema format) for:

- Subsystem available messages sent from the SCCP
- Subsystem available messages received by the SCCP

Use the following command:

```
sccp schema sccpstats11 format "Subsys avail SCCP Tx: %ssa-txed%\nSubsys
avail SCCP Rx: %ssa-rcvd%\n"
```

schema

Configures the system-level bulk statistics schema.

Product

All

Privilege

Security Administrator, Administrator

Syntax

schema *schema_name* **format** *format_string*

no schema *schema_name*

no

Removes the specified schema.

schema_name

Specifies the schema name as an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the schema format as an alphanumeric string of 1 through 3599 characters. For syntax details, see Schema Format String Syntax section.

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for system-level bulk statistics collection. Multiple schemas can be created to categorize system-level bulk statistics. All of the schemas are processed at each collection interval. To create multiple system schemas, re-issue the **schema** *schema_name* command using a different schema name.

Example

The following command creates a schema called *systemstats1* that records the number of current Simple IP and the number of current Mobile IP sessions:

```
schema systemstats1 format "%sess-cursipconn% - %sess-curmipconn%"
```

To create a system-level schema called *bulksysstats* that specifies a schema format of:

- Number of currently active sessions: *sess-curactcall*
- Number of currently dormant sessions: *sess-curdormcall*

Use the following command:

```
schema bulksysstats format "Number of currently active sessions: %sess-
curactcall%\nNumber of currently dormant sessions: %sess-curdormcall%\n"
```

sgs schema

Configures the collection of statistics for the SGs schema.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

sgs schema *schema_name* **format** *format_string*

no sgs schema *schema_name*

no

Removes the specified SGs schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the format of the collected SGs statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for SGs bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple SGSN schemas can be created to categorize SGSN bulk statistics. All of the schemas are processed at each collection interval. To create multiple SGSN schemas, re-issue the **sgs schema** *sgs_schema_name* command using a different schema name each time.

Example

Include the bulk statistic variable names to create an SGs schema named *stats_SGs_release* that specifies a collection of statistics (a schema format) for the total number of release messages transmitted, retransmitted, and received:
Use the following command:

```
sgs schema stats_SGs_release format "Total transmitted: %rel-req-
tx%\nTotal retransmitted: %rel-req-retx%\nTotal received: %rel-req-rx%\n"
```

sgsn schema

Configures the collection of statistics for the SGSN schema.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn schema *schema_name* **format** *format_string*

no sgsn schema *schema_name*

no

Removes the specified SGSN schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the format of the collected SGSN statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for SGSN bulk statistics collection in the generated stats report files. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple SGSN schemas can be created to categorize SGSN bulk statistics. All of the schemas are processed at each collection interval. To create multiple SGSN schemas, re-issue the **sgsn schema** *sgsn_schema_name* command using a different schema name each time.

Example

Include the bulk statistic variable names to create an SGSN schema named *stats_3Gsgsn1* that specifies collection of statistics (a schema format) for the total number of 3G Attaches per LAC/RAC per MCC& MNC:
Use the following command:

```
sgsn schema stats_3Gsgsn1 format "MCC: %mcc%\nMNC: %mnc%\nLAC:
%lac%\nRAC: %rac%\nTotal 3G Subs Attached: %3G-attached%\n"
```

sgtp schema

Configures the collection of the SGSN's GTP-C and GTP-U activity statistics.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgtp schema *schema_name* **format** *format_string*

no sgtp schema *schema_name*

no

Removes the specified SGTP schema from statistics collection.

schema_name

Specifies a name for a model collection schema for SGTP statistics. *schema_name* must be an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the format of the collected SGTP statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters.The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for SGTP bulk statistics collection in the generated stats report files.. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple SGTP schemas can be created to categorize SGTP bulk statistics. All of the schemas are processed at each collection interval. To create multiple SGTP schemas, re-issue the **sgtp schema** *sgtp_schema_name* command using a different schema name each time.

Example

Include the bulk statistic variable names to create an SGTP schema named *sgtpstats_sgsn1* that specifies collection of statistics (a schema format) will be by IuPS service interface and by RNC for the total number of GTP-C Create PDP Context Request messages received.
Use the following command:

```
sgtp schema sgtpstats_sgsn1 format "IuPS Service ID: %iups-service%\nRNC:
%rnc-address%\nTotal CPCR Rx: %sgtpc-total-cpc-req%\n"
```

sgw schema

Configures the collection of the S-GW activity statistics.

Product

S-GW

Privilege

Administrator

Syntax

sgw schema *schema_name* **format** *format_string*

no sgw schema *schema_name*

no

Removes the specified S-GW schema from statistics collection.

schema_name

Specifies a name for a model collection schema for S-GW statistics. *schema_name* must be an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the format of the collected S-GW statistics by identifying the statistics variables and ordering the variables for presentation within the bulk statistics messages. The format value comprises an alphanumeric string of 1 through 3599 characters.The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for S-GW bulk statistics collection in the generated stats report files.. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.
Multiple S-GW schemas can be created to categorize S-GW bulk statistics. All of the schemas are processed at each collection interval. To create multiple S-GW schemas, re-issue the **sgw schema** *sgw_schema_name* command using a different schema name each time.

Example

Include the bulk statistic variable names to create an S-GW schema named *sgwstats_sgw1* that specifies collection of statistics (a schema format) will be by S-GW service interface for the total number of currently idle and active UEs.
Use the following command:

```
sgw schema sgwstats_sgw1 format "SGW Service ID: %servname%\nTotal
Current Idle Ues: %sessstat-totcur-ueidle%\nTotal Current Active Ues:
%sessstat-totcur-ueactive%\n"
```

show variables

Displays the bulk statistics variable information based on schema names.

Product

All

Privilege

Security Administrator, Administrator

Syntax

show variables [*schema_name* **] [obsolete]**

---

show variables *schema_name*

Displays all valid bulkstat schema statistics, or only the statistics for the specified schema. *schema_name* specifies the name of the schemas available on the system. Following is the list of available schemas in this release.

- aal2
- alcap
- apn
- asngw
- asnpc
- bcmcs
- card
- closedrp
- common
- context
- cs-network-ranap
- cs-network-rtp
- cscf
- cscfintf
- dcca
- diameter-acct
- diameter-auth
- dlci-util
- dpca
- ecs
- egtpc
- epdg

- fa
- fng
- gprs
- gtpc
- gtpp
- gtpu
- ha
- hnbgw-hnbap
- hnbgw-ranap
- hnbgw-rtp
- hnbgw-rua
- hnbgw-sctp
- hsgw
- imsa
- ippool
- ipsg
- lac
- lma
- lns
- mag
- map
- mipv6ha
- mme
- mvs
- nat-realm
- pcc-af
- pcc-policy
- pcc-service
- pcc-sp-endpt
- pdg
- pdif
- pgw
- phsgw
- phspc

- port
- ppp
- ps-network-ranap
- radius
- rp
- sccp
- sgs
- sgsn
- sgtp
- sgw
- ss7link
- ss7rd
- system
- vpn

obsolete

Displays obsolete (but still available) schema variables. An asterisk (*) is displayed next to schema variables that have been obsoleted.

Usage

Use this command to list supported bulk statistic variables. Variables can be listed for a specified schema. If no schema is specified, all supported variables are listed on a per-schema basis.

Example

The following command displays the bulkstat variables only for the card schema:

```
show variables card
```

ss7link schema

Configures the collection of the SS7 link activity statistics.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ss7link schema *schema_name* **format** *format_string*

no ss7link schema *schema_name*

no

Removes the specified SS7 Link schema from statistics collection.

schema_name

Specifies the name to use to refer to the schema and associated format string. *schema_name* must be an alphanumeric string of 1 through 31 characters.

format *format_string*

Specifies the naming convention format to use. *format_string* must be an alphanumeric string of 1 through 3599 characters. The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for SS7 link and linkset bulk statistics collection per SS7 routing domain in a generated stats report file. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple collection schemas can be created to categorize SS7 link bulk statistics. All of the schemas are processed at each collection interval. To create multiple SS7 link schemas, re-issue the **ss7link schema** *ss7link_schema_name* command using a different schema name each time.

Example

The following command creates a schema called *ss7lnk1stats1* that records the changeover orders sent and received per linkset and link and per SS7 routing domain:

```
ss7link schema ss7lnk1stats1 format "%ss7rd-number%-%ss7-linkset-id%-
%ss7-link-id%-%ss7rd-asp_instance%-%ss7-link-mtp3-changeover-order-tx%-
%ss7-link-mtp3-changeover-order-rx%"
```

ss7rd schema

Configures the collection of bulk statistics for SS7 routing domain services, which include the activity statistics for SCTP, MTP, and M3UA data.

Product

SGSN, HNB-GW

Privilege

Security Administrator, Administrator

Syntax

ss7rd schema *schema_name* **format** *format_string*

no ss7rd schema *schema_name*

no

Removes the specified SS7 routing domain schema from statistics collection.

schema_name

Specifies the name to use to refer to the model collection schema and the associated format string. *schema_name* must be an alphanumeric string of 1 to 31 characters.

format *format_string*

Specifies the format of the collected SS7 routing domain statistics by identifying the statistics variables and the ordering of the variables for presentation within the bulk statistics collection report. The format value comprises an alphanumeric string of 1 through 3599 characters.The format string syntax is described by Schema Format String Syntax .

Important: For a complete list of the statistics that are supported for this schema, refer to the *Statistics and Counters Reference*.

Usage

Use this command to define schemas for collection of SS7 routing domain statistics to be included in the generated stats report file. Usually a schema consists of multiple variables to collect all the statistics for a particular situation. Using double quote marks and text within this command, the reported statistics can be easily identified.

Multiple collection schemas can be created to categorize SS7 routing domain bulk statistics. All of the schemas are processed at each collection interval. To create multiple SS7 routing domain schemas, re-issue the **ss7rd schema** *ss7rd_schema_name* command using a different schema name each time.

Example

The following command creates a schema called *ss7rd1stats1* that identifies the SS7 routing domain and records the Application Server Process instance in the SS7 routing domain, along with the total number of sent and received SHUTDOWN messages per SS7 routing domain:

```
ss7rd schema ss7rd1stats1 format "%ss7rd-number%-%ss7rd-asp_instance%-
%ss7rd-sctp-shutdown-tx%-%ss7rd-sctp-shutdown-rx%"
```

transfer-interval

Configures the frequency of transfer of collected statistics to the receiver.

Product

All

Privilege

Security Administrator, Administrator

Syntax

transfer-interval *minutes*

minutes

Specifies the number of minutes between the transfer of collected statistics to the receivers as an integer from 1 through 999999.

Usage

Modify the transfer interval based upon the number of sessions per second. As the number of session requests a second increases it may become necessary to increase the transfer interval to reduce the processing overhead frequency for statistics delivery. This is tempered by the impact reduced resolution of statical data has on usefulness of data when the interval gets larger than the least busy hours and most busy hours of the day.

The system is shipped from the factory with the transfer interval set to 480 minutes.

Example

```
transfer-interval 1440
```

Chapter 43
Call Control Profile Configuration Mode

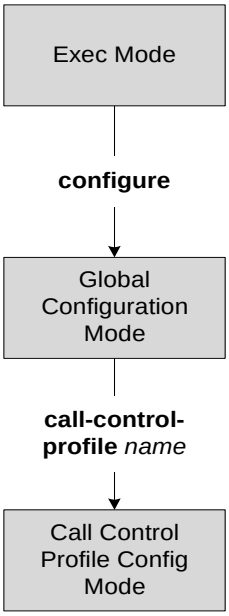
Call Control Profile configuration mode defines call-handling rules which can be combined with other profiles – such as an APN profile (see the *APN Profile Configuration Mode Commands* chapter) – when using the Operator Policy feature. The call control profile is a key element in the Operator Policy feature and the profile is not valid until it is associated with an operator policy (see the *Operator Policy Configuration Mode Commands* chapter).

The MME and SGSN each support a maximum of 1,000 call control profiles; only one profile can be associated with an operator policy.

By configuring a call control profile, the operator fine tunes any desired restrictions or limitations needed to control call handling per subscriber or for a group of callers across IMSI (International Mobile Subscriber Identity) ranges.

Upon accessing this mode, the CLI prompt be similar to the following:

```
[local]asr5000(config-call-control-profile-<profile_name>)#
```



access-restriction-data

Enables the operator to assign a failure code to be included in reject messages if the attach rejection is due to access restriction data (ARD) checking in the incoming subscriber data (ISD) messages. The operator can also disable the ARD checking behavior.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

access-restriction-data { failure-code *cause_code* **| no-check }**

remove access-restriction-data failure-code

---

remove

Removes the failure code setting for the reject message that could result from ARD checking.

---

failure-code *cause_code*

cause_code: Enter an integer from 2 through 111; default code is 13 (roaming not allowed in this location area [LA]).
Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable

- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

no-check

Including this keyword with the command disables the ARD checking behavior.

Usage

By default, the SGSN checks access restriction data (ARD) within incoming insert subscriber data (ISD) messages. This enables operator to selectively restrict subscribers in either 3G (UTRAN) or 2G (GERAN). The SGSN ARD checking behavior occurs during the attach procedure and if a reject occurs, the SGSN sends the subscriber an Attach Reject message with a configurable failure cause code.

Example

For this call control profile, the following command disables the ARD checking function:

```
access-restriction-data no-check
```

accounting context

Defines the name of the accounting context and optionally associates a GTPP group with this call control profile.

Product

SGSN, S-GW

Privilege

Security Administrator, Administrator

Syntax

accounting context *ctxt_name* **[gtpp group** *grp_name* **]**

remove accounting context

remove

Removes the accounting configuration from this profile's configuration.

ctxt_name

Specifies the accounting context as an alphanumeric string of 1 through 79 characters.

gtpp group *grp_name*

Identifies the GTPP group, where the GTPP related parameters have been configured in the GTPP Group Configuration mode, to associate with this call control profile.
grp_name: Enter an alphanumeric string of 1 through 63 characters to identify the GTPP group created with the **gtpp group** command in the Context configuration mode.

Usage

This command can be used to associate a predefined GTPP server group - including all its associated configuration - with a specific call control profile. The GTPP group would have been defined with the **gtpp group** command (see the *Context Configuration Mode Commands* chapter).
If the GTPP group is not specified, then a default GTPP group in the accounting context will be used.
If this command is not specified, use the name of the accounting context configured in the SGSN service configuration mode (for 3G) or the GPRS service configuration mode (for 2G), either will automatically use a "default" GTPP group generated in that accounting context.
If the accounting context is specified in the GPRS service or SGSN service and in a call control profile, the priority is given to the accounting context of the call control profile.

Example

For this call control profile, the following command identifies an accounting context called *acctng1* and associates a GTPP server group named *roamers* with defined charging gateway accounting functionality.

```
accounting context acctng1 gtpp group roamers
```

accounting mode

Configures the mode to be used for accounting – GTPP (default), RADIUS/Diameter or None.

Product

S-GW

Privilege

Administrator

Syntax

```
[ default ] accounting mode { gtpp | none | radius-diameter }
```

default accounting mode

Sets the accounting mode to GTPP.

gtpp

Specifies that GTPP accounting is performed. This is the default method.

none

Specifies that no accounting will be performed for the call control profile.

radius-diameter

Specifies that RADIUS/Diameter will be performed for the call control profile.

Usage

Use this command to specify the accounting mode for a call control profile. For additional information on accounting mode and its relationship to operator policy, refer to the *System Administration Guide*.

Example

The following command specifies that RADIUS/Diameter accounting will be used for the call control profile:

```
accounting mode radius-diameter
```

allocate-ptmsi-signature

Enables or disables the allocation of a P-TMSI (Packet Temporary Mobile Subscriber Identity) signature.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] allocate-ptmsi-signature
```

no

Disables the allocation of the P-TMSI signature.

default

Resets the configuration value to the default: allocates the P-TMSI signature.

Usage

Use this command to enable or disable the allocation of the P-TMSI signature.

Example

```
allocate-ptmsi-signature
```

apn-restriction

Enables the APN restriction feature and configures the instruction for the SGSN on the action to take when an APN restriction value is received from the GGSN during an Update PDP Context procedure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

apn-restriction update-policy deactivate *restriction*

default apn-restriction

default

Creates a default APN restriction configuration.

update-policy deactivate *restriction*

Specifies one of the two restriction types to define the appropriate action if the APN restriction value received conflicts with the stored value:

- **least-restrictive:** least restrictive value applicable when there are no already active PDP context(s).
- **most-restrictive:** most restrictive is the most stringent restriction required by any already active PDP context(s).

Usage

When this feature is enabled, the SGSN will send the maximum APN restriction value in every CPC Request message sent to the GGSN. The SGSN expects to receive an APN restriction value in each PDP Context received from the GGSN. The SGSN stores and compares received APN restriction values to check for conflicts. In the case of a conflict, the SGSN rejects the PDP Context with appropriate messages and error codes to the MS.
If an APN restriction value is not assigned by the GGSN, the SGSN assumes the value of "1" (least restrictive) to allow APN restriction rules will be possible when valid values are assigned for new PDP Context(s) from the same MS.

Example

The following command applies the lowest level of APN restrictions:

```
apn-restriction update-policy deactivate least-restrictive
```

associate

Associates various MME-specific lists and databases with this call control profile.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

associate { ho-restrict-list *list_name* **| hss-peer-service** *service_name* **[s13-interface | s6a-interface] | tai-mgmt-db** *tai-db_name* **}**

remove associate { ho-restrict-list | hss-peer-service [s13-interface | s6a-interface] | tai-mgmt-db }

remove

Remove the specified association definition from the call control profile.

ho-restrict-list *list_name*

Identifies the handover restriction list that should be associated with this call control profile. *list_name* is an alphanumeric string of 1 through 64 characters.

hss-peer-service *service_name*

Associates a Home Subscriber Server (HSS) peer service with this call control profile. *service_name* is an existing HSS peer service expressed as an alphanumeric string of 1 through 63 characters.

[s13-interface | s6a-interface]

Optionally, identify the interface to be associated with the HSS service in this call control profile.

tai-mgmt-db *tai-db_name*

Identifies the tracking area identifier (TAI) database that should be associated with this call control profile. *tai-db_name* is an alphanumeric string of 1 through 64 characters.
This configuration overrides the S-GW selection and TAI list assignment functionality for a call that uses an operator policy associated with this call control profile. The TAI management object provides a TAI list for calls and provides S-GW selection functionality if a DNS is not configured for S-GW discovery for this operator policy or if a DNS discovery fails.

Usage

Use this command to associate handover restriction lists, HSS service (and interfaces), and TAI dB with the call control profile. This ensures that the information is available for application when a Request is received. Repeat the command as needed to associate each feature.

Example

Link HO restriction list named *HOrestrict1* with this call control profile:

```
associate ho-restrict-list HOrestrict1
```

attach

Defines attach-related configuration parameters for this call control profile.

Important: SGSN only: Before using this command, ensure that the appropriate location area code (LAC) information has been defined via the **location-area-list** command.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

attach access-type { gprs | umts } { all | location-area-list instance *list_id* **} { failure-code** *code* **| user-device-release { before-r99 failure code** *code* **| r99-or-later failure code** *code* **} }**

default attach access-type { gprs | umts } { all | location-area-list instance *list_id* **} { failure-code | user-device-release { before-r99 failure code | r99-or-later failure code }**

[no] attach allow access-type { eps | gprs | umts } location-area-list instance *list_id*

[no] attach restrict access-type { eps | gprs | umts } { all | location-area-list instance *list_id* **}**

attach imei-query-type { imei | imei-sv | none } [[verify-equipment-identity] [allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency]

remove attach imei-query-type

default

Restores the default values for the for the specified parameter.

no

Deletes the specified attach configuration.

remove

Deletes the specified attach configuration.

access-type *type*

Defines the type of access to be allowed or restricted.

- **eps**
- **gprs**
- **umts**

If this keyword is not included, then both access types are allowed by default.

allow

Allow re-enables attaches in the configuration after an **attach restrict** command has been used.

restrict

Restrict attaches (do not accept calls) of specified **access-type** and from specified location areas (defined using either the **all** or **location-area-list** keywords).

all

Instructs the SGSN or MME to apply the command action to all location area lists. Location area lists should already have been created with the **location-area-list** command. The location area list consists of one or more LACs, location area codes, where the MS is when placing the call.

location-area-list instance *list_id*

Instructs the MME or SGSN to apply the command action to a specific location area list. Location area lists should already have been created with the **location-area-list** command. The location area list consists of one or more LACs, location area codes, where the MS is when placing the call.
Using this keyword with either the **allow** or **restrict** keywords enables you to configure with more granularity.
list_id: Enter an integer between 1 and 5.

failure-code *code*

Specify a GMM failure cause code to identify the reason an attach did not occur. This GMM cause code will be sent in the reject message to the MS.
Default: 14.
fail-code: Enter an integer from 2 to 111. Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion

- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

---

user-device-release { before-r99 | r99-or-later } failure-code *code*

Default: disabled
Enables the SGSN to reject an Attach procedure based on the detected 3GPP release version of the MS equipment and selectively send a failure cause code in the reject message. The SGSN uses the following procedure to implement this configuration:

1. When Attach Request is received, the SGSN checks the subscriber's IMSI and current location information.
2. Based on the IMSI, an operator policy and call control profile are found that relate to this Attach Request.
3. Profile is checked for access limitations.
4. Attach Request is checked to see if the revision indicator bit is set
   - if not, then the configured common failure code for reject is sent;
   - if set, then the 3GPP release level is verified and action is taken based on the configuration of this parameter

One of the following options must be selected and completed:

- **before-r99**: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111.

- **r99-or-later** : Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111.

---

imei-query-type { imei | imei-sv | none }

This keyword set is specific to the MME.
Defines device Attach limitations if an IMEI is not already present in the Attach Request.

- **imei**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity (IMEI).
- **imei-sv**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity - Software Version (IMEI-SV).

- **none**: Specifies that the MME does not need to query for IMEI or IMEI-SV.

verify-equipment-identity [allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency]

Specifies that the identification (IMEI or IMEI-SV) of the UE is to be performed by the Equipment Identity Register (EIR) over the S13 interface.

- **allow-on-eca-timeout**: Configures the MME to allow equipment that has timed-out on ECA during the attach procedure.
- **deny-greylisted**: Configures the MME to deny grey-listed equipment during the attach procedure.
- **deny-unknown**: Configures the MME to deny unknown equipment during the attach procedure.
- **verify-emergency**: Configures the MME to ignore the IMEI validation of the equipment during the attach procedure in emergency cases. This keyword is only supported in release 12.2 and higher.

Usage

Once the IMSI of an incoming call is known and matched with a specific operator policy, according to the filter definition of the **mcc** command, then the associated call control profile is selected to determine how the incoming call is handled.
By default, all attaches are allowed. If no access limitations are needed, then do not use the **attach** command.

Important: Before using this command, ensure that the appropriate LAC information has been defined with the **location-area-list** command.

Use this command to define attach limitations for the call control profile.
Use this command to fine-tune the attach configuration specifying which calls/subscribers can attach and which calls are restricted from attaching and what failure code is included in the Reject message.
Attachment restrictions can be based on any one or combination of the options, such as location area code or access type. It is even possible to restrict all attaches.
The command can be repeated using different keyword values to further fine-tune the attachment configuration.

Example

For calls under the purview of this call control profile, the following command restricts the attaches of **all** subscribers using the GPRS access type.

```
attach restrict access-type gprs all
```

Use the next command to reverse the previous attach restrict command:

```
attach allow access-type gprs all
```

Or, change the attach restriction to only restrict attaches of GPRS subscribers from specified LACs included in location area list #2 and include failure-code 45 as the reject cause. This configuration requires two CLI commands:

```
attach restrict access-type gprs location-area-list instance 2

attach access-type gprs location-area-list instance 2 failure-code 45
```

In the case of a dual-access SGSN, it is possible to also add a second definition to restrict attaches of UMTS subscribers within the LACs included in location area list #3.

```
attach restrict access-type UMTS location-area-list instance 3
```

Change the configuration to allow attaches for GPRS access for all previously restricted LACs - note that GPRS attaches would still be limited:

```
no attach restrict access-type gprs all
```

Restrict (deny) all GPRS attach requests (coming from any location area) and assign a single failure code for the reject messages. This is a two command process:

```
attach restrict access-type gprs all

attach access-type grps all failure-code 22
```

Remove the restrictions defined above - so that the access type is reset to the default (both types) and the failure code returns to the default value (14).

```
default attach access-type gprs all failure-code
```

authenticate activate

Allows the operator to define authentication procedures in response to a received Activate Request.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
authenticate activate [ access-type { gprs | umts } | first | frequency frequency |
primary ] [ access-type { gprs | umts } ]

[ no | remove ] authenticate activate [ access-type { gprs | umts } | first | primary ] [
access-type { gprs | umts } ] ]
```

no

Disables the specified activate authentication configuration in the call control profile.

remove

Removes the specified activate authentication configuration from the call control profile configuration file.

access-type *type*

One of the following must be selected to identify the type of network access if the **access-type** keyword is included in the command:

- **gprs**
- **umts**

The **access-type** keyword can be included with any of the other three keywords available with the **authenticate activate** command.

first

Including this keyword enables authentication only for the first Activate Request for an MS/UE.

frequency *frequency*

This keyword defines 1-in-N selective authentication for Activate Request events. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the twelfth event. *frequency* must be an integer from 1 to 16.

primary

Including this keyword enables authentication for every primary PDP context Activate Request.

Usage

Activate Requests are not authenticated by default. Use this command to enable authentication of Activate Requests.

Repeat the commands as needed to configure desired authentication responses to Activate Request messages for this call control profile.

Example

Configure Request Activate authentication for every primary PDP context for MS with GPRS access:

```
authenticate activate primary access-type gprs
```

authenticate all-events

Allows the operator to quickly define authentication procedures, based on limited parameters, for all types of events.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
authenticate all-events [ access-type { gprs | umts } | frequency frequency [ access-type
{ gprs | umts } ] ]

[ no | remove ] authenticate all-events [ access-type { gprs | umts } ]
```

no

Disables the specified authentication configuration in the call control profile.

remove

Removes the specified authentication configuration from the call control profile configuration file.

access-type *type*

One of the following must be selected to identify the type of network access if the **access-type** keyword is included in the command:

- **gprs**
- **umts**

The **access-type** keyword can be included with any of the other three keywords available with the **authenticate all-events** command.

frequency *frequency*

This keyword defines 1-in-N selective authentication for all types of subscriber events. If the frequency is set for 12, then the service skips authentication for the first 11 events and authenticates on the 12th event. *frequency* must be an integer from 1 to 16.

Usage

By default, authentication is not performed for any subscriber events. Use this command to enable authentication for all types of events at one time, such as but not limited to: Activate Requests, Attach Requests, Detach Requests, Service-Requests.

Example

The following command configures all authentication for all subscriber events to occur every tenth time a specific type of event occurs (for example every tenth time an Attach Request is received):

```
authenticate all-events frequency 10
```

The following command configures authentication for all Detach Requests and RAUs to occur if the UE access-type is UMTS:

```
authenticate all-events access-type umts
```

authenticate attach

Allows the operator to define authentication for Attach procedures.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

authenticate attach access-type { gprs | umts }

authenticate attach attach-type { combined | gprs-only } [access-type { gprs | umts } | frequency *frequency* **]**

authenticate attach frequency *frequency* **[access-type { gprs | umts }]**

authenticate attach inter-rat [access-type { gprs | umts } | attach-type { combined | gprs-only } [access-type { gprs | umts } | frequency *frequency* **] | frequency** *frequency* **[access-type { gprs | umts }]**

[no | remove] authenticate attach [access-type { gprs | umts } | attach-type { combined | gprs-only } | inter-rat | attach-type { combined | gprs-only }] [access-type { gprs | umts }]]

no

Disables the defined authentication procedures configured for Attach Requests from the call control profile.

remove

Deletes the defined authentication procedures for Attach Requests from the call control profile configuration file.

access-type *type*

One of the following must be selected to identify the type of network access if the **access-type** keyword is included in the command:

- **gprs**
- **umts**

attach-type

This keyword configures the Attach authentication based on the type of attach requested. The **attach-type** must be one of the following options:

- **combined**: Authenticates combined GPRS/IMSI Attaches.
- **gprs-only**: Authenticates GRPS Attaches only.

frequency *frequency*

This keyword defines 1-in-N selective authentication for this type of subscriber event - Attach Request. If the frequency is set for 12, then the service skips authentication for the first 11 events and authenticates on the twelfth event.
frequency must be an integer from 1 to 16.

inter-rat

Enables/disables authentication for Inter-RAT Attaches.

Usage

Authentication for Attach is disabled by default. This command enables/disables authentication for an Attach with a local P-TMSI or Attaches with an IMSI, which will be authenticated to acquire the CK (cipher key) and the IK (integrity key).

Example

The following command configures authentication to occur after every tenth attach event for GPRS access.

```
authenticate attach frequency 10 access-type gprs
```

The following command disables authentication for Inter-RAT Attaches, use:

```
no authenticate attach inter-rat
```

authenticate detach

Allows the operator to enable and define authentication for Detach procedures.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
authenticate detach access-type { gprs | umts }

[ no | remove ] authenticate detach [ access-type { gprs | umts }
```

no

Disables the defined authentication procedures configured for Detach Requests from the call control profile.

remove

Deletes the defined authentication procedures for Detach Requests from the call control profile configuration file.

access-type *type*

One of the following must be selected to identify the type of network access if the **access-type** keyword is included in the command:

- **gprs**
- **umts**

Usage

Authentication for Detach procedures is disabled by default. This command enables/disables authentication for a Detach Request and allows the operator to limit authentication based on the MS/UE access-type.

Example

The following command configures detach authentication to occur only for UMTS attached subscribers:

```
authenticate detach access-type umts
```

The following command disables authentication for all Detach Requests, use:

```
no authenticate detach
```

authenticate on-first-vector

Allows the operator to enable the SGSN to begin MS authentication immediately after receiving the first vector from the HLR.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
authenticate on-first-vector

remove authenticate on-first-vector
```

remove

Removes the authenticate on-first-vector definition from the configuration file and resets the default behavior so that the SGSN waits to receive all vectors before beginning authentication towards the MS.

Usage

After an initial attach request, some end devices restart themselves after waiting for the PDP to be established. In such cases, the SGSN restarts and a large number of end devices repeat their attempts to attach. The attach requests flood the radio network, and if the devices timeout before the PDP is established then they continue to retry, thus even more traffic is generated.
To avoid the high traffic levels during PDP establishment, the SGSN has been modified to reduce the attach time, as much as possible, so that the devices can attach and discontinue sending requests. The current enhancement is intended to reduce the time needed to retrieve vectors over the GR interface by allowing the operator to configure the SGSN to start authentication towards the MS as soon as it receives the first vector from the AuC/HLR. With the new command included in the configuration, the SGSN begins the MS authentication process immediately after receiving the first vector from the HLR while the SAI continues in parallel.

Example

Use the following command to configure the SGSN to begin MS authentication immediately after receiving the first vector from the AuC/HLR:

```
authenticate on-first-vector
```

Use the following command to reset the default behavior, so that the SGSN waits to receive all vectors requested in the SAI from the AuC/HLR before begining authentication towards the MS:

```
remove authenticate on-first-vector
```

authenticate rau

Enables or disables and fine tunes authentication procedures for routing area updates (RAUs)

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

authenticate rau [access-type { gprs | umts } | frequency *frequency* **[access { gprs | umts }] | periodicity** *duration* **[access { gprs | umts }] | update-type { combined-update | imsi-combined-update | periodic | ra-update } [access-type { gprs | umts } | frequency** *frequency* **| periodicity** *duration* **| with { foreign-ptmsi | inter-rat-local-ptmsi | local-ptmsi } [access-type { gprs | umts } | frequency** *frequency* **| periodicity** *duration* **]**

no authenticate rau [access-type { grps | umts } | update-type { combined-update | imsi-combined-update | periodic | ra-update } [access-type { gprs | umts } | with { foreign-ptmsi | inter-rat-local-ptmsi | local-ptmsi } [access-type { gprs | umts }]

remove authenticate rau [access-type { gprs | umts } | periodicity [access { gprs | umts }] | update-type { combined-update | imsi-combined-update | periodic | ra-update } [access-type { gprs | umts } | periodicity | with { foreign-ptmsi | inter-rat-local-ptmsi | local-ptmsi } [access-type { gprs | umts } | periodicity]]

no

Disables authentication for the RAUs specified in the configuration for the call control profile.

remove

Deletes the authentication configuration for the RAUs from the call control profile in the configuration file.

access-type *type*

One of the following must be selected to identify the type of network access if the **access-type** keyword is included in the command:

- **gprs**
- **umts**

The **access-type** keyword can be included with any of the other keywords available with the **authenticate rau** command.

frequency *frequency*

Defines 1-in-N selective authentication for RAU events. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the twelfth event.
frequency must be an integer from 1 to 16.

periodicity *duration*

Defines the length of time (number of minutes) that authentication can be skipped.

duration: Must be an integer from 1 to 10800.

update-type

Defines the type of RAU Request. Select one of the following:

- **combined-update [access-type | with inter-rat-local-ptmsi]**
- **imsi-combined-update [access-type | with inter-rat-local-ptmsi]**
- **periodic [access-type | frequency | periodicity]**
- **ra-update [access-type | with inter-rat-local-ptmsi]**

Usage

By default, authentication is not performed for routing area updates (RAUs). Use this command to enable/disable authentication and to fine tune the authentication procedure based on frequency, periods for skipping authentication and the various types of routing area updates.

Example

The following command configures RAU authentication to occur after every tenth event for GPRS access.

```
authenticate rau frequency 10 access-type gprs
```

The following command disables authentication for RAUs based on the combined IMSI with foreign P-TMSIs, use:

```
no authenticate rau imsi-combined-update with foreign-ptmsi
```

The following command deletes all authentication configuration from the call control profile for all RAUs using GPRS access-type:

```
remove authenticate rau access-type gprs
```

authenticate service-request

Enables or disables and fine-tunes authentication procedures for Service Requests.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
authenticate service-request [ frequency frequency | periodicity duration | service-type
{ data | page-response | signaling } [ frequency frequency | periodicity  duration ] ]

no authenticate service-request [ service-type { data | page-response | signaling } ]

remove authenticate service-request [ periodicity  | service-type { data | page-response
| signaling } [ periodicity ] ]
```

no

Disables authentication for the Service Requests specified in the configuration for the call control profile.

remove

Deletes the authentication configuration for Service Requests from the call control profile in the configuration file.

frequency *frequency*

Defines 1-in-N selective authentication for this type of subscriber event - Service Request. If the frequency is set for 12, then the service skips authentication for the first 11 events and authenticates on the twelfth event.
frequency must be an integer from 1 to 16.

periodicity *duration*

Defines the length of time (number of minutes) that authentication can be skipped.
duration: Must be an integer from 1 to 10800.

signaling-type

Defines the type of service being requested by the Service Request. Select one of the following:

- **data**
- **page-response**
- **signaling**

Usage

By default, authentication is not performed for Service Requests. Use this command to enable/disable authentication and to fine-tune the authentication procedure based on frequency and periods for skipping authentication and the various types of service. Repeat the commands as needed to configure criteria for all service types.

Example

The following command configures authentication Service Requests for data service to only occur every 5 minutes:

```
authenticate service-request service-type data periodicity 5
```

authenticate sms

Enables or disables and fine tunes authentication procedures for Short Message Service (SMS).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

authenticate sms [access-type { gprs | umts } | frequency *frequency* **[access-type { gprs umts }] | sms-type { mo-sms | mt-sms } [access-type { gprs | umts } | frequency** *frequency* **]]**

[no | remove] authenticate sms [access-type { gprs | umts } | sms-type { mo-sms | mt-sms } [access-type { gprs umts }]]

no

Disables authentication for the SMS Requests specified in the configuration for the call control profile.

remove

Deletes the authentication configuration for SMS Requests from the call control profile in the configuration file.

access-type *type*

One of the following must be selected to identify the type of network access if the **access-type** keyword is included in the command:

- **gprs**
- **umts**

The **access-type** keyword can be included with any of the other keywords available with the **authenticate sms** command.

frequency *frequency*

Defines 1-in-N selective authentication for SMS Requests. If the frequency is set for 12, then the SGSN skips authentication for the first 11 events and authenticates on the twelfth event.
frequency must be an integer from 1 to 16.

sms-type

Enables authentication for the following SMS types:

- **mo-sms**: mobile-originated SMS
- **mt-sms**: mobile-terminated SMS

Usage

By default, authentication is not performed for short message service (SMS). Use this command to enable/disable authentication and to fine-tune the authentication procedure based on MS/UE access type and

the frequency for the selected SMS type. Repeat the commands as needed to configure criteria for all service types.

Example

The following command configures MO-SMS authentication to occur every fifth request:

```
authenticate sms sms-type mo-sms frequency 5
```

authenticate tau

Allows the operator to enable/disable and fine-tune authentication for the tracking area update (TAU) procedures.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

authenticate tau [freqency *frequency* **| inter-rat | periodicity** *interval* **]**

no authenticate tau inter-rat

no

Disables the TAU authentication procedures specified in the call control profile configuration.

frequency *frequency*

Defines 1-in-N selective authentication for this type of subscriber event - a tracking area update for an inter-RAT Attach. If the frequency is set for 12, the MME skips authentication for the first 11 events and authenticates on the twelfth event.
frequency must be an integer from 1 to 16.

inter-rat

Enables authentication for TAU procedures for inter-RAT Attaches.

periodicity *duration*

Defines the length of time (number of minutes) that authentication can be skipped.
duration: Must be an integer from 1 to 10800.

Usage

Authentication for TAU procedures is disabled by default. This command enables/disables authentication for a inter-RAT TAU procedures and allows the operator to limit authentication based on the frequency of the events or elapsed intervals between the events.

Example

The following command configures TAU authentication to occur when there is 15 minutes between inter-RAT Attaches:

```
authenticate tau periodicity 15
```

The following command disables authentication for all TAU Inter-RAT Attaches, use:

```
no authenticate tau
```

cc

Defines the charging characteristics to be applied for CDR generation when the handling rules are applied via the Operator Policy feature.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
cc { behavior-bit no-records bit_value | local-value behavior bit_value profile index_bit
| prefer { hlr-hss-value | local-value } }

no cc behavior-bit no-records

remove cc { behavior-bit no-records | local-value | prefer }
```

---

no

Disables the charging characteristics configuration of behavior bit from this call control profile.

---

remove

Removes the configured charging characteristics from this profile.

---

behavior-bit no-records *bit_value*

Default: disabled
Specify the charging characteristic behavior bit. **no-records** indicates that no accounting records should be generated.
If charging characteristics has no-records bit set, the system will not generate any accounting records, regardless of what may be configured elsewhere. Use "no" to indicate that there is no such bit.
bit_value must be must be an integer from 1 through 12.

---

local-value behavior *bit_value* **profile** *index_bit*

Default: bit_value = 0x0
index_bit = 8
This keyword sets the call control profile to configure the value of the behavior bits and profile index for the charging characteristics when the HLR does not provide value for this.
If the HLR provides the charging characteristics with behavior bits and profile index and operator want to ignore it, then specify **prefer local-value** keyword with this command.
bit_value: Enter a hexadecimal value between 0x0 and 0xFFF.
index_bit: Enter an integer value from 1 through 15.
Some of the index values are predefined according to 3GPP standard:

- **1** for hot billing
- **2** for flat billing
- **4** for prepaid billing
- **8** for normal billing

prefer { hlr-hss-value | local-value }

Default: **hlr-hss-value**
Specifies preference for using charging characteristics settings received from HLR or HSS, or set by the SGSN or MME locally.

- **hlr-hss-value**: Sets the call control profile to use charging characteristics settings received from HLR or HSS. This is the default preference.
- **local-value**: Sets the call control profile to use charging characteristics settings from the SGSN or MME only. If no charging characteristics received from HLR then local value will be applicable.

Usage

Use this command to set the behavior for charging characteristic coming from either an HLR or locally from an SGSN.
These charging characteristics parameters are configurable from APN Profile configuration mode too. For generation of M-CDRs, the parameters configured in this mode, Call Control Profile configuration mode, will prevail but for generation of S-CDRs the parameters configured in the APN Profile configuration mode will prevail.
The first four bits of charging characteristics (use keyword profile) is for the charging trigger profile index and is used to select different charging trigger profiles.
The 12 behavior bits (with keyword local-value behavior) can to enable or disable the CDR generation.

Example

The following command specifies a rule not to use records for charging characteristics and to set behavior bit to *2*:

```
cc behavior-bit no-records 2
```

check-zone-code

Enables or disables the zone code checking mechanism.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | remove ] check-zone-code
```

no

Included with the command, this keyword disables the mechanism.

remove

Included with the command, this keyword causes the removal of the current **check-zone-code** configuration and returns to the SGSN to the default where zone-code checking is enabled.

Usage

Use this command to enable/disable the zone-code checking function.

Example

Disable checking of the zone code:

```
no check-zone-code
```

ciphering-algorithm-gprs

Defines the order of preference of the ciphering algorithms.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ciphering-algorithm-gprs priority *priority algorithm*

remove ciphering-algorithm-gprs priority *priority*

remove

Delete the priority definition.

priority *priority*

Sets the order in which the algorithm will be selected for use.
priority is an integer from 1 to 8.

algorithm

Identifies the ciphering algorithm to be used.
algorithm is one of the following: `gea0, gea1, gea2, gea3.`

Usage

Define the order in which the ciphering algorithms are chosen for use. The command can be repeated to provide multiple definitions -- multiple priorities.

Example

Define gea1 as the third priority algorithm:

```
ciphering-algorithm-gprs priority 3 gea1
```

csfb

Configures circuit-switched fallback options. CSFB is the mechanism to move a subscriber from LTE to a legacy technology to obtain circuit switched voice or short message.

Product

MME

Privilege

Administrator

Syntax

```
csfb { policy { not-allowed | sms-only } | sms-only }

remove csfb { policy | sms-only }
```

remove csfb { policy | sms-only }

sms-only: Removes the SMS-only restriction allowing the UE to request voice and short message service (SMS) support for circuit-switched fallback (CSFB).
policy: Removes the configured policy

policy { not-allowed | sms-only }

not-allowed: Specifies that the CSFB function is not allowed for both voice and SMS.
sms-only: Specifies that the CSFB function only supports SMS.

sms-only

Specifies that the circuit-switched fallback function only supports SMS.

Important: This is a legacy keyword that remains to support earlier versions of the code. It operates identically to the **policy sms-only** keyword.

Usage

Use this command to restrict the circuit-switched fallback function to SMS only or no support for either voice or SMS.

Example

The following command enforces the SMS-only functionality for UEs requesting circuit-switched fallback:

```
csfb policy sms-only
```

description

Allows you to enter a relevant descriptive string.

Product

MME, SGSN, S-GW

Privilege

Security Administrator, Administrator

Syntax

description *description*

no description

description

Enter an alphanumeric string of 1 to 100 characters. The string may include spaces, punctuation, and case-sensitive letters if the string is enclosed in double quotation marks (“).

no

Removes the description from the call control profile.

Usage

Define information that identifies this particularly call control profile.

Example

```
description “call-control-profile handling incoming from CallTell”
```

diameter-result-code-mapping

Maps an EMM (EPS Mobility Management) NAS (Network Access Server) cause code to map to a Diameter result code.

Product

MME

Privilege

Administrator

Syntax

```
diameter-result-code-mapping s6a diameter-error-rat-not-allowed mme-emm-cause { no-suitable-cell-in-tracking-area | roaming-not-allowed-in-this-tracking-area | tracking-area-not-allowed }

remove diameter-result-code-mapping s6a diameter-error-rat-not-allowed
```

`remove diameter-result-code-mapping s6a diameter-error-rat-not-allowed`

Removes the mapping.

`s6a diameter-error-rat-not-allowed`

Specifies the Diameter result code to which the EMM NAS cause code is mapped.

`mme-emm-cause { no-suitable-cell-in-tracking-area | roaming-not-allowed-in-this-tracking-area | tracking-area-not-allowed }`

Specifies the EMM NAS cause mapped to the Diameter result code.
`no-suitable-cell-in-tracking-area`: Specifies that the EMM NAS cause code “no suitable cell in tracking area” is to be mapped to the specified Diameter result code.
`roaming-not-allowed-in-this-tracking-area`: Specifies that the EMM NAS cause code “roaming not allowed in this tracking area” is to be mapped to the specified Diameter result code.
`tracking-area-not-allowed`: Specifies that the EMM NAS cause code “tracking area not allowed” is to be mapped to the specified Diameter result code.

Usage

Use this command to map a selected EMM NAS cause code to a specific Diameter result code.

Example

The following command maps the EMM NAS cause code “roaming not allowed in this tracking area” to the Diameter result code “S6a Diameter error RAT not allowed”:

```
diameter-result-code-mapping s6a diameter-error-rat-not-allowed mme-emm-cause roaming-not-allowed-in-this-tracking-area
```

direct-tunnel

Allows direct tunneling if direct tunneling is supported by the destination node.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
direct-tunnel attempt-when-permitted

remove direct-tunnel
```

remove

Removes the configured setting from the call control profile.

attempt-when-permitted

Enables direct tunneling if the destination node allows it. Default: disabled.

Usage

Use this command to enable the Direct-Tunnel feature.
To ensure that direct tunnel is fully configured for support by the SGSN, check the settings for **direct-tunnel** in

- the APN profile -- from the Exec mode, use command: **show apn-profile** *<profile_name>* **all**
- the RNC (radio network controller) configuration -- from the Exec mode, use command: **iups-service** *<service_name>* **all**

Important: Direct tunneling must be enabled at both of these two points to allow direct tunneling for the MS/UE.

Example

The following command sets the configuration to instruct the SGSN to attempt to setup a direct tunnel if permitted at the destination node:

```
direct-tunnel attempt-when-permitted
```

dns-ggsn

Defines the context to be used to do DNS lookup for GGSNs.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

dns-ggsn context *ctxt_name*

no dns-ggsn context *ctxt_name*

no

Removes the dns-ggsn configuration from this call control profile.

context *ctxt_name*

Specifies the context to be used to do DNS lookup for GGSNs as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to define the context to be used to do DNS lookup to find the GGSN address.

Example

```
dns-ggsn context sgsn1
```

dns-sgsn

Identifies the context to be used to do DNS to find an SGSN address.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] dns-sgsn context *ctxt_name*

no

Removes the dns-sgsn configuration from this call control profile.

context *ctxt_name*

Specifies the context to be used to do DNS to find an SGSN address as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to configure the context ID for the SGSN address that will be used to do the DNS lookup.

Example

```
dns-sgsn context sgsn1
```

dns-pgw

Defines the context to be used to do DNS lookup for P-GWs.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

[remove] dns-pgw context *ctxt_name*

remove

Deletes this definition from the call control profile.

context *ctxt_name*

Specifies the context to be used to do DNS lookup for P-GWs as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to configure the context ID for the DNS lookup.

Example

```
dns-pgw context pgw1
```

dns-sgw

Defines the context to be used to do DNS lookup for S-GWs.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

[remove] dns-sgw context *ctxt_name*

remove

Deletes this definition from the call control profile.

context *ctxt_name*

Specifies the context to be used to do DNS lookup for S-GWs as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to configure the context ID for the DNS lookup.

Example

```
dns-sgw context sgw1
```

encryption-algorithm-lte

Defines the priorities for using the encryption algorithms.

Product

MME

Privilege

Administrator

Syntax

```
encryption-algorithm-lte priority1 128-eea { 0 | 1 | 2 } priority2 128-eea { 0 | 1 | 2 }
priority3 128-eea { 0 | 1 | 2 }

remove encryption-algorithm-lte
```

remove

Deletes the priorities definition from the call control profile configuration.

priority1 128-eea { 0 | 1 | 2 }

Enter 0, 1, or 2 at the end of **128-eea** to define the algorithm being given first priority.

priority2 128-eea { 0 | 1 | 2 }

Enter 0, 1, or 2 at the end of **128-eea** to define the algorithm being given second priority.

priority3 128-eea { 0 | 1 | 2 }

Enter 0, 1, or 2 at the end of **128-eea** to define the algorithm being given third priority.

Usage

Set the order or priority in which the MME will select a 128-EEA algorithm for use. All three priorities must be set or the definition is invalid. The command can be re-entered to change the priorities without removing the configuration.

Example

Configure 128-EEA2 as first priority encryption algorithm:

```
encryption-algorithm-lte priority1 128-eea 2 priority2 128-eea 0
priority3 128-eea 1
```

encryption-algorithm-umts

Defines the priorities for using the encryption algorithms.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

encryption-algorithm-umts { *uea0* | *uea1* | *uea2* } [then-uea*#* | then-uea*#*]

no encryption-algorithm-lte

no

Deletes the priorities definition from the call control profile configuration.

{ *uea0* | *uea1* | *uea2* }

Enter one of the three options to define the first priority algorithm.

[then-uea# | then-uea#]

If a second algorithm is to be included as an option, give it second priority. Enter 0, 1, or 2 at the end of **then-uea** to define the algorithm being given second priority.

then-uea#

If a third algorithm is to be included as an option, give it third priority. Enter 0, 1, or 2 at the end of **then-uea** to define the algorithm being given third priority.

Usage

Set the order or priority in which the SGSN will select a UEA algorithm for use. It is not necessary to define priorities for all three priority levels. The command can be re-entered to change the priorities without removing the configuration.

Example

Configure algorithm UEA2 as the first priority encryption algorithm with no others to be considered:

```
encryption-algorithm-umts uea2
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

equivalent-plmn

Configures the definition for an equivalent public land mobile network identifier (PLMN ID) and the preferred radio access technology (RAT). This is a of PLMNs which should be considered by the mobile as equivalent to the visited PLMN for cell reselection and network selection. When configured, the equivalent PLMN list will be sent to the UE in NAS ATTACH ACCEPT / TAU ACCEPT messages (up to 15 PLMNs in each message).

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

equivalent-plmn radio-access-technology { 2G | 3g | 4g | any } plmnid mcc *mcc_number* **mnc** *mnc_number* **priority** *priority*

no equivalent-plmn radio-access-technology { 2G | 3g | any } plmnid mcc*mcc_number* **mnc** *mnc_number*

no

Removes the equivalent-PLMN configuration from this call control profile.

radio-access-technology { 2G | 3g | 4g | any }

Identify the RAT type of the equivalent PLMN:

- **2G**: 2nd generation
- **3G**: 3rd generation
- **4G**: 4th generation
- **any**: Any RAT

plmnid mcc *mcc_number* **mnc** *mnc_number*

- **mcc**: Specifies the mobile country code (MCC) portion of the PLMN ID. The number can be any integer between 100 and 999.
- **mnc**: Specifies the mobile network code (MNC) portion of the PLMN ID. The number can be any 2- or 3-digit integer between 00 and 999.

priority *priority*

Enter an integer between 1 and 15 with the highest priority assigned to the integer of the lowest numeric value.

Usage

Use the command to identify an ‘equivalent PLMN’ and assign it a priority to define the preferred equivalent PLMN to be used. This command can be entered multiple times to set priorities of usage.

Example

The following command sets up a secondary equivalent PLMN definition that allows for any RAT with a PLMN ID of MCC121.MNC767:

```
equivalent-plmn radio_access_technology any plmnid mcc 121 mnc 767
priority 2
```

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

gmm information-in-messages

Provides the configuration to include the information in messages for the GPRS mobility management (GMM) parameters.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gmm information-in-messages access-type { { gprs | umts } [network-name { full-text *name* **| short-text** *name* **} | [send-after { attach | rau }] }**

[default | no] gmm { information-in-messages access-type { gprs | umts }

---

no

Disables the GMM configuration from this call control profile.

---

default

Sets up a GMM configuration with system default values.

---

access-type

Must select one of the following options:

- **gprs** - General Packet Radio Service network
- **umts** - Universal Mobile Telecommunications System network

After selecting the access-type, an additional parameter can be configured:

- **network-name**: identifies the network name in either short text or full text.
- **send-after**: configures the information in message to send after attachment or Routing Area Update (RAU).

---

network-name { full-text *name* **| short-text** *name* **}**

This keyword provides the option to add the network name to the message. The network name will in full text or short text. Possible options are:

- full-text *name*: Indicate the network name in full text
- short-text *name*: Indicate the network name in short text

---

send-after{ attach | rau }

This keyword configures the information in message to send after attachment or RAU message. Possible options are:

- **attach**: Information sent after attachment
- **rau**: Information sent after routing area update

Usage

Use this command to configure identifying information about the network that will be included in GMM messages.

Example

```
default gmm information-in-messages access-type gprs
```

gmm retrieve-equipment-identity

Configures the International Mobile Equipment Identity (IMEI) or software version (SV) retrieval and validation procedure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gmm retrieve-equipment-identity { imei | imeisv [ unciphered ] [ then-imei ] } [ verify-
equipment-identity [ deny-greylisted ] ]

[ no | default ] gmm retrieve-equipment-identity
```

---

no

Disables the equipment identity retrieval procedure configured for this call control profile.

---

default

Sets the default action for equipment identity retrieval (EIR) procedure:

- **retrieve-equipment-identity**: Default action is disabled - no retrieval of IMEI/IMEI-SV
- **verify-equipment-identity**: Default action is disabled - no verification with Equipment Identity Register (EIR)

---

equipment-identity-type

Default: disabled
Indicates the type of equipment identification, with the possible values:

- **imei**: International Mobile Equipment Identity
- **imeisv**: International Mobile Equipment Identity - Software Version

---

imei

Indicates the equipment identity retrieval type to International Mobile Equipment Identity (IMEI). IMEI is a unique 15-digit number consisting of a TAC (Technical Approval Code), a FAC (Final Assembly Code), an SNR (Serial Number), and a check digit.

---

imeisv [unciphered] [then-imei]

Indicates the equipment identity retrieval type to IMEI with software version (SV). IMEI with SV is a unique 16-digit number consisting of a TAC (Technical Approval Code), a FAC (Final Assembly Code), an SNR (Serial Number), and a 2-digit software version number.

- **unciphered**: This optional keyword enables the unciphered retrieval of IMEI-SV. If this option is enabled the retrieval procedure will get IMEISV (if auth is still pending, get as part of Authentication and Ciphering Response otherwise, via explicit Identification Request after Security Mode Complete).
- **then-imei**: This optional keyword enables the retrieval of software version number before the IMEI. If this option is enabled the equipment identity retrieval procedure will get IMEISV on secured link

(after Security mode procedure via explicit GMM Identification Request), and if MS is not having IMEISV (responded with NO Identity), SGSN will try to get IMEI.

If no other keyword is provided, imeisv will get IMEISV on a secured link (after a Security mode procedure via explicit GMM Identification Request).

verify-equipment-identity [deny-greylisted]

Default: disabled

This keyword enables the equipment identity validation and validates the equipment identity against the EIR.

- **deny-greylisted**: This keyword fine-tunes the configuration and enables the restriction to the user having mobile equipment with an IMEI in the EIR grey list.

Usage

Use this command to enable and configure the procedures for mobile equipment identity retrieval and validation from the EIR identified in the MAP Service Configuration mode.

Example

The following command enables the SGSN to send "check IMEI" messages to the EIR:

```
gmm retrieve-equipment-identity imei verify-equipment-identity
```

gs-service

Associates the context of a Gs service interface with this call control profile.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

gs-service *gs_srvc_name* **context** *ctx_name*

no gs-service *svc_name*

no

Removes/disassociates the named Gs service from the call control profile.

gs-service *gs_srvc_name*

Specifies the name of a specific Gs service for which to display information. *gs_srvc_name* is the name of a configured Gs service expressed as an alphanumeric string of 1 through 63 characters that is case sensitive.

context *ctx_name*

Specifies the specific context name where Gs service is configured. If this keyword is omitted, the named Gs service must exist in the same context as the GPRS/SGSN service.
ctx_name is name of the configured context of Gs service expressed as an alphanumeric string from 1 through 63 characters that is case sensitive.

Usage

Use this command to associate a specific Gs service interface with this GPRS service instance.

Important: A Gs service can be used with multiple SGSN and/or GPRS service.

Example

The following command associates a Gs service instance named *stargs1*, which is configured in context named *star_ctx*, with a call control profile:

```
gs-service stargs1 context star_ctx
```

gtp send

Configures which information elements (IE) the SGSN sends in GTP messages. These are required by the GGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
gtp send { imeisv [ derive-imeisv-from-imei ] | ms-timezone | rai | rat | uli }

remove gtp send { imeisv | ms-timezone | rai | rat | uli }

no gtp send
```

remove

Removes the specified GTP send definition from the system configuration.

no

Disables the specified GTP send configuration.

imeisv

Instructs the SGSN to include the IMEISV (International Mobile Equipment Identity with Software Version) of the mobile when sending GTP messages of the type Create PDP Context Request.

derive-imeisv-from-imei

This is a filter for the **imeisv** keyword. It allows the operator to configure the SGSN to send IMEI to the GGSN as IMEI-SV.
This filter instructs the SGSN to add four 1s (1111) to the final semi-octet of the CPCQ (Create PDP Context Request) message which enables the SGSN to deduce the IMEI-SV value from the IMEI. If this filter is used, then IMEI is also sent as IMEI-SV when the **gmm retrieve-equipment-identity** command is configured.

ms-timezone

Instructs the SGSN to include this IE in GTP messages of the type Create PDP Request and Update PDP Context Request. This IE specifies the offset between universal time and local time, where the MS currently resides, in 15-minute steps.
This IE is sent by default.

rai

Configures the SGSN to include the Routing Area Identity (RAI) of the SGSN in the following situations:

- 2G new SGSN RAU
- 3G new SGSN SRNS
- 2G -> 3G HO (only if PLMN Id has changed)
- 3G -> 2G HO (only if PLMN Id has changed)

- multiple IUPS service RAU (only if PLMN Id has changed)
- multiple GPRS service RAU (only if PLMN Id has changed)
- 3G new SGSN RAU (change in behavior)
- 3G primary and secondary PDP activation (change in behavior)
- 2G primary and secondary PDP activation (change in behavior)

rat

Specifies which radio access technology (RAT) is being used by the MS (GERAN, UTRAN, or GAN). Including this keyword instructs the SGSN to include this IE when sending GTP messages of the type Create PDP Request and Update PDP Context Request.
This IE is sent by default.

uli

Specifies the CGI (MCC, MNC, etc.) and SAI of the MS where it is registered. Including this keyword instructs the SGSN to include the IE when sending GTP messages of the type Create PDP Request and Update PDP Context Request.
This IE is not sent by default.

Usage

Use this command to define a preferred set of information to include when GTP messages are sent. Repeat this command multiple times to enable or disable multiple options. This instruction will be implemented when the specific operator policy and call control profile are applied.

Example

The following command series instructs the SGSN to send ULI and RAT in the GTP messages:

```
gtp send uligtp send rat
```

gtpu fast-path

Enables or disables the network processing unit (NPU) Fast Path support for NPU processing of GTP-U packets of user sessions at the NPU.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] gtpu fast-path
```

remove

Removes the NPU fast path functionality configuration from the call control profile.

Usage

Use this command to enable/disable the NPU processed fast-path feature for processing of GTP-U data packets received from GGSN/RNC. This feature enhances the GTP-U packet processing by adding the ability to fully process and forward the packets through the NPU itself.

Important: When enabled/disabled, fast-path processing will be applicable only to new subscriber who establishes a PDP context after issuing this command (enabling GTP-U fast path). No existing subscriber session will be affected by this command.

Example

The following command enables the NPU fast path processing for all new subscribers' session established with this call control profile:

```
gtpu fast-path
```

gw-selection

Configures the parameters controlling the gateway selection process.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] gw-selection { co-location | pgw weight | sgw weight | topology }
```

remove gw-selection

Deletes the gw-selection definition from the call control profile.

co-location

Selects “co-location” as the determining factor for gateway selection.

pgw weight

Selects PDN-Gateway as the determining factor for gateway selection.

sgw weight

Selects Serving Gateway as the determining factor for gateway selection.

topology

Selects topology as the determining factor for gateway selection.

Usage

Use this command to define the criteria for gateway selection.

Example

The following command instructs the MME to determine gateway selection on the basis of topology:

```
gw-selection topology
```

integrity-algorithm-lte

Specifies the order of preference for using an Integrity Algorithm.

Product

MME

Privilege

Administrator

Syntax

```
integrity-algorithm-lte priority1 { 128-eia0 | 128-eia1 | 128-eia2 } priority2 128-eia {
0 | 1 | 2 } priority3 128-eia { 0 | 1 | 2 }

remove integrity-algorithm-lte
```

remove

Deletes the priorities definition from the call control profile configuration.

priority1 128-eia { 0 | 1 | 2 }

Enter 0, 1, or 2 at the end of **128-eia** to define the algorithm being given first priority.

priority2 128-eia { 0 | 1 | 2 }

Enter 0, 1, or 2 at the end of **128-eia** to define the algorithm being given second priority.

priority3 128-eia { 0 | 1 | 2 }

Enter 0, 1, or 2 at the end of **128-eia** to define the algorithm being given third priority.

Usage

Set the order or priority in which the MME will select an integrity algorithm for use. All three priorities must be set or the definition is invalid. The command can be re-entered to change the priorities without removing the configuration.

Example

Configure 128-EIA0 as first priority integrity algorithm:

```
integrity-algorithm-lte priority1 128-eia 0 priority2 128-eia 2 priority3
128-eia 1
```

integrity-algorithm-umts

Configures the order of preference for the Integrity Algorithm used for 3G.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

integrity-algorithm-umts *type* **then_** *type*

default integrity-algorithm-umts

default

Specifies the default preference based on system defaults.

type

Creates a configuration defining an order of preference. Enter one or more of the following options in the order of preference:

- **uia1** - uia1 Algorithm
- **uia2** - uia2 Algorithm

Usage

Use this command to determine which integrity algorithm is preferred 3G. This command is configured in tandem with the algorithm type for **encryption-algorithm-umts** command.

Example

```
default integrity-algorithm-umts
```

local-cause-code-mapping

Maps a selected cause code to the restricted zone code result.

Product

MME

Privilege

Administrator

Syntax

```
local-cause-code-mapping restricted-zone-code emm-cause-code { eps-service-not-allowed-in-this-plmn | no-suitable-cell-in-tracking-area | plmn-not-allowed | roaming-not-allowed-in-this-tracking-area | tracking-area-not-allowed }

remove local-cause-code-mapping restricted-zone-code
```

remove

Removes the configured cause code mapping.

restricted-zone-code

Specifies the event for which the cause code is returned.

emm-cause-code { eps-service-not-allowed-in-this-plmn | no-suitable-cell-in-tracking-area | plmn-not-allowed | roaming-not-allowed-in-this-tracking-area | tracking-area-not-allowed }

Specifies the EPS Mobility Management (EMM) cause code to apply when a UE requests access to a restricted zone:

eps-service-not-allowed-in-this-plmn
no-suitable-cell-in-tracking-area
plmn-not-allowed
roaming-not-allowed-in-this-tracking-area
tracking-area-not-allowed

Usage

Use this command to configure the cause code returned when a UE requests access to a restricted zone.

Example

The following command maps the “PLMN not allowed” cause code to the restricted zone code event:

```
local-cause-code-mapping restricted-zone-code emm-cause-code plmn-not-allowed
```

location-area-list

Defines the location area list to allow or restrict services in the specified location areas identified by location area code (LAC).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

location-area-list instance *instance* **area-code** *area_code* **[** *area_code* ***** **]**

no location-area-list instance *instance***[area-code** *area_code* **]**

no

If the **area-code** keyword is included in the command, then only the specified area code is removed from the identified list. If the **area-code** keyword is not included with the command, the entire list of LACs is removed from this call control profile.

instance *instance*

Specifies an identification for the specific location area list.
instance must be an integer between 1 and 5.

area-code *area_code* *****

This keyword defines the location area codes (LACs) to be used by this call control profile as a determining factor in the handling of incoming calls. Multiple LACs can be defined in a single location-area-list.
area_code: Enter an integer between 1 and 65535.
***** If desired, enter multiple LACs separated by a single blank space.

Usage

Use the command multiple times to configure multiple LAC lists or to modify the a list.

Example

The following command creates a location area list for a single area code:

```
location-area-list instance 1 area-code 514
```

This command creates a second location area list for with multiple area codes - all separated by a single blank space:

```
location-area-list instance 2 area-code 514 62552 32 1513
```

The next command corrects an area code mistake (327 not 32) made in the previous configuration:

```
location-area-list instance 1 area-code 514 62552 327 1513
```

lte-zone-code

Configures the enforcement of allowed or restricted zone code lists and associates an EPS Mobility Management (EMM) cause code to rejected attach attempts.

Product

MME

Privilege

Administrator

Syntax

```
lte-zone-code [ allow | restrict } { emm-cause-code { eps-service-not-allowed-in-this-plmn | no-suitable-cell-in-tracking-area | plmn-not-allowed | roaming-not-allowed-in-this-tracking-area | tracking-area-not-allowed ] zone-code-list zc_id +

remove lte-zone-code zone-code-list
```

remove

Removes the zone code list from the call control profile.

[allow | restrict]

Specifies whether the zone code list is allowed or restricted.

Important: You can only create an allowed or restricted list, not both.

emm-cause-code [eps-service-not-allowed-in-this-plmn | no-suitable-cell-in-tracking-area | plmn-not-allowed | roaming-not-allowed-in-this-tracking-area | tracking-area-not-allowed]

Optionally, specify one of the following EMM cause codes to apply when a UE request is rejected:
eps-service-not-allowed-in-this-plmn
no-suitable-cell-in-tracking-area
plmn-not-allowed
roaming-not-allowed-in-this-tracking-area
tracking-area-not-allowed

zone-code-list *zc_id* **+**

Specifies the zone code in the allowed or restricted list of zone codes. *zone_code* must be an integer value from 0 to 65535.

Usage

Use this command to create zone code lists that allow or restrict access to UEs managed by this call control profile.

Example

The following command restricts access to zone codes 234 and 456 and returns an EMM cause code of "tracking area not allowed":

```
lte-zone-code restrict emm-cause-code tracking-area-not-allowed zone-
code-list 234 456
```

map

Configures the optional extensions to Mobile Application Part (MAP) messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] map message update-gprs-location [ imeisv | private-extension access-type ]
```

remove

IMEI-SV is not included in the GLU request -- this is the default behavior.

message update-gprs-location

Includes a GLU message. This keyword-set is required.

imeisv

Specifies the International Mobile equipment Identity-Software Version (IMEI-SV) information to include in the GPRS Location Update (GLU) request message. SGSN will include IMEI-SV in the message, if available. Default: disabled

private-extension access-type

Includes a specific access-type private extension in the message.

Usage

This command configures optional extensions to MAP messages. The HLR should ignore these extensions if not supported by the HLR.

Example

```
map message update-gprs-location private-extension access-type
```

map-service

Identifies a Mobile Application Part (MAP) service and the context which contains it and associates both with the call control profile.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

map-service context *ctxt_name* **service** *map_srvc_name*

no map-service context

no

Disables use of MAP service with this call control profile.

context *ctxt_name*

Specifies the name of the context for the MAP service as an alphanumeric string of 1 through 64 characters.

service *map_srvc_name*

Specifies the MAP service name as an alphanumeric string of 1 through 64 characters.

Usage

Use this command to enable or disable MAP service with this call control profile.

Example

```
no map-service context
```

max-bearers-per-subscriber

Defines the maximum number of bearers allowed per subscriber.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

max-bearers-per-subscriber *number*

remove max-bearers-per-subscriber

remove

Deletes the definition from the call control profile.

number

Identifies the maximum number of bearers allowed per subscriber as an integer from 1 to 11.

Usage

Use this command to set the maximum number of bearers allowed per subscriber.

Example

Set the maximum to 3:

```
max-bearers-per-subscriber 3
```

max-pdns-per-subscriber

Defines the maximum number of PDNs allowed per subscriber.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

max-pdns-per-subscriber *number*

remove max-pdns-per-subscriber

remove

Deletes the definition from the call control profile.

number

Identifies the maximum number of PDNs allowed per subscriber as an integer from 1 to 11.

Usage

Use this command to set the maximum number of PDNs allowed per subscriber.

Example

Set the maximum to 4:

```
max-pdns-per-subscriber 4
```

min-unused-auth-vectors

Configures a specific minimum number of unused vectors to be maintained by the SGSN.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

min-unused-auth-vectors *min#_vectors*

remove min-unused-auth-vectors

remove

Removes the definition from the configuration file and restores the default behavior, which does not use the threshold.

min#_vectors

Enables and defines a threshold for the minimum number of unused vectors that the SGSN retains to trigger the initation of a service area identity request (SAI) .
min#_vectors: Enter a digit betwen 1 and 4.

Usage

Vectors are used by the SGSN for authentication. Use this command to enable a minimum threshold for unused vector for this call control profile. When the unused vector count falls below this configured threshold, then an SAI is initiated to fill the buffer back to 5 or to the most appropriate number based on the MAP service configuration.

Example

Enter a command similar to the following to set a threshold of *3*:

```
min-unused-auth-vectors 3
```

Use the following command to disable this function and restore the default behavior, which does not use a threshold to trigger an SAI:

```
remove min-unused-auth-vectors
```

network-feature-support-ie

Configures support for IMS Voice over Packet-Switched information element (IE) as part of the MME (Network) Feature Support.

Product

MME

Privilege

Administrator

Syntax

```
network-feature-support-ie ims-voice-over-ps

remove network-feature-support-ie
```

remove

Disables support for Voice over PS.

ims-voice-over-ps

Enables support for Voice over PS.

Usage

Use this command to enable Voice over PS which "switches on" an IE in a message sent by the MME indicating the features it supports.

Example

The following command enables Voice over PS on the MME:

```
network-feature-support-ie ims-voice-over-ps
```

network-initiated-pdp-activation

Configures the call control profile to perform two functions: (1) to enable or disable network-requested PDP context activation (NRPCA) for 3G attachments and (2) to define a failure cause code for inclusion in NRPCA-related reject messages.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

`[ remove ] network-initiated-pdp-activation { allow primary | restrict primary } access type { gprs | umts } { all | location-area-list instance` *`<instance>`* **`}`**

`network-initiated-pdp-activation primary access type { gprs | umts } { all | location-area-list instance` *`<instance>`* **`} failure-code`***`code`*

`remove`

Including this keyword with the command, removes all configured values for the specified configuration.

`allow`

Allows network-initiated PDP context activation. This keyword must be followed by other parameters to indicate the limitations for allowing the NRPCA.
Allow is the default for NRPCA.

`restrict`

Restricts network-initiated PDP context activation. This keyword must be followed by other command parameters to indicate the limitations for restricting the NRPCA.

`primary`

Specifies that only network-initiated primary PDP context activations are to be allowed.

`secondary`

Important: The **`secondary`** keyword is visible and can be selected, however, secondary NRPCA functionality is in development and currently this keyword is not supported for configuration.

`all`

Configures the SGSN to allow or to restrict NRPCA for calls within all location areas.

`location-area-list instance` *`instance`*

Selects a pre-defined list of location area codes (LACs) and allows/restricts the NRPCA procedure for calls within the listed area codes.
`instance`: Enter a list ID; an integer between 1 and 5.

Important: Before using this keyword, ensure that the appropriate LAC information has been defined with the **location-area-list** command, also in this configuration mode.

failure-codes *code*

Enter an integer from 192 to 226 to identify the GTPP failure cause code (from 3GPP TS29.060, list below) to be included in the reject messages when NRPCA is restricted. If a failure cause code is not defined, the default value is 200 (service not supported).

- 192 - Non-existent
- 193 - Invalid message format
- 194 - IMSI not known
- 195 - MS is GPRS Detached
- 196 - MS is not GPRS Responding
- 197 - MS Refuses
- 198 - Version not supported
- 199 - No resources available
- 200 - Service not supported
- 201 - Mandatory IE incorrect
- 202 - Mandatory IE missing
- 203 - Optional IE incorrect
- 204 - System failure
- 205 - Roaming restriction
- 206 - P-TMSI Signature mismatch
- 207 - GPRS connection suspended
- 208 - Authentication failure
- 209 - User authentication failed
- 210 - Context not found
- 211 - All dynamic PDP addresses are occupied
- 212 - No memory is available
- 213 - Relocation failure
- 214 - Unknown mandatory extension header
- 215 - Semantic error in the TFT operation
- 216 - Syntactic error in the TFT operation
- 217 - Semantic errors in packet filter(s)
- 218 - Syntactic errors in packet filter(s)
- 219 - Missing or unknown APN
- 220 - Unknown PDP address or PDP type
- 221 - PDP context without TFT already activated
- 222 - APN access denied – no subscription

- 223 - APN Restriction type incompatibility with currently active PDP Contexts
- 224 - MS MBMS Capabilities Insufficient
- 225 - Invalid Correlation-ID
- 226 - MBMS Bearer Context Superseded

Usage

Use this command to allow or restrict network-requested PDP context activation (NRPCA) based on access-type and location areas. NRPCA is used when there is downlink data at the GGSN for a subscriber, but there is no valid context for the already-established PDP address so the GGSN initiates an NRPCA procedure towards the SGSN.

This command can also be used to define the failure cause code that will be included in activation reject messages.

These commands can be repeated to define a unique set of NRPCA parameters for each access-type and each location area list.

The **T3385-timeout** and the **max-actv-retransmission** timers configure the retransmission timer and the number of retries for PDP context activation requests. Both of these timers are set in the SGSN service configuration mode.

The configuration for NRPCA can be viewed via the **show call-control-profile full name** *profile_name*. Statistics associated with NRPCA can be seen via the **show gmm-sm statistics** output and via the **show sgtpc statistics verbose** output.

Example

The following command changes the failure code for Reject messages from 200 (service not supported) to 205 (roaming restriction) for primary NRPCA for all GRPS access and all LACs:

```
network-initiated-pdp-activation primary access-type gprs all failure-
code 205
```

The following command enables network-initiated primary PDP context activation for UMTS calls from the LACs in location-area-list 1:

```
network-initiated-pdp-activation allow primary access-type umts location-
area-list instance 1
```

The following command restricts network-initiated primary PDP context activation for UMTS calls from the LACs in location-area-list 2:

```
network-initiated-pdp-activation restrict primary access-type umts
location-area-list instance 2
```

override-arp-with-ggsn-arp

Enables or disables the ability of the SGSN to override an Allocation/Retention Priority (ARP) value with one received from a GGSN. If there is no authorized Evolved ARP received from the GGSN, by default the SGSN continues to use the legacy ARP included in the Quality of Service (QoS) Profile IE.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] override-arp-with-ggsn-arp
```

remove

Adding the **remove** keyword to the command disables the override feature.

Usage

Enabling this function on the SGSN will allow the ARP sent by the GGSN, in CPCR / UPCR / UPCQ, to be applicable as an overriding value.

Example

Use this command to configure the SGSN to negotiate the ARP to be used as an overriding value:

```
override-arp-with-ggsn-arp
```

pdp-activate access-type

Configures the PDP context activation option based the type of access technology.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

pdp-activate access-type { grps | umts } { all | location-area-list instance *instance* **} failure-code** *failure_code*

default pdp-activate access-type { grps | umts } { all | location-area-list instance *instance* **} failure-code** *code*

default

Resets the configuration to system default values for PDP context activation request.

{ grps | umts }

Specifies the access technology type for PDP context activation.

- **gprs**: Enables access type as GPRS.
- **umts**: Enables access type as UMTS.

all

Default: allow
Configures the system to allow the creation of all PDP context activation requests received from MS.

location-area-list instance *instance*

Specifies the location area instance for which to create a PDP context as an integer from 1 through 5. The value must be an already defined instance of a location area code (LAC) list created via the **location-area-list** command.

failure-code *code*

Specifies the failure code for PDP context activation as an integer from 8 through 112. Default: 8

Usage

Use this command to configure this call control profile to allow GPRS/UMTS access through PDP context activation request from MS.

Example

The following command configures the system to create the PDP context for requests from MS for GPRS access with location area list instance *2* and failure-code *5*:

```
pdp-activate access-type gprs location-area-list 2 failure-code 5
```

pdp-activate allow

Configures the system to allow the PDP context activation based on the type of access technology.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

[no] pdp-activate allow access-type { grps | umts } location-area-list instance *instance*

no

Removes the configured permission to create PDP context on request of PDP context activation from MS for an access type.

access-type { grps | umts }

Specifies the access technology type for PDP context activation.

- **gprs**: Enables access type as GPRS.
- **umts**: Enables access type as UMTS.

location-area-list instance *instance*

Specifies the location area instance to create PDP context.
instance must be an integer from 1 through 5. The value must be an already defined instance of a location area code (LAC) list created via the **location-area-list** command.

Usage

Use this command to configure this call control profile to allow GPRS/UMTS access through PDP context activation request from MS.

Example

The following command configures the system to allow the PDP context activation for GPRS access type with location area list instance *2*:

```
pdp-activate allow access-type gprs location-area-list instance 2
```

pdp-activate restrict

Configures the system to restrict the PDP context activation based on the type of access technology.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] pdp-activate restrict { { access-type { grps | umts } { all | location-area-list
instance instance } | secondary-activation { access-type { grps | umts } { all |
location-area-list instance instance } } }
```

no

Removes the configured restriction on PDP context activation through this command.

access-type { grps | umts }

Specifies the access technology type for which to restrict PDP context activation.

- **gprs**: Enables access type as GPRS.
- **umts**: Enables access type as UMTS.

all

Default: allow
Configures the system to restrict all PDP context activation requests from the MS.

location-area-list instance *instance*

Specifies the location area instance to restrict PDP context activation.
list_id must be an integer from 1 through 5. The value must be an already defined instance of a location area code (LAC) list created with the **location-area-list** command.

secondary-activation

Specifies the type of PDP context to restrict for secondary activation. This keyword restricts the system to create the secondary PDP context on receiving the PDP Context Activation Request from the MS.

Usage

Use this command to configure this call control profile to restrict GPRS/UMTS access through PDP context activation request from MS.

Example

The following command configures the system to restrict the PDP context activation for request from MS to access GPRS service with location area list instance *2*:

```
pdp-activate restrict access-type gprs location-area-list instance 2
```

plmn-protocol

Configures the protocol supported by the PLMN (Public Land Mobile Network).

Product

MME

Privilege

Security Administrator, Administrator

Syntax

plmn-protocol plmnid mcc *mcc_num* **mnc** *mnc_num* **{ s5-protocol | s8-protocol } { gtp | pmip }**

remove plmn-protocol plmnid mcc *mcc_num* **mnc** *mnc_num*

remove

Deletes the definition from the call control profile configuration.

plmn-id mcc *mcc_num* **mnc** *mnc_num*

Identifies the PLMN by MCC (mobile country code) and MNC (mobile network code).
mcc_num: Enter a 3-digit integer from 100-999.
mnc_num: Enter a 2- or 3-digit integer from 00 to 999.

s5-protocol | s8-protocol

Select which protocol – S5 or S8 – that controls the identified PLMN.

gtp | pmip

Select the protocol variant - GTP or PMIP - that controls functionality for the identified PLMN.

Usage

Use this command to identify a particular PLMN and, at a higher level, its operational characteristics.

Example

The following command instructs the MME to use PLMN MCC423.MNC40.GPRS with PMIP under S8 Protocol:

```
plmn-protocol plmnid mcc 423 mnc 40 s8-protocol pmip
```

ptmsi-reallocate

Defines P-TMSI reallocation for Attach Requests, RAU Request, and Service Requests.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ptmsi-reallocate { attach | frequency *frequency* **| interval** *interval* **| routing-area-update [update-type] | service-request [service-type] } [access-type { gprs | umts }]**

ptmsi-reallocate routing-area-update [access-type { gprs | umts } | frequency *frequency* **| update-type { combined-update | imsi-combined-update | periodic | ra-update } [access-type { gprs | umts } | frequency** *frequency* **]]**

ptmsi-reallocate service-request [frequency *frequency* **| service-type { data | page-response | signaling } [frequency** *frequency* **]]**

[no | remove] ptmsi-reallocate { attach | frequency | interval | routing-area-update [update-type { combined-update | imsi-combined-update | periodic | ra-update } [access-type { gprs | umts }]] | service-request [service-type { data | page-response | signaling }] } [access-type { gprs | umts }]

no

Disables the authentication procedures configured for the specified P-TMSI reallocation configuration in the call control profile.

remove

Deletes the defined authentication procedures for the specified P-TMSI reallocation configuration from the call control profile configuration file.

attach

Enables/disables P-TMSI reallocation for Attach with local P-TMSI.

Important: IMSI or inter-SGSN Attach is not configurable and will always be reallocated.

access-type *type*

One of the following must be selected to reallocate on the basis of the type of network access:

- **gprs**
- **umts**

This keyword can be used in combination with other keywords to refine the reallocation configuration.

frequency *frequency*

Defines 1-in-N selective reallocation. If the frequency is set for 12, then the SGSN skips reallocation for the first 11 messages and reallocates on receipt of the 12th request message.
frequency must be an integer from 1 to 50.
This keyword can be used in combination with other keywords to refine the reallocation configuration.

interval *minutes*

Enter an integer between 1 and 1440 to define the time interval (in minutes) for skipping the service/RAU/attach request message procedure.

routing-area-update [update-type]

Enables/disables P-TMSI reallocation for RAU (routing area update) with local P-TMSI. To refine the reallocation configuration, include one of the optional types of updates to limit reallocation:

- **combined-update**
- **imsi-combined-update**
- **periodic**
- **ra-update**

Important: Inter-SGSN RAU will always be reallocated.

service-request [service-type]

Enables/disables P-TMSI reallocation for Service Requests. To refine the Service-Request reallocation configuration, include on of the optional service-types to limit the reallocation:

- **data**
- **page-response**
- **signaling**

Usage

By default, reallocation is not enabled. Use this command to enable P-TMSI reallocation for Attach Requests, RAU Request, and Service Requests. Fine-tune the reallocation configuration according to frequency, interval, or access-type.

Example

The following command configures the SGSN to perform P-TMSI reallocation upon receiving 2G Attach Requests

```
ptmsi-reallocate attach access-type gprs
```

The following command configures the SGSN to disable all previously defined P-TMSI reallocations based on the combined criteria of interval and 3G requests:

```
no ptmsi-reallocate interval access-type umts
```

ptmsi-signature-reallocate

Enables P-TMSI signature reallocation during Attach/RAU procedures.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

ptmsi-signature-reallocate { attach | frequency *frequency* **| interval** *interval* **| ptmsi-reallocation-command | routing-area-update [update-type] } [access-type { gprs | umts } | frequency** *frequency* **]**

ptmsi-signature-reallocate routing-area-update [access-type { gprs | umts } | frequency *frequency* **| update-type { combined-update | imsi-combined-update | periodic | ra-update }] [access-type { gprs | umts } | frequency** *frequency* **]**

[no | remove] ptmsi-signature-reallocate { attach | frequency | interval | routing-area-update [update-type { combined-update | imsi-combined-update | periodic | ra-update }] } [access-type { gprs | umts }]

no

Disables the authentication procedures configured for the specified P-TMSI signature reallocation configuration in the call control profile.

remove

Deletes the defined authentication procedures for the specified P-TMSI signature reallocation configuration from the call control profile configuration file.

attach

Enables/disables P-TMSI signature reallocation for Attach with local P-TMSI.

access-type *type*

One of the following must be selected to reallocate on the basis of the type of network access:

- **gprs**
- **umts**

This keyword can be used in combination with other keywords to refine the reallocation configuration.

frequency *frequency*

Defines 1-in-N selective reallocation. If the frequency is set for 12, then the SGSN skips reallocation for the first 11 messages and reallocates on receipt of the twelfth request message.
frequency must be an integer from 1 to 50.
This keyword can be used in combination with other keywords to refine the reallocation configuration.

interval *minutes*

Enter an integer between 1 and 1440 to define the time interval (in minutes) for skipping the service/RAU/attach request message procedure before performing a P-TMSI signature reallocation.

ptmsi-reallocation-command

Includes P-TMSI signature reallocation as a part of the P-TMSI reallocation configuration.

routing-area-update [update-type]

Enables/disables P-TMSI signature reallocation for RAU (routing area update) with local P-TMSI. To refine the reallocation configuration, include one of the optional types of updates to limit reallocation:

- **combined-update**
- **imsi-combined-update**
- **periodic**
- **ra-update**

Usage

By default, P-TMSI signature reallocation is disabled. This command allows the operator to configure when the P-TMSI signature is reallocated.

Example

The following command configures the SGSN to reallocate the P-TMSI signature for every third UMTS attach procedure:

```
ptmsi-signature-reallocate attach frequency 3 access-type umts
```

The following command configures the SGSN to reallocate the P-TMSI signature for every seventh GPRS periodic RAU procedure:

```
ptmsi-signature-reallocate routing-area-update uupdate-type periodic
frequency 7 access-type gprs
```

The following command removes all configuration instances for reallocating the P-TMSI signature based on intervals and UMTS access:

```
remove ptmsi-signature-reallocate interval access-type umts
```

qos

Configures the quality of service (QoS) parameters to be applied.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] qos { gn-gp | ue-ambr }

qos gn-gp { arp high-priority priority medium-priority priority | pre-emption {
capability { may-trigger-pre-emption | shall-not-trigger-pre-emption } | vulnerability {
not-pre-emptable | pre-emptable }

qos ue-ambr max-ul mbr_up max-dl mbr_dl
```

remove

Deletes the configuration from the call control profile.

gn-gp

Configures Gn-Gp pre-release 8 ARP and pre-emption parameters.

arp

Maps usage of ARP (address retention protocol) high-priority (H) and medium-priority (M):

- **high-priority** *priority*: Enter an integer from 1 to 13.
- **medium-priority** *priority*: Enter an integer from 2 to 14.

pre-emption

Defines the pre-emption/vulnerability criteria for PDP Contexts imported from SGSN on Gn/Gp:

- **capability**
  - **may-trigger-pre-emption**: PDP Contexts imported from Gn/Gp SGSN may preempt existing bearers.
  - **shall-not-trigger-pre-emption**: PDP Contexts imported from Gn/Gp SGSN shall not preempt existing bearers.
- **vulnerability**
  - **not-pre-emptable**: PDP Contexts imported from Gn/Gp SGSN are not vulnerable to pre-emption.
  - **pre-emptable**: PDP Contexts imported from Gn/Gp SGSN are vulnerable to pre-emption.

ue-ambr

Configures the aggregate maximum bit rate that will be stored on the UE (user equipment).

- **max-ul** *mbr-up*: Defines the maximum bit rate for uplink traffic.

  mbr-up: Enter a value from 0 to 1410065408.

- **max-dl** *mbr-up*: Defines the maximum bit rate for downlink traffic.

  mbr-up: Enter a value from 0 to 1410065408.

Usage

Use this command to configure the MME QoS parameters for the call control profile.

Example

```
qos gn-gp arp high-priority 2 medium-priority 3
```

rau-inter

Defines an acceptable procedure for inter-SGSN routing area updates.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

rau-inter access-type { all | location-area-list instance *instance* **} { failure-code** *fail_code* **| user-device-release { before-r99 } { failure-code** *fail_code* **| r99-or-later } { failure-code** *fail_code* **} }**

default rau-inter access-type { all | location-area-list instance *instance***} user-device-release { before-r99 failure-code | r99-or-later failure-code }**

no rau-inter { allow access-type | restrict access-type } { [all] failure-code *fail_code* **| location-area-list instance** *instance* }

default rau-inter { allow access-type | restrict access-type } { [all] failure-code *fail_code* **| location-area-list instance** *instance* **} }**

---

no

Including "no" as part of the command structure disables the values already configured for parameters specified in the command.

---

default

Resets the configuration of specified parameters to system default values.

---

allow access-type

Including this keyword-set with one of the following options, configures the SGSN to allow MS/UE with the identified access-type extension to be part of the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

---

restrict access-type

Including this keyword-set with one of the following options, configures the SGSN to restrict MS/UE with the identified access-type extension from the inter-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

---

all

all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.

location-area-list instance *instance*

list_id must be an integer between 1 and 5. The value must be an already defined instance of a location area code (LAC) list created with the **location-area-list** command.

failure-code *fail-code*

Specify a GSM Mobility Management (GMM) failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS.
fail-code must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

user-device-release { before-r99 | r99-or-later } failure-code *code*

Default: Disabled
Enables the SGSN to reject an Inter-RAU procedure based on the detected 3GPP release version of the MS equipment and selectively send a failure cause code in the reject message. The SGSN uses the following procedure to implement this configuration:

1. When Attach Request is received, the SGSN checks the subscriber's IMSI and current location information.
2. Based on the IMSI, an operator policy and call control profile is found that relates to this Attach Request.
3. call control profile is checked for access limitations.
4. Attach Request is checked to see if the revision indicator bit is set
   - if not, then the configured common failure code for reject is sent;
   - if set, then the 3GPP release level is verified and action is taken based on the configuration of this parameter

One of the following options must be selected and completed:

- **before-r99**: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111.

- **r99-or-later**: Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111.

Usage

Use this command to configure the restrictions and function of the inter-RAU procedure.

Example

```
default rau-inter allow access-type gprs location-area-list instance 1
```

rau-inter-plmn

Enables or disables restriction of all Routing Area Updates (RAUs) occurring between different PLMNs.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

rau-inter-plmn access-type { all | location-area-list instance *instance* **} { failure-code** *fail_code* **| user-device-release { before-r99 } failure-code** *fail_code* **| r99-or-later } { failure-code** *fail_code* **} }**

default rau-inter-plmn access-type { all | location-area-list instance *instance***} user-device-release { before-r99 failure-code | r99-or-later failure-code }**

[no] rau-inter-plmn { restrict | allow } access-type { gprs | umts } { all | location-area-list instance instance }

[no] rau-inter-plmn { allow access-type | restrict access-type } { [all] failure-code *fail_code* **| location-area-list instance** *instance* **}**

default rau-inter { allow access-type | restrict access-type } { [all] failure-code *fail_code* **| location-area-list instance** *instance* **} }**

no

Including "no" as part of the command structure disables the values already configured for parameters specified in the command.

default

Resets the configuration of specified parameters to system default values.

allow access-type

Including this keyword-set with one of the following options, configures the SGSN to allow MS/UE with the identified access-type extension to be part of the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

restrict access-type

Including this keyword-set with one of the following options, configures the SGSN to restrict MS/UE with the identified access-type extension from the inter-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

all

all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.

location-area-list instance *instance*

list_id must be an integer between 1 and 5. The value must be an already defined instance of a LAC list created with the **location-area-list** command.

failure-code *fail-code*

Specify a GSM Mobility Management (GMM) failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS.
fail-code must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state

- 111 - Protocol error, unspecified

user-device-release { before-r99 | r99-or-later } failure-code *code*

Default: Disabled
Enables the SGSN to reject an Inter-RAU procedure based on the detected 3GPP release version of the MS equipment and selectively send a failure cause code in the reject message. The SGSN uses the following procedure to implement this configuration:

1. When Attach Request is received, the SGSN checks the subscriber's IMSI and current location information.
2. Based on the IMSI, an operator policy and call control profile are found that relate to this Attach Request.
3. The call control profile is checked for access limitations.
4. Attach Request is checked to see if the revision indicator bit is set
   - if not, then the configured common failure code for reject is sent;
   - if set, then the 3GPP release level is verified and action is taken based on the configuration of this parameter

One of the following options must be selected and completed:

- **before-r99**: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111.

- **r99-or-later**: Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111.

Usage

Use this command to configure the restrictions and function of the inter-RAU procedure occurring across RNCs or BSSs where the PLMN changes. For example:

- inter-IuPS RAU, where the two IuPSs have different PLMNs
- inter-GPRS RAU, where the two GPRSs have different PLMNs
- inter-RAT RAU (2G > 3G), where the IuPS/GPRS services have different PLMNs
- inter-RAT-RAU (3G > 2G), where the IuPS/GPRS services have different PLMNs

Example

```
default rau-inter allow access-type gprs location-area-list instance 1
```

rau-intra

Defines an acceptable procedure for intra-SGSN Routing Area Updates (RAUs).

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

rau-intra access-type { all | location-area-list instance *instance* **} { failure-code** *fail_code* **| user-device-release { before-r99 } { failure-code** *fail_code* **| r99-or-later } { failure-code** *fail_code* **} }**

default rau-intra access-type { all | location-area-list instance *instance***} user-device-release { before-r99 failure-code | r99-or-later failure-code }**

rau-intra { allow access-type | restrict access-type } { [all] failure-code *fail_code* **| location-area-list instance** *instance* **} }**

no rau-intra { allow access-type | restrict access-type } { [all] failure-code *fail_code* **| location-area-list instance** *instance* **}**

default rau-intra { allow access-type | restrict access-type } { [all] failure-code *fail_code* | location-area-list instance *instance* **} }**

---

no

Including "no" as part of the command structure disables the values already configured for parameters specified in the command.

---

default

Resets the configuration of specified parameters to system default values.

---

allow access-type

Including this keyword-set with one of the following options, configures the SGSN to allow an MS/UE with the identified access-type extension to be part of the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

---

restrict access-type

Including this keyword-set with one of the following options, configures the SGSN to restrict an MS/UE with the identified access-type extension from the intra-RAU procedure.

- **gprs** - General Packet Radio Service
- **umts** - Universal Mobile Telecommunications System

all

all - adding this option to the keyword determines that the failure cause code will be applicable to all location areas.

location-area-list instance *instance*

list_id must be an integer between 1 and 5. The value must be an already defined instance of a location area code (LAC) list created via the **location-area-list** command.

failure-code *fail-code*

Specify a GSM Mobility Management (GMM) failure cause code to identify the reason an inter SGSN RAU does not occur. This GMM cause code will be sent in the reject message to the MS.
fail-code must be an integer from 2 to 111. Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 -MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated
- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state

- 111 - Protocol error, unspecified

user-device-release { before-r99 | r99-or-later } failure-code *code*

Default: Disabled
Enables the SGSN to reject an Intra-RAU procedure based on the detected 3GPP release version of the MS equipment and selectively send a failure cause code in the reject message. The SGSN uses the following procedure to implement this configuration:

1. When Attach Request is received, the SGSN checks the subscriber's IMSI and current location information.
2. Based on the IMSI, an operator policy and call control profile are found that relate to this Attach Request.
3. Call control profile is checked for access limitations.
4. Attach Request is checked to see if the revision indicator bit is set
   - if not, then the configured common failure code for reject is sent;
   - if set, then the 3GPP release level is verified and action is taken based on the configuration of this parameter

One of the following options must be selected and completed:

- **before-r99**: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111.

- **r99-or-later**: Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111.

Usage

Use this command to configure the restrictions and function of the intra-RAU procedure.

Example

```
default rau-intra allow access-type gprs location-area-list instance 1
```

re-authenticate

Enables or disables the re-authentication feature. This command is available in releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
re-authenticate [ access-type { gprs | umts } ]

remove re-authenticate
```

remove

Including this keyword with the command disables the feature. The feature is disabled by default.

access-type

Defines the type of access to be allowed or restricted.

- **gprs**
- **umts**

If this keyword is not included, then both access types are allowed by default.

Usage

Use this command to enable or disable the re-authentication feature, which instructs the SGSN to retry authentication with another RAND in situations where failure of the first authentication has occurred. To address the introduction of new SIM cards, for security reasons a systematic "last chance" authentication retry with a fresh Authentication Vector is needed, particularly in cases where there is an SRES mismatch at authentication.

Example

```
re-authenticate
```

regional-subscription-restriction

Allows the operator to define the cause code for subscriber rejection when it is due to regional subscription information failure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

`[ remove ] regional-subscription-restriction [ failure-code` *`code`* **`| user-device-release { before-r99 failure-code`** *`code`* **`| r99-or-later failure-code`** *`code`* **`} ]`**

`remove`

This keyword causes the configuration to be deleted from the call control profile configuration.

`failure-code` *`cause_code`*

`cause_code:` Enter an integer from 2 to 111; default code is 13 (roaming not allowed in this location area [LA]).
Refer to the GMM failure cause codes listed below (from section 10.5.5.14 of the 3GPP TS 124.008 v7.2.0 R7):

- 2 - IMSI unknown in HLR
- 3 - Illegal MS
- 6 - Illegal ME
- 7 - GPRS services not allowed
- 8 - GPRS services and non-GPRS services not allowed
- 9 - MSID cannot be derived by the network
- 10 - Implicitly detached
- 11 - PLMN not allowed
- 12 - Location Area not allowed
- 13 - Roaming not allowed in this location area
- 14 - GPRS services not allowed in this PLMN
- 15 - No Suitable Cells In Location Area
- 16 - MSC temporarily not reachable
- 17 - Network failure
- 20 - MAC failure
- 21 - Synch failure
- 22 - Congestion
- 23 - GSM authentication unacceptable
- 40 - No PDP context activated

- 48 to 63 - retry upon entry into a new cell
- 95 - Semantically incorrect message
- 96 - Invalid mandatory information
- 97 - Message type non-existent or not implemented
- 98 - Message type not compatible with state
- 99 - Information element non-existent or not implemented
- 100 - Conditional IE error
- 101 - Message not compatible with the protocol state
- 111 - Protocol error, unspecified

---

user-device-release { before-r99 | r99-or-later } failure-code *code*

Enables the SGSN to assign a reject cause code based on the detected 3GPP release version of the MS equipment.
One of the following options must be selected and completed:

- **before-r99**: Indicates the MS would be a 3GPP release prior to R99 and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111. Refer to the list above.

- **r99-or-later**: Indicates the MS would be a 3GPP Release 99 or later and an appropriate failure code should be defined.

  failure-code *code*: Enter an integer from 2 to 111. Refer to the list above.

Usage

Use this command to define GMM reject cause codes when rejection is due to regional subscription information failure.

Example

The following command sets a location area rejection message, code 12 for regional restriction rejections:

```
regional-subscription-restriction failure-code 12
```

reuse-authentication-triplets

Creates a configuration entry to enable or disable the reuse of authentication triplets in the event of a failure.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no | remove } reuse-authentication-triplets no-limit
```

no

Disables this configuration entry and disables reuse of authentication triplets.

remove

This keyword causes the reuse configuration to be deleted from the call control profile configuration. This is the default behavior. Triplets are reused.

no-limit

This keyword enables reuse triplets as needed.

Usage

Use this command to enable reuse of authentication triplets.

Example

```
reuse-authentication-triplets no limit
```

rfsp-override

Configures RAT frequency selection priority override parameters for this call control profile.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

rfsp-override { default | ue-val *value* **new-val** *value* **+ }**

remove rfsp-override { default | ue-val *value*

remove

Deletes the rfsp-override configuration from the call control profile.

default

Restores the default value assigned.

ue-val *value*

Assign the UE value for the RAT frequency selection priority.
value: Enter an integer from 1 to 256.

new-val *value*

Assign a new value for the RAT frequency selection priority as an integer from 1 to 256.

Usage

Use this command to configure the RAT frequency selection priority override parameter. Multiple UE value/new value combinations can be configured.

Example

Reset the default value for the RAT frequency selection priority override function:

```
rfsp-override default
```

s1-reset

Configures the behavior of user equipment (UE) on S1-reset.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
s1-reset { detach-ue | idle-mode-entry }

default s1-reset
```

default

Reset the profile configuration to the system default of **idle-mode-entry**.

detach-ue

Upon S1-reset the MME will detach the UE.

idle-mode-entry

Upon S1-reset the MME will move the UE to idle-mode. This is the default setting for this command.

Usage

Use this command to set the MME's reactions to an S1-reset.

Example

Configure the MME to put the UE into idle-mode upon receipt of S1-reset:

```
s1-reset idle-mode-entry
```

sctp-down

Configures the behavior towards UE (user equipment) when Stream Control Transmission Protocol (SCTP) goes down.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
sctp-down { detach-ue | idle-mode-entry }

default sctp-down
```

default

Reset the profile configuration to the system default when SCTP layer goes down. The default for this command is **idle-mode-entry**.

detach-ue

When SCTP goes down, the MME will detach the UE.

idle-mode-entry

When the SCTP goes down, the MME will move the UE to idle-mode. This is the default for this command.

Usage

Use this command to set the MME's reactions when the SCTP goes down.

Example

Configure the MME to put the UE into idle-mode when the SCTP layer goes down:

```
sctp-down idle-mode-entry
```

sgsn-address

Defines the IP addresses for peer SGSNs in a static SGSN address table. These configured addresses can be used rather than using DNS.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
sgsn-address rac rac-id lac lac_id [ nri nri ] prefer { fallback-for-dns | local }
address { ipv4 ip_address | ipv6 ip_addess }

no sgsn-address { ipv4 ip_address | ipv6  ip_addess } rac  rac_id lac lac_id [ nri nri
```

no

Disables the peer-SGSN address configuration for the designated IP address.

rac *rac_id*

Identifies the foreign routing area code (RAC) of the peer-SGSN address to be configured in the static peer-SGSN address table. *rac_id* must be an integer from 1 to 255.

lac *lac_id*

Identifies the foreign location area code (LAC) ID of the peer-SGSN address to be configured in the static peer-SGSN address table. *lac_id* must be an integer from 1 to 65535.

nri *nri*

Identifies the network resource identifier stored in the P-TMSI (bit 17 to bit 23). *nri* must be an integer from 0 to 63.

Important: Typically, use of this keyword is optional. However, it must be included in the command when Flex (SGSN-Pooling) is implemented.

prefer

Indicates the preferred source of the address to be used.

- **fallback-for-dns** -

  Important: The **fallback-for-dns** option is under development for future use and is not supported in this release.

- **local** - instructs the system to use the local IP address configured with this command.

address *ip_address*

- **ipv4** - specifies a valid address in IPv4 dotted-decimal notation.

- **ipv6 -**

  Important: The **ipv6** option is under development for future use and is not supported in this release.

Usage

Use this command to save time by avoiding DNS. This command enables a local mapping by setting the peer-SGSN IP address to be used for inter-SGSN Attach and inter-SGSN-RAU. When configured, if the SGSN receives a RAU or an Attach Request with a P-TMSI and an old-RAI that is not local, the SGSN consults this table and uses the configured IP address instead of resolving via DNS. If this table is not configured, then IP address resolution is done using DNS.

The MCC and MNC of the RAI are taken from the IMSI range configured in the operator policy and the LAC and RAC are configured here in the call control profile configuration mode.

The **sgsn-address** command differs from other Call Control Profile configuration mode commands in the following ways:

- Within the SGSN's call logic, all other configuration elements defined with the other commands in this mode are used *after* the IMSI is learnt. The configuration defined with this command is part of the decision logic *prior* to the IMSI being known.
- With the peer-SGSN address configured using this **sgsn-address** command, the peer-SGSN-RAI's MCC/MNC is used as a 5 or 6-digit IMSI and the operator policy and call control profile selection are completed.

Important: Typically, use of this command is optional. However, it must be included in the configuration when Flex (SGSN-Pooling) is implemented if (1) the SGSN functions as a default SGSN, then configure the local-NRI of other SGSN with this command; or if (2) another SGSN is offloading, then configure the NB-RAI/null-NRI of the peer-SGSN with this command.

Example

Create a local peer-SGSN address mapping of an RAI with RAC of *123* and LAC of *4444* and an *IPv4* address of *123.11.313.11* for the peer-SGSN:

```
sgsn-address rac 123 lac 4444 local address ipv4 123.11.313.11
```

sgsn-core-nw-interface

This command is under development and not yet supported for configuration.

Product

SGSN

Privilege

Security Administrator, Administrator

sgsn-number

Defines the SGSN's E.164 number to be used for interactions via the Mobile Application Part (MAP) protocol. E.164 is an ITU-T recommendation that defines the international public telecommunication numbering plan used in public switched telephone networks (PSTN) and some other data networks.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgsn-number *E164_number*

no sgsn-number

no

Disables the use of this configuration definition.

E164_number

Specifies a string of 1 to 16 digits that serve as the SGSN's E.164 identification.

Usage

This command configures the current SGSN E164 contact number.
The SGSN number configured for a call control profile is related to the SGSN number configured in the SGSN service configuration and/or in the GPRS service configuration. If the SGSN number is not configured as part of the call control profile configuration, then the SGSN number defined as part of the SGSN service or GPRS service configuration is used.
When the 3G SGSN supports multiple PLMNs configured through different IuPS services or when network sharing is implemented, then it may be required to use different SGSN numbers for each PLMN. In such cases, configure the per-PLMN SGSN number in a call control profile. SGSN number definition for a call control profile allows emulation of a different SGSN to each HLR per PLMN. SGSN number definitions in the call control profile also enable the SGSN to use a different SGSN number per operator when network sharing is implemented.

Example

Map the E.164 number *198765432123456* for the SGSN to this call control profile configuration:

```
sgsn-number 198765432123456
```

sgtp-service

Identifies the SGTP service configuration to be used according to this call control profile.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

sgtp-service context *ctxt_name* **service** *sgtp_service_name*

no sgtp-service context

context *ctxt_name*

Specifies the SGTP context as an alphanumeric string of 1 through 64 characters.

service *sgtp_service_name*

Specifies the SGTP service name as an alphanumeric string of 1 through 64 characters.

no

Disables use of SGTP service.

Usage

Use this command to configure enabling or disabling of SGTP service for this call control profile.

Example

```
sgtp-service context sgtp1 service sgtp-srvc1
```

sms-mo

Configures how mobile-originated (MO) short message service (SMS) messages are handled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] sms-mo { { access-type { gprs | umts } { all-location-areas | location-area-
list } | allow access-type { gprs | umts } | restrict access-type { gprs | umts } }
```

remove

Deletes the specified configuration.

access-type *type*

Access by SMS will be limited to SMS coming from this network type:

- **gprs**
- **umts**

allow

Allow either GPRS or UMTS type access for SMS.

restrict

Restrict either GPRS or UMTS type access for SMS.

location-area-list instance *instance*

instance must be an integer between 1 and 5. The value must identify an already defined location area code (LAC) list created with the **location-area-list** command.

failure-code *code*

code: Must be an integer from 2 to 111.

Usage

Configure filtering for SMS-MO messaging.

Example

```
sms-mo access-type gprs all-location-areas failure-code 100
```

sms-mt

This command configures how mobile-terminated (MT) short message service (SMS) messages are handled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] sms-mt { { access-type { gprs | umts } { all-location-areas | location-area-
list } | allow access-type { gprs | umts } | restrict access-type { gprs | umts } }
```

remove

Deletes the specified configuration.

access-type *type*

Access by SMS will be limited to SMS coming from this network type:

- **gprs**
- **umts**

allow

Allow either GPRS or UMTS type access for SMS.

restrict

Restrict either GPRS or UMTS type access for SMS.

location-area-list instance *instance*

instance must be an integer between 1 and 5. The value must identify an already defined LAC list created with the **location-area-list** command.

failure-code *code*

code: Must be an integer from 2 to 111.

Usage

Configure filtering for SMS-MT messaging.

Example

```
sms-mt access-type gprs all-location-areas failure-code 100
```

srns-inter

Defines handling parameters for Inter-SRNS (Serving Radio Network Subsystem) relocation.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

srns-inter (all failure-code | allow location-area-list instance *instance* **| location-area-list instance** *instance* **failure-code** *code* **| restrict location-area-list instance** *instance* **}**

no srns-inter { allowlocation-area-list instance *instance* **| restrictlocation-area-list instance** *instance* **}**

default srns-inter { all | location-area-list-instance *instance* **}**

no

Deletes the inter-SRNS relocation configuration.

default

Resets the configuration to default values.

all failure-code *code*

Define the failure code that will apply to all inter-SRNS relocations.
code: Must be an integer from 2 to 111.

allow location-area-list instance *instance*

Identify the location area list Id (LAC Id) that will allow services in the defined location area.

location-area-list instance *instance*

instance: Must be an integer between 1 and 5 that identifies the previously defined location area list created with the **location-area-list** command.

restrict location-area-list instance *instance*

Identify the location area list Id (LAC Id) that indicates the location areas where services will be restricted.

Usage

This command defines the operational parameters for inter-SRNS relocation.

Example

The following command allows services in areas listed in LAC list #3:

```
srns-inter allow location-area-list instance 3
```

srns-intra

Defines handling parameters for intra-SRNS (Serving Radio Network Subsystem) relocation.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

srns-intra (all failure-code | allow location-area-list instance *instance* **| location-area-list instance** *instance* **failure-code** *code* **| restrict location-area-list instance** *instance* **}**

no srns-intra { allow location-area-list instance *instance* **| restrictlocation-area-list instance** *instance* **}**

default srns-intra { all | location-area-list-instance *instance* **}**

no

Deletes the intra-SRNS relocation configuration.

default

Resets the configuration to default values.

all failure-code *code*

Define the failure code that will apply to all intra-SRNS relocations.
code: Must be an integer from 2 to 111.

allow location-area-list instance *instance*

Identify the location area list Id (LAC Id) that will allow services in the defined location area.

location-area-list instance *instance*

instance: Must be an integer between 1 and 5 that identifies the previously defined location area list created with the **location-area-list** command.

restrict location-area-list instance *instance*

Identify the location area list Id (LAC Id) of the target RNC to determine the location areas where services will be restricted.

Usage

This command defines the operational parameters for intra-SRNS relocation.

Example

The following command restricts service in areas listed in the LAC list 1:

```
srns-intra restrict location-area-list instance 1
```

subscriber-control-inactivity

Configures \the subscriber-control inactivity timer. The system detects inactivity when no PDP context is activated and starts the timer.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

subscriber-control-inactivity timeout minutes *time* **detach { immediate | next-connection | reattach-time-period }**

{ no | default } subscriber-control-inactivity

---

no

Deletes the timer configuration.

---

default

Resets the timer configuration to the default value of 7 days (10080 minutes).

---

timeout minutes *time***[detach]**

Sets the number of minutes the SGSN monitors the connection after inactivity has been detected. When the timer expires, the subscribe will be detached.
time: Enter an integer from 1 to 20160 (two weeks).

---

detach [immediate | next-connection | reattach-time-period]

Instructs the SGSN to detach and can be configured to specify when the detach will occur after inactivity is detected. To fine-tune the detach instruction, include one of the following with the command:

- **immediate** - Instructs the SGSN to detach immediately after inactivity is detected. May combine with **reattach-time-period**.
- **next-connection** - instructs the SGSN to detach after the next Iu connection after inactivity is detected.

  Important: Supported for 3G SGSNs only.

- **reattach-time-period** *period***[action]** - Specify the number of seconds the SGSN will monitor a new re-attach after the previous detach was due to inactivity. Also, you can define the action to be taken regarding new attaches.

  period: Enter an integer from 60 to 3600.

  action - Select an action:

  - **deny**
  - **permit-and-stop-monitoring**

Usage

Use this command to configure the timeout timer. After this timer times out the subscriber is detached from the SGSN.

Example

The following command instructs the SGSN to monitor the connection for up to *360* minutes after inactivity is detected, or detach immediately after inactivity is detected:

```
subscriber-control-inactivity timeout minutes 360 detach immediate
```

super-charger

Enables or disables the SGSN to work with a super-charged network.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] super-charger
```

remove

Disables the super-charger functionality.

Usage

By enabling the super charger functionality for 2G or 3G connections controlled by an operator policy, the SGSN changes the hand-off and location update procedures to reduce signalling traffic management.

Example

The following command enables the super charger feature:

```
super-charger
```

tau

Configure parameters for the tracking area update (TAU) procedure.

Product

MME

Privilege

Security Administrator, Administrator

Syntax

```
tau { imei-query-type { imei | imei-sv | none } [ verify-equipment-identity [ allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency ] ] | inter-rat security-ctxt { allow-mapped | native } }

remove tau { imei-query-type | inter-rat security-ctxt }
```

remove

Deletes this TAU configuration from the call control profile.

imei-query-type { imei | imei-sv | none }

This keyword set is specific to the MME.
Sets the IMEI query-type if an IMEI (International Mobile Equipment Identity) is not already present.

- **imei**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity (IMEI).
- **imei-sv**: Specifies that the MME is required to query the UE for its International Mobile Equipment Identity - Software Version (IMEI-SV).
- **none**: Specifies that the MME does not need to query for IMEI or IMEI-SV.

verify-equipment-identity [allow-on-eca-timeout | deny-greylisted | deny-unknown | verify-emergency]

Specifies that the identification (IMEI or IMEI-SV) of the UE is to be performed by the Equipment Identity Register (EIR) over the S13 interface.

- **allow-on-eca-timeout**: Configures the MME to allow equipment that has timed-out on ECA during the attach procedure.
- **deny-greylisted**: Configures the MME to deny grey-listed equipment during the attach procedure.
- **deny-unknown**: Configures the MME to deny unknown equipment during the attach procedure.
- **verify-emergency**: Configures the MME to ignore the IMEI validation of the equipment during the attach procedure in emergency cases. This keyword is only supported in release 12.2 and higher.

inter-rat security-ctxt { allow-mapped | native }

Configure inter-RAT parameters for TAU. This keyword provides the operator with the option of continuing with the mapped context or creating a new native context after an inter-RAT handover.

- **allow-mapped**: Configures inter-RAT security-context type as mapped. Mapped security context is allowed after inter-RAT handover. This is the default value.

- **native**: Configures inter-RAT security-context type as native only. Inter-RAT handover will always result in a native security context.

Usage

Use this command to define tracking area update procedures such as inter-RAT security context and IMEI query-type.

Example

The following command sets the IMEI query type to IMEI-SV:

```
tau imei-query-type imei-sv verify-equipment- identity
```

treat-as-hplmn

Enables or disables the MME or SGSN to treat an IMSI series as coming from the home PLMN.

Product

MME, SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ remove ] treat-as-hplmn
```

remove

Deletes this configuration from the profile. This would disable this function and is the default.

Usage

Use this command to enable or disable the MME/SGSN to treat an IMSI series as coming from the home PLMN.

Example

The following command disables previously configured feature:

```
remove treat-as-hplmn
```

zone-code

Configures a zone code listing of one or more location area code (LACs) included in the zone.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

zone-code *zc_id* **location-area-code** *lac*

no zone-code *zc_id* **[location-area-code** *lac* **]**

no

Removes either a specific LAC from the zone code list. If the **location-area-code** parameter is not included in the command, then the entire zone code list definition is removed from configuration.

zc_id

Identifies an instance of a zone code list as an integer from 1 to 65535.
An unlimited number of zone code lists can be configured per call control profile as the zone code lists are allocated dynamically. A maximum of 10 zone code lists can be configured per Call Control Profile.

location-area-code *lac*

Prompts for the location area-code(s), where the subscribers can roam, that are part of the zone. *lac* is an integer from 1 to 65535.
Repeat the command with this parameter to include up to 100 LACs in the zone code list.

Usage

Important: While there is no limit to the number of zone codes that can be created, only 10 LACs per zone code can be defined.

Use this command to define zone code restrictions. Regional subscription data at the home location register (HLR) is used to determine the regional subscription area in which the subscriber is allowed to roam. The regional subscription data consists of a list of zone codes. A zone code is comprised of one or more location areas (identified by a LAC) into which the subscriber is allowed to roam. Regional subscription data, if present in the insert subscriber data (ISD) request from the HLR, defines the subscriber's subscription area for the addressed SGSN. It contains the complete list (up to 10 zone codes) that apply to a subscriber in the currently visited PLMN.
During the GPRS Location Update procedure, the zone code list is received in the ISD request from the HLR. The zone code list from the HLR is validated against the configured values in the operator policy. If matched, then the ISD is allowed to proceed. If not matched, then the ISD response is that the Network Node Area is Restricted and the GPRS Location Update procedure fails. If no zone codes are included in the ISD (whether or not the zone codes are defined in the SGSN configuration), then checking is not done.

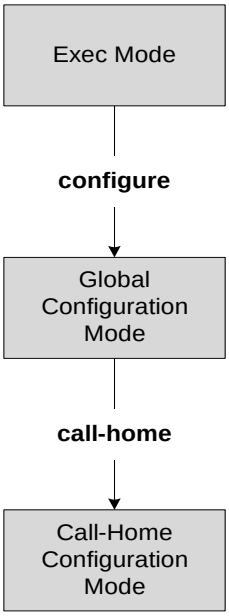
Example

The following command defines multiple LACs for zone code 1:

```
zone-code 1 lac 413 212 113
```

Chapter 44
Call-Home Configuration Mode

The Call-Home Configuration Mode sets parameters for the Smart Call Home feature. Smart Call Home is a contracted service that sends real-time alerts, remediation, and personalized web-based reports to the Cisco Technical Assistance Center (TAC) and other configured receivers.



activate

Activates the Cisco Smart Call Home service.

Product

All

Privilege

Security Administrator, Administrator

Syntax

activate

default activate

no activate

default

Configures the call-home service back to default settings.

no

Disables the call-home services.

activate

Enables the call-home services.

Usage

Use this command to enable the call-home services.

Example

The following command disables the call-home service:

```
no activate
```

alert-group

Enables or disables the Smart Call Home alert-group.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default | no] alert-group { all | configuration | crashinfo | diagnostic | environment | inventory | syslog }

default

Configures the alert-group back to default settings. The default is enabled.

no

Disables the alert-groups.

alert-group all

Enables an alert group for all categories.

alert-group configuration

Enables an alert group related to configuration.

alert-group crashinfo

Enables an alert group related to crashes.

alert-group diagnostics

Enables an alert group related to diagnostics.

alert-group environment

Enables an alert group related to environment. These typically include events related to power, fan, and temperature alarms.

alert-group inventory

Enables an alert group related to inventory. This is a non-critical event that could include notifications when cards are inserted or removed, or when the system is cold-booted.

alert-group syslog

Enables an alert group related to syslog. This includes events generated by the syslog PORT facility.

Usage

An alert group is a predefined subset of Smart Call Home alerts that are supported on this device. Alert groups allow you to select the set of Smart Call Home alerts that you want to send to a predefined or custom destination profile.

Example

The following command enables alerts for all of the preconfigured Smart Call Home alerts:

```
alert-group all
```

contact-email-addr

Sets the e-mail address of the person identified as the prime contact for this system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] contact-email-addr *email_addr*

no

Removes the contact e-mail address.

contact-email-addr *email_addr*

Specifies the information for prime contact as an alphanumeric string in the format *local-part@domain*, where domain can be made up of a number of labels, each separated by a period and between 1 and 63 characters in length. The local-part can be 1-64 characters. The domain-label can be 1-63 characters. The domain can be 1 through 135 characters. The entire alphanumeric string can be a no larger than 200 characters.

Usage

Use this command to set up the e-mail address for the person identified as the contact person for this device.

Important: You can enter any valid e-mail address. You cannot use spaces.

Example

The following command specifies e-mail address for the entity *notity.TAC@NOCservices.net*:

```
contact-email-addr notity.TAC@NOCservices.net
```

contract-id

Configures the system's contract-identifier for Cisco AutoNotify.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default | no] contract-id *contractID*

default

Configures the call-home contract-id back to default settings.

no

Removes the call-home contract-id.

contract-id *contractID*

Specifies the call-home contract-id as an alphanumeric string of 1 through 64 characters that is case sensitive. If you include spaces in this string, you must enclose it in double quotation marks.

Usage

Use this command to enter this system's AutoNotify contract ID.

Example

The following command specifies the contract-id as *Contract1234_ID*:

```
contract-id Contract1234_ID
```

customer-id

Configures the system's customer-identifier for Cisco AutoNotify.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default | no] customer-id *customerID*

default

Configures the call-home customer-id back to default settings.

no

Removes the call-home customer-id.

customer-id *customerID*

Specifies the call-home customer-id as an alphanumeric string of 1 through 64 characters that is case sensitive. If you include spaces in the string, you must enclose it in double quotation marks.

Usage

Use this command to set up the system's customer ID for Cisco's AutoNotify.

Example

The following command specifies the customer-id as *CustID_1234*:

```
customer-id CustID_1234
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

mail-server

Configures the Smart Call Home mail-server.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] mail-server *server_name* **priority** *priority_num*

no

Removes the call-home mail-server.

mail-server *server_name*

Identifies the mail server as an alphanumeric string of 1 through 64 characters. The server ID can take the form of a host name (DNS) or an IPv4 address in dotted-decimal notation.

priority

Sets the mail server priority order as an integer from 1 (highest) to 100 (lowest).

Usage

Use this command to set up the mail server for Smart Call Home. This configuration is mandatory when the user profile is configured to only send out e-mail messages.

Example

The following command specifies the mail-server as *10.2.3.4* with a priority of *1*:

```
mail-server 10.2.3.4 priority 1
```

phone-number

Enables or disables the phone-number for the Smart Call Home contact person.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no | default] phone-number *phone-number-string*

default

Configures the phone number back to default settings. The default is enabled.

no

Removes the call-home phone number.

phone-number *phone-number-string*

Specifies the phone number for the contact person for this system as an alphanumeric string that can only contain: + (plus sign), - (dash) and numbers. The total length of the string is 12 to 16 characters. If you include spaces, you must enclose the string in double quotation marks.

Usage

Use this command to set up the phone number for Smart Call Home contact.

Example

The following command specifies the phone number as *+866-111-2234*:

```
phone-number 866-111-2234
```

profile

Creates the Smart Call Home profile.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no] profile *profile_name*

no

Removes the call-home profile.

profile *profile_name*

Creates or modifies the profile name for this system as an alphanumeric string of 1 through 31 characters.

Usage

Use this command to create a new profile or modify an existing profile. This command moves you to the Call-Home Profile Configuration mode.

Example

The following command creates a profile named *Profile_1*:

```
profile Profile_1
```

rate-limit

Enables or disables the message rate-limit for Smart Call Home features.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no | default] rate-limit *message_count*

default

Sets the rate limit back to the default of 20 messages per minute.

no

Removes the call-home rate-limit.

rate-limit *message_count*

Sets the rate limit in messages per minute. *message_count* is an integer from 1 to 60. Default: 20

Usage

Use this command to configure the call-home message rate limit per minute. The default is 20 messages per minute.

Example

The following command sets the call-home rate limit to *10*:

```
rate-limit 10
```

sender

Specifies the Smart Call Home e-mail settings for the “from” address and “reply-to” address.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[no | default] sender { from *email_address* **| to** *email_address* **}**

default

Sets the sender back to the default.

from *email_address*

Sets the sender’s reply from address.

no

Removes the call-home sender.

to *email_address*

Sets the sender’s reply-to address.

email_address

This is an alphanumeric string in the format *local-part@domain*, where domain can be made up of a number of labels, each separated by a period and between 1 and 63 characters in length. The local-part can be 1-64 characters. The domain-label can be 1-63 characters. The domain can be 1 through 135 characters. The entire alphanumeric string can be a no larger than 200 characters.

Usage

Use this command to specify the e-mail settings for the sender. This command sets the “to” and “from” fields in the e-mail.

Example

The following command sets the from address to *notity.TAC@NOCservices.net* and the reply-to address to *support@cisco.com*:

```
semder from notity.TAC@NOCservices.net to support@cisco.com
```

site-id

Specifies the Smart Call Home site identifier for this system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default | no] site-id *siteID*

default

Sets the site-id back to the default.

no

Removes the call-home site-id.

site-id *siteID*

Specifies the site ID as an alphanumeric string of 1 through 200 characters. If you include spaces, then you must enclose your entry in quotes.

Usage

Use this command to specify the Smart Call Home site identifier for this system.

Example

The following command sets the site-id to *NOC_Services_site_1011*:

```
site id NOC_Services_site_1011
```

street-address

Specifies the Smart Call Home street address for the system.

Product

All

Privilege

Security Administrator, Administrator

Syntax

[default | no] street-address *streetADR*

default

Sets the street-address back to the default.

no

Removes the call-home street-address.

street-address *streetADR*

Specifies e Smart Call Home street-address as an alphanumeric string of 1 through 200 characters. You can include the street address, City, State, and ZIP Code. If you include spaces, then you must enclose the string in double quotation marks.

Usage

Use this command to set up the street address for the system.

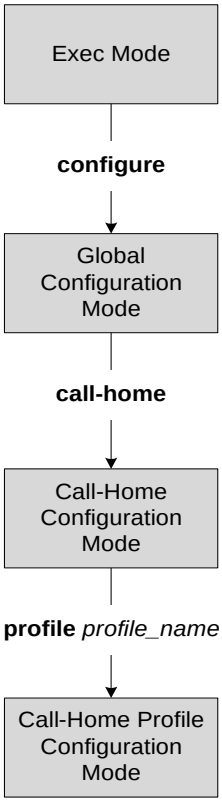
Example

The following command sets the street address to *123 Main St., Chicago, IL 60000*:

```
street-address "123 Main St., Chicago, IL 60000"
```

Chapter 45
Call-Home Profile Configuration Mode

The Call-Home Profile Configuration Mode is used to create groups of users that will receive alerts when events occur. The Smart Call Home service sends real-time alerts, remediation, and personalized web-based reports to the Cisco Technical Assistance Center (TAC) and other configured receivers.



active

Activates this Smart Call Home profile.

Product

All

Privilege

Security Administrator, Administrator

Syntax

active

default active

no active

default

Configures the call-home profile back to default settings. By default, the profile is enabled.

no

Deletes the call-home profile.

activate

Activates this Smart Call Home profile.

Usage

Use this command to activate or deactivate this call-home profile. By default, the profile is enabled.

Example

The following command disables the call-home profile:

```
no active
```

destination

Configures the message destinations for this Smart Call Home profile.

Product

All

Privilege

Security Administrator, Administrator

Syntax

destination [address [email *email_address* **| http** *http_url* **] | message-size-limit** *size* **| preferred-msg-format [long-text | short-text | xml] | transport-method [email** *email_address* **| http** *http_url***]]**

default destination [message-size-limit | preferred-msg-format | transport-method]

no destination [address [email *email_address* **| http** *http_url* **] | message-size-limit** *size* **| preferred-msg-format [long-text |short-text | xml] | transport-method [email** *email_address* **| http** *http_url* **]]**

---

address [email *email_address* **| http** *http_url* **]**

Configures an destination e-mail address or HTTP URL where short-text/long-text call-home message and XML-based call-home messages will be sent.

- **email**: Use this option to add an e-mail address to this profile. *email_addr* is an alphanumeric string of the form *local-part@domain* where domain can be made up of a number of labels, each separated by a period and between 1 and 63 characters in length. The local-part can be 1-64 characters. The domain-label can be 1-63 characters. The domain can be 1-135 characters. The entire alphanumeric string can be a no larger than 200 characters.
- **http**: Use this option to add an HTTP URL to this profile. *http_url* is an alphanumeric string of 1 through 200 characters.

---

default

Configures the call-home profile back to default settings. By default, the profile is enabled.

---

message-size-limit *size*

Specifies the message size (in bytes) for this profile as an integer from 50 to 3145728. The default is 3145728.

---

no

Deletes the call-home profile.

---

preferred-msg-format [long-text | short-text | xml]

Specifies the message format for the profile. The default is xml.

- **long-text**: Use this option to set long-text messages as the preferred message format. The long message format has all the details related to the event, including information related to chassis, card, and outputs of show commands for the alert group.

- **short-text**: Use this option to set short-text messages as the preferred message format. The short message has information on the severity of event, a short description of the event, the event time, and the device ID.
- **xml**: Use this option to set XML as the preferred message format. (Default)

transport-method [email *email_address* **| http** *http_url***]]**

Specifies the transport-method for the messages. The default is e-mail. For the user profile, both e-mail and http can be enabled. If all are options are disabled, e-mail will be set for the profile.
For the Cisco TAC profile, only one transport method can be enabled. If the user enables a second transport method, the first one will be automatically disabled.

- **email**: Enables an e-mail address for this profile. This is the default.
- **http**: Enables an HTTP URL for this profile.

Usage

Use this command to activate the current call-home profile. By default, the profile is enabled.

Example

The following command disables the call-home profile:

```
no destination
```

The following command sets the preferred message format for the profile to the call-home profile to short text:

```
destination preferred-msg-format short-text
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

subscribe-to-alert-group

Subscribes this profile to the alert group for the call-home profile.

Product

All

Privilege

Security Administrator, Administrator

Syntax

subscribe-to-alert-group [all {severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] } | configuration { periodic [daily | monthly | weekly] } | crashinfo | diagnostic { severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] } | environment { severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] } | inventory { periodic [daily | monthly | weekly] } | syslog {severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] }]

default subscribe-to-alert-group

no subscribe-to-alert-group [all {severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] } | configuration { periodic [daily | monthly | weekly] } | crashinfo | diagnostic {severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] } | environment {severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] } | inventory { periodic [daily | monthly | weekly] } | syslog {severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] [pattern *pattern_to_match*] }]

---

all {severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] }

Enables call-home messages based for all group-types and severity for the profile. The following severities are supported:

- **catastrophic**– Level 1: catastrophic event, matches platform logging level critical.
- **disaster** – Level 2: disaster event, matches platform logging level critical.
- **fatal** – Level 3: fatal event, matches platform logging level critical.
- **critical** – Level 4: critical event, matches platform logging level critical.
- **major** – Level 5: major event, matches platform logging level error.
- **minor** – Level 6: minor event, matches platform logging level warning.
- **warning** – Level 7: warning event, matches platform logging level warning.
- **notification** – Level 8: notification event, matches platform logging level unusual.
- **normal** – Level 9: normal event, matches platform logging level info.

configuration { periodic [daily | monthly | weekly] }

Enables call-home messages based for configuration alert groups. The messages are sent at periodic intervals such as:

- **daily**: Sends a daily call-home message.
- **monthly**: Sends a monthly call-home message.
- **weekly**: Sends a weekly call-home message.

crashinfo

Configures the call-home profile back to default settings. By default, the profile is enabled.

default

Restores the parameter back to the default value.

diagnostic { severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] }

Enables call-home messages based for diagnostic group-types and severity for the profile. The following severities are supported:

- **catastrophic**– Level 1: catastrophic event, matches platform logging level critical.
- **disaster** – Level 2: disaster event, matches platform logging level critical.
- **fatal** – Level 3: fatal event, matches platform logging level critical.
- **critical** – Level 4: critical event, matches platform logging level critical.
- **major** – Level 5: major event, matches platform logging level error.
- **minor** – Level 6: minor event, matches platform logging level warning.
- **warning** – Level 7: warning event, matches platform logging level warning.
- **notification** – Level 8: notification event, matches platform logging level unusual.
- **normal** – Level 9: normal event, matches platform logging level info.

environment {severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] }

Enables call-home messages based for environment group-types and severity for the profile. The following severities are supported:

- **catastrophic**– Level 1: catastrophic event, matches platform logging level critical.
- **disaster** – Level 2: disaster event, matches platform logging level critical.
- **fatal** – Level 3: fatal event, matches platform logging level critical.
- **critical** – Level 4: critical event, matches platform logging level critical.
- **major** – Level 5: major event, matches platform logging level error.
- **minor** – Level 6: minor event, matches platform logging level warning.
- **warning** – Level 7: warning event, matches platform logging level warning.
- **notification** – Level 8: notification event, matches platform logging level unusual.
- **normal** – Level 9: normal event, matches platform logging level info.

inventory { periodic [daily | monthly | weekly] }

Enables call-home messages based for inventory alert groups. The messages are sent at periodic intervals such as:

- **daily**: Sends a daily call-home message.
- **monthly**: Sends a monthly call-home message.
- **weekly**: Sends a weekly call-home message.

no

Deletes the alert groups.

syslog { severity [catastrophic | diasaster | fatal | critical | major | minor | warning | notification | normal] [pattern *pattern_to_match*] }]

Enables and disables call-home messages based on severity and syslog string pattern match for the profile. The following severities are supported:

- **catastrophic**– Level 1: catastrophic event, matches platform logging level critical.
- **disaster** – Level 2: disaster event, matches platform logging level critical.
- **fatal** – Level 3: fatal event, matches platform logging level critical.
- **critical** – Level 4: critical event, matches platform logging level critical.
- **major** – Level 5: major event, matches platform logging level error.
- **minor** – Level 6: minor event, matches platform logging level warning.
- **warning** – Level 7: warning event, matches platform logging level warning.
- **notification** – Level 8: notification event, matches platform logging level unusual.
- **normal** – Level 9: normal event, matches platform logging level info.

pattern_to_match is an alphanumeric string of 1 through 80 characters.

Usage

Use this command to enable or disable the call-home messages based on specified alert-groups and severities for the profile.

Example

The following command sets an alert group for the profile to send a daily inventory message:

```
subscribe-to-alert-group inventory periodic daily
```

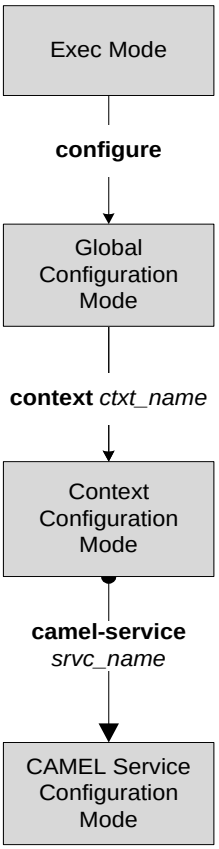
Chapter 46
CAMEL Service Configuration Mode Commands

The CAMEL Service configuration mode provides a set of commands to define the parameters for the Customised Applications for Mobile networks Enhanced Logic (CAMEL) service functionality and the CAMEL interface - the Ge interface.

CAMEL service enables operators of 2.5G/3G networks to provide operator-specific services (such as prepaid GPRS service and prepaid SMS service) to subscribers, even when the subscribers are roaming outside their home public land mobile network (HPLMN).

When this mode is accessed, the command prompt should resemble:

```
[context_name]asr5000(config-camel-service)#
```



associate-sccp-network

Configure an association between this CAMEL service and a specified SCCP network.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

associate-sccp-network *sccp_network_id*

no associate-sccp-network

no

Removes the association with the CAMEL service configuration.

sccp_network_id

Identifies an already defined SCCP network.
sccp_network_id : Enter an integer from 1 to 12.

Usage

The SCCP network must be configured prior to use this command.
CAMEL service will not function unless an SCCP network is associated.

Example

Associate this CAMEL service with SCCP network configuration ID 2:

```
associate-sccp-network 2
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Return to the Exec mode.

exit

Exits the current configuration mode and returns to the context configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Move to the previous configuration mode.

tcap destination-address

Configure the gsmSCF address to be used to open TC dialogues.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
tcap destination-address { configured-address | received-address }

default tcap destination-address
```

configured-address

Default.
Instructs the SGSN to use the SCF address from the GPRS-CSI.

received-address

Instructs the SGSN to overwrite the gsmSCF address with the memorised gsmSCF address that was in the first response message to the InitialDPGPRS and then to use that gsmSCF address.

Usage

This command enables the operator to determine which gsmSCF address is to be used to open new TC dialogues. In accordance with 3GPP 29.078, section 14.1.4.1.3, this command enables the SGSN to establish new TC dialogues within the context of a current GPRS dialogue, based on the operators choice:

- to use a 'received-address' where the gprsSSF learns the gsmSCF address used in the first response message to the InitialDPGPRS and uses it to open new TC dialogues, or
- to use a 'configured-address' where the gprsSSF uses the gsmSCF address from the GPRS-CSI to open new TC dialogues.

Example

Configure the SGSN to overwrite the SCF address and to use the gsmSCF address received in the response message:

```
tcap destination-address received-address
```

timeout

Configure a range of timers needed to support CAMEL service.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

timeout { gprs-apply-charging-report-ack-timer *seconds* **| gprs-entity-release-ack-timer** *seconds* **| gprs-event-report-ack-timer** *seconds* **| gprs-tssf-timer** *seconds* **| sms-event-report-ack-timer** *seconds* **| sms-tssf-timer** *seconds* **| tc-guard-timer** *seconds* **}**

default timeout { gprs-apply-charging-report-ack-timer | gprs-entity-release-ack-timer | gprs-event-report-ack-timer | gprs-tssf-timer | sms-event-report-ack-timer | sms-tssf-timer | tc-guard-timer }

default

Resets the timers to default values.

gprs-apply-charging-report-ack-timer *seconds*

Configure the TCAP invoke timer to set the length of time the SGSN waits for an acknowledgement after sending an ApplyChargingReportGPRS to the SCF.
seconds : Enter an integer from 1 to 20. Default: 4

Important: This timer value should be less than the value configured for the `tc-guard-timer`.

gprs-entity-release-ack-timer *seconds*

Configure the TCAP invoke timer to set the length of time the SGSN waits for an acknowledgement from the SCF after sending Entity Release information.
seconds : Enter an integer from 1 to 20. Default: 4

gprs-event-report-ack-timer *seconds*

Configure the TCAP invoke timer to set the length of time the SGSN waits for an acknowledgement from the SCF after the SGSN sends an event report.
seconds : Enter an integer from 1 to 20. Default: 4

gprs-tssf-timer *seconds*

Configure the GPRS TSSF timer to set the length of time the SGSN waits for an instructions from the SCF. On expiry the SGSN handles the transaction through the default handling specified in the corresponding CSI.
seconds : Enter an integer from 1 to 10. Default: 5

sms-event-report-ack-timer *seconds*

Configure the TCAP invoke timer to set the length of time the SGSN waits for an acknowledgement from the SCF after the SGSN sends an event report for SMS.

seconds : Enter an integer from 1 to 20. Default: 4

sms-tssf-timer *seconds*

Configure the SMS TSSF timer to set the length of time the SGSN waits for an instructions from the SCF. On expiry the SGSN handles the transaction through the default handling specified in the corresponding CSI.
seconds : Enter an integer from 1 to 10. Default: 5

tc-guard-timer *seconds*

Configure the guard tier to start when the SGSN sends ApplyChargingReportGPRS to the SCF. On expiry the SGSN closes the TCAP dialogue if the GPRS Dialogue state is “monitoring”. Default handling complies with 3GPP 23.078.
seconds : Enter an integer from 1 to 10. Default: 5

Important: This timer value should be greater than the value configured for the `gprs-apply-charging-report-ack-timer`.

Usage

The SCCP network must be configured prior to use this command.
CAMEL service will not function unless an SCCP network is associated.
Repeat the command to configure multiple timers.

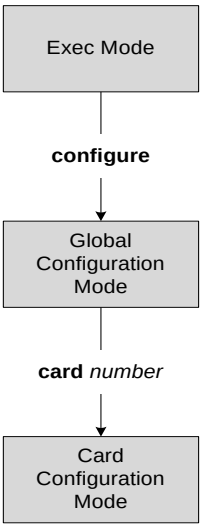
Example

Set the tc-guard timer for 4:

```
tc-guard-timer 4
```

Chapter 47
Card Configuration Mode Commands

Use the Card configuration mode to create and manage the physical cards in the chassis.



aps

Configures the parameters for the automatic protection switching (APS) feature for SONET CLC2 and OLC2 line cards or for multiplexed section (or switching) protection (MSP) type APS for SDH CLC2 and OLC2 line cards.

Important: This command should only be used **after** APS has been enabled with the **aps-mode** keyword of the redundancy command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
aps [ 1+1 ] [ uni-directional ] [ non-revertive ] [ -noconfirm ]

no aps
```

1+1

Selects 1+1 line (linear) protection.Traffic is carried simultaneously by the working line and the protection line. GR-253 and ITU-T G.783 require the bridging to be done at the electrical level; therefore, the same payloads are transmitted over the working and protection lines.

uni-directional

Enables protection on one end of the connection.

non-revertive

Prevents the network from automatically reverting to the original working line/port when the the original working line/port is recovered/restored.

-noconfirm

Executes the command without additional prompting for command confirmation.

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

framing

Configures the type of framing to be used for the signaling generated on a specific line card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
framing { ethernet | sdh [ ds1 | e1 ] [ ss-bits ] | sonet [ ds1 | e1 ] | unspecified } [
-noconfirm ]

default framing [ -noconfirm ]
```

default

Resets the framing generated by the card to the default for the particular card type.

ethernet

Configures the system to use Ethernet framing for this line card. This type of framing can only be used on an Ethernet card.
Default: Ethernet framing type is the default for an Ethernet line card.

Important: Using this keyword with an OLC/OLC2 or CLC/CLC2 takes the card offline.

sdh [ds1 | e1] [ss-bits]

Configures the system to use SDH signal framing for either an OLC/OLC2 or CLC/CLC2 line card in an SGSN.

Important: Using this keyword with an Ethernet line card takes the line card offline.

In releases 8.1 and higher, you can also set the type of signaling path for a CLC2.
ds1 - configures the card to support a DS1/T1.
e1 - configures the card to support an E1. This is the default for SDH.
ss-bits - enables/disables use of ss-bits (per ITU 1997 G.783 specification) for SDH configured line card.

sonet [ds1 | e1]

Configures the system to use SONET signal framing for either an OLC/OLC2 or CLC/CLC2 line card in an SGSN.
Default: SONET is the default framing type for an OLC/OLC2 or CLC/CLC2 line card.

Important: Using this keyword with an Ethernet line card takes the line card offline.

In releases 8.1 and higher, you can also set the type of signaling path for a CLC2.

ds1 - configures the card to support a DS1/T. This is the default for SONET.
e1 - configures the card to support an E1.

unspecified

Configures the system to use the default framing type for the particular line card resident in the identified slot.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use the **framing** command to identify the type of signal framing to be used by the line card in the identified slot.
Note that each type of line card uses a different type of signal framing. If you configure the wrong framing type for a line card, the line card is taken offline.

Important: This command is not supported on all platforms.

Example

Use the following command to configure SDH signal framing on a CLC2. If you do not include the path-type, the default of **e1** is automatically included in the card's framing configuration:

```
framing sdh
```

header-type

Defines the size of the header frame for Frame Relay transmissions over a CLC or CLC2 channelized line card.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

header-type *header-size* [**-noconfirm**]

default header-type [-noconfirm]

default

Resets the configuration to the default header size of 2-bytes.

header-type *header-size*

Sets the size, number of bytes, for the header frame. *header-size* must be either 2-bytes or 4-bytes.

-noconfirm

Executes the command without additional prompting for command confirmation.

Usage

Use this command to set the size of the header frame for Frame Relay messages emanating from the line card. The size (2-bytes or 4-bytes) determines the amount of information that can be transmitted in that first information frame.

Important: Not supported on all platforms

Example

Set the header to the smallest size.

```
header-type 2-byte
```

initial-e1-framing

Configures the type of framing mode that will initially be available at the time the line card boots.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
initial-e1-framing [ crc4 | standard ]

default initial-e1-framing
```

default

Returns the configuration to CRC4 as the default type.

initial-e1-framing crc4

Accepts the default CRC4, in the configuration, as the initial at-boot framing mode.

initial-e1-framing standard

Accepts the **standard** mode as the initialization framing mode.

Usage

For a CLC-type line card, the default E1 framing mode is CRC4. When a card reboots, all E1s are initialized with CRC4 framing mode and then switch to the configured framing mode. With this keyword, you have the option to choose the initialization framing mode.

Important: Only supported on CLC/CLC2

Example

```
initial-e1-framing standard
```

link-aggregation

This command and its keywords are now obsolete. Configuring the link aggregation feature is now accomplished in two parts. The first part requires the configuration of master port options via the **link-aggregation** command in the Ethernet Port Configuration mode. The second part configures the switching options for network deployments with multiple network devices via the **link-aggregation switch to** command in the Exec mode. For additional information see the *System Administration Guide*.

mode

Sets the application processor card's current administrative state to active or standby.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
mode { active | standby } [ -noconfirm ]

default mode [ -noconfirm ]
```

default

Returns the mode to the default value appropriate to the card type.
The default administrative mode for line cards affects a single card and its mated line card. The default state for line cards in the top shelf is active. The default for line cards in the bottom shelf is standby.
The default administrative state for the SPIO in slot 24 is active and the SPIO in slot 25 is standby.
The default administrative mode for packet processing cards is standby.

Important: This command results in a migration of processes if the default mode for a card is different than the current state of the card.

mode active

Defines which card type is to be switched from standby to active state. If a card is present in the slot, the packet processing card is automatically selected depending upon the type of card. If no card is present in the slot, a packet processing card is assumed.

mode standby

Sets the packet processing card in the slot to standby mode.

Caution: Switching an active packet processing card to standby deletes all port configurations, including bindings, for the attached line cards.

-noconfirm

Executes the command without additional prompting for command confirmation.

Usage

Set the desired mode of mated cards. The card targeted for maintenance is placed in the standby state first. The setting of the mode determines which packet processing cards are to be active and which are to be the standby cards for redundancy. Use this command to configure the set of active and standby packet processing cards. The application processor card's standby priority is then used in conjunction with the set of standby packet processing cards to determine the order in which the standby cards are used for redundancy support.

Important: Not supported on all platforms

Important: This command results in a migration of processes if the mode specified for the card is different than the current state of the card.

Example

The following commands set the state of a card to active and standby, respectively.

```
mode active

mode standby
```

redundancy

Configures the type of redundancy for a line card or SPIO.

Product

PDSN, FA, HA, GGSN, SSGN

Privilege

Security Administrator, Administrator

Syntax

```
redundancy { aps-mode | card-mode |port-mode } [-noconfirm ]

default redundancy [ -noconfirm ]
```

default

Restores redundancy to **port-mode** type redundancy.

aps-mode

SGSN only.
Enables automatic protection switching (APS), if the card is either a CLC2 or an OLC2 line card with card framing set to SONET. (Refer to the framing command.)
Enables multiplexed section (or switching) protection (MSP) type APS, if the card is a CLC2 line card with card framing set to SDH. (Refer to the framing command.)

Important: Using this keyword with any card type other than a CLC2 or an OLC2 will take the card offline.

Related parameters: You should consider setting appropriate SDSF BER (signal degrade/signal failure bit error rate) threshold settings. Access the hopath-sdsf, lopath-sdsf, and toh-sdsf commands via the port channelized configuration mode -- for a CLC2 line card refer to the *Channelized Port Configuration Mode Commands* chapter and for an OLC2 line card refer to the *ATM Port Configuration Mode Commands* chapter.

card-mode

Specifies no port redundancy is used. This is used mostly for legacy products.

port-mode

Enables port redundancy on line cards or on SPIO cards.
This is the default setting used by the system.

Important: Port-type redundancy does not affect line card failover/redundancy operations.

pseudo-aps-mode

This command has been deprecated.

-noconfirm

Instructs the system to execute the command without additional prompting for command confirmation.

Usage

Use this command to configure redundancy on a line card (LC) or a SPIO card. With **port-mode** enabled, if an external network device or cable failure occurs that causes a link down failure on the port, the redundant port is used.

Important: Not supported on all platforms

Important: You do not need to enter this command for each line card or SPIO card, as the system intuitively understands that if the command is entered for an active line card or SPIO card, the standby line card or SPIO card switches to operate in the same mode. For example, if you enter the **port-mode** command for an LC in slot 17, you automatically enable a redundant line card in slot 33 for port redundant operation.

Important: **asp-mode** and **port-mode** are mutually exclusive.

Example

The following command sets the redundancy mode to port redundancy.

```
redundancy port-mode
```

The following sets APS/MSP 1+1 inter-card redundancy for the specified OLC2 or CLC2 line card:

```
redundancy aps-mode
```

redundant with

Enables side-by-side (SBS) redundancy for XGLCs.

Product

All

Privilege

Security Administrator, Administrator

Syntax

redundant with *card_number*

redundant with *card_number*

Identifies the neighboring top slot number of the card to pair with the XGLC being configured. *card_number* is an integer between 1 and 48.

Important: Attempting to use this command with any card other than an XGLC takes the card offline.

Usage

Use this command during configuration to identify the slot holding the XGLC card that will be used to provide redundancy to the XGLC you are configuring. Entering this command enables SBS redundancy when the two XGLCs occupy two upper (top) slots in a chassis.

Example

Pair the card in slot 30 with the card being configured:

```
redundant with 30
```

service-type

Configures the type of service the CLC or CLC2 line card will support.

Important: Supported in software releases 8.1 and higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
service-type { frame-relay | mtp2 | pwe3-cesopsn | unspecified } [ -noconfirm ]

default service-type [ -noconfirm ]
```

default

Returns the card configuration to *unspecified*.

service-type frame-relay

Configures the card to operate in Frame Relay service mode.

service-type mtp2

Important: MTP2 functionality is not yet supported.

Enables MTP2 type service to support narrowband transmissions.

service-type pwe3-cesopsn

Important: **pwe3-cesopsn** functionality has been replaced by **mtp2**.

service-type unspecified

This is the default mode for a CLC or CLC2 line card.

Important: You must configure the line card to one of the available service types or the card will not function.

-noconfirm

Executes the command without additional prompting for command confirmation.

Usage

Use this command to configure the operational service mode for the channelized line card - CLC or CLC2. Once you select the service-type, refer to the Channelized Port configuration mode chapter to review the commands needed to configure the parameters for the port.

Example

```
service-type frame-relay
```

shutdown

Configures a card for active service or terminates all processes on the card.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

no shutdown enables the card.
Enter only the **shutdown** keyword to shut the card down.

Usage

Shut down a card to remove it from service or to enable a card to put it into service.

Important: Do not use this command to remove a card from service for maintenance. Use the command **card halt** to remove a card for service to avoid changing or deleting the active-mode configuration. See the Exec Mode chapter.

Important: Not supported on all platforms

Example

The following commands shutdown the card and switch a card to online, respectively.

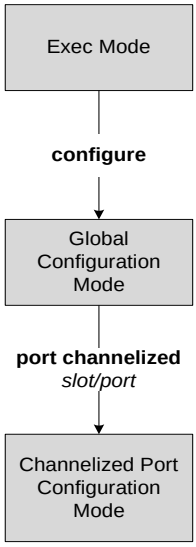
```
shutdown

no shutdown
```

Chapter 48
Channelized Port Configuration Mode Commands

The channelized port configuration mode provides the commands to create, configure, bind, and manage the Frame Relay service ports on the channelized line card.

Important: Before using these commands, card framing should be configured for either SDH or SONET with the framing command described in the Card Configuration Mode chapter.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

alarm-disable

Entering this command disables the alarm detection for designated sets of alarms.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
alarm-disable { all | ds1-e1 | none | sonet-sdh }

[ no | default ] alarm-disable
```

no

Deletes the disable configuration.

default

Returns the settings for disabling alarms to the system default.

all

Disables detection of all SONET/SDH and DS1/E1 alarms.

ds1-e1

Disables detection of the DS1/E1 alarms.

none

None of the alarm detection is disabled so that all DS1/E1 and SONET/SDH alarms are detected.

sonet-sdh

Disables detection of SONE/SDH alarms.

Usage

Configure selected alarm detection for the port.

Example

Enter the following command to enable DS1/E1 and SONET/SDH alarm detection.

```
alarm-disable none
```

alarm-soak-timer

This command sets the timer for the duration that a detected alarm will be soaked before the alarm is reported.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

alarm-soak-timer *seconds*

default alarm-soak-timer

default

Returns the timer settings to the system default.

seconds

Defines the number of seconds the system waits (soaks the alarm) before reporting the alarm.
seconds: any integer from 0 to 32767.

Usage

Configures the delay before reporting detected alarms.

Example

Configure a 20 second alarm report delay.

```
alarm-soak-timer 20
```

clock-source

This command sets the source of the port's transmit clock.

Important: This command is only available for releases 8.1 or higher.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
clock-source { internal-timing | loop-timing }

default clock-source
```

default

Using this command combination sets the port clock source to internal timing.

internal-timing

Sets the port clock to derive timing from the recovered receive clock.

loop-timing

Sets the port clock to transmit in sync with the system timing.

Usage

Use this command for either SONET or SDH channelized (Frame Relay) ports on the SGSN.

Example

The following command resets the transmit clock source to internal timing.

```
default clock-source
```

description

Defines descriptive text that provides useful information about the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

description *text*

no description

no

Erases the port's description from the configuration file.

text

text must be a string of 1 to 79 alphanumeric characters with no spaces or a string within double quotes that includes printable characters. The description is case-sensitive.

Usage

Set the description to provide helpful information, for example the port's primary function, services, end users. Define any information, the only limit is the number of characters.

Example

description *samplePortDescriptiveText*

description *"This is a sample description"*

dlci

Identifies a data link connection identifier (DLCI), a frame relay logical connection, and binds it with a specific channelized path configuration. Once the DLCI is bound to the path, the system enters DLCI configuration mode.

Important: The **path** command must be configured prior to attempting configuration with the **dlci** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

dlci path *path_id* **{ ds1 | e1 }** *connects* **{ dlci** *dlci_id* **| timeslots** *slot#* **dlci** *dlci_id* **}**

no dlci path path_id { ds1 | e1 } *connects*

no

Disables the configured DLCI.

path *path_id*

Identifies a specific path configuration, set with the **path** command in this configuration mode, that will be associated with a DLCI.
path_id must be an integer from 1 to 3.

ds1 *connects* **| e1** *connects*

Selects the framing speed for the connection.
DS1: Is associated with North American networks and would be the best choice to work with the SONET framing selected with the **card** configuration command.
connects: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
E1: is associated with European networks and would be associated with the SDH framing selected with the **card** configuration command.
connects: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

dlci *dlci_id*

Identifies a specific Frame Relay PVC DLCI to associate with the path.
dlci_id: an integer from 16 to 991.

timeslot *slot#*

Identifies one of the timeslots within a timeslot group configured with the **path** command for the E1, DS1 or fractional E1 port. Identifying one slot in a group means that all the slots in that group will have the Frame Relay parameters configured in the same manner.
slot#: Must be an integer from 1 to 31.

Usage

Associating a routing path with a specific frame relay DLCI is a significant part of the process for defining the frame relay interface.

Example

Associate path 1 with DLCI 123.

```
dlci path 1 ds1 21 dlci  123
```

end

Exits the Channelized Port configuration mode and returns to the Exec mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Change the mode back to the Exec mode.

exit

Exits the Channelized Port configuration mode and returns to the Global configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Return to the Global Configuration mode.

frame-relay

Configures the parameters for the Frame Relay connections for E1, DS1 and fractional E1 ports created with the **path** command. Frame

Important: The **path** command must be configured prior to attempting configuration with the **frame-relay** command.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

frame-relay path *path_id* **{ ds1** *connects* **| e1** *connects* **} timeslot** *slot#* **[intf-type** *intf_type* **] [lmi_type** *lmi_type* **]**

path *path_id*

Identifies a specific path configuration, set with the **path** command in this configuration model. *path_id* must be an integer from 1 to 3.

ds1 *connects* **| e1** *connects*

Selects the pipe splitting for the connection.
DS1: Is associated with North American networks and would be the best choice to work with the SONET framing selected with the **card** configuration command. DS1 splits the path into 28 logical connections.
connects: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
E1: is associated with European networks and would be associated with the SDH framing selected with the **card** configuration command. E1 splits the path into 21 logical connections.
connects: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

timeslot *slot#*

Identifies one of the timeslots within a timeslot group configured with the **path** command for the E1, DS1 or fractional E1 port. Identifying one slot in a group means that all the slots in that group will have the Frame Relay parameters configured in the same manner.
slot#: Must be an integer from 1 to 31.

intf-type *intf_type*

Selecting the interface type specifies signaling parameters for the DLCI, options include:

- **dce**: Selects data circuit-terminating equipment -type signaling.
- **dte**: Selects data terminal equipment -type signaling.
- **nni**: Selects the network-to-network interface

Default: DTE for Release 8.0
Default: DCE for Release 8.1

frame-relay lmi_type *lmi_type*

Default: **none**.
Line management options include:

- **ansi** - ANSI ANNEXED LMI, may include option:
- **cisco** - Cisco/Gang Of Four LMI
- **none** - LMI Disabled
- **q933a** - Q.933A LMI

Any of the above LMI types can take one or more additional options

- **n391** *value* - Number of keep exchanges before requesting a full status message. Default is 6. *value* must be an integer from 1 to 255.
- **n392** *value* - Error Threshold value. Default is 2. *value* must be an integer from 1 to 10.
- **n393** *value* - Monitored events count value. Default is 2. *value* must be an integer from 1 to 10.
- **t391** *value* - Timer to send messages. Default is 10. *value* must be an integer from 5 to 30.
- **t392** *value* - Polling verification timer value. Default is 15. *value* must be an integer from 5 to 30.

Usage

Use this command to define LMI type and timers and to associate time group 2 with the Frame Relay connection.

Example

```
frame-relay path 1e1 3 timeslot 2
```

hopath-sdsf

Configures the high-order path for degrade/signal failure (SDSF) bit error rate (BER) thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

hopath-sdsf *hopath_value*

hopath_value

- 0: Disabled
- 1 -1.E-03
- 2 - 1.E-04
- 3 - 1.E-05
- 4 - 1.E-06
- 5 - 1.E-07
- 6 - 1.E-08
- 7 - 1.E-09
- 8 - 1.E-10

Usage

Sets a standard option for the high-order path for SDSF.
The SD is kept at a value of 100 erroredBits/sec less than the corresponding value of the SF. So if the SD threshold is configured at 1 error in every 100000 bits/sec, then the SF threshold automatically becomes 1 error in every 1000 bits/sec.

Example

```
hopath-sdsf 1
```

line-timing

This command enables the SPIO to recover transmit timing source via line attached to the selected port. By default, line-timing is not enabled.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] line-timing
```

no

Disables line-timing as the source for the transmit clock.

Usage

The port must be enabled (with the **no shutdown** command) to enable recovery of timing source via the line. As well, the card's slot number must be entered in the **recover line#** command of the BITS port configuration mode.

Example

Disable timing clock recovery on this port.

```
no line-timing
```

loopback

Configures the type of loopback mode used for diagnostic testing.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
loopback { ds1-e1-diag | ds1-e1-line | none | sonet-sdh-diag | sonet-sdh-line }
```

ds1-e1-diag

Enables a system generated diagnostic lookback signal at the DS1/E1 layer.

ds1-e1-line

Loops back a network diagnostic signal at the DS1/E1 layer.

none

Stops diagnostic loopback signalling.

sonet-sdh-diag

Enables a system generated diagnostic lookback signal at the SONET/SDH layer.

sonet-sdh-line

Loops back a network diagnostic signal at the SONET/SDH layer.

Usage

Setup diagnostic loopback signals for troubleshooting purposes.

Example

```
loopback ds1-e1-diag
```

lopath-sdsf

Configures the low-order path for signal degrade/signal failure (SDSF) bit error rate (BER) thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

lopath-sdsf *lopath_value*

lopath_value

- 0: Disabled
- 1 -1.E-03
- 10 - 1.E-12
- 2 - 1.E-04
- 3 - 1.E-05
- 4 - 1.E-06
- 5 - 1.E-07
- 6 - 1.E-08
- 7 - 1.E-09
- 8 - 1.E-10
- 9 - 1.E-11

Usage

Sets a standard option for the low-order path for SDSF.
The SD is kept at a value of 100 erroredBits/sec less than the corresponding value of the SF. So if the SD threshold is configured at 1 error in every 100000 bits/sec, then the SF threshold automatically becomes 1 error in every 1000 bits/sec.

Example

lopath-sdsf *1*

path

This command configures the parameters that define the routing path for a DLCI. It must match with the DLCI configuration parameters. The values entered with these commands should be noted as they will be needed to configure the **frame-relay** and **dlci** commands also in this configuration mode.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

path *path_id* **{ ds1** *connects* **| e1** *connects* **}** *frame-mapping multiplexing index# index#* **framing** *mode* **mapping-mode { bit-sync | byte-sync } [timeslots** *slot#* **[** *slot#* **] | frame-relay [intf-type** *intf_type* **[lmi_type** *lmi_type* **]]]**

no path *path_id* **{ ds1 | e1 }***connects*

---

no

Deletes the routing path entry from the configuration.

---

path *path_id*

Identifies a specific path configuration that will be associated with a DLCI. The *path_id* must be an integer from 1 to 3.

---

ds1 *connects* **| e1** *connects*

Selects the channelization for the connection.
DS1: (AKA: T1) Is associated with North American networks and would be the best choice to work with the SONET (can also work with SDH) framing selected with the **card** configuration command. DS1 splits the path into 28 logical connections.
connects: Defines the number of logical connections supported via the DS1. The selection must be an integer from 1 to 28.
E1: is associated with European networks and would be associated with the SDH (can also work with SONET) framing selected with the **card** configuration command. E1 splits the path into 21 logical connections.
connects: Defines the number of logical connections supported via the E1. The selection must be an integer from 1 to 21.

---

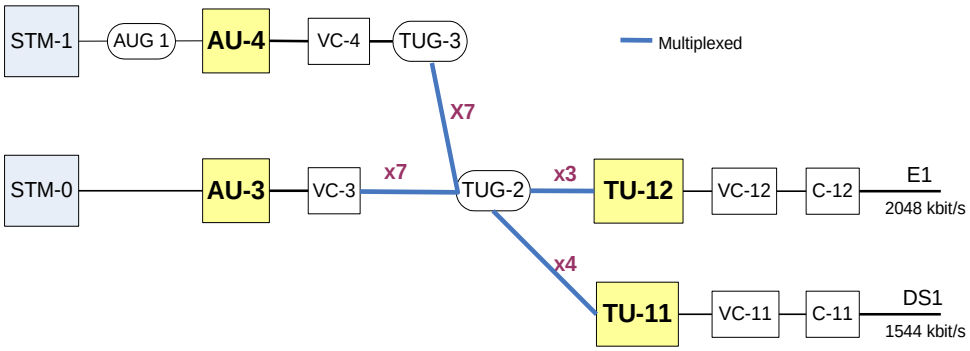
frame-mapping

Frame mapping sets the channelization according to the national standards that correlate with the framing/speed standards. This option selects the mapping of containers (C), virtual containers (VC), tributary units (TU), and tributary unit groups (TUG), that is appropriate for the channel characteristics:

- **tu11-au3**: Appropriate for DS1 in SDH. Maps as follows AU-3—VC-3— m# —TUG-2— m# —TU-12—VC-12—C-12
- **tu11-au4**: Appropriate for DS1 in SDH. Maps as follows AU-4—VC-4—TUG-3— m# —TUG-2— m# —TU-11—VC-11—C-11

- **tu12-au3**: Appropriate for E1 in SDH. Maps as follows AU-3—VC-3— m# —TUG-2— m# —TU-12—VC-12—C-12
- **tu12-au4**: Appropriate for E1 in SDH. Maps as follows AU-4—VC-4—TUG-3— m# —TUG-2— m# —TU-12—VC-12—C-12

Frame Mapping for E1 and DS1 to STM-n Interfaces



- **vt1.5**: Only appropriate for DS1 in SONET framing.
- **vt2**: Only appropriate for E1 in SONET framing.

---

multiplexing index# index#

index#: TUG-2 index - Must be an integer from 1 to 7 to identify a multiplex channel between TUG-2 and VC-3 (E1) or TUG-3 (DS1).
index#: TU index - Must be an integer from 1 to 4 (DS1) or 1 to 3 (E1) to identify a multiplex channel between TU-11 (DS1) and TUG-2 or between TU-12 (E1) and TUG-2.

---

framing *mode*

Defines the framing modes to be used for the channelization to E1 or T1 of the (optical) port.

- options for E1:
  - **cas:** standard mapping with CAS
  - **cas-crc4:** CRC4 mapping with CAS
  - **crc4:** CRC4 mapping
  - **standard:** mapping
- options for DS1:
  - **esf:** extended superframe mapping
  - **sf:** superframe mapping
  - option for either E1 or DS1:
  - **unframed**

---

mapping-mode

- **bit-sync**
- **byte-sync**

timeslots *timeslots*

Defines up to 8 timeslot groupings for multiple fractional DS1/E1 channels. Each slot is 2.048/32 Mbytes. Slots 0 and 16 are reserved for synchronization and alarms. Slots 1-15 and 17-31 are used for data. Timeslots must be unique -- a timeslot can not be used in more than one grouping.
timeslots: Must be an integer from 1 to 31. Timeslot groups are separated by spaces and can consist of a single slot and/or a range indicated with a hyphen. Example: 3,7-10 is a single fractional group. NOTE there is no space after the comma. Timeslots must be unique -- a timeslot can not be used in more than one grouping.

frame-relay

Enables definition of a Frame Relay connection with the **frame-relay** command.

Important: For release 8.1 and higher, this feature has been moved to the **frame-relay** command.

intf-type *intf_type*

Selecting the interface type specifies signaling parameters for the DLCI, options include:

- **dce**: Selects data circuit-terminating equipment -type signaling.
- **dte**: Selects data terminal equipment -type signaling.
- **nni**: Selects the network-to-network interface

Default: DTE for Release 8.0
Default: DCE for Release 8.1

Important: For release 8.1 and higher, this feature has been moved to the **frame-relay** command.

lmi_type *lmi_type*

Default: **none**.
Line management type options include:

- **ansi** - ANSI ANNEXED LMI, may include option:
- **cisco** - Cisco/Gang Of Four LMI
- **none** - LMI Disabled
- **q933a** - Q.933A LMI

Any of the above LMI types can take one or more additional options

- **n391** *value* - Number of keep exchanges before requesting a full status message. Default is 6. *value* must be an integer from 1 to 255.
- **n392** *value* - Error Threshold value. Default is 2. *value* must be an integer from 1 to 10.
- **n393** *value* - Monitored events count value. Default is 2. *value* must be an integer from 1 to 10.
- **t391** *value* - Timer to send messages. Default is 10. *value* must be an integer from 5 to 30.
- **t392** *value* - Polling verification timer value. Default is 15. *value* must be an integer from 5 to 30.

Important: For release 8.1 and higher, this feature has been moved to the **frame-relay** command.

Usage

Defines the signaling characteristics of a frame relay connection or timeslots for a fractional connection. Use this command to create E1 ports or fractional E1 ports. Fractional E1 ports are created with the timeslot definitions. The fractional E1 port can consist of one or more or all of the timeslots.

Example

In the first example, define timers for the q933a LMI-type.

```
path 1 e1 1 tu12-au4 1 1 framing crc4 mapping-mode bit-async frame-relay
intf-type dce lmi_type  q933a  n391 6 n392 2 n393 2 t391 10 t392 15
```

The next example defines 3 groups of fractional timeslots with group 1 having slots 1-5 and 8, group 2 having slot 22-25, and group 3 having slots 31.

```
path 1 e1 1 tu12-au3 1 1 framing cas  mapping-mode bit-async timeslots 1-
5,8 22-25 31
```

preferred slot

Identifies which card in a chassis should assume revertive (redundancy auto-recovery) functionality should the slot/port being configured go down. This command must be issued on a per port basis, allowing you to configure specific ports to be used on individual LCs or SPIO cards. For example, ports 1 through 4 could be configured as "preferred" on the LC in slot 17 while ports 5 through 8 are "preferred" on the LC in slot 33. In this scenario, both LCs would be in an Active operational state while still providing LC and port redundancy for the other.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

preferred slot *slot#*

no preferred slot

slot#

Identifies the physical slot in the chassis where the line card is installed.

no

Disables revertive, or auto-recovery, operation for the port.

Usage

This command enables or disables revertive port redundancy. So after a port failover, when the original port is restored to service (i.e. link up) the system will return service to that port automatically.
Disabled, which is the default setting, causes non-revertive operation; requiring an administrative user to manually issue a port switch to command to return service to the original port.

Example

```
preferred slot 17
```

pwe3-cesopsn

This command has been deprecated and replaced by the **mtp2** command.

shutdown

Terminates all processes supporting the port or blocks the shutting down of the port. Conversely, this command with the **no** keyword enables the port.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] shutdown
```

no

Enables the port's administrative state. When omitted the card is shutdown (removed from service).

Usage

Shut down a port prior to re-cabling and/or other maintenance activities.
This command with the **no** keyword is required to bring a port into service.

Example

Use the following command to disable a port:

```
shutdown
```

Use the following command to enable a port for service:

```
no shutdown
```

snmp trap link-status

Enables/disables the generation and sending of an SNMP (notification) trap when the port experiences a change of state (up or down).

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] snmp trap link-status
```

no

Disables the sending of traps for link-status changes.

Usage

Enable the sending of link-status change traps if there is a monitoring facility that can use the information or if there are troubleshooting activities in progress.

Example

```
snmp trap link-status
```

threshold high-activity

Configures the port's high and low activity thresholds.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold high-activity *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 50
Sets the threshold for the highest percentage of port activity that must be met or exceeded, within the polling interval, to generate an alert or alarm.
high_thresh_% can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 50
Sets the threshold for the lowest percentage level of port activity that must be met to generate and send a clear alarm. If port activity does not drop to or below this threshold then the alarm is maintained.
low_thresh_% can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

High port activity thresholds generate alerts or alarms based on the utilization percentage of each configured port during the specified polling interval. This threshold is configured on a per-port basis.
Alerts or alarms are triggered for high port activity based on the following rules:

- **Enter condition:** Actual percent utilization of a port > High Threshold
- **Clear condition:** Actual percent utilization of a port < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.
Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a high port utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold high-activity 70 clear 50
```

threshold monitoring

Enables thresholding for port-level values.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] threshold monitoring
```

no

Disables threshold monitoring for port-level values. This is the default setting.

Usage

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e high-activity) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps:** SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values. Complete descriptions and other information pertaining to these traps is located in the starentMIB(8164).starentTraps(2) section of the SNMP MIB Reference.

The generation of specific traps can be enabled or disabled on the system allowing you to view only those traps that are most important to you.

- **Logs:** The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.
- **Alarm System:** High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists and/or a condition clear alarm is generated.

"Outstanding" alarms are reported to through the system's alarm subsystem and are viewable through the system's CLI.

The following table indicates the reporting mechanisms supported by each of the above models.

Table 14. Thresholding Reporting Mechanisms by Model

Model	SNMP Traps	Logs	Alarm System
Alert	X	X	
Alarm	X	X	X

This command enables thresholding for port-level values. Refer to the **threshold high-activity**,**threshold rx-utilization**, and **threshold tx-utilization** commands in this chapter for information on configuring these values. In addition refer to the **threshold poll** command in the

Global Configuration Mode Commands chapter of this reference for information on configuring the polling interval over which these values are monitored.

Example

Use the following command to terminate thresholding:

```
no threshold monitoring
```

threshold rx-utilization

Configures thresholds for receive-port utilization.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold rx-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 80
The high threshold receive port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear*low_thresh*

Default: 80
Allows the configuration of the low threshold.
The low threshold receive port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Receive port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data received during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for receive port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for received data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for received data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a receive port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold rx-utilization 70 clear 50
```

threshold tx-utilization

Configures thresholds for transmit port utilization.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

threshold tx-utilization *high_thresh* **[clear** *low_thresh* **]**

high_thresh

Default: 80
The high threshold transmit port utilization percentage that must be met or exceeded within the polling interval to generate an alert or alarm.
The percentage can be configured to any integer value between 0 and 100.

clear *low_thresh*

Default: 80
Allows the configuration of the low threshold.
The low threshold transmit port utilization percentage that maintains a previously generated alarm condition. If the utilization percentage falls below the low threshold within the polling interval, a clear alarm will be generated.
The percentage can be configured to any integer value between 0 and 100.

Important: This value is ignored for the Alert model. In addition, if this value is not configured for the Alarm model, the system assumes it is identical to the high threshold.

Usage

Transmit port utilization thresholds generate alerts or alarms based on the utilization percentage of each configured port in relation to data transmitted during the specified polling interval. This threshold is configured on a per-port basis.

Important: Ports configured for half-duplex do not differentiate between data received and data transmitted. Therefore, to avoid redundant alarms, it is recommended that only the receive **or** transmit utilization threshold be configured.

Alerts or alarms are triggered for transmit port utilization based on the following rules:

- **Enter condition:** Actual percent utilization of a port for transmit data ³ High Threshold
- **Clear condition:** Actual percent utilization of a port for transmit data < Low Threshold

If a trigger condition occurs within the polling interval, the alert or alarm will not be generated until the end of the polling interval.

Refer to the **threshold poll** command in the Global Configuration Mode Commands chapter of this reference to configure the polling interval and the **threshold monitoring** command in this chapter to enable thresholding for this value.

Example

The following command configures a transmit port high utilization threshold percent of 70 and a low threshold of 50 for an system using the Alarm thresholding model:

```
threshold tx-utilization 70 clear 50
```

toh-sdsf

Enable/disable line SDSF BER thresholds and configure the line transport overhead (TOH) signal degrade and signal failure (SDSF) bit error rate (BER) threshold.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

toh-sdsf *toh_value*

default toh-sdsf

default

Resets the default which disables this threshold.

toh_value

To facilitate configuration the SD and SF rates have been combined into a single setting. .

- 0: Disabled
- 1 -1.E-04
- 2 - 1.E-05
- 3 - 1.E-06
- 4 - 1.E-07
- 5 - 1.E-08
- 6 - 1.E-09
- 7 - 1.E-10
- 8 - 1.E-11

Usage

This command can be used to configure the line threshold whether the port is active or standby and sets a standard option for the paired values of the line's signal degrade and signal failure (SDSF) BER.
The SD is kept at a value of 100 erroredBits/sec less than the corresponding value of the SF. So if the SD threshold is configured at 1 error in every 100000 bits/sec, then the SF threshold automatically becomes 1 error in every 1000 bits/sec.
The port will go operationally down as soon as the SD threshold is crossed.

Example

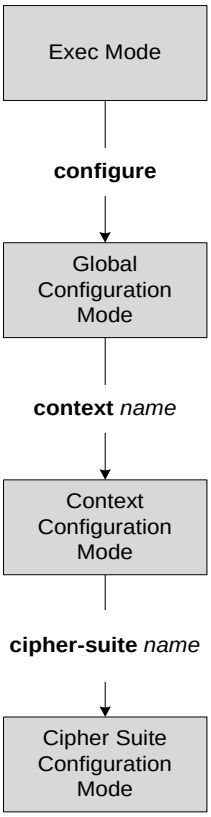
toh-sdsf *1*

vc-mapping

This command has been deprecated. Go to the **frame-mapping** keyword in the **path** command to configure this functionality.

Chapter 49
Cipher Suite Configuration Mode Commands

The Cipher Suite Configuration Mode is used to configure the building blocks for SSL cipher suites, including the encryption algorithm, hash function, and key exchange.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

encryption

Specifies the encryption algorithm for the SSL cipher suite.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
encryption { 3des | aes-128 | null | rc4 }

default encryption
```

default

Sets the encryption option to its default value of RC4.

encryption 3des | aes-128 | null | rc4

Specifies the encryption algorithm.
3des: Encryption algorithm 3DES (Triple Encryption Algorithm). 3DES applies the Data Encryption Standard (DES) cipher algorithm three times to each data block.
aes-128: Encryption algorithm AES-128 (Advanced Encryption Standard-128). AES-128 is a symmetric-key encryption standard which has a 128-bit block size, with key size of 128.
null: Encryption algorithm Null.
rc4: Encryption algorithm RC4 (Rivest Cipher 4). RC4 is a stream cipher used with SSL protocol.

Usage

Use this command to specify encryption for the SSL cipher suite.

Example

The following command sets the encryption option to its default value, which is RC4:

```
encryption rc4
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

hmac

Specifies the HMAC (keyed-Hash Message Authentication Code) for the SSL cipher suite.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
hmac { sha1 }

default hmac
```

default

Sets the HMAC option to its default value of SHA-1.

hmac sha1

Specifies the SHA-1 (Secure Hash Algorithm-1) HMAC for the SSL cipher suite.SHA-1 uses a 160-bit secret key and produces a 160-bit digest.

Usage

Use this command to specify the SHA-1 HMAC for the SSL cipher suite. The default and only currently available option is SHA-1.
A keyed-Hash Message Authentication Code, or HMAC, is a type of message authentication code (MAC) calculated using a cryptographic hash function in combination with a secret key to verify both data integrity and message authenticity.

Example

The following command sets the HMAC option to its default value, which is SHA-1:

```
hmac sha1
```

key-exchange

Specifies the key exchange algorithm for the SSL cipher suite.

Product

SCM (P-CSCF, A-BG)

Privilege

Administrator

Syntax

```
key-exchange { rsa }

default key-exchange
```

default

Sets the key exchange option to its default value of RSA.

key-exchange rsa

Specifies the RSA (Rivest, Shamir, and Adleman) key exchange algorithm for the SSL cipher suite. With RSA, the secret key is encrypted with the receiver's public key, and a public-key certificate from the receiver's key must be made available.

Usage

Use this command to specify the RSA key exchange for the SSL cipher suite. The default and only currently available option is RSA.
The key exchange algorithm provides the means by which the cryptographic keys for conventional encryption and MAC calculations are exchanged.

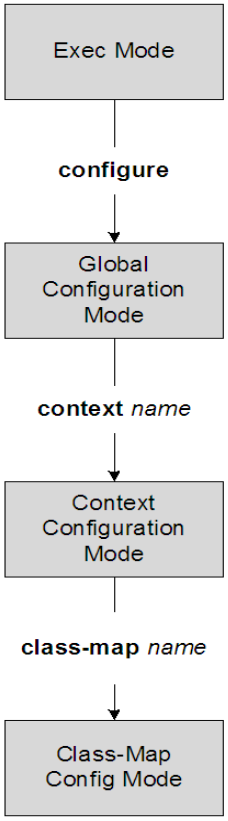
Example

The following command sets the key exchange option to its default value, which is RSA:

```
key-exchange rsa
```

Chapter 50
Class-Map Configuration Mode Commands

Class-Map is used to configure a packet classifier for the flow-based Traffic Policing feature within destination context. It filters egress and/or ingress packets of a subscriber session based on rules configured in a subscriber context.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

exit

Usage

Use this command to return to the parent configuration mode.

match any

Allows all traffic types in this class map.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
match any
```

Usage

Sets the match rule to allow all traffic flow for specific class map.

Example

The following command allows all packets going to a system with this class map.

```
match any
```

match dst-ip-address

Specifies a traffic classification rule based on the destination IP address of packets.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

match dst-ip-address *dst_ip_address* **/***subnet_mask*

match dst-ip-address *dst_ip_address*/*subnet_mask*

Specifies the destination IP address of the packets.
dst_ip_address must be entered in IPv4 dotted-decimal or IPv6 colon-separated notation.
subnet_mask is an option that is entered in CIDR notation.

Usage

Sets the match rule based on the destination IP address of packets for specific Class Map.

Example

The following command specifies the rule for packets going to a system having an IP address *10.1.2.6*.

```
match dst-ip-address 10.1.2.6
```

match dst-port-range

Specifies a traffic classification rule based on the range of destination ports for L4 packets.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

match dst-port-range *initial_port_number* **[to** *last_port_number* **]**

match dst-port-range *initial_port_number* **[to** *last_port_number* **]**

Specifies the destination port or range of ports of L4 packets.
initial_port_number is the starting port number and must be an integer 1 to 65535 but less than *last_port_number*, if specified.
last_port_number is the end port number and must be an integer from 1 to 65535 but more than *initial_port_number*.

Usage

Sets the match rule based on the destination port number or range of ports of L4 packets for specific Class Map.

Example

The following command specifies the rule for packets having destination port number from *23* to *88*.

```
match dst-port-range 23 to 88
```

match ip-tos

Specifies a traffic classification rule based on the IP Type of Service value in ToS field of packet.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Administrator

Syntax

match ip-tos { *service_value* [ip-tos-mask *mask_value*] | tos-range *low_value* to *high_value* }

---

match ip-tos *service_value*

Specifies the IP Type-of-Service value to match inside the ToS field of packets as an integer from 0 to 255.

---

ip-tos-mask *mask_value*

Specifies the IP Type-of-Service mask value to match inside the ToS field of packets as an integer from 1 to 255.

---

tos-range *low_value* to *high_value*

Specifies a range that a ToS value in a received packet must fall within to be considered a match. *low_value* and *high_value* must be an integer from 0 to 255.

Usage

Sets the match rule based on the IP ToS value in ToS field of packets for specific Class Map.

Example

The following commands specifies the IP ToS value of *3* is the value to match in a ToS field in received packets.

```
match ip-tos 3
```

match ipsec-spi

Specifies a traffic classification rule based on the IPSec Security Parameter Index (SPI) value in the SPI field of packet.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

match ipsec-spi *index_value*

match ipsec-spi *index_value*

Specifies the IPSec SPI value to match inside the SPI field of packets as an integer from 1 to 65535.

Usage

Sets the match rule based on the IPSec SPI value in SPI field of packets for specific Class Map.

Example

The following command specifies the IPSec SPI value as *1234* for the SPI field in packets.

```
match ipsec-spi 1234
```

match packet-size

Specifies a traffic classification rule based on the size of packet.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

match packet-size [gt | lt] *size*

match packet-size [gt | lt] *size*

Specifies the packet length in bytes.
gt: indicates a packet size greater than the specified size.
lt: indicates a packet size less than the specified size.
size must be an integer from 1 to 65535.

Usage

Sets the match rule based on the size of packets for specific Class Map. This command is only applicable for static policies; it is not available for dynamic policies.

Example

The following command specifies the packet length to be *1024* bytes.

```
match packet-size 1024
```

match protocol

Specifies a traffic classification rule based on the protocol used for session flow.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

```
match protocol { gre | ip-in-ip | number | rtp | sip | tcp | udp }
```

match protocol gre

Sets the match rule for session flow using Generic Routing Encapsulation (GRE) Protocol. It matches the protocol field to GRE inside the packet.

match protocol ip-in-ip

Sets the match rule for session flow using IP-in-IP encapsulation protocol. It matches the protocol field to ip-in-ip inside the packet.

match protocol number

Sets the match rule for a session flow using Transmission Control Protocol (TCP). It matches the specified protocol field inside the packet.

match protocol rtp

Sets the match rule for a session flow using Real Time Protocol (RTP). It matches the specified protocol field inside the packet.

match protocol sip

Sets the match rule for a session flow using Session Initiation Protocol (SIP). It matches the specified protocol field inside the packet.

match protocol tcp

Sets the match rule for a session flow using Transmission Control Protocol (TCP). It matches the protocol field to TCP inside the packet.

match protocol udp

Sets the match rule for a session flow having User Datagram Protocol (UDP). It matches the protocol field to UDP inside the packet.

Usage

Sets the match rule based on the protocol of packet flow for a specific Class Map.

Example

The following command specifies the rule for packet flow using IP-in-IP protocol.

```
match protocol ip-in-ip
```

match src-ip-address

Specifies a traffic classification rule based on the source IP address of packets.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

match src-ip-address *src_ip_address* **/***subnet_mask*

match src-ip-address *src_ip_address*/*subnet_mask*

Specifies the destination IP address of the packets.
src_ip_address must be entered in IPv4 dotted-decimal or IPv6 colon-separated notation.
subnet_mask is an option that is entered in CIDR notation.

Usage

Sets the match rule based on the source IP address of packets for specific Class Map.

Example

The following command specifies the rule for packets coming from a system having an IP address *10.1.2.3*.

```
match src-ip-address 10.1.2.3
```

match src-port-range

Specifies a traffic classification rule based on the range of source ports of L4 packets.

Product

PDSN, HA, ASN-GW, HSGW, P-GW, SCM

Privilege

Security Administrator, Administrator

Syntax

match src-port-range *initial_port_number* **[to** *last_port_number* **]**

initial_port_number **[to** *last_port_number* **]**

Specifies the source port or range of ports of the L4 packets.
initial_port_number is the starting port number and must be an integer from 1 to 65535 but less than *last_port_number*, if specified.
last_port_number is the end port number and must be an integer from 1 to 65535 but more than *initial_port_number*.

Usage

Sets the match rule based on source port number or range of ports of L4 packets for specific Class Map.

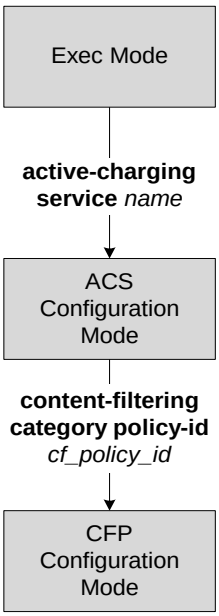
Example

The following command specifies the rule for packets having source port number from *23* to *88*.

```
match src-port-range 23 to 88
```

Chapter 51
Content Filtering Policy Configuration Mode Commands

The Content Filtering Policy Configuration Mode allows you to configure analysis and action when Content Filtering (CF) matches a Content Filtering Category Policy Identifier.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

analyze

Specifies the action to take for the indicated result after content filtering analysis.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

In 12.1 and earlier releases:

```
analyze priority priority { all | category category | x-category string } action { allow
| content-insert content_string | discard | redirect-url url | terminate-flow | www-
reply-code-and-terminate-flow reply_code } [ edr edr_format_name ]

no analyze priority priority
```

In 12.2 and later releases:

```
analyze priority priority { all | category category | x-category string } action { allow
| content-insert content_string | discard | redirect-url url | terminate-flow | www-
reply-code-and-terminate-flow reply_code } [ reporting-edr reporting_edr_format_name ]

no analyze priority priority
```

---

no

Removes the specified analyze priority configuration.

---

priority *priority*

Specifies the precedence of a category in the content filtering policy.
priority must be an integer from 1 to 65535 that is unique in the content filtering policy.

---

all

Specifies the default action to take if the category returned after rating is not configured in the subscriber's content filtering policy. This has the lowest priority.

---

category *category*

Specifies the category.
category must be one of the following.

- ABOR
- ADULT
- ADVERT
- ANON
- ART
- AUTO
- BACKUP

- BLACK
- BLOG
- BUSI
- CAR
- CDN

Important: Content can simultaneously match multiple categories, therefore specific **priority** must be used for required evaluation precedence.

x-category *string*

This keyword can be used to configure runtime categories not present in the CLI.
string specifies the unclassified category to be rated, and must be an alphanumeric string of 1 through 6 characters.
A maximum of 10 x-categories can be configured.

action { allow | content-insert *content_string* **| discard | redirect-url** *url* **| terminate-flow | www-reply-code-and-terminate-flow** *reply_code* **}**

Specifies the action to take for the indicated result of content filtering analysis.
allow: With static content filtering, this option allows the request for content. In dynamic content filtering it allows the content itself.
content-insert *content_string*: Specifies the content string to be inserted in place of the message returned from prohibited/restricted site or content server.
For static content filtering, *content_string* is used to create a response to the subscriber's attempt to get content. In dynamic content filtering, it is used to replace the content returned by a server.
content_string must be an alphanumeric string of 1 through 1023 characters.
discard: For static content filtering, this option discards the packet(s) that requested. In dynamic content filtering, it discards the packet(s) that contain(s) the content.
redirect-url *url*: Redirects the subscriber to the specified URL.

url must be an alphanumeric string of 1 through 1023 characters in the *http://search.com/subtarg=#HTTP.URL#* format.
terminate-flow: Terminates the TCP connection gracefully between the subscriber and server, and sends a TCP FIN to the subscriber and a TCP RST to the server.
www-reply-code-and-terminate-flow *reply_code*: Terminates the flow with the specified reply code. *reply_code* must be a reply code that is an integer from 100 through 599.

Important: Static-and-Dynamic Content Filtering is only supported in 9.0 and later releases.

edr *edr_format_name*

Important: This option is applicable only to 12.1 and earlier releases. In 12.2 and later releases, it is deprecated and replaced by the **reporting-edr** option.

Generates separate EDRs for content filtering based on action and content category using a specified EDR file format name.
edr_format_name is the name of a pre-defined EDR file format name in the EDR Format Configuration Mode, and must be an alphanumeric string of 1 through 63 characters.

Important: EDRs generated through this keyword are different from charging EDRs generated for subscriber accounting and billing. For more information on generation of charging EDRs, refer to the *ACS Rulebase Configuration Mode Commands* chapter.

reporting-edr *reporting_edr_format_name*

Important: This option is available only in 12.2 and later releases.

Generates separate reporting EDRs for Content Filtering based on the action and content category using the specified EDR file format name.
reporting_edr_format_name must be an alphanumeric string of 1 through 63 characters.

Usage

Use this command to specify the action and priorities for the indicated result of content filtering analysis. Up to 64 priorities and actions can be entered with this command.

Example

The following command sets priority *10* for category *ADULT* with action as **terminate-flow**:

```
analyze priority 10 category ADULT action terminate-flow
```

discarded-flow-content-id

Accounts for packets discarded as a result of content filtering action.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

discarded-flow-content-id *content_id*

no discarded-flow-content-id

content_id

Specifies the content ID for discarded flows as an integer from 1 through 65535.

Usage

Use this command in the configuration to account for packets discarded as a result of CF action.
A flow end-condition EDR would be generated as a charging EDR for content-filtered packets. No billing EDRs (even with flow-end) would be generated for a discarded packet as the flow will not end. Dual EDRs would exist for customers who want to use "flow end" to get EDRs for charging, plus CF-specific EDRs. The second EDR for charging comes from the **flow end-condition content-filtering** configuration in the Rulebase Configuration Mode.
The **discarded-flow-content-id** configuration can be used for accumulating statistics for UDR generation in case CF discards the packets. These statistics for UDR generation (based on the CF content ID) would also be accumulated in case of ACS error scenarios where the packets are discarded but the flow does not end.
If, in the Rulebase Configuration Mode, the **content-filtering flow-any-error** configuration is set to **deny**, then all the denied packets will be accounted for by the **discarded-flow-content-id** config. That is, the *content_id* will be used to generate UDRs for the denied packets in case of content filtering.

Example

Use the following command to set the accumulation of statistics for UDR generation based on the CF content ID *1003*:

```
discarded-flow-content-id 1003
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

end

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

failure-action

Specifies the failure action when the content filtering analysis results are not available to analyze.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
failure-action { allow | content-insert content_string | discard | redirect-url url |
terminate-flow | www-reply-code-and-terminate-flow reply_code } [ edr edr_format_name ]

default failure-action [ edr edr_format_name ]
```

default

Configures the default setting of discard.

allow

In static content filtering, this option allows the request for content. In dynamic content filtering it allows the content itself.

Important: Static-and-Dynamic Content Filtering is only supported in 9.0 and later releases.

content-insertion *content_string*

Specifies the content string to be inserted in place of the message returned from the content server due to connection timeout or when no category policy ID is available for the content.
For content filtering, the *content_string* is used to create a response to the subscriber's attempt to get content. In dynamic content filtering it replaces the content returned by a server.
content_string is an alphanumeric string of 1 through 1023 characters.

Important: Static-and-Dynamic Content Filtering is only supported in 9.0 and later releases.

discard

In static content filtering, specifies discarding the packet(s) that requested. In dynamic content filtering it discards the packet(s) that contain the content.

Important: Static-and-Dynamic Content Filtering is only supported in 9.0 and later releases.

redirect-url *url*

Redirects the subscriber to the specified URL.
url must be an alphanumeric string of 1 through 1023 characters, in the following format:
http://search.com/subtarg=#HTTP.URL#

terminate-flow

Terminates the TCP connection gracefully between the subscriber and external server and sends a TCP FIN to the subscriber and a TCP RST to the server.

www-reply-code-and-terminate-flow *reply_code*

Sets action as terminate-flow with a reply code that is a 3-digit integer from 100 through 599.

edr *edr_format_name*

Specifies the name of a pre-defined EDR format to be generated on the content filtering action as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to set the failure action to take when no content filtering analysis result is available to analyze for **analyze priority** *priority* **category** *category_string* command.

Example

The following command sets the failure action as **discard**:

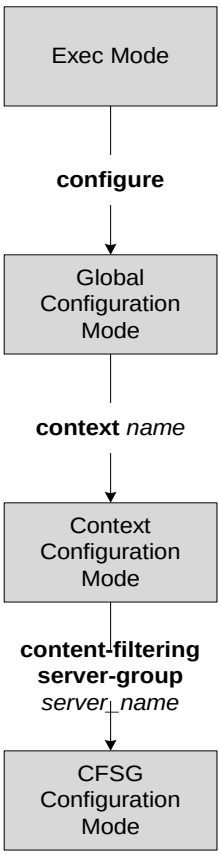
```
failure-action discard
```

timeout action

This command has been deprecated, and is replaced by the failure-action command.

Chapter 52
Content Filtering Server Group Configuration Mode Commands

Content Filtering Server Group Configuration Mode sets the parameters for interoperating with a group of external servers. It is accessed by entering the **`content-filtering server-group`** command in the Context Configuration Mode.



Important: The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).

connection retry-timeout

Configures the TCP connection retry timer for Internet Content Adaptation Protocol (ICAP) server and client.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

connection retry-timeout *duration*

{ default | no } connection retry-timeout

default

Configures the default setting of 30 seconds.

no

Removes the connection retry timeout configuration.

duration

Specifies the duration (in seconds) as an integer from 1 to 3600. Default: 30

Usage

Use this command to configure the connection retry timer between ICAP server and client TCP connection, i.e. how long to wait before re-attempting to establish a TCP connection.

Example

The following command sets the ICAP client and server connection retry timer to 120 seconds:

```
connection retry-timeout 120
```

deny-message

Configures the text message that is returned to the subscriber in a deny response.

Important: This command is obsolete in 10.0 and later releases.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

deny-message *string*

{ default | no } deny-message

default

Configures the default setting of Disabled.

no

Removes previously configured deny message setting.

string

Specifies a text message that is to be returned to the subscriber in a deny response as an alphanumeric string of 1 through 511 characters.

Usage

Use this command to define a text message that is returned to the subscriber in a deny response.

Example

The following command sets the text message to *no_Authorization* in a deny message:

```
deny-message no_Authorization
```

deny-response code

Configures the deny response message that is to be sent from the ICAP server to the subscribers.

Product

ICAP

Privilege

Security Administrator, Administrator

Syntax

```
deny-response code { 200 message string | 403 }

{ default | no } deny-response code
```

default

Configures the default setting of **deny-response code 200**.

no

Removes previously configured deny response message setting.

deny-response code 200 message *string*

Specifies a text message that is to be returned to the subscriber in a code 200 deny response. as an alphanumeric string of 1 through 511 characters.
If **deny-response code 200** is configured, the response sent to the subscriber will be of the form 200 OK with deny messages denied. If a message is configured for response code 200, that message will be used instead of "Access denied".

deny-response code 403

This keyword is used to set response code 403 for the deny response message.
When this keyword is configured, the deny response from the ICAP server will be sent “as is” to the subscriber.

Usage

Use this command to define a text message that is returned to the subscriber in a deny response.

Example

The following command sets the text message to *Not allowed* in a deny response message:

```
deny-response code 200 message Not allowed
```

dictionary

Specifies the dictionary to use for requests to the server(s) in this Content Filtering Server Group (CFSG).

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
dictionary { custom1 | custom2 | standard }

{ default | no } dictionary
```

default

Sets the default dictionary.
Default: **default**

no

Removes the previously configured dictionary setting.

custom1

Specifies a custom-defined dictionary that conforms to TS 32.015 v 3.6.0 for R99. It provides proprietary header fields for MSISDN and APN/subscriber. Please contact your local Cisco representative for more information.

custom2

Custom-defined dictionary. Please contact your local Cisco representative for additional information.

standard

Default: Enabled
This dictionary uses an HTTP Get Request to specify the URL. It conforms to TS 32.215 v 4.6.0 for R4 (and also R5 - extended QoS format).

Usage

Use this command to specify the standard and customized encoding mechanism used for elements included messages.

Example

The following command configures the system to use standard dictionary to encode messages:

```
default dictionary
```

end

Exits the current configuration mode and returns to the Exec mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
end
```

Usage

Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
exit
```

Usage

Use this command to return to the parent configuration mode.

failure-action

Specifies the actions to be taken when communication between ICAP endpoints within this Content Filtering Server Group (CFSG) fail.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

failure-action { allow | content-insertion *content_string* **| discard | redirect-url** *url* **| terminate-flow }**

{ default | no } failure-action

default

Configures the default setting of **terminate-flow**.

no

Removes previously configured failure action.

allow

For static content filtering, this option allows the request for content. In dynamic content filtering, it allows the content itself.

content-insertion *content_string*

Specifies the content string to be used for failure action.
For static content filtering, the specified text is used to create a response to the subscriber's attempt to get content. In dynamic content filtering, the specified text replaces the content returned by a server.
content_string must be an alphanumeric string of 1 through 128 characters.

discard

For static content filtering, this option discards the packet(s) requested. In dynamic content filtering, it discards the packet(s) that contain(s) the content.

redirect-url *url*

Redirects the subscriber to the specified URL.
url must be an alphanumeric string of 1 through 128 characters in the following format:
http://search.com/subtarg=#HTTP.URL#

terminate-flow

For TCP, gracefully terminates the connection between the subscriber and external server, and sends a TCP FIN to the subscriber and a TCP RST to the server.

For WAP-Connection Oriented, the WSP session is gracefully terminated by sending WTP Aborts for each of the outstanding requests, and WSP Disconnect to the client and the server. For WSP-Connectionless, only the current WSP request is rejected.

Usage

Use this command to set the actions on failure for server connection.
ICAP rating is enabled for retransmitted packets when the default ICAP failure action was taken on an ICAP request for that flow. ICAP default failure action is taken on the pending ICAP request for a connection when the connection needs to be reset and there is no other redundant connection available. For example, in the ICAP request timeout and ICAP connection timeout scenarios, the retransmitted packet in the uplink direction is sent for ICAP rating again.
For WAP CO, uplink retransmitted packets for the WAP transactions for which ICAP failure action was taken will be sent for ICAP rating. The WSP header of the retransmitted packet is not parsed by the WSP analyzer. The URL received in the previous packet for that transaction is used for ICAP rating. If failure action was taken on multiple WTP transactions for the same flow (case: WTP concatenated GET request), the uplink retransmitted packet for each of the transactions is sent for rating again.
For HTTP, uplink retransmitted packets for the HTTP flow on which ICAP failure action is taken are sent for ICAP rating. The URL present in the current secondary session (last uplink request) is used for ICAP rating. However, if there were multiple outstanding ICAP requests for the same flow (pipelined request), the retransmitted packet for the URL sent for rating will be that of the last GET request.
Retransmission in various cases of failure-action taken on retransmitted packets when the ICAP response is not received for the original request and the retransmitted request comes in:

- WSP CO:
  - Permit: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed/blocked. It is possible that the WAP gateway sends the response for the permitted GET request. Hence, there is a race condition and the subscriber may be able to view the web page even thought the rating was redirect or content insert.
  - Content Insert: The retransmitted packet is not sent for ICAP rating.
  - Redirect: The retransmitted packet is not sent for ICAP rating.
  - Discard: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed/blocked.
  - Terminate flow: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed or blocked. The WAP gateway may send an Abort transaction for this GET request if the WSP disconnect packet sent while terminating the flow is received by the WAP gateway.
- HTTP:
  - Permit: The uplink packet is sent for ICAP rating and depending on the ICAP response the last HTTP GET request. It is possible that the HTTP server sends the response for the permitted GET request. Hence there is a race condition and the subscriber may be able to view the web page even thought the rating was redirect or content insert.
  - Content Insert: Retransmitted packets are dropped and not charged.
  - Redirect: Retransmitted packets are dropped and not charged.
  - Discard: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction allowed/blocked.
  - Terminate flow: Retransmitted packets will be dropped and not charged.

Example

The following command sets the failure action to terminate:

```
failure-action terminate-flow
```

icap server

Adds an Internet Content Adaptation Protocol (ICAP) server configuration to the current Content Filtering Server Group (CFSG).

Important: In 8.1 and later releases, a A maximum of five ICAP servers can be configured per Content Filtering Server Group. In 8.0 and earlier releases, only one ICAP Server can be configured per Content Filtering Server Group.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

icap server *ip_address* **[port** *port_number* **] [max** *messages* **] [priority** *priority* **]**

no icap server *ip_address* **[port** *port_number* **] [priority** *priority* **]**

no

Removes the specified ICAP server configuration from the current Content Filtering Server Group.

ip_address

Specifies the ICAP server's IP address in IPv4 dotted-decimal or IPv6 colon-separated notation.

port *port_number*

Specifies the ICAP server's port number to use for communications as an integer from 1 to 65535. Default: 1344

max *messages*

Specifies the maximum number of unanswered outstanding messages that may be allowed to the ICAP server as an integer from 1 to 4096. Default: 256

Important: The maximum outstanding requests per ICAP connection is limited to one. Therefore the value configured using the **max** keyword will be ignored.

priority *priority*

Specifies priority of the ICAP server in the current Content Filtering Server Group. The priority is used in server selection to determine which standby server becomes active. *priority* must be an integer from 1 (highest priority) to 65535 (lowest priority). Default: 1

Important: The **priority** keyword is only available in 8.1 and later releases.

Usage

This command is used to add an ICAP server configuration to a Content Filtering Server Group with which the system is to communicate for content filtering communication.
In 8.0, the ICAP solution supports only one connection between ACS Manager and ICAP server.
In 8.1, multiple ICAP server connections are supported per manager. At any time only one connection is active with the other connections acting as standby. In case of a connection failure, based on its priority, a standby connection becomes active. Any pending ICAP requests are moved to the new active connection. If a standby connection is unavailable, failure action is taken on all pending ICAP requests. See the failure-action command.
In 8.1 and later releases, a maximum of five ICAP servers can be configured per Content Filtering Server Group with a priority associated with each server. Once configured, an ICAP server's priority cannot be changed. To change a server's priority, the server configuration must be removed, and added with the new priority.

Example

The following command sets the ICAP server IP address to *10.2.3.4* and port to *1024*:

```
icap server 10.2.3.4 port 1024
```

The following command specifies an ICAP server with IP address *10.6.7.8*, port number *1024*, and priority *3*:

```
icap server 10.6.7.8 port 1024 priority 3
```

origin address

Specifies a bind address for the Content Filtering Server Group (CFSG) endpoint.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

origin address *ip_address*

no origin address

no

Disables/releases the binding address for the CFSG endpoint.

ip_address

Specifies the IP address to bind the CFSG endpoint in IPv4 dotted-decimal or IPv6 colon-separated notation.

Usage

Use this command to set the bind address for the CFSG endpoint.

Example

The following command sets the origin address of *10.1.1.1*:

```
origin address 10.1.1.1
```

response-timeout

Sets the response timeout for the ICAP connection between the ICAP server and client.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

response-timeout *duration*

{ default | no } response-timeout

default

Configures the default setting of 30 seconds.

no

Removes the response timeout configuration.

duration

Specifies the timeout duration (in seconds) as an integer from 1 to 300. Default: 30

Usage

Use this command to set the ICAP connection response timeout, after which connection will be marked as unsuccessful between ICAP endpoint.

Example

The following command sets the ICAP connection response timeout to *100* seconds:

```
response-timeout 100
```

timeout action

This command has been deprecated, and is replaced by the failure-action command.

url-extraction

Enables configuration of ICAP URL extraction behavior.

Product

CF

Privilege

Security Administrator, Administrator

Syntax

```
url-extraction { after-parsing | raw }

default url-extraction
```

default

Configures the default setting of **after-parsing**.

after-parsing

Specifies sending the parsed URI and host name. Percent-encoded hex characters in URLs sent from the ACF client to the ICAP server will be converted to corresponding ASCII characters before being sent.
For example, the URL: *http://www.google.co.uk/?this%20is%20a%20test* will be sent to the ICAP server as:
http://www.google.co.uk/?this is a test

raw

Specifies sending raw URI and host name. The URLs will contain percent-encoded hex characters "as is".
For example, the URL *http://www.google.co.uk/?this%20is%20a%20test* will be sent to the ICAP server as:
http://www.google.co.uk/?this%20is%20a%20test

Usage

Use this command to configure the ICAP URL extraction behavior. Percent-encoded hex characters—for example, space (%20) and the percent character (%25)—in URLs sent from the ACF client to the ICAP server can be sent either as percent-encoded hex characters or as their corresponding ASCII characters.

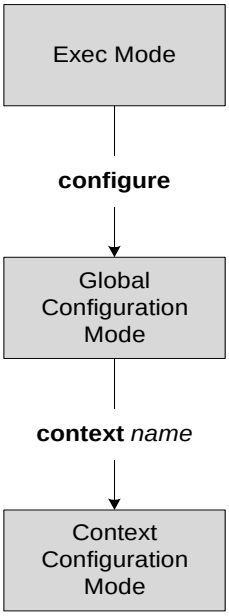
Example

The following command configures URLs sent from the ACF client to the ICAP server to contain the escape encoding as is:

```
url-extraction raw
```

Chapter 53
Context Configuration Mode Commands

The Context Configuration Mode is used to create and manage contexts in the system. Contexts facilitate management of subscribers and services in the system.



aaa accounting

This command enables/disables accounting for subscribers and context-level administrative users for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
aaa accounting { administrator radius-diameter | subscriber [ radius-diameter ] }

default aaa accounting { administrator | subscriber }

no aaa accounting { administrator | subscriber } [ radius-diameter ]
```

default

Configures the default setting.
Default: RADIUS

no

Disables AAA accounting per the options specified.

radius-diameter

Enables AAA accounting for context-level administrative users.

subscriber

Enables AAA accounting for subscribers.

radius-diameter

Enables RADIUS or Diameter accounting for subscribers.

Usage

Use this command to enable/disable accounting for subscribers and context-level administrative users for the current context.
To enable or disable accounting for individual local subscriber configurations refer to the **accounting-mode** command in the *Subscriber Configuration Mode Commands* chapter.

Important: The accounting parameters in the APN Configuration Mode take precedence over this command for subscriber sessions. Therefore, if accounting is disabled using this command but enabled within the APN configuration, accounting is performed for subscriber sessions.

Example

The following command disables AAA accounting for context-level administrative users:

```
no aaa accounting administrator
```

The following command enables AAA accounting for context-level administrative users:

```
aaa accounting administrator radius-diameter
```

aaa authentication

This command enables/disables authentication for subscribers and context-level administrative users for the current context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] aaa authentication { administrator | subscriber } { local | none | radius-diameter }
```

```
default aaa authentication { administrator | subscriber }
```

default

Configures the default setting for the specified parameter.

- **administrator**: local+RADIUS
- **subscriber**: RADIUS

no

Disables AAA authentication for administrator(s)/subscribers as specified.

- **local**: Disables local authentication for current context.
- **none**: Disables NULL authentication for current context, which enables both local and RADIUS-based authentication.
- **radius-diameter**: Disables RADIUS or Diameter-based authentication.

administrator | subscriber

- **administrator**: Enables authentication for administrative users.
- **subscriber**: Enables authentication for subscribers.

local | none | radius-diameter

Enables AAA authentication for administrator(s)/subscribers as specified.

- **local**: Enables local authentication for the current context.
- **none**: Disables authentication for the current context.
- **radius-diameter**: Enables RADIUS or Diameter-based authentication.

Usage

Use this command to enable/disable AAA authentication during specific maintenance activities or during test periods. The authentication can then be enabled again for the entire context as needed.

Example

The following command disables RADIUS or Diameter-based authentication for subscribers for the current context:

```
no aaa authentication subscriber radius-diameter
```

The following command enables RADIUS or Diameter-based authentication for subscribers for the current context:

```
aaa authentication subscriber radius-diameter
```

aaa constructed-nai

This command configures the password used during authentication for sessions using a Constructed Network Access Identifier (NAI) or an APN-specified user name.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

aaa constructed-nai authentication [[encrypted] password *user_password* **| use-shared-secret-password]**

no aaa constructed-nai authentication

no

Disables authentication based upon the constructed NAI.

[encrypted] password *user_password*

encrypted: Specifies that the user password should be encrypted.
password *user_password*: Specifies an authentication password for the NAI-constructed user.
In 12.1 and earlier releases, the *user_password* must be an alphanumeric string of 0 through 63 characters with or without encryption.
In 12.2 and later releases, the *user_password* must be an alphanumeric string of 0 through 63 characters without encryption, or 1 through 132 characters with encryption.

use-shared-secret-password

Specifies using RADIUS shared secret as the password. Default: No password

Usage

This command configures passwords for user sessions that utilize a constructed NAI assigned via a PDSN service or a user name assigned via the APN configuration.
For simple IP sessions facilitated by PDSN services in which the **authentication allow-noauth** and **aaa constructed-nai** commands are configured, this command provides a password used for the duration of the session.
For PDP contexts using an APN in which the outbound user name is configured with no password, this command is used to provide the password. Additionally, this command is also used to provide a password for situations in which an outbound username and password are configured and the **authentication imsi-auth** command has been specified.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.
If a password is configured with this keyword, then the specified password is used. Otherwise, an empty user-password attribute is sent.

Note that this configuration works in a different way for GGSN services. If a password is configured with this keyword for GGSN service, the specified password is used. Otherwise, if an outbound password is configured, that password is used. If no outbound password is configured, the RADIUS server secret is used as the user-password string to compute the user-password RADIUS attribute.
The NAI-construction consists of the subscriber's MSID, a separator character, and a domain. The domain that is used is either the domain name supplied as part of the subscriber's user name or a domain alias.

Important: The domain alias can be set with the **nai-construction domain** command in the PDSN Service Configuration mode, or the **aaa default-domain subscriber** command in the Global Configuration mode for other core network services.

The domain alias is determined according to the following rules:

- If the domain alias is set by **nai-construction domain**, that value is always used and the **aaa default-domain subscriber** value is disregarded, if set. The NAI is of the form **<msid><symbol><nai-construction domain>**.
- If the domain alias is not set by **nai-construction domain**, and the domain alias is set by **aaa default-domain subscriber**, the **aaa default-domain subscriber** value is used. The NAI is of the form **<msid><symbol><aaa default-domain subscriber>**.
- If the domain alias is not set by **nai-construction domain** or **aaa default-domain subscriber**, the domain name alias is the name of the source context for the PDSN service. The NAI is of the form **<msid><symbol><source context of PDSN Service>**.

The special separator character can be one of the following six: @, -, %, \, -, /
The subscriber's MSID is constructed in one of the formats displayed in the following figure.

Mobile Country Code (3 digits)	Mobile Network Code (2 or 3 digits)	Mobile Subscriber Identification Number (10 digits max)

International Mobile Station Identity (IMSI)

Area Code (3 digits)	Office Code (3 digits)	Subscriber Number (4 digits)

Mobile Identification Number (MIN)

Mobile Country Code (3 digits)	Mobile Network Code (1 digit)	Subscriber Number (6 digits)

International Roaming MIN (IRM)

Example

The following command configures the authentication password for the NAI-constructed user.

```
aaa constructed-nai authentication
```

aaa filter-id rulebase mapping

This command configures the system to use the value of the Filter-Id AVP as the ACS rulebase name.

Product

ACS

Privilege

Security Administrator, Administrator

Syntax

```
[ no | default ] aaa filter-id rulebase mapping
```

no

Disables the mapping of Filter-Id AVP and ACS rulebase name.

default

Configures the default setting. Default: Disabled

Usage

Use this command to enable the mapping of Filter-Id attribute's value returned during RADIUS authentication as the ACS rulebase name.
This feature provides the flexibility for operator to transact between multi-charging-service support for postpaid and prepaid subscribers through Access Control Lists (ACLs) entered in AAA profiles in RADIUS server to single-charging-service system based on rulebase configuration for postpaid and prepaid subscribers.
This feature internally maps the received ACL in to rulebase name and configures subscriber for postpaid or prepaid services accordingly.
When this feature is enabled and ACS rulebase attribute is not received from RADIUS or not configured in local default subscriber template system copies the filter-id attribute value to ACS rulebase attribute.
This copying happens only if the filter-id is configured and received from RADIUS server and ACS rulebase is not configured in ACS or not received from RADIUS.

Example

The following command enables the mapping value of the Filter-Id attribute to ACS rulebase name:

```
aaa filter-id rulebase mapping
```

aaa group

This command enables/disables the creation, configuration or deletion of AAA server groups in the context.

Product

All

Privilege

Security Administrator, Administrator

Syntax

aaa group *group_name* **[-noconfirm]**

no aaa group *group_name*

no

Deletes the specified AAA group.

group_name

Specifies name of the AAA group.
If the specified AAA group does not exist, it is created, and the prompt changes to the AAA Server Group Configuration Mode, wherein the AAA group can be configured.
If the specified AAA group already exists, the prompt changes to the AAA Server Group Configuration Mode, wherein the AAA group can be configured.
group_name must be an alphanumeric string of 1 through 63 characters.

-noconfirm

Executes the command without any prompt and confirmation from the user.

Usage

Use this command to create/configure/delete AAA server groups within the context. Also, refer to the *AAA Server Group Configuration Mode Commands* chapter.

Example

The following command enters the AAA Server Group Configuration Mode for a AAA group named *test321*:

```
aaa group test321
```

aaa nai-policy

This command sets policies on how Network Access Identifiers (NAIs) are handled during the authentication process.

Product

PDSN, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
[ default | no ] aaa nai-policy reformat-alg-hex-0-9
```

default

Sets the NAI policy back to its default setting which is to remap hexadecimal digits in NAIs and accept calls with embedded 0x00 hexadecimal digits.

no

Disable remapping of hexadecimal digits in the NAI and reject calls that have a 0x00 hexadecimal digit embedded in the NAI.

reformat-alg-hex-0-9

Default: Enabled
Controls remapping of NAIs that consist only of hex digits 0x00 through 0x09 or if a 0x00 hexadecimal digit is embedded in the NAI.
By default, the system remaps NAIs that consist solely of characters 0x00 through 0x09 to their ASCII equivalent. For example; 0x00 0x01 0x2 0x03 will get remapped to 123.
Also by default the system accepts an NAI containing one or more 0x00 characters within the NAI ignoring all characters after the first 0x00.
When this keyword is disabled NAIs are processed as follows:

- Remapping of hexadecimal digits 0x00 through 0x09 within the user-provided NAI is disabled.
- When the NAI has an embedded 0x00 character anywhere within it (including if there is an extra 0x00 character at the end) the call is rejected.

Usage

Use this command to disable or re-enable remapping of hexadecimal digits in the NAI.

Example

The following command disables the remapping of hexadecimal digits in the NAI:

```
no aaa nai-policy reformat-alg-hex-0-9
```

access-list undefined

Configures the behavior of access control for the current context when an undefined access control list is specified.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
access-list undefined { deny-all | permit-all }

{ default | no } access-list undefined
```

default

Configures the default setting.

no

Disables handling undefined access lists.

access-list undefined deny-all

Specifies to drop all packets when an undefined ACL is specified.

access-list undefined permit-all

Specifies to forward all packets when an undefined ACL is specified.

Usage

Use this command to specify the default behavior when an ACL specified does not exist.
When the security policies require strict access control the **deny-all** handling should be configured.

Example

The following command sets the packet handling to ignore (drop) all packets when an undefined ACL is specified.

```
access-list undefined deny-all
```

administrator

Configures a user with Security Administrator privileges in the current context.

Product

All

Privilege

Security Administrator

Syntax

administrator *user_name* **[encrypted] password** *password* **| [ecs] [expiry-date** *date_time* **] [ftp] [li-administration] [nocli] [noecs] [timeout-absolute** *timeout_absolute* **] [timeout-min-absolute** *timeout_min_absolute* **] [timeout-idle** *timeout_idle* **][timeout-min-idle** *timeout_min_idle* **]**

no administrator *user_name*

---

no

Removes Security Administrator privileges for the specified user name.

---

administrator *user_name*

Specifies the user name for which Security Administrator privileges must be enabled in the current context. *user_name* must be an alphanumeric string of 1 through 32 characters.

[encrypted] password *password*

Specifies password for the user name. Optionally, the **encrypted** keyword can be used to specify the password uses encryption.
password must be an alphanumeric string of 1 through 63 characters without encryption, and 1 through 132 characters with encryption.
The **encrypted** keyword is intended only for use by the system while saving configuration scripts. The system displays the **encrypted** keyword in the configuration file as a flag that the variable following the **password** keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

---

ecs

Permits the user to use ACS-specific configuration commands. Default: Permitted

---

expiry-date *date_time*

Specifies the date and time that this login account expires.
Enter the date and time in the YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss format. Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

---

ftp

Permits the user to use FTP and SFTP. Default: Not permitted

li-administration

Refer to the *Lawful Intercept Configuration Guide* for a description of this parameter.

nocli

Prevents the user from using the command line interface. Default: Permitted

noecs

Prevents the user from accessing ACS-specific commands.

timeout-absolute *timeout_absolute*

Important: This keyword is obsolete. It has been left in place for backward compatibility. If used, a warning is issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum time, in seconds, the Security Administrator may have a session active before the session is forcibly terminated. *timeout_absolute* must be an integer from 0 through 300000000.
The value 0 disables this timeout configuration.
Default: 0

timeout-min-absolute *timeout_min_absolute*

Specifies the maximum time (in minutes) the Security Administrator may have a session active before the session is forcibly terminated. *timeout_min_absolute* must be an integer from 0 through 525600. The value 0 disables this timeout configuration. Default: 0

timeout-idle *timeout_idle*

Important: This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum time, in seconds, the Security Administrator may have a session active before the session is terminated. *timeout_idle* must be an integer from 0 through 300000000.
The value 0 disables the idle timeout configuration.
Default: 0

timeout-min-idle *timeout_min_idle*

Specifies the maximum time, in minutes, the Security Administrator may have a session active before the session is terminated. *timeout_min_idle* must be an integer from 0 through 525600. The value 0 disables the idle timeout configuration. Default: 0

Usage

Use this command to create new Security Administrators or modify existing user's settings.
Security Administrator users have read-write privileges and full access to all contexts and command modes.
Refer to the *Command Line Interface Overview* chapter for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example

The following command creates a Security Administrator account named *user1* with access to ACS configuration commands:

```
administrator user1 password secretPassword
```

The following removes the Security Administrator account named *user1*:

```
no administrator user1
```

apn

Creates or deletes Access Point Name (APN) templates and enters the APN Configuration Mode within the current context.

Product

GGSN, P-GW

Privilege

Security Administrator, Administrator

Syntax

[no] apn *apn_name* **[-noconfirm]**

no

Deletes a previously configured APN template.

apn_name

Specifies a name for the APN template as an alphanumeric string of 1 through 62 characters that is case insensitive. It may also contain dots (.) and/or dashes (-).

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with the **no apn** *apn_name* command, the APN named *apn_name* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

This command creates an APN within the system and causes the CLI to enter the APN Configuration Mode. The APN is a logical name for a packet data network and/or a service to which the system supports access. When a create PDP context request is received by the system, it examines the APN information element within the packet. The system determines if an APN with the identical name is configured. If so, the system uses the configuration parameters associated with that APN as a template for processing the request. If the names do not match, the request is rejected with a cause code of 219 (DBH, Missing or unknown APN). APN templates should be created/configured within destination contexts on the system. Up to 1000 APNs can be configured.

Example

The following command creates an APN template called *isp1*:

```
apn isp1
```

asn-qos-descriptor

Creates, deletes or manages the Quality of Service (QoS) descriptor table identifier for Access Service Node Gateway (ASN-GW) service and enters the ASN QoS Descriptor Table Identifier Configuration mode within the source context.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

asn-qos-descriptor id *qos_table_id* **[default] dscp [be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af 42 | af 43 | ef] [-noconfirm]**

no asn-qos-descriptor *qos_table_id* **[default] dscp [be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af 42 | af 43 | ef] [-noconfirm]**

no

Deletes a preciously configured ASN QoS descriptor table identifier.

asn-qos-descriptor id *qos_table_id*

Specifies a unique identifier for ASN QoS descriptor table to create/configure. *qos_table_id* must be an integer from 1 through 65535.

[default] dscp

Specifies DSCP marking for this QoS descriptor.

[be | af11 | af12 | af13 | af21 | af22 | af23 | af31 | af32 | af33 | af41 | af 42 | af 43 | ef]

The DSCP marking for this QoS descriptor. Default value is be (best effort).

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asn-qos-descriptor id** *qos_table_id* command the ASN QoS descriptor table with identifier *qos_table_id* will be deleted with all active/inactive configurations without prompting any warning or confirmation.

Usage

Use this command to configure a QoS description table to manage QoS functionality for an ASN-GW service subscriber. This command creates and allows the configuration of QoS tables with in a context. This command is also used to remove previously configured ASN-GW services QoS descriptor table.
A maximum of 16 QoS Descriptor Tables can be configured per system.
Refer to the *ASN QoS Descriptor Configuration Mode Commands* chapter of this reference for additional information.

Example

The following command creates a QoS descriptor table with identifier *1234* for the ASN-GW service subscribers:

```
asn-qos-descriptor id 1234
```

asn-service-profile

Creates, deletes or manages the Service Profiles Identifier for Access Service Node Gateway (ASN-GW) service subscribers and enters the ASN Service Profile Configuration mode within the current context.

Product

ASN-GW

Privilege

Administrator

Syntax

asn-service-profile id *asn_profile_id* **direction { bi-directional | downlink | uplink } [activation-trigger {activate | admit | dynamic-reservation | provisioned } [-noconfirm]**

no asn-service-profile id *asn_profile_id* **[-noconfirm]**

no

Deletes a preciously configured ASN service profile identifier.

asn-service-profile id *asn-profile_id*

Specifies a unique identifier for ASN profile to create/configure.

direction { bi-directional | downlink | uplink }

Specifies the direction of data traffic to apply this service profile.
bi-directional: Enables this service profile in both direction of uplink and downlink.
downlink: Enables this service profile in downlink direction, towards the subscriber.
uplink: Enables this service profile in uplink direction, towards the system.

activation-trigger {activate | admit | dynamic-reservation | provisioned

Use this option to configure the activation-trigger for the asn-service-profile. Default: provisioned | admit | activate

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asn-service-profile id** *asn_profile_id* command the ASN service profile with identifier *asn_profile_id* will be deleted with all active/inactive configurations without prompting any warning or confirmation.

Usage

Use this command to configure a service profile to apply the ASN-GW service subscribers. This command creates and allows the configuration of service profiles with in a context. This command is also used to remove previously configured ASN-GW services profiles.
A maximum of 32 ASN Service Profiles can be configured per context.

Refer to the *ASN Service Profile Configuration Mode Commands* chapter of this reference for additional information.

Example

The following command creates an ASN Service Profile with identifier *1234* for the ASN-GW service subscribers:

```
asn-service-profile id 1234 direction uplink
```

asngw-service

Creates, deletes or manages an Access Service Node Gateway (ASN-GW) service and enters the ASN Gateway Service Configuration Mode within the current context.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

asngw-service *asngw_name* **[-noconfirm]**

no asn-service *asngw_name* **[-noconfirm]**

no

Deletes a previously configured ASN-GW service.

asngw-service *asngw_name*

Specifies the name of the ASN-GW service to create/configure as an alphanumeric string of 1 through 63 characters that is case sensitive.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asn-service** *asngw_name* command the ASN-GW service named *asngw_name* will be deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

Services are configured within a context and enable certain functionality. This command creates and allows the configuration of services enabling the system to function as an ASN Gateway in a WiMAX network. This command is also used to remove previously configured ASN-GW services.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the *ASN Gateway Service Configuration Mode Commands* chapter of this reference for additional information.

Example

The following command creates an ASN-GW service name *asn-gw1*:

```
asngw-service asn-gw1
```

asnpc-service

Creates, deletes or manages an ASN Paging Controller service to manage the ASN paging controller service and enters the ASN Paging Controller Configuration mode within the current context.

Product

ASN-GW

Privilege

Security Administrator, Administrator

Syntax

[no] asnpc-service *asn_pc_svc_name* **[-noconfirm]**

no

Deletes a preciously configured ASN paging controller service.

asnpc-service *asn_pc_svc_name*

Specifies the name of the ASN Paging Controller Service to create and enable as an alphanumeric string of 1 through 63 characters that is case sensitive.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no asnpc-service** *asn_pc_svc_name* command the ASN Paging Controller service named *asn_pc_svc_name* will be deleted and disabled with all active/inactive paging groups and paging agents configured in a context for ASN paging controller service without prompting any warning or confirmation.

Usage

Use this command to create and enable the ASN paging controller services in the system to provide functionality of an ASN Paging Controller service within a context. Additionally this command provides the access to the ASN Paging Controller Service Configuration mode and also used to remove previously configured ASN Paging Controller services.
A maximum of 256 services (regardless of type) can be configured per system.

Caution: Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

Refer to the *ASN Paging Controller Service Configuration Mode Commands* chapter of this reference for additional information.

Example

The following command creates an ASN paging controller service name *asnpc_1*:

```
asnpc-service asnpc_1
```

bfd-protocol

Enables or disables Bidirectional Forwarding Detection (BFD) protocol and enters the BFD Configuration mode.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] bfd-protocol
```

Usage

Use this command to set configuration parameters for detecting faults in paths established with BFD-enabled routers.
Refer to the *BFD Configuration Mode Commands* chapter for additional information.

Example

The following command enables BFD Configuration mode:

```
bfd-protocol
```

bgp extended-asn-cap

Enables or disables the router to send 4-octet ASN capabilities.

Product

All

Privilege

Security Administrator, Administrator

Syntax

```
[ no ] bgp extended-asn-cap
```

Example

The following command enables the router to send 4-octet ASN Capabilities:

```
bgp extended-asn-cap
```

bmsc-profile

Creates or deletes Broadcast Multicast Service Center (BM-SC) profiles and enters the BMSC Profile Configuration Mode within the current context.

Product

GGSN

Privilege

Security Administrator, Administrator

Syntax

[no] bmsc-profile name *bmsc_profile_name* [**-noconfirm**]

no

Deletes a previously configured BM-SC profile.

bmsc-profile name *bmsc_profile_name*

Specifies a name for the BM-SC profile as an alphanumeric string of 1 through 62 characters that is case insensitive. It may also contain dots (.) and/or dashes (-).

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

WARNING: If this keyword option is used with **no bmsc-profile name** *bmsc_profile_name* command the BM-SC profile named *bmsc_profile_name* is deleted with all active/inactive subscribers without prompting any warning or confirmation.

Usage

Use this command to create a BM-SC profile within the context and take the user to enter the BMSC Profile Configuration Mode.
The BM-SC profile is a logical name for a Broadcast Multicast Service Center in Multimedia Broadcast and Multicast service.
BM-SC profile should be created/configured within contexts on the system. Up to four BM-SC profiles can be configured.

Example

The following command creates a BM-SC Profile called *mbms_sc_1*:

```
bmsc-profile name mbms_sc_1
```

busyout ip pool

Makes addresses from an IP pool in the current context unavailable once they are free.

Product

PDSN, HA, GGSN, NAT

Privilege

Security Administrator, Administrator

Syntax

busyout ip pool { all | all-dynamic | all-static | name *pool_name* **} [address-range** *start_address end_address* **| lower-percentage** *percent* **| upper-percentage** *percent* **]**

no busyout ip pool { all | all-dynamic | all-static | name *pool_name* **} [address-range** *start_address end_address* **| lower-percentage** *percent* **| upper-percentage** *percent* **]**

no

Disables the busyout command specified.

busyout ip pool all

Applies to all IP pools in the current context.

busyout ip pool all-dynamic

Applies to all dynamic IP-pools in the current context.

busyout ip pool all-static

Applies to all static IP pools in the current context.

busyout ip pool name *pool_name*

Applies the named IP pool or IP pool group in the current context. *pool_name* must be the name of an existing IP pool or IP pool group in the current context.

address-range *start_address end_address*

Busyout all addresses from *start_address* through *end_address*. *start_address*: The beginning IP address of the range of addresses to busyout. This IP address must exist in the pool specified and entered in IPv4 dotted-decimal notation.
end_address: The ending IP address of the range of addresses to busyout. This IP address must exist in the pool specified and entered in IPv4 dotted-decimal notation.

lower-percentage *percent*

Busyout the percentage of IP addresses specified, beginning at the lowest numbered IP address. This is a percentage of all of the IP addresses in the specified IP pool. *percent* must be an integer from 0 through 100.

upper-percentage *percent*

Busyout the percentage of IP addresses specified, beginning at the highest numbered IP address. This is a percentage of all of the IP addresses in the specified IP pool. *percent* must be an integer from 0 through 100.

Usage

Use this command to busyout IP addresses when resizing an IP pool.
Up to 32 instances of this command can be executed per context.
A single instance of this command can busy-out multiple IP address pools in the context through the use of the **all**, **all-static**, or **all-dynamic** keywords.

Example

Assume an IP pool named *Pool10* with addresses from *192.168.100.1* through *192.168.100.254*. To busy out the addresses from *192.168.100.50* through *192.169.100.100*, enter the following command:

```
busyout ip pool name Pool10 address-range 92.168.100.50 192.169.100.100
```

To restore the IP addresses from the previous example and make them accessible again, enter the following command:

```
no busyout ip pool name Pool10 address-range 92.168.100.50
192.169.100.100
```

cae-group

Creates a CAE group, which is a CAE server cluster that services TCP video requests from the Mobile Video Gateway. The Mobile Video Gateway uses the configured CAE group for CAE load balancing. The CAE (Content Adaptation Engine) is an optional component of the Mobile Videoscape.

Product

MVG

Privilege

Security Administrator, Administrator

Syntax

[no] cae-group *cae_group_name* **[-noconfirm]**

---

no cae-group *cae_group_name*

Deletes the CAE group if previously configured.

---

cae-group *cae_group_name*

Creates the specified CAE group and enters the Video Group Configuration Mode. *cae_group_name* is an alphanumeric string of 1 through 79 characters.

-noconfirm

Executes the command without any prompt and confirmation from the user.

Usage

Use this command to create a CAE group and enter the Video Group Configuration Mode. This command gets issued from the Context Configuration Mode.

Example

The following command creates a CAE group named *group_1* and enters the Video Group Configuration Mode:

```
cae-group group_!
```

camel-service

Creates an instance of the Customized Applications for Mobile Enhanced Logic (CAMEL) service and enters the CAMEL service configuration mode. This mode configures or edits the configuration for the parameters which control the CAMEL functionality on the SGSN.

Important: For details about the commands and parameters, check the *CAMEL Service Configuration Mode* chapter.

Product

SGSN

Privilege

Security Administrator, Administrator

Syntax

camel-service *srvc_name*

no camel-service *srvc_name*

no

Remove the configuration for the specified SGSN service from the configuration of the current context.

camel-service *srvc_name*

Creates a CAMEL service instance having a unique name expressed as an alphanumeric string of 1 through 63 characters.

Usage

Use this command to create, edit, or remove an CAMEL service

Example

The following command creates an CAMEL service named *camel1* in the current context:

```
camel-service camel1
```

The following command removes the CAMEL service named *camel2* from the configuration for the current context:

```
no camel-service camel2
```

cipher-suite

Creates a new SSL cipher suite or specifies an existing cipher suite and enters the Cipher Suite Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

`[ no ] cipher-suite` *`name`*

`no`

Removes the specified SSL cipher suite from the context.

`cipher-suite` *`name`*

Specifies the name of a new or existing SSL cipher suite as n alphanumeric string of 1 through 127 characters that must be unique across all CSCF services within the same context and across all contexts.

Usage

Use this command to create a new SSL cipher suite or modify an existing one.

Important: One SSL cipher suite can be created per SSL template.

A cipher suite contains the cryptographic algorithms supported by the client, and defines a key exchange and a cipher spec, which specifies the encryption and hash algorithms used during authentication. SSL cipher suites allow operators to select levels of security and to enable communication between devices with different security requirements.
Entering this command results in the following prompt:

```
[context_name]hostname(cfg-ctx-cipher-suite)#
```

Cipher Suite Configuration Mode commands are defined in the *Cipher Suite Configuration Mode Commands* chapter.

Example

The following command specifies the SSL cipher suite *`cipher_suite_1`* and enters the Cipher Suite Configuration Mode:

```
cipher-suite cipher_suite_1
```

class-map

Creates or deletes a class map. If the class-map is newly created, the system enters the Class-Map Configuration Mode within the current destination context to configure the match rules for packet classification to flow-based traffic policing for a subscriber session flow.

Product

PDSN, HA, ASN-GW, HSGW

Privilege

Security Administrator, Administrator

Syntax

`[ no ] class-map name` *`class_name`* **`[ match-all | match-any ]`**

`no`

Deletes configured Class-Map within the context.

`lass-map name` *`class_name`*

Specifies the name of Class-Map rule as an alphanumeric string of 1 through 15 characters and is case sensitive.

`match-all`

Default: Enabled.
Enables AND logic for all matching parameters configured in specific Class-Map to classify traffic flow/packets. It indicates to match all classification rules in specific Class-Map to consider the specified Class-Map as a match.

`match-any`

Default: Disabled.
Enables OR logic for matching parameters configured in specific Class-Map to classify traffic flow/packets. It indicates to match any of the classification rule in specific Class-Map to consider the specified Class-Map as a match.

Usage

Use this command to enter in Class-Map Configuration Mode to set classification parameters or filters in traffic policy for a subscriber session flow.

Important: In this mode classification rules added sequentially with **match** command to form a Class-Map. To change and/or delete or re-add a particular rule entire Class-Map is required to delete.

Example

Following command configures classification map *`class_map1`* with option to match any condition in match rule.

```
class-map name class_map1 match-any
```

closedrp-rp handoff

Enables or disables session handoff between Closed-RP and RP connections. Default: Disabled

Product

PDSN

Privilege

Security Administrator, Administrator

Syntax

```
closedrp-rp handoff

[ default | no ] closedrp-rp handoff
```

default

Resets the command to its default setting of disabled.

no

Disables Closed-RP to RP session handoff.

closedrp-rp handoff

Enables Closed-RP to RP session handoff.

Usage

Use this command to enable a PDSN service to handoff sessions between Closed-RP and RP connections.

Example

To enable Closed-RP to RP handoffs, use the following command:

```
closedrp-rp handoff
```

To disable Closed-RP to RP handoffs, use the following command:

```
no closedrp-rp handoff
```

config-administrator

Configures a context-level administrator account within the current context.

Product

All

Privilege

Security Administrator

Syntax

config-administrator *user_name* **[encrypted] password** *password* **[ecs] [expiry-date** *date_time* **] [ftp] [li-administration] [nocli] [noecs] [timeout-absolute** *abs_seconds* **] [timeout-min-absolute** *abs_minutes* **] [timeout-idle** *timeout_duration* **] [timeout-min-idle** *idle_minutes* **]**

no config-administrator *user_name*

no

Removes a previously configured context-level administrator account.

config-administrator *user_name*

Specifies the name for the account as an alphanumeric string of 1 through 32 characters.

[encrypted] password *password*

Specifies the password to use for the user which is being given context-level administrator privileges within the current context. The encrypted keyword indicates the password specified uses encryption.
password is an alphanumeric string of 1 through 63 characters without encryption, or 1 through 127 characters with encryption.
The encrypted keyword is intended only for use by the system while saving configuration scripts. The system displays the encrypted keyword in the configuration file as a flag that the variable following the password keyword is the encrypted version of the plain text password. Only the encrypted password is saved as part of the configuration file.

ecs

Permits the user access to ACS-specific configuration commands. Default: Enhanced Charging Service (ECS / ACS) specific configuration commands allowed.

expiry-date *date_time*

Specifies the date and time that this account expires in the format YYYY:MM:DD:HH:mm or YYYY:MM:DD:HH:mm:ss.
Where YYYY is the year, MM is the month, DD is the day of the month, HH is the hour, mm is minutes, and ss is seconds.

ftp

Indicates the user gains FTP and SFTP access with the administrator privileges. Default: FTP and SFTP are not allowed.

li-administration

Refer to the *Lawful Intercept Configuration Guide* for a description of this parameter.

nocli

Indicates the user is not allowed to access the command line interface. Default: CLI access allowed.

noecs

Prevents the specific user from accessing ACS-specific configuration commands.

timeout-absolute *abs_seconds*

Important: This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum amount of time (in seconds) that the administrator may have a session active before the session is forcibly terminated. *abs_seconds* must be an integer from 0 through 300000000. The value 0 disables the absolute timeout. Default: 0

timeout-min-absolute *abs_minutes*

Specifies the maximum amount of time (in minutes) the context-level administrator may have a session active before the session is forcibly terminated. *abs_minutes* must be an integer from 0 through 525600 (365 days). The value 0 disables the absolute timeout. Default: 0

timeout-idle *timeout_duration*

Important: This keyword is obsolete. It has been left in place for backward compatibility. If used a warning is issued and the value entered is rounded to the nearest whole minute.

Specifies the maximum amount of idle time, in seconds, the context-level administrator may have a session active before the session is terminated. *timeout_duration* must be a value in the range from 0 through 300000000. The value 0 disables the idle timeout. Default: 0

timeout-min-idle *idle_minutes*

Specifies the maximum amount of idle time, in minutes, the context-level administrator may have a session active before the session is terminated. *idle_minutes* must be a value in the range from 0 through 525600 (365 days). The value 0 disables the idle timeout. Default: 0

Usage

Create new context-level administrators or modify existing administrator's options, in particular, the timeout values.
Administrator users have read-write privileges and full access to all contexts and command modes (except for a few security functions). Refer to the *Command Line Interface Overview* chapter of this guide for more information.

Important: A maximum of 128 administrative users and/or subscribers may be locally configured per context.

Example

The following configures a context-level administration named *user1* with ACS parameter control:

```
config-administrator user1 password secretPassword ecs
```

The following command removes a context-level administrator named *user1*:

```
no config-administrator user1
```

content-filtering

Enables or disables the creation, configuration or deletion of Content Filtering Server Groups (CFSG).

Product

CF

Privilege

Security Administrator, Administrator

Syntax

content-filtering server-group *cf_server_group_name* **[-noconfirm]**

no content-filtering server-group *cf_server_group_name*

no

Removes the specified CFSG previously configured in this context.

content-filtering server-group *cf_server_group_name*

Specifies the name of the CFSG as an alphanumeric string of 1 through 63 characters.

-noconfirm

Executes the command without any prompt and confirmation from the user.

Usage

Use this command to create/configure/delete a CFSG.

Example

The following command creates a CFSG named *CF_Server1*:

```
content-filtering server-group CF_Server1
```

credit-control-service

Enables or disables the creation, configuration or deletion of credit-control services.

Product

All

Privilege

Security Administrator, Administrator

Syntax

credit-control-service *service_name* **[-noconfirm]**

no credit-control-service *service_name*

no

Deletes the specified credit-control service.

credit-control-service *service_name*

Specifies name of the credit-control service as an alphanumeric string of 1 through 63 characters.
If the named credit-control service does not exist, it is created, and the CLI mode changes to the Credit Control Service Configuration Mode wherein the service can be configured.
If the named credit-control service already exists, the CLI mode changes to the Credit Control Service Configuration Mode wherein the service can be configured.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

Usage

Use this command to create, configure or delete credit-control services.
Entering this command results in the following prompt:
`[context_name]hostname(config-credit-control-service)`
Credit control service configuration commands are described in the *Credit Control Service Configuration Mode Commands* chapter.

Example

The following command enters the Credit Control Service Configuration Mode for a credit-control service named *test159*:

```
credit-control-service test159
```

crypto group

Creates or deletes a crypto group and enters the Crypto Configuration Mode allowing the configuration of crypto group parameters.

Product

PDSN, PDIF, HA, GGSN

Privilege

Administrator, Config-Administrator

Syntax

[no] crypto group *group_name*

no

Deletes a previously configured crypto group.

[no] crypto group *group_name*

Specifies the name of the crypto group as an alphanumeric string of 1 through 127 characters that is case sensitive.

Important: A maximum of 32 crypto groups per context can be configured.

Usage

Use this command to enter the configuration mode allowing the configuration of crypto group parameters. Crypto (tunnel) groups are used to support the Redundant IPSec Tunnel Fail-over feature and consist of two configured ISAKMP crypto maps. Each crypto map defines the IPSec policy for a tunnel. In the crypto group, one tunnel serves as the primary, the other as the secondary (redundant).

Example

The following command configures a crypto group called *group1*:

```
crypto group group1
```

crypto ipsec transform-set

Configures transform-sets on the system and enters the Crypto Trans Configuration Mode.

Product

PDSN, PDIF, HA, GGSN

Privilege

Security Administrator, Administrator

Syntax

```
crypto ipsec transform-set transform_name [ ah { hmac { md5-96 | none | sha1-96 } { esp {
hmac { { md5-96 | sha1-96 } { cipher { 3des-cbc | aes-cbc-128 | aes-cbc-256 | des-cbc } }
| none } } } } ]

no crypto ipsec transform-set transform_name
```

no

Removes a previously configured transform set

crypto ipsec transform-set *transform_name*

Specifies the name of the transform set as an alphanumeric string of 1 through 127 characters that is case sensitive.

ah hmac

Configures the Authentication Header (AH) hash message authentication codes (HMAC) parameter for the transform set to one of the following:

- **md5-96**: Message Digest 5 truncated to 96 bits
- **none**: Disables the use of the AH protocol for the transform set.
- **sha1-96**: Secure Hash Algorithm-1 truncated to 96 bits

esp hmac

Configures the Encapsulating Security Payload (ESP) hash message authentication codes (HMAC) parameter for the transform set to one of the following:

- **md5-96**: Message Digest 5 truncated to 96 bits
- **none**: Disables the use of the AH protocol for the transform set.
- **sha1-96**: Secure Hash Algorithm-1 truncated to 96 bits

cipher

If ESP is enabled, this option must be used to set the encapsulation cipher protocol to one of the following:

- **3des-cbc**: Triple Data Encryption Standard (3DES) in chain block (CBC) mode.
- **aes-cbc-128**: Advanced Encryption Standard (AES) in CBC mode with a 128-bit key.
- **aes-cbc-256**: Advanced Encryption Standard (AES) in CBC mode with a 256-bit key.
- **des-cbc**: DES in CBC mode.

Usage

Use this command to create a transform set on the system.
Transform Sets are used to define IPSec security associations (SAs). IPSec SAs specify the IPSec protocols to use to protect packets.
Transform sets are used during Phase 2 of IPSec establishment. In this phase, the system and a peer security gateway negotiate one or more transform sets (IPSec SAs) containing the rules for protecting packets. This negotiation ensures that both peers can properly protect and process the packets.

Important: The **ah** and subsequent keywords are required when the transform set is initially configured.

Example

Create a transform set that has the name *tset1*, no authentication header, an encapsulating security protocol header hash message authentication code of **md5**, and a bulk payload encryption algorithm of **des-cbc** with the following command:

```
crypto ipsec transform-set tset1 ah hmac none esp hmac md5 cipher des-cbc
```

crypto map

Configures the name of the policy and enters the specified Crypto Map Configuration mode.

Product

PDSN, HA, GGSN, P-GW, PDIF

Privilege

Security Administrator, Administrator

Syntax

```
crypto map name [ ikev2-ipv6 | ipsec-dynamic | ipsec-ikev1 | ipsec-manual ]

no crypto map name
```

no

Removes a previously configured crypto map.

crypto map *name*

Specifies the name of the crypto map as an alphanumeric string of 1 through 127 characters that is case sensitive.

ikev2-ipv6

Refer to the *Lawful Intercept Configuration Guide* for a description of this parameter.

ipsec-dynamic

Creates a dynamic crypto map and/or enters the Crypto Map Dynamic Configuration Mode.

ipsec-ikev1

Creates an IKEv1 crypto map and/or enters the Crypto Map IKEv1 Configuration Mode.

ipsec-manual

Creates a manual crypto map and/or enters the Crypto Map Manual Configuration Mode.

Usage

Crypto Maps define the policies that determine how IPSec is implemented for subscriber data packets. There are several types of crypto maps supported by the system. They are:

- **Manual crypto maps**: These are static tunnels that use pre-configured information (including security keys) for establishment. Because they rely on statically configured information, once created, the tunnels never expire; they exist until their configuration is deleted.

Important: Because manual crypto map configurations require the use of static security keys (associations), they are not as secure as crypto maps that rely on dynamically configured keys. Therefore, it is recommended that they only be configured and used for testing purposes.

- **IKEv1 crypto maps**: These tunnels are similar to manual crypto maps in that they require some statically configured information such as the IP address of a peer security gateway and that they are applied to specific system interfaces. However, IKEv1 crypto maps offer greater security because they rely on dynamically generated security associations through the use of the Internet Key Exchange (IKE) protocol.
- **IKEv2-IPv6 crypto maps**: Refer to the *Lawful Intercept Configuration Guide* for a description of this parameter.
- **Dynamic crypto maps:** These tunnels are used for protecting L2TP-encapsulated data between the system and an LNS/security gateway or Mobile IP data between an FA service configured on one system and an HA service configured on another.

Important: The crypto map type (dynamic, IKEv1, IKEv2-IPv6, or manual) is specified when the map is first created using this command.

Example

Create a dynamic crypto map named *map1* and enter the Crypto Map Dynamic Configuration Mode by entering the following command:

```
crypto map map1 ipsec-dynamic
```

crypto template

Creates a new or specifies an existing crypto template and enters the Crypto Template Configuration Mode.

Product

PDIF, S-GW

Privilege

Security Administrator, Administrator

Syntax

crypto template *name* **ikev2-dynamic**

no crypto template *name*

no

Deletes a previously configured crypto template.

crypto template *name* **ikev2-pdif**

Specifies the name of a new or existing crypto template as an alphanumeric string of 1 through 127 characters.

ikev2-dynamic

Configures the Crypto Template to be used for configuring IPSec functionality.

Usage

Use this command to create a new or enter an existing crypto template.
Entering this command results in the following prompt:

```
[context_name]hostname(cfg-crypto-tmpl-ikev2-tunnel)#
```

Crypto Template Configuration Mode commands are defined in the *Crypto Template Configuration Mode Commands* chapter.

Example

The following command configures a IKEv2 dynamic crypto template called *crypto1* and enters the Crypto Template Configuration Mode:

```
crypto template crypto1 ikev2-dynamic
```

cscf access-profile

Creates a new or enters an existing access profile used to set signaling compression for various network access types.

Product

SCM

Privilege

Administrator

Syntax

cscf access-profile { default | name *profile_name* **} [-noconfirm]**

no cscf access-profile name *profile_name*

default

Specifies that the system is to enter the Access Profile Configuration Mode for the default access profile.

cscf access-profile name *profile_name*

Specifies a name for the access profile as an alphanumeric string of 1 through 79 characters.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

no cscf access-profile name *profile_name*

Removes the CSCF access profile from the context.

Usage

Use this command to create an access profile for the CSCF service and cause the system to enter the Access Profile Configuration Mode where parameters are configured for the profile.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-access-profile)#
```

Access Profile Configuration Mode commands are defined in the *CSCF Access Profile Configuration Mode Commands* chapter.

Example

The following command creates a CSCF Access Profile named *profile2* and enters the Access Profile Configuration Mode:

```
cscf access-profile name profile2
```

cscf acl

Creates an Access Control List (ACL) and enters the ACL Configuration Mode.

Product

SCM

Privilege

Administrator

Syntax

cscf acl { default | name *list_name* **} [-noconfirm]**

no cscf acl name *list_name*

default

Specifies that the system is to enter the ACL Configuration Mode for the default ACL.

cscf acl name *list_name*

Specifies a name for the ACL as an alphanumeric string of 1 through 47 characters.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

no cscf acl name *list_name*

Removes the CSCF ACL from the context.

Usage

Use this command to create an access control list for the CSCF service and cause the system to enter the ACL Configuration Mode where parameters are configured for the new list.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-acl)#
```

ACL Configuration Mode commands are defined in the *CSCF ACL Configuration Mode Commands* chapter.
Use this command when configuring the following SCM components: P-CSCF, S-CSCF, and SIP Proxy.

Example

The following command creates a CSCF access control list named *acl1* and enters the ACL Configuration Mode:

```
cscf acl name acl1
```

cscf diameter-selection

Creates a CDF or HSS diameter selection table and enters the CSCF Diameter Selection Configuration Mode.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

```
cscf diameter-selection type { cdf | hss } [ -noconfirm ]

no cscf diameter-selection type { cdf | hss }
```

type { cdf | hss }

Specifies the type of diameter selection table.
cdf: Diameter selection table for selecting CDF server
hss: Diameter selection table for selecting HSS server

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

no cscf diameter-selection type { cdf | hss }

Removes the specified CDF or HSS diameter selection table.

Usage

Use this command to cause the system to enter the Diameter Selection Configuration Mode where parameters are configured for the diameter group.

Important: When HSS table has entries, this criteria is always applied for HSS server selection. CDF server selection, however, can be enabled or disabled for a given access type.

Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-diameter-selection)#
```

Diameter Selection Configuration Mode commands are defined in the *CSCF Diameter Selection Configuration Mode Commands* chapter.
Use this command when configuring the S-CSCF.

Example

The following command creates an HSS diameter selection table and enters the Diameter Selection Configuration Mode:

```
cscf diameter-selection type hss
```

cscf ifc-filter-criteria

Creates Initial Filter Criteria (iFC) filter criteria for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-filter-criteria id *fc_id* **priority** *pri* **[profile-part-indicator { registered | unregistered }] app-server uri scheme { sip | sips }** *as* **as-default-handling { session-continue | session-terminate } [-noconfirm] | [service-info** *info* **] [trigger-point** *tp_name* **] [-noconfirm] | [trigger-point** *tp_id* **] [-noconfirm]**

no cscf ifc-filter-criteria id *fc_id*

cscf ifc-filter-criteria id *fc_id*

Specifies an ID for the iFC filter criteria as an integer from 1 through 200.

priority *pri*

Specifies the priority of the filter criteria, which is used to select a particular filter criteria from multiple ones present under an ISC template. *pri* must be an integer from 0 through 1024.

profile-part-indicator { registered | unregistered }

Indicates whether the iFC is a part of the **registered** or **unregistered** user profile. If a value is not specified, then the configuration will be applied to both registered and unregistered subscribers.

app-server uri scheme { sip | sips }

Determines the associated application server's URI scheme.
sip: SIP URI
sips: SIPS URI (TLS)

as

Specifies an address for the associated application server as an alphanumeric string of 1 through 127 characters.

as-default-handling { session-continue | session-terminate }

Determines whether the dialog should be released (**session-terminate**) or not (**session-continue**) when the application server could not be reached or on application server error is returned.

-noconfirm

Executes command without any additional prompt and confirmation from the user.

service-info *info*

Specifies optional service information to be sent to the application server. *info* is an alphanumeric string of 1 trough 63 characters.

trigger-point *tp_id*

Assigns an iFC trigger point to the filter criteria as an integer from 1 through 200.

no cscf ifc-filter-criteria id *fc_id*

Removes the specified CSCF iFC filter criteria from the context.

Usage

Use this command to create a filter criteria ID and associate an application server address to it. You may also define a trigger point ID to be executed in order to select the application server. If no trigger point is specified, then the application server is selected unconditionally.

Important: Filter criteria is associated with an ISC template in the ISC Template Configuration Mode.

Important: Filter criteria can be assigned to more than one ISC template.

Example

The following command creates a iFC filter criteria *15*, which has a priority of 2 and is part of the registered user profile. Filter criteria *15* is assigned to a sip application server named *appserver*. The dialog will not be released if the application server can not be reached. Filter criteria *15* is also assigned trigger point *12*:

```
cscf ifc-filter-criteria id 15 priority 2 profile-part-indicator
registered app-server uri scheme sip appserver as-default-handling
session-continue trigger-point 12
```

cscf ifc-spt-condition

Creates an Initial Filter Criteria (iFC) Service Point Trigger (SPT) condition for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-spt-condition id *cond_id* **{ request-uri content** *uri_content* **| session-case { originating-registered | originating-unregistered | terminating-registered | terminating-unregistered } | session-description** *sdp* **[content** *sdp_data* **] | sip-header** *hdr* **[content** *hdr_data* **] | sip-method** *method* **} [-noconfirm] [condition-negated]**

no cscf ifc-spt-condition id *cond_id*

cscf ifc-spt-condition id *cond_id*

Specifies an ID for the iFC SPT condition as an integer from 1 through 200.

request-uri content *uri_content*

Specifies request URI content as an alphanumeric string of 1 through 127 characters.

Important: Wildcard Extended Regular Expressions (ERE) are supported for this value. For example, "sip.user[0-9]@192\\.168\\.176\\.150"

session-case { originating-registered | originating-unregistered | terminating-registered | terminating-unregistered }

Determines the type of session:

- **originating-registered**: Session handling an originating end user.
- **originating-unregistered**: Session handling an unregistered originating end user.
- **terminating-registered**: Session handling a terminating registered end user.
- **terminating-unregistered**: Session handling a terminating unregistered end user.

session-description *sdp* **[content** *sdp_data* **]**

Specifies an SDP line type.
sdp is an alphanumeric string of 1 through 15 characters.
content specifies content on the SDP line.
sdp_data is an alphanumeric string of 1 through 127 characters.

sip-header *hdr* **[content** *hdr_data* **]**

Specifies a header type.
hdr is an alphanumeric string of 1 through 127 characters.
content specifies content on the header.
hdr_data is an alphanumeric string of 1 through 127 characters.

sip-method *method*

Specifies a sip method.
method is an alphanumeric string of 1 through 127 characters.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

condition-negated

Negates the specified condition.

no cscf ifc-spt-condition id *cond_id*

Removes the specified CSCF iFC SPT condition from the context.

Usage

Use this command to create individual SPT conditions that are later associated with an SPT group in the iFC SPT Group Configuration Mode.

Important: An iFC SPT group may be associated with multiple SPT conditions.

Example

The following command creates iFC SPT condition *10* which handles an originating end user:

```
cscf ifc-spt-condition id 10 session-case originating-registered
```

The following command negates the condition created above:

```
cscf ifc-spt-condition id 10 session-case originating-registered
condition-negated
```

cscf ifc-spt-group

Creates an Initial Filter Criteria (iFC) Service Point Trigger (SPT) group for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-spt-group id *group_id* **[[-noconfirm] | reg-type { de-registration | initial-registration | re-registration } [-noconfirm]]**

no cscf ifc-spt-group id *group_id*

cscf ifc-spt-group id *group_id*

Specifies an ID for the iFC SPT group as an integer from 1 through 200.

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

reg-type { de-registration| initial-registration | re-registration }

Defines whether the SPT condition matches to REGISTER messages that are related to:

- **de-registration**
- **initial-registration**
- **re-registration**

no cscf ifc-spt-group id *group_id*

Removes the specified CSCF iFC SPT group from the context.

Usage

Use this command to create an iFC SPT group ID and bind different SPT conditions under it.

Important: An iFC SPT group may be associated with multiple SPT conditions.

The SPT group can also specify the registration type that defines whether the SPT condition matches to REGISTER messages that are related to initial registrations, re-registrations, or de-registrations.
Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-ifc-spt-group)#
```

iFC SPT Group Configuration Mode commands are defined in the *CSCF IFC SPT Group Configuration Mode Commands* chapter.

Example

The following command creates iFC SPT group *21*:

```
cscf ifc-spt-group id 21
```

cscf ifc-trigger-point

Creates an Initial Filter Criteria (iFC) trigger point for shared iFC functionality.

Product

SCM (S-CSCF, SIP Proxy)

Privilege

Administrator

Syntax

cscf ifc-trigger-point id *tp_id* **condition-type { cnf | dnf } [-noconfirm]**

no cscf ifc-trigger-point id *tp_id*

cscf ifc-trigger-point id *tp_id*

Specifies an ID for the iFC trigger point as an integer from 1 through 200.

condition-type { cnf | dnf }

Defines the condition type of the iFC trigger point:
cnf: conjunctive normal form
dnf: disjunctive normal form

-noconfirm

Executes the command without any additional prompt and confirmation from the user.

no cscf ifc-trigger-point id *tp_id*

Removes the specified CSCF iFC trigger point from the context.

Usage

Use this command to create a trigger point ID and bind different SPT groups under it.

Important: An iFC SPT group can be assigned to more than one iFC trigger point.

Entering this command results in the following prompt:

```
[context_name]hostname(config-cscf-ifc-trigger-point)#
```

IFC Trigger Point Configuration Mode commands are defined in the *CSCF IFC Trigger Point Configuration Mode Commands* chapter.

Example

The following command creates iFC trigger point *11* with a **cnf** condition type:

```
cscf ifc-trigger-point id 11 condition-type cnf
```

cscf isc-template

Creates an IMS Service Control (ISC) template and enters the ISC Template Configuration Mode.

Product

SCM (S-CSCF)

Privilege

Administrator

Syntax

[no] cscf isc-template id *template_id*

no

Removes the CSCF ISC template from the context.

cscf isc-template id *template_id*
